SkepDic.com

FLIM- FLAM!

Psychics, ESP, Delusions
and other Deceptions

by James Randi
(The Amazing Randi)

Introduction by Isaac Asimov

abracadabra

Abracadabra is a mystical word used to magically invoke benevolent spirits for protection against disease. The expression is also used by modern magicians as they pretend to invoke paranormal or supernatural powers to aid in their illusions. This magical formula may be related to the word '[abraxas](#)', which was found on many [amulets](#) during the last years of the Roman Empire and is thought to have originated with the [Gnostics](#) or the Egyptians. In any case, *abracadabra* is just as effective as *abraxas* or *hocus-pocus*.

reader comments:

24 Apr 00

I always enjoy reading your dictionary (it's the first place I turn to for my skeptical research). I noticed the entry for "abracadabra," and wanted to suggest another source for the term. According to a Princeton professor of Hebrew I knew, the phrase "avrah ke dibrah" translates roughly into "it happened as it was said." Magicians would use the phrase in the course of working their tricks. The words would be similar in Aramaic and other related languages.

Sheryl Zohn

Fri, 21 Jun 2002

To expand on Sheryl Zohn's definition of the word ABRACADABRA. In Aramaic, it is part of a sentence uttered by ancient magicians and healers . ABRA/CAD/ABRA. "It will pass when it will pass". (When it's time for it to pass).

Meyer Klein

[Voodoo call for African peace](#)

zombies and p-zombies

Zombies are dead bodies with no souls, created by the black magic of [voodoo sorcerers](#). Voodoo is a religion which originated in West Africa and was brought to Haiti in the early 16th century by West African slaves. The slaves could not practice their religion openly and were forced to adopt in public the practices of the French Catholic settlers. Voodoo is still a popular religion in Haiti and in cities where Haitians have emigrated, such as New Orleans. *Vodu* is an African word meaning spirit or god. The black magic of voodoo sorcerers allegedly consists of various poisons (perhaps that of the puffer fish) which immobilize a person for days, as well as hallucinogens administered upon revival. The result is a brain damaged creature used by the sorcerers as slaves, viz., the zombies. The zombie is not to be confused with the *zombie astral*, whose **soul** (*ti-bon-ange*) is controlled by the sorcerer.

It is quite understandable that a religion practiced under slavery would emphasize evil spirits. It is a cruel irony that some in the religion would evolve to worship at evil's altar and engage in practices which not only enslave others but keep the community in line from fear of being turned into a zombie/slave.

Many people are skeptical of the existence of zombies, which I take to mean they are skeptical that a dead person could be revived with or without retaining his or her "soul" or "self-consciousness" or "mind." Once you are dead, you are dead forever. For those who don't believe a person has a soul, death is not the separation of the body from the soul, but the end of life and consciousness. The voodoo zombie is not a dead person, but a living person who has been brain damaged.

There is another kind of zombie, however: the philosophical zombie. A philosophical zombie (p-zombie, for short) would be a human body without consciousness which would nevertheless behave like a human body with consciousness. To some philosophers (e.g., [Daniel Dennett](#)) this is a contradictory notion and thus an impossible conception. If it behaves like a person and is indistinguishable from a person, then it *is* a person. Other philosophers (e.g. Todd Moody and [David Chalmers](#)) argue that a p-zombie would be distinguishable from a person even though indistinguishable from a *conscious* person. It is distinguishable, say these philosophers, because it is stipulated that it is not conscious even though it is indistinguishable from a conscious being. In case you are wondering why philosophers would debate whether it is possible to conceive of a p-zombie, it is because some philosophers do not believe or do not want to believe that consciousness can

be reduced to a set of materialistic functions. Important metaphysical and ethical issues seem to hinge on whether there can be p-zombies. Can machines be conscious? If we created a machine which was indistinguishable from a human person, would our artificial creation be a "person" with all the rights and duties of natural persons? To the p-zombie advocates, consciousness is more than brain processes and neurological functions. No adequate account of consciousness will ever be produced that is "reductionist," i.e., completely materialistic.

I think it is possible to conceive of a machine which "perceives" without being aware of perceiving. In fact, they already exist: motion detectors, touch screens, tape recorders, smoke alarms, certain robots. An android which could process visual, auditory, tactile, olfactory and gustatory input but which would lack self-consciousness, i.e., would not be aware of perceiving anything, is conceivable. We can even conceive of such machines resembling humans in the flesh. How would we distinguish such automata from persons? The same way we do now: by the imperfect and fallible methods of conversation and observation. But that is not what would make the two distinct; self-consciousness or the lack of it would distinguish the automata from persons. "Visual perception" by a motion detector is unlike visual perception by a person just because of the difference in awareness of perception, i.e., self-consciousness. A smoke detector might "smell" certain chemicals, but it does not process odors the way a person does. In my view, the only conceivable p-zombie would be a machine which perceives but has no awareness of perceiving, i.e., no self-consciousness. Such machines are essentially distinct from conscious persons.

For what it's worth, I side with Dennett and those who think that the concept of the p-zombie is a logical absurdity. If the "zombie" exhibits all the symptoms of consciousness, then the "zombie" is not a zombie; for to exhibit all the symptoms of consciousness is to have consciousness, which the zombie is denied by definition.

Anyway, this reminds me of a story by Raymond Smullyan, the great logician and paradoxer. A man wants to commit suicide but does not want to cause his family any grief. He finds out about an elixir he can take which will kill him, i.e., separate his soul from his body, but leave his body intact to wake up, go to work, play with the kids, keep the wife satisfied and bring home the bacon. But before he takes the elixir, a well-intentioned friend sneaks in during the night and injects his suicidal friend with the stuff, thereby killing him, i.e., releasing his soul. The man wakes up and doesn't know he's dead (i.e., that he has no soul), so he takes the elixir. He can't kill himself, since he's already dead. But he thinks he can kill himself and become a p-zombie. However, he is already a p-zombie. Question: if the p-zombie can't tell the difference between a real person and a p-zombie, why would we think that we real persons could tell the difference? In fact, since the conception of the "soul" makes absolutely no difference in either the nature of a person or a p-zombie, the concept of the "soul" is superfluous. If persons are indistinguishable from

p-zombies then they are not two distinct concepts, but one concept manipulated by language to mislead us into thinking there are two distinct concepts here.

As to the ethical questions regarding how we should treat androids which are behaviorally indistinguishable from natural persons, I think that if we stipulate that such creatures are persons with rights, then they will be persons; otherwise, they will not be persons. The concept of a person is not a matter of discovery, but of stipulation. I would argue, also, that the same is true of the concept of "soul." But it is not true of the concept of "consciousness": anyone who is conscious should be able to tell the difference between a dead body and a living person. Dead bodies which act like persons, and bodiless souls which perceive like conscious persons, exist only in the movies or in the minds of certain philosophers and other fantasy writers.

Personally, I would argue that self-conscious androids should be granted the status of persons on the grounds that the distinction between being synthetic or natural is insignificant. I have a feeling that believers in souls would disagree and would justify creating a race of androids to serve as slaves and to be treated as things not persons.

acupuncture

...I bet when they go in for a root canal the only needle they want to see is a shot of novocaine. --Cecil Adams

Acupuncture is a traditional Chinese medical technique for manipulating [chi](#) (ch'i or qi) in order to balance the opposing forces of [yin and yang](#). Chi, an alleged "energy" which permeates all things, is believed to flow through the body along 14 main pathways called meridians. When yin and yang are in harmony, chi flows freely within the body and a person is healthy. When a person is sick, diseased, or injured it is believed that there is an obstruction of chi along one of the meridians. Acupuncture consists of inserting needles through particular points on the body, allegedly removing unhealthy obstructions of chi and thereby restoring the distribution of yin and yang. Sometimes the needles are twirled, heated, or even stimulated with weak electrical current, ultrasound or certain wavelengths of light. But no matter how it is done, scientific research over the past twenty years has failed to demonstrate that acupuncture is effective against any disease.

A variation of traditional acupuncture is called [auriculotherapy or ear acupuncture](#). It is a method of diagnosis and treatment based on the unsubstantiated belief that the ear is the map of the bodily organs. A problem with an organ such as the liver is to be treated by sticking a needle into a certain point on the ear which is supposed to be the corresponding points for that organ. Similar notions about a part of the body being an organ map are held by [iridologists](#) (the iris is the map of the body) and [reflexologists](#) (the foot is the map of the body). A variation of auriculotherapy is staplepuncture, a method of treatment which puts staples at key points on the ear hoping to do such wonderful things as help people stop smoking. There is no supportive scientific evidence for any of these theories or practices.

Acupuncture has been used in China for more than 4,000 years to alleviate pain and cure disease. Traditional Chinese medicine is not based upon knowledge of modern physiology, biochemistry, nutrition, anatomy or any of the known mechanisms of healing. Nor is it based on knowledge of cell chemistry, blood circulation, nerve function, or the existence of hormones or other biochemical substances. There is no correlation between the meridians used in traditional Chinese medicine and the actual layout of the organs and nerves in the human body. The National Council for Reliable Health Information (NCRHI) notes that of the 46 medical journals published by the Chinese Medical Association, none of them is devoted to acupuncture or other traditional Chinese medical practices. (NCRHI was formerly known as The National Council Against Health Fraud, Inc. It is a private nonprofit, voluntary health agency that focuses upon health misinformation, fraud, and quackery as public health problems.) Nevertheless, it is estimated that somewhere between 10 and 15 million Americans spend approximately \$500

million a year on acupuncture for everything from relieving pain to treating drug addiction to fighting AIDS.

The UCLA medical schools has one of the largest acupuncture training courses in the United States for licensed physicians. The 200-hour program teaches nearly 600 physicians a year. According to the [American Academy of Medical Acupuncture](#), about 4,000 U.S. physicians have training in acupuncture.

Despite a lack of scientific support, acupuncture is used in the treatment of depression, allergies, asthma, arthritis, bladder and kidney problems, constipation, diarrhea, colds, flu, bronchitis, dizziness, smoking, fatigue, gynecologic disorders, headaches, migraines, paralysis, high blood pressure, PMS, sciatica, sexual dysfunction, stress, stroke, tendonitis and vision problems. Thus, it seems that while China is moving forward in the scientific treatment of illness and disease, many in America and other parts of the world are moving backward, looking for metaphysical answers to their physical problems.

In March, 1996, the Federal Drug Administration (FDA) classified acupuncture needles as medical devices for general use by trained professionals. Until then, acupuncture needles had been classified as Class III medical devices, meaning their safety and usefulness was so uncertain that they could only be used in approved research projects. Because of that "experimental" status, many insurance companies, as well as Medicare and Medicaid, had refused to cover acupuncture. This new designation has meant both more practice of acupuncture and more research being done using needles. It also means that insurance companies may not be able to avoid covering useless or highly questionable acupuncture treatments for a variety of ailments. Nevertheless, Wayne B. Jonas, director of the Office of Alternative Medicine at the National Institutes of Health in Bethesda, MD, has said that the reclassification of acupuncture needles is "a very wise and logical decision". The Office of Alternative Medicine is very supportive (i.e. willing to spend good amounts of tax dollars) on new studies of the effectiveness of acupuncture. However, because of the nature of acupuncture, what will be tested in America and other western countries, will not be acupuncture, but something much more narrow. We will be testing the effectiveness of sticking needles into muscles. If doing this lowers blood pressure, for example, it will not be a validation of acupuncture because traditional Chinese acupuncture is not a scientific theory, but a metaphysical one. And metaphysical theories can't be empirically tested. How a physical needle affects a metaphysical entity such as chi is not likely to be addressed by those testing acupuncture. Of course, the positive side of this is that traditional acupuncture can't be disproved, either. There is a perfect harmony here between proof and disproof: each is impossible.

Perhaps the most frequently offered defense of acupuncture by its defenders

in both the East and West is the pragmatic defense: acupuncture works! What does that really mean? It certainly does not mean that sticking needles into one's body opens up blocked chi. At most, it means that it relieves some medical burden. The NCAHF has issued a position paper which asserts that "Research during the past twenty years has failed to demonstrate that acupuncture is effective against any disease" and that "the perceived effects of acupuncture are probably due to a combination of expectation, suggestion, counter-irritation, operant conditioning, and other psychological mechanisms...." In short, most of the perceived beneficial effects of acupuncture are probably due to the power of suggestion and the [placebo effect](#).

The most common claim of success by acupuncture advocates is in the area of pain control. Studies have shown that many acupuncture points are more richly supplied with nerve endings than are the surrounding skin areas. There is some research which indicates sticking needles into certain points affects the nervous system and stimulates the body's production of such natural painkilling chemicals as endorphins and enkephalins, and triggers the release of certain neural hormones including serotonin. Another theory suggests that acupuncture blocks the transmission of pain impulses from parts of the body to the central nervous system. These theories regarding chemical stimulation and blockage of nerve signals are empirically testable. They are couched in terms of the western scientific view of the body's anatomical and neurological system. Even here, however, most of the evidence for the effectiveness of acupuncture is identical to the majority of evidence we have for any so-called "alternative" health practice: it is mainly anecdotal. Unfortunately, for every anecdote of someone whose pain was relieved by acupuncture there is another anecdote of someone whose pain was not relieved by acupuncture. For some, the relief is real but short-lived. The treatment is akin to anesthesia. The patient has to be assisted with walking afterwards, driven home, feels good for awhile, and then the pain returns within a day or two. All we know for sure right now is that sticking needles in people at various traditional acupuncture points often seems to be effective in alleviating pain. However, most pain researchers agree that 30% to 35% of subjects' pain improves from suggestion or the placebo effect no matter what treatment is used.

There are other difficulties which face any study of pain. Not only is pain measurement entirely subjective, traditional acupuncturists evaluate success of treatment almost entirely subjectively, relying on their own observations and reports from patients, rather than objective laboratory tests. Furthermore, many individuals who swear by acupuncture (or [therapeutic touch](#), [reiki](#), [iridology](#), [meditation](#), [mineral supplements](#), etc.) often make several changes in their lives at once, thereby making it difficult to isolate significant causal factors in a [control study](#).

If control studies show that sticking needles into people really does help drug addicts or cure AIDS, will acupuncturists claim vindication? Will they say

that chi flows along the same paths as the blood and nerve impulses, that there is a parallel universe to the physical one, a sort of pre-established harmony between chi/yin/yang and the physical body? Theoretically, whatever is demonstrated regarding the stimulation of endorphins, for example, may be claimed to be also due to chi, despite the uselessness and superfluousness of the theory. But what happens if it turns out that sticking needles into people doesn't lower high blood pressure or cure bronchitis? Will that be taken as proof that chi is a chimera?

Some of the acupuncture studies supported by the Office of Alternative Medicine at the National Institutes of Health try to mimic traditional control group studies, but no control study can test for the presence of chi, yin, yang or any other metaphysical entity. Some studies have been tried where patients were randomly divided into those who would receive treatment with acupuncture and those who would receive "sham acupuncture." The latter treatment consisted of acupuncture needles being inserted at the "wrong" points (i.e., not one of the 500 traditional points). It seems very unwise to compare people stuck with a needle in a "right" point versus a "wrong" point, unless you already know that sticking people can help alleviate pain and you are just trying to find the right place to stick them. The false point stickings were said to be analogous to a placebo treatment, but are they? If better results are achieved by sticking the traditional points, does that confirm traditional acupuncture? Of course not. What such a result would show is that after 4,000 years the Chinese had figured out the best places to stick to relieve pain, etc. But no such study will reveal if chi was unblocked or if yin and yang are in or out of harmony. Control studies using objective measurements of treatment success could determine, however, how much of the success of acupuncture is due to nothing more than subjective assessment by interested parties. Such studies could also determine whether any effects of acupuncture are short-term or long-term.

Finally, is any harm being done to people who are undergoing acupuncture? Well, besides those who are not being treated for diseases or injuries which modern medicine could treat effectively, there are some other risks. There have been some reports of lung and bladder punctures, some broken needles, and some allergic reactions to needles containing substances other than surgical steel. Acupuncture may be harmful to the fetus in early pregnancy since it may stimulate the production of adrenocorticotrophic hormone (ACTH) and oxytocin which affect labor. Then of course, there is always the possibility of infection from unsterilized needles.

chi (ch'i or qi)

Ch'i or *qi* (pronounced "chee" and henceforth spelled "*chi*") is the Chinese word used to describe "the natural energy of the Universe." This energy, though called "natural," is spiritual or supernatural, and is part of a metaphysical, not an empirical, belief system. *Chi* is thought to permeate all things, including the human body. Such metaphysical systems are generally referred to as types of *vitalism*. One of the key concepts related to *chi* is the concept of *harmony*. Trouble, whether in the universe or in the body, is a function of disharmony, of things being out of balance and in need of restoration to equilibrium.

Proponents claim to prove the existence and power of *chi* by healing people with [acupuncture](#) or [chi kung](#) (qi gong), by doing magic tricks such as breaking a chopstick with the edge of a piece of paper or resuscitating a "dead" fly, or by martial arts stunts like breaking a brick with a bare hand or foot. When examined under controlled conditions, however, the seemingly paranormal or supernatural feats of masters of *chi* turn out to be quite ordinary feats of [magic, deception, or natural powers](#).

Vitalism is a popular philosophy in many cultures. Thus, *chi* has many counterparts: [prana](#) (India and [therapeutic touch](#)), [ki](#) (Japan); Wilhelm Reich's [orgone](#), Mesmer's [animal magnetism](#), [Bergson's élan vital](#) (vital force), to name just a few. The concept is very popular among New Age thinking, where it generally goes by the name of *energy*, though the concept bears no resemblance to the concept as used by physicists.

yin and yang

According to traditional Chinese philosophy, yin and yang are the two primal cosmic principles of the universe. Yin is the passive, female principle. Yang is the active, masculine principle.

According to legend, the Chinese emperor Fu Hsi claimed that the best state for everything in the universe is a state of harmony represented by a balance of yin and yang. Unsurprisingly, legend has it that, according to Fu Hsi, true harmony requires yang to be dominant. It's just the nature of things.

In classical Chinese, yin and yang refer to the shady and sunny sides of a hill or valley.

[Eye-opening success for iris scans \(New Scientist\) August 8, 2001](#)

iridology

Iridology is the study of the iris of the eye in order to diagnose disease. Iridology is based on the questionable assumption that every organ in the human body has a corresponding location within the iris and that one can determine whether an organ is healthy or diseased by examining the iris rather than the organ itself. Iridology is likely to be practiced by a [naturopath](#), a [chiropractor](#), a [homeopath](#) or an [acupuncturist](#), rather than by a traditional medical doctor. [The Canadian Institute of Iridology](#) says that "Iridology is one of the fastest growing fields in [alternative health care](#) in Canada today."

Traditional physicians see the [iris](#) as being the part of the eye that regulates the amount of light entering. The iris is the colored part of the eye which has a contractile opening in the center, the pupil. The pupil admits light to the lens. The lens brings the light rays to a focus, forming an image upon the retina where the light falls upon the rods and cones, causing them to stimulate the optic nerve and transmit visual impressions to the brain. Traditional physicians also recognize that certain symptoms of non-ocular disease can be detected by an eye exam. They may even recognize and find amusing that *Iris* was the ancient Greek goddess who personified the rainbow.

Iridology was the invention of Ignatz Von Peczely, a 19th-century Hungarian physician. The story is that he got the idea for this novel diagnostic tool when he saw a similarity between the eyes of a man he was treating for a broken leg and the eyes of an owl whose leg Von Peczely had broken years earlier. The striking similarity consisted of a dark streak. The hunt was on. Von Peczely then went on to document similarities in eye markings and illnesses in his patients. Other wise men finished off the map of the eye. A typical map divides up the eye into sections, using the image of a clock face as a base. So, for example, if you want to know the condition of a patient's thyroid gland, you need not touch the patient to feel for any enlargement of the gland. Nor do you need to do any tests of the gland itself. All you need to do is look in [the iris of the right eye](#) at about half two and [the iris of the left eye](#) at about half nine. Discolorations, flecks, streaks, etc. in those parts of the eyes are all you need concern yourself with, if it is the condition of the thyroid you wish to know. For problems with the vagina or penis, look at 5 o'clock in the right eye. And so on. An iridologist can do an examination with nothing more than an iridology map, a magnifying glass and a flashlight.

If Von Peczely's reasoning is typical, we can surmise that he and other iridologists deceived themselves by looking for and finding correlations between eye markings and illness. They were working with vague notions of

"markings" and "illness." Diseases may not have been precisely or accurately diagnosed in many cases. They were able to validate iridology by finding many correlations that in fact were not established as causal relationships by rigorously defined controlled studies. Some of their correlations may be accurate, but many are undoubtedly bogus, due to very broad interpretations of "markings" and "disease." They found patterns where in fact there are no patterns. They misinterpreted data and gave extraordinary significance to confirmations, while ignoring or not seeking disconfirmations. Many of their confirmations may have been merely matters of [self-validation](#). We have no way of knowing how much the power of suggestion played in their patients' illnesses. Many diagnoses were probably wrong, but no objective tests were done to check out the validity of the diagnoses. Some diagnoses may have been correct but the iridologists may have been using other signs besides eye markings to make their diagnoses. One thing they did not do were [clearly defined, controlled, double-blind, randomized, repeatable, publicly presented studies](#). Had they done proper scientific testing of their claims, they would have been able to validate or invalidate iridology once and for all. Similar lack of rigorous scientific testing has led to [self-deception](#) in other similar fields such as [reflexology](#) and [ear acupuncture](#).

With that said, it should not be assumed that the condition of the eye is an irrelevant diagnostic tool for non-eye diseases. Ophthalmologists and optometrists can identify non-ocular health problems by examining the eye. If a problem is suspected, these doctors then refer their patients to an appropriate specialist for further examination. However, recognizing symptoms of disease by looking in the eyes is *not* what iridology is about. In fact, when iridologists have been tested to see if they could distinguish healthy from sick people by looking at slides of their eyes, they have failed. In a study published in the *Journal of the American Medical Association* (1979, vol. 242, 1385-1387), three iridologists incorrectly identified nearly all of the study slides of the irises of 143 healthy and diseased people. "In fact, they often read the irises of the sickest people as being healthy and vice versa. They did not even agree with each other." Similar results involving five Dutch iridologists were published in the *British Medical Journal* (1988, vol. 297, 1578-1581) ([Lisa Niebergall, M.D.](#)).

Iridology goes way beyond the claim that the eyes often provide signs of disease. Iridologists maintain that each organ has a counterpart in the eye and that you can determine the state of the organ's health by looking at a particular section of the eye. Evidence for this belief is sorely lacking.

What is most peculiar about the iris is that, on the one hand, each iris is absolutely unique and unchangeable, so much so that many claim that the iris is a better identifier of an individual than fingerprints. On the other hand, each iris allegedly changes with each change in state of each bodily organ. This would make the iris both immutable and in a state of constant flux, a magical union of the worlds of Parmenides and Heraclitus.

reflexology

The massaging of feet to diagnose and cure disease. In the 1930s, Eunice Ingham (1889-1974) applied Occam's razor to Dr. William Fitzgerald's teachings in *Zone Therapy* (1917) and dubbed the result reflexology. She eliminated all of Fitzgerald's [energy](#) zones--he said there are ten such zones in the body--except for the feet. Reflexology is based on the unsubstantiated belief that each part of each foot is a mirror site for a part of the body. The big toe, for example, is considered a reflex area for the head. As [iridology](#) maps the body with irises, reflexology maps the body with the feet, the right foot corresponding to the right side of the body and the left foot corresponding to the left side of the body. Because the whole body is represented in the feet, reflexologists consider themselves to be [holistic](#) health practitioners, not foot doctors. Allegedly, the ancient Chinese and Egyptians practiced reflexology, and it is still very popular in [Europe](#).

Practitioners of reflexology claim that they can cure a variety of aches and pains by massaging the correct reflex points on the foot. It is said by those who practice it that reflexology can cure migraine headaches and relieve sinus problems. It can restore harmony to hormonal imbalances and cure breathing disorders and digestive problems. If you have a back problem, a massage on the right spot on the right foot (which might be the left foot in some cases) can alleviate your suffering. If you suffer from circulatory problems or have a lot of tension and stress, reflexology promises relief.

There are many variations of reflexology and many names for these variations, including Zone Therapy, Vacuflex, and Vita Flex. Some chiropodists are also reflexologists, although there is no necessary connection between the two. Some reflexologists deny that they diagnose or treat diseases, but claim they can restore "balance" to one's "energy."

Reflexology is often combined with other therapies and practices, such as acupressure, shiatsu, yoga, and tai chi, and it often involves the hands and other body parts or zones, not just the feet. Reflexology seems to be a variation of acupressure, with its notion that there are correspondences between special pressure points and the flow of [chi](#) to bodily organs. Polarity therapy, a variant of reflexology, replaces the [yin and yang](#) opposition with the positive/negative energy charges of the sides of the body (the right side is positively charged); [massage](#) allegedly restores the proper balance of energy. In polarity therapy, the foot is the site of just one of many key massage points.

One reason foot massage may be so pleasurable and is associated with significant improvement in mood is that the area of the brain that connects to

the foot is adjacent to the area that connects to the genitals. There may be some neuronal overlapping. Neuroscientist V.S. Ramachandran writes of a person whose leg was amputated and who experienced orgasms in his phantom foot (1998: 36-37). "The genitals are right next to the foot in the body's brain maps," he notes, and speculates that this fact may account for foot fetishes.

["Against Depression, a Sugar Pill Is Hard to Beat Placebos Improve Mood, Change Brain Chemistry in Majority of Trials of Antidepressants" by Shankar Vedantam Washington Post](#)

the placebo effect

The placebo effect is the measurable, observable, or felt improvement in health not attributable to treatment. This effect is believed by many people to be due to the placebo itself in some mysterious way. A placebo (Latin for “I shall please”) is a medication or treatment believed by the administrator of the treatment to be inert or innocuous. Placebos may be sugar pills or starch pills. Even “fake” surgery and “fake” psychotherapy are considered placebos.

Researchers and medical doctors sometimes give placebos to patients. Anecdotal evidence for the placebo effect is garnered in this way. Those who believe there is scientific evidence for the placebo effect point to clinical studies, many of which use a [control](#) group treated with a placebo. Why an inert substance, or a fake surgery or therapy, would be effective is not known.

the psychological theory: it's all in your mind

Some believe the placebo effect is *psychological*, due to a *belief* in the treatment or to a subjective *feeling* of improvement. Irving Kirsch, a psychologist at the University of Connecticut, believes that the effectiveness of Prozac and similar drugs may be attributed almost entirely to the placebo effect. He and Guy Sapirstein analyzed 19 clinical trials of antidepressants and concluded that the expectation of improvement, not adjustments in brain chemistry, accounted for 75 percent of the drugs' effectiveness ([Kirsch 1998](#)).

"The critical factor," says Kirsch, "is our beliefs about what's going to happen to us. You don't have to rely on drugs to see profound transformation." In an earlier study, [Sapirstein analyzed 39 studies](#), done between 1974 and 1995, of depressed patients treated with drugs, psychotherapy, or a combination of both. He found that 50 percent of the drug effect is due to the placebo response.

A person's beliefs and hopes about a treatment, combined with their suggestibility, may have a significant biochemical effect. Sensory experience and thoughts can affect neurochemistry. The body's neurochemical system affects and is affected by other biochemical systems, including the hormonal and immune systems. Thus, it is consistent with current knowledge that a person's hopeful attitude and beliefs may be very important to their physical well-being and recovery from injury or illness.

However, it may be that much of the placebo effect is not a matter of mind over molecules, but of mind over behavior. A part of the behavior of a "sick" person is learned. So is part of the behavior of a person in pain. In short, there is a certain amount of role-playing by ill or hurt people. Role-playing is not the same as faking or malingering. The behavior of sick or injured persons is

socially and culturally based to some extent. The placebo effect may be a measurement of changed behavior affected by a belief in the treatment. The changed behavior includes a change in attitude, in what one says about how one feels, and how one acts. It may also affect one's body chemistry.

The psychological explanation seems to be the one most commonly believed. Perhaps this is why many people are dismayed when they are told that the effective drug they are taking is a placebo. This makes them think that their problem is "all in their mind" and that there is really nothing wrong with them. Yet, there are too many studies which have found objective improvements in health from placebos to support the notion that the placebo effect is entirely psychological.

Doctors in one study successfully eliminated warts by painting them with a brightly colored, inert dye and promising patients the warts would be gone when the color wore off. In a study of asthmatics, researchers found that they could produce dilation of the airways by simply telling people they were inhaling a bronchodilator, even when they weren't. Patients suffering pain after wisdom-tooth extraction got just as much relief from a fake application of ultrasound as from a real one, so long as both patient and therapist thought the machine was on. Fifty-two percent of the colitis patients treated with placebo in 11 different trials reported feeling better -- and 50 percent of the inflamed intestines actually looked better when assessed with a sigmoidoscope ("The Placebo Prescription" by Margaret Talbot, *New York Times Magazine*, January 9, 2000).*

It is unlikely that such effects are purely psychological. But it is not necessarily the case that the placebo is actually effective in such cases.

the nature-taking-its-course theory

Some believe that at least part of the placebo effect is due to an illness or injury taking its natural course. We often heal spontaneously if we do nothing at all to treat an illness or injury. Furthermore, many disorders, pains and illnesses, wax and wane. What is measured as the placebo effect could be, in many cases, the measurement of natural [regression](#). In short, the placebo may be given credit that is due to Nature.

However, spontaneous healing and spontaneous remission of disease cannot explain all the healing or improvement that takes place because of placebos. People who are given no treatment at all often do not do as well as those given placebos or real medicine and treatment.

the process-of-treatment theory

Another theory gaining popularity is that a process of treatment that involves showing attention, care, affection, etc., to the patient/subject, a process that is encouraging and hopeful, may itself trigger physical reactions in the body which promote healing. According to Dr. Walter A. Brown, a psychiatrist at Brown University,

there is certainly data that suggest that just being in the healing situation accomplishes something. Depressed patients who are merely put on a waiting list for treatment do not do as well as those given placebos. And -- this is very telling, I think -- when placebos are given for pain management, the course of pain relief follows what you would get with an active drug. The peak relief comes about an hour after it's administered, as it does with the real drug, and so on. If placebo analgesia was the equivalent of giving nothing, you'd expect a more random pattern ("The Placebo Prescription" by Margaret Talbot, *New York Times Magazine*, January 9, 2000).*

Dr. Brown and others believe that the placebo effect is mainly or purely *physical* and due to physical changes which promote healing or feeling better. It is assumed that the physical changes are not caused by the placebo itself. So, what is the explanatory mechanism for the placebo effect? Some think it is the *process* of administering it. It is thought that the touching, the caring, the attention, and other interpersonal communication that is part of the controlled study process (or the therapeutic setting), along with the hopefulness and encouragement provided by the experimenter/healer, affect the mood of the subject, which in turn triggers physical changes such as release of endorphins. The process reduces stress by providing hope or reducing uncertainty about what treatment to take or what the outcome will be. The reduction in stress prevents or slows down further harmful physical changes from occurring.

The process-of-treatment hypothesis would explain how inert [homeopathic](#) remedies and the questionable therapies of many "alternative" health practitioners are often effective or thought to be effective. It would also explain why pills or procedures used by conventional medicine work until they are shown to be worthless.

Forty years ago, a young Seattle cardiologist named Leonard Cobb conducted a unique trial of a procedure then commonly used for angina, in which doctors made small incisions in the chest and tied knots in two arteries to try to increase blood flow to the heart. It was a popular technique - - 90 percent of patients reported that it helped -- but when Cobb compared it with placebo surgery in which he made

incisions but did not tie off the arteries, the sham operations proved just as successful. The procedure, known as internal mammary ligation, was soon abandoned ("The Placebo Prescription" by Margaret Talbot, *New York Times Magazine*, January 9, 2000).*

Of course, *spontaneous healing* or [regression](#) can also adequately explain why homeopathic remedies might appear to be effective. Whether the placebo effect is mainly psychological, misunderstood spontaneous healing, due to showing care and attention, or due to some combination of all three may not be known with complete confidence.

the powerful placebo challenged

The powerful effect of the placebo is not in doubt. [It should be](#), however, according to Danish researchers Asbjorn Hrobjartsson and Peter C. Gotzsche. Their meta-study of 114 studies involving placebos found "little evidence in general that placebos had powerful clinical effects...[and]...compared with no treatment, placebo had no significant effect on binary outcomes, regardless of whether these outcomes were subjective or objective. For the trials with continuous outcomes, placebo had a beneficial effect, but the effect decreased with increasing sample size, indicating a possible bias related to the effects of small trials ("Is the Placebo Powerless? An Analysis of Clinical Trials Comparing Placebo with No Treatment," *The New England Journal of Medicine*, May 24, 2001 (Vol. 344, No. 21))."

According to Dr. Hrobjartsson, professor of medical philosophy and research methodology at University of Copenhagen, "The high levels of placebo effect which have been repeatedly reported in many articles, in our mind are the result of flawed research methodology."* This claim flies in the face of more than fifty years of research. At the very least, we can expect to see more rigorously designed research projects trying to disprove Hrobjartsson and Gotzsche.

the origin of the idea

The idea of the powerful placebo in modern times originated with H. K. Beecher. He evaluated over two dozen studies and calculated that about one-third of those in the studies improved due to the placebo effect ("The Powerful Placebo," 1955). Other studies calculate the placebo effect as being even greater than Beecher claimed. For example, studies have shown that placebos are effective in 50 or 60 percent of subjects with certain conditions, e.g., "pain, depression, some heart ailments, gastric ulcers and other stomach complaints."* And, as effective as the new psychotropic drugs seem to be in the treatment of various brain disorders, [some researchers maintain](#) that there is not adequate evidence from studies to prove that the new drugs are more effective than placebos.

Placebos have even been shown to cause [unpleasant side-effects](#). Dermatitis medicamentosa and angioneurotic edema have resulted from placebo therapy, according to [Dodes](#). There are even reports of people becoming [addicted to placebos](#).

the ethical dilemma

The power of the placebo effect has led to an ethical dilemma. One should not deceive other people, but one should relieve the pain and suffering of one's patients. Should one use deception to benefit one's patients? Is it unethical for a doctor to knowingly prescribe a placebo without informing the patient? If informing the patient reduces the effectiveness of the placebo, is some sort of deception warranted in order to benefit the patient? Some doctors think it is justified to use a placebo in those types of cases where a strong placebo effect has been shown and where distress is an aggravating factor.* Others think it is always wrong to deceive the patient and that informed consent requires that the patient be told that a treatment is a placebo treatment. Others, especially "alternative" medicine practitioners, don't even want to know whether a treatment is a placebo or not. Their attitude is that as long as the treatment is effective, who cares if it a placebo? Of course, if the placebo effect is an illusion, then another ethical dilemma arises: should placebos be given if it is known that deception does not really reduce pain or aid in the cure of anything?

are placebos dangerous?

While skeptics may reject faith, prayer and "alternative" medical practices such as [bioharmonics](#), [chiropractic](#) and [homeopathy](#), such practices may not be without their salutary effects. Clearly, they can't cure cancer or repair a punctured lung, and they might not even prolong life by giving hope and relieving distress as is sometimes thought. But administering useless therapies does involve interacting with the patient in a caring, attentive way, and this can provide some measure of comfort. However, to those who say "what difference does it make *why* something works, as long as it seems to work" I reply that it is likely that there is something which works even better, something for the other two-thirds or one-half of humanity who, for whatever reason, cannot be cured or helped by placebos or spontaneous healing or natural regression of their pain. Furthermore, placebos may not always be beneficial or harmless. In addition to adverse side-effects, mentioned above, John Dodes notes that

Patients can become dependent on nonscientific practitioners who employ placebo therapies. Such patients may be led to believe they're suffering from imagined "reactive" hypoglycemia, nonexistent allergies and yeast infections, dental filling amalgam "toxicity," or that they're

under the power of Qi or extraterrestrials. And patients can be led to believe that diseases are only amenable to a specific type of treatment from a specific practitioner ([The Mysterious Placebo](#) by John E. Dodes, *Skeptical Inquirer*, Jan/Feb 1997).

In other words, the placebo can be an open door to quackery.

therapeutic touch

Therapeutic touch (TT) is a type of [energy](#) medicine whereby the therapist moves his or her hands over the patient's "energy field," allegedly directing the flow of [chi](#) or [prana](#) so the patient can heal. TT is based on the belief that each living thing has a "life energy field" which extends beyond the surface of the body and generates an [aura](#). This energy field can become unbalanced, misaligned, obstructed, or out of tune. Energy healers think they can feel and manipulate this energy field by making movements that resemble massaging the air a few inches above the surface of the patient's body. Energy healers also think that they can transfer some of their own life energy to the patient. These airy manipulations allegedly restore the energy field to a state of balance or harmony, to a proper alignment, or they unblock a clog in the field or transfer life energy from healer to patient. This restoration of integrity to the field is thought to make it possible for the body to heal itself.

TT has no scientific basis but it does have a history. It was created by a nurse and a [theosophist](#). [Dolores Krieger](#), Ph.D., R.N., and a faculty member at New York University's Division of Nursing began TT in the early 1970s. She was convinced that the palms are [chakras](#) and can channel healing energy. She is the author of *Therapeutic Touch: How to Use Your Hands to Help and to Heal* (1979) and several other books on TT. Dora Kunz, president of the Theosophical Society of America, was her mentor and an [intuitive healer](#). TT is practiced primarily by nurses, though TT is apparently being practiced worldwide by all kinds of "alternative" healers and laypersons.

Practitioners admit that there has never been any scientific detection of a human energy field. This, they say, is because of the inadequacies of our present technology. One with a trained sense, however, is allegedly able to detect the human energy field and assess its integrity. Despite the obvious [metaphysical](#) basis for this [quackery](#), defenders of TT claim it is scientific because it is based on quantum physics. A grant proposal [to study therapeutic touch on burn victims](#) asserts: "Quantum theory states that all of reality is made up of energy fields and that over 99% of the universe is simply space." Another defender claims

The underlying principles upon which this technique is based include acceptance of the Einstein paradigm of a complex, energetic field-like universe (i.e., the existence of a Life energy flowing through and around all of us). Further, if life is characterized by an interchange of various qualities of energy, it can be assumed that any form of obstruction -- either within the organism or between the organism and the

environment -- is contrary to Nature's tendencies and therefore unhealthy. In practicing Therapeutic Touch, one attempts to influence this energy imbalance towards health to restore the integrity of this field. In this way the TT practitioner does not so much "heal" the patient as facilitate the patient's own healing processes, by gently manipulating the body's energy flow and adjusting it as a whole. With the achievement of balance in mind, body and spirit, we have a truly holistic approach (Rebecca Witmer, "Hands that Heal: The Art of Therapeutic Touch," *Healing Arts*, 1995).

Let's carefully examine these claims and the inferences drawn from them. Einstein did not have a [paradigm](#) which included the notion of "a Life energy flowing through and around all of us." He may have written of interchanges of *quantities* of energy. Many physicists have written of such things as transforming mechanical energy into electrical energy, for example, but would the typical physicist understand the expression "life is an interchange of *qualities* of energy"? From this notion Ms. Witmer infers that any form of obstruction within the organism or between the organism and the environment is contrary to Nature's tendencies and therefore unhealthy. This seems like a non sequitur, but she goes on: "if life is characterized by an interchange of various qualities of energy, it can be assumed that any form of obstruction -- either within the organism or between the organism and the environment -- is contrary to Nature's tendencies and therefore unhealthy." This seems like an "alternative" logic using an "alternative" science to support an "alternative" therapy.

It might be true that an obstruction within an organism is contrary to Nature's tendencies, if by that we mean such things as: *blockage of an air passage is unhealthy* or *blocked arteries are unhealthy*. Yet, most rational patients with such blockages would probably want someone to physically unblock the passageway. A rational person would not think that a mystic waving her hands over one's energy field would ever remove any such blockage. On the other hand, for most organisms the environment is mostly obstructions. This may not be healthy, but it is certainly natural. In any case, what does it mean to say that *it is unhealthy to go contrary to Nature's tendencies*? Are the hurricane, the tornado, the volcano, the flood, the lightning bolt and the earthquake *contrary* to Nature's tendencies? How could they be, since they are part of Nature. Is the lion eating the gazelle contrary to Nature's tendencies?

Why so many believers?

One might wonder why a group of otherwise intelligent, highly trained professionals such as nurses would be attracted to something like TT. Ms. Witmer might have the answer. She writes

Those who practice Therapeutic Touch often report reaping benefits for themselves. For example, the ability of TT to reduce burnout in health care professionals has been well-documented.

The TT therapist has powers physicians don't have: secret, mystical powers which only the practitioner can measure. You get a lot of positive feedback. You can't hurt anyone because you're not even touching them, much less invading their body with drugs or surgical instruments. You network and those in your network feed off of each other's enthusiasm. There is a great deal of [communal reinforcement](#). Many patients swear they can feel your good work. You feel revitalized, empowered.

Why do so many *patients* testify to the benefits of therapeutic touch or other bogus therapies such as [homeopathy](#) and [magnet therapy](#)? Some commit the [regressive fallacy](#). Most [testimonials](#) are not followed up. They are based on immediate or early impressions. Both therapist and patient are deceived into thinking a temporary lift, which may be due to expectation, is significant and will last. Or, credit is given to TT when the real causative agent was a concurrent treatment (drugs or surgery, for example). Also, the feelings associated with illness or injury can be quite complex, involving not just pain but various emotions and desires. The patient may be anxious and fearful, or hopeful and optimistic. The intervention of any caring therapist--and those who practice TT are universally admired for their caring attitude--can profoundly affect these feelings. The patient may *feel* better, but the feeling may have nothing to do with being cured or healed. There is scientific evidence that [supportive therapy of breast cancer patients](#) improves mood and pain control, but not longevity (Goodwin 2001). It may be that therapies such as TT have a similar effect on mood, though they do nothing to curtail the illness or disease itself. Elevated mood may be misinterpreted as improved health. The same improvement might have been induced by watching a Buster Keaton movie.

reiki

Reiki (pronounced *ray-key*) is a form of healing through manipulation of *ki*, the Japanese version of [chi](#). *Rei* means spirit in Japanese, so reiki literally means *spirit life force*.

Like their counterparts in traditional Chinese medicine who use [acupuncture](#), as well as their counterparts in the West who use [therapeutic touch](#) (TT), the practitioners of reiki believe that health and disease are a matter of the life force being disrupted. Each believes that the universe is full of energy which cannot be detected by any scientific instruments but which can be felt and manipulated by special people who learn the tricks of the trade. Reiki healers differ from acupuncturists in that they do not try to unblock a person's *ki*, but to channel the *ki* of the universe so that the person heals. The channeling is done with the hands, and, like TT no physical massaging is necessary since *ki* flows through the body of the healer into the patient via the air. The reiki master claims to be able to draw upon the energy of the universe and increase his or her own energy while performing a healing. Reiki healers claim to channel *ki* into "diseased" individuals for "rebalancing." Larry Arnold and Sandra Nevins claim in *The Reiki Handbook* (1992) that reiki is useful for treating brain damage, cancer, diabetes and venereal diseases. If the healing fails, however, it is because the patient is *resisting* the healing energy.

Reiki is very popular among New Age spiritualists, who are very fond of "attunements," "harmonies," and "balances." Reiki apprentice healers pay up to \$10,000 to their masters to become masters themselves. The process involves going through several levels of *attunement*. One must learn which symbols to use, when to call up the universal life force, how to heal an emotional or spiritual illness, and how to heal someone who isn't present.

Reiki was popularized by [Mikao Usui \(1865-1926\)](#). After fasting and meditating for several weeks, he began hallucinating and hearing voices giving him "the keys to healing."

Transcendental Meditation (TM)

"As a student at Maharishi University of Management you discover that when you experience transcendental consciousness, you are experiencing the ocean of consciousness or intelligence, which is at the basis of the life and evolution of the universe."

"Over 500 scientific studies conducted at more than 200 universities and research institutions in 33 countries have documented the benefits of Transcendental Meditation (TM) for mind, body, behavior, and environment." [The Transcendental Meditation (TM) Program at Maharishi University of Management]

An interesting claim, since "transcendental consciousness" is not a scientific concept, but a metaphysical one.

Transcendental Meditation (TM[®]) is a set of Hindu meditation techniques introduced to the western world by Maharishi Mahesh Yogi, dubbed the "giggling guru" because of his habit of constantly giggling during television interviews. TM[®] allegedly brings the practitioner to a special state of consciousness often characterized as "enlightenment" or "bliss." The method involves entertaining a [mantra](#), an allegedly special expression which is often nothing more than the name of a Hindu god. Disciples pay hundreds of dollars for their mantra. They are led to believe that theirs is special and chosen just for them. The claim of uniqueness for the mantra is just one of many questionable claims made by TM[®] leaders.

The TM[®] website claims it is a "program" and that it is "scientifically validated." It is actually a religious business or [cult](#) and its advocates' claim to scientific validation is extremely misleading. One must take with a grain of salt claims such as the following:

The Transcendental Meditation[®] (TM[®]) program of Maharishi Mahesh Yogi is the single most effective technique available for gaining deep relaxation, eliminating stress, promoting health, increasing creativity and intelligence, and attaining inner happiness and fulfillment.*

These exaggerated claims are based mainly on the attempt to deceive people into thinking that any study done anywhere on the benefits of relaxation

techniques validate TM.

The TM[®] movement began in 1956 in India and is now worldwide, claiming more than 5 million followers, though the actual number of TM[®] advocates is probably much smaller. Many know of TM[®] because of the [Beatles](#) and other celebrities like Mia Farrow and Donavan, who hung around at the Maharishi's ashram in the late sixties. It may be that the Beatles found that money and fame weren't all they're made out to be, and like many others they turned to the East for help in finding the happiness and fulfillment they couldn't get from fame and drugs. Many think meditation offers a way to a high higher than any drug and a power higher than all others, the power of self-control. It also has the pleasant side-effect of leaving one feeling relaxed and content, as long as one's guru isn't charging too much for the lessons, financially or psychologically, and isn't constantly harassing you to recruit others into the happy, happy cult.

One of the main appeals of TM[®] has been its claim to be a scientific means to overcoming [stress](#). TM[®] claims to be based on the "Science of Creative Intelligence," in which one may get a [graduate](#) degree at the [Maharishi University of Management](#) (formerly Maharishi International University) in Fairfield, Iowa. MUM offers "a Full Range of Academic Disciplines for Successful Management of All Fields of Life." It is also the basis for a number of [health and beauty](#) products for sale to those who want a perfect body to go with the perfect mind.

TM recruiting literature is full of charts and graphs demonstrating "scientifically" the wonders of TM. Things like metabolic rate, oxygen consumption rate, bodily production of carbon dioxide, hormone production, brain waves, etc. are measured and charted and graphically presented to suggest that TM really takes a person to a new state of consciousness. The truth is that most TM 'scientists' do not do controlled experiments and, in fact, are on par with most [parapsychologists](#) when it comes to experimental design and controls. That is, their work is incompetent, if not fraudulent. Some of [the studies are simply trivial](#): you can get some of the same physiological results by relaxing completely. Though, according to TM advocates, tests have shown that TM produces "neurophysiological signatures that are distinctly different from relaxation and rest." [Judy Stein, personal correspondence] Critics disagree, however, and cite other studies suggesting that TM may be hazardous to your health. For example, a [German study](#) done in 1980 found that three-fourths of 67 long-term transcendental meditators experienced adverse health effects.* One should be cautious in drawing any strong conclusions from this small study, however. TM may attract many people who are stressed out and are seeking relief. Thus, many of those who have physical or psychological problems after meditating may have had them before they started meditating. Thus, for many in the study, meditation may not have *caused* their problems, but *it didn't relieve them*, either.

Probably the least believable claim of TMers is that they can fly--well, not really *fly*, more like *hover*. TM loudly promoted [levitation](#) in its early days. Television news programs featured clips of TMers hopping around in the lotus position, claiming to be flying. Apparently, this claim was too easily disproved and now TMers do not claim to be able to fly or hover. Some advocates, however, claim they can achieve a range of supernatural or paranormal powers through TM, including invisibility. Apparently, since television is a visual medium, this skill has gone largely unnoticed.

One of the demonstrable powers claimed by TM is the "Maharishi effect." This is another so-called scientifically demonstrated fact: "collective meditation causes changes in a fundamental, unified physical field, and...those changes radiate into society and affect all aspects of society for the better" ([Barry Markovsky](#)). One TM® study by a MUM physics professor, Dr. Robert Rabinoff, claimed that the Maharishi effect was responsible for reducing crime and accidents while simultaneously increasing crop production in the vicinity of Maharishi University in Fairfield, Iowa. [James Randi](#) checked with the Fairfield Police Dept, the Iowa Dept of Agriculture, and the Dept of Motor Vehicles and found that the Rabinoff's data was invented (Randi 1982, 99-108).

Apparently, MUM's *accounting* practices were on par with their *scientific* research. Attorney Anthony D. DeNaro, was hired by MUM in 1975 as Director of Grants Administration and legal counsel. In an affidavit signed in 1986 and presented to the United States District Court for the District of Columbia, DeNaro stated

it was obvious to me that [the] organization was so deeply immersed in a systematic, wilful pattern of fraud including tax fraud, lobbying problems and other deceptions, that it was ethically impossible for me to become involved further as legal counsel.

I discussed this with Steve Druker [the University's Executive Vice President], but agreed to remain as Director of Grants provided certain conditions and restrictions were met. In practice, however, because I recognized a very serious and deliberate pattern of fraud, designed, in part, to misrepresent the TM® movement as a science (not as a cult), and fraudulently claim and obtain tax-exempt status with the IRS, I was a lame duck Director of Grants Administration.*

According to DeNaro, "there is no difference at all between other meditation techniques, and TM® except the much-publicized propaganda and advertising claims." He also claims in his affidavit that MUM was characterized by a

disturbing denial or avoidance syndrome....even outright lies and deception are used to cover-up or sanitize the dangerous reality on campus of very serious nervous breakdowns, episodes of dangerous and bizarre behavior, suicidal and homicidal ideation, threats and attempts, psychotic episodes, crime, depression and manic behavior that often accompanied roundings (intensive group meditations with brainwashing techniques).

Defenders of TM claim that DeNaro is just a disgruntled former member who has sour grapes. He is not alone.

Patrick Ryan is a graduate of MUM and practiced TM for ten years. He founded a support group for former members (TM-Ex). Ryan also claims TM is not simply a "harmless way to relax through meditation." He agrees with DeNara that TM uses a good deal of deception

In its advertising, TM emphasizes the practical benefits of meditation - particularly the reduction of stress. TM promoters show videos of members from all walks of life testifying to its benefits. TM sales pitches are full of blood pressure charts, heart-rate graphs, and other clinical evidence of TM's effectiveness. Not mentioned is the fact that scientific tests show similar benefits can be obtained by listening to soothing music, or by performing basic relaxation exercises available in books costing a couple of dollars. After a TM student pays up to \$400 and receives his own personal mantra to chant, he is told never to reveal it to another. Why? Because the same "unique" mantra has been given - on the basis of age - to thousands of people.*

What other relaxation program has a support group for ex-relaxers?

TM®'s political agenda

TM is, like other religious groups these days, heavily involved in politics. [The Natural Law Party](#) is TM's attempt to introduce its metaphysical teachings and practices into every aspect of American life: education, health, economics, prison reform, energy, the environment...they even have a policy on *healthy foods*.

There have also been attempts to introduce TM into public schools. For example, The March 1, 1995, edition of the *Sacramento Bee* (p. B4) reports that John Black, director of a TM program in Palo Alto, California, tried to convince officials in San Jose to let him teach TM in the schools. Meditation in the classroom, he claims, will increase test scores, reduce teenage

pregnancies, rid campuses of violence and drugs and diminish teacher burnout. This powerful message was delivered at a free forum for teachers and meditators titled "Solving the Crisis in Our Schools."

It may be true that people such as John Black really believe that TM can do all these things, but they have no proof that TM in the schools will accomplish any of these noble goals. John Black says that "the crisis in the schools is that people are stressed out." He may be right, but it is doubtful that the claim is even intelligible. Wisely, school officials have remained unconvinced. Even a newspaper ad in which Maharishi Mahesh Yogi himself offered "A Proven Program to Eliminate Crime in San Jose" for a mere \$55.8 million a year couldn't convince City Hall. Similar ads were placed in several major newspapers around the country. There were no takers.

Who said you can't trust City Hall?

See related entry on [Ayurvedic medicine & Deepak Chopra](#).

Joel D. Wallach, "The Mineral Doctor"

[Joel D. Wallach](#), MS, DVM, ND, is a veterinarian and [naturopath](#) who claims that all diseases are due to mineral deficiencies, that everyone who dies of natural causes dies because of mineral deficiencies, and that just about anyone can live more than one hundred years if they take daily supplements of colloidal minerals harvested from a pit in Utah. He learned all this from living on a farm, working with Marlin Perkins (of Mutual of Omaha's "Wild Kingdom" fame), doing necropsies on animals and humans, reading stories in *National Geographic* magazine, and reading the 1934 novel by James Hilton, *The Lost Horizon*.

Dr. Wallach makes his claims about minerals despite the fact that in 1993 a research team from the Centers for Disease Control and Prevention in Atlanta, Georgia, reported the results of a 13-year study on 10,758 Americans which failed to find any mortality benefits from vitamin and mineral supplements. The study found that even though supplement users smoke and drink less than non-users, eat more fruits and vegetables than non-users, and are more affluent than non-users, they didn't live any longer than non-users. The study also found no benefit from taking vitamin and mineral supplements for smokers, heavy drinkers or those with chronic diseases.

The basic appeal of Dr. Wallach is the hope he gives to people who fear or are mistrustful of medical doctors and scientific knowledge. He gives hope to those who want to live for a really long time. He gives hope to those who are diagnosed with diseases for which current medical knowledge has no cure. He gives hope to those who want to avoid getting a terminal disease. And he gives hope to those who want to be healthy but who do not want to diet or exercise. All we have to do is drink a magic elixir of colloidal minerals and we'll be healthy. You can't just take your minerals in pill form, he warns us. You must take the colloidal variety in liquid form. Furthermore, this elixir must come from a pit in Utah, the only source approved by Dr. Wallach, and the only one, I suspect, in which he has a financial interest.

the audiotape

Dr. Wallach seems to be most famous for a widely circulated audiotape he calls "Dead Doctors Don't Lie." The label of the tape I have notes that Dr. Wallach was a Nobel Prize nominee. This is true. He was nominated for a Nobel Prize in medicine by the Association of Eclectic Physicians "for his notable and untiring work with deficiencies of the trace mineral selenium and its relationship to the congenital genesis of Cystic Fibrosis." [The Association of Eclectic Physicians](#) is a group of naturopaths founded in 1982 by two naturopathic physicians, Dr. Edward Alstat and Dr. Michael Ancharski. In his

book *Let's Play Doctor* (co-authored with Ma Lan, M.D., M.S.) he states that [cystic fibrosis](#) is preventable, is 100% curable in the early stages, can be managed very well in chronic cases, leading to a normal life expectancy (75 years). If these claims were true, he might have won the Prize. He didn't win, but he gave a lot of (false?) hope to parents of children with cystic fibrosis.

The basic danger of Dr. Wallach is not that people will be harmed by taking colloidal minerals, or even that many people will be wasting their money on a product they do not need. Many of his claims are not backed up with scientific control studies, but are anecdotal or fictional. Because he and other naturopaths exaggerate the role of minerals in good health, he may be totally ignored by the scientific community even if the naturopaths happen to hit upon some real connections between minerals and disease. Furthermore, there is the chance that legitimate scientific researchers may avoid this field for fear of being labeled a kook.

Dr. Wallach claims that there are 5 cultures in the world that have *average life-spans* of between 120 and 140 years: the Tibetans in Western China; the Hunzas in Eastern Pakistan; the Russian Georgians and the Armenians, the Abkhasians, and the Azerbaijanis. He also mentions the people of the Vilcabamba in Ecuador, and those who live around Lake Titicaca in Peru and Bolivia. The secret of their longevity is "glacier milk" or water full of colloidal minerals. It is probably news to these people that they live so long. Dr. Wallach does not mention on what scientific data he bases his claims, but I am sure there are many anthropologists and tour book authors who would like to know about these Shangri-La havens.

He claims to have written over 70 articles in peer reviewed journals, but a search of the University of California periodical index list comes up with zero articles authored or co-authored by him, as did a search in the [Multimedia Medical Reference Library](#). He claims to have written several books, but the only one in the UC library is *Diseases of exotic animals: medical and surgical management* (Philadelphia: Saunders, 1983) which he wrote with William J. Boever.

As mentioned above, his audio tape is titled "Dead Doctors Don't Lie." The label on the tape I have says "Learn why the average life span of an MD is only 58 years." On his tape, Dr. Wallach claims that "the average life span of an American is 75 years, but the average lifespan of an American doctor is only 58 years!" Maybe dead doctors don't lie, but this living one certainly stretches the truth. If he is telling the truth, it is *not* the whole truth and nothing but the truth. According to Kevin Kenward of the American Medical Association: "Based on over 210,000 records of deceased physicians, our data indicate the average life-span of a physician is 70.8 years." One wonders where Dr. Wallach got his data. The only mention in his tape of data on physician deaths is in his description of a rather gruesome hobby of his: he collects obituaries of local physicians as he takes his mineral show from town

to town . Maybe he extrapolated his statistic from this "data"?

On his tape, Dr. Wallach says

...what I did was go back to school and become a physician. I finally got a license to kill (laughter), and they allowed me to use everything I had learned in veterinary school about nutrition on my human patients. And to no surprise to me, it worked. I spent 12 years up in Portland, Oregon, in general practice, and it was very fascinating.

Dr. Wallach is an N.D., a doctor of naturopathy, not an M.D. as his tape obviously suggests. It is unlikely that most of the people in his audience know that naturopaths call themselves physicians and that there is a very big difference between an M.D. and an N.D. He also claims he did hundreds of autopsies on humans while working as a veterinarian in St. Louis. How does a veterinarian get to do human autopsies?

Well, again, to make a long story short, over a period of some twelve years I did 17,500 autopsies on over 454 species of animals and 3,000 human beings who lived in close proximity to the zoos, and the thing I found out was this: every animal and every human being who dies of natural causes dies of a nutritional deficiency.

To accomplish this feat, he would have to do 6 autopsies a day, working 5 days a week for the twelve years and taking only a two-week vacation each year. He was allegedly performing all these autopsies in addition to his other duties, and presumably while he was writing essays and books as well. Maybe all those minerals gave him superhuman powers!

an attack and a panegyric

Dr. Wallach's "Dead Doctors Don't Lie" tape is both an attack on the medical profession and a panegyric for minerals. The attack is vicious and mostly unwarranted, which weakens his credibility about the wonders of minerals. For example, he claims that "300,000 Americans are killed each year in hospitals through neglect and sloppy mistakes." This statistic is taken from Ralph Nader, he says. As far as I know, there has never been a national study of the issue. There was a study done in New York in 1991 (The Harvard Medical Practice Study) which found that nearly 4 percent of patients were harmed in the hospital and 14 percent of these died, presumably of their hospital-inflicted injuries. Lucian L. Leape, a Boston physician, extrapolated from this data that as many as 180,000 Americans may be dying each year of medical injuries suffered at the hands of medical care providers. Statistical extrapolations are notoriously unreliable, but the fact that large numbers of people are being killed by medical personnel in hospitals should not be

ignored. However, it doesn't follow from the fact that medical personnel are killing patients through incompetence that it is safer to seek treatment from a naturopath, especially one who recommends minerals for your cancer, heart disease, cystic fibrosis, schizophrenia, or just about any other ailment imaginable.

Also worth noting is Dr. Wallach's tone and attitude toward the medical profession. He does not come across as an objective, impersonal scientist. He delights in ridiculing "Haavaad" University and cardiologists who die young from heart attacks. (My mother's cardiologist will probably die young. He only went into the field because he was born with a congenital heart defect. But when this man dies, Dr. Wallach will say the cause of death was "mineral deficiency." Apparently, the science of genetics is not taught at colleges of naturopathy.) He reverts to name calling on several occasions, as well. Doctors, he says, routinely commit many practices that would be considered illegal in other fields. At one point he claims that the average M.D. makes over \$200,000 a year in kickbacks. This ludicrous claim didn't even get a peep of skeptical bewilderment from his audience. He sounds like a bitter, rejected oddball who is getting even with the medical profession for ignoring him and his "research."

In addition to citing his many scientific studies and years of research as proof that we need mineral supplements for good health, Dr. Wallach presents U.S. Senate document #264. This paper claims that U.S. soils are 85% depleted of essential minerals. According to Dr. Wallach, that is why we can't get enough minerals from our foods. He has further evidence, too:

...to live to be 100+ we need to consume 90 nutrients per day...60 minerals, 16 vitamins, 12 amino acids and 3 fatty acids...there are some 10 diseases associated with the lack of each of these 90 nutrients or potentially 900 diseases...the American Medical Association did a study in 1939 and came to the conclusion that it is no longer feasible to get all the vitamins we need from foods.

I wonder if the AMA has done any studies on this issue since 1939? If so, why aren't they mentioned? And why, even if mineral supplements are needed can't we buy them off the shelf of our local supermarket? Because they aren't "colloidal." He suggests at one point in his tape that minerals in pill form aren't absorbed at all; they just pass right through the body and out into the sewer lines. But why do our colloidal minerals have to come from a pit in Utah? Here is his explanation:

the only place you can get these in the United States is from a prehistoric Valley in southern Utah that, according to geologists, seventy-five million years ago had sixty to seventy-two minerals in the walls and the floor of that

valley, and those trees and the grasses in that valley and that forest took up all the metallic minerals and made colloidal minerals in their tissues. About that time there was a volcanic eruption which entombed that valley with a thin layer of mud and ash, not thick enough or heavy enough to crush or pressurize this into oil or coal. It was very dry in here, so it never became fossilized or petrified. Okay. Never became rock.

Today, if you put a shaft into this valley, it's still just dried hay. It's seventy-five million year old hay, according to geologists. You can still see the grass and the leaves and the twigs and the pine cones and the bark and so forth. And we grind this plant material up into a flour, very small, particle sized flour, just like a good wheat flour and for three to four weeks we soak it in filtered spring water and when it reaches a specific gravity of 3.0, it's very heavy, it has thirty-eight grams of this colloidal mineral in it per quart or liter and by actual analysis it has sixty colloidal minerals in it. This particular product has been on the market since 1926. It's the only nutritional product on the market that has a legal consent decree from a federal court and an approval from the U.S. Department of Health and Human Services to be harvested and sold as a nutritional supplement. Everybody else who has a vitamin, or mineral, or what not, just follows the labeling requirements of the FDA. This is the only one that, in fact, has a federal consent decree to do it, because it passed all their tests. It's the only one that has been put to this level of test because it works.

How do we know it works? Dr. Wallach guarantees it. Or your money back! Should you trust him? Why wouldn't you trust someone who tells stories about people in China who lived to be over 250 years old or about a 137 year-old cigar-smoking woman! Of course, it is up to you to infer that they lived so long because they took colloidal minerals, though the good Dr. has enough sense not to make such a claim. In case you are still not convinced of this man's trustworthiness, let me inform you that, according to Dr. Wallach, for the past twenty years there have been cures for arthritis, diabetes and ulcers. These cures were discovered by veterinarians, who also discovered the cause of Alzheimer's disease years ago.

Not everyone is so enthusiastic about colloidal minerals. For example, Ellen Coleman, RD, MA, MPH, says: "Colloidal mineral products have not been proven safe or effective. They are not better absorbed than regular mineral supplements."* Research scientist James Pontolillo is concerned that colloidal mineral products may contain toxic organic compounds.* The National Nutritional Food Association (NNFA) says that some colloidal mineral

products "contain aluminum or toxic minerals; others are high in sodium. Some do not contain detectable amounts of minerals listed on their labels. Finally, there is no evidence that colloidal minerals are more bioavailable than those found in other forms."*

In conclusion, Dr. Wallach has spawned a small industry of mineral sellers, including some [MLM](#) projects and a few who [advertise on the WWW](#). Keeping in the truthful mode of Dr. Wallach, some of these WWW sites quote Linus Pauling as saying "You can trace every sickness, every disease, and every ailment to a mineral deficiency." This claim is supposed to come from the man who spent much of the latter part of his long life as an advocate for vitamin C. Maybe Dr. Pauling didn't know the difference between a vitamin and a mineral. I think it is more likely that Dr. Wallach and his followers don't know the difference between fact and fiction.

control group study, double-blind and random tests

A control group study uses a control group to compare to an experimental group in a test of a causal hypothesis. The control and experimental groups must be identical in all relevant ways except for the introduction of a suspected causal agent into the experimental group. If the suspected causal agent is actually a causal factor of some event, then logic dictates that that event should manifest itself more significantly in the experimental than in the control group. For example, if 'C' causes 'E', when we introduce 'C' into the experimental group but not into the control group, we should find 'E' occurring in the experimental group at a significantly greater rate than in the control group. Significance is measured by relation to chance: if an event is not likely due to chance, then its occurrence is significant.

A double-blind test is a control group test where neither the evaluator nor the subject knows which items are controls. A random test is one which randomly assigns items to the control or experimental groups.

The purpose of controls, double-blind and random testing is to reduce error, self-deception and bias. An example should clarify the necessity of these safeguards.

The DKL LifeGuard Model 2, from DielectroKinetic Laboratories, can detect a living human being by receiving a signal from the heartbeat at distances of up to 20 meters through any material, according to its manufacturers. [Sandia Labs](#) tested the device using a double-blind, random method of testing. Sandia is a national security laboratory operated for the U.S. Department of Energy by the Sandia Corporation, a Lockheed Martin Co. The causal hypothesis they tested could be worded as follows: the human heartbeat causes a directional signal to activate in the Lifeguard, thereby allowing the user of the LifeGuard to find a hidden human being (the target) up to 20 meters away, regardless of what objects might be between the LifeGuard and the target.

The testing procedure was quite simple: five large plastic packing crates were set up in a line at 30-foot intervals and the test operator, using the DKL LifeGuard Model 2, tried to detect in which of the five crates a human being was hiding. Whether a crate would be empty or contain a person for each trial was determined by random assignment. This is to avoid using a pattern which might be detected by the subject. Their tests showed that [the device performed no better than expected from random chance](#). The test operator was a DKL representative. The only time the test operator did well in detecting his targets was when he had prior knowledge of the target's location. The

LifeGuard was successful ten out of ten times when the operator knew where the target was. It may seem ludicrous to test the device by telling the operator where the objects are, but it establishes a baseline and affirms that device is working. Only when the operator agrees that his device is working should the test proceed to the second stage, the double-blind test. For, the operator will not be as likely to come up with an [ad hoc hypothesis](#) to explain away his failure in a double-blind test if he has agreed beforehand that the device is working properly.

If the device could perform as claimed, the operator should have received no signals from the empty crates and signals from each of the crates with a person within. In the main test of the LifeGuard, when neither the test operator nor the investigator keeping track of the operator's results knew which of five possible locations contained the target, the operator performed poorly (six out of 25) and took about four times longer than when the operator knew the target's location. If human heartbeats cause the device to activate, one would expect a significantly better performance than 6 of 25, which is what would be expected by chance.

The different performances--10 correct out of 10 tries versus 6 correct out of 25 tries--vividly illustrates the need for keeping the subject blind to the controls: it is needed to eliminate self-deception and [subjective validation](#).

The evaluator is kept blind to the controls to prevent him or her from subtly tipping off the subject, either knowingly or unknowingly. If the evaluator knew which crates were empty and which had persons, he or she might give a visual signal to the subject by looking only at the crates with persons. To eliminate the possibility of cheating or evaluator bias, the evaluator is kept in the dark regarding the controls.

The lack of testing under controlled conditions explains why many psychics, graphologists, astrologers, dowzers, paranormal therapists, etc., believe in their abilities. To test a dowser it is not enough to have the dowser and his friends tell you that it works by pointing out all the wells that have been dug on the dowser's advice. One should perform a random, double-blind test, such as the one done by Ray Hyman with an experienced dowser on the PBS program *Frontiers of Science* (Nov. 19, 1997). The dowser claimed he could find buried metal objects, as well as water. He agreed to a test that involved randomly selecting numbers which corresponded to buckets placed upside down in a field. The numbers determined which buckets a metal object would be placed under. The one doing the placing of the objects was not the same person who went around with the dowser as he tried to find the objects. The exact odds of finding a metal object by chance could be calculated. For example, if there are 100 buckets and 10 of them have a metal object, then getting 10% correct would be predicted by chance. That is, over a large number of attempts, getting about 10% correct would be expected of anyone, with or without a dowsing rod. On the other hand, if someone consistently got 80% or 90% correct, and we were sure he or she was not cheating, that would

confirm the dowser's powers.

The dowser walked up and down the lines of buckets with his rod but said he couldn't get any strong readings. When he selected a bucket he qualified his selection with something to the effect that he didn't think he'd be right. He was right about never being right! He didn't find a single metal object despite several attempts. His performance is typical of dowsers tested under controlled conditions. His response was also typical: he was genuinely surprised. Like most of us, the dowser is not aware of the many factors that can hinder us from doing a proper evaluation of events: self-deception, [wishful thinking](#), suggestion, unconscious bias, [selective thinking](#), [subjective validation](#), [communal reinforcement](#), etc.

Many control group studies use a [placebo](#) in control groups to keep the subjects in the dark as to whether they are being given the causal agent that is being tested. For example, both the control and experimental groups will be given identical looking pills in a study testing the effectiveness of a new drug. Only one pill will contain the agent being tested; the other pill will be a placebo. In a double-blind study, the evaluator of the results would not know which subjects got the placebo until his or her evaluation of observed results was completed. This is to avoid evaluator bias from influencing observations and measurements.

alternative health practices

Health or medical practices are called "alternative" if they are based on untested, untraditional or unscientific principles, methods, treatments or knowledge. "Alternative" medicine is often based upon metaphysical beliefs and is frequently anti-scientific. Because truly "alternative" medical practices would be ones that are known to be equally or nearly equally effective, most "alternative" medical practices are not truly "alternative." If the "alternative" health practice is offered along with conventional medicine, it is referred to as "complementary" medicine.

It is estimated that "alternative" medicine is a \$15 billion a year business. Traditionally, most insurance companies have not covered "alternative" medicine, but American Western Life Insurance Company is typical of a growing trend. It offers a network of about 300 providers in California, Arizona, Colorado, New Mexico and Utah specializing in acupuncture, aromatherapy, biofeedback, chiropractic, herbal medicine, massage, naturopathy, reflexology and yoga, among other therapies. Also, Mutual of Omaha Insurance Co. has reimbursed clients for the costs of a non-surgical "alternative" therapy for heart disease. Dr. Dean Ornish, an internist and director of the Preventive Medicine Research Institute in Sausalito, developed the therapy, which includes a vegetarian diet, meditation and exercise. Mutual of Omaha was quick to note that they were not opening the door to covering all forms of "alternative" therapies. They considered Dr. Ornish's treatment to have been proven to be effective.

The National Institutes of Health's Office of Alternative Medicine has supported a number of research studies of unorthodox cures, including the use of shark cartilage to treat cancer and the effectiveness of bee pollen in treating allergies. The most popular "alternative" therapies are relaxation techniques, chiropractic, herbal medicine and massage. Very few scientific studies are done by "alternative" practitioners. Indeed, many disdain science in favor of metaphysics, faith, and magical thinking.

On the other hand, many questionable products touted as cure-alls or as cures for serious illnesses such as cancer or heart disease are promoted with scientific gobbledygook and misrepresentation or falsification of scientific studies. [Jodie Bernstein](#), Director of the FTC's Bureau of Consumer Protection, offers the following list of signs of quackery:

**** The product is advertised as a quick and effective cure-all for a wide range of ailments.**

**** The promoters use words like scientific breakthrough,**

miraculous cure, exclusive product, secret ingredient or ancient remedy.

**** The text is written in "medicalese" - impressive-sounding terminology to disguise a lack of good science.**

**** The promoter claims the government, the medical profession or research scientists have conspired to suppress the product.**

**** The advertisement includes undocumented case histories claiming amazing results.**

**** The product is advertised as available from only one source.**

The general rule is "if it sounds too good to be true, it probably is."

DAILY MAIL (London)

Hidden risks in alternative therapies (December 21, 1998).

"Potentially life-threatening problems have been caused by treatments such as homeopathy, acupuncture and chiropractic, a survey has found. Hepatitis B infections, nerve damage, allergic reactions and delayed diagnoses of cancer were reported by GPs to researchers at the University of Exeter's Department of Complementary Medicine. It wants tighter controls on alternative therapies, which have not been properly tested and are mostly unregulated.

One in ten of the 686 GPs reported serious side-effects suspected to have been triggered by complementary therapies. A further third reported non-serious side effects such as inappropriate treatment. About half the serious side-effects, including nerve damage, spinal cord compression and worsening of existing conditions, resulted from spinal manipulation, usually by chiropractic or osteopathic techniques, according to the survey published in the *International Journal of Risk and Safety in Medicine*. Acupuncture was blamed for two hepatitis B infections and a lodged broken needle, aromatherapy triggered allergic reactions and hypnotherapy caused one patient to suffer severe hallucinations.

Homeopathy was held responsible for at least one 'avoidable death' from pneumonia, there were delays in cancer diagnosis and asthmatics needed hospital treatment after being told to stop medication."

Why is "alternative" health care so popular?

The New England Journal of Medicine reported on a study in January 1993 which showed that about one-third of American adults sought some sort of unorthodox therapy during the preceding year. Why is "alternative" health care [AHC] so popular? There are several reasons.

1. *Drugs and surgery are not part of AHC. Fear of surgery and of the side effects of drugs alienate many people from conventional medicine. AHC is attractive because it does not offer these frightening types of treatments. Furthermore, conventional medicine often harms patients. AHC treatments are usually inherently less risky and less likely to cause direct harm.*

Selective thinking and **confirmation bias** can easily lead one to focus on cases where surgeons amputate the wrong limb, remove the wrong part of the brain, or kill a patient by administering too much anaesthetic or radiation. Many people ignore the millions of patients who are alive and well today because of surgery or drugs. They focus instead on the cases of patients who die after "routine" surgery, who are permanently disabled because of an adverse reaction to a drug, or who are killed by a deranged nurse acting as a self-appointed "mercy" killer.

This fear and skepticism regarding drug treatment, hospitalization, and surgery is not without foundation. Some harm is caused by malpractice, some is the tragic but inevitable outcome of unpredictable reactions to drugs or surgery. Because there are often legal issues involved, physicians and hospitals are often not forthcoming with details of patient deaths for which they might be responsible. Confidence in medicine erodes with each report of "therapeutic misadventures."

Are these "therapeutic misadventures" rare? As far as I know, there has never been a national study of the issue. There was a study done in New York in 1991 (The Harvard Medical Practice Study) which found that nearly 4 percent of patients were harmed in the hospital and 14 percent of these died, presumably of their hospital-inflicted injuries. Lucian L. Leape, a Boston physician, extrapolated from this data that as many as 180,000 Americans may be dying each year of medical injuries suffered at the hands of medical care providers. He notes, for dramatic effect, that this is the equivalent of three jumbo-jet crashes every two days. ("Truth about human error in hospitals," by Abigail Trafford, editor of the *Washington Post's* health section, printed in the *Sacramento Bee*, March 21, 1995, p. B7.)

On the other hand, the risks of being positively harmed by an "alternative" practitioner such as homeopath, for example, are negligible when compared to the risks of being harmed by a

conventional physician dispensing powerful drugs and performing risky surgeries. This is because a homeopath is not intervening in any significant way. The doses they give are not likely to have any effect on anyone. A homeopath is not likely to ever kill a patient by mistake. "Alternative" medical treatments are essentially non-interventionist and their risks are generally negative, not positive. The harm to the patients comes not from positive intervention but from **not** getting treatment (drugs or surgery) which would improve their health and increase their life span.

While it is true that conventional medicine is not without its risks--even fatal risks--it is unreasonable to reject it altogether on these grounds. Reasonable people can't ignore the diabetics now alive and well, thanks to their drugs, or the millions of people who owe their lives to vaccinations against lethal or crippling diseases. We can't ignore the millions whose pain is gone thanks to surgery, or who owe their continuing existence to successful medical treatment involving both drugs and surgery.

A reasonable response to the very real risks of treatment by conventional health care providers is to take greater responsibility for one's treatment. A reasonable patient cannot have blind faith in his or her physician, no matter how godlike the doctor may seem or try to present himself. (A very dear friend of mine who lived to be 80 thanks to pills and surgery, found great humor in telling her physicians she knew M.D. stands for "medical divinity.") We have to become more knowledgeable of the drugs prescribed to us. We have to participate more in our own treatment, which means we have to ask lots of questions and assume nothing. We can't assume that the drug the nurse wants us to swallow is the one our physician has prescribed. (Just ask, "What's this pill?" You should know whether you're supposed to take it or not.) We need to seek second and third opinions, which doesn't mean look for another doctor who will tell you what you want to hear. It means do research. Read about your illness and the prescribed treatment for it. We can never eliminate risk altogether when we must depend on human beings, fallible and imperfect as we are. But we can reduce our risk by being more responsible for our health care and being less passive. Some faith in the competence of our health care providers is necessary, but it need not be *blind faith*. You may have to have surgery to have a limb removed or an artery widened, but you may need to make sure that the surgeon ready to operate doesn't think he's supposed to remove your gall bladder. The young boy who was to have a leg amputated and had written in large ink letters on his good leg "NOT THIS ONE" may have gotten a laugh from the hospital personnel. We can admire the boy's humor, but it is his lack of blind faith that is most admirable to a skeptic.

2. *Conventional medicine often fails to discover the cause of an illness or*

to relieve pain. This is true of AHC as well. But conventional practitioners are not as likely to express hopefulness when their medicine fails. "Alternative" practitioners often encourage their patients to be hopeful even when the situation is hopeless.

3. *When conventional medicine does discover the cause of an illness, it often fails to offer treatment that is guaranteed to be successful. Again, AHC offers hope when conventional medicine can't offer a safe and sure cure.* A local television news anchor rejected chemotherapy for her breast cancer in favor of [Gerson Therapy](#). Pat Davis followed a rigorous 13-hour-a-day regimen of diet (green vegetables and green juices), exercise, and coffee enemas (four a day) developed by Dr. Max Gerson. Davis' mother had had breast cancer twice, undergoing chemotherapy and a mastectomy. Davis knew the dangers of chemotherapy and the effects of breast surgery. She refused to accept that there were no alternatives. Gerson therapy gave her hope. When it was clear that the Gerson treatment was ineffective, Davis agreed to undergo chemotherapy. She died four months later on March 20, 1999, at the age of 39, after two and one half years of fighting her cancer. Could chemotherapy have saved her had she sought the treatment earlier? Maybe. The odds may have been against her, but the slim hope offered by scientific medicine was at least a real hope. The hope offered by Gerson is a false hope through and through.
4. *AHC often uses "natural" remedies. Many people believe that what is [natural](#) is necessarily better and safer than what is artificial (such as pharmaceuticals).* Just because something is natural does not mean that it is good, safe or healthy. There are many natural substances that are dangerous and harmful. There are also many natural products that are ineffective and of little or no value to one's health and well-being.
5. *AHC is often less expensive than conventional medicine. This fact has made "alternative" treatments attractive to Health Maintenance Organizations (HMOs) and to insurance companies, both of whom are coming to realize that it is cheaper and thus more profitable to offer "alternative" treatments.* If "alternative" therapies were truly alternatives, it would make no sense to pay more for the same quality treatment. However, most so-called "alternative" therapies are not truly alternatives; they are not equally effective treatments. Thus, the fact that they are cheaper is of little significance.
6. *AHC is often sanctioned by state governments, which license and regulate "alternative" practices and even protect "alternative" practitioners from attacks by the medical establishment.* Chiropractors, for example, won a major restraint-of-trade lawsuit against the American Medical Association in 1987. A federal judge permanently barred the AMA from "hindering the practice of chiropractic." Being government licensed, regulated and protected is seen as legitimizing AHC. Actually, much of the licensing and regulation is aimed at

protecting the public from frauds and quacks.

7. *Many doctors of conventional medicine treat diseases first and people secondly.* "Alternative" practitioners are often "holistic," claiming to treat the mind, body and soul of the patient. Many people are attracted to the spiritual and metaphysical connections made by AHC practitioners. Many AHC patients claim that their "healers" treat them as persons and seem to care about them, whereas conventional doctors often seem to lack good "bedside manner."

Conventional physicians often work out of large hospitals or HMOs and see hundreds or thousands of patients for their specialized needs. "Alternative" therapists, on the other hand, often work out of their homes or small offices or clinics, and see many fewer patients. More importantly, those who seek help from a conventional physician usually do not care what his or her personal religious, metaphysical or spiritual beliefs are. Those who seek "alternative" medicine often are attracted to the personality and worldview of their practitioner. For example, a person with diabetes who goes to an endocrinologist probably will not be interested in his or her physician's belief in *chi* or any other spiritual or metaphysical notions. Whether the doctor believes in God or the soul is irrelevant. What matters is the doctor's knowledge and experience with the disease. If the doctor is kind and personable, that is all the better. A cold and indifferent "alternative" practitioner would not have much business. A cold and indifferent conventional physician may have patients standing in line for treatment if he or she is an excellent physician.

8. *Many people apparently do not understand that conventional medicine has the same shortcomings as all other forms of human knowledge: it is fallible. It also is correctable.* Systems of thought that are fundamentally metaphysical in nature are not testable and can therefore never be proven incorrect. Hence, once they get established they tend to become dogmatically adhered to and never change. The only way to change dogma is to become a heretic and set up your own counter-dogma. When scientific medicine errs, it errs in ways that can be corrected. Treatments and practices that are ineffective or harmful are eventually rejected.

"Alternative" practices and treatments are often based upon faith and belief in metaphysical entities such as [chi](#) and lend themselves to [ad hoc hypotheses](#) to explain away failure or ineffectiveness. In scientific medicine there will be disagreement and controversy, error and argument, testing and more testing, etc. Decisions will be made by fallible human beings engaging in the fallible practice of scientific medicine. Some of those decisions will be bad decisions, but in time they will be discovered for what they are and treatments which were once standard will be rejected and replaced with other treatments.

Medicine will grow, it will progress, it will change dramatically. Homeopathy, iridology, reflexology, aromatherapy, therapeutic touch, etc. will not change in any fundamental ways over the years. Their practitioners do not challenge each other, as scientific medicine requires. Instead, "alternative" practitioners generally do little more than reinforce each other.

9. *"Alternative" therapies appeal to magical thinking.* Ideas with little scientific backing, such as those of [sympathetic magic](#), are popular among "alternative" practitioners and their clients. Conventional medicine is rejected by some simply because it is *not* magical. While conventional medicine may sometimes seem to work miracles, the miracles of modern medicine are based on science not faith.
10. *The main reason people seek "alternative" health care, however, is because they think it "works." That is, they feel better, healthier, more vital, etc., after the treatment.* Those who say "alternative" medicine "works" usually mean little more than that they are satisfied customers. For many AHC practitioners, having satisfied customers is all the proof they need that they are true healers. In many cases, however, a person's condition would have improved had he or she done nothing at all. But since the improvement came *after* the treatment, it is believed that the improvement must have been caused by the treatment (the [post hoc fallacy](#) and [the regressive fallacy](#)). In many cases, the successful treatment is due to nothing more than [the placebo effect](#). In some cases, treatment by conventional medicine causes more harm than good and the improvement one feels is due to *stopping* the conventional treatment rather than to starting the "alternative" one. (One reason spiritual healers in pre-modern medicine times may have had better success rates on the battlefield than conventional healers is due to the fact that conventional healers often harmed their patients: e.g., infecting them while treating them. Spiritual healers, who did nothing to the wound, didn't infect the patient, who often healed thanks to the body's own internal healing mechanisms.)

In many cases, the cure was actually effected by the conventional medicine taken along with the "alternative" therapy, but the credit is given to the "alternative." Also, many so-called cures are not really cures at all in any objective sense. The patient may have been misdiagnosed in the first place, so no cure actually took place.ⁿ Also, a patient subjectively reports that he or she "feels better" and that is taken as proof that the therapy is working. Psychological effects of therapies are not identical to objective improvements, however. A person may feel much worse but actually be getting much better. Conversely, a person may feel much better but actually be getting much worse.

11. *Finally, many advocates of "alternative" therapies refuse to admit*

failure. When comedian Pat Paulsen died while receiving "alternative" cancer therapy in Tijuana, Mexico, his daughter did not accept that the therapy was useless. Rather, she believed that the only reason her father died was because he had not sought the "alternative" therapy sooner. Such faith is common among those who are desperate and vulnerable, common traits among those who seek "alternative" therapies.

acupuncture

29 Dec 2000

Time for some hearsay...

I was reading over all the comments about acupuncture, and was amazed. I think the whole chi yin/yang thing more religious than scientific, and thus will never be proven. Deal with it people, I have with my personal religious beliefs.

But I have co-worker who got some impromptu AP (I'm tired of worrying if I'm spelling it right) from a physical instructor when he sprained his knee. The swelling and pain stopped, but he was then told to get home and rest for the rest of the day. Why? he asked. Because all AP did was "turn off" a nerve, thus easing the pain, but also over-riding the body's natural defense against injury. If he had continued, he would have damaged his knee more.

Now, there is no evidence for this. It would explain a great many things. I am inclined to believe it as it is the only argument I can reasonably believe to be true (I know from experience that when I bang my arm just right, it goes dead for a while, maybe same principle).

All that chi explanation is based on faith and personal belief, and like religion, is personal and doesn't transfer well to others not raised with the belief already. Doesn't mean it isn't true, but you will never prove it, so stop trying. Stick to what you might be able to prove and cut your losses. Testimonials are not proof.

Have a nice day!

Gordon Thomas

reply: I agree. Testimonials are not proof.

28 Dec 2000

I, too, do not believe in acupuncture, and will stop going to the acupuncturist when it stops working.

I had a plantar wart removed by surgery. A year later, another one appeared. Not wanting to go through the surgery again, I procrastinated, and it got bigger and bigger. Then my back went out, and I went to the acupuncturist. Two days

later, my back was on the mend. Two weeks later, the plantar wart was gone.

My acupuncturist explains that the procedure seems to have some effect of improving the efficiency of the immune system. That makes some sense.

He also noted the difference between western medical approaches and the eastern approach. Asians historically have accepted that acupuncture works, and have developed explanations that fit - hence the chi - Ying - yang metaphors. Western medicine derives treatments from empirical studies; therefore, these treatments must have been "proven".

This physician has studied both approaches. He holds a Medical Doctor certificate and certificates for proficiency in acupuncture.

David Whitehead

reply: Because the second wart appeared a year after the surgery, you wouldn't think of making a causal connection between the two, but since your back "was on the mend" two days after acupuncture, you see a causal connection. There could be one, but I doubt if it has anything to do with "improving the efficiency of the immune system," since back pain is not usually caused by an immune system deficiency.

The wart was gone two weeks after the acupuncture and you see a causal connection, but you don't mention whether you did anything else for the wart in those two weeks. I bring this up because while looking for some information on plantar warts I found the [following](#):

My daughter had a plantar wart when she was 6. We treated it in much the same way you did with the same results. We also had liquid nitrogen treatments to burn it off with some success. Nothing was fool proof.

I then read [Andrew Weil's](#) suggestion for visualization. For my daughter this involved visualizing little Smurfs (a cartoon character if you haven't heard of them) marching through her blood stream and digging away at the wart. We went through a little visualization routine just before bed each night for about a week. We also used Dr. Scholl's plantar wart remover at the same time, so you can be the judge of what worked.

The acupuncture may have cured your wart, but I would think that one session would be about as effective as a few cuts and bruises from a fall for kick-starting your immune system enough to combat a wart. Anyway, I'm glad you didn't have to have another surgery.

David Whitehead replies:

This physician tells me that recovery from these back injuries is accomplished by the body's healing processes. Repairing soft tissues and killing a wart seem to be similar in this regard. I'm interested to know if the same biological systems are involved. If so, the claim that acupuncture invigorates these systems may have some merit. I did nothing else for the wart during those two weeks. It could have started to go away before the acupuncture, but I didn't notice that. Do those kinds of warts just die on their own? My perception of the thing was that it was flourishing - it had been there for several months and had reproduced many times - and it was starting to make me limp. Then, after the acupuncture, it just vanished.

reply: The wart is caused by a virus; it is highly unlikely that the back problem was viral.

I've had a wart that just went away on its own, but not a plantar wart.

Another interesting claim the physician/acupuncturist made: some people have a higher affinity for, or susceptibility to, acupuncture. Apparently, I am one of those people.

reply: I'll bet he tells that to all his successes!

The Smurf treatment? That's great! Although I'm glad I don't need to go to that extreme.

What about this idea of the eastern "scientific" approach: It works, we don't know why, but we devise a metaphor of meridians, chi blockages, and ying/yang balance, to fit the perceived results. If it works, and the metaphor allows us to repeat the treatment successfully, then cannot the metaphysical pronouncements of some acupuncturists be ignored? I mean: people will say anything for attention.

reply: Sounds good to me. The actual origins of chi, meridians, etc., and their connection to acupuncture is not known, however.

23 Dec 2000

Some of your information regarding acupuncture is false. As you are a seeker of knowledge I am sure you would like to consult the American Medical Association, and the United Nations World Health Organization which have recognized acupuncture as being a scientifically proven effective treatment--although the mechanism is not clear, some think it may stimulate the lymphatic system or other aspects of the immune system--in at least 200 specific medical conditions. In addition, your skeptic belief--as it is no more founded on scientific evidence than its opposite--that the scientifically observable effects of

acupuncture are merely due to 'psychological expectations' and 'placebo' effect is highly dubious. Someone with even an elementary knowledge of acupuncture would be familiar with the fact that acupuncture has not only had scientifically verifiable effects in humans but since its beginnings, has been used effectively in veterinary (on animals) applications--historically it was widely used on war horses in China, then later on other livestock, and finally in companion animals. I do not see how an animal such as a horse or a cow or a dog could harbor beneficial 'psychological expectations' regarding being stuck with needles, or harbor such a 'placebo effect'.

The fact is that acupuncture is scientifically proven effective treatment for over 200 specific medical conditions.

The existence of chi is disputable.

But, acupuncture deserves your respect at least in those many cases where it is scientifically proven and recognized by the AMA and the UNWHO as effective, at least until you can scientifically refute this evidence.

I understand that there are many frauds out there--yes there are frauds out there claiming to be acupuncturists, especially in this country since acupuncture is new and there are no established traditions, inadequate expertise, inadequate 'peer review', etc..

Perhaps there is no chi, perhaps acupuncture is just the accumulation of many centuries of trial-and-error, but in many cases it does work, and as a man concerned with upholding the naked truth I think you owe it to the public to change your web page to reflect this fact.

Just because you can't explain it, or just because their explanation is wrong, doesn't change the fact that it is an effective treatment for some conditions--a fact, a treatment which shouldn't be denied simply on intellectual loyalties or beliefs contrary to scientific proof.

As someone who is studying Western Science (cell biology, genetics), it is frustrating when things are beyond our explanation or when people neglect to think critically, but that doesn't mean that just because science can't explain it that it doesn't work: gunpowder was a fact long before the laws of combustion were understood.

George Jones

reply: You need to learn the difference between a *claim* and a *fact*. I know there are dozens of studies which *claim* that acupuncture is an effective remedy for depression, allergies, asthma, arthritis, bladder and kidney problems, constipation, diarrhea, colds, flu, bronchitis, dizziness, smoking, fatigue, gynecologic disorders, headaches, migraines, paralysis, high blood

pressure, PMS, sciatica, sexual dysfunction, stress, stroke, tendonitis and vision problems. I mention this claim in the article.

I find it more than interesting that you do not mention by name a single study to support your *claim* that acupuncture has been shown to be a "scientifically proven effective treatment...in at least 200 specific medical conditions." Nor do you reveal where you got the notion that the American Medical Association says that this claim is a fact.

Your focus on whether science can explain how acupuncture works is misplaced. First, it must be established what is meant by "works." Then, it must be established *that* it works. After that, explanations as to *how* it works become appropriate. All this is addressed in the article. In case you missed it, I mention that some researchers think that acupuncture stimulates nerve endings, releasing endorphins. I also link to an [article](#) which asserts "A team of researchers at the University of California-Irvine and a university in China has found that acupuncture activates a group of nerve cells called the endorphin system to lower blood pressure and treat some types of heart disease." This is a long way from "proven effective for 200 specific medical conditions."

10 Oct 2000

Several years ago I had the flu. I've never been so sick in my life and I found it hard to believe that I could live to my late 20's without ever having had the flu before. Every muscle in my body ached. Ache is too mild. Well, I recovered slowly but the flu seemed to have settled in my arms. Weird, I know, but that's what I kept thinking. I could use the hand of one arm but the arm itself hurt when moved, and the other arm was okay but the hand hurt when moved. This subsided after a couple of weeks but one arm still hurt so much that it was all I thought of day and night.

My symptoms did not match carpal tunnel syndrome so I convinced myself that it was a "pinched nerve". After suffering for a few more weeks I got a referral to a neurologist. He confirmed that I did not have CTS, and even though my GP had ruled this out I was still relieved. CTS meant surgery. The neurologist stuck a needle in a couple of places in my hand and arm and looked at some monitor. He said "well, it's not a pinched nerve". He gave me a prescription and off I went. I never had it filled. Know why? My arm stopped hurting. Did the needles do it? Nah. It was being told that after weeks of being sick (the flu, then the arm pain), and working myself up to basically one tense muscle mass that there was nothing wrong with me. The pain was real, I didn't imagine it. But I think my tension, or the why I was in constant awareness of the arm pain made me hold it in a certain way or not move it, whatever, that kept the pain there. How many acupuncture customers do the same thing? They get relief because they believe it works, then work themselves up before the next appointment. The reader who

responded that once a quarter seemed to keep his ailment at bay. The human mind works in mysterious ways.

Lori

17 Aug 2000

I enjoy your web site, and generally find it educational, enlightening, entertaining, and an invaluable resource. I would like to make a few comments, however, with regard to your discussion of acupuncture.

As several other respondents have noted, it is unreasonable to reject acupuncture out-of-hand simply because chi theory has historically been invoked to explain its effects. The effectiveness of acupuncture and its mechanism of action are two separate issues, and should be dealt with as such.

The difficulty actually stems from your definition of acupuncture. You define acupuncture as a traditional Chinese medical technique for manipulating chi (ch'i or qi) in order to balance the opposing forces of yin and yang. Since you define acupuncture in terms of chi, you can refute acupuncture by refuting chi. I would suggest, however, that the goal of acupuncture is not to manipulate chi but to improve health; chi manipulation is simply a supposed explanatory mechanism, one which may or may not turn out to have an objective basis in reality.

My dictionary (Webster's New Collegiate 1981) defines acupuncture as an orig. Chinese practice of puncturing the body (as with needles) to cure disease or relieve pain. When defined in this way, we see that acupuncture is the practice of sticking needles into people, and thus must be evaluated on the merits of needle sticking. If it turns out that sticking needles into people can have positive health effects, acupuncture will indeed be vindicated. If it further turns out that sticking needles into people using traditional needle techniques and point combinations is more effective than other ways of sticking needles into people, then traditional acupuncture will be vindicated. However, even if we do establish that the practice of acupuncture can have health benefits, we have still said nothing about the mechanism, which is really what the concept of chi speaks to.

Chi may turn out to be a chimera metaphysical claptrap, balderdash, stuff and nonsense. It may turn out to be a useful heuristic device a poetic and metaphorical way to describe muscle tension, skin temperature, and other quite down-to-earth physical processes and correspondences. Or, it may turn out that the ancient Chinese were on to something, and that chi corresponds to some subtle but physical force, perhaps bioelectromagnetism, that we do not as yet fully appreciate. Chi may turn out to be a useful concept in our efforts to understand acupuncture, or it may turn out to be completely superfluous. And in the end, once we are confident that we fully understand what chi is and how it

relates to acupuncture, acupuncture itself will continue to be exactly as effective (or ineffective, as the case may be) as it has always been.

In short, it is not valid to define acupuncture in terms of a postulated metaphysical mechanism of action, and then discredit acupuncture by discrediting the mechanism. Such an analysis does not speak to the effectiveness of acupuncture (that is, whether sticking needles in people does any good), but only to the validity of the suggested mechanism. Certainly both the effectiveness of acupuncture and its mechanism of action are important issues. I suggest that the discussion of acupuncture on your web site would benefit were you to more clearly distinguish between the two.

Dennis Kitchen

reply: I make it clear what I mean by acupuncture, and the meaning I use is much more complete than the one in your dictionary. Most readers should be able to understand from what I have written that acupuncture in the loose sense of sticking needles into the skin is what is being tested in the Western world. Belief in chi is irrelevant to these studies.

19 Jun 2000

Your article suggests that acupuncture, while becoming more and more popular in the West, is being practised less and less in China. This is far from true. In fact the Chinese are trying very hard to combine western and traditional Chinese medicine, as was advocated by Mao Zedong. There are hospitals devoted to this purpose. They are also investigating the physical nature of qi (chi). Considerable efforts are being made to sort the wheat from the chaff, thus the banning of the fraudulent Falun Gong cult, which incorporates traditional zen and bagua (a kind of martial art,) jumbled up with superstition, pseudo- and anti-science and worship of the cult's founder Li Hongzhi.

Julian Clegg
Taiwan

18 May 2000

Your entry on "acupuncture" implies that the effectiveness of the practice is simply a placebo effect. It is my understanding that there is increasing use of acupuncture in veterinary medicine. That would, I would think, call the placebo hypothesis into doubt. (Even if the animals' owners believe in the practice, I don't see how that could affect the animals--unless of course you believe in inter-species telepathy...)

Gordon Kaswell

reply: First, I don't claim that the effectiveness of acupuncture is simply a

placebo effect. I don't claim it is effective at all for most of the things it is supposedly able to cure.

As for animals: how does an animal tell you whether acupuncture is "effective"? Vets use all kinds of tricks to make their human customers think they're getting their money's worth. The fact that acupuncture is used by some veterinarians does not mean it is effective. No vet goes to veterinary school to learn acupuncture, so if acupuncture is used, it is most likely used in conjunction with traditional therapies and drugs. True, one can't prove it wasn't the acupuncture that helped the animal get back on all fours, but we can't prove it was, either.

07 Jul 1999

It seems the "acupuncture works" defense could equally be applied to gurus. In India snake-bite victims are usually taken to the local guru (magic man). About 90 percent of the time the snake-bite victim makes a full recovery. Gurus work! Or do they...

About 90 per cent of snake bites in India are from snakes that are not venomous. Provided the guru does nothing to harm the victim, he or she will make a full recovery. The other 10 percent always die.

It's not good enough to look at the outcome and say "it works" (at least most the time). Better information could save 90 percent of Indian snake bite victims a trip to the guru. The others 10 per cent could save much more.

By the way, the snake bite anecdote come from the movie "guru busters" which I'm pleased to see gets a mention in your dictionary.

Matt Crowe
Sydney, Australia

31 Aug 1999

Regarding the recently posted reader comment by Simone Kissane regarding accupuncture and chi dated Aug. 23, 1999, and your reply:

In defenses of metaphysical claims, I often encounter the argument that some particular posited metaphysical phenomenon is not an invalid construction or improvable proposition merely because it cannot be observed. The defender ventures that because atoms or electromagnetic fields cannot be seen, and yet the scientific "establishment" grants them reality, it is merely a case of prejudice that we do not also grant to chi, body meridians, crystal power, the astral plane, god, or the like, the same degree of existence. Putting aside the finer points of logical fallacy often present in such arguments, it has always

been one of my pet peeves, as an atomic physicist, to see that people aren't really aware that one can "see" atoms. (I think there's a lot of science information with bearing on areas of metaphysical speculation that hasn't percolated to the general public. This seems to be a historical pattern...) It's as if people were to say "you can't see wind, either, and yet we say that wind exists." Duh. I don't know what those people are thinking when they see the trees shake and smoke drifting horizontally under the action of some mysterious force...

It's about the same with atoms these days. Naturally, it requires some technological intervention to see atoms, but I can tell you that I have seen a single atom. Yep. With nothing more than a high-quality camera lens to focus the atom's light for me. It was a barium atom, and it was blue, and small, and surrounded by darkness. Now granted, what one actually sees is the light emitted by the atom as it sits in a trap (made of electromagnetic fields), not the atom itself, but then we're into a bit of a quandary about what it means to "see" something (quantum mechanically versus classically), which is not what most metaphysical claim defenders have in mind in raising this argument. So attached is a nice image from a group at the National Institute of Standards and Technology of several trapped atoms (ionized atoms, actually) of mercury, illuminated by resonant ultraviolet light, all in a row. Their website is full of papers and descriptions of trapping ions in little groups. They can make movies of clouds of small numbers of ions in little clouds wiggling back and forth under the influence of electromagnetic fields.

<http://www.boulder.nist.gov/timefreq/ion/index.htm>

There's the issue of the mediating influence of the camera to detect the ultraviolet light, but as I say, you can see other types of atoms' fluorescence with the unaided eye. I trap sodium atoms myself -- we can make clouds of hundreds to millions of atoms hanging suspended by electromagnetic fields in empty space. It could be logically possible that the clouds we see aren't atoms, but I don't see how you can make that argument with single trapped atoms or ions.

Another technology capable of resolving individual atoms is Scanning Tunneling Electron Microscopy (STEM), a subfield of Atomic Force Microscopy (AFM). I've attached an image from a group at Amherst College of individual carbon atoms in graphite.

<http://www.amherst.edu/~dfpadowi/menu.html>

This is just an example. You can image all kinds of different atoms (some make better pictures than others) and molecules at fantastic resolutions. This technology is less satisfying as a refutation of the argument "you can't SEE atoms either" because it requires the intervention of a larger number of pieces of technical equipment (i.e. a computer to collate the data into an image). But

there it is -- you're looking at the electron distribution of individual atoms on a surface. You can "see" the shapes of the atoms and the molecular bonds.

What's more, electromagnetic fields aren't invisible, either. Nope. You can see them. Nearly everyone can. Electromagnetic fields of a particular frequency range is called light. Wow. I recall an amusing anecdote as a graduate student: a grad student colleague of mine was married to a very nice woman who was worried about the biological effects of extremely low frequency electromagnetic radiation (the power line, electric blanket, brain cancer issue...), particularly on her children. She had listened to a hysterical report on the radio by some yutz investigator about how every home should have an electromagnetic field detector to see what terrible danger we were all living in. She called up her husband at work asking if he had an electromagnetic field detector in the lab and he said "Well, sure, but you've already got two of them at home, dear -- try your eyes." She really got pretty angry at what she took to be a glib answer.

I admit, it's not much in the way of dispelling ignorance and combating superstitious belief, but it's one of my pet peeves in arguments because it's just so wrong. I wonder if you'd consider discussing this particular argument on your website as I seem to encounter it so often. But it's probably just a bias effect with me.(!) The point is that the things claimed to be "just theories" (atoms, gravity, electromagnetic fields, the Big Bang, quarks) in science have observable, testable consequences that anyone can see.

I continue to enjoy your website and find it very informative.

Mass Media Bunk

7

October. *Los Angeles Times*. [Andrew Weil, M.D.](#), "**In the medicine chest, a place for herbs.**" This article begins by making a plea for herbal remedies while claiming that the *New England Journal of Medicine* attacked herbal remedies in a recent editorial. He also claims that a study done at Stanford University indicates that some 70% of us are using "alternative" medicine, i.e., medicine that does not include drugs or surgery. However, the article quickly degenerates into a paranoid whining about how the big bad bullies of real medicine have hogged all the money for research and that's why naturopaths and homeopaths can't do science. Weil thinks we should fund "integrative medicine" (i.e., whatever spiritual hocus-pocus is suggested by whatever shaman who happens to be in the neighborhood). If only these quackmeisters had the funds they could prove the real value of shark cartilage or bee pollen. But the big bullies at the A.M.A. have all the resources. The same kind of pathetic plea was made in the 1950s and 60s by parapsychologists. The only reason they couldn't prove ESP, remote viewing, etc., and collect their deserved Nobel Prizes was that the real scientists had a good 'ol boys club and excluded them from participation. They couldn't get university jobs where all the research was done. So now they have departments and labs all over the world and what have they discovered that is of any value to anyone? They've proved only that whining loud enough and long enough pays off. The same tactic seems to be working for the "alternative" folks. The National Institutes of Health has upped the budget for the "Alternative" division to some [\\$20,000,000 a year](#).

November 3, 1998. Update. [Bastyr University](#), a naturopathic college in Bothell, Washington, announced it will be the home of the new National Center for Complementary and Alternative Medicine. Congress has approved \$50,000,000 for the center, which will look for ways to integrate Chinese medicine, homeopathy and Ayurvedic medicine into mainstream health care.

Also, [Bastyr](#) will be a title sponsor of the [International Conference on Integrative Medicine](#), which will be held at the Washington State Convention & Trade Center, April 30 through May 2, 1999.

astrology on the attack

Don't be surprised if we next hear from the astrologers demanding their "rightful" place in our universities. Ivan Kelly, foremost critic of astrology (see "further reading" under the [astrology](#) entry in the Skeptic's Dictionary), sent me a copy of a troublesome article by astrologer Valerie Vaughan. "Debunking the Debunkers: Lessons to Be Learned," appeared in Aug/Sept 1998 issue of *The Mountain Astrologer*. Vaughan claims that astrologers are persecuted by establishment science. That is why astrologers can't get "access to research funding." And that is why astrologers fail to design "research protocols and run controlled tests in order to

supply evidence for their art." Yet, in the same article Vaughan also claims that "astrology is not a science in the same sense as chemistry or physics....At most, it might be considered a social science."

Having firmly established that astrology is a social science, she then notes that "other social sciences, such as history, are not regularly attacked for their failure to apply scientific methodology in a laboratory setting." How true. Apparently, Ms. Vaughan does not understand that scientific methodologies can be and are regularly applied outside a lab in the social sciences. Some of these methodologies are based upon logical principles such as [Mill's Methods](#), which most astrologers do not seem to believe apply to their discipline. Some of these methodologies involve the use of statistical analysis of data. Vaughan understands the need for statistical analysis, but does not believe the usual scientific protocols apply to astrology. She says that scientists "insist on statistical analysis using random samples. But astrology cannot be proved or disproved using random samples because astrology is based on the premise that *conditions are never random*."

A scientifically minded person might think Vaughan is wrong, considering all the tests done using random samples of both subjects and astrological readings that have shown that astrology has no significant predictive value. But Vaughan has something else in mind. Those studies made the assumption

that any time is just as good as another to perform a test of astrology, but what if you're testing whether Pisces is less aggressive than Aries, and it so happens that Mars is rising during the test? Or suppose that preliminary research does reveal some validity in astrology, but in a later attempt at replicating the results, the Moon is void of course or Neptune is rising? Of course the results will be inconclusive!

Further complicating matters, she says, is that when scientists (read "non-astrologers") test astrology they test parts of a person's chart. They ignore "the wholeness of a chart." Thus they commit the [fallacy of composition](#) (not her term): they assume "the whole equals the sum of its parts."

Astrology is incredibly complex; there are innumerable variables which must be considered before an astrologer can confidently make a statement. Practitioners of astrology know that no one factor, such as the Moon in Aquarius, can 'mean' anything in an absolute sense. That Aquarian Moon could be out-of-bounds, in a different house, opposed Saturn, or affected by any number of other conditions that modify its significance.

Vaughan has no awareness that it is this very complexity which marks astrology as a pseudoscience. Nothing could ever disprove it. Astrology can explain everything that happens, even contradictory events. There is always some ready [ad hoc hypothesis](#) to explain away any apparent refuting data.

However, what is disturbing about Vaughan's article is not her profound misunderstanding of science and scientific methodologies, but her call to astrologers

to take to the road like the [creationists](#) did a few years ago and go on the attack. She is outraged that there are now textbooks in our schools that "contain entire units or learning activities aggressively aimed at teaching students to distinguish between science and 'pseudoscience.'" Worst of all, astrology is often used as the prototypical pseudoscience. This must be changed, she says. The debunkers of astrology are "intellectual control junkies who cannot bear the thought of a phenomenon they can't explain." The reason astrology is so badly treated is because mainstream academia is afraid of "losing control, power, and status. Because of their need for intellectual and financial control, they keep expanding their territory, applying the scientific approach to areas that are just plain none of their business."

According to Vaughan, "scientist debunkers [of astrology] have entered the realm of public school education, but what else would you expect with Pluto currently in Sagittarius?" (What was that about nothing can mean anything in an absolute sense?) That is not all. Vaughan invites us to go with her down the slippery slope to envision science "infiltrating" the humanities, religion, philosophy, ethics--where "even poetry and drama are at risk."

Vaughan's article is primarily a call to action. She urges astrologers not to sit back and be persecuted by Science. She advises that astrologers try to get astrology into the public school curriculum under the guise of "multicultural frameworks."

Since every culture in the world has developed a form of astrology, it is inherently diverse....A possible tactic is to approach the school authorities about admitting Western Astrology as a valid cultural tradition, and see what happens.

Another approach, she says, is to try to take advantage of "a new educational craze which emphasizes student participation."

The idea here is that, if students show an interest in a particular question (no matter how unrelated it is to the established curriculum), teachers are supposed to follow the direction of inquiry and incorporate it into the lesson. In other words, if students in an astronomy class show an interest in astrology, the new standards stipulate that the teacher shouldn't say that this is a topic students are not supposed to be learning. It will be interesting to see how this kind of situation is handled, because it is in direct confrontation with the standards that allow science teachers to debunk astrology under the guise of instruction in science history, 'critical thinking,' and scientific method.

The reader might laugh at this, thinking that astrologers aren't going to get that close to any school curriculum. Think again. Astrologers have children and can belong to the P.T.A. Their kids can bring them to school for show-and-tell. Or, they could have credentials like Vaughan. She has a masters degree in Information Science and is the director of a science education library, where her duties include staying current with "guidelines and trends in science teaching, and to review the latest curriculum materials available."

[update: Astrologers start their own college in Washington](#)

- "'Debunking the Debunkers' - A Response to an Astrologer's Debunking of Skeptics" by I.W. Kelly, *Skeptical Inquirer* Nov/Dec 1999.

October 25-31 has been declared "Haunted History Week" by the so-called History Channel. Stories on [ghosts](#) and [haunted houses](#) and places will be featured in honor of that most important annual historical event: [Halloween](#). I am sure they apologize to viewers who were looking forward to a dozen movies set in Nazi Germany.

[September 1998. Discover Magazine. "Needles and Nerves," by Catherine Dold.](#)

This article claims that a physicist has some "high-tech" evidence supporting the claim that [acupuncture](#) "has a real effect on the body." What starts off as an anecdote about 62-year old Zang-Hee Cho who fell down and hurt himself, but had his pain relieved in ten minutes by an acupuncturist, deteriorates into a pseudoscientific argument of minimal significance.

While sticking needles into a few student volunteers, he took pictures of their brains and discovered that by stimulating an acupuncture point said to be associated with vision-but that is nowhere near anything known to be connected to the eyes-he could indeed trigger activity in the very part of the brain that controls vision. There just might be something to this acupuncture thing, he figured.

This is very unscientific thinking. Before making such a logical leap, Dr. Cho should first have consulted with a neuroscientist. Just thinking about something visual will stimulate the visual cortex and there is no connection between stimulating the visual cortex and healing the eye. Even if sticking needles into the foot, where the traditional points associated with eye health and disease are located, did stimulate the visual cortex, it would be irrelevant to curing eye problems. If stimulating the visual cortex could heal the eye, then all one would have to do would be to look at things or imagine looking at things to heal the eye. We could fire all the optometrists and ophthalmologists as quacks.

Acupuncture claims that by sticking needles into certain points on the body, one can heal the eye by unblocking [chi](#) and restoring a proper balance of [yin and yang](#). Why would anyone think that stimulating the visual cortex has anything to do with healing the eye, unblocking chi or affecting yin and yang? Well, one could assume this is the case and simply beg the question, which is what Dr. Cho seems to have done. When confronted with the fact that some of his twelve subjects showed an increase and some a decrease of activity in the visual cortex when given acupuncture, Cho attributed this data not as refuting his hypothesis but as supporting it! Those who did not show an increase in visual cortex activity have too much yin! This is a nice [ad hoc hypothesis](#) to boot. No matter what results he got, Dr. Cho could explain the data in terms of yin and yang. Nothing could refute his hypothesis. There could be no

clearer case of pseudoscientific reasoning.

In response to a personal e-mail from Dold which she does not want published, I am adding the following comments.

Dold's article is not *just* a case of reporting on a pseudoscientific thinker (Dr. Cho) without critical comment. She does quote Dr. Wallace Sampson as saying that "Cho's paper proves nothing....It's a simple case of pseudoscience."

However, the only supportive evidence Sampson allegedly provided was that "the study was too small and poorly controlled to detect real effects." Those comments do not address the *pseudoscience* issue. Dr. Sampson, a rabid critic of "alternative" health practices, is likely to have had a lot more to say regarding the pseudoscientific nature of Cho's research. That he wasn't quoted further, as well as other omissions, indicate that the author does not have a clear idea of pseudoscience.

She also quotes Dr. Bruce Pomerantz, a neuroscientist at the University of Toronto, as saying "People have looked for meridians but haven't found anything.... They've tried to measure [qi](#) without success. But the failure to find something doesn't mean it doesn't exist." Pomerantz is right, of course, but scientists don't investigate *metaphysical* entities such as qi, meridians, or [ying/yang](#)....unless they don't know the difference between science and metaphysics.

Dold does a good job of distinguishing two types of "acupuncture" studies. One type indicates that sticking needles into various traditional acupuncture points stimulates the production of pain killers such as endorphins. The other type indicates that stimulating certain traditional acupuncture points triggers brain activity not associated with the body part stuck with a needle. Cho's is of the latter type. He stuck a needle into the toe and found (using MRI) that he thereby stimulated a part of the brain associated with the visual system.

Cho found that three of his subjects showed more activity (more oxygen flow) in the brain, while the other three showed less activity (less oxygen), indicating that stimulating the toe may increase or decrease activity in the part of the brain associated with visual activity. Dold, however, makes no comment when Cho gives a metaphysical explanation for his confusing results. Cho finds an acupuncturist who explains this anomaly as due to differences of yin and yang in the subjects. The issue then shifts from Cho's study to the acupuncturist's seemingly magical knowledge:

...without seeing the data, the practitioner correctly pointed out who had shown an increase in activity (yang) and who had had a decrease (yin) in 11 of 12 cases. "I don't know how to explain it," Cho says ([Dold](#)).

Dold shows no skepticism at this anecdote, nor any interest in noting that Cho and his acupuncturist are not now discussing anything remotely scientific.

Dold recognizes that "Like many preliminary scientific reports, Cho's small study raises more questions than it answers and that "he has demonstrated new functional effects of acupuncture." Still, I think her article is misleading. The article claims to

answer the skeptics who are "reluctant to accept that acupuncture has a real effect on the body." Skeptics are aware of the fact that sticking needles into people has a real effect on the body. Discovering that sticking a needle into the toe affects a part of the brain associated with the visual system could be of great importance. But no scientist will establish the value of this effect by looking for qi, meridians or differences in yin and yang.

Pseudoscientists do not distinguish what can be empirically tested from what cannot. To write an article that suggests that the two can commingle in the high-tech lab is to promote a pseudoscientific argument. The likelihood that Cho is going to "push the scientific frontier a little further by using fMRI (functional magnetic resonance imaging) and other imaging systems to explore connections between acupoints and the brain" seems remote given his methodology. He should stick to physics, where presumably his methodologies are a bit more orthodox, and leave neuroscience to scientifically-minded neuroscientists, not to the likes of Dr. Pomerantz who seems to think there is hope of finding empirical evidence for metaphysical entities.

 [the Skeptic's Refuge](http://skepdic.com/refuge/)

[More bunk](#) 

ad hoc hypothesis

An ad hoc hypothesis is one created to explain away facts that seem to refute one's theory. Ad hoc hypotheses are common in paranormal research and in the work of [pseudoscientists](#). For example, [ESP](#) researchers have been known to blame the hostile thoughts of onlookers for unconsciously influencing pointer readings on sensitive instruments. The hostile vibes, they say, made it impossible for them to duplicate a positive ESP experiment. Being able to duplicate an experiment is essential to confirming its validity. Of course, if this objection is taken seriously, then no experiment on ESP can ever fail. Whatever the results, one can always say they were caused by paranormal psychic forces, either the ones being tested or others not being tested.

Martin Gardner reports on this type of ad hoc hypothesizing reaching a ludicrous peak with parapsychist Helmut Schmidt who put cockroaches in a box where they could give themselves electric shocks. One would assume that cockroaches do not like to be shocked and would give themselves shocks at a chance rate or less, if cockroaches can learn from experience. The cockroaches gave themselves more electric shocks than predicted by chance. Schmidt concluded that "because he hated cockroaches, maybe it was his pk that influenced the randomizer!" (Gardner, p. 59)

Ad hoc hypotheses are common in defense of the pseudoscientific theory known as [biorhythm theory](#). For example, there are very many people who do not fit the predicted patterns of biorhythm theory. Rather than accept this fact as refuting evidence of the theory, a new category of people is created: the arrhythmic. In short, whenever the theory does not seem to work, the contrary evidence is systematically discounted. Advocates of biorhythm theory claimed that the theory could be used to accurately predict the sex of unborn children. However, W.S. Bainbridge, a professor of sociology at the University of Washington, demonstrated that the chance of predicting the sex of an unborn child using biorhythms was 50/50, the same as flipping a coin. An expert in biorhythms tried unsuccessfully to predict accurately the sexes of the children in Bainbridge's study based on Bainbridge's data. The expert's spouse suggested to Bainbridge an interesting ad hoc hypothesis, namely, that the cases where the theory was wrong probably included many homosexuals with indeterminate sex identities!

Astrologers are often fond of using statistical data and analysis to impress us with the scientific nature of [astrology](#). Of course, a scientific analysis of the statistical data does not always pan out for the astrologer. In those cases, the astrologer can make the data fit the astrological paradigm by the ad hoc hypothesis that those who do not fit the mold have other, unknown influences that counteract the influence of the dominant planets.

Using ad hoc hypotheses is not limited to pseudoscientists. Another type of ad

hoc hypothesis occurs in science when a new scientific theory is proposed which conflicts with an established theory and which lacks an essential explanatory mechanism. An ad hoc hypothesis is proposed to explain what the new theory cannot explain. For example, when Wegener proposed his theory of continental drift he could not explain how continents move. It was suggested that gravity was the force behind the movement of continents, though there was no scientific evidence for this notion. In fact, scientists could and did show that gravity was too weak a force to account for the movement of continents. Alexis du Toit, a defender of Wegener's theory, argued for radioactive melting of the ocean floor at continental borders as the mechanism by which continents might move. Stephen Jay Gould noted that "this ad hoc hypothesis added no increment of plausibility to Wegener's speculation." (Gould, p. 160)

Finally, rejecting explanations that require belief in occult, supernatural or paranormal forces in favor of simpler and more plausible explanations is called applying [Occam's razor](#). It is not the same as ad hoc hypothesizing. For example, let's say I catch you stealing a watch from a shop. You say you did not steal it. I ask you to empty your pockets. You agree and pull out a watch. I say, "Aha!, I was right. You stole the watch." You reply that you did not steal the watch, but you admit that it was not in your pocket when we went into the store. I ask you to explain how the watch got into your pocket and you say that you used telekinesis: you used your thoughts to transport the watch out of a glass case into your pocket. I ask you to repeat the act with another watch and you say "ok." Try as you will, however, you cannot make a watch magically appear in your pocket. You say that there is too much pressure on you to perform or that there are too many bad vibes in the air for you to work your powers. You have offered an ad hoc hypothesis to explain away what looks like a good refutation of your claim. My hypothesis that the watch is in your pocket because you stole it, is not an ad hoc hypothesis. I have chosen to believe a plausible explanation rather than an implausible one. Likewise, given the choice between believing that my headache went away of its own accord or that it went away because some nurse waved her hands over my hand while chanting a mantra, I will opt for the former every time.

It is always more reasonable to apply Occam's razor than to offer speculative ad hoc hypotheses just to maintain the possibility of something supernatural or paranormal.

pseudoscience

A pseudoscience is set of ideas based on theories put forth as scientific when they are not scientific.

Scientific theories are characterized by such things as (a) being based upon empirical observation rather than the authority of some sacred text; (b) explaining a range of empirical phenomena; (c) being empirically tested in some meaningful way, usually involving testing specific predictions deduced from the theory; (d) being confirmed rather than falsified by empirical tests or with the discovery of new facts; (e) being impersonal and therefore testable by anyone regardless of personal religious or metaphysical beliefs; (f) being dynamic and fecund, leading investigators to new knowledge and understanding of the interrelatedness of the natural world rather than being static and stagnant leading to no research or development of a better understanding of anything in the natural world; and (g) being approached with skepticism rather than gullibility, especially regarding paranormal forces or supernatural powers, and being fallible and put forth tentatively rather than being put forth dogmatically as infallible.

Some pseudoscientific theories are based upon an authoritative text rather than observation or empirical investigation. [Creationists](#), for example, make observations only to confirm infallible dogmas, not to discover the truth about the natural world. Such theories are static and lead to no new scientific discoveries or enhancement of our understanding of the natural world.

Some pseudoscientific theories explain what non-believers cannot even observe, e.g. [orgone energy](#).

Some can't be tested because they are consistent with every imaginable state of affairs in the empirical world, e.g., [L. Ron Hubbard's engram theory](#).

Some pseudoscientific theories can't be tested because they are so vague and malleable that anything relevant can be [shoehorned](#) to fit the theory, e.g., the [enneagram](#), [iridology](#), the theory of [multiple personality disorder](#), the [Myers-Briggs Type Indicator](#)®, the theories behind many [New Age psychotherapies](#), and [reflexology](#).

Some theories have been empirically tested and rather than being confirmed they seem either to have been falsified or to require numerous [ad hoc hypotheses](#) to sustain them, e.g., [astrology](#), [biorhythms](#), [facilitated communication](#), [plant perception](#), and [ESP](#). Yet, despite seemingly insurmountable evidence contrary to the theories, adherents won't give them

up.

Some pseudoscientific theories rely on ancient myths and legends rather than on physical evidence, even when their interpretations of those legends either requires a belief contrary to the known laws of nature or to established facts, e.g., [Velikovsky's](#), [von Däniken's](#), and [Sitchen's](#) theories.

Some pseudoscientific theories are supported mainly by *selective* use of [anecdotes](#), intuition, and examples of [confirming instances](#), e.g., [anthropometry](#), [aromatherapy](#), [craniometry](#), [graphology](#), [metoposcopy](#), [personology](#), and [physiognomy](#).

Some pseudoscientific theories confuse [metaphysical](#) claims with empirical claims, e.g., the theories of [acupuncture](#), [alchemy](#), [cellular memory](#), [Lysenkoism](#), [naturopathy](#), [reiki](#), [rolfing](#), [therapeutic touch](#), and [Ayurvedic medicine](#).

Some pseudoscientific theories not only confuse metaphysical claims with empirical claims, but they also maintain views that contradict known scientific laws and use ad hoc hypotheses to explain their belief, e.g., [homeopathy](#).

Pseudoscientists claim to base their theories on empirical evidence, and they may even use some scientific methods, though often their understanding of a controlled experiment is inadequate. Many pseudoscientists relish being able to point out the consistency of their theories with known facts or with predicted consequences, but they do not recognize that such consistency is not proof of anything. It is a necessary condition but not a sufficient condition that a good scientific theory be consistent with the facts. A theory which is contradicted by the facts is obviously not a very good scientific theory, but a theory which is consistent with the facts is not necessarily a good theory. For example, "the truth of the hypothesis that plague is due to evil spirits is not established by the correctness of the deduction that you can avoid the disease by keeping out of the reach of the evil spirits" (Beveridge 1957, 118).

[SkepDic.com](http://skepdic.com)

[According to a Gallup poll, belief in ESP has remained steady for the past decade at 50%](#)

ESP (extrasensory perception)

Extrasensory perception is perception occurring independently of sight, hearing, or other sensory processes. People who have extrasensory perception are said to be [psychic](#). It is commonly called ESP, a term coined by [J.B. Rhine](#), who began investigating the phenomenon at Duke University in 1927. ESP refers to [telepathy](#), [clairvoyance](#), [precognition](#), and in recent years, [remote viewing](#) and [clairaudience](#). The existence of ESP and other paranormal powers such as [telekinesis](#), are disputed, though systematic experimental research on these subjects, known collectively as [psi](#), has been ongoing for over a century in [parapsychology](#).

Most of the evidence for ESP is [anecdotal](#) and is dismissed by skeptics as based on one or several of the following:

- incompetence or fraud by [parapsychologists](#) or believers in psi
- trickery by [mentalists](#)
- [cold reading](#)
- [subjective validation](#)
- [selective thinking](#) and [confirmation bias](#)
- poor grasp of probabilities and of the [law of truly large numbers](#)
- [shoehorning](#), [retrospective clairvoyance](#), and [retrospective falsification](#)
- gullibility, [self-deception](#), and [wishful thinking](#)

The following case is typical of those cited as proof of ESP. It is unusual only in that it involves belief in [a psychic dog](#), rather than a psychic human. The dog in question is a terrier who has achieved fame as having ESP as exhibited by his ability to know when his owner, [Pam Smart](#), is deciding to come home when she is away shopping or on some other business. The dog's name is Jaytee. He has been featured on several television programs in Australia, the United States and England, where he resides with Pam and her parents, who were the first to perceive the dog's psychic abilities. They observed that the dog would run to the window facing the street at precisely the moment Pam was deciding to come home from several miles away. (How the parents knew the precise moment Pam was deciding to come home is unclear.)

Parapsychologist [Rupert Sheldrake](#) investigated and declared the dog is truly psychic. Two scientists, [Dr Richard Wiseman](#) and Matthew Smith of the University of Hertfordshire, tested the dog under controlled conditions. The scientists synchronized their watches and set video cameras on both the dog and its owner. Alas, several experimental tries later, they had to conclude that [the dog wasn't doing what had been alleged](#). He went to the window and did so quite frequently, but only once did he do so near the exact time his master

was preparing to come home and that case was dismissed because the dog was clearly going to the window after hearing a car pull up outside his domicile. Four experiments were conducted and the results were published in the *British Journal of Psychology* (89:453, 1998).

Much of the belief in ESP is based upon apparently unusual events that seem inexplicable. However, we should not assume that every event in the universe can be explained. Nor should we assume that what is inexplicable requires a paranormal (or supernatural) explanation. Maybe an event can't be explained because there is nothing to explain.

Most ESP claims do not get tested, but parapsychologists have attempted to verify the existence of ESP under controlled conditions. Some, like [Charles Tart](#) and [Raymond Moody](#), claim success; others, such as [Susan J. Blackmore](#), claim that years of trying to find experimental proof of ESP have failed to turn up any proof of indisputable, repeatable psychic powers. Defenders of psi claim that the [gansfeld experiments](#), the [CIA's remote viewing experiments](#) and attempts to influence randomizers at [Princeton Engineering Anomalies Research](#) have produced evidence of ESP.

Psychologists who have thoroughly investigated parapsychological studies, like [Ray Hyman](#) and Blackmore, have concluded that where positive results have been found, the work was fraught with fraud, error, incompetence, and statistical legerdemain.

biorhythms

The theory of biorhythms is a [pseudoscientific](#) theory that claims our daily lives are significantly affected by rhythmic cycles overlooked by scientists who study biological rhythms. Biochronometry is the scientific study of rhythmicity and biological cycles or "clocks," such as the circadian (from the Latin *circa* and *dia*; literally, "about a day"). Circadian rhythms are based upon such things as our sensitivity to light and darkness, which is related to our sleep/wakefulness patterns. Biorhythms is not based upon the scientific study of biological organisms. The cycles of biorhythm theory did not originate in scientific study, nor have they been supported by anything resembling a scientific study. The theory has been around for over one hundred years and there has yet to be a scientific journal that has published a single article supporting the theory. There have been some three dozen studies supporting biorhythm theory but all of them have suffered from methodological and statistical errors (Hines, 1998). An examination of some 134 biorhythm studies found that the theory is not valid (Hines, 1998). It is empirically testable and has been shown to be false. Terence Hines believes that this fact implies that biorhythm theory "can not properly be termed a pseudoscientific theory." However, when the advocates of an empirically testable theory refuse to give up the theory in the face of overwhelming evidence against it, it seems reasonable to call the theory pseudoscientific. For, in fact, the adherents to such a theory have declared by their behavior that there is nothing that could falsify it, yet they continue to claim the theory is scientific.

Biorhythm theory is based more on [numerology](#), [testimonials](#) and the [Forer effect](#), mass media hype, and intuition than on scientific study. The theory originated in the nineteenth century with Wilhelm Fliess, a Berlin physician, numerologist and good friend and patient of Sigmund Freud.¹ Fliess was fascinated by the fact that no matter what number he picked he could figure out a way to express it in a formula with relation to either 23, 28 or both.² The latter number he associated with menstruation and thus when he was convinced that all the world is governed by 23 and 28, he called the 28-day period "female" and the 23-day period "male." In 1904, several years after Fliess's discovery, Dr. Hermann Swoboda of the University of Vienna, claimed he discovered these same periods on his own. In the 1920s, Alfred Teltscher, an Austrian engineering teacher, added the 'mind' period of 33 days, based upon his observation that his students' work followed a 33-day pattern. The theory was popularized in the 1970s by George Thommen (*Is This Your Day? How Biorhythm Helps You Determine Your Life Cycles*) and Bernard Gittleson (*Biorhythm--A Personal Science*). Neither book provides scientific evidence for biorhythms. They consist of little more than speculation and anecdotes. However, by now the static idea of periods was replaced with the dynamic notion of *cycles*, which are now known as the *physical*, *emotional* and *intellectual* cycles. Interestingly, not only did the "female" period become the

emotional cycle, but both men and women are said to share the same physical and emotional cycles of 23 and 28 days respectively. One might have expected that, given the different hormonal natures of males and females, the sexes might have at least some unique and distinct rhythmic cycles.

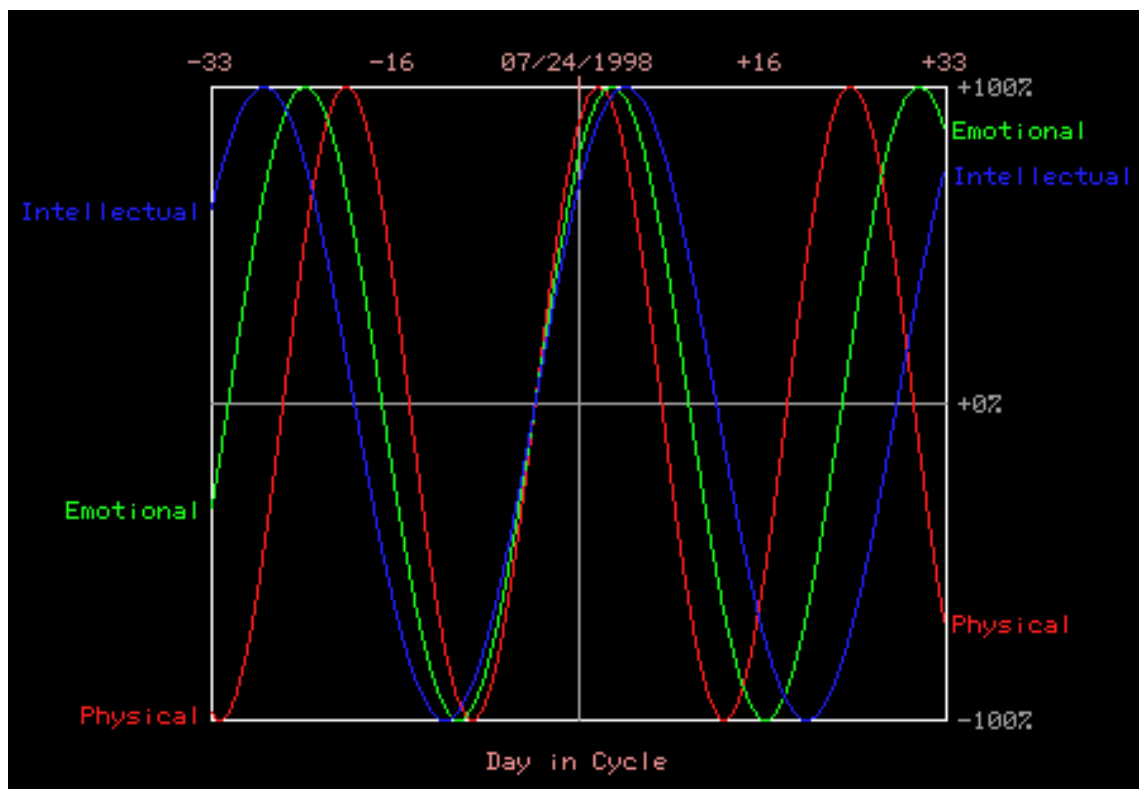

[New cycles have been added in recent years.](#) There is the 38-day *intuitional cycle*, the 43-day *aesthetic cycle*, and the 53-day *spiritual cycle*. Others claim there are [cycles that are combinations of the three primary cycles](#). The *passion cycle* is the physical joined with the emotional cycle. The *wisdom cycle* is the emotional joined with the intellectual cycle. And the *mastery cycle* is the intellectual joined with the physical cycle.

However many cycles there are, the function is the same: to predict what kind of day one is likely to have.

Generally speaking, the more positive a cycle is at any given point in time, the better one is able to interact in that arena. For example, high emotional level tends to mean that a person is more stable, is better able to make relationship decisions, and so on. This is not to say that when the cycle is in the negative range that the person is not doing well in that arena, rather, it means that it is harder to do well. --Plan exams when your Intellectual cycle is high. [[Facade](#)]

At the moment of birth, according to the theory, the biorhythmic cycles are set to zero. Knowing your birthday, the number of days you have lived and where in each cycle you are can be determined for any given day. A biorhythmic chart for July 24, 1998, for someone born four days earlier would look like this:

Biorhythm chart for a 4-day-old born on 7/20/98

The line going through the middle is the zero line. A cycle is said to be in a positive phase when above the zero line and in a negative phase when below the zero line. A cycle begins in an ascent for the first fourth of a cycle, then half of the cycle is in descent, then the last quarter of the cycle ascends back to the zero line. The cycles repeat until you die. Should you live to be something like 58 years and 66 days old, you will reach the point at which the physical, emotional and intellectual cycles return to the same point on the zero line. For some, this is a moment of "rebirth."

According to the theory, when certain points on the cycles are reached a person may enjoy special strength or suffer special weakness. "Switch point days," when cycles cross the zero line on the ascent or descent, are "critical" days. Performance on critical days is supposedly very poor. It has even been predicted that people are especially accident prone on critical days. This empirical claim is easily testable. It has been tested and shown to be false. However, any cycle with an odd number of days does not have an exact day in the middle, a fact which has led some "experts" to do some slippery math. For example, one "scientific study" said to support biorhythm theory claims that something like 60% of all accidents occur on critical days but critical days make up only 22% of all days. If true, this statistic would not likely be due to chance and biorhythm advocates could justifiably claim their theory had been confirmed by this data. However, biorhythmists include both the day before and the day after a switch point day as "critical" days. Thus, an accurate statistic would be something like *about 60% of all accidents occur on about 60% of all days, which is to be expected by chance* (Hines).

In any case, according to the theory, critical days are days you want to know about in advance so you can prepare for them. For example, if you are scheduled to take a test that will measure your thinking ability, make sure you

do not take the test on a day when your intellectual cycle is at a critical or a low point. Of course, to do well one must also get a good night's sleep, be generally healthy, eat properly, and study, but those preparations will do you no good if your intellectual cycle is not in the right spot. On the other hand, if you are a long distance runner, try to pick your next race date so that you are at a peak on your physical cycle. Of course, you must train properly, eat well, get sufficient rest, be healthy, etc., but these will not suffice if your physical cycle is at the wrong point.

The worst day of all, according to the classical (3-cycle) theory, is the "triple critical," the day when all three cycles are at a switch point. Next worst is the "double critical", when two cycles meet at the switch point. As you can imagine, it gets very complicated tracing all these cycles on their ascents, descents, switch points, etc. But it does not take a mathematician to figure out that it is going to be easy to find cases that fit the theory. For example, the physical cycle is 23 days long. That means that every 11.5 days is a physical cycle switch over day. So, the odds of, say, having a heart attack on a given physical switch over day are about 1 in 11. Most people would agree that having a heart attack is having a bad physical day. One valid empirical test of the theory would be to collect data on heart attack victims and see if significantly more than 9% (1 out of 11) had their heart attacks on physical switch over days. Instead, the usual evidence given by believers is an anecdote about Clark Gable or someone else who had a heart attack on a switch over day. There are thousands of heart attack victims each year and 1 out of 11 of them would be predicted by chance to have the attack on a switch over day. So, finding several individual cases of people who have serious physical problems on a critical physical day is to be expected, not wowed at.

The ho-hum response that anecdotes such as the Clark Gable story should evoke from a reasonable person should put one to sleep when you consider that biorhythmists generally count the day before and after a critical day as being just as bad as critical days. This means that 6 out of every 23 days (26% of our days) are danger days for the body. Thus, the odds are about one in four that any given person who has a bad physical day is at a "critical" point. Anecdotes of people having bad physical days are particularly inconsequential given such odds. A meaningful test of the theory might be to study heart attack victims. If significantly greater than 25% of the sample have attacks on a critical days, then you have a scoop.

Another typical but useless test of the theory is to keep track of how accurate the theory is by charting each day and keeping a diary of your days. Actress Susan St. James, a fervid believer in biorhythms, once described on a television talk show how she had done this. If her chart predicted a low emotional day, she was upset that day. If her chart predicted a physical high, she felt great that day. On a day when her intellectual cycle was at a low, she couldn't think straight about anything. In some circles this is known as the self-fulfilling prophecy, the power of suggestion or [subjective validation](#). Whatever you call it, it isn't science.

To demonstrate the folly of using subjective validation to count as support for biorhythm theory, James Randi had George Thommen, president of Biorhythm Computers, Inc., do a biorhythm chart for Randi and his secretary. One of the listeners to Randi's radio program was selected for an experiment. She was to be given her own personal chart and she was to keep a day-by-day diary for two months and to rate her chart for accuracy. She reported that the chart had been "at least ninety percent accurate." The devious Randi had actually sent her *his own* chart. He told the subject that he had done this by mistake. She agreed to check her diary with her real chart, which Randi gave her. She reported that the new chart was even more accurate than the other one. Actually, she'd been given Randi's *secretary's* chart. This kind of data retrofitting is common among believers in such [pseudosciences](#) as [astrology](#), [graphology](#) and biorhythms. In fact, similar tests of subjective validation, with identical results, have been done on astrological charts and graphological readings. Randi's deception, of course, was not intended to disprove biorhythms, but to call attention to the problem of subjective validation, something consistently overlooked by devotees of astrology, graphology and biorhythms.

Biorhythms is a pseudoscience because there have been several meaningful tests of the theory, all failing to support it (Hines, 1991), yet its advocates refuse to give up the theory. Advocates of this theory have more [ad hoc hypotheses](#) to explain away disconfirming evidence than Galapagos has islands. My favorite is the hypothesis that some people are *arrhythmic* some or all of the time. Any contrary case can be explained away by reference to the case being arrhythmic. Another favorite ad hoc hypothesis concerns Thommen's claim that he could predict with 95% accuracy the sex of a child by the biorhythms of the mother. If, during conception, the mother's physical (masculine) cycle was at a high point, a boy was likely. If, during conception, the mother's emotional (female) cycle was at a high point, a girl was likely. A study done by W.S. Bainbridge, a professor of sociology at the University of Washington, concluded that using the biorhythm theory your chances of predicting the sex of the child were 50/50, the same as flipping a coin. A defender of the theory suggested to Bainbridge that the cases where the theory was wrong probably included many homosexuals, who have *indeterminate sex identities!*

When the anecdotes don't fit the theory, biorhythmists are likely to change the theory. For example, one of the more common ways to defend the theory has been to point out that great feats occur when high in a cycle. Defenders of the theory commonly cite the example of Mark Spitz (born 2/10/50) being in a high physical and emotional phase when he won seven gold medals in the 1972 Olympics.

Biorhythm chart for Mark Spitz (9/5/72)

Note how Spitz's emotional and physical cycles converged on September 5, the day of [the Munich massacre](#). Coincidence? Not to inquiring minds. No doubt this is evidence of [synchronicity](#). Note, too, that his intellectual cycle was very low during this period. Why not conclude that he did so well physically because his mind was inactive. Thus, he was not distracted by doing any serious thinking, a known hindrance to athletic performance. Of course, the simplest theory is that he did so well because he was a damn good swimmer! Those of a logical bent might use [Occam's razor](#) to reject biorhythms in favor of this simpler explanation.

However, Reggie Jackson, who was inaugurated into Baseball's Hall of Fame and was born on May 18, 1946, had the greatest day in his brilliant career on October 18, 1977. On that day he hit three consecutive home runs on three consecutive pitches off three different pitchers to help the New York Yankees win the game and the World Series against the Los Angeles Dodgers. Jackson's cycles were all in the low end of their negative phases on that day.

Biorhythm chart for Reggie Jackson (10/18/77)

[Russ Streiffert has an explanation](#): "Studies have shown that location in the graphic data may be less important than trend or which way your [sic] going. This is a dynamic interpretation as opposed to earlier views. Briefly starting at the bottom of the graph we have increasing resource discharge (available)...then maximum discharge across the center line...then decreasing discharge approaching the top. Starting back down we have increasing recharge (unavailable)...maximum recharge across the center line...then decreasing recharge approaching the bottom. In the graph above, notice how Mr. Jackson's resources appear charged (available) and synchronized on October 18, 1977. While this does not constitute proof that these cycles contributed to his achievements, it appears to be an excellent correlation and is certainly not disproof. " The studies that have shown this are not cited by Mr. Streiffert.

So, when the data seems to conflict with what would be predicted by the theory, we are to engage in a new kind of interpretation. Reggie Jackson was not in a negative phase of all cycles; he was "charged and synchronized." We are to think in terms of recharging our energy as we ascend in a cycle, and discharging energy as we descend (or is it the other way around?). In this dynamic and energetic view, even days in the negative phase of a cycle can be good and days in the positive cycle can be bad and vice-versa, depending upon whether they are ascending or descending, charging or discharging, available or unavailable. Such constructions may make it impossible to refute the theory, but they render it untestable and so slippery as to be of little use for predicting the future. What was a pseudoscientific theory because its advocates continued to support it even though it failed all scientific empirical tests, is now a pseudoscience because it claims to be a scientific theory but it is not empirically testable. Everything can be made to fit the theory, even contrary readings such as those of Mark Spitz

and Reggie Jackson, who deserve more credit for their accomplishments than biorhythm theory can provide.

Notes

¹ Freud's letters to Fliess were preserved, much to Freud's dismay. They were first published in English as *Origins of Psychoanalysis: Letters to Wilhelm Fliess Drafts and Notes, 1887-1902*. Edited by Marie Bonaparte, Anna Freud and Ernst Kris, translation by Eric Mosbacher and James Strachey (London: Imago Pub. Co., 1954). A more recent translation by Jeffrey Moussaieff Masson is available: *The Complete Letters of Sigmund Freud to Wilhelm Fliess, 1887-1904* (Cambridge, Mass.: Belknap Press of Harvard University Press, 1985). Fliess's masterpiece is entitled *The Rhythm of Life: Foundations of an Exact Biology* (Leipzig: 1906). There is a discussion of Freud, Fliess and biorhythms in Frank Sulloway's *Freud: Biologist of Mind* (Cambridge, Mass.; Harvard University Press, 1993).

² How did Fliess come up with his theory about the magic of the numbers 23 and 28? Martin Gardner writes:

Fliess's basic formula can be written $23x + 28y$, where x and y are positive or negative integers. On almost every page Fliess fits this formula to natural phenomena, ranging from the cell to the solar system....He did not realize that if any two positive integers that have no common divisor are substituted for 23 and 28 in his basic formula, it is possible to express any positive integer whatever. Little wonder that the formula could be so readily fitted to natural phenomena! [Gardner pp. 134-135]

SkepDic.com

According to a Gallup poll, belief in astrology has increased from 25% to 28% over the last decade of the 20th century.

According to AC Nielsen eRatings.com, Astrology.com had 868,000 surfers the week ending Dec. 16, 2001.

astrology

...as above, so below...

"Astrology, as it is presently practiced (in either its traditional or psychological form), has no relevance to understanding ourselves, or our place in the cosmos. Modern advocates of astrology cannot account for the underlying basis of astrological associations with terrestrial affairs, have no plausible explanation for its claims, and have not contributed anything of cognitive value to any field of the social sciences. Further, astrology does not have the theoretical/conceptual resources to resolve its own internal problems adequately, or external anomalies, or to adjudicate between conflicting astrological claims or systems." -- I.W. Kelly, *Modern Astrology: A critique*, p. 931.

"You shouldn't dismiss as incredible the possibility that a long enough search might reveal a golden grain of truth in astrological superstition." -- Johannes Kepler

**If you want to know who controls your soul
don't look to Mars or Venus;
Look instead to the President
for the danger's in his penis.
[author unknown to me]**

Astrology, in its traditional form, is a type of [divination](#) based on the theory that the positions and movements of celestial bodies (stars, planets, sun, and moon) at the time of birth profoundly influence a person's life. In its psychological form, astrology is a type of New Age therapy used for self-understanding and personality analysis. (This entry concerns traditional astrology. See the entry on [astrotherapy](#) for a discussion of psychological astrology.)

The most popular form of traditional astrology is Sun Sign Astrology, the kind found in many daily newspapers which publish horoscopes. A horoscope is an astrological forecast. The term is also used to describe a map of the zodiac at the time of one's birth. The zodiac is divided into twelve zones of the sky, each named after a constellation which originally fell within its zone (Taurus, Leo, etc.). The apparent paths of the sun, the moon, and the major planets all fall within the zodiac. Because of the precession of the equinoxes, the equinox and solstice points have each moved westward about 30 degrees

in the last 2,000 years. Thus the zodiacal constellations named in ancient times no longer correspond to the segments of the zodiac represented by their signs. In short, had you been born at the same time on the same day of the year 2,000 years ago, you would have been born under a different sign.

Traditional Western astrology may be divided into tropical and sidereal. (Astrologers in non-Western traditions use different systems.) The tropical, or solar, year is measured relative to the sun and is the time (365 days, 5 hr, 48 min, 46 sec of mean solar time) between successive vernal equinoxes. The sidereal year is the time (365 days, 6 hr, 9 min, 9.5 sec of mean solar time) required for the earth to complete an orbit of the sun relative to the stars. The sidereal year is longer than the tropical year because of the precession of the equinoxes, i.e., the slow westward shift of the equinoctial points along the plane of the ecliptic at a rate of 50.27 seconds of arc per year, resulting from precession of the earth's axis of rotation. Sidereal astrology uses the actual constellation in which the sun is located at the moment of birth as its basis; tropical astrology uses a 30-degree sector of the zodiac as its basis. Tropical astrology is the most popular form and it assigns its readings based on the time of the year, while generally ignoring the positions of the sun and constellations relative to each other. Sidereal astrology is used by a minority of astrologers and bases its readings on the constellations near the sun at the time of birth.

One of the common arguments in favor of astrology is the fallacious argument from popularity and tradition: astrology is believed by millions of people and it has survived for thousands of years. These claims are true, but are irrelevant to the "truth" of astrology. The ancient Chaldeans and Assyrians engaged in astrological divination some three thousand years ago. By 450 B.C.E. the Babylonians had developed the 12-sign zodiac, but it was the Greeks--from the time of Alexander the Great to their conquest by the Romans--who provided most of the fundamental elements of modern astrology.

The spread of astrological practice was arrested by the rise of Christianity, which emphasized divine intervention and free will. During the Renaissance, astrology regained popularity, in part due to rekindled interest in science and astronomy. Christian theologians, however, warred against astrology, and in 1585 Pope Sixtus V condemned it. At the same time, the work of Kepler and others undermined astrology's tenets.

Is astrology testable?

A second argument in favor of astrology is that it is testable and there is evidence that the data support the hypothesis that there is a causal connection between heavenly bodies and human events. For example, according to the so-called "[Mars Effect](#)", great athletes are born not made. This claim is based on a statistical analysis of birth dates of great athletes and the position of Mars when they were born. It is said that the correlation is greater than one would

expect by chance. Others disagree and claim the evidence does not show a correlation that would not be expected by chance. However, even if there were a significant correlation between the position of Mars at one's birth and one becoming an exceptional athlete, that would not imply or even indicate that there is a causal connection between the position of a planet and the kind of endeavors one is likely to be good at here on earth. Correlation between x and y is not a sufficient condition for reasonable belief that x causes y. Even a statistically significant correlation between x and y is not a sufficient condition for reasonable belief in a causal connection, much less for the belief that x causes y. Correlation does not prove causality.

Correlation may not prove causality, but it is extremely attractive to defenders of astrology. For example: "Among 3,458 soldiers, Jupiter is to be found 703 times, either rising or culminating when they were born. Chance predicts this should be 572. The odds here: one million to one" (Gauquelin). I'm willing to assume that all the statistical data which show a significant correlation between various planets rising, falling, culminating, or whatever else they might be seen as doing, are accurate. However, it would be more surprising if of all the billions and billions of celestial motions conceivable, there weren't a great many that could be significantly correlated with dozens of mass events or individual personality traits.

For example, defenders of astrology are fond of noting that 'the length of a woman's menstrual cycle corresponds to the phases of the moon' and 'the gravitational fields of the sun and moon are strong enough to cause the rising and falling of tides on Earth.' If the moon can affect the tides, then surely the moon can affect a person. But what is the analog to the tides in a person? We are reminded that humans begin life in an amniotic sea and the human body is 70 percent water! If oysters open and close their shells in accordance with the tides, which flow in accordance with the electromagnetic and gravitational forces of the sun and moon, and humans are full of water, then isn't it obvious that humans must be influenced by the moon as well? It may be obvious, but the evidence from [moon studies](#) does not support it.

Astrologers emphasize the importance of the positions of the sun, moon, planets, etc., at the time of birth. But why are the initial conditions more important than all subsequent conditions for one's personality and traits? Why is the moment of birth chosen as the significant moment rather than the moment of conception? Why aren't other initial conditions such as one's mother's health, the delivery place conditions, forceps, bright lights, dim room, back seat of a car, etc., more important than whether Mars is ascending, descending, culminating or fulminating? Why isn't the planet Earth, much closer to us at birth, considered a major influence on who we are and what we become?

Other than the sun and the moon and an occasional passing comet or asteroid, most planetary objects are so distant from us that any influences they might

have on anything on our planet are likely to be wiped out by the influences of the sun and moon. Earth, and the people and things on earth that a person comes in direct contact with, are likely to be more important as influencing factors in our lives than distant heavenly bodies. What's more, if it turns out that we can determine specific effects from specific birthplace conditions, then we can control those conditions to bring about beneficial results. On the other hand, even if it were true that the position of the stars and planets is more important to your life than whether your birth was a difficult one under horrendous conditions, there is nothing we can do about the stars and there is a limit to how much control we can have over the time of a person's birth. (I am glad I won't be an astrologer in the age of test tube babies. How would I know when my client was 'born'? The birthing process isn't instantaneous. There is no single moment that a person is born. The fact that some official somewhere writes down a time of birth is irrelevant. Do they pick the moment the water breaks? the moment the first dilation occurs? when the first hair or toenail peeks through? when the last toenail or hair passes the last millimeter of the vagina or belly surface? when the umbilical cord is cut? when the first breath is taken? or the moment when the physician or nurse looks at a clock or watch [no doubt magically free from the possibility of inaccuracy] to note the time of birth?)

No one would claim that in order to grasp the effect of the moon on the tides or potatoes one must understand initial conditions of the Singularity before the Big Bang, or the positions of the stars and planets at the time the potato was harvested. If you want to know what tomorrow's low tide will be you do not need to know where the moon was when the first ocean or river was formed, or whether the ocean came first and then the moon, or vice-versa. Initial conditions are less important than present conditions to understanding current effects on rivers and vegetables. If this is true for the tides and plants, why wouldn't it be true for people?

correlation is not causality

This fascination with correlation is also found in the reasoning of those who try to make every ancient megalithic site into an astronomical observatory of some sort. Defenders of astrology should note what Aubrey Burl wrote of such reasoning.

...the odds are in favour of a good celestial sightline occurring fortuitously in almost any circle. Examine a site like Grey Croft, Cumberland,...27.1 x 24.4 m in diameter with twelve stones and an outlier, there appear to be so many possible lines and so many possible targets that to discover nothing would be improbable (Burl, 50).

Also, while it is true that the odds are inconceivably large that anyone would make more than 20 straight passes at the craps table, it's happened. Given enough craps games, the inconceivable will become the frequent. In short, what seems to defy the ["laws" of statistics](#), may not do so when examined more carefully.

Finally, there are those who defend astrology by pointing out how accurate professional horoscopes are. A colleague of mine, a history teacher with a Ph.D. in history from the University of California at Davis, practices astrology. Of course, he's high tech and has a computer program to help him do his readings. He is aware of all the arguments against astrology and even admits that logically it shouldn't work. But it does, he believes. This concept of 'works' is intriguing. What does it mean?

Basically, to say astrology *works* means that there are a lot of satisfied customers. It does *not* mean that astrology is accurate in predicting human behavior or events to a degree significantly greater than mere chance. The main support for this argument is in the form of anecdotes and [testimonials](#). There are many satisfied customers who believe that their horoscope accurately describes them and that their astrologer has given them good advice. Such evidence does not prove astrology so much as it demonstrates the effects of [cold reading](#), [the Forer effect](#), and [confirmation bias](#). Good astrologers give good advice, but that does not validate astrology. There have been several studies which have shown that people will use selective thinking to make any chart they are given fit their preconceived notions about themselves and their charts. Many of the claims made about signs and personalities are vague and would fit many people under many different signs. Even professional astrologers, most of whom have nothing but disdain for Sun Sign Astrology, can't pick out a correct horoscope reading at better than a chance rate. Yet, astrology continues to maintain its popularity, despite the fact that there is scarcely a shred of scientific evidence in its favor. Even the First Lady of the United States, [Nancy Reagan, and her husband, Ronald, consulted an astrologer while he was the leader of the free world](#). From which I can only conclude that *astrologers have more influence than the stars do*.

Is it possible that I am who I am because of the position of the planets, stars, moons, comets, asteroids, quasars, black holes, etc., at the moment of my birth? Yes, it is possible. Do I have any reason to think that this possibility is more likely than the opposite possibility, namely, that these matters are insignificant and irrelevant to my 'destiny'? No. I can't find a single good reason for believing any of this. But I am a Taurus and we all know how stubborn I should be.

See related entries on [astrotherapy](#), [cosmobiology](#), and the [full moon](#).

Occam's razor

"*Pluralitas non est ponenda sine neccesitate*" or "plurality should not be posited without necessity." The words are those of the medieval English philosopher and Franciscan monk William of Ockham (ca. 1285-1349). Like many Franciscans, William was a minimalist in this life, idealizing a life of poverty, and like St. Francis himself, battling with the Pope over the issue. William was excommunicated by Pope John XXII. He responded by writing a treatise demonstrating that Pope John was a heretic.

What is known as Occam's razor was a common principle in medieval philosophy and was not originated by William, but because of his frequent usage of the principle, his name has become indelibly attached to it. It is unlikely that William would appreciate what some of us have done in his name. For example, atheists often apply Occam's razor in arguing against the existence of God on the grounds that God is an unnecessary hypothesis. We can explain everything without assuming the extra metaphysical baggage of a Divine Being.

William's use of the *principle of unnecessary plurality* occurs in debates over the medieval equivalent of [psi](#). For example, in Book II of his *Commentary on the Sentences* of Peter Abelard, he is deep in thought about the question of "Whether a Higher Angel Knows Through Fewer Species than a Lower." Using the principle that "plurality should not be posited without necessity" he argues that the answer to the question is in the affirmative. He also cites Aristotle's notion that "the more perfect a nature is the fewer means it requires for its operation." This principle has been used by atheists to reject the God-the-Creator hypothesis in favor of natural evolution: if a Perfect God had created the Universe, both the Universe and its components would be much simpler. William would not have approved.

He did argue, however, that natural theology is impossible. Natural theology uses reason alone to understand God, as contrasted with revealed theology which is founded upon scriptural revelations. According to Occam, the idea of God is not established by evident experience or evident reasoning. All we know about God we know from revelation. The foundation of all theology, therefore, is faith. It should be noted that while others might apply the razor to eliminate the entire spiritual world, Ockham did not apply the principle of parsimony to the articles of faith. Had he done so, he might have become a Socinian like John Toland (*Christianity not Mysterious*, 1696) and pared down the Trinity to a Unity and the dual nature of Christ to a single nature.

William was somewhat of a minimalist in philosophy, advocating nominalism against the more popular view of realism. That is, he argued that [universals](#)

have no existence outside of the mind; universals are just names we use to refer to groups of individuals and the properties of individuals. Realists claim that not only are there individual objects and our concepts of those objects, there are also *universals*. Ockham thought that this was one too many pluralities. We don't need universals to explain anything. To nominalists and realists there exist Socrates the individual and our concept of Socrates. To the realist there also exist such realities as the *humanity* of Socrates, the *animality* of Socrates, etc. That is, every quality which may be attributed to Socrates has a corresponding "reality", a "universal" or *eidōs*, as Plato called them. William might be said to have been skeptical of this realm of plurality called the realm of universals. It is not needed for logic, epistemology or metaphysics, so why assume this unnecessary plurality? Plato and the realists could be right. Perhaps there is a realm of *eidōs*, of universal realities which are eternal, immutable models for individual objects. But we don't need to posit such a realm in order to explain individuals, our concepts or our knowledge. Plato's *Eidōs* (Forms) are excess and unnecessary metaphysical and epistemological baggage.

It might well be argued that [Bishop George Berkeley](#) applied Occam's razor to eliminate material substance as an unnecessary plurality. According to Berkeley, we need only minds and their ideas to explain everything. Berkeley was a bit selective in his use of the razor, however. He needed to posit God as the Mind who could hear the tree fall in the forest when nobody is present. Subjective Idealists might use the razor to get rid of God. All can be explained with just minds and their ideas. Of course this leads to [solipsism](#), the view that I and my ideas alone exist, or at least they are all I know exist. Materialists, on the other hand, might be said to use the razor to eliminate minds altogether. We don't need to posit a plurality of minds as well as a plurality of brains.

Occam's razor is also called the *principle of parsimony*. These days it is usually interpreted to mean something like "the simpler the explanation, the better" or "don't multiply hypotheses unnecessarily." In any case, Occam's razor is a principle which is frequently used outside of [ontology](#), e.g., by philosophers of science in an effort to establish criteria for choosing from among theories with equal explanatory power. When giving explanatory reasons for something, don't posit more than is necessary. [Von Däniken](#) could be right: maybe extraterrestrials did teach ancient people art and engineering, but we don't need to posit alien visitations in order to explain the feats of ancient people. Why posit pluralities unnecessarily? Or, as most would put it today, don't make any more assumptions than you have to. We can posit the ether to explain action at a distance, but we don't need ether to explain it, so why assume an ethereal ether?

Oliver W. Holmes and Jerome Frank might be said to have applied Occam's razor in arguing that there is no such thing as "the Law." There are only judicial decisions; individual judgments and the sum of them make up the

law. To confuse matters, these eminent jurists called their view *legal realism*, instead of *legal nominalism*. So much for simplifying matters.

Because Occam's razor is sometimes called *the principle of simplicity* some simpleminded [creationists](#) have argued that Occam's razor can be used to support creationism over evolution. After all, having God create everything is much simpler than evolution, which is a very complex mechanism. But Occam's razor does not say that the more simpleminded a hypothesis, the better. If it did, Occam's would be dull razor for a dim populace indeed.

Some have even found a use for Occam's razor to justify [budget cuts](#), arguing that "what can be done with less is done in vain with more." This approach seems to apply Occam's razor to the principle itself, eliminating the word "assumptions." It also confuses matters by confusing "less" with "fewer." Occam was concerned with fewer assumptions, not less money.

The original principle seems to have been invoked within the context of a belief in the notion that perfection is simplicity itself. This seems to be a metaphysical bias which we share with the medievals and the ancient Greeks. For, like them, most of our disputes are not about this principle but about what counts as necessary. To the materialist, dualists multiply pluralities unnecessarily. To the dualist, positing a mind as well as a body, is necessary. To atheists, positing God and a supernatural realm is to posit pluralities unnecessarily. To the theist, positing God is necessary. And so on. To von Daniken, perhaps, the facts make it necessary to posit extraterrestrials. To others, these aliens are unnecessary pluralities. In the end, maybe Occam's razor says little more than that for atheists God is unnecessary but for theists that is not true. If so, the principle is not very useful. On the other hand, if Occam's razor means that when confronted with two explanations, an implausible one and a probable one, a rational person should select the probable one, then the principle seems unnecessary because so obvious. But if the principle is truly a minimalist principle, then it seems to imply the more reductionism the better. If so, then the principle of parsimony might better have been called Occam's Chainsaw, for its main use seems to be for clear-cutting [ontology](#).

cold reading

Cold reading refers to a set of techniques used by professional manipulators to get a subject to behave in a certain way or to think that the cold reader has some sort of special ability that allows him to "mysteriously" know things about the subject. Cold reading goes beyond the usual tools of manipulation: suggestion and flattery. In cold reading, salespersons, hypnotists, advertising pros, faith healers, con men and some therapists bank upon their subject's inclination to find more meaning in a situation than there actually is. The desire to make sense out of our experience has led us to many wonderful discoveries, but it has also led some of us to many follies. The manipulator knows that his mark will be inclined to try to make sense out of whatever he is told, no matter how farfetched or improbable. He knows, too, that people are generally self-centered, that we tend to have unrealistic views of ourselves and that we will generally accept claims about us that reflect not how we are or even how we really think we are but how we wish we were or think we should be. He also knows that for every several claims he makes about you which you reject as being inaccurate, he will make one that meets with your approval; and he knows that you will remember the hits he makes and forget the misses.

Thus, a good manipulator can provide a *reading* of a total stranger, which will make the stranger feel that the manipulator possesses some special power. For example, [Bertram Forer](#) has never met you, the reader, yet he offers the following cold reading of you:

Some of your aspirations tend to be pretty unrealistic. At times you are extroverted, affable, sociable, while at other times you are introverted, wary and reserved. You have found it unwise to be too frank in revealing yourself to others. You pride yourself on being an independent thinker and do not accept others' opinions without satisfactory proof. You prefer a certain amount of change and variety, and become dissatisfied when hemmed in by restrictions and limitations. At times you have serious doubts as to whether you have made the right decision or done the right thing. Disciplined and controlled on the outside, you tend to be worrisome and insecure on the inside.

Your sexual adjustment has presented some problems for you. While you have some personality weaknesses, you are generally able to compensate for them. You have a great deal of unused capacity which you have not turned to your advantage. You have a tendency to be critical of yourself.

You have a strong need for other people to like you and for them to admire you.

Here's another reading:

People close to you have been taking advantage of you. Your basic honesty has been getting in your way. Many opportunities that you have had offered to you in the past have had to be surrendered because you refuse to take advantage of others. You like to read books and articles to improve your mind. In fact, if you're not already in some sort of personal service business, you should be. You have an infinite capacity for understanding people's problems and you can sympathize with them. But you are firm when confronted with obstinacy or outright stupidity. Law enforcement would be another field you understand. Your sense of justice is quite strong.

The last one was from astrologer Sidney Omarr. He's never even met you and yet he knows so much about you (*Flim-Flam!*, 61). The first one was taken by Forer from a newsstand astrology book.

The selectivity of the human mind is always at work. We pick and choose what data we will remember and what we will give significance to. In part, we do so because of what we already believe or want to believe. In part, we do so in order to make sense out of what we are experiencing. We are not manipulated simply because we are gullible or suggestible, or just because the signs and symbols of the manipulator are vague or ambiguous. Even when the signs are clear and we are skeptical, we can still be manipulated. In fact, it may even be the case that particularly bright persons are more likely to be manipulated when the language is clear and they are thinking logically. To make the connections that the manipulator wants you to make, you must be thinking logically.

Not all cold readings are done by malicious manipulators. Some readings are done by astrologers, graphologists, tarot readers, and psychics who genuinely believe they have paranormal powers. They are as impressed by their correct predictions or "insights" as are their clients. We should remember, however, that just as scientists can be wrong in their predictions, so pseudoscientists and quacks can sometimes be right in theirs.

There seem to be three common factors in these kinds of readings. One factor involves *fishing for details*. The psychic says something at once vague and suggestive, e.g., "I'm getting a strong feeling about January here." If the subject responds, positively or negatively, the psychic's next move is to play off the response. E.g., if the subject says, "I was born in January" or my mother died in January" then the psychic says something like "Yes, I can see

that," anything to reinforce the idea that the psychic was more precise than he or she really was. If the subject responds negatively, e.g., "I can't think of anything particularly special about January," the psychic might reply, "Yes, I see that you've suppressed a memory about it. You don't want to be reminded of it. Something painful in January. Yes, I feel it. It's in the lower back [fishing]...oh, now it's in the heart [fishing]...umm, there seems to be a sharp pain in the head [fishing]...or the neck [fishing]." If the subject gives no response, the psychic can leave the area, having firmly implanted in everybody's mind that the psychic really did 'see' something but the subject's suppression of the event hinders both the psychic and the subject from realizing the specifics of it. If the subject gives a positive response to any of the fishing expeditions, the psychic follows up with more of "I see that very clearly, now. Yes, the feeling in the heart is getting stronger."

Fishing is a real art and a good mentalist carries a variety of bait in his memory. For example, professional mentalist and author of one of the best books on cold reading, Ian Rowland (2002), says that he has committed to memory such things as the most common male and female names and a list of items likely to be lying about the house such as an old calendar, a photo album, newspaper clippings, and so on. Rowland also works on certain themes that are likely to resonate with most people who consult psychics: love, money, career, health, and travel. Since cold reading can occur in many contexts, there are several tactics Rowland covers. But whether one is working with [astrology](#), [graphology](#), [palmistry](#), [psychometry](#), or [Tarot cards](#), or whether one is [channeling](#) messages from the dead à la [James Van Praagh](#), there are specific techniques one can use to impress clients with one's ability to know things that seem to require paranormal powers.

Another characteristic of these readings is that *many claims are put in either vague statement form* ("I'm getting a warm feeling in the crotch area") *or in the form of a question* ("I sense that you have strong feelings about someone in this room. Am I right?") Most of the specific claims are provided by the subject himself.

Finally, *those occasions where the psychic has guessed wrongly about the subject will be forgotten* by the subject and the audience. What will be remembered are the seeming hits, giving the overall impression of "wow, how else could she have known all this stuff unless she is psychic." This same phenomenon of suppression of contrary evidence and [selective thinking](#) is so predominant in every form of psychic demonstration that it seems to be related to the old psychological principle: a man sees what he wants to see and disregards the rest.

See related entries on [ad hoc hypotheses](#), [communal reinforcement](#), [confirmation bias](#), [control study](#), [medium](#), [Occam's razor](#), [the placebo effect](#), [the post hoc fallacy](#), [psychic](#), [selective thinking](#), [self-deception](#), [subjective validation](#), [testimonials](#), [James Van Praagh](#) and [wishful thinking](#).

by Robert T. Carroll

communal reinforcement

Communal reinforcement is the process by which a claim becomes a strong belief through repeated assertion by members of a community. The process is independent of whether the claim has been properly researched or is supported by empirical data significant enough to warrant belief by reasonable people. Often, the mass media contribute to the process by uncritically supporting the claims. More often, however, the mass media provide tacit support for untested and unsupported claims by saying nothing skeptical about even the most outlandish of claims.

Examples abound: [alien abductions](#), [astral projections](#), [racist ideas](#), [past-life regression](#), the notion that children have memories that are completely accurate, the idea that children rarely says things that aren't true, that [Edgar Cayce](#) had psychic healing powers, that an Indian Yogi was buried but his body did not decay, that people levitate, that it is possible to have sex with the spirits of the dead, that you can rid yourself of cancer by visualization or humor, that some animals have [ESP](#), that [surgery can be performed and tumors removed from internal organs using psychic powers](#), that the FBI has a wiretap on every phone in America, that the military has implanted microchips in our butts and can order us around at will, that Russian troops are amassing on the Mexican border waiting to invade the U.S. and take it over for the United Nations, that Jews control all the power and money of the world, that once assault weapons are banned it will only be a matter of time before all our weapons are confiscated and a totalitarian regime will take away our right to pray, to play and to slay, etc. etc. etc.

Communal reinforcement explains how entire nations can pass on ineffable gibberish from generation to generation. It also explains how testimonials reinforced by other testimonials within the community of therapists, sociologists, psychologists, theologians, politicians, talk show aficionados, etc., can supplant and be more powerful than scientific studies or accurate gathering of data by disinterested parties.

[Becoming
a Critical Thinker](#)
by Robert T. Carroll

post hoc fallacy

The *post hoc ergo propter hoc* (after this therefore because of this) fallacy is based upon the mistaken notion that simply because one thing happens after another, the first event was a cause of the second event. Post hoc reasoning is the basis for many superstitions and erroneous beliefs.

Many events follow sequential patterns without being causally related. For example, you have a cold, so you drink fluids and two weeks later your cold goes away. You have a headache so you stand on your head and six hours later your headache goes away. You put acne medication on a pimple and three weeks later the pimple goes away. You perform some task exceptionally well after forgetting to bathe, so the next time you have to perform the same task you don't bathe. A solar eclipse occurs so you beat your drums to make the gods spit back the sun. The sun returns, proving to you the efficacy of your action.

You use your dowsing stick and then you find water. You imagine heads coming up on a coin toss and heads comes up. You rub your lucky charm and what you wish for comes true. You lose your lucky charm and you strike out six times. You have a "vision" that a body is going to be found near water or in a field and later a body is found near water or in a field. You have a dream that an airplane crashes and an airplane crashes the next day or crashed the night before.

However, sequences don't establish a probability of causality any more than correlations do. Coincidences happen. Occurring after an event is not sufficient to establish that the prior event caused the later one. To establish the probability of a causal connection between two events, controls must be established to rule out other factors such as chance or some unknown causal factor. Anecdotes aren't sufficient because they rely on intuition and subjective interpretation. A [controlled study](#) is necessary to reduce the chance of error from self-deception.

See related entries on [ad hoc hypotheses](#), [confirmation bias](#), [cold reading](#), [control study](#), [communal reinforcement](#), [Occam's razor](#), [paranormal](#), [the placebo effect](#), [regressive fallacy](#), [selective thinking](#), [self-deception](#), [subjective validation](#), [testimonials](#), [James Van Praagh](#), and [wishful thinking](#).

selective thinking

Selective thinking is the process whereby one selects out favorable evidence for remembrance and focus, while ignoring unfavorable evidence for a belief. This kind of thinking is the basis for most beliefs in the [psychic](#) powers of so-called [mind readers](#) and [mediums](#). It is also the basis for many, if not most, [occult](#) and [pseudoscientific](#) beliefs.

It should be noted that selective thinking works independently of [wishful thinking](#) and should not be confused with [biased thinking](#), whereby one seriously *considers* data contrary to one's belief, but one is much more critical of such data than one is of supportive data.

See **related entries** on [ad hoc hypothesis](#), [cold reading](#), [communal reinforcement](#), [confirmation bias](#), [control study](#), [Occam's razor](#), [the placebo effect](#), [the post hoc fallacy](#), [self-deception](#), [subjective validation](#), [testimonials](#) and [wishful thinking](#).

[Deception & Self-deception:
Investigating
Psychics by Richard
Wiseman](#)

self-deception

Ninety-four percent of university professors think they are better at their jobs than their colleagues.

Twenty-five percent of college students believe they are in the top 1% in terms of their ability to get along with others.

Seventy percent of college students think they are above average in leadership ability. Only two percent think they are below average.

--Thomas Gilovich *How We Know What Isn't So*

Eighty-five percent of medical students think it is improper for politicians to accept gifts from lobbyists. Only 46 percent think it's improper for physicians to accept gifts from drug companies.

--Dr. Ashley Wazana [JAMA](#) Vol. 283 No. 3, January 19, 2000

People tend to hold overly favorable views of their abilities in many social and intellectual domains....This overestimation occurs, in part, because people who are unskilled in these domains suffer a dual burden: Not only do these people reach erroneous conclusions and make unfortunate choices, but their incompetence robs them of the metacognitive ability to realize it.

--"Unskilled and Unaware of It: How Difficulties in Recognizing One's Own Incompetence Lead to Inflated Self-Assessments," by Justin Kruger and David Dunning Department of Psychology Cornell University, [Journal of Personality and Social Psychology](#) December 1999 Vol. 77, No. 6, 1121-1134.

Self-deception is the process or fact of misleading ourselves to accept as true or valid what is false or invalid. Self-deception, in short, is a way we justify false beliefs to ourselves.

When philosophers and psychologists discuss self-deception, they usually focus on unconscious motivations and intentions. They also usually consider self-deception as a bad thing, something to guard against. To explain how self-deception works, they focus on self-interest, prejudice, desire, insecurity, and other psychological factors unconsciously affecting in a negative way the will to believe. A common example would be that of a parent who believes his child is telling the truth even though the objective evidence strongly supports the claim that the child is lying. The parent, it is said, deceives him or herself into believing the child because the parent *desires* that the child tell the truth. A belief so motivated is usually considered more flawed than one due to lack

of ability to evaluate evidence properly. The former is considered to be a kind of moral flaw, a kind of dishonesty, and irrational. The latter is considered to be a matter of fate: some people are just not gifted enough to make proper inferences from the data of perception and experience.

However, it is possible that the parent in the above example believes the child because he or she has intimate and extensive experience with the child but not with the child's accusers. The parent may be unaffected by unconscious desires and be reasoning on the basis of what he or she knows about the child but does not know about the others involved. The parent may have very good reasons for trusting the child and not trusting the accusers. In short, an apparent act of self-deception may be explicable in purely cognitive terms without any reference to unconscious motivations or irrationality. The self-deception may be neither a moral nor an intellectual flaw. It may be the inevitable existential outcome of a basically honest and intelligent person who has extremely good knowledge of his or her child, knows that things are not always as they appear to be, has little or no knowledge of the child's accusers, and thus has not sufficient reason for doubting the child. It may be the case that an independent party could examine the situation and agree that the evidence is overwhelming that the child is lying, but if he or she were wrong we would say that he or she was *mistaken*, not self-deceived. We consider the parent to be self-deceived because we assume that he or she is not simply mistaken, but is being irrational. How can we be sure?

A more interesting case would be one where (1) a parent has good reason to believe that his or her child is likely to tell the truth in any given situation, (2) the objective evidence points to innocence, (3) the parent has no reason to especially trust the child's accusers, but (4) the parent believes the child's accusers anyway. Such a case is so defined as to be practically impossible to explain without assuming some sort of unconscious and irrational motivation (or brain disorder) on the part of the parent. However, if cognitive incompetence is allowed as an explanation for apparently irrational beliefs, then appeals to unconscious psychological mechanisms are not necessary even in this case.

Fortunately, it is not necessary to know whether self-deception is due to unconscious motivations or not, in order to know that there are certain situations where self-deception is so common that we must systematically take steps to avoid it. Such is the case with belief in paranormal or occult phenomena such as ESP, prophetic dreams, dowsing, therapeutic touch, facilitated communication and a host of other topics taken up in the [Skeptic's Dictionary](#).

In *How We Know What Isn't So*, Thomas Gilovich describes the details of many studies which make it clear that we must be on guard against the tendencies to

1. **misperceive random data and see patterns where there are none**
2. **misinterpret incomplete or unrepresentative data and give extra attention to confirmatory data while drawing conclusions without attending to or seeking out disconfirmatory data**
3. **make biased evaluations of ambiguous or inconsistent data, tending to be uncritical of supportive data and very critical of unsupportive data.**

It is because of these tendencies that scientists require clearly defined, [controlled, double-blind, randomized, repeatable, publicly presented studies](#).

Otherwise, we run a great risk of deceiving ourselves and believing things that are not true. It is also because of these tendencies that in trying to establish beliefs non-scientists ought to try to imitate science whenever possible. In fact, scientists must keep reminding themselves of these tendencies and guard against [pathological science](#).

Many people believe, however, that as long as they guard themselves against [wishful thinking](#) they are unlikely to deceive themselves. Actually, if one believes that all one must be on guard against is wishful thinking, then one may be *more* rather than less liable to self-deception. For example, many intelligent people have invested in numerous fraudulent products that promised to save money, the environment, the world, etc., not because they were guilty of wishful thinking but because they *weren't*. Since they were not guilty of wishful thinking, they felt assured that they were correct in defending their product. They could easily see the flaws in critical comments. They were adept at finding every weakness in opponents. They were sometimes brilliant in defense of their useless devices. Their errors were cognitive, not emotional. They misinterpreted data. They gave full attention to confirmatory data, but were unaware of or oblivious to disconfirmatory data. They sometimes were not aware that the way in which they were selecting data made it impossible for contrary data to have a chance to occur. They were adept at interpreting data favorably when either the goal or the data itself was ambiguous or vague. They were sometimes brilliant in arguing away inconsistent data with ad hoc hypotheses. Yet, had they taken the time to design a clear test with proper controls, they could have saved themselves a great deal of money and embarrassment. The defenders of the [DKL LifeGuard](#) and the many defenders of perpetual motion machines and [free energy](#) devices are not necessarily driven by the *desire to believe* in their magical devices. They may simply be the victims of quite ordinary cognitive obstacles to critical thinking. Likewise for all those nurses who believe in [therapeutic touch](#) and those defenders of [facilitated communication](#), [ESP](#), [astrology](#), [biorhythms](#), [crystal power](#), [dowsing](#), and a host of other notions that seem to have been clearly refuted by the scientific evidence. In short, self-deception is not necessarily a weakness of will, but may be a matter of cognitive ignorance, laziness, or incompetence.

On the other hand, self-deception may not always be a flaw and may even be

beneficial at times. If we were too brutally honest and objective about our own abilities and about life in general, we might become debilitated by depression.

the Forer effect (a.k.a. the *P.T. Barnum effect* and *subjective validation*)

"We have something for everyone." --P.T. Barnum

The Forer or Barnum effect is also known as the *subjective validation effect* or the *personal validation effect*. (The expression, "the Barnum effect," seems to have originated with psychologist Paul Meehl, in deference to circus man P.T. Barnum's reputation as a master psychological manipulator.)

Psychologist B.R. Forer found that people tend to accept vague and general personality descriptions as uniquely applicable to themselves without realizing that the same description could be applied to just about anyone. Consider the following as if it were given to you as an evaluation of your personality.

You have a need for other people to like and admire you, and yet you tend to be critical of yourself. While you have some personality weaknesses you are generally able to compensate for them. You have considerable unused capacity that you have not turned to your advantage. Disciplined and self-controlled on the outside, you tend to be worrisome and insecure on the inside. At times you have serious doubts as to whether you have made the right decision or done the right thing. You prefer a certain amount of change and variety and become dissatisfied when hemmed in by restrictions and limitations. You also pride yourself as an independent thinker; and do not accept others' statements without satisfactory proof. But you have found it unwise to be too frank in revealing yourself to others. At times you are extroverted, affable, and sociable, while at other times you are introverted, wary, and reserved. Some of your aspirations tend to be rather unrealistic.

Forer gave a personality test to his students, ignored their answers, and gave each student the above evaluation. He asked them to evaluate the evaluation from 0 to 5, with "5" meaning the recipient felt the evaluation was an "excellent" assessment and "4" meaning the assessment was "good." The class average evaluation was 4.26. That was in 1948. The test has been repeated hundreds of times with psychology students and the average is still around 4.2.

In short, Forer convinced people he could successfully read their character. His accuracy amazed his subjects, though his personality analysis was taken from a newsstand astrology column and was presented to people without regard to their sun sign. The Forer effect seems to explain, in part at least, why so many people think that [pseudosciences](#) "work". [Astrology](#), [astrotherapy](#), [biorhythms](#), [cartomancy](#), [chiromancy](#), [the enneagram](#), [fortune telling](#), [graphology](#), etc., seem to work because they seem to provide accurate personality analyses. Scientific studies of these pseudosciences demonstrate that they are not valid personality assessment tools, yet each has many satisfied customers who are convinced they are accurate.

The most common explanations given to account for the Forer effect are in terms of hope, wishful thinking, vanity and the tendency to try to make sense out of experience, though Forer's own explanation was in terms of human gullibility. People tend to accept claims about themselves in proportion to their *desire* that the claims be true rather than in proportion to the empirical accuracy of the claims as measured by some non-subjective standard. We tend to accept questionable, even false statements about ourselves, if we deem them positive or flattering enough. We will often give very liberal interpretations to vague or inconsistent claims about ourselves in order to make sense out of the claims. Subjects who seek counseling from psychics, mediums, fortune tellers, mind readers, graphologists, etc., will often *ignore* false or questionable claims and, in many cases, by their own words or actions, will provide most of the information they erroneously attribute to a pseudoscientific counselor. Many such subjects often feel their counselors have provided them with profound and personal information. Such subjective validation, however, is of little scientific value.

Psychologist Barry Beyerstein believes that "hope and uncertainty evoke powerful psychological processes that keep all occult and pseudoscientific character readers in business." We are constantly trying "to make sense out of the barrage of disconnected information we face daily" and "we become so good at filling in to make a reasonable scenario out of disjointed input that we sometimes make sense out of nonsense." We will often fill in the blanks and provide a coherent picture of what we hear and see, even though a careful examination of the evidence would reveal that the data is vague, confusing, obscure, inconsistent and even unintelligible. Psychic mediums, for example, will often ask so many disconnected and ambiguous questions in rapid succession that they give the impression of having access to personal knowledge about their subjects. In fact, the psychic need not have any insights into the subject's personal life; for, the subject will willingly and unknowingly provide all the associations and validations needed. Psychics are aided in this process by using [cold reading](#) techniques.

David Marks and Richard Kamman argue that

once a belief or expectation is found, especially

one that resolves uncomfortable uncertainty, it biases the observer to notice new information that confirms the belief, and to discount evidence to the contrary. This self-perpetuating mechanism consolidates the original error and builds up an overconfidence in which the arguments of opponents are seen as too fragmentary to undo the adopted belief.

Having a pseudoscientific counselor go over a character assessment with a client is wrought with snares that can easily lead the most well intentioned of persons into error and delusion.

Barry Beyerstein suggests the following test to determine whether the apparent validity of the pseudosciences mentioned above might not be due to the Forer effect, [confirmation bias](#), or other psychological factors. (Note: the proposed test also uses subjective or personal validation and is not intended to test the accuracy of any personality assessment tool, but rather is intended to counteract the tendency to self-deception about such matters.)

...a proper test would first have readings done for a large number of clients and then remove the names from the profiles (coding them so they could later be matched to their rightful owners). After all clients had read all of the anonymous personality sketches, each would be asked to pick the one that described him or her best. If the reader has actually included enough uniquely pertinent material, members of the group, on average, should be able to exceed chance in choosing their own from the pile.

Beyerstein notes that "no occult or pseudoscientific character reading method...has successfully passed such a test."

The Forer effect, however, only partially explains why so many people accept as accurate occult and pseudoscientific character assessment procedures. [Cold reading](#), [communal reinforcement](#), and [selective thinking](#) also underlie these delusions. Also, it should be admitted that while many of the assessment claims in a pseudoscientific reading are vague and general, some are specific. Some of those that are specific actually apply to large numbers of people and some, by chance, will be accurate descriptions of a select few. A certain number of specific assessment claims should be expected by chance.

There have been numerous studies done on the Forer effect. Dickson and Kelly have examined many of these studies and concluded that overall there is

significant support for the general claim that Forer profiles are generally perceived to be accurate by subjects in the studies. Furthermore, there is an increased acceptance of the profile if it is labeled "for you". Favorable assessments are "more readily accepted as accurate descriptions of subjects' personalities than unfavorable" ones. But unfavorable claims are "more readily accepted when delivered by people with high perceived status than low perceived status." It has also been found that subjects can generally distinguish between statements that are accurate (but would be so for large numbers of people) and those that are unique (accurate for them but not applicable to most people). There is also some evidence that personality variables such as *neuroticism*, *need for approval*, and *authoritarianism* are positively related to belief in Forer-like profiles. Unfortunately, most Forer studies have been done only on college students.

testimonial evidence

Testimonials and vivid anecdotes are one of the most popular and convincing forms of "evidence" presented for beliefs in the transcendent, paranormal and pseudoscientific. Nevertheless, testimonials and anecdotes in such matters are of near zero value in establishing the probability of the claims they are put forth to support. A sincere and vivid account of one's encounter with an angel, an alien, a ghost, a Bigfoot; or purple auras around dying patients, a miraculous dowser, a levitating guru, or a psychic surgeon, is of little empirical value in establishing the reasonableness of believing in such matters. Such accounts are inherently unreliable and biased. They are of no more value than the televised accounts of satisfied customers of the latest weight loss program.

The testimonial of "personal experience" in paranormal or supernatural matters has no scientific value. If others cannot experience the same thing under the same conditions, then there will be no way to verify the experience. If there is no way to test the claims made, then there will be no way to tell if the experience was a delusion or was interpreted correctly. If others can experience the same thing, then it is possible to make a test of the testimonial and determine whether the claim based on it is worthy of belief.

The reason the testimonials regarding paranormal experiences are scientifically worthless is because in such matters [selective thinking](#) and [self-deception](#) must be controlled for. Most [psychics](#) do not even realize that they need to do a [controlled test](#) of their powers to rule out the possibility that they are deceiving themselves. They are satisfied with their experience as a psychic. Controlled tests of psychics will prove once and for all that they are not being selective in their evidence gathering, i.e., counting only the apparent successes and conveniently ignoring or underplaying the misses. Controlled tests can also determine if other factors, such as cheating, might be involved. Thus, in and of themselves, the testimonials of psychics are scientifically worthless.

If such testimonials are scientifically worthless, why are they so popular and why are they so convincing? There are several reasons. Testimonials are often very vivid and detailed, making them appear very believable. They are often made by enthusiastic people, who seem trustworthy and honest, with no apparent reason for wanting to deceive us. They are often made by people with some semblance of authority, such as a Ph.D. in psychology or physics. They are also often given soon after the treatment, before the real effect, if any, occurs. They thus measure a change in *mood* rather than a change in physical condition. Finally, testimonials are believable because people *want* to believe them. Nevertheless, testimonials which are of untestable claims are

worthless on their face. And testimonials of testable claims are often worthless until tested.

For example, someone posted a story on the WWW at <http://www2.corenet.net:80/numer/healing.html> (the link is now dead, as is, I suspect, the patient in the story) called "Cancer Treatment by [TT](#)." It is the story of the author's uncle who had cancer and was told by his doctor that the two months of radiation therapy he had been getting had done no good. Nine months earlier the man was told he had two months to live. According to the nephew, he is now "alive and well" because a spiritual healer treated his cancer with TT. The author described how TT works.

The healer directs his energy to the patient's body without touching it wave by wave. In our case he would place his hands over my uncle's chest and then move them in a slow motion around his lungs for about 30 minutes.

It is obvious the doctor was wrong in his prediction of how long his patient had to live. Predicting how long a cancer patient will live is a fallible business. Maybe this error will teach the doctor not to be so cocksure in his predictions in the future. Or maybe the uncle and his nephew misunderstood the doctor, who may have stated his prediction in a qualified way, such as, "my best guess is..." or "based on similar cases I have had, I would estimate...." It is also possible that the doctor was wrong about the effectiveness of the radiation therapy and that it had worked better than he or she thought. It is possible that the cancer went into spontaneous remission. It is possible that the uncle was misdiagnosed and mistreated and he is alive only because his doctors had given him up for dead. It is possible the author is lying. It is also possible that TT worked in this case. But what seems more probable? All we know for sure--assuming the basic facts are true--is that the man lived longer than a doctor predicted and that both radiation therapy and TT were administered. The evidence is not strong enough to justify believing that either the radiation therapy or the TT were significant causal factors in the patient's living seven months beyond a prediction. Controlled studies, not anecdotes, are needed to determine whether TT truly is a significant causal factor in cancer treatment.

Finally, it should be noted that testimonials are often used in many areas of life, including medical science by physicians in treating patients, and that giving due consideration to such testimonials is considered wise not foolish. A physician will use the testimonies of his or her patients to draw conclusions about certain medications or procedures. For example, a physician will take anecdotal evidence from a patient about a reaction to a new medication and use that information in deciding to adjust the prescribed dosage or to change the medication. This is quite reasonable. But the physician cannot be selective in listening to testimony, listening only to those claims which fit his or her own prejudices. To do so is to risk harming one's patients. Nor should the

average person be selective when listening to testimonials of some paranormal or occult experience.

wishful thinking

Wishful thinking is interpreting facts, reports, events, perceptions, etc., according to what one would like to be the case rather than according to the actual evidence. If it is done intentionally and without regard for the truth, it is called misinterpretation, falsification, dissembling, disingenuous, or perversion of the truth.

ad hoc hypothesis

20 Sep 1996

As a skeptic I was delighted to find your dictionary on the net. Just as I was about to conclude that the net is full of useless crap. (I'm a neophyte and I persevere. Obviously there is a great deal of useful information and entertainment here.) I think I understand that you are often playing the devil's advocate. Some of the items you debunk do not necessarily deserve the offhand dismissal you tend to dish out. Chiropractic for example does seem to have some validity, but not the all pervasiveness that some exponents would argue.

Anyhow, re your article on ad hoc hypothesis: When you, for example, posit that in cases of hands on healing, chiropractic etc. that the subject may have improved without any intervention at all, are you not indulging yourself in a little ad hoc hypothesis? Perhaps this is called fighting fire with fire. I suppose this only points out how difficult it is to counter assumptions that start from a premise that cannot be tested empirically.

Doug Harper

reply: Well, let's say I thought I caught you stealing a watch from a shop. You say you didn't steal it. I ask you to empty your pockets. You agree and pull out a watch. I say, "Aha, I was right. You stole the watch." You reply that you did not steal the watch, but you admit that it was not in your pocket when we went into the store. I ask you to explain how the watch got in your pocket and you say that you used telekinesis: you used your thoughts to transport the watch out of a glass case into your pocket. I ask you to repeat the act with another watch and you say "ok." But try as you will, you can't make a watch magically appear in your pocket. You say that there is too much pressure on you to perform and there are too many bad vibes in the air for you to work your powers. You've offered an ad hoc hypothesis to explain away what looks like a good refutation of your hypothesis. I have not offered an ad hoc hypothesis about anything. I don't call this fighting fire with fire, but fighting the implausible with the probable. Accepting a simpler and more plausible explanation in terms consistent with universal human experience, rather than a farfetched explanation requiring belief in occult, supernatural or paranormal forces, is called applying [Occam's razor](#). It differs considerably from ad hoc hypothesizing.

Afrocentrism

Afrocentrism is a mythology that is racist, reactionary, and essentially therapeutic. It suggests that nothing important has happened in black history since the time of the pharaohs and thus trivializes the history of black Americans. Afrocentrism places an emphasis on Egypt that is, to put it bluntly, absurd. --Clarence E. Walker*

Afrocentrism is a [pseudohistorical](#) political movement that erroneously claims that African-Americans should trace their roots back to ancient Egypt because it was dominated by a race of black Africans. Some of Afrocentrism's other claims are: the ancient Greeks stole their main cultural achievements from black Egyptians; Jesus, Socrates and Cleopatra, among others, were black; and Jews created the slave trade of black Africans.

The main purpose of Afrocentrism is to encourage black nationalism and ethnic pride as a psychological weapon against the destructive and debilitating effects of universal racism.

Some of Afrocentrism's leading proponents are Professor Molefi Kete Asante of Temple University; Professor Leonard Jeffries of City University of New York; and Martin Bernal, author of *Black Athena*.

One of the more important Afrocentric texts is the pseudo-historical *Stolen Legacy* (1954) by George G. M. James. Mr. James claims, among other things, that Greek philosophy and the mystery religions of Greece and Rome were stolen from Egypt; that the ancient Greeks did not have the native ability to develop philosophy; and that the Egyptians from whom the Greeks stole their philosophy were black Africans. Many of James' ideas were taken from Marcus Garvey (1887-1940), who thought that white accomplishment is due to teaching children they are superior. If blacks are to succeed, he said, they would have to teach their children that they are superior.

James's principal sources were Masonic, especially *The Ancient Mysteries and Modern Masonry* (1909) by the Rev. Charles H. Vail. The Masons in turn derived their misconceptions about Egyptian mystery and initiation rites from the eighteenth century work of fiction *Sethos, a History or Biography, based on Unpublished Memoirs of Ancient Egypt* (1731) by the Abbe Jean Terrasson (1670-1750), a professor of Greek. Terrasson had no access to Egyptian sources and he would be long dead before Egyptian hieroglyphics could be deciphered. But Terrasson knew the Greek and Latin writers well. So he constructed an imaginary Egyptian religion based upon sources which described Greek and Latin rites as if they were Egyptian (Lefkowitz). Hence,

one of the main sources for Afrocentric Egyptology turns out to be Greece and Rome. The Greeks would have called this *irony*. I don't know what Afrocentrists call it.

James's pseudo-history is the basis for other Afrocentric pseudo-histories such as *Africa, Mother of Western Civilization* by Yosef A.A. ben-Jochannnan, one of James's students, and *Civilization or Barbarism* by Cheikh Anta Diop of Senegal.

Afrocentrism is being taught in many universities and colleges, and is the basis of an entire [curriculum for children in two Milwaukee schools](#).

pseudohistory

Pseudohistory is purported history which

- treats myths, legends, sagas and similar literature as literal truth
- is neither critical nor skeptical in its reading of ancient historians, taking their claims at face value and ignoring empirical or logical evidence contrary to the claims of the ancients
- is on a mission, not a quest, seeking to support some contemporary political or religious agenda rather than find out the truth, the whole truth and nothing but the truth about the past
- often denies that there is such a thing as historical truth, clinging to the extreme skeptical notion that only what is absolutely certain can be called 'true' and nothing is absolutely certain, so nothing is true
- often maintains that history is nothing but mythmaking and that different histories are not to be compared on such traditional academic standards as accuracy, empirical probability, logical consistency, relevancy, completeness, fairness, honesty, etc., but on moral or political grounds
- is selective in its use of ancient documents, citing favorably those that fit with its agenda, and ignoring or interpreting away those documents which don't fit
- considers the *possibility* of something being true as sufficient to believe it is true if it fits with one's agenda
- often maintains that there is a conspiracy to suppress its claims because of racism, atheism or ethnocentrism, or because of opposition to its political or religious agenda

Examples of pseudohistory include [Afrocentrism](#), [creationism](#), [holocaust revisionism](#) and the catastrophism of Immanuel [Velikovsky](#).

Pseudohistory should be distinguished from the ancient texts it is based on. The sagas, legends, myths and histories which have been passed on orally or in written documents by ancient peoples are sometimes called pseudohistory. Some of it is pseudohistory, some of it is flawed history and some of it isn't history at all.

Pseudohistory should also be distinguished from historical fiction and fantasy. Books such as Terence Flanagan's *The Year of the French*, *The Tenants of Time* and *The End of the Hunt* are not pseudohistories but works of fiction in a historical setting. Despite the fact that historical fiction is often historically accurate, it is not history. Anyone who cites a work of historical fiction as if it were a history text is a practicing pseudohistorian. I suppose one should also refer to writers such as the Abbe Jean Terrason (1670-175?) as

pseudohistorians. These are writers of historical fiction who intentionally falsify and invent ancient history, as Terrason did in his *Sethos, a History or Biography, based on Unpublished Memoirs of Ancient Egypt*. This technique of claiming to find an ancient document and publishing it in order to express one's own ideas is still used, e.g., [The Celestine Prophecy](#). A variation on this theme is to claim that one is [channeling](#) a book from some ancient being, e.g., [The Urantia Book](#) and [Bringers of the Dawn](#).

pseudohistory at the movies

Films seem to present a special challenge for some people; for, they argue endlessly about the duty of filmmakers to be historically accurate. Is Oliver Stone's *JFK* fiction, fantasy, myth, pseudohistory or what? The film invents fictional characters and events to enhance the story and Stone's personal views, some of which are improbable or known to be false. Unless a film claims to be a documentary, it is fiction or fantasy no matter how accurate or realistic it is. Film makers have no more duty to be historians than do novelists. Anyone who would cite films such as *JFK* or *Michael Collins* as if they were historical documents is a pseudohistorian. Rather than demand that filmmakers be responsible historians or citizens, we should demand that filmgoers be critical thinkers. Being "based on a true story" is not a sufficient condition for being non-fiction. Likewise, the *X-Files* and similar television programs, which may be realistic and or even claim to be based on a true story, are not non-fiction. To site such fantasy programs as evidence for claims about supernatural or paranormal events is to engage in the type of pseudoresearch practiced by pseudohistorians.

Afrocentrism

22 Apr 2000

While examining your site, I came across the entries on Afrocentrism. While some of the claims made by Afrocentrists are demonstrably false, the ancient Egyptians were dark skinned Africans, as the Arabs didn't arrive until the 7th century.

Documentation follows.

First, are several quotes from Compton's encyclopedia, obtained by searches for "Hamite"

"Most Egyptians are Hamitic Arabs. They are descendants of the Hamites of ancient Egypt and of the Arabs who migrated to Egypt after the Muslim conquests of the 7th century. The Nubians, who are related to the Berber tribes of North Africa, are located south of Aswan. They were resettled in new villages near Kom Ombo when Lake Nasser flooded their homeland. A few Europeans, primarily Armenians and Greeks, live in cities. Most are in Alexandria. "

"Ham, son of Noah; biblical ancestor of Hamites, who included the Cushites, the Phoenicians, and the Egyptians (Bible, Gen. vi, ix). "

"Kush (or Cush), the ancient name for a region of what is now part of the Sudan, in Africa, and for two powerful kingdoms that extended their influence into Egypt; first kingdom of Kush raided Upper Egypt in about 1650 BC; destroyed by Egyptian Pharaoh Amenhotep; new kingdom appeared about 750 BC; conquered all Egypt about 715 BC and founded 25th dynasty of ancient Egypt, with capital at Memphis; driven out by Assyrians under Ashurbanipal in 663 BC; Egypt destroyed the Cushite capital in 590 BC, but the kingdom survived another 900 years."

"Cushite (716-656 BC), 25th dynasty of Egypt, founded by Shabaka "

"Sudan is the Arab word for "land of the blacks," but only the southern part of the country is heavily populated by black Africans. Of a total population of nearly 30 million in the mid-1990s, more than half were Arabic-speaking adherents of the Sunnah branch of the Islam living in the north and central areas. Most black Africans living in the south are Christians or animists. Some non-Arab groups in the north have converted to Islam. Among these tribes are the Nubians, who live along the Nile; the Beja of the Red Sea Hills; and the Fur, who are settled farmers living in the Jebel Marra region in the far west."

[Afrocentrism](#)

Other information follows from a usenet discussion I was involved in at alt.fan.cecil-adams.

I wrote this: "Yeah, this looks like a white person.

<http://mcclungmuseum.utk.edu/pernex/egypt/eg-mumc1.jpg> And this Ba Bird does, too, huh?

<http://mcclungmuseum.utk.edu/pernex/egypt/eg-mumc1.jpg> Not to mention the skin color of these guys:

<http://mcclungmuseum.utk.edu/pernex/egypt/egb-text.htm> This is a picture of AMENOPHIS.

<http://www.tourism.egnet.net/culture/images/3g159.jpg> He looks uncannily like Elden Campbell, don't he?

<http://cbs.sportsline.com/u/reuters/bldphoto.cgi?CHC101041221>

<http://www.tourism.egnet.net/culture/images/11g129.jpg> shows Hatsephut. Looks like Eartha Kitt, doesn't she?

<http://www.tourism.egnet.net/culture/images/22g87.jpg> is Sesostris I. Looks like Patrick Ewing with a beard.

<http://cbs.sportsline.com/u/reuters/bldphoto.cgi?XMSG105041821>"

And some other guy wrote this: iknowso@my-deja.com

Not only were Ancient Egyptians not Arabs, they were not related (linguistically, culturally, phenotypically or religiously) to any of the western Asiatic peoples. Their roots were in Africa. They traced their origins (Papyrus of Henefu) to the Mountains of the Moon which is at the source of the White Nile in Uganda. Their legends always referred to the land south of them as Ta-Meri (land of the ancestors/fathers).

All ancient travelers to Egypt who bothered to describe the local inhabitants, described them, without exception, as having black or dark skin and wooly hair. Here are a few quotes from ancient Greeks and Romans:

1.) Danaos (describing the Aegyptiads): 'I can see the crew with their black limbs and white tunics.' (Aeschylus, *The Suppliants*, vv. 719- 20, 745)

2.) "Aegyptos conquered the country of the black-footed ones and called it Egypt after himself" (Apollodorus, *Book II*, paras 3 and 4)

3.) Lycinus (describing an Egyptian): 'this boy is not merely black; he has thick lips and his legs are too thin...his hair worn in a plait shows that he is not a freeman.' (Lucian, *Navigations*, paras 2-3)

4.) "Those who are too black are cowards, like for instance, the Egyptians and Ethiopians. But those who are excessively white are also cowards as we can see from the example of women, the complexion of courage is between the two." (?) (Aristotle, *Physiognomy*, 6)

Some have suggested that the paintings on the walls of the temples and tombs prove that AE's weren't "black". It's understandable why this statement is made when one peruses a book written by an American or European. It almost seems as if a conscious effort is made to select the most Caucasian looking sculptures and paintings. However, one gets a different impression of the people of AE when they actually go to Egypt and witness the many artifacts for themselves. Here are a few of the pictures that you never see in western books:

and here, on the left, is a picture of the mummy of Masharta, son of Pinedjem I of Dynasty XXI:

<http://www.geocities.com/Athens/Olympus/8192/Hamitic.jpg>

I don't believe the AE's were a completely homogeneous culture all throughout their 2500 yr. long history of successive dynasties. However, in the face of all the evidence, many scholars are beginning to realize that AE was a fundamentally African civilization that encompassed the full range of physical characteristics present in Ethiopia, Eritrea, Somalia and all throughout the Nile Valley.

Please make the appropriate corrections to your cite.

**Thank you, and good day,
George Haley**

reply: Right. Well, the entry on Afrocentrism doesn't claim that the ancient Egyptians were a pure Semitic race with no contact with the rest of Africa, including trading, intermarriage, interbreeding, slavery, etc. What is claimed is that the ancient Egyptians were not a black African race of people and the rest of European civilization did not steal their culture from this alleged black African race. Both points seem consistent with what you and your scholarly colleagues have written.

In any case, we're all one race. I pity both the modern Greek and the modern African-American if their main source of pride comes from what some dead relatives did thousands of years ago.

31 Mar 2000

Living in the central New York region, I am essentially limited in the media outlets that are available. Syracuse, New York has two newspapers the Post Standard and the Herald Journal although both papers are basically part of the same larger entity.

Anyway the reason that I am composing this email is in regard to one of the topics that was listed in the skeptics dictionary. That topic is Afrocentrism. It was interesting to me that the dictionary had listed this pseudoscience (what it truly is) and equally compelling in light of the fact that approximately one month ago the aforementioned newspapers devoted an entire week to an editorial series which espoused these odd theories and twisted history. Without offering divergent viewpoints or listing any genuine historical references the series gave credence to the ideas that the European civilizations of Greece and Rome had taken and used accumulated knowledge in all academic fields from the Egyptians.

While it is true that the Egyptian civilization made many contributions to the world progress, the editorial provided no context for such contributions and did not highlight exactly what the contributions specifically were, in comparison to those made by the Greeks, Romans and others. It is especially interesting to note that the title of the series was "Stolen Legacy", and the work relied heavily upon pseudo scientific writer Martin Bernal. [Mary Lefkowitz](#) or others with opposing viewpoints were entirely absent in the piece.

The editorial sections of newspapers are vehicles for the free expression of ideas, but when the editorial staff of a paper begins printing highly questionable stories, without regard to reference, opposing viewpoints, traditional historical methods,

and instead gives us George James as a voice of truth, worthy of the press, I submit that we have disaster in the making. As a student of Roman history, beginning with the Etruscans and continuing to the fall of Romulus Augustulus, the Barbarian invasions, the Eastern empire, and the crowning of Charlemagne, I couldn't believe that a professional media organization would print such nonsense.

Well, maybe it was really the long ago relatives of Mr. Bernal that measured the height of the great pyramids. Thales probably ripped them off and a lawsuit is in the making.

Edna Supley

reply: Nothing the mass media present should surprise anymore.

14 Jul 1999

This is another example of white racism trying to discredit any potential successes or positivity from black people past or present. We don't even have to go back as far as Egypt. No history books mention the fact that a black man performed the first open heart surgery in the United States, or that a black man performed [sic] the traffic light, or the walkie talkie, or that a black man invented the light bulb itself used by Edison, or who the statue of liberty really is. White America is not ready for the truth, black people are not trying to take over the schools with Afrocentric teachings but inform students of the great accomplishments of the past of people of color as well as everyone else. Speaking of Egypt, the first 5 dynasties were 100% African in origin, much like the first 5 generations of slaves brought to the United States were. (The anonymous writer recommends [THE AFRICAN PRESENCE IN THE ANCIENT FAR EAST By RUNOKO RASHIDI](#). Rashidi identifies anything "black" with African, including the "black blood" of a true samurai.)

reply: Nothing positive is gained that isn't outweighed by the negative when we reconstruct history to our political wishes.

3 Dec 1996

Everybody knows that Cleopatra wasn't black--she was from Mars.

*Keep up the good work,
Aaron Ramson White*

10 Dec 1996

I realize that this is the skeptic's dictionary and all, meaning it is a dictionary for people who are skeptical about various topics, beliefs, etc. However I have a

comment on the tone of your entry on Afrocentrism. You are saying in essence that the belief that the inhabitants of ancient Egypt were black is unfounded and therefore untrue. However no one has proved that the inhabitants of Ancient Egypt were not black either. I am not saying that they were nor am I saying that they weren't. See, it can go both ways. It can be noted though that they definitely weren't of White or European descent. They were definitely people of color as is proved by Ancient Egyptian art which depicts people are a darker skin tone.

Lynne

reply: The Egyptians of 5,000 years ago were probably similar in skin tone to modern Egyptians, as today's Ethiopians are probably similar in skin tone to their ancestors. Egyptians and Ethiopians are quite distinct in skin color; you are quite right: neither is white or European. Neither ancient Egyptians nor Ethiopians apparently made as much fuss about skin color as we do, except within their own societies. In Egyptian painted sculpture, for example, males are depicted as dark, and females as light. We probably make much more of this fact than the ancient Egyptians did.

The claim that "no one has proved that the inhabitants of Ancient Egypt were not black" is curious. If by 'prove' you mean demonstrate with absolute certainty, then that is true but trivial: no empirical claim can be proved with absolute certainty. On the other hand, if by 'prove' you mean, demonstrate to a high degree of probability, then you are also right but that is because it has not needed any proof, any more than say, one needs to prove that the modern Japanese are not black. I think it is unfortunate that because of the claims of Afrocentrists, historians such as Mary Lefkowitz have been diverted to the task of providing arguments in support of the claim that the ancient Egyptians were not black.

16 Jun 1997

Dear Prof. Carroll,

While we are not in disagreement on the nature of Afrocentrism as an ahistorical creation of a usable past applied to present ends, the subject matter and its treatment by the American public do merit further questioning in the eyes of this sceptic. Some questions I have asked myself are:

1. the fundamental epistemological problem of objectivity and subjectivity as applied to history. Does not (white) American and any other history give ample evidence of the fact that history is not an object but a function of societies legitimizing their values and actions, creating traditions and identity? One example: the image of Native Americans created by whites has consistently served to justify their killing, removal, the systematic destruction of their culture, appropriation of their land - today distorted "noble savages" carry eco-

commercials. Only very recently has historical science even attempted to correct these images.

reply: bad historical work should be rejected not imitated. The standards to which historians today adhere are significantly higher than those of the past, excluding, of course, the propaganda and pap which is published as history for our children in their text books. Such stuff is no more real history than the texts which exclude mention of evolution are examples of real science. As for "noble savages" and eco-commercials....well, all I can say is you should see the ads which try to associate Indian casinos and gambling with the welfare of tribal nations. Again, these efforts at reconstruction and propaganda should not be imitated.

2. Is not the knee-jerk like panic reaction of whites towards Afrocentrism an indication of their need to preserve their own cherished myths?

reply: the reaction is neither knee-jerk nor a matter of self-preservation, but an honest concern for the truth. I don't see the concern as one regarding which tribal myths should dominate.

3. Would it not be more important to discover why Afrocentrism is gaining currency among blacks -and some whites - instead of just lambasting it for its inaccuracy? That might be a chance to enter into dialogue.

reply: before seeking explanations one must first establish that there is something which needs explaining. The critics of Afrocentrism have established that there is something which needs explaining. Now we can move on either to the question of why Afrocentrism is so popular or we can ask another question: are history departments going to continue to tolerate Afrocentrism or are they going to hold the Afrocentrists to the same standards as other faculty? I think the former question is one for sociologists to ponder; the latter is one all history departments must face. They're both important questions.

Scepticism is a good thing when universal, which means being particularly sceptical about one's own constructions of reality (Sorry for sounding so postmodern). Otherwise it degenerates into just another ideology.

I guess I am suggesting that you add an entry on perhaps not just Eurocentrism but ethnocentrism in general, even if this goes beyond the basic intention of the dictionary. Or perhaps I'm asking for a theoretical discussion on why it is that people believe things in the way they do.

Thomas Clark

Institut for English and American Studies,
J.W. Goethe Universitdt,
Frankfurt, Germany

reply: You are right that such issues go beyond the scope of the *Skeptic's Dictionary*. Ethnocentrism is a topic I cover in *Becoming a Critical Thinker*. There I write that "If we cannot master our *egocentrism* and our *ethnocentrism*--the tendency to think that we and our culture are the standards of truth and reality--we will never become critical thinkers. Every society, however, promotes ethnocentrism and discourages the disputing of traditional beliefs and values. Thus, critical thinking is likely to be more rare than common, more difficult than easy to achieve."

How Afrocentrism Became an Excuse to Teach Myth as History

by Mary Lefkowitz

How Afrocentrism Became an Excuse to Teach Myth as History

by Mary Lefkowitz

New York: Basic Books, 1996

This is a book for teachers and scholars, written by a professor of classics at Wellesley College. I wish there were no need for such a book. It is to our national shame both that [Afrocentrism](#) has been allowed to flourish inside our schools, but outside the boundaries of the traditional standards of empirical research, and that there has been a need for Afrocentrism to develop in the first place.

Lefkowitz has defended the profession of teaching against those who would use the classroom as a pulpit for propaganda. And she has defended the standards of honesty and accuracy in the interpretation of history against the [pseudohistorians](#) who repress such values in favor of advancing political purposes. Watching her do this is like watching someone shoot fish in a barrel.

My overall emotional response to Lefkowitz's obliteration of the opponents of historical accuracy and honesty is not one of joy but of disgust and sadness. We have witnessed a similar debacle in the debates over creationism vs. evolution with scholars such as Stephen Jay Gould stripping away the veneer of argument from [creationists](#). Gould can hardly debate and argue with his opponents, for they have all but obliterated traditional standards of evidence and argument. So too with Lefkowitz and her opponents. They distort and twist facts and interpretations of facts at will. Many scholars have been afraid to take on the creationists when they have threatened science and scientific knowledge, methods and standards. Textbook authors still kowtow to religious fundamentalists and falsify science in text after text by ignoring evolution or treating it as "just a theory, like creationism." Likewise, few scholars have publicly stated their opposition to Afrocentrism. Lefkowitz stands out as a voice in the academic wilderness, defending traditional standards of inductive reasoning to the most probable conclusions. It is as if the voices of relativism, historicism and the fear of being labelled a "racist" have silenced the majority of scholars and teachers.

What is offensive about Afrocentrism is not that its advocates assert such

things as that Socrates and Cleopatra were black Africans or that Aristotle stole his ideas from the library at Alexandria when he visited Egypt. What is offensive is not that they claim that the ancient Greeks took everything they are known for from the Egyptians, and that those Egyptians were black Africans. What is offensive is that these claims are put forth as articles of faith. Any challenge to them is seen as racist. What is offensive is that these claims are not based on scholarly research, evidence and argument from evidence. Nor are they based on a sincere desire to discover historical truth. They are based on unsubstantiated opinions of mythmakers and fiction writers. They are based on the *possibility* they are true. They are based on a desire for them to be true. They are based on a preconceived notion that white scholars have conspired from time immemorial to repress the truth that everything good about Western civilization came out of black Africa. They are based on the desire to give African-American children self-esteem and pride.

How did this happen? How did Afrocentrism develop unchecked until now? My opinion is that racism made Afrocentrism necessary. That doesn't justify or excuse the excesses of Afrocentrism, but it makes it understandable. Martin Bernal's *Black Athena*, to take just one example, is a work of propaganda, but it is pleasing propaganda to some ears. It is a voice saying to a people that you are noble, you come from greatness, you are great, your children are great. It is a voice saying that racism may have belittled you and demeaned you in its attempts to make you feel inferior. But you are the one who is superior. The racists are the ones who are inferior.

The choice is flight or fight; the Afrocentrists have chosen to fight. Have scholars been fair, accurate and honest in their treatment of people of color? No. Most of the sins of traditional scholarship may have been sins of omission, but they were grievous nonetheless. Have respected historians falsified facts, twisted evidence, or jumped to grand conclusions on the basis of mere possibilities, in order to serve some political purpose? Yes. It does little good to protest that these are not admirable qualities and should be avoided. Why would Afrocentrists follow in the footsteps of historians whose ideas of fairness, accuracy, honesty and integrity have traditionally ignored or belittled Africa and the descendants of Africans on other continents?

Do these facts about historians justify Afrocentrism? Of course not. Nothing justifies a Louis Farrakan proclaiming to millions of people that Napoleon's soldiers defaced the Egyptian sphinx because he was offended by its negroid features. You do not elevate your race by proclaiming as true something for which there is no evidence. By spreading such falsehoods and myths as historical truth, you breed contempt for white and black people alike. Your black followers will accept your claim as one more piece of evidence of white hatred for blacks; and many whites will see you as one more black racist blaming whites for all the problems of all the people of your race.

The modern Afrocentrists are not the first to claim Egypt as the source of

Western civilization, though they're the first to claim that the ancient Egyptians were *black* Africans. Many ancient writers claimed Egypt as the source of Greek art, philosophy, science, etc. Lefkowitz names Herodotus, Strabo, Diadorus, Eudoxos, Aristobulus and others as tracing Greek cultural achievements to Egyptian sources. Most modern classicists are distrustful of these ancient accounts. Not only are many of their claims contradicted by evidence, but their methods of gathering data cast serious doubts upon the accuracy of the claims they make. Not to put too fine a point on it, these guys were sloppy and gullible to a fault. Modern classicists therefore do not take them at their word, but are cautious in evaluating their claims, attempting to check them against what is now known from later research. Modern Afrocentrists, on the other hand, commit two sins in the use of these ancient sources: they accept them uncritically and selectively. When the claims of these ancient writers fit their political agenda, they accept them at face value; when they don't, they ignore them.

Afrocentrists are not the only ones, however, to approach ancient stories and myths with an uncritical and selective eye. This approach is a favorite of the catastrophist pseudohistorian [Immanuel Velikovsky](#). In fact, the Afrocentrists, Velikovsky and the ancient writers they are fond of using as sources for their many questionable claims, share in common the trait of uncritical and non-skeptical thinking. They are all fond of etymologies and words that they think would sound alike in ancient languages. And they use trivial similarities in words or practices or stories as scientific evidence of the "truths" they espouse. All seem extremely erudite with their parallels, etymologies, homophones and scholarly citations from sources of various cultures. All seem more interested in telling a good story and satisfying some political, religious or philosophical goal, than they are in checking out their stories against *all* the evidence. But the modern Afrocentrist and catastrophist have in common two things that their ancient sources did not: they put forth their claims as articles of faith and they believe that there is a *conspiracy* to suppress their notions.

It is not an accident that the students of Afrocentrism and catastrophism act more like disciples of a guru than students of a scientific teacher. They are on a mission, not a quest. And, as with many before them with noble goals, they believe the end justifies the means. Hence, it is nearly futile to engage them in debate. Scholars have difficulty debating opponents such as Afrocentrists, catastrophists, creationists or even anti-abortionists, because they expect their opponents to be civil and play by the rules of scholarly evidence. They mistakenly believe they have entered an arena where all sides are in quest of the same truth. What they are actually getting into is a street fight, where the goal is to defeat and humiliate your enemy. Their opponents don't follow traditional standards of evidence in their printed arguments and diatribes, so why expect them to be any different in a public debate? If you challenge their accuracy, they will question your integrity. If you ask for evidence, they will insult you. If you challenge their sources, you will be asked to prove the absolute certainty of your sources. You think the arena is an intellectual one

where the combatants use wit and intelligence to score points, but while you are looking above your opponent's shoulders, he will kick you in the groin. You may have the evidence and the arguments on your side but your opponent doesn't care about the evidence and is not interested in your arguments. He already knows the truth.

Dr. Lefkowitz tried to debate Afrocentrism and seemed genuinely shaken that she wasn't treated like a scholar, that her opponents and their disciples are fond of poisoning the well and other ad hominem attacks and that they do not follow traditional scholarly standards of evidence. On a clip I saw of Lefkowitz debating Afrocentrists ("60 Minutes", Nov. 24, 1996), the African-American moderator asks her, "And how many times have *you* been to Africa, Professor Lefkowitz?" When she replies that she's never been to Africa, the moderator says triumphantly, "I thought so." The audience (I think it was Howard University, but I could be mistaken) indicated by its response that they, along with the moderator, believe that going to Africa is a necessary condition for speaking with authority on Afrocentrism. They also seemed to believe that being African-American and going to Egypt in itself gives one authority on Afrocentrism not available to whites.

Afrocentrists are already entrenched in our schools and universities. They are part of a growing, not diminishing, movement. Is there hope that the excesses of Afrocentrism might be overcome and the good that motivates its adherents will eventually drive Afrocentrists to a quest for historical truth? My view is that it will not be possible to curb the excesses and errors of Afrocentrism because its major proponents advocate an epistemology which rejects the notion that there is such a thing as "truth" or "accuracy" or "getting it right rather than wrong." White people have their truth and Afrocentrists have their truth. Fairness demands that each "truth" be heard. If this sounds vaguely familiar, that's because it is: the creationists have maintained a similar kind of notion with respect to "theories." Fairness demands that the theory of evolution and the theory of creationism should be taught to our children. Theories aren't absolutely certain, so they're epistemologically equal. Truths aren't absolutely certain or objective, so they're epistemologically equal. The errors behind these beliefs are distinct, however. The creationists do not recognize that theories of different kinds are not in competition with one another: metaphysical theories such as creationism do not compete with scientific theories such as evolution. Furthermore, they are wrong in assuming that some theories are not better than others. The history of science could supply them with plenty of examples of theories replacing other theories because they are superior to the ones they replace.

Afrocentrists, on the other hand, seem to believe that all truth is subjective. Truth is whatever you want it to be. Since historians interpret facts differently, there is no such thing as historical accuracy. Any interpretation is as good as any other, epistemologically speaking. Morally, some views are superior to others. It is just arrogance and racism which gives greater value to white theories than to Afrocentrist theories. Whites interpret the same data

differently from Afrocentrists because whites have a different agenda. Differences of opinion are not resolvable by scholarly argument over evidence, because all scholars are biased. To an Afrocentrist the fact that we do not know who Cleopatra's paternal grandmother was is sufficient evidence to justify believing that Cleopatra was a black African. The fact that she was a member of the Ptolemaic line, recognized by all as Macedonian, which for generations had practiced incestual marriages to keep the bloodline pure, is of little importance. It is politically important that young African-American children believe that they descend from Queens like Cleopatra.

One can admire Professor Lefkowitz for taking on this challenge, but I fear she has chosen an opponent she cannot fight with, much less defeat. If, however, some eminent African-American scholars enter the arena, not to kill the dragon but to tame it and direct it, she will have done much good not only for historical scholarship and academic integrity but for African-American scholarship and integrity as well.

The only complaint I have about the book is that it is very repetitious. Much of the text is based on essays previously published and little effort went into editing those essays so that the book would be more focused and streamlined. Also, there is a glitch in the introduction which states that the third chapter will deal with the issue of whether Greek philosophy was stolen from the Egyptians. That topic is also stated in the introduction to be the focus of chapter five, which it is. Chapter three, "Ancient Myths of Cultural Dependency," actually concerns a much broader topic: the way historians such as Herodotus, Diodorus, Strabo, Eudoxus and Aristobulus created the myth that the Greeks owed their entire culture to the Egyptians.

Chapter one describes how the author became involved in the debunking of Afrocentrism. At a lecture at Wellesley given by Dr. Yosef A.A. ben-Jochannan, introduced as "a distinguished Egyptologist," she asked him what his evidence was for his claim that Aristotle had robbed the library at Alexandria and stolen his ideas from black Egyptians, when that library had not been built until after Aristotle's death. The Egyptologist said he resented the tone of her inquiry; several students called her a racist for asking such a question; and colleagues indicated that they were indifferent to the matter.

Chapter two is called "Myths of African Origins," and focuses on the myth that Egyptians invaded Greece during the second millennium B.C., a claim made in *Civilization or Barbarism* (1981) by the Senegalese scholar Cheikh Anta Diop. The main source for Diop's claim is Diodorus of Sicily, who wrote in the first century B.C. Professor Lefkowitz is not the first scholar to question the reliability and accuracy of Diodorus. Diop's other sources are quickly disposed of by Lefkowitz and she moves on to Martin Bernal's *Black Athena*, who also treats myths and stories as history. She engages Bernal on his use of philological evidence and questions his etymologies and assumed homophones and misunderstood homographs of various Egyptian and Greek words. She also mentions that many of the basic claims of Afrocentrism

originate in France in the eighteenth century, but that will be the subject matter for chapter four. In chapter two, she focuses on the notion that Socrates and Cleopatra were black Africans.

The main evidence for the claim that Socrates was black seems to be (a) he could have been black, (b) he is compared to a silenus by Plato, and the features of the silenus were associated with Ethiopians by the Greeks, and (c) there is a conspiracy to suppress the truth about black supremacy.

Chapter four is called "The Myth of the Egyptian Mystery System." Here the author shows the origin for the myth that an ancient Egyptian mystery religion was the source of Greek and Roman mystery religions. The idea was given its Afrocentrist push by George G.M. James in *Stolen Legacy* (1954). James's principal sources were Masonic, especially *The Ancient Mysteries and Modern Masonry* (1909) by the Rev. Charles H. Vail. The Masons in turn derived their misconceptions about Egyptian mystery and initiation rites from the eighteenth century work of fiction *Sethos, a History or Biography, based on Unpublished Memoirs of Ancient Egypt* (1731) by the Abbe Jean Terrason, a professor of Greek. Terrason had no access to Egyptian sources and he would be long dead before Egyptian hieroglyphics could be deciphered. But Terrason knew the Greek and Latin writers well. So he constructed an imaginary Egyptian religion based upon sources which described Greek and Latin rites as if they were Egyptian. Hence, one of the main sources for Afrocentric Egyptology turns out actually to be Greece and Rome. Thus, many of the claims that the modern world owes its origins to black Egyptians rather than to Greeks and Romans, turn out to mean that we owe a debt to Greece and Rome. The Greeks would have called this *irony*. I don't know what Afrocentrists call it.

Chapter five is devoted to James's *Stolen Legacy*, which Lefkowitz calls "perhaps the most influential Afrocentrist text." Terrason and Herodotus are fingered as the main sources for "The Myth of the Stolen Legacy." This chapter connects James to Frederick Douglass (1817-1895), Edward Wilmot Blyden (1832-1912) and Marcus Mosiah Garvey (1887-1940), men who are considered heroes by many African-Americans. Philosophy teachers will find this chapter especially interesting, since one of the main themes of *Stolen Legacy* is that Greek philosophy was *all* stolen from the Egyptians.

The sixth and concluding chapter takes on such issues as Should Afrocentrism be taught? And what will its longterm effects be? Is pseudohistory to be admitted into our curricula? Does historicism mean we must accept the notion of "many truths"? Are there no limits to academic freedom? She might well have asked for directions to the Records Department of the Ministry of Truth where

"all history was a palimpsest, scraped clean and reinscribed exactly as often as was necessary" (George Orwell, 1984).

[The Skeptic's Refuge](#)

SkepDic.com

agnosticism

Agnosticism is the position of believing that knowledge of the existence or non-existence of God is impossible. It is often put forth as a middle ground between [theism](#) and [atheism](#). Understood this way, agnosticism is [skepticism](#) regarding all things theological. The agnostic holds that human knowledge is limited to the natural world, that the mind is incapable of knowledge of the supernatural. Understood this way, an agnostic could also be a theist or an atheist. The former is called a *fideist*, one who believes in God purely on faith. The latter is sometimes accused by theists of having *faith in the non-existence of God*, but the accusation is absurd and the expression meaningless. The agnostic atheist simply finds no compelling reason to believe in God.

The term 'agnostic' was created by [T. H. Huxley](#) (1825-1895), who took his cue from [David Hume](#) and [Immanuel Kant](#). Huxley says that he invented the term to describe what he thought made him unique among his fellow thinkers:

They were quite sure that they had attained a certain "gnosis" -- had more or less successfully solved the problem of existence; while I was quite sure I had not, and had a pretty strong conviction that the problem was insoluble.

'Agnostic' came to mind, he says, because the term was "suggestively antithetic to the '[gnostic](#)' of Church history, who professed to know so much about the very things of which I was ignorant..." Huxley seems to have intended the term to mean that [metaphysics](#) is, more or less, bunk. In short, he seems to have agreed with Hume's conclusion at the end of *An Enquiry Concerning Human Understanding*:

When we run over libraries, persuaded of these principles, what havoc must we make? If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, Does it contain any abstract reasoning concerning quantity or number? No. Does it contain any experimental reasoning concerning matter of fact and existence? No. Commit it then to the flames: for it can contain nothing but sophistry and illusion.*

Kant's *Critique of Pure Reason* resolved some of the main epistemological issues raised by Hume, but at the expense of rejecting the possibility of knowing anything beyond appearances of phenomena. We can't know God but the *idea* of God is a practical necessity, according to [Kant](#).

atheism

Atheism is traditionally defined as *disbelief* in the existence of God. As such, atheism involves *active rejection* of belief in the existence of God.

However, since there are many concepts of God and these concepts are usually rooted in some culture or tradition, atheism might be defined as the belief that a particular word used to refer to a particular god is a word that has no reference. Thus, there are as many different kinds of atheism as there are names of gods.

Some atheists may know of many gods and reject belief in the existence of all of them. Such a person might be called a *polytheist*. But most people who consider themselves atheists probably mean that they do not believe in the existence of the local god. For example, most people who call themselves atheists in a culture where the Judeo-Christian-Islamic God (JCIG) dominates would mean, at the very least, that they deny that there is an Omnipotent and Omniscient Providential Personal Creator of the universe. On the other hand, people who believe in the JCIG would consider such denial tantamount to atheism. [Baruch de Spinoza](#) (1632-1677), for example, defined God as being identical to Nature and as a substance with infinite attributes. Many Jews and Christians considered him an atheist because he rejected both the traditional JCIG and the belief in personal immortality. [Thomas Hobbes](#) (1588-1679) was also considered an atheist because he believed that all substances are material and that God must therefore be material, not spiritual. Yet, neither Spinoza nor Hobbes called themselves atheists.

Epicurus did not call himself an atheist, either, but he rejected the concept of the gods popular in ancient Greece. The gods are perfect, he said. Therefore, they cannot be the imperfect beings depicted by Hesiod, Homer, and others. Their gods have human flaws, including jealousy. Perfect beings would not be troubled by anything, including the behavior of humans. Hence, the notion that the gods will reward or punish us is absurd. To be perfect is to be unperturbed. The concept of perfection, therefore, requires that the gods be indifferent to human behavior. Some have rejected belief in the Christian God for similar reasons. The idea of a perfect being creating the universe is self-contradictory. How can perfection be improved upon? To create is to indicate a lack, an imperfection. If that objection can be answered, another arises: if God is All-Good and All-Powerful, evil should not exist. Therefore, either God is All-Good but allows evil because God is not All-Powerful, or God is All-Powerful but allows evil because God is not All-Good. Such an argument clearly does not deny the existence of all gods.

Others have rejected the Christian God because they believe that the concept

of *worship*, essential to most Christians, contradicts the concept of *omnipotence* (Rachels 1989). Still others reject a belief in the JCIG because they consider the scriptures used to support that belief to be unbelievable. Some theologians have tried to prove through reason alone that this God exists. Rejection of such proofs, however, is not atheism.

Some Christians consider Buddhists to be atheists, apparently for the same reason they consider Spinoza or Plato to be atheists: Anyone who rejects the Omnipotent and All-Good Providential Personal Creator rejects God. Yet, rejecting the JCIG is not to reject all gods. Nor is rejecting the JCIG the same as rejecting belief in an ultimate ground or principle of being and goodness, a being that explains both why there is something rather than nothing and why everything is as it is. Nor is rejection of the JCIG the same as rejecting belief in a realm of beings such as [devas](#) or spirits that are not limited by mortality and other human or animal frailties.

Finally, atheists do not deny that people have ‘mystical’ or ‘religious’ experiences, where one feels God’s presence or a sense of the oneness and significance of everything in the universe. Nor do atheists deny that many people experience God’s presence in their everyday lives. Atheists deny that the brain states that result in such feelings and experiences have supernatural causes.

How widespread is atheism? A worldwide survey in 2000 by the [Gallup polling agency](#) found that 8% do not think there is in any spirit, personal God, or life force. Another 17% are not sure. However, more than half the world’s population, and more than 90% of the world’s [scientists](#), do not believe in a personal God, and hence would be considered atheists by many Christians.

See **related entries** on [agnosticism](#), God, [miracles](#) and [theism](#).

Philosophical Skepticism

The passion for philosophy...may only serve...to foster a predominant inclination...of the natural temper....There is, however one species of philosophy which seems little liable to this inconvenience, and that because it strikes ... no disorderly passion of the human mind, nor can mingle itself with any natural affection or propensity; and that is the Academic or sceptical philosophy....It is surprising, therefore, that this philosophy, which in almost every instance must be harmless and innocent, should be the subject of so much groundless reproach and blame.
--David Hume, *Inquiry Concerning Human Understanding*

The worst speculative Sceptic ever I knew, was a much better Man than the best superstitious Devotee & Bigot.
--David Hume (Letter to Gilbert Elliot of Minto, March 10, 1751)

Skepticism originally arose from metaphysics and its lawless dialectics.
--Immanuel Kant

Philosophical Skepticism is a critical attitude which systematically questions the notion that absolute knowledge and certainty are possible, either in general or in particular fields. Philosophical Skepticism is opposed to *philosophical dogmatism*, which maintains that a certain set of positive statements are authoritative, absolutely certain and true.

Philosophical Skepticism should be distinguished from *ordinary skepticism*, where doubts are raised against certain beliefs or types of beliefs because the evidence for the particular belief or type of belief is weak or lacking. Ordinary skeptics are not credulous or gullible. They don't take things on trust, but must see the evidence before believing. Ordinary skeptics doubt the miraculous claims of religions, the claims of alien abductions, the claims of psychoanalysis, etc. But they do not necessarily doubt that certainty or knowledge is possible. Nor do they doubt these things because of systematic arguments that undermine all knowledge claims.

On the other hand, Philosophical Skeptics can be quite gullible. Most of what we know about ancient Philosophical Skepticism comes from [Sextus Empiricus](#), who flourished around the year 200, and who believed, among other things, that some animals bypass fertilization in reproduction and originate in fire, fermented wine, mud, slime, donkeys, cabbage, fruit, and

putrefied animals.

Philosophical Skepticism is very ancient. For example, the sophist [Gorgias](#) (483-378 BCE) claimed that nothing exists or if something exists, it cannot be known, or if something does exist and can be known, it cannot be communicated. Gorgias, however, is known primarily as a [Sophist](#) rather than as a Philosophical Skeptic. [Pyrrho](#) (c. 360-c.270 BCE) is generally considered the first Philosophical Skeptic in western philosophy. Little is known of Pyrrho or his followers, or of the next big names in the history of skepticism, Arcesilaus (ca. 316-241 BCE) and Carneades (214-270 BCE), each of whom headed the [Academy](#) founded by Plato. The first group of Philosophical Sceptics are known as *Pyrrhonists*, the latter are known as the *Academics*. Neither the Pyrrhonists nor the Academics seem to have advocated the kind of nihilism Gorgias maintained.

Other sophists can also be seen as Philosophical Sceptics. For example, [Protagoras](#) (480-411 BCE) said that "Man is the measure of all things." This statement is usually interpreted to mean that there are no absolute standards or values and that each person is the standard of truth in all things. When applied to moral rules, this view is known as [moral relativism](#), a type of Philosophical Skepticism that denies there are any absolute moral values.

Gorgias' Skepticism was based upon his belief that all knowledge originates in sense experience and sense experience varies from person to person, moment to moment. His view might be called *sensory Skepticism*, the philosophical position that we cannot have absolute certainty about anything that is based solely on sense experience. Throughout the history of philosophy, arguments demonstrating the unreliability of sense experience have flourished, especially among dogmatists such as [Plato](#) and [Descartes](#). One common argument is that what we perceive via the senses cannot be a reliable guide as to what is really beyond those appearances. The [materialist Democritus](#) (460-370 BCE), a contemporary of Gorgias and not generally considered a Philosophical Skeptic, made such an argument.

Throughout the history of philosophy, sensory Sceptics have argued that we perceive only things as they appear to us and cannot know what, if anything, causes those appearances. Thus, if there is sense knowledge, it is always personal, immediate and mutable. Any inferences from appearances are subject to error and we are without a method to know whether the inferences or judgments we make are correct. However, these arguments did not prevent many Sceptics from putting forth a defense of *probabilism* with regard to empirical knowledge. Nor has sensory Skepticism hindered dogmatists from seeking absolute truth elsewhere, namely in Reason or Logic.

Perhaps the broadest criticism of the possibility of absolute truth is to be found in the Sceptic's argument regarding the *criterion of truth*. Any criterion

used to judge the truth of a claim can be challenged because a further criterion is needed by which to judge the present criterion, and so on ad infinitum. This argument did not deter philosophers such as Plato and Descartes from claiming to have found an absolutely impeccable criterion of truth. While most Skeptics would reject the notion that such criteria are what their advocates claim them to be, most would probably accept the arguments of St. Augustine and others that there are absolutely certain claims, but that these are matters of Logic or definition and have nothing to do with establishing the certainty of any claim that goes beyond immediate perception.

The ancient Skeptics did not all agree on even the most fundamental of matters, such as whether certainty and knowledge are possible. Some believed that they knew certainty was not possible; others claimed that they did not know whether knowledge is possible. The position that one knows that knowledge is impossible seems to be self-refuting. The view that one does not know whether knowledge is possible is consistent with the notion that it makes sense to strive to know, even if one can't be sure that one will arrive at knowledge. And, while some ancient Skeptics seem to have advocated that the ideal is to have no strong opinions, most seem to have maintained that when there was a preponderance of evidence supporting the probability of one position rather than another, then belief in the more probable position was desirable. Most ancient Skeptics do not seem to have believed that simply because one cannot be absolutely certain about anything, one should therefore suspend judgment on *all* things. Such a view would be self-refuting. For, according to the principle itself one should not accept it, but suspend judgment on it. Suspending judgment on claims should be reserved for those claims one knows nothing about, or *can* know nothing about, and for those claims for which the evidence is proportionate on opposing sides. It may be true that nothing is absolutely certain, but it is not true that all claims are equally probable. A reasonable person uses probability as a guide to belief, not absolute certainty, according to most Philosophical Skeptics.

The Greek word *skeptikoi* means *seekers* or *inquirers*. Socrates, who claimed that the only thing he knew was that he knew nothing, frequently said "*Skepton*," meaning *we must investigate this*. The Pyrrhonists sought the truth, even if most of the time that meant that they sought contrary arguments to dogmatic positions held by other philosophers, such as the [Stoics](#) or [Epicureans](#). On those issues where argument and counterargument equaled one another, the Pyrrhonists held that we should suspend judgment. They apparently found that such a stance fit well with their desired goal of peace of mind (*ataraxia*). For, it is the dogmatist who gets agitated when he doesn't possess the good or truth he knows he should have, or when others refuse to accept what he knows is the truth.

The other ancient school of Skeptics, the Academics, rejected their founder's metaphysical dogmatism and defended probabilism. It is this view that probabilities rather than absolute certainty are possible and do us just fine on

the important matters in life that made possible the advancements of modern science in the seventeenth century. The dogmatists, led by Descartes and the [Continental Rationalists](#), made contributions to math (analytic geometry and calculus) but not to physics; whereas, the probabilists, led by the founders of the Royal Society and the [British Empiricists](#), made modern empirical science possible.

While probabilism in empirical matters was defended as reasonable by Skeptics, such an attitude was considered unreasonable with regard to metaphysics. One particular type of *metaphysical skepticism* (also known as [positivism](#)) is noteworthy: *theological skepticism*. A theological skeptic raises doubts regarding the possibility of knowledge about God. A theological skeptic may be an [atheist](#), but the two positions are distinct and a theological skeptic may be a [theist](#) or an [agnostic](#). The theological skeptic maintains that we cannot know for certain whether God exists. Such a view does not entail the notion that we should be atheists. The theological skeptic does not necessarily hold that one should only assent to absolutely certain propositions. Some theological skeptics, however, will defend atheism on the grounds that there is much more support for the probability that God does not exist than for the probability that God exists. A theist might disagree and think the probability is greater for theism. An agnostic, as distinguished from a theological skeptic, would hold that neither theism nor atheism is more probable than the other.

Theological skepticism is based upon the nature of theological claims and the nature of the human mind. Theological claims transcend the limits of human knowledge. It is for this reason that some Skeptics assert that revelation from God is necessary. Ordinary skeptics may be atheists and be completely unaware of the arguments of theological skepticism. The ordinary skeptic may be an atheist simply because he or she perceives little, if any, evidence for the belief in God.

In addition to providing philosophical doubts about metaphysics, some Skeptics aimed their arguments at specific types of claims. One of the most important figures in the history of Skepticism is [David Hume](#) (1711-1776), whose skeptical arguments against belief in [miracles](#) is still considered by many Skeptics to be the best single argument in the history of Skepticism. In fact, Hume hoped his argument would serve as "an everlasting check to all kinds of superstitious delusion." Basically, Hume argues that for the same reason it is reasonable to avoid the vicious dog trying to bite us, it is reasonable to reject miraculous claims. Miraculous claims assert that a violation of the laws of nature has occurred. Laws of nature are based on experience. Experience is our guide in avoiding the vicious dog and must be our guide in judging the miraculous event. To accept an event as miraculous is to accept that experience is not a reliable guide. However, it is our *only* guide in such matters, unless we abandon reason and believe on pure [faith](#). As he so eloquently and succinctly puts it:

A miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined.

What other kinds of superstitious delusions would Hume's argument apply to? It seems that it would apply to things such as [homeopathy](#), [channeling](#), [astral projection](#), [levitation](#), [past life regression](#), [psychic surgery](#), [map dowsing](#), and other things which require us to abandon experience as a guide. Claims about [ESP](#), however, would not be covered by the argument, unless advocates maintain that ESP occurs outside the realm of the laws of nature. As long as the ESP advocate claims that ESP follows natural laws but we haven't discovered them yet, then Hume's argument would not apply.

Many Skeptics would agree that Logic is an area where dogmatism is justified. The *principle of contradiction*, that a statement is either true or false but not both, is accepted by many Skeptics as true but empty. That is, such a truth reveals nothing about the world of experience. In addition to formal truths, such as the principle of contradiction or the *principle of identity*, most Skeptics would probably accept that there are semantic truths, i.e., some statements that are true by definition. "A bachelor is an unmarried male," is true and does provide information about the world of experience, namely, how a certain word is used in a certain language. But the statement is a matter of convention, not discovery.

Philosophical Skepticism was never put forth as a literal guide for practical living. The earliest Skeptics did not allow vicious dogs to bite them on the ground that their senses might be deceiving them. Even if it cannot be proved with absolute certainty that any phenomenal object is real, experience is a good guide as to the probability of what will happen if one allows a vicious dog to tear into one's leg. Skeptics don't deny the reality of sense perception. Dog bites hurt and honey tastes sweet. What the Skeptics deny is that beyond the appearances of the biting dog there is a "dog essence" or that the experience of sweetness when tasting honey justifies inferring that "sweetness" is part of the essence of honey. Skeptics don't deny appearances and subjective knowledge. They don't deny that one bitten by a dog feels real pain and knows he or she is in pain. Skeptics deny that it is justifiable to infer from subjective experience to indubitable propositions about a reality beyond those appearances. Any inference to "objective reality," a reality that transcends immediate experience, should be couched in probabilistic language at best.

Nevertheless, ancient Skepticism was considered a guide for living by its advocates. Their goal was *ataraxia*, a state of no perturbedness, of peace of mind. Denying appearances would not serve such a goal. Rejecting

dogmatism did. Finding ways to combat dogmatism is still the central element of Philosophical Skepticism. Absolute certainty is not needed, according to Skeptics, either for science or for daily living. Science can do quite well even if limited to appearances and to probabilities. We can find guides for daily living, including moral principles, without needing absolute certainty. We can figure out what principles are likely to lead us to what we desire: a peaceful, happy life. Many Philosophical Sceptics of the Greco-Roman period advocated a very conservative lifestyle, maintaining that nature and custom know best. They advocated following the laws and customs, including the religious customs, of one's native country. They believed that following our natural appetites is a generally reliable guide to living well. It seems, however, that social and political conservatism, while probably serving well the goal of *ataraxia* for most Sceptics, is a non sequitur. That is, such a position is not a reasonable inference from either sensory or moral skepticism. The probabilism advocated for science seems sufficient for practical living as well.

Dogmatic philosophies have become rare. The age of metaphysics is long gone, indicating that the Sceptics have won the war with the Dogmatists. Logic is about the only philosophical area left where professional philosophers still speak of absolute certainty with a straight face. The chance of another Plato or Hegel arising in the 21st century seems very slim. Most philosophers today content themselves with probabilistic arguments based on empirical knowledge and the application of logical principles to concepts.

metaphysics

*...metaphysics...has for centuries spoiled many a sound mind. --
Immanuel Kant*

Metaphysics is a branch of philosophy consisting of [ontology](#) and [cosmology](#). In the 'weak' sense, metaphysics is used loosely to refer to New Age and non-empirical notions such as 'energy' ([chi](#), [prana](#)) being *balanced, harmonized, tuned, aligned, unblocked*, etc. Although 'metaphysics' in the weak sense is the most common in the *Skeptic's Dictionary*, here we are concerned with 'metaphysics' in the strong sense.

The term 'metaphysics' is often used to entail ideas and theories as to what kinds of beings are real, the nature of those beings and of the concepts and language used to think and speak or write about those beings. For example, a theory of mind would be a metaphysical theory concerned with mental phenomena and related concepts such as *perception, idea, consciousness, memory, intention, motive, reasoning, etc.*

However, typically, 'metaphysics' refers to broad theories of reality, such as [materialism](#) and [dualism](#), and to broad issues regarding the nature of reality.

Why is there something rather than nothing? Is there free will or is every action determined by causes? Was the universe created or has it always existed? Are there spiritual beings? Is there life after death? What is the nature of the universe, of substance, causality, etc.? These are all metaphysical questions.

Most philosophers would agree that metaphysical claims are not scientific and that contradictory metaphysical positions cannot be tested empirically to determine which is false. For example, [materialism](#) and [dualism](#) are contradictory but both theories are coherent and consistent with experience, and there is no empirical event that could falsify either theory.

Modern philosophy is often said to begin with Descartes, when the focus of philosophy turned to epistemological questions, i.e., questions regarding the origins, nature, and limits of knowledge. Metaphysical speculation about kinds of realities, which at one time dominated Western philosophy, has gradually given way to careful analyses of what can reasonably be posited about reality given what we know about how we come to experience reality and how we come to generate ideas about reality.

Philosophers give various reasons for preferring one metaphysical belief to

another. One thinks one's own theory is more coherent than a rival theory, or that one's own belief has more explanatory power or requires fewer assumptions. Some argue that their metaphysical beliefs fit better with what is known from other disciplines such as science, history, or psychology. Some criticize rival theories for being too farfetched: possible but implausible.

Some defend their metaphysical beliefs by appealing to the consequences of belief, e.g., it gives hope for an afterlife or meaning to existence. Others maintain that such considerations are irrelevant to the truth of the claims, and indicate the belief is based more on desire than good logical reasons.

Since coherent metaphysical beliefs cannot be refuted it is sometimes maintained that philosophers adhere to their metaphysical theories more out of personal disposition and temperament than evidence and proof.

Some consider metaphysics to represent what is highest in human nature, the drive to know and understand the nature of the universe in which we find ourselves while we move towards our inevitable end. Others consider metaphysics, specifically speculative metaphysics about non-empirical and transcendent realities, to be, more or less, bunk. Perhaps Kant was correct when he said that although we can never hope to answer our metaphysical questions, we can't help asking them anyway.

Akashic record

The Akashic record is an imagined spiritual realm, supposedly holding a record of all events, actions, thoughts and feelings that have ever occurred or will ever occur. Theosophists believe that the Akasha is an "astral light" containing occult records which spiritual beings can perceive by their special "astral senses" and "astral bodies". Clairvoyance, spiritual insight, prophecy and many other untestable metaphysical and religious notions are made possible by tapping into the Akasha.

Edgar Cayce (1877-1945)

Edgar Cayce is known as one of America's greatest psychics. His followers maintain that Cayce was able to tap into some sort of higher consciousness, such as God or the [Akashic record](#), to get his "psychic knowledge." He used this "knowledge" to predict that California will slide into the ocean and that New York City will be destroyed in some sort of cataclysm. He predicted that in 1958 the U.S. would discover some sort of death ray used on [Atlantis](#). Cayce is one of the main people responsible for some of the sillier notions about Atlantis, including the idea that the Atlantaeans had some sort of Great Crystal. Cayce called the Great Crystal the *Tuaoi Stone* and said it was a huge cylindrical prism that was used to gather and focus "energy," allowing the Atlanteans to do all kinds of fantastic things. But they got greedy and stupid, tuned up their Crystal to too high a frequency and set off volcanic disturbances that led to the destruction of that ancient world. He made other predictions concerning such things as the Great Depression (that 1933 would be a good year) and the Lindbergh kidnapping (most of it wrong, all of it useless), and that China would be converted to Christianity by 1968. He also claimed to be able see and read [auras](#), but this power was never tested under controlled conditions. However, Edgar Cayce is best known for being a psychic medical diagnostician and psychic reader of past lives.

Cayce was known as "the sleeping prophet" because he would close his eyes and appear to go into a trance when he did his readings (Stern). At his death, he left thousands of accounts of past life and medical readings. A stenographer took notes during his sessions and some 30,000 transcripts of his readings are under the protection of the [Association for Research and Enlightenment](#). However, Cayce usually worked with an assistant (hypnotist and mail-order osteopath Al Layne; John Blackburn, M.D.; homeopath Wesley Ketchum). According to Dale Beyerstein, "these documents are worthless by themselves" because they provide no way of distinguishing what Cayce discerned by psychic ability from information provided to him by his assistants, by letters from patients, or by simple observation. In short, the only evidence for Cayce's psychic doctoring is useless for testing his psychic powers. Nevertheless, it is the volume and alleged accuracy of his "cures" that seem to provide the main basis for belief in Cayce as a psychic. In fact, however, the support for his accuracy consists of little more than anecdotes and [testimonials](#). There is no way to demonstrate that Cayce used psychic powers even on those cases where there is no dispute that he was instrumental in the cure.

It is true, however, that many people considered themselves cured by Cayce

and that's enough evidence for true believers. It works! The fact that thousands don't consider themselves cured or can't rationalize an erroneous diagnosis won't deter the true believer. Gardner notes that Dr. J.B. Rhine, famous for his ESP experiments at Duke University, was not impressed with Cayce. Rhine felt that a psychic reading done for his daughter didn't fit the facts. Defenders of Cayce claim that if a patient has any doubts about Cayce, the diagnosis won't be a good one. Yet, what reasonable person wouldn't have doubts about such a man, no matter how kind or sincere he was?

Cayce's defenders provide some classic *ad hoc* hypotheses to explain away their hero's failures. For example, Cayce and a famous dowser named Henry Gross set out together to discover buried treasure along the seashore and found nothing. Their defenders suggested that their psychic powers were accurate because either there once was a buried treasure where they looked but it had been dug up earlier, or there would be a treasure buried there sometime in the future (one wonders why their psychic powers didn't discern this).

There are many myths and legends surrounding Cayce: that an angel appeared to him when he was 13 and asked him what his greatest desire was (Cayce allegedly told the angel that his greatest desire was to help people); that he could absorb the contents of a book by putting it under his pillow while he slept; that he passed spelling tests by using [clairvoyance](#); that he was illiterate and uneducated. *The New York Times* is greatly responsible for the illiteracy myth ("Illiterate Man Becomes a Doctor When Hypnotized," (Sunday magazine section, October 9, 1910). Many of the myths were passed on unchecked by Thomas Sugrue, who believed Cayce had cured him of a disabling illness. In his 1945 book *There is a River: The Story of Edgar Cayce*, Sugrue asserts that it was Cayce, not the medical doctors who treated them, that was responsible for the cures of Cayce's son ("blindness") and wife ("tuberculosis").

One of the most common reasons given for believing in the psychic abilities of people such as Cayce is the claim that *there's no way he could have known this stuff by ordinary means*. He must have been told this by God or spirits or have been astrally projected back or forth in space or time, etc. Yet, Cayce's "psychic knowledge" is easily explained by quite ordinary ways of knowing things.

Even though Cayce didn't have a formal education much beyond grammar school, he was a voracious reader, worked in bookstores, and was especially fond of occult and osteopathic literature. ([Osteopathy](#), in his day, was primitive and akin to [naturopathy](#) and folk medicine.) He was in contact with and assisted by people with various medical backgrounds. Even so, many of his readings would probably only make sense to an osteopath of his day. Martin Gardner cites Cayce's reading of Cayce's own wife as an example. The woman was suffering from tuberculosis:

.... from the head, pains along through the body from the second, fifth and sixth dorsals, and from the first and second lumbar...tie-ups here, floating lesions, or lateral lesions, in the muscular and nerve fibers which supply the lower end of the lung and the diaphragm...in conjunction with the sympathetic nerve of the solar plexus, coming in conjunction with the solar plexus at the end of the stomach....

The fact that Cayce mentions the *lung* is taken by his followers as evidence of a correct diagnosis; it counts as a psychic "hit." But what about the incorrect diagnoses: dorsals, lumbar, floating lesions, solar plexus and stomach? Why aren't those counted as diagnostic misses? And why did Cayce recommend osteopathic treatment for people with tuberculosis, epilepsy and cancer?

In addition to osteopathy, Cayce was knowledgeable of [homeopathy](#) and [naturopathy](#). He was the first to recommend laetrile as a cancer cure. (Laetrile contains [cyanide](#) and is known to be ineffective for cancer.) He also recommended "oil of smoke" for a leg sore; "peach-tree poultice" for convulsions; "bedbug juice" for dropsy; and "fumes of apple brandy from a charred keg" for tuberculosis.

Jeane Dixon & the Jeane Dixon effect

Jeane Dixon (1918-1997) was an [astrologer](#) and alleged [psychic](#) who did not predict the assassination of President Kennedy. She was featured every year in various publications that engage in the entertaining pursuit of making predictions for the new year. Ms. Dixon was never correct in any prediction of any consequence. She predicted that the Soviets would beat the U.S. to the moon, for example, and that World War III would begin in 1958. When that didn't happen, she predicted there would be a cure for cancer in 1967. Most of her predictions were equivocal, vague or mere possibility claims.

Dixon achieved a reputation as a very good psychic, however, when the mass media perpetuated the myth that she had predicted President Kennedy's assassination. In 1956 she predicted in *Parade* magazine that the 1960 election would be won by a Democrat and that he would die in office, "although not necessarily in his first term." However, in 1960, apparently forgetting or overriding her earlier prediction, she predicted unequivocally that "John F. Kennedy would fail to win the presidency." These inconvenient facts were omitted in Ruth Montgomery's 1965 book *A Gift of Prophecy: the Phenomenal Jeane Dixon*. More than 3,000,000 copies of this mythological account of Dixon's psychic prowess were sold with nary a cry of "non-sense" from the mass media.

[Dixon was an FBI stooge](#), who agreed to make claims about [Russia](#) being behind the civil rights movement and [left-wing agitation](#) on college campuses. She was chummy enough with [J. Edgar Hoover](#) that he agreed to serve as an honorary director to Children to Children Inc., a foundation established by Dixon to help sick children.

In her obituary and in its final issue of 1997, *The Sacramento Bee* perpetuated the myth of Jeane Dixon's psychic powers by declaring her to have predicted the assassination of JFK.

The *Jeane Dixon effect* refers to the tendency of the mass media to hype or exaggerate a few correct predictions by a psychic, guaranteeing that they will be remembered, while forgetting or ignoring the much more numerous incorrect predictions.

Gordon-Michael Scallion (GMS)

Gordon-Michael Scallion claims to have the "gift of prophecy" like [Nostradamus](#) and [Edgar Cayce](#). Like Cayce, [Atlantis](#) has visited him, and like Nostradamus and Cayce, his head is filled with visions of disasters and apocalypses. In fact, Scallion's head is filled with many of the same visions Cayce claimed to have had. Coincidence? Not likely. He has predicted earthquakes in California and hurricanes in Florida. His doomsday prophecies are very popular with [Art Bell](#), on whose radio show Scallion has been featured several times. His predictions are so wild that his followers seem not to care that his accuracy is on par with [Jeane Dixon's](#). Skeptics might think Scallion is a plagiarist; true believers might think he, Cayce, Dixon, Nostradamus, etc., tapped into the [Akashic record](#).

Scallion is actually a prophetic industry that he calls [The Matrix Institute](#). One of his more popular items for sale is a map of the future Earth as seen by GMS (as he is known by those in the know). On this map--which he claims will be the true map of the world by at least the year 2,002--[California is nothing but a few islands in the Pacific](#) and Denver is where the ocean front property sits. (This is a revision of an earlier prophecy that proved false.) Eventually, says GMS, the United States will restructure itself as thirteen colonies, proving that what goes around comes around.

Scallion claims to have first noticed his gift in 1979 while hospitalized. It was then that he started hearing voices and having cataclysmic visions. Soon after he was healed, he started to believe that he also was given the gift of healing along with the gift of hallucination. He became another Edgar Cayce, doing readings and healings, and giving lectures to all who would listen. Soon he founded his own newsletter, the *Earth Changes Report* (6 issues/\$36 year), to keep track of all his apocalyptic dreams and hallucinations, which began arriving at a furious rate. The visions now began appearing on his computer screen. And since you can subscribe to the on-line version of *Earth Changes*, Scallion's visions can appear on *your* screen should you so desire.

Those living in Palm Springs should know that according to Scallion you were hit with 9.0 earthquake sometime between 1995 and 1997. Sonoma Country (north of San Francisco) was hit by an 8.5 quake during that period, as well. If you didn't feel it, that may be because they didn't occur as predicted by GMS. Nor did the volcanic ash arrive that was supposed to cover the whole planet.

His recent poor track record was predictable, however, since he predicted that California would be in the Pacific Ocean by May of 1993 and Denver was

supposed to be on the Pacific coast by 1998. Also, one-fourth of Alaska is supposed to be gone by now.

No wonder scientists are not rushing to verify his latest vision: El Niño is fueled by underground volcanoes.

[James Randi, *The Mask of Nostradamus*](#)

[Becoming
a Critical Thinker](#)
by Robert T. Carroll

Nostradamus (1503-1566)

"D'vn Chef vieillard naiftra fens hebet, Degenerant par f³auoir & par armes."*

("To an old leader will be born an idiot heir, weak both in knowledge and in war.") I. 78.* (Some ungenerous souls think this quatrain refers to two birds named [Bush](#) solely because the younger [Bush](#) has a bit of trouble with the language. Codswallop!)

"The devil can cite Scripture to his purpose...." - Antonio, in the *Merchant of Venice* by W. Shakespeare*

Michel Nostradamus was a 16th century French physician and astrologer. His modern followers see him as a prophet. His prophecies have a magical quality for those who study them: they are muddled and obscure before the predicted event, but become crystal clear after the event has occurred.

Nostradamus wrote four-line verses (quatrains) in groups of 100 (Centuries). Skeptics consider the "prophecies" of Nostradamus to be mainly gibberish. For example:

L'an mil neuf cens nonante neuf sept

mois

**Du ciel viendra grand Roy deffraieur
Resusciter le grand Roy d'Angolmois.
Avant apres Mars regner par bon heur.**

**The year 1999 seven months
From the sky will come the great King of Terror.
To resuscitate the great king of the Mongols. Before and
after Mars reigns by good luck. (X-72)***

(or, according to the [Alta Vista translator](#), appropriately called Babelfish:

The year millet nine taxable quotas ninety nine seven

months

Of the sky will come large Roy deffraior Resusciter large

Roy d' Angolmois.

Before after Mars regner by good hor.)

Nobody, not even the most fanatical of Nostradamus' disciples, had a clue what this passage might have meant before July 1999. However, after John F. Kennedy Jr., his wife Carolyn Bessette and her sister Lauren Bessette, were killed in a plane crash on July 18, 1999, the retroprophets came out of the woodwork. Here is just one example:

Could the crash of John F. Kennedy Jr.'s airplane in July of 1999 fulfill the line "from the sky will come "the great King of Terror"? Could the human fear of death and bodily injury be the intended definition of "the great King of Terror"? It might be possible!

Other disciples were generous enough to think that Nostradamus was referring to a solar eclipse that would occur on August 11th, 1999. Others feared a NASA space probe would come crashing down on earth. The quatrain is imprecise enough to mean dozens of different things, most of which are easily [shoehorned](#) to the "prophecy."

Some claim that Nostradamus predicted the Challenger space shuttle disaster on January 28, 1986. Of course, they didn't recognize that he had predicted it until it was too late. Here is the passage:

**D'humain troupeau neuf seront mis a` part,
De iugement & conseil separez:
Leur sort sera diuise' en depart,
Kappa, Thita, Lambda mors bannis esgarez.**

**From the human flock nine will be sent away,
Separated from judgment and counsel:
Their fate will be sealed on departure
Kappa, Thita, Lambda the banished dead err.**

Thiokol made the defective O-ring that is blamed for the disaster. The name has a 'k', 'th' and an 'l'. What more proof does one need? Never mind that there were seven who died, not nine. The rest is vague enough to fit many different scenarios.

True believers, such as Erika Cheetham (*The Final Prophecies of Nostradamus*, 1989), believe that Nostradamus foresaw the invention of bombs, rockets, submarines, and airplanes. He predicted the Great Fire of London (1666) and the rise of Adolph Hitler and many other wonders.

Skeptics, such as James Randi, cast doubt upon the interpretation of Nostradamus' quatrains.

Here is how Randi and Cheetham read one of the more famous quatrains, allegedly predicting the rise of Adolph Hitler to power in Germany:

*Bestes farouches de faim fleuves tranner
Plus part du champ encore Hister sera
En caige de fer le grand sera traisner
Quand rien enfant de Germain observa.*

Cheetham's version:

**Beasts wild with hunger will cross the rivers,
The greater part of the battle will be against Hitler.
He will cause great men to be dragged in a cage of iron,
When the son of Germany obeys no law.**

Randi's version:

**Beasts mad with hunger will swim across rivers,
Most of the army will be against the Lower Danube.
The great one shall be dragged in an iron cage
When the child brother will observe nothing.**

Neither translation seems to make much sense, but at least Randi's recognizes that 'Hister' refers to a geographical region, not a person. So does 'Germania', by the way; it refers to an ancient region of Europe, north of the Danube and east of the Rhine. It may also refer to a part of the Roman Empire, corresponding to present-day northeastern France and part of Belgium and the Netherlands. Why anyone would think Hister refers to Hitler rather than exclusively to an area of the Danube is a mystery.

September 11, 2001

After the terrorist attacks on the World Trade Center, a rumor was spread that Nostradamus had predicted it. The following quatrains were offered as proof:

**In the year of the new century and nine months,
From the sky will come a great King of Terror...
The sky will burn at forty-five degrees.
Fire approaches the great new city..."**

**In the city of York there will be a great collapse,
2 twin brothers torn apart by chaos
while the fortress falls the great leader will succumb
third big war will begin when the big city is burning.**

These alleged quatrains are [hoaxes](#). The first two lines seem to be an alteration of Centuries X quatrain 72:

**L'an mil neuf cens nonante neuf sept mois
Du ciel viendra vn grand Roy d'effrayeur**

or, in English

**The year 1999 seven months
From the sky will come the great King of Terror.***

There is no reference in Nostradamus to "the new century and nine months."

The next two lines are from Centuries VI, quatrain 97.

**Cinq & quarante degrez ciel bruslera,
Feu approcher de la grand cité neuue,**

**At forty-five degrees the sky will burn,
Fire to approach the great new city:**

Some rumormongers speculated that this refers to the latitude of New York, but the [latitude](#) in Central Park is 40° 47' N. Any but the dimmest bulb should be able to [shoehorn](#) "at 45 degrees the sky will burn." The remainder of VI.97 is

**Instant grand flamme espars sautera,
Quand on voudra des Normans faire preuue,**

**In an instant a great scattered flame will leap up,
When one will want to demand proof of the Normans.**

The only thing in these lines that is even vaguely close to what happened is the mention of "a great scattered flame." But again, even the dimmest of bulbs should be able to find some way to connect [Normans giving proof](#) with what happened.

The only thing more disgusting than these hoaxes are the psychics such as [Silvia Brown](#), [Patricia Lane](#), etc. who claim *after the fact* that they predicted the attacks. Brown even had the chutzpah to claim she couldn't tell us the details in advance because she's not "omniscient." One does not need to be psychic to know that.

According to David Emery, one of the hoaxed versions was written a few years ago by a student named [Neil Marshall](#) "to demonstrate...that the

writings of Nostradamus are so cryptic that they can be interpreted to mean almost anything." (See also [Barbara and David P. Mikkelson's Urban Legends page](#).) If we have some imagination we can [shoehorn](#) just about any any event to some passage in Nostradamus (or [Bob Dylan](#), for that matter).

Finally, there is a video program out known as "Nostradamus: Prophet of Doom." It is a highly uncritical and misleading presentation, mainly rehashing Cheetham's views, and has been broadcast by A & E television network in their biography series--a lowlight in an otherwise fairly informative series. James Randi, who has written a critical and skeptical book on the Nostradamus phenomenon, was interviewed for the program, but he claims his views were twisted or ignored. Says Randi

I now know what validity I will assign to anything the "Biography" program presents to me in the future, and I hope that my readers will, too. The lack of respect for truth and for the education of the viewers that was demonstrated by the show's producers, Craig Haffner, Donna Lusitana, and Scott Paddor, will not in the least trouble them; the money is already in the bank, and they just don't care.

Yet, how interesting would a program be that ran through a thousand quatrains, most of which are ludicrously obscure, and showed how each of them either made no sense or could be greatly stretched to fit events that had already occurred? The few "predictions" that seem precise are easily accounted for by [coincidence](#) and laws of chance. Any rigorous appraisal of this non-sense would be met with low ratings. Thus, don't look for such a program to occur in this millennium. And certainly don't look for a program that agrees with [Jean-Claude Pecker](#) of the [Collège de France](#) in Paris. He maintains that Nostradamus described not *future* events but events of his own and earlier times. According to Pecker, Nostradamus disguised "them in a sort of coded French" because "in his troubled period" he was "under constant threat." (See page 81 of the September/October 2001 issue of the *Skeptical Inquirer*.)

One thing Nostradamus didn't predict was that he would become a one-man industry in the 20th century. Publishing houses will never go broke printing non-sense claiming to be the latest predictions culled from the manuscripts of Nostradamus.

theosophy

"We assert that the divine spark in man being one and identical in its essence with the Universal Spirit, our "spiritual Self" is practically omniscient, but that it cannot manifest its knowledge owing to the impediments of matter. Now the more these impediments are removed, in other words, the more the physical body is paralyzed, as to its own independent activity and consciousness, as in deep sleep or deep trance, or, again, in illness, the more fully can the inner Self manifest on this plane. This is our explanation of those truly wonderful phenomena of a higher order, in which undeniable intelligence and knowledge are exhibited. " [Madame Blavatsky]

"...we are imprisoned in the body, like an oyster in his shell." [The Socrates of Plato, [Phaedrus](#)]

To the philosopher, the body is "a disturbing element, hindering the soul from the acquisition of knowledge..."

"...what is purification but...the release of the soul from the chains of the body?" The Socrates of [Plato, [Phaedo](#)]

Theosophy, or *divine wisdom*, refers either to the *mysticism* of philosophers who believe that they can understand the nature of God by direct apprehension, without revelation, or it refers to the *esotericism* of eclectic collectors of mystical and occult philosophies who claim to be handing down the great secrets of some ancient wisdom.

Theosophical mysticism is indebted to [Plato](#) (c. 427-347 BCE), [Plotinus](#) (204/5-270) and other [neo-Platonists](#), and [Jakob Boehme](#) (1575-1624), among others. It experienced its last great Western philosophical burst in 19th century [German Idealism](#). The mystical tradition continues to be a strong element in many non-Western philosophies, such as Indian philosophy.

Theosophic esotericism begins with [Helena Petrovna Blavatsky \(1831-1891\)](#) usually known as Madame Blavatsky, one of the co-founders of the Theosophical Society in New York in 1875. The esoteric theosophical tradition of Blavatsky is indebted to several philosophical and religious traditions: [Zoroastrianism](#), [Hinduism](#), [Gnosticism](#), [Manichaeism](#), the [Cabala](#), among others.

Her harshest critics consider Madame Blavatsky to be "one of most accomplished, ingenious, and interesting impostors in history." Her devoted followers consider her to be a saint and a genius. [They claim she discovered the true nature of light either by [clairvoyance](#) or intuition alone, without any need for scientific training or communication with other scientists.] Since these characteristics are not contradictory, it is possible she was both a fraud and a saintly genius. Much of what is believed about Blavatsky originates with Madame herself, her devoted followers or her enemies. Nevertheless, a few things seem less dubious than others. She seems clearly to have been widely traveled and widely read. Blavatsky claims she spent several years in Tibet and India being initiated into occult mysteries by various "masters" (*mahatmas* or *adepts*) especially the Masters Morya and Koot Hoomi, who had "astral" bodies. These Adepts were said to dwell in the Himalayas, Egypt, Tibet and other exotic places. They are known for their extraordinary psychic powers and are the sacred keepers of some mysterious "Ancient Wisdom". They are not divine, she said, but more highly evolved than the rest of us mere mortals. (Evolution, according to Blavatsky, is a spiritual process.) Their goal is to unite all humanity in a Great White Brotherhood, despite the fact that they dwell in the remotest regions of the world and apparently have as little contact with the rest of us as possible.

Blavatsky's deceptions

Blavatsky seems clearly to have had an overpowering personality. She was knowledgeable of the tricks of [spiritualists](#), having worked for one in Egypt, and in the early days of the Theosophical Society seems clearly to have used trickery to deceive others into thinking she had paranormal powers. She most certainly faked the materialization of a tea cup and saucer, as well as written messages from her Masters, presumably to enhance her credibility. She certainly claimed to have paranormal experiences, but whether she really believed she was clairvoyant or possessed psychic powers, I can't say.

In 1875 she founded the Theosophical Society in New York City in collaboration with Henry Steele Olcott, a lawyer and writer, and W. Q. Judge. She met Olcott in 1874 while he was investigating the spiritualism of the Eddy brothers in Vermont. They continued to meet with other like-minded seekers and together founded their society. A few years later, she and Olcott went to India together and established [Theosophical headquarters](#) there. She left under a cloud of suspicion in 1885, having been accused of faking materializations of teachings from her Masters. Back in Europe in 1888 she published her major work *The Secret Doctrine*. The book "is an attempt...to reconcile science, the Ancient Wisdom, and human culture through...cosmology, history, religion, and symbolism." (Ellwood) [According to Blavatsky herself](#), "The chief aim of the...Theosophical Society [was] to reconcile all religions, sects and nations under a common system of ethics, based on eternal verities."

She did not reject religions such as Christianity and Hinduism, but claimed that all religions have an exoteric and an esoteric tradition. The exoteric traditions are unique and distinct for each religion. The esoteric doctrine is the same for all. She claimed to be passing on the wisdom of the shared esoteric doctrines. And even though she had an early association with spiritualism, she eventually claimed that "the spirits of the dead cannot return to earth -- save in rare and exceptional cases...."

One might wonder why, if Theosophy is so ancient and universal, it was so unknown until 1875. Madame had an answer. This was due to "willing ignorance". We humans have lost "real spiritual insight" because we are too devoted to "things of sense" and have for too long been slaves "to the dead letter of dogma and ritualism." "But the strongest reason for it," she said, "lies in the fact that real Theosophy has ever been kept secret." There were several reasons why it was kept secret. "...Firstly, the perversity of average human nature and its selfishness, always tending to the gratification of personal desires to the detriment of neighbours and next of kin. Such people could never be entrusted with divine secrets. Secondly, their unreliability to keep the sacred and divine knowledge from desecration. It is the latter that led to the perversion of the most sublime truths and symbols, and to the gradual transformation of things spiritual into anthropomorphic, concrete, and gross imagery -- in other words, to the dwarfing of the god-idea and to idolatry." [[The Key to Theosophy](#)] One wonders, what in the world was any different in the late 19th century? If at that time humans were any less perverse, selfish, materialistic, profane, etc., than they had ever been, this should come as a great shock to all social historians.

Ancient wisdom

What was this "Ancient Wisdom" which the theosophists promised to share? It is truly an eclectic compilation of Hindu, Egyptian, Gnostic and other exotic scriptures and teachings, neo-Platonism, and stories like the [Atlantis](#) myth. These are philosophies and stories for those who shake and quiver at the sound of such words as *secret, special, spiritual, enlightenment, transformation, esoteric, occult, divine, ancient wisdom, cosmic, vision, dynamics, golden, Isis, mysteries* and *masters*. They promise escape from the evils of the world, especially the body, while providing an explanation for Evil. They claim to know that the reason spiritual progress is so slow in coming is because of all this horrible stuff in the universe called "matter." They promise the power of divinity while providing an explanation for miracles which takes them out of the realm of the supernatural and puts the believer into the center of the spiritual universe. They promise union with some great moral purpose while offering membership in an isolated society of very special beings. But, probably the biggest attraction to joining such an esoteric society is that you don't have to go to college and you don't have to read Kant.

What you do need, though, is a penchant for the occult. This is dangerous stuff, according to Blavatsky, but theosophy can help.

When ignorant of the true meaning of the esoteric divine symbols of nature, man is apt to miscalculate the powers of his soul, and, instead of communing spiritually and mentally with the higher, celestial beings, the good spirits (the gods of the theurgists of the Platonic school), he will unconsciously call forth the evil, dark powers which lurk around humanity -- the undying, grim creations of human crimes and vices -- and thus fall from theurgia (white magic) into goetia (or black magic, sorcery). [*What Is Theosophy?*]

According to Madame, "...no one can be a true Occultist without being a real Theosophist; otherwise he is simply a black magician, whether conscious or unconscious." She even thought that [mesmerism](#) and [hypnotism](#) were occult arts.

Occult sciences are not, as described in Encyclopaedias, "those imaginary sciences of the Middle Ages which related to the supposed action or influence of Occult qualities or supernatural powers, as alchemy, magic, necromancy, and astrology," for they are real, actual, and very dangerous sciences. They teach the secret potency of things in Nature, developing and cultivating the hidden powers "latent in man," thus giving him tremendous advantages over more ignorant mortals. Hypnotism, now become so common and a subject of serious scientific inquiry, is a good instance in point. Hypnotic power has been discovered almost by accident, the way to it having been prepared by mesmerism; and now an able hypnotizer can do almost anything with it, from forcing a man, unconsciously to himself, to play the fool, to making him commit a crime -- often by proxy for the hypnotizer, and for the benefit of the latter. Is not this a terrible power if left in the hands of unscrupulous persons? And please to remember that this is only one of the minor branches of Occultism. [*The Key to Theosophy*]

Blavatsky may have understood the secret of the divine essence, but I don't think she understood the nature of hypnosis or mesmerism. However, I believe she was right when she claimed that "...the ecstatic trance of mystics and of the modern mesmerists and spiritualists, are identical in nature, though various as to manifestation." [*What Is Theosophy?*] I believe that none of these so-called "trance" states is a unique state of consciousness, though they are states of mind, states governed by social role-playing rules, a position argued for by many contemporary psychologists including [Nicholas P.](#)

[Spanos.](#)

Where are the plaudits?

The reader may wonder why theosophy isn't universally recognized as the salvation of mankind. For some it may have been the messenger which kept them away. Many people are not likely to take seriously a Russian noblewoman who claimed to have had childhood visions of a tall Hindu who eventually materialized in Hyde Park and became her guru and advisor. Many skeptics scoff at her noble origins and subsequent employment as a circus performer and séance assistant, plus we take seriously the charges of deception for whatever noble motive. For others, it may be the doctrines which keep us away. Despite the stated moral goals, and the desire for peace on earth and good will toward men and women, there is the small problem of astral bodies, evolution of spiritual races, Aryans, paranormal powers, Atlantis, the so-called Ancient Wisdom, etc. To some this may seem better than the Incarnation, [transubstantiation](#) and the Trinity, but to skeptics this is just more metaphysical [codswallop](#). Finally, others may be repelled by the self-discipline required of theosophy.

...the foremost rule of all is the entire renunciation of one's personality -- i. e., a pledged member has to become a thorough altruist, never to think of himself, and to forget his own vanity and pride in the thought of the good of his fellow-creatures, besides that of his fellow-brothers in the esoteric circle. He has to live, if the esoteric instructions shall profit him, a life of abstinence in everything, of self-denial and strict morality, doing his duty by all men.

"...every member must be either a philanthropist, or a scholar, a searcher into Aryan and other old literature, or a psychic student." (*The Key to Theosophy*)

It is not an easy life, pursuing the path of the mahatmas and the Ancient Wisdom, striving to unite all humankind into a Great Brotherhood of spiritually evolved beings with secret knowledge of such great vacation spots for astrals as Atlantis. Plus, perhaps there were inconsistencies or inadequacies in the secret doctrines, as the group seemed to splinter and dissipate after the death of Madame. Her dream of a Brotherhood of Man remains a dream, although there are Theosophical societies [all over the world](#).

anthroposophy, Rudolf Steiner and Waldorf Schools

The Austrian-born Rudolf Steiner (1861-1925) was the head of the German [Theosophical](#) Society from 1902 until 1912, at which time he broke away and formed his *Anthroposophical* Society. He may have abandoned the *divine* wisdom for *human* wisdom, but one of his main motives for leaving the theosophists was that they did not treat Jesus or Christianity as special. Steiner had no problem, however, in accepting such Hindu notions as [karma](#) and [reincarnation](#). By 1922 Steiner had established what he called the Christian Community, with its own liturgy and rituals for Anthroposophists. Both the Anthroposophical Society and the Christian Community still exist, though they are separate entities.

It wasn't until Steiner was nearly forty and the 19th century was about to end that he became deeply interested in the occult. Steiner was a true polymath, with interests in agriculture, architecture, art, chemistry, drama, literature, math, medicine, philosophy, physics, and religion, among other subjects. His doctoral dissertation at the University of Rostock was on [Fichte's](#) theory of knowledge. He was [the author of many books and lectures](#), many with titles like *The Philosophy of Spiritual Activity* (1894), *Occult Science: An Outline* (1913), *Investigations in Occultism* (1920), and *How to Know Higher Worlds* (1904). He was also much attracted to Goethe's mystical ideas and worked as an editor of Goethe's works for several years. Much of what Steiner wrote seems like a rehash of Hegel. He thought Marx had it wrong, that it really is the spiritual that drives history. Steiner even speaks of the tension between the search for community and the experience of individuality, which, he believed, are not really contradictions but represent polarities rooted in human nature.

His interests were wide and many but by the turn of the century his main interests were esoteric, mystical, and occult. Steiner was especially attracted to two theosophical notions: (1) There is a special spiritual consciousness that provides direct access to higher spiritual truths; (2) Spiritual evolution is hindered by being mired in the material world.

Steiner may have broken away from the Theosophical Society, but he did not abandon the eclectic mysticism of the theosophists. Steiner thought of his Anthroposophy as a "spiritual science." Convinced that reality is essentially spiritual, he wanted to train people to overcome the material world and learn to comprehend the spiritual world by the higher, spiritual self. He taught that there is a kind of spiritual perception that works independently of the body

and the bodily senses. Apparently, it was this special spiritual sense that provided him with information about the occult.

According to Steiner, people existed on Earth since the creation of the planet. Humans, he taught, began as spirit forms and progressed through various stages to reach today's form. Humanity, Steiner said, is currently living in the Post-Atlantis Period, which began with the gradual sinking of [Atlantis](#) in 7227 BC ... The Post-Atlantis Period is divided into seven epochs, the current one being the European-American Epoch, which will last until the year 3573. After that, humans will regain the clairvoyant powers they allegedly possessed prior to the time of the ancient Greeks ([Boston](#)).

Steiner's most lasting and significant influence, however, has been in the field of education. In 1913 at Dornach, near Basel, Switzerland, Steiner built his Goetheanum, a "school of spiritual science." This would be a forerunner of the Steiner or Waldorf schools. The term "Waldorf" comes from the school Steiner was asked to open for the children of workers at the Waldorf-Astoria cigarette factory in Stuttgart, Germany, in 1919. The owner of the factory had invited Steiner to give a series of lectures to his factory workers and apparently was so impressed he asked Steiner to set up the school. The first U.S. Waldorf school opened in New York City in 1928. Today, the Steinerians claim that there are more than 600 Waldorf schools in over 32 countries with approximately 120,000 students. About 125 Waldorf schools are said to be currently operating in North America. There is even a non-accredited [Rudolf Steiner College](#) offering degrees in Anthroposophical Studies and Waldorf Education.

Steiner designed the curriculum of his schools around notions that he apparently got by special spiritual insight into the nature of Nature and the nature of children. He believed we are each comprised of body, spirit, and soul. He believed that children pass through three seven-year stages and that education should be appropriate to the spirit for each stage. Birth to age 7, he claimed, is a period for the spirit to adjust to being in the material world. At this stage, children best learn through imitation. Academic content is held to a minimum during these years. Children are told fairy tales, but do no reading until about the second grade. They learn about the alphabet and writing in first grade.

According to Steiner, the second stage of growth is characterized by imagination and fantasy. Children learn best from ages 7 to 14 by acceptance and emulation of authority. The children have a single teacher during this period and the school becomes a "family" with the teacher as the authoritative "parent".

The third stage, from 14 to 21, is when the [astral body](#) is drawn into the physical body, causing puberty. These anthroposophical ideas are not part of the standard Waldorf school curriculum, but apparently are believed by those in charge of the curriculum. Waldorf schools leave religious training to parents, but they tend to be spiritually oriented and are based on a generally Christian perspective.

Even so, because they are not taught fundamentalist Christianity from the Bible, Waldorf schools are often attacked for encouraging [paganism](#) or even [Satanism](#). This may be because they emphasize the relation of human beings to Nature and natural rhythms, including an emphasis on festivals, myths, ancient cultures, and various non-Christian celebrations. (The Sacramento Unified School District abandoned its plan to turn Oak Ridge Elementary into a Waldorf magnet school after many of the parents complained about it and at least one teacher complained of Satanism. The school district put the Waldorf program in a new location and is now being [sued in federal court](#) for violation of separation of church and state by [PLANS, Inc.](#), a group of Waldorf School Critics.)

Some of the ideas of the Waldorf School are not Steiner's but are in tune with the master's spiritual insights. For example, television viewing is discouraged because of its typical content and because it discourages the growth of the imagination. This idea is undoubtedly attractive to some parents, since it is very difficult to find anything of positive value for young children on television. I agree that when children are very young they should be socializing, speaking, listening, and interacting with nature and people, not sitting in a catatonic trance before the boob tube. I don't know what the Waldorf teachers think of video games, but I would be very surprised if they didn't discourage them for their dehumanizing depictions of violent behavior as well as for their stifling of the imagination.

Waldorf schools also discourage computer use by young children. I agree that the benefits of computer use by children has yet to be demonstrated, though it seems to be widely believed and accepted by educators who spend billions each year on the latest computer equipment for students who often can barely read or think critically, and who have minimal social and oral skills. Waldorf schools, on the other hand, may be as daffy over the arts as public schools are over technology. What the public school consider frills, Waldorf schools consider essential, e.g., weaving, knitting, playing a musical instrument, woodcarving, and painting.

One of the more unusual parts of the curriculum involves something Steiner called "eurythmy," an art of movement that tries to make visible what he believed were the inner forms and gestures of language and music. According to the Waldorf [FAQ](#), "it often puzzles parents new to Waldorf education, [but] children respond to its simple rhythms and exercises which help them strengthen and harmonize their body and their life forces; later, the older

students work out elaborate eurythmic representations of poetry, drama and music, thereby gaining a deeper perception of the compositions and writings. Eurythmy enhances coordination and strengthens the ability to listen. When children experience themselves like an orchestra and have to keep a clear relationship in space with each other, a social strengthening also results."

Perhaps the most interesting consequence of Steiner's spiritual views was his attempt to instruct the mentally and physically handicapped. Steiner believed that it is the *spirit* that comprehends knowledge and the spirit is the same in all of us, regardless of our mental or physical differences.

Most critics of Steiner find him to have been a truly remarkable man, most decent and admirable. Unlike many other "spiritual" gurus, Steiner seems to have been a truly moral man who didn't try to seduce his followers and who remained faithful to his wife. His moral stature has been challenged by charges of [racism](#), however. Steiner believed in reincarnation and that souls pass through stages, including racial stages, with African races being lower than Asian races and European races being the highest form.* Defenders of Steiner refer to such writings as his *Philosophy of Freedom*, where one finds vague and seemingly contradictory passages like the following:

A racial group is a totality and all the people belonging to it bear the characteristic features that are inherent in the nature of the group. How the single member is constituted, and how he will behave, are determined by the character of the racial group. Therefore the physiognomy and conduct of the individual have something generic about them. If we ask why some particular thing about a man is like this or like that, we are referred back from the individual to the genus. The genus explains why something in the individual appears in the form we observe.

Man, however, makes himself free from what is generic. For the generic features of the human race, when rightly understood, do not restrict man's freedom, and should not artificially be made to do so. A man develops qualities and activities of his own, and the basis for these we can seek only in the man himself. What is generic in him serves only as a medium in which to express his own individual being. He uses as a foundation the characteristics that nature has given him, and to these he gives a form appropriate to his own being. If we seek in the generic laws the reasons for an expression of this being, we seek in vain.*

There is no question that Steiner made contributions in many fields, but as a philosopher, scientist, and artist he rarely rises above mediocrity and is singularly unoriginal. His spiritual ideas seem less than credible and are certainly not scientific. Some of his ideas on education, however, are worth

considering. He was correct to note that there is a grave danger in developing the imagination and understanding of young people if schools are dependent upon government. State-funded education will likely lead to emphasis on a curriculum that serves the State, i.e., one mainly driven by economic and social policies. Education is driven not by the needs of children, but by the economic needs of society. The competition that drives most of public education may benefit society, but it probably does not benefit most individuals. An education where cooperation and love, rather than competition and resentment, mark the essential relationship among students might be more beneficial to the students' intellectual, moral, and creative well-being.

Steiner was also ahead of his time in understanding sexism.

The social position of women is for the most part such an unworthy one because in so many respects it is determined not as it should be by the particular characteristics of the individual woman, but by the general picture one has of woman's natural tasks and needs. A man's activity in life is governed by his individual capacities and inclinations, whereas a woman's is supposed to be determined solely by the mere fact that she is a woman. She is supposed to be a slave to what is generic, to womanhood in general. As long as men continue to debate whether a woman is suited to this or that profession "according to her natural disposition," the so-called woman's question cannot advance beyond its most elementary stage. What a woman, within her natural limitations, wants to become had better be left to the woman herself to decide.*

On the other hand, it is likely that some of anthroposophy's weirder notions about astral bodies, [Atlantis](#), [Aryans](#), [Lemurians](#), etc., will get passed on in a Waldorf education, even if Steiner's philosophical theories are not part of the curriculum for children. Is it that hard to defend love and cooperation without having to ground them in some cosmic mist? Why does one have to leap into the realm of murky mysticism in order to defend criticizing the harm done to the individual by a life spent in pursuit of material possessions with little concern for what is being done to other human beings or to the planet? Why does one have to blame lack of spirituality for the evil around us? One might as well blame too much spirituality for our problems: The spiritual people think so little of this material world that they don't do enough to make it a better place. Why can't people tell stories, dance and sing, play music, create works of art, *and* study chemistry, biology, and physics? Why can't we study the natural world without the process being seen either as a means to job security and material wealth or as harmonizing one's soul with cosmic spirituality?

Children should not be burdened with either spirituality or materialism. They

should be loved and be taught to love. They should be allowed to grow in an atmosphere of cooperation. They should be introduced to the best we have to offer in nature, art, and science in such a way that they do not have to connect everything either to their souls or to their future jobs. Unfortunately, most children have parents and their parents would not stand for such an education.

alchemy

Alchemy is an occult art and [pseudoscience](#). Its practitioners' main goals have been

1. to turn base metals (like lead or copper) into precious metals (like gold or silver) (the transmutation motif);
2. to create an elixir or potion or metal which could cure all ills (the medical motif), and
3. discover an elixir which would lead to immortality (the transcendence motif).

The magical substance that was to transmute metals, to be the universal panacea and to serve as the key to immortality was called the [philosopher's stone](#).

Alchemy is based on the belief that there are four basic elements--fire, air, earth and water--and three essentials: salt, sulfur and mercury. Great symbolic and metaphysical systems have been built from these seven pillars of alchemy. Ancient Chinese and Egyptian occult literature are said to be the foundation upon which alchemy is based. Alchemy was very popular in medieval Europe where one of the most sacred books of the alchemists was allegedly written by the Egyptian god Thoth, known as [Hermes Trismegistus](#) (Hermes, the thrice-great, was the Greek god who served as a messenger and delivered the souls of the dead to Hades.) In 1455, a manuscript entitled Corpus Hermeticum began circulating in Florence, Italy. It was allegedly a compilation of the alchemical, astrological and magical knowledge of the Egyptian god. However, it is now known that the work was of European origin and dates from somewhat after the time Thoth prospered. The work is full of magic spells and incantations and other useless occult notions.

Today, the transmutation motif is largely ignored, while the transcendence and medical motifs are still going strong in areas such as [homeopathy](#) and [aromatherapy](#). Many modern alchemists combine their occult art with [astrology](#), [acupuncture](#), [hypnosis](#) and a wide variety of New Age spiritual quests. Unlike modern chemistry, which grew out of alchemy, the ancient art is heavily spiritual. Alchemists may have been the first ones to try out their ideas by devising experiments, but because of their intensely metaphysical purposes and beliefs, alchemists did not develop modern scientific methods. Alchemy never separated itself from the supernatural, the [magickal](#) and the superstitious. Perhaps that is why it is still popular, even though it has accomplished practically nothing of lasting value. Alchemists never transmuted metals, never found a panacea, and never discovered the fountain

of youth.

Some alchemists did make contributions to the advancement of knowledge, however. For example, [Paracelsus](#) (1493-1541) introduced the concept of disease to medicine. He rejected the notion that disease is a matter of imbalance or disharmony in the body, even though this view is favored by modern alchemists. Instead, Paracelsus maintained that disease is caused by agents outside of the body which attack it. He recommended various chemicals to fight disease.

Alchemy continues to prosper among the anti-scientific. [Robin Murphy](#), for example, has joined alchemy with [homeopathy](#), [qigong](#) and [astrology](#) to create his own brand of [alternative medicine](#). The Alchemical Institute advertises [Alchemical Hypnotherapy](#) for those seeking a New Age empowerment therapy based on occult pseudoscience. Alchemist [John Reid](#) promises health and success in the search for the QUINTESSENCE! It should be noted that science as we know it was able to develop only when the search for [essences](#) and the quintessence of things was abandoned.

[Three-month ban for homeopathy GP](#)

[Bad](#)

[Medicine: Misconceptions and Misuses Revealed, from Distance Healing to Vitamin O by Christopher Wanjek](#)

homeopathy

"Unless the laws of chemistry have gone awry, most homeopathic remedies are too diluted to have any physiological effect...."

---*Consumer Reports* (January 1987)

"If the FDA required homeopathic remedies to be proved effective in order to remain on the market, homeopathy would face extinction in the United States."

---**Stephen Barrett, M.D.**

"How do homeopaths explain this supposed potency of infinitesimal doses, even when the dilution removes all molecules of a drug? They invoke mysterious vibrations, resonance, force fields, or radiation totally unknown to science."

--- **Martin Gardner**

Homeopathy is a system of medical treatment based on the use of minute quantities of remedies that in massive doses produce effects similar to those of the disease being treated. The term is derived from two Greek words: *homeo* (similar) and *pathos* (suffering). The 19th century German physician, [Samuel Hahnemann](#) (1755-1843), is considered the father of homeopathy, allegedly being inspired to the notion that *like cures like* from the treatment of malaria with cinchona bark. The bark contains quinine, which helps in the treatment of malaria but also causes fevers. Advocates of homeopathy think that concoctions with as little as one molecule per million can stimulate the "body's healing mechanism." Critics maintain that such minute doses are unlikely to have any significant effect on the body.

Homeopathy is very popular in Europe, especially among the Royal Family of Britain. It is also very popular in [India](#), where there are more than 100 schools of homeopathy.

Homeopaths tend to believe in such things as "vital forces" being in harmony (health) or out of harmony (disease). And they tend to advocate [holistic medicine](#), treating "vital forces," "spirits," "minds", etc., as well as the body. Homeopaths like to say that they treat "persons" not "bodies" or "diseases."

One criticism of homeopathy is that it takes the "cookie cutter" approach to treatment: one-size-fits-all. No matter what ails you, treatment with a diluted like agent is the cure. Experience teaches otherwise. For example, the treatment for scurvy is not more scurvy but vitamin C; the treatment for diabetes is not sugar, but insulin. There seem to be countless examples one could come up with which would contraindicate homeopathy as a reasonable approach to the treatment of disease. Thus, simply because it is *sometimes*

reasonable to treat like with like (e.g., polio vaccines), it does not follow that it is *always* reasonable to treat like with like. It is misleading, however, to compare the use of vaccines in medicine to homeopathic remedies; for, medical vaccines would be ineffective if they were as diluted as homeopathic remedies.

One of the stranger tenets of homeopathy, proposed by Dr. Hahnemann himself, is that the potency of a remedy *increases* as the drug becomes more and more dilute. Some drugs are diluted so many times that they don't contain any molecules of the substance that was initially diluted, yet homeopaths claim that these are their most potent medications! It is not surprising to find that there is no explanation as to how this happens or is even possible, though some homeopaths have speculated that the water used to dilute a remedy has a "memory" of the initial substance.

Homeopathy's supporters point to clinical trials which indicate a homeopathic efficacy that cannot be explained by the placebo effect. Critics contend that such studies are poorly designed, methodologically biased, statistically flawed, etc. The known laws of physics and chemistry would have to be completely revamped if a tonic from which every molecule of the "active" ingredient were removed could be shown to nevertheless to be effective.

Homeopathic advocates give ardent testimonials to the curative powers of their remedies. How can so many case histories be dismissed? Easily: the "cures" are probably the result of (a) misdiagnosis (the patient wasn't cured since the disease it "cured" wasn't present); (b) spontaneous remission (the body healed itself) or (c) the [placebo effect](#). The many [testimonials](#) given as proof that homeopathy "works" are of little value as empirical evidence for the effectiveness of homeopathic remedies. Even so, such "cures" are not meaningless. Left alone, the body often heals itself. And, unlike conventional medicine with its powerful drugs and antibiotics, the likelihood of an adverse reaction to a homeopathic remedy is remote. The main harm from homeopathy is not likely to come from its remedies, which are probably safe but ineffective. One potential danger is in the encouragement to self-diagnosis and treatment. Another is not getting proper treatment by a conventional medical doctor in those cases where the patient could be helped by such treatment, such as for a bladder or yeast infection, or for cancer.

In short, the main benefits of homeopathy seem to be that its remedies are not likely to cause harm in themselves, and they are generally inexpensive. The main drawbacks seem to be that its remedies are most likely inert and they require acceptance of metaphysical baggage incapable of scientific analysis. Homeopathy "works", just as [astrology](#), [biorhythms](#), [chiropractic](#) or conventional medicine, for that matter, "work": i.e., it has its satisfied customers. Homeopathy does not work, however, in the sense of explaining pathologies or their cures in a way which not only conforms with known facts but which promises to lead us to a greater understanding of the nature of

health and disease.

Homeopathy is said to be \$200 million a year industry in the United States. Donald Driscoll, an attorney in Northern California, and Dr. Wallace Sampson, a cancer doctor, want to reduce that amount to zero. They are suing the manufacturers and distributors of homeopathic remedies, claiming the homeopathic products are being pushed in violation of a California consumer law against unfair business practices and false advertising ["Homeopathic remedies besieged by lawsuits," by Tom Philp, *Sacramento Bee*, Dec. 16, 1996]. If Driscoll and Sampson win, they will do in one year what science and logical argumentation could not accomplish in 200 years: wipe out a pseudoscience. Frankly, I don't approve. If people want to buy and drink lemonade which some aquatic entrepreneur has called a tonic that can cure warts, boils and cancer, let them. As long as their products aren't dangerous in themselves, and the government isn't using tax dollars to subsidize the fiasco, then let the buyer beware and let the lawyers be quiet.

[Can Light and
Aromatherapy Treat
Dementia?](#)

aromatherapy

Aromatherapy is a term coined by French chemist René Maurice Gattefossé in the 1920's to describe the practice of using essential oils taken from plants, flowers, roots, seeds, etc., in healing. The term is a bit misleading, since the aromas of oils, whether natural or synthetic, are generally not themselves therapeutic. Aromas are used to identify the oils, to determine adulteration, and to stir the memory, but not to directly bring about a cure or healing. It is the "essence" of the oil--its chemical properties--that gives it whatever therapeutic value the oil might have. Furthermore, vapors are used in some but not all cases of aromatherapy. In most cases, the oil is rubbed onto the skin or ingested in a tea or other liquid. Some aromatherapists even consider cooking with herbs a type of aromatherapy.

The healing power of essential oils is the main attraction in aromatherapy. It is also the main question for the skeptic. There is very little evidence for all the claims made by aromatherapists regarding the various healing properties of oils. Most of the support for the healing power of such substances as tea tree oil is in the form of [anecdotes](#) such as the following:

In the plane on my way to India [from Europe] a few years ago, my index finger began throbbing violently. A rose thorn had lodged in it two days before, as I pruned my roses. It was now turning septic. I straight away applied tea tree oil undiluted to the finger. By the time I arrived in Bangalore, the swelling had almost gone and the throbbing had stopped (Daniele Ryman, *Aromatherapy*).

This kind of [post hoc reasoning](#) abounds in the literature of alternative health care. What would be more convincing would be some [control studies](#) such as the following:

Professor Tomas Riley of the Department of Microbiology at the University of Washington has published a paper in [blah blah scientific journal] which demonstrates that tea tree oil kills many bacteria present in common infections, including some staphylococci and streptococci.*

When references are made to other aromatherapists, they are usually of the following type:

Marguerite Maury prescribed rose for frigidity, ascribing aphrodisiac properties to it. She also considered rose a great

tonic for women who were suffering from depression
(Daniele Ryman, *Aromatherapy*, p, 205).

Such [testimonials](#) are never met with skepticism or even curiosity as to what evidence there is for them. They are just passed on as if they were articles of faith.

Besides personal experience, the only kind of research aromatherapists seem interested in is in reading what other aromatherapists have said or believed about plants or oils. The practitioners and salespersons of aromatherapeutic products seem singularly uninterested in scientific testing of their claims, many of which are empirical and could be easily tested. Of course, there are many aromatherapists who make non-testable claims, such as claims regarding how certain oils will affect their "subtle body," bring balance to their chakra, restore harmony to their energy flow, return one to their center, or contribute to spiritual growth. Aromatherapy is said to restore or enhance mental, emotional, physical or spiritual health. Such claims are essentially non-testable. They are part of New Age mythology and can't really engender any meaningful discussion or debate.

When aromatherapists get into professional debates about empirical matters it is generally over such matters as whether natural oils are superior to synthetic ones, though even here references to scientific studies of the issue are sought in vain. The way aromatherapist Daniele Ryman, a defender of natural oils, treats the subject of "lavender" is typical. In her book, *Aromatherapy*, she gives some botanical and historical information about the plant, including a claim by Matthiöle, a 16th century botanist, that lavender is a panacea which can cure epilepsy, apoplexy and mental problems. She tells us that the principal constituents of lavender are alcohols such as borneol, geraniol and linalool; esters such as geranyl and linalyl; and terpenes such as pinene and limonene. Lavender also contains a high percentage of phenol, a strong antiseptic and antibiotic. She also notes that while many essential oils are very toxic, lavender is one of the least toxic of all oils. Then she tells us that lavender is "the oil most associated with burns and healing of the skin." She says lavender is "very effective in treating cystitis, vaginitis, and leucorrhöa." Furthermore, as an herbal tea, lavender "is also good as a morning tonic for convalescents, as a digestive after meals, for rheumatic conditions, and at the first appearance of a cold or flu." To prevent varicose veins, Ryman advises that you "massage the legs with an oil consisting of 3 drops cypress oil, 2 drops each of lavender and lemon oil, and 1 ounce of soy oil" (p. 143). Nowhere does she give any indication that anyone anywhere has done any control studies with lavender to test any of these claims. Now, it's true that expressions such as 'very effective' and 'is good' are not very precise, but they are not complete weaslers like 'helps' (which is what she says lavender in your bath will do for cellulite). And 'most associated' with burns doesn't actually say that it will do any good for burns. Still, I think these claims can be made precise enough to test, though I doubt if Ryman or most other aromatherapists have any interest in doing such tests.

For some reason, Ryman doesn't say much about lavender's use to reduce stress in her chapter on lavender. However, in a section on "Insomnia" she says that "lavender is a gentle narcotic, recommended for mental and physical strain." There has been a study done, not mentioned by Ryman, which compared the effects on intensive care patients of aromatherapy using lavender, massage therapy and rest. The study concluded that rest was best (Dunn).

I would not reject aromatherapy out of hand, however. When I have a cold and a stuffy nose, I'll use Vicks VapoRub, a mixture of camphor, menthol and eucalyptus oil. Strictly speaking, I suppose I am a practicing aromatherapist. However, when I look at what people who call themselves aromatherapists claim, I have to conclude that aromatherapy is a mostly a pseudoscientific alternative medical therapy. It is a mixture of folklore, trial and error, anecdote, testimonial, New Age spiritualism and fantasy. What aromatherapy lacks is a knack for sniffing out non-sense.

2002 The Guardian](#)

[Hypnosis does not
help accurate
memory recall, says
study By Celia Hall,
Medical Editor
\(Filed: 27/08/2001\)](#)

hypnosis

Hypnosis is a process involving a hypnotist and a subject who agrees to be hypnotized. Being hypnotized is usually characterized by (a) intense concentration, (b) extreme relaxation, and (c) high suggestibility.

The versatility of hypnosis is unparalleled. Hypnosis occurs under dramatically different social settings: the showroom, the clinic, the classroom, and the police station. Showroom hypnotists usually work bars and clubs. Their subjects are usually people whose idea of a good time is to join dozens or hundreds of others in a place where alcohol is the main social bonding agent. The subjects of clinical hypnotists are usually people with problems who have heard that hypnotherapy works for [relieving pain](#) or overcoming an addiction or a fear, etc. Others use hypnosis to [recover repressed memories](#) of sexual abuse or of [past lives](#). Some psychologists and hypnotherapists use hypnosis to discover truths hidden from ordinary consciousness by tapping into the [unconscious mind](#) where these truths allegedly reside. Finally, some hypnotic subjects are people who have been victims or witnesses of a crime. The police encourage them to undergo hypnosis to help them remember details from their experiences.

Hypnosis: the common view challenged

The common view of hypnosis is that it is a trance-like altered state of consciousness. Many who accept this view also believe that hypnosis is a way of accessing an unconscious mind full of [repressed memories](#), [multiple personalities](#), [mystical insights](#), or [memories of past lives](#). This view of hypnosis as an altered state and gateway to occult knowledge about the self and the universe is considered a myth by many psychologists. There are two distinct, though related, aspects to this mythical view of hypnosis: *the myth of [the altered state](#)* and *the myth of [the occult reservoir](#)*.

Those supporting the altered state theory often cite studies that show that during hypnosis (1) the brain's electrical states change and (2) brain waves differ from those during waking consciousness. The critics of the mythical view point out that these facts are irrelevant to establishing hypnosis as an altered state of consciousness. One might as well call daydreaming, concentrating, imagining the color red, or sneezing altered states, since the experience of each will show electrical changes in the brain and changes in

brain waves from ordinary waking consciousness.

Those supporting the unconscious occult reservoir theory support their belief with anecdotes of numerous people who, while hypnotized, (a) recall events from their present or past life of which they have no conscious memory, or (b) relate being in distant places and/or future times while under hypnosis.

Most of what is *known* about hypnosis, as opposed to what is *believed*, has come from studies on the *subjects* of hypnosis. We know that there is a significant correlation between being imaginative and being responsive to hypnosis. We know that those who are fantasy-prone are also likely to make excellent hypnotic subjects. We know that vivid imagery enhances suggestibility. We know that those who think hypnosis is rubbish can't be hypnotized. We know that hypnotic subjects are not turned into [zombies](#) and are not controlled by their hypnotists. We know that hypnosis does not enhance the accuracy of memory in any special way. We know that a person under hypnosis is very suggestible and that memory is easily "filled-in" by the imagination and by suggestions made under hypnosis. We know that [confabulation](#) is quite common while under hypnosis and that many States do not allow testimony which has been induced by hypnosis because it is intrinsically unreliable. We know the greatest predictor of hypnotic responsiveness is what a person *believes* about hypnosis.

Hypnosis in its socio-cognitive context

If hypnosis is not an altered state or gateway to a mystical and occult unconscious mind, then what is it? Why do so many people, including those who write psychology textbooks, or dictionary and encyclopedia entries, continue to perpetuate the mythical view of hypnosis as if it were established scientific fact? For one thing, the mass media perpetuates this myth in countless movies, books, television shows, etc., and there is an entrenched tradition of hypnotherapists who have faith in the myth, make a good living from it, and see many effects from their sessions which, from their point of view, can only be called "successes." They even have a number of scientific studies to support their views. Psychologists such as Robert Baker think such studies are about as valid as the studies which supported the belief in [phlogiston](#) or the [aether](#). Baker claims that what we call hypnosis is actually a form of *learned social behavior*.

The hypnotist and subject learn what is expected of their roles and reinforce each other by their performances. The hypnotist provides the suggestions and the subject responds to the suggestions. The rest of the behavior--the hypnotist's repetition of sounds or gestures, his soft, relaxing voice, etc., and the trance-like pose or sleep-like repose of the subject, etc.--are just window dressing, part of the drama that makes hypnosis seem mysterious. When one strips away these dramatic dressings what is left is something quite ordinary, even if extraordinarily useful: a self-induced, "psyched-up" state of

suggestibility.

Psychologist Nicholas Spanos agrees with Baker: “hypnotic procedures influence behavior indirectly by altering subjects’ motivations, expectations and interpretations.” This has nothing to do with putting the subject into a trance and exercising control over the subconscious mind. Hypnosis is a learned behavior, according to Spanos, issuing out of a socio-cognitive context. We can accomplish the same things in a variety of ways: going to college or reading a book, taking training courses or teaching oneself a new skill, listening to pep talks or giving ourselves a pep talk, enrolling in motivation courses or simply making a willful determination to accomplish specific goals. In short, what is called hypnosis is an act of social conformity rather than a unique state of consciousness. The subject acts in accordance with expectations of the hypnotist and hypnotic situation and behaves as he or she thinks one is supposed to behave while hypnotized. The hypnotist acts in accordance with expectations of the subject (and/or audience) and the hypnotic situation, and behaves as he or she thinks one is supposed to behave while playing the role of hypnotist.

Spanos compares the popularity of hypnosis with the nineteenth century phenomenon we now call [mesmerism](#). Furthermore, he draws an analogy between the belief in hypnosis and the belief in demonic possession and [exorcism](#). Each can be explained in terms of sociocognitive context. The conceptions of the roles for the participants in all of these beliefs and behaviors are learned and reinforced in their social settings. They are context-dependent and depend upon the willingness of participants to play their established roles. Given enough support by enough people in a social setting, just about any concept or behavior can become adamantly defended as dogma by the scientific, theological, or social community.

Another psychologist, E.M. Thornton, extends the analogy between hypnotism, mesmerism, and exorcism. She maintains that hypnotic subjects are asked basically to take on “what really amounts to a parody of epileptic symptoms.” If some hypnotic or mesmerized subjects seem possessed, that is because possession involves a similar socio-cognitive context, a similar role-playing arrangement and rapport. The central beliefs differ and the dominant idea of an altered state, of animal magnetism or of invading demons, gives the experiences their distinguishing characteristics. Deep down, however, hypnotism, mesmerism, hysteria, and demonic possession share the common ground of being social constructs engineered mainly by enthusiastic therapists, showmen, and priests on the one side, and suggestible, imaginative, willing, fantasy-prone players with deep emotional needs or abilities on the other.

hypnosis: the good, the bad and the ugly

The godfather of the repression, Freud, wisely gave up using hypnosis in

therapy. Unfortunately, however, hypnosis continues to be used in a wide variety of contexts, not all of which are beneficial. Using hypnosis to help people quit smoking or stick to a diet may be useful, and even if it fails it is probably not harmful. Using hypnosis to help people remember license plate numbers of cars used in crimes may be useful, and even if it fails it is probably not harmful. Using hypnosis to help victims or witnesses of crimes remember what happened may be useful, but it can also be dangerous because of the ease with which the subject can be manipulated by suggestions from the hypnotist. Overzealous police hypnotists may put conviction of those they think are guilty above honest conviction by honest evidence presented to a jury. Hypnosis is also dangerous in the police setting, because of the tendency of too many police officers to believe in truth serums, [lie detectors](#), and other [magical and easy ways to get to the truth](#).

Using hypnosis to help people recover memories of sexual abuse by their closest relatives or by [aliens in spaceships](#) is dangerous, and in some cases, clearly immoral and degrading. For, in some cases, hypnosis is used to encourage patients to remember and then believe events which probably never happened. If these memories were not of such horrible and painful events, they would be of little concern. But by nurturing delusions of evil suffered, therapists often do irreparable harm to those who put their trust in them. And they do this in the name of healing and caring, as did the priests of old when they hunted witches and exorcised demons.

magick

Magick is the alleged art and science of causing change in accordance with the will by non-physical means.

Magick is associated with all kinds of [paranormal](#) and [occult](#) phenomena, including but not limited to: [ESP](#), [astral projection](#), [psychic healing](#), [the cabala](#), and [chakras](#). Magick uses various symbols, such as the [pentagram](#), as well as a variety of symbolic ritual behaviors aimed at achieving powers which allow one to contravene the laws of physics, chemistry, etc. Magick should not be confused with magic, which is the art of [conjuring](#) and legerdemain.

The religions based on the Old and New Testaments have long associated magick with false prophets, based upon the belief that [Satan](#) regularly exhibits his powers to and shares them with humans. Using powers which contravene natural forces is good if done by or through God (white magick), according to this view. Such exhibitions of divine power are called [miracles](#). If done by diabolical forces, it is evil (black magick).

The idea of being able to control such things as the weather or one's health by an act of will is very appealing. So is the idea of being able to wreak havoc on one's enemies without having to lift a finger: just think it and thy will will be done. Stories of people with special powers are appealing, but for those contemplating becoming a magus consider this warning from an authority on the subject:

...magick ritual (or any magick or occultism) is very dangerous for the mentally unstable. If you should somehow 'get out too far', eat 'heavy foods' . . . and use your religious background or old belief system for support. But remember too, that weird experiences are not necessarily bad experiences. [[Phil Hansford, Ceremonial Magick](#)]

On the other hand, weird experiences are not necessarily good, either.

The magic of performing magicians is related to magick in that performers use tricks and deception to make audiences think they have done things which, if real, would require supernatural or paranormal powers, e.g., materializing objects such as rings or ashes, doves or rabbits. Some magicians have attributed their feats not to magic but to supernatural or paranormal powers, e.g., [Sai Baba](#) and [Uri Geller](#).

Of course, the beauty and magic of nature has nothing to do with magick. There is the magic of the birth of a healthy child; the magic of true love. There is the magic of getting out of bed in the morning through an act of will. Unfortunately, this only seems to be magic to those who do not have this power. Those of us who can direct our bodies through acts of will too often take this power for granted. We fail to see the wondrousness of simple things, like wiping the sweat from one's brow. We take for granted the act of opening our eyes to feast on the sublimity of glaciers and oceans or the beauty of sunsets or meadows of wild flowers. These are truly magical deeds and, when contemplated, hold enough wonder to fill universes. But for many, it seems, such *real* magic will never be enough.

[Qigong : Chinese
Medicine or
Pseudoscience?](#)
[by Zixin Lin \(Editor\),
Yu Li, Guo Zhengyi,
Shen Zhenyu, Zhang
Honglin, Lin Zixin](#)

chi kung (ch'i kung or qi gong)

Ch'i kung or qi gong (pronounced *chee gung* and henceforth spelled *chi kung*) is claimed to be "the science and practice" of [chi](#). Chi kung literally means *energy cultivation*. Physical and mental health are allegedly improved by learning how to manipulate *chi* through controlled breathing, movement, and acts of will. *Chi kung* masters claim to be able to heal at a distance by manipulating *chi*. It is even said that one can strengthen the immune system by mastering one's *chi*.

Most Westerners are vaguely familiar with [Kung Fu](#) and [Tai Chi](#), both of which are related to *chi kung*. The former is a martial art and the latter is a type of exercise, or internal martial art. The former is sometimes known for demonstrations of breaking bricks with bare hands. The latter is known for the graceful poses of its practitioners. These demonstrations, and stories of even more powerful demonstrations, are offered as evidence of the paranormal or supernatural power that comes to those who master *chi*.

Asian martial arts schools have become very popular in the West. There is certainly a good side to these training centers for children and adults. They encourage attention to diet and physical exercise. They cultivate physical strength and mental self-discipline. Many focus on self-defense, and they boost self-confidence and self-esteem, even if they don't really make one invincible. However, they also often encourage students to believe they can achieve supernatural or paranormal powers, or heal just about any illness by an act of will, by training and discipline under a "master."

What empirical evidence is there for *chi* or its harnessing? [Testimonials](#) and [self-validating statements](#) are offered in lieu of [controlled scientific tests](#). Nevertheless, advocates are convinced they are not deluded in their metaphysical explanations. The [acupuncturist](#) is convinced he or she is unblocking *chi*. The [reiki](#) therapist and [therapeutic touch](#) nurse think they are channeling ki or [prana](#). The Reichians think they can heal the body by harnessing and directing [orgone](#). As a philosophy, chi kung and its relatives may provide one with a sense of harmony, power and meaning. As a metaphysical belief there is no way to disprove the existence of *chi*. However, explanations of events in terms of controlling and harnessing chi are superfluous by [Occam's razor](#).

[alchemy](#)

reader comments:

alchemy

4 Feb 2000

You make the ridiculous assertion that science as we know it has advanced only after the search for the essence of life has been abandoned (your supposed "definition" of alchemy); just a cursory examination of the lives of Newton, Einstein, Abel , Bohr, Fludd, Descartes, Pascal, etc. would show you what a fool you really are.

Scott Damon

reply: I apologize for not being clearer so a serious scholar such as yourself would not misunderstand. I have added a link to the term 'essence' to make it clear that I am referring to the fact that as long as inquirers searched for the *formal essence* of things, believed to be real and distinct from physical entities as well as knowable by rational intuition, scientific progress was not possible. For example, until *heat* was understood as an effect of matter in motion rather than as a *real quality* belonging to bodies, a scientific understanding of heat was not possible.

Descartes retained this scholastic way of looking at things, for instance, and he made no significant contribution to physics. Newton did not seek *essences* and we all know what he accomplished.

[Robert Fludd](#) belongs in a different list, I think, from [Niels Bohr](#) and [Einstein](#).

[A Gallup poll indicates that belief in visitations from alien beings has increased from 27% to 33% over the past decade.](#)

Note: this entry is included in [UFOs \(San Diego: Greenhaven Press, 1999\) edited by William Dudley](#)

alien abductions

"...despite the fact that we humans are great collectors of souvenirs, not one of these persons [claiming to have been aboard a flying saucer] has brought back so much as an extraterrestrial tool or artifact, which could, once and for all, resolve the UFO mystery."

Philip Klass

There is a widespread belief that alien beings have traveled to earth from some other planet and are doing reproductive experiments on a chosen few. Despite the incredible nature of this belief and a lack of credible supportive evidence, a cult has grown up around it. According to a Gallup poll done at the end of the twentieth century, about one-third of Americans believe aliens have visited us, an increase of 5% over the previous decade.

According to the tenets of this cult, aliens crashed at [Roswell](#), New Mexico, in 1947. The U.S. Government recovered the alien craft and its occupants, and has been secretly meeting with aliens ever since in a place known as [Area 51](#). The rise in [UFO](#) sightings is due to the increase in alien activity on earth. The aliens are abducting people in larger numbers, are leaving other signs of their presence in the form of so-called crop circles, are involved in [cattle mutilation](#), and occasionally provide revelations such as the [Urantia Book](#) to selected prophets. The support for these beliefs about aliens and UFOs consists mostly of speculation, fantasy, fraud, and unjustified inferences from questionable evidence and testimony. UFO devotees are also convinced that there is a government and mass media conspiracy to cover-up the alien activities, making it difficult for them to prove that the aliens have landed.

It is probable that there is life elsewhere in the universe and that some of that life is intelligent. There is a high mathematical probability that among the trillions of stars in the billions of galaxies there are millions of planets in age and proximity to a star analogous to our Sun. The chances seem very good that on some of those planets life has evolved. It is even highly probable that natural selection governs that evolution (Dawkins). However, it is not inevitable that the results of that evolution would yield intelligence, much less intelligence equal or superior to ours. It is possible that we are unique (Pinker, 150 ff.).

We should not forget, however, that the closest star (besides our Sun) is so far away from Earth that travel between the two would take more than a human lifetime. The fact that it takes our Sun about 200 million years to revolve once around the Milky Way gives one a glimpse of the perspective we have to take of interstellar travel. We are 500 light-seconds from the sun. The next nearest star to earth's sun (Alpha Centauri) is about 4 light-years away. That might

sound close, but it is actually something like 24 trillion miles away. Even traveling at one million miles an hour, it would take more than 2,500 years to get there. To get there in twenty-five years would require traveling at more than 100 million miles an hour for the entire trip.* Our fastest spacecraft, Voyager, travels at about 40,000 miles an hour and would take 70,000 years to get to Alpha Centauri.*

Despite the probability of life on other planets and the possibility that some of that life may be very intelligent, any signal from any planet in the universe broadcast in any direction is unlikely to be in the path of another inhabited planet. It would be folly to explore space for intelligent life without knowing exactly where to go. Yet, waiting for a signal might require a wait longer than any life on any planet might last. Finally, if we do get a signal, the waves carrying that signal left hundreds or thousands of years earlier and by the time we tracked its source down, the sending planet may no longer be habitable or even exist.

Thus, while it is probable that there is intelligent life in the universe, traveling between solar systems in search of that life poses some serious obstacles. Such travelers would be gone for a very long time. We would need to keep people alive for hundreds or thousands of years. We would need equipment that can last for hundreds or thousands of years and be repaired or replaced in the depths of space. These are not impossible conditions, but they seem to be significant enough barriers to make interstellar and intergalactic space travel highly improbable. The one thing necessary for such travel that would not be difficult to provide would be people willing to make the trip. It would not be difficult to find many people who believe they could be put to sleep for a few hundred or thousand years and be awakened to look for life on some strange planet. They might even believe they could then gather information to bring back to Earth where they would be greeted with a ticker tape parade down the streets of whatever is left of New York City.

abduction and rape?

Despite the fact of the improbability of interplanetary travel, it is not impossible. Perhaps there are beings who can travel at very fast speeds and have the technology and the raw materials to build vessels that can travel at near the speed of light or greater. Have such beings come here to abduct people, rape and experiment on them? There have been many reports of abduction and sexual violation by creatures who are small and bald; are white, gray or green; have big craniums, small chins, large slanted eyes, and pointed or no ears. How does one explain the number of such claims and their similarity? The most reasonable explanation for the accounts being so similar is that they are based on the same movies, the same stories, the same television programs and the

same comic strips.

The alien abduction story that seems to have started the cult beliefs about alien visitation and experimentation is the Barney and Betty Hill story. The Hills claim to have been abducted by aliens on September 19, 1961. Barney claims the aliens took a sample of his sperm. Betty claims they stuck a needle in her belly button. She took people out to an alien landing spot, but only she could see the aliens and their craft. The Hills recalled most of their story under hypnosis a few years after the abduction. Barney Hill reported that the aliens had "wraparound eyes," a rather unusual feature. However, twelve days earlier an episode of "The Outer Limits" featured just such an alien being (Kottmeyer). According to Robert Schaeffer, "we can find all the major elements of contemporary UFO abductions in a 1930 comic adventure, *Buck Rogers in the 25th Century*."

The Hill's story has been repeated many times. There is a period of amnesia following the alleged encounter. There is then usually a session of hypnosis, counseling or psychotherapy during which comes the recollection of having been abducted and experimented on. The only variation in the abductees' stories is that some claim to have had implants put in them and many claim to have scars and marks on their bodies put there by aliens. All describe the aliens in much the same way.

Whitley Strieber, who has written several books about his alleged abductions, came to the realization he had been abducted by aliens after psychotherapy and hypnosis. Strieber claims that he saw aliens set his roof on fire. He says he has traveled to distant planets and back during the night. He wants us to believe that he and his family alone can see the aliens and their spacecraft while others see nothing. Strieber comes off as a very disturbed person, but one who really believes he sees and is being harassed by aliens. He describes his feelings precisely enough to warrant believing he was in a very agitated psychological state prior to his visitation by aliens. A person in this heightened state of anxiety will be prone to hysteria and be especially vulnerable to radically changing behavior or belief patterns. When Strieber was having an anxiety attack he consulted his analyst, Robert Klein, and Budd Hopkins, an alien abduction researcher. Then, under hypnosis, Strieber started recalling the horrible aliens and their visitations.

Hopkins demonstrated his sincerity and investigative incompetence on the public television program Nova ("Alien Abductions," first shown on February 27, 1996). The camera followed Hopkins through session after session with a very agitated, highly emotional "patient". Then Nova followed Hopkins to Florida where he cheerfully helped a visibly unstable mother inculcate in her children the belief that they had been abducted by aliens. In between more sessions with more of Hopkin's "patients", the viewer heard him repeatedly give plugs for his books and his reasons for showing no skepticism at all regarding the very bizarre claims he was eliciting from his "patients". Dr.

Elizabeth Loftus was asked by Nova to evaluate Hopkin's method of "counseling" the children whose mother was encouraging them to believe they had been abducted by aliens. From the little that Nova showed us of Hopkins at work, it was apparent that Mr. Hopkins encouraged the creation of memories, though Hopkins claims he is uncovering repressed memories. Dr. Loftus noted that Hopkins did much encouraging of his "patients" to remember more details, as well as giving many verbal rewards when new details were brought forth. Dr. Loftus characterized the procedure as "risky" because we do not know what effect this "counseling" will have on the children. It seems we can safely predict one effect: they will grow up thinking they've been abducted by aliens. This belief will be so embedded in their memory that it will be difficult to get them to consider that the "experience" was planted by their mother and cultivated by alien enthusiasts like Hopkins.

John Mack

Another alien enthusiast is Harvard psychiatrist Dr. John Mack, who has written books about his patients who claim to have been abducted by aliens. Many of Mack's patients have been referred to him by Hopkins. Dr. Mack claims that his psychiatric patients are not mentally ill (then why is he treating them?) and that he can think of no other explanation for their stories than that they are true. However, until the good doctor or one of his patients produces physical evidence that abductions have occurred, it seems more reasonable to believe that he and his patients are deluded or frauds. Of course, the good doctor can hide behind academic freedom and the doctor/patient privacy privilege. He can make all the claims he wants and refuse to back any of them up on the grounds that to do so would be to violate his patients' rights. He can then publish his stories and dare anyone to take away his academic freedom. He is in the position any con person would envy: he can lie without fear of being caught.

Dr. Mack also appeared on the *Nova* "Alien Abductions" program. He claimed that his patients are otherwise normal people, which is a debatable point if his patients are anything like Hopkin's patients who appeared on the program. Mack also claimed that his patients have nothing to gain by making up their incredible stories. For some reason it is often thought by intelligent people that only morons are deceived or deluded and that if a person's motives can be trusted then his or her testimony can be trusted, too. While it is true that we are justified in being skeptical of a person's testimony if she has something to gain by the testimony (such as fame or fortune), it is not true that we should trust any testimony given by a person who has nothing to gain by giving the testimony. An incompetent observer, a drunk or drugged observer, a mistaken observer, or a deluded observer should not be trusted, even if he is as pure as the mountain springs once were. The fact that a person is kind and decent and has nothing to gain by lying does not make him or her immune to error in the interpretation of their perceptions.

One thing Dr. Mack did not note is that his patients gain a lot of attention by

being abductees. Furthermore, no mention was made of what he and Hopkins have to gain in fame and book sales by encouraging their clients to come up with more details of their "abductions". Mack received a \$200,000 advance for his first book on alien abductions. Mack also benefits by publicizing and soliciting funds for his Center for Psychology and Social Change and his Program for Extraordinary Experience Research. Dr. Mack, by the way, is very impressed by the fact that his patients' stories are very similar. He also believes in [auras](#) and has indicated that he believes that some of his wife's gynecological problems may be due to aliens. Harvard keeps him on staff in the name of academic freedom.

Another contributor to the mythology of alien abductions is Robert Bigelow, a wealthy Las Vegas businessman who likes to use his money to support paranormal research (see entry on [Charles Tart](#)) and who partially financed a Roper survey on alien abductions. The survey did not directly ask its 5,947 respondents if they had been abducted by aliens. Instead it asked them if they had undergone any of the following experiences:

--Waking up paralyzed with a sense of a strange person or presence or something else in the room.

--Experiencing a period of time of an hour or more, in which you were apparently lost, but you could not remember why, or where you had been.

--Seeing unusual lights or balls of light in a room without knowing what was causing them, or where they came from.

--Finding puzzling scars on your body and neither you nor anyone else remembering how you received them or where you got them.

--Feeling that you were actually flying through the air although you didn't know why or how.

Saying yes to 4 of the 5 "symptoms" was taken as evidence of alien abduction. A sixty-two page report, with an introduction by John Mack, was mailed to some 100,000 psychiatrists, psychologist and other mental health professionals. The implication was that some 4 million Americans or some 100,000,000 earthlings have been abducted by aliens. As Carl Sagan wryly commented: "It's surprising more of the neighbors haven't noticed." The timing of the mailing was impeccable: shortly before the CBS-TV miniseries based on Strieber's *Intruders*.

Some of those who claim to have been abducted by aliens are probably frauds, some are very stressed, and some are probably suffering from a severe

psychiatric disorder, but most seem to be fairly normal people who are especially fantasy-prone. Most do not seem to be money grabbers, using their weird experiences as a chance to get on television or to have movies made of their lives. In other words, the testimony is often, if not mostly, made by reasonably normal people without known ulterior motives. If their claims were not so bizarre, it would be indecent to distrust many of them. Defenders of the reasonableness of belief in alien abductions point to the fact that not all of the stories can be accounted for by confabulation. However, hypnosis and other suggestive means are often used to access memories of abduction. Hypnosis is not only an unreliable method of gaining access to accurate memories, it is a method that can be very easily used to implant memories. Furthermore, it is known that people who believe they have been abducted by aliens are very fantasy prone. Being fantasy-prone is not an abnormality, if abnormality is defined in terms of minority belief or behavior. The vast majority of humans are fantasy prone, otherwise they would not believe in God, angels, spirits, immortality, devils, ESP, Bigfoot, etc. A person can function "normally" in a million and one ways and hold the most irrational beliefs imaginable, as long as the irrational beliefs are culturally accepted delusions. Little effort is put forth to try to find out why people believe the religious stories they believe, for example, but when someone holds a view outside of the culture's accepted range of delusional phenomena, there seems to be a need to "explain" their beliefs.

shared cultural delusions

Those who claim to have been abducted by aliens may be neither crazy nor telling the truth. It might be better to think of them as sharing a cultural delusion. They are similar to the people who have [near-death experiences](#) of going down the dark tunnel to the bright light, or who see Jesus beckoning to them. These shared experiences do not prove that the experiences were not fantasies. They are likely due to similar brain states in the near-death experience, and similar life experiences and death expectations. The alternatives are not either that they are totally crazy or that they really did die, go to another world, and return to life. There is a naturalistic explanation in terms of brain states and shared cultural beliefs.

Alien abductees might also be seen as similar to mystics. Both believe they have experienced something denied to the rest of us. The only evidence for their experience is their belief that it happened and the account they give of it. There is no other evidence. The comparison of abductees to mystics is not as farfetched as it might at first seem. The accounts of mystical experiences fall into two basic categories: the ecstatic and the contemplative. Each type of mysticism has its history of anecdotes and testimonials. Like the stories of abductees, the stories of each type of mystic are very similar. Ecstatic mystics tend to describe their indescribable experiences in terms clearly analogous to sexual ecstasy. Going from darkness into the light recalls the birth experience. The contemplative mystics describe their experience of perfect peace and bliss in ways which are reminiscent of a good night's sleep. In the more

advanced stages of mysticism, the experience is clearly analogous to death: a state of total unity, i.e., no diversity, no change, no anything. In short, the fact that mystical experiences are described in similar ways by mystics born in different countries and in different centuries is not evidence of the authenticity of their experiences. The similarity speaks more to the uniformity of human experience. Every culture knows of birth, sex and death.

Abductees are very much analogous not only to mystics, but to medieval nuns who believed they'd been seduced by devils, to ancient Greek women who thought they'd had sex with animals, and to women who believed they were witches. The abductees' counselors and therapists are like the priests of old who do not challenge delusional beliefs, but encourage and nurture them. They do everything in their power to establish their stories as orthodox. It will be very hard to find an abductee who has not been heavily influenced in their belief by reading stories of aliens, or books like Strieber's *Communion* or *Intruders*, or by seeing movies featuring aliens. It will be even more difficult to find an abductee who has not been greatly encouraged in their delusion by a counselor like Hopkins or a therapist like Mack. Given a great deal of encouragement by a believing community, and reinforced by the high priests of the alien abduction cult, it is not very difficult to understand why there are so many people today who believe they have been abducted by aliens.

Yet, if there are beings clever enough to travel around the universe today, there probably were some equally intelligent beings who could have done so in ancient or medieval times. The delusions of the ancients and the medievals are not couched in terms of aliens and spacecraft because these are our century's creations. We can laugh at the idea of gods taking on the form of swans to seduce beautiful women, or of devils impregnating nuns, because they do not fit with our cultural prejudices and delusions. The ancients and medievals probably would have laughed at anyone who would have claimed to have been picked up by aliens from another planet for sex or reproductive surgery. The only reason anyone takes the abductees seriously today is because their delusions do not blatantly conflict with our cultural beliefs that intergalactic space travel is a real possibility and that it is highly probable that we are not the only inhabited planet in the universe. In other times, no one would have been able to take these claims seriously.

Of course, we should not rule out wishful thinking as being at work here. Although, it is a bit easier to understand why someone would wish to have a mystical experience than it is to grasp why anyone would want to be abducted by an alien. But the ease with which we accept that a person might want to have a mystical experience is related to our cultural prejudice in favor of belief in God and the desirability of union with God. The desire to transcend this life, to move to a higher plane, to leave this body, to be selected by a higher being for some special task....each of these can be seen in the desire to be abducted by aliens as easily as in the desire to be one with God or to have an [out-of-body experience \(OBE\)](#).

It is possible, too, that abductees may be describing similar hallucinations due to similar brain states, as Michael Persinger argues. Likewise, the ecstatic and contemplative accounts of mystics may be similar due to similar brain states associated with bodily detachment and a sense of transcendence. Using electrodes to stimulate specific parts of the brain, Persinger has duplicated the feelings of the sensed presence and other experiences associated with [near-death-experiences \(NDEs\)](#), OBEs, mystical experience and the alien abduction experience. The language and symbols of birth, sex and death may be nothing but analogues for brain states. Shared recollections of experiences do not prove that the experiences were not delusions. The experience which abductees think of as an alien abduction experience may be due to certain brain states. These states may be associated with [sleep paralysis](#) or other forms of sleep disturbances, including mild brain seizures. Sleep paralysis occurs in the [hypnagogic state](#) or the [hypnopompic state](#). The description abductees give of their experience--being unable to move or speak, feeling some sort of presence, feeling fear and an inability to cry out--is a list of the symptoms of sleep paralysis. Sleep paralysis is thought by some to account for not only many alien abduction delusions, but also other delusions involving paranormal or supernatural experiences.

There are, of course, certain psychiatric disorders which are characterized by delusions. Many people with these disorders are treated with drugs which affect the production or functioning of neurotransmitters. The treatments are very successful in eliminating the delusions. Persinger has treated at least one person with anti-seizure medication which effectively stopped her from having recurring experiences of the type described by alien abductees and those with sleep paralysis. Countless schizophrenics and manic-depressives, when properly medicated, cease having delusions about God, Satan, the FBI, the CIA, and aliens.

Even though the stories of alien abduction do not seem plausible, if there were physical evidence even the most hardened skeptic would have to take notice. Unfortunately, the only physical evidence that is offered is insubstantial. For example, so-called "ground scars" allegedly made by UFOs have been offered as proof that the aliens have landed. However, when scientists have examined these sites they have found them to be quite ordinary and the "scars" to be little more than fungus and other natural phenomena.

Many abductees point to various scars and "scoop marks" on their bodies as proof of abduction and experimentation. These marks are not extraordinary in any way and could be accounted for by quite ordinary injuries and experiences.

The most dramatic type of physical evidence would be the "implants" which many abductees claim the aliens have put up their noses or in various other parts of their anatomy. Budd Hopkins claims he has examined such an implant and has MRIs (magnetic resonance imaging) to prove numerous

implant claims. When Nova put out an offer to abductees to have scientists analyze and evaluate any alleged implants, they did not get a single person willing to have their so-called implants tested or verified. So, of all the evidence for abduction, the physical evidence seems to be the weakest.

Roswell

On or around Independence Day, 1947, during a severe thunderstorm near Roswell, New Mexico, an Air Force experiment using high altitude balloons blew apart and fell to the earth. This minor event in the history of reconnaissance turned out to be the Big Bang of UFOlogy. UFO enthusiasts have come to see that 4th of July as the day an alien spaceship crashed on earth. Some UFOlogists claim that aliens were taken away by the U.S. Air Force and other government co-conspirators for an interrogation or an autopsy. Some claim that all our modern technology was learned by analyzing and copying the technology of the aliens.

The actual crash site was on the Foster ranch 75 miles north of Roswell, [a small town doing a big business](#) feeding the insatiable appetite of UFO enthusiasts. Roswell now houses two UFO museums and hosts an annual alien festival. Shops cater to this curious tourist trade, much as Inverness caters to the Loch Ness crowd. This seems a bit unfair to Corona, New Mexico, since it is actually the closest town to the "crash site". Roswell is the nearest military base, however, and that is where the remains of the alien craft and its occupants were allegedly taken. Why the aliens were not taken to a superior medical facility remains a mystery.

William "Mac" Brazel (rhymes with dazzle), foreman of the Foster Ranch, along with a 7-year old girl, Dee Proctor, found the most famous debris in modern history. They had never seen anything like it before. Millions now agree: the stuff was strange. Actually, it was pretty mundane stuff, including a reinforcing tape whose flower-like design was taken to be alien hieroglyphics. Worse, the Air Force was not consistent in describing the debris. The Air Force has even had the audacity to claim that perhaps ardent UFOlogists have had a little trouble with their source memory. Perhaps what people are recalling as a single event was actually several events which occurred in different years (such as weather balloon and nuclear explosion detection balloon tests, airplane crashes with burned bodies, dumping of featureless dummies from airplanes, etc.). The likelihood that Roswell is a reconstruction involving many events over many years is supported by the fact that Roswell was ignored by UFOlogists until Charles Berlitz and William Moore published a book on the subject in 1980, more than thirty years after the event. This is the same Berlitz who popularized the myth of Atlantis and the urban legend regarding The Philadelphia Experiment. Berlitz is essentially an unreliable source who has made a career out of finding other unreliable sources to support his theories.

To the UFO buff, however, the suggestion that they have erred is ludicrous. Yet, they trust Berlitz and others with fantastic stories based on 30-year-old

memories. That the government made errors and was inconsistent is taken as sufficient evidence that there is a massive conspiracy by the government and mass media. They are trying to conceal the truth from the general public that the aliens have landed. Some even believe that the U.S. government has signed a treaty with the aliens. If so, let's hope the U.S. government is more faithful with the aliens than it was with the Native Americans.

Skeptics agree that something crashed near Roswell in 1947, but not an alien craft. Skeptical explanations have varied from weather balloons to secret aircraft to espionage devices. Current conventional wisdom among skeptics is that what was found on the Brazel ranch was part of Project Mogul, a top secret project testing giant, high-flying balloons to detect Soviet nuclear explosions.

The amount of energy expended on Roswell could probably support several alien galaxies for a million eons. It is enough to make a person believe in cranial cold fusion. To UFOers, Roswell is the resurrection, the proof of their faith. They have witnesses, they have inexplicable debris, and they have eyewitness accounts of the little creatures. They have proof after proof of government and media conspiracy and cover-up. They have an entertainment industry that tries to pass off itself as part of the news media, especially the Fox (Alien) Network. This industry consists of radio and TV talk show hosts, publishers and television producers of UFO "specials" on the Discovery Channel and A&E. This industry does little to provide useful information and a great deal to feed UFO enthusiasts hungry for "proof" of their confabulations and government cover-ups. They even have an inept forgery of a [filmed alien autopsy](#) which was shown to more than 10 million people in August 1995 on the Fox (Alien) Network. They've got Marketing Mecca.

To skeptics, Roswell is a classic example of what D.H. Rawcliffe called [retrospective falsification](#). A story of the extraordinary is told, then retold with embellishments and remodeled with favorable points being emphasized while unfavorable ones are dropped. False witnesses put in their two cents. In the case of Roswell, we also have a few unreliable characters who add their delusions, such as Whitley Strieber, Budd Hopkins and John Mack (see the [alien abduction](#) entry). There is also Robert Spencer Carr, the high school graduate who liked to be called "Professor Carr". Carr is a hero in the UFO literature, but his stories of flying saucers and alien creatures were all delusions. His son has written: "I am so very sorry that my father's pathological prevarication has turned out to be the foundation on which such a monstrous mountain of falsehoods has been heaped." It was that mountain of falsehoods that became part of the UFO memory, fixating conviction in a remarkable tale. It happened at Fatima (during a time when the only aliens thought to be visiting our planet were messengers from God) and it happened at Roswell. One might think, however, that unlike the belief in our Lady of Fatima and other beliefs in apparitions from the supernatural world, Roswell might be settled some day since it involves testable hypotheses and refutable

claims. Don't count on it. UFO enthusiasts are every bit as devoted to their belief system as religious fanatics are to theirs. Evidence and rational argument are of little concern to those who consider science fiction to be a wiser guide than science, logic and reasonable probability.

Area 51

"Area 51" is a part of an off-limits military base near Groom Dry Lake in Nevada. UFOers are sure it is used to hide aliens from us. The state of Nevada recently designated a barren 98-mile stretch of Route 375, which runs near Area 51, as the Extraterrestrial Highway. Such a move is no doubt proof of a government attempt to throw us off the track and think there is not a cover-up when there is one. This is a cover-up of the cover-up, typical of government agencies when dealing with sensitive information regarding UFOs and aliens.

Since you can be shot if you try to trespass on the military base where Area 51 is located, UFO tourists must view the sacred ground from a distant vantage point. Many do this, hoping for a glimpse of a UFO landing. Apparently, our government has a treaty with the aliens that allows them to fly into this area at will, as long as we can experiment on them and try to duplicate their aircraft. You don't really think that any *human* could have come up with the idea of the Stealth Bomber, do you?

Skeptics don't doubt that something secret is going on in area 51. And what is going on may be more sinister than building secret aircraft or developing new weapons. "Sixty Minutes" did a segment where Leslie Stahl suggested that area 51 might be an illegal dumping ground for toxic substances. If so, Area 51 might turn out to be hazardous to your health in more ways than one. Several former workers at Area 51 and widows of former workers have filed lawsuits against the government for injuries or death resulting from illegal hazardous waste practices. So far the government has been protected from such suits because of "national security." In fact, the government does not even acknowledge the existence of the base known as Area 51. Such denials, of course, do little more than provide more ammo for those who claim there is a government conspiracy to cover up just about anything it's ever been involved in.

[Scientists Debunk Spate of UFO Claims Tied to Sun-Observing Spacecraft 1-27-03](#)

[Modern World Kills Magic of UFOs - Technology and Culture Have Erased the Feeling of Wonder From Night Sky](#)
By Charley Lindsey
Sept 1, 2002

According to a Gallup poll (in 2001) belief in visitations from alien beings has increased from 27% to 33% over the last decade of the 20th century.

UFOs (unidentified flying objects)

"...nothing has come from the study of UFOs in the past 21 years that has added to scientific knowledge...further extensive study of UFOs probably cannot be justified in the expectation that science will be advanced thereby." -Edward U. Condon

A **UFO** is an **unidentified flying object** which has been identified as a possible or actual alien spacecraft. Such objects include meteors, disintegrating satellites, flocks of birds, aircraft, lights, weather balloons, and just about anything moving within the visible band of electromagnetism. So far, however, nothing has been positively identified as an alien spacecraft in a way required by common sense and science. That is, there has been no recurring identical UFO experience and there is no physical evidence in support of either a UFO flyby or landing.

There are as many photographs of UFOs as there are of the Loch Ness Monster, and they are of equal quality: blurs and forgeries. Other physical evidence, such as alleged debris from alien crashes, or burn marks on the ground from alien landings, or implants in noses or brains of alien abductees, have turned out to be quite terrestrial, including forgeries. The main reasons for believing in UFOs are the testimony of many people, the inability to distinguish science fiction from science, the willingness to trust incompetent men telling fantastic stories, the ability to distrust all contrary sources as being part of an evil conspiracy to withhold the truth, and a desire for contact with the world above. Belief in aliens in UFOs is akin to belief in supernatural beings..

"UFOlogy is the mythology of the space age. Rather than angels...we now have...extraterrestrials. It is the product of the creative imagination. It serves a poetic and existential function. It seeks to give man deeper roots and bearings in the universe. It is an expression of our hunger for mystery...our hope for transcendental meaning. The gods of Mt. Olympus have been transformed into space voyagers, transporting us by our dreams to other realms." --Paul Kurtz

Dr. J. Allen Hynek, astronomer, foremost proponent of UFOs, and the one who came up with the expression "close encounters of the third kind," defines a UFO as:

[T]he reported perception of an object or light seen in the sky or upon land the appearance, trajectory, and general dynamic and luminescent behavior of which do not suggest a logical, conventional explanation and which is not only mystifying to the original percipients but remains unidentified after close scrutiny of all available evidence by persons who are technically capable of making a common sense identification, if one is possible.

These mystifying words seem to say that when you see something which intelligent people cannot rationally explain, then you are seeing a UFO. Witnesses to such sightings often claim that what they saw could not be explained by the known laws of physics. They claim to have witnessed a violation of a law of nature, i.e., a [miracle](#).

What Hynek considers to be "all available evidence" may be much less than what a skeptic would

require. For example, the evidence appealed to by UFOlogists consists of (1) the testimony of people who claim to have seen aliens and/or alien spacecraft; (2) facts about the type of people who give the testimony; (3) the lack of contrary testimony or physical evidence that would either explain the sighting by conventional means (weather balloon, prank, meteor shower, reflection of light, etc.) or discredit the reliability of the eyewitness; and, (4) alleged weaknesses in the arguments of skeptics against the UFOlogists. The last item is irrelevant to the issue, yet it plays a disproportionately large role in UFOlogy.

Attacking an opponent's arguments or motives, instead of presenting positive evidence in defense of one's own view is common among defenders of the claim that UFOs are alien spacecraft. Of course, there is nothing wrong with attacking an opponent's argument and exposing weaknesses and faults thereby. But refutation is no substitute for support. It is simply faulty logic to assume that because an opponent's reasons are flawed, one's own reasons are valid. One's own reasons may be just as flawed as an opponent's, or even more flawed.

Another common tactic of UFOlogists is to claim that the skeptic cannot prove that what was seen was not an alien craft. One is supposed to infer from this fact that the perception probably was of an alien craft. This kind of reasoning is known as the argumentum ad ignorantiam. A claim does not become true or reasonable if a contrary claim cannot be proved to be true. With arguments for UFOs there are two distinct moves here. One is to claim that no logical explanation is possible because some scientist, pilot, Air Force Colonel, or Ph.D. cannot think of one. The other is to point to the lack of contrary evidence: no counter-testimony of other eyewitnesses, no proof that there were not aliens or alien spacecraft. Here, too, there is a logical error. The fact that some genius cannot come up with an explanation for something is irrelevant to deciding whether the correct explanation should be couched in terms of visitors from outer space. The choice is not either (A) we know this conventional explanation is correct, or (B) we must conclude that aliens have visited us.

It seems more reasonable to believe that the only reason we cannot explain these sightings by conventional means is because we do not have all the evidence; it is not because these sightings are probably due to alien visitations. If we had all the evidence, we would probably be able to explain the sightings by some conventional means. The fact that we cannot prove that Mr. and Mrs. Barney Hill were not abducted by aliens, does not support the hypothesis that they were [abducted by aliens](#).

Many UFOlogists think that if eyewitnesses such as Whitley Strieber, Betty and Barney Hill, or other alleged alien abductees are not insane or evil, then they cannot be deluded and are to be trusted with giving accurate accounts of alien abduction. Yet, it seems obvious that most sane, good, normal people are deluded about many things and not to be trusted about certain things. While it is generally reasonable to believe the testimony of sane, good, normal people with no ulterior motive, it does not follow that unless you can prove a person is deranged, evil, or a fraud that you should trust his or her testimony about any claim whatsoever. When the type of claim being made involves the incredible, additional evidence besides eyewitness testimony is required.

Would it be reasonable to convict a paraplegic of a crime on the basis of the testimony of ten pillars of the community who said they saw the defendant flying naked with angel's wings and snatch the purse from a little old lady? It is much more reasonable to believe that good people are doing evil things, or that they are deluded, than to believe a paraplegic could sprout wings and fly.

UFOlogists would rather follow their faulty logic than accept the conclusions of Project Blue Book, the U.S. Air Force report which states that "after twenty-two years of investigation...none of the unidentified objects reported and evaluated posed a threat to our national security." (It was in this Blue Book that [Edward Ruppelt](#) coined the term "UFO.") UFOlogists are unimpressed with the Condon Report, as well. Edward U. Condon was the head of a scientific research team which was contracted to the University of Colorado to examine the UFO issue. His report concluded that "nothing has come from the study of UFOs in the past 21 years that has added to scientific knowledge...further extensive study of UFOs probably cannot be justified in the expectation that science will be advanced thereby."

It is assumed by UFOlogists that the government, especially the CIA, is lying and covering up alien landings and communication. However, there is no evidence for this other than a general distrust of the government and the fact that many government officials have lied, distorted the truth and been mistaken when reporting to the general public. The CIA, however, has shown little interest in UFOs since about 1950, except to encourage UFOlogists to believe that reconnaissance flights might be alien craft. UFOlogists prefer another kind of lie to the government lie. They support the work of NBC, for example, which produced two dozen programs called "Project UFO," said to be based on Project Blue Book. However, unlike the Air Force, NBC suggested that there were documented cases of alien spacecraft sightings. The programs, produced by Jack Webb of *Dragnet* fame, distorted and falsified information to make the presentation look more believable. No UFOlogist took NBC to task for lying. To the skeptic, NBC was pandering to the taste of the viewing audience. Government agents lie for all sorts of reasons, but covering up alien landings does not seem to be one of them.

Most unidentified flying objects are eventually identified as hoaxes or astronomical events, aircraft, satellites, weather balloons, or other natural phenomena. In studies done by the Air Force, less than 2% of UFO sightings remain unidentifiable. It is more probable that with more information those 2% would be identified as meteors, aircraft, etc., than that they are alien spacecraft.

The reason no logical explanation seems credible to UFOlogists is probably because those making and hearing the reports either do not want to hear a logical explanation or they make little or no effort to find one. In any case, the fact that some pilots or scientists claim they cannot think of any logical explanations for some perceptual observations is hardly proof that they have observed alien spacecraft.

Finally, it should be noted that UFOs are usually observed by untrained skywatchers and almost never by professional or amateur astronomers, people who spend inordinate amounts of time observing the heavens above. One would think that astronomers would have spotted some of these alien craft. Perhaps the crafty aliens know that good scientists are skeptical and inquisitive. Such beings might pose a threat to the security of a story well-told.

[Rats blamed for mysterious cattle mutilations](#)

cattle "mutilations"

The term "mutilations" is used by [UFO](#) devotees to describe animal corpses with "unusual" or "inexplicable" features. What counts as "unusual" or "inexplicable" is just about any cut, mark, wound, excision, incision, swelling, distention, abrasion, contusion, scrape, bruise, or organ or blood absence. These "mutilations," we are told, are being done by bad aliens. No one has shown either that there are thousands of inexplicable animal deaths around the globe or that, if there are, they are related, much less that they are the result of alien experimentation. These facts, however, are no deterrent to those who are sure we are not alone. To them, these visitors from other worlds are not only responsible for the deaths and mutilations of thousands of cattle, horses, cats, and other domestic animals around the globe, they are also responsible for numerous [human abductions](#) for the purpose of experimental and reproductive surgery. Furthermore, some of these aliens are destroying [crops](#) around the globe in an effort to impress us with their artistic abilities or to communicate to us in strange symbols just how much they like our planet's cattle.

The belief that aliens have been killing and mutilating animals is supported by little more than an [argument to ignorance](#): Since there is a lack of evidence that aliens aren't responsible for the deaths or the post mortem conditions of the animals, it follows that the aliens are responsible. Defenders of this view reject the notion that there could be an earthly and naturalistic explanation. They are convinced that aliens need cow blood and organs for their experiments. What seems most convincing to the alien theorists is that "wounds" and missing organs such as the tongue and the genitalia seem completely inexplicable to them in any but mysterious terms, i.e., alien surgeons. Naturalistic explanations in terms of diseases such as lactic acidosis, predators (skunks, buzzards, weasels, etc.), insects (such as blowflies), and birds are to no avail, even though the most thorough examination of so-called cattle mutilations concluded there was nothing mysterious that needed explaining (Rommel 1980). It is useless to note that insects and animals often devour the vulnerable mucous membranes and the softer parts of dead animals such as the genitalia, instead of trying to burrow through the cowhide. It is pointless to note that incisions to a carcass by the teeth of predators or scavengers often resemble knife cuts. It is of no use to point out that there is little or no blood oozing from the wounds because blood settles, the heart does not pump when an animal is dead, and insects

devour the blood that does spill out. It is pointless to note that all the phenomena that seem unusual to those who favor the alien hypothesis are consistent with [lactic acidosis](#).

Typical of the alien surgeon accounts is that given in *An Alien Harvest* (1989) by Linda Moulton Howe, which includes photographs of wounds described as *weird, bizarre, suspicious* and *inexplicable*. She claims that her photos reveal

for the first time that tissue gathered from mutilator cuts in Arkansas on March 11, 1989, revealed the following characteristics under microscopic examination: 1) The line is pinpoint thin; 2) The line was subjected to high heat, probably 300 degrees Fahrenheit or above, leaving a hard and darkened edge; 3) The cuts were made rapidly, probably in two minutes or less, because there is no inflammatory cell destruction which typically begins in a few minutes after any trauma to tissue (See contrasting photomicrographs).

The photographs are considered to be "scientific proof" of unnatural happenings, even though the scientific community considers such photos to be of little significance. Even if the photos are not doctored, they need no explanation in terms of alien surgeons. But there is no point in suggesting anything earthly as probably being responsible for the cattle deaths or conditions, since those explanations have already been ruled out by such experts as Howe. The wounds are too weird, the lack of blood too bizarre, the coincidences too many, they say, for any naturalistic explanation.

Besides, if there were earthly explanations, one could not invoke the favored government conspiracy theory to juice up the story. Cattle mutilations are not only associated with UFO sightings, alien abductions, and crop circles, they are linked to black helicopter sightings as well. This suggests to the well-trained conspiratorial mind that our military forces are testing new weapons on the livestock of unsuspecting citizen ranchers. It shouldn't surprise anyone to find that the military thinks it is OK to experiment on cattle surreptitiously, since they've done it on people in the past. Another possibility, according to UFOlogists, is that the helicopters are UFOs disguised to appear as terrestrial craft. Some even think that the aliens have been in collusion with the Air Force for the past 30 years and that the animal mutilations are being performed by aliens with the full knowledge of our military. We allow it because of some sort of treaty the U.S. government supposedly signed with the aliens. You would think that such intelligent beings might have worked out a better arrangement.

Of course, inquiring minds want to know why beings with the intelligence and power to travel billions of miles to our planet would spend their time mutilating cows, experimenting on otherwise unremarkable people, or carving

up wheat fields. They need cow blood and glands for food and experiments. They are harvesting enzymes and are working on a genetic engineering project that will blend the Gray race (the aliens) with a Nordic race so they can interface with humans better. They are altering cow DNA to create some sort of artificial life form. They are carving up wheat fields with ever more elaborate designs to impress upon us how intelligent they are. Why would they come here and behave so preposterously? They're aliens and are beyond our comprehension. Nothing is preposterous for beings who are beyond our comprehension.

The Urantia Book

According to The Urantia Book Fellowship (UBF), *The Urantia Book* (UB) is

an anthology of 196 'papers' indited [i.e., dictated] between 1928 and 1935 by superhuman personalities.... The humans into whose hands the papers were delivered are now deceased. The means by which the papers were materialized was unique and is unknown to any living person.

The UB Fellowship was founded in 1955 as the Urantia Brotherhood and is an association of people who say they have been inspired by the "transformative teachings" of the UB. According to the UBF, these "superhuman personalities" are from another world. They synthesized the work of more than 1,000 human authors in a variety of fields, including an "astronomical-cosmological organization of the universe" unknown to modern science and an elaborate extension (700 pages) on the life of Jesus. The UB also reveals that the "Universe is literally teeming with inhabited planets, evolving life, civilizations in various states of development, celestial spheres, and spirit personalities." In short, the UB is over 2,000 pages of "revelations" from superhuman beings which "correct" the errors and omissions of the Bible. "Urantia" is the name these alleged superhumans gave to our planet. According to these supermortal beings, Earth is the 606th planet in Satania which is in Norlatiadek which is in Nebadon which is in Orvonton which revolves around Havona, all of which revolves around the center of infinity where God dwells.

Martin Gardner is skeptical of the UBF's claims. He believes the UB has very real *human* authors. Originally, he says, the UB was the "Bible" of a cult of separatist Seventh Day Adventists, allegedly [channeled](#) by Wilfred Kellogg and edited by founder William Sadler, a Chicago psychiatrist. According to Gardner, in addition to an array of bizarre claims about planets and names of angels, etc., the Urantia Book contains many Adventist doctrines. Sadler died in 1969 at the age of 94 but his spiritual group lives on. Sadler got his start working for [Dr. John Harvey Kellogg](#), Adventist surgeon, health and diet author, and brother of cornflake king William Keith Kellogg. These are the same Kellogg brothers who were featured and lampooned in the movie ["The Road to Wellville."](#)

One can easily understand why Gardner suspects that the UB has human rather than superhuman origins. The book has all the traits of humanity upon it. For example, our human philosophers and theologians are mimicked perfectly in passages such as the following:

The philosophers of the universes postulate a Trinity of Trinities, an existential-experiential Trinity Infinite, but they are not able to envisage its personalization; possibly it would equvalate to the person of the Universal Father on the conceptual level of the I AM. But irrespective of all this, the original Paradise Trinity is potentially infinite since the Universal Father actually is infinite. ([Foreword XII, The Trinities](#))

Any medieval casuist would be proud of such writing and thinking.

Primary supernaphim are the supernal servants of the Deities on the eternal Isle of Paradise. Never have they been known to depart from the paths of light and righteousness. The roll calls are complete; from eternity not one of this magnificent host has been lost. These high supernaphim are perfect beings, supreme in perfection, but they are not absonite, neither are they absolute. ([Paper 27](#))

Some UBFers are attracted not so much to the theology, but to its great insights. Here are a few of those insights culled from [paper 100, "Religion in Human Experience."](#) Ask yourself if a superhuman being was necessary to reveal these gems.

The experience of dynamic religious living transforms the mediocre individual into a personality of idealistic power....

Give every developing child a chance to grow his own religious experience....

Religious experience is markedly influenced by physical health, inherited temperament, and social environment....

Spiritual development depends, first, on the maintenance of a living spiritual connection with true spiritual forces....

The goal of human self-realization should be spiritual, not material....

Human likes and dislikes do not determine good and evil; moral values do not grow out of wish fulfillment or emotional frustration....

Jesus was an unusually cheerful person, but he was not a blind and unreasoning optimist....

If the philosophical, theological or spiritual insights do not impress you, then you might want to consider the scientific insights of the UB, such as the resurrection of the pre-Adamite thesis of [Isaac de la Peyrère](#) (1596-1676), who felt compelled to believe that the Bible is the history of the Jews, not of

all people, and that in order to explain things such as racial differences the most reasonable hypothesis is that races of people existed before Adam and Eve..

Not everyone agrees with Gardner's claim that the *Urantia Book* was channeled by Wilfred Kellogg. [Ernest Moyer](#), for example, believes that the UB is a revelation from God that appeared "out of thin air" in fully developed form, exactly as we know it today. Moyer claims that Sadler was put through a lengthy process by our "planetary supervisors" in order to prepare him to accept the UB as true revelations. The process began by introducing Sadler to the Sleeping Subject (SS), whose nocturnal ramblings would later be understood to be preparatory messages from extraterrestrial "midwayers." According to Moyer, "SS was a member of the Chicago Board of Trade, a highly pragmatic, hard-nosed business man who did not believe in 'psychic' phenomena or any such nonsense." Why SS was selected for this task is unknown, but Moyer assures us that the midwayers never took over SS's mind and came only at night when SS was unconscious so as not to disrupt his life too much. Moyer contrasts this with the evil spirit who invaded [Edgar Cayce](#) during the daytime, a sure sign that Cayce was a false prophet. Sadler was selected, according to Moyer, because of his personality and training.

Moyer is convinced that we are on the verge of a nuclear holocaust and that the UB offers advice on how to save oneself from destruction and what to do afterward. This is all part of God's plan, as revealed to Sadler. According to Moyer, "God is using this technique to screen the human race."

It seems to me that God tried this once before with water instead of nuclear bombs. Well, if at first you don't succeed....

auras

An aura, according to New Age metaphysics, is a colored outline, or set of contiguous outlines, allegedly emanating from the surface of an object. Auras are not to be confused with the aureoles or halos of saints, which are devices of Christian iconography used to depict the radiance of light associated with divine infusion. In the New Age, even the lowly amoeba has an aura, as does the mosquito and every lump of goat dung. The aura supposedly reflects a supernatural energy field or life force that permeates all things. Human auras allegedly emerge from the [chakras](#). Under ordinary

circumstances, auras are only visible to certain people with special psychic power. However, with a little bit of training, or with a special set of Aura Goggles with "pinacyanole bromide" filters (available at your local New Age Head Shop), anyone can see auras. You may also use [Kirlian photography](#) to capture auras on film. At least that is what New Age spiritualists believe.

On the other hand, you may also see auras if you have a [migraine](#), a certain form of [epilepsy](#), a [visual system disorder](#) or a [brain disorder](#). Most aura training exercises involve staring at an object placed against a white background in a dimly lit room. What one sees is due to retinal fatigue and other natural perceptual processes, not the unleashing of hidden psychic powers. Something similar happens when you stare at certain [colored or black and white patterns](#). Vision is not the verbatim recording of the outside world. When looking at a colored object, for example, the eye does not transmit to the brain a continuous series of duplicate impressions. The brain itself supplies much of the visual perception. In short, even if auras are perceived, that is not good evidence that there is an energy field in the physical or supernatural world corresponding to the perceptions.

Some psychics claim that the specific colors in auras have specific meanings. [Edgar Cayce](#), for example, not only gave a meaning to each of seven colors, he also connected each color with a note on the musical scale, a planet in the solar system, and possible health disorders. [Robert Bruce](#), an aura expert in his own mind, objects to the notion that specific colors have specific meanings. In his view, even colors have auras, so what color clothing you have on will affect the color of your aura. According to Bruce,

The human aura is both an energy field and a reflection of the subtle life energies within the body. These energies make us what we are and in turn, are affected by our surroundings and life style. The aura reflects our health, character, mental activity and emotional state. It also shows disease - often long before the onset of symptoms.

The notion that auras reflect health is a common one among true believers. The problem is, what color reflects what condition? There is no consensus on what the colors mean, which makes it difficult if not impossible to devise an empirical test to determine whether there is any correlation between specific colors and specific diseases. In other words, reading auras is something like reading [Rorschach tests](#) with the added difficulty of each psychic potentially seeing a different pattern.

For every other object of color we have scientific devices which can measure any energy emitted from the object, as well as the wavelengths of light reflected from the object. Even though equipment exists capable of measuring extremely minute energy levels, no one has ever detected an aura or the alleged energy that gives rise to an aura using scientific equipment. Human tissue is about a million times less sensitive than something like a PET scanner, yet we are supposed to believe that some special people can "see" what cannot otherwise be detected. Or, we are supposed to believe that we all have the power to see auras but somehow we have repressed or never trained our psychic selves to unleash the power within.

Furthermore, the best aura reader in the West was tested before a live television audience and failed miserably. The Berkeley Psychic Institute (BPI) sent their top aura reader for a chance to win \$10,000 if she could prove her powers. She agreed that the devised test was a fair and accurate. The test was televised on a program hosted by Bill Bixby. [James Randi](#) put up the \$10,000. The psychic was presented with about twenty people on stage and was asked if she could see their auras. She said that she could see the auras, they all had one and they emanated at least a foot or two above each person's head. The twenty aura-wearing people then went offstage. A curtain was lifted, revealing a number of partitions behind which only some of the twenty people were standing. Thus, Bixby and the psychic were looking at twenty partitions but only several of them had a person behind it. The psychic was asked if she could see any auras creeping up above the partitions. She said she could. To get her ten grand all she had to do was correctly identify each partition that had a person behind it. She was to do this by seeing each person's aura above the partition. The audience was given an aerial camera view of the proceeding. Well, the psychic claimed that she saw an aura above all the partitions and that there was a person behind each partition. The partitions were removed, revealing about 6 people behind the partitions. The psychic didn't even seem surprised. She might console herself that 6 out of 20 is not bad in a hostile arena.

Of course, the test only demonstrates the lack of aura reading power of one person, not that there is no such thing as an aura or that auras are not indicative of mental, emotional and physical health or sickness. However, Randi's offer is still open to any psychic who wants to try it, except that now the prize is over \$1,000,000. Why is there not a line of psychics outside Randi's house? If what the psychics say is true about auras and reading them, taking this money would be easier than taking candy from a baby. Even if there are no poor psychics who need the money, they might still demonstrate their powers and give the prize to their favorite charity.

The Berkeley Psychic Institute has a special place in my heart. One day a few years ago, I noticed a poster from BPI on a bulletin board near my office at Sacramento City College. In addition to information about BPI, the poster exclaimed: *You may not be psychotic, you may be psychic!* I wrote a note to our school psychologist who handled the "psychologically challenged" at the time. I told her I was concerned about the poster. She wrote me back and asked me how in the world did I know that she had attended BPI. (If I occasionally express a bit of disdain for psychologists and therapists, please keep in mind that I have had a traumatic adulthood, dotted with experiences such as this one.)

I was familiar with BPI from their work at an annual local affair. Every year in May at the University of California at Davis there is a Whole Earth Festival reminiscent of the sixties. For three days the campus is filled with tie-dyed shirts, psychedelic music, incense burning, children with flowers in their hair, marijuana smoking, gurus, massages with scented oils, handcrafts, the latest in New Age healing and religion, karma patrol (for those who overdose on drugs), etc. The Aura Reading Booth is run by BPI. For a few dollars, one sits in a chair in the great outdoors with the music playing, the incense wafting, and people swaying while someone from BPI reads your aura. Actually, the BPI psychic uses colored crayons to fill in a piece of paper pre-printed with a series of outlines in the vague shape of a person. Then the psychic tells you what your aura reveals. They only charge a few dollars and for the longest time I considered their activity a harmless parlor game. But now I feel I should put up posters near their booth saying, *If you see auras, you may not be psychic; you may have a brain or vision disorder. See your physician ASAP.*

Charles Tart (1937-)

"Anyone who thinks [the brain](#) is the total answer is ignorant." -- --

Charles Tart

A [parapsychologist](#) with a Ph.D. in psychology (University of North Carolina, 1963), known for his work on [lucid dreams](#), [astral projection](#), LSD, marijuana, and [ESP](#). After retiring from the University of California at Davis psychology department, he joined the [Institute of Transpersonal Psychology](#) in Palo Alto and spent a year developing a curriculum for [Robert Bigelow's](#) endowed [Chair of Consciousness Studies](#) at the University of Nevada at Las Vegas. Bigelow, a wealthy Las Vegas businessman with a penchant for funding paranormal research, gave nearly \$4 million to UNLV to teach courses on such subjects as dreams, meditation, hypnosis, out-of-body experiences, telepathy, and the ever-popular subject among college students, drug-induced altered states of consciousness. (In 1971, Tart authored *On Being Stoned: A Psychological Study of Marijuana Intoxication*.)

Early in his career, Tart edited a psychology text, *Altered States of Consciousness* (1969) and authored several of the articles in his anthology. He defined an [altered state of consciousness](#) (ASC) as one in which an individual "clearly feels a *qualitative* shift in his pattern of mental functioning." For those who prefer a behaviorist definition, he offered the following: "an ASC is a hypothetical construct invoked when an S's behavior (including the behavior of verbal report) is radically different from his ordinary behavior." Tart believes that Eastern Yoga and Zen had long been tapping into ASCs and that there was something mystical or spiritual, something superior or higher about these altered states of consciousness. For Tart, ASCs are a gateway to a higher consciousness, to the realm of the [paranormal](#) and the spiritual.

Tart considers a hypnotized person to be in an altered state, and one of the more unusual uses of [hypnosis](#) is described in his article "Psychedelic Experiences Associated with a Novel Hypnotic Procedure, Mutual Hypnosis." Tart's scientific experiment involved two people, or Ss, called A and B. Tart had A hypnotize B. Then, while under hypnosis, B hypnotized A. Then A would deepen B's hypnotic state; then B would deepen A's hypnotic state, "and so on." He wanted to see if he could increase the depth of hypnosis a given S could reach by having S *en rapport*, defined as "the special relationship supposed to exist between hypnotist and S." Says Tart: "I reasoned that if *rapport* was greatest in deep hypnotic states, a technique which markedly increased *rapport* would likely increase the depth of hypnosis" (292). Tart concluded: "Although this report is based on only two Ss, the results with them were dramatic enough to warrant considerable

research on mutual hypnosis” (307). He notes that mutual hypnosis “might offer a way to produce psychedelic experiences in the laboratory without the use of drugs and with more flexibility and control than is possible with drugs” (308).

Tart explains how he first got interested in the paranormal in the following story told at a talk he gave in Casper, Wyoming:

There was a time, years ago, when I was highly skeptical of any paranormal claims of any kind. One of the things that convinced me that there must be something to this is a strange experience that I personally went through. It was wartime. I was at Berkeley, California, and everybody was working overtime....the young lady who was my assistant at the time worked with me until very late this one night. She finally went home; I went home. Then the very next day she came in, all excited....She reported that during this night she had suddenly sat bolt upright in her bed, convinced that something terrible had happened. “I had a terrible sense of foreboding,” she said, but she did not know what had happened. “I immediately swung out of bed and went over to the window and looked outside to see if I could see anything that might have happened like an accident. I was just turning away from the window and suddenly the window shook violently. I couldn’t understand that. I went back to bed, woke up the next morning and listened to the radio.” A munitions ship at Port Chicago had exploded. It literally took Port Chicago off the map. It leveled the entire town and over 300 people were killed....She said she had sensed the moment when all these people were snuffed out in this mighty explosion. How would she have suddenly become terrified, jumped out of bed, gone to the window, and then - from 35 miles away, the shock wave had reached Berkeley and shook the window? (Randi 1992)

There is no need to perceive this event as paranormal, according to James Randi, who tape-recorded the story. A shock wave travels at different speeds through the ground and through the air. The difference over 35 miles would be about 8 seconds. Most likely the shaking earth woke up the young lady in a fright and 8 seconds later the window shook. She and Tart assumed that the explosion took place when the window shook, making her experience inexplicable by the known laws of physics. This explanation only makes sense, however, if one ignores the known laws of physics.

Tart once wrote, “The implications of ESP for understanding human nature are enormous, and call for extensive, high quality scientific research” (letter to the *New York Review*, February 19, 1981). Yet, Tart and other parapsychologists seem to have made little headway in justifying the first claim or in living up to the second (Randi 1982, 153; Gardner 1981, 211).

[What's the Deal With the Bright Light You See Before Dying? By Brendan I. Koerner \(Slate\) October 1, 2002](#)

['Near death experiences' probed - 11/30/01](#)

near-death experience (NDE)

One study found that 8 to 12 percent of 344 patients resuscitated after suffering cardiac arrest had NDEs and about 18% remembered some part of what happened when they were clinically dead (*Lancet*, December 15, 2001).*

A wide array of experiences reported by some people who have nearly died or who have thought they were going to die. There is no single shared experience reported by those who have had NDEs. Even the experiences of most interest to parapsychologists--such as the "mystical experience," the "light at the end of the tunnel" experience, the "life review" experience, and the out-of-body experience--rarely occur together in near-death experiences. However, the term NDE is most often used to refer to an OBE occurring while near death.

Two M.D.s who have popularized the idea that the NDE is proof of life after death are Elizabeth Kübler-Ross and [Raymond Moody](#). The former is well known for her work on death and dying. The latter has written several books on the subject of life after life, and has comprised a list of features he considers to be typical of the near-death experience. According to Moody, the typical NDE includes a buzzing or ringing noise, a sense of blissful peace, a feeling of floating out of one's body and observing it from above, moving through a tunnel into a bright light, meeting dead people, saints, Christ, angels, etc.; seeing one's life pass before one's eyes; and finding it all so wonderful that one doesn't want to return to one's body. This composite experience is based on interpretations of [testimonials](#) and anecdotes from doctors, nurses, and patients. Characteristic of Moody's work is the glaring omission of cases that don't fit his hypothesis. If Moody is to be believed, no one near death has had a horrifying experience.

There are numerous reports of bad NDE trips involving tortures by elves, giants, demons, etc. Some [parapsychologists](#) take these good and bad NDE trips as evidence of heaven and hell. They believe that some souls actually leave their bodies and go to the other world for a time before returning to their bodies. If so, then what is one to conclude from the fact that most people near death do not experience either the heavenly or the diabolical? Is that fact good evidence that there is no afterlife or that most people end up in some sort of limbo? Such reasoning is on par with supposing that dreams in which one appears to oneself to be outside of one's bed are to be taken as evidence of the soul or mind actually leaving the body during sleep.

What little research there has been in this field indicates that the experiences Moody lists as typical of the NDE may be due to brain states triggered by

cardiac arrest and anesthesia (Blackmore 1993). Furthermore, many people who have not been near death have had experiences that seem identical to NDEs. These mimicking experiences are often the result of psychosis (due to severe neurochemical imbalance) or drug usage, such as hashish, LSD, or [DMT](#).

Moody thinks that NDEs prove the existence of life after death. Skeptics believe that NDEs can be explained by neurochemistry and are the result of brain states that occur due to a dying, demented or drugged brain. For example, neural noise and retino-cortical mapping explain the common experience of passage down a tunnel from darkness into a bright light. According to [Susan Blackmore](#), vision researcher Dr. Tomasz S. Troscianko of the University of Bristol speculated:

If you started with very little neural noise and it gradually increased, the effect would be of a light at the centre getting larger and larger and hence closer and closer....the tunnel would appear to move as the noise levels increased and the central light got larger and larger....If the whole cortex became so noisy that all the cells were firing fast, the whole area would appear light (Blackmore 1993, 85).

Blackmore attributes the feelings of extreme peacefulness of the NDE to the release of endorphins in response to the extreme stress of the situation. The buzzing or ringing sound is attributed to [cerebral anoxia](#) and consequent effects upon the connections between brain cells (op. cit. 64).

Dr. Karl Jansen has reproduced NDEs with ketamine, a short-acting, hallucinogenic, dissociative anaesthetic.

The anaesthesia is the result of the patient being so 'dissociated' and 'removed from their body' that it is possible to carry out surgical procedures. This is wholly different from the 'unconsciousness' produced by conventional anesthetics, although ketamine is also an excellent analgesic (pain killer) by a different route (i.e. not due to dissociation). Ketamine is related to phencyclidine (PCP). Both drugs are arylcyclohexylamines - they are not opioids and are not related to LSD. In contrast to PCP, ketamine is relatively safe, is much shorter acting, is an uncontrolled drug in most countries, and remains in use as an anaesthetic for children in industrialised countries and all ages in the third world as it is cheap and easy to use. Anaesthetists prevent patients from having NDE's ('emergence phenomena') by the co-administration of sedatives which produce 'true' unconsciousness rather than dissociation.*

According to Dr. Jansen, ketamine can reproduce all the main features of the NDE, including travel through a dark tunnel into the light, the feeling that one is dead, communing with God, hallucinations, out-of-body experiences, strange noises, etc. This does not prove that there is no life after death, but it does prove that an NDE is not proof of an afterlife.

While neural activity might explain bright lights, buzzing noises, and hallucinations, there are some aspects of some NDEs that still remain puzzling. Some people who are thought to be dead, but are actually just unconscious, recover and remember things like looking down and seeing their own bodies being worked on by doctors and nurses. They recall conversations being held while they were "dead." Of course, they weren't dead at all, but they feel as if their mind or soul had left their body and was observing it from above. Those who have had such experiences--and they are many--often find them life-altering and defining moments. They are convinced such experiences are proof of life after death by a disembodied consciousness. But are they? It is possible that a person may appear dead to our senses or our scientific equipment but still be perceiving. The visual and auditory perceptions occurring while unconscious-but-perceiving may be produced by a variety of neuronal mechanisms. It is possible that the soul leaves the body, but it is not necessary to posit a soul to explain these experiences.

[Raymond Quigg Lawrence](#) (*Blinded by the Light*) thinks that NDEs are the work of [Satan](#). Perhaps. Or, they may be telepathic communications from doctors, nurses, or others in attendance when the subject is near death. Or, they may be mixed memories composed after waking up and hearing others talk about what was happening while one was near death. Or, they may be recollections of subconsciously recorded data overheard while in a groggy state. At this point in our knowledge, to claim that NDEs provide proof that the soul exists independently of the body seems very premature.

[Hit The O-Spot For Out-of-Body Had an out-of-body experience? Scientists believe they know why BY JEFFREY KLUGER Time.com 9/26/2002](#)

out-of-body experience (OBE)

Surveys show that about 15% to 20% of the population have had an OBE at some time during their life (Blackmore, 1982).

A feeling of departing from one's physical body and observing both one's self and the world from outside of one's body. The experience is quite common in [dreams](#), daydreams, and [memories](#), where we quite often take the external perspective. Some people experience an OBE while under the influence of an anesthetic or while semi-conscious due to trauma. Some people have an OBE while under the influence of drugs. OBEs have been induced by electrically stimulating the right angular gyrus (located at the juncture of the temporal and parietal lobes).^{*} Finally, some people experience an OBE when they are near death ([near-death experiences](#) or NDEs).

Susan Blackmore, a former parapsychologist with heavy skeptical leanings, is considered one of the world's leading authorities on OBEs and NDEs. She had an OBE while attending Oxford University during the early 1970s. By her own admission she "spent much of the time stoned, experimenting with different drugs" (Shermer 1998). During her first year at Oxford she had an OBE after several hours on the [Ouija board](#) while stoned on marijuana. The experience also occurred during a period of her life when sleep deprivation was common for her. She describes herself as having been in "a fairly peculiar state of mind" when she had the OBE (ibid.).

In her OBE, Blackmore went down a tunnel of trees toward a light, floated on the ceiling and observed her body below, saw a silver cord connecting her floating [astral body](#), floated out of the building around Oxford and then over England, and finally across the Atlantic to New York. (In *An Unquiet Mind*, [Kay Redford Jamison](#), who suffers from bipolar disorder, describes a similar voyage to Jupiter while she was enjoying the manic phase of her mental illness.)

After hovering around New York, Blackmore floated back to her room in Oxford where she became very small and entered her body's toes. Then she grew very big, as big as a planet at first, and then she filled the solar system and finally she became as large as the universe.

Blackmore attributes her experience to peculiar brain processes such as might cause "neuronal disinhibition in the visual cortex," which is her explanation for hallucinations and NDEs. She did not consider investigating abnormal psychology, where she would find many similar cases of Alice-in-Wonderland voyagers. Instead, she says that she devoted her study to [astral](#)

[projection](#) and [theosophy](#), hoping to find an answer. Her experience with the silver cord is right out of traditional occult literature on astral projection.

One explanation of the OBE is that consciousness is a separate entity from the body ([dualism](#)) and can exist without the body and the body without it. The disembodied consciousness can 'see,' 'hear,' 'feel,' 'taste' and 'smell'. Some speculate that 'mind', 'spirit', or 'consciousness' can operate over vast distances and perceive objects by some mysterious power not yet discovered. Others think that they are due to brain states triggered by disease or stress.

If minds were leaving bodies, one would expect that there would be minds out of their bodies everywhere. You'd think that there'd be a mix-up occasionally and one or two souls or astral bodies would come back to the wrong physical bodies, or at least get their silver cords tangled up. One would expect some minds to get lost and never find their way back to their bodies. There should be at least a few mindless bodies wandering or lying around, abandoned by their souls as unnecessary baggage. There should also be a few confused souls who don't know who they are because they're in the wrong bodies.

My suspicion is that the neuroscientists are on the right track, and that someday we will understand the pathology of the OBE. That is not to say that these experiences are not real. For example, one of my students has been having OBEs since she was seven. She's now 19 and says she has six or more OBEs a year. They only occur at night when she is in bed and they are all spontaneous. Even though she was, and remains, frightened by these experiences (because she fears she is dying and will not return to her body), she told me she used to think everybody had them. She's been to heaven and has seen Jesus and her guardian angels (she says we all have *two*). They were very large and dressed in white, though Jesus wore a purple sash. She told me she's very spiritual and suffers from migraines but has never seen a doctor about them because her family doesn't believe one should go to a doctor unless one is at death's door. Does her mind leave her body? Or is her brain playing tricks on her? I strongly suspect the latter, but even if it were discovered that she has a brain abnormality that is causing both her migraines and her OBEs, it is still theoretically possible that her mind leaves her body and that her experiences are not hallucinations. I suppose it is also theoretically possible that her experiences are paranormal. Maybe she's getting [telepathic](#) messages from her mother, who is very spiritual, too. Either way, these experiences seem to define her existence.

sleep paralysis

Sleep paralysis is a condition that occurs in the state just before dropping off to sleep ([the hypnagogic state](#)) or just before fully awakening from sleep ([the hypnopompic state](#)). The condition is characterized by being unable to move or speak. It is often associated with a feeling that there is some sort of presence, a feeling which often arouses fear but is also accompanied by an inability to cry out. The paralysis may last only a few seconds. The description of the symptoms of sleep paralysis is similar to the description many alien abductees give in recounting their abduction experiences. Sleep paralysis is thought by some to account for not only many [alien abduction](#) delusions, but also other delusions involving [paranormal](#) or supernatural experiences.

Sleep paralysis is something many people experience once or twice in a lifetime but it is a frequent occurrence of those suffering from [narcolepsy](#).

[Crop circle secrets revealed](#) Oct. 8, 2002

[Harvesting a hoax: The new movie 'Signs' exploits the corny crop-circle phenomenon](#) by Jami Bernard

[Experts 'amazed' by crop circle designs](#) BBC July 19, 2002

crop circles

Crop circles are geometric patterns, some very [intricate and complex](#), appearing in fields, usually wheat fields and usually in England. Most, if not all, of them are probably due to pranksters, such as Doug Bower and David Chorley who, in 1991, admitted to hoaxing approximately 250 circles over many years. There is a segment of the population that believes the circles are messages from alien spacecraft. Some maintain that the aliens are trying to communicate with us using ancient Sumerian symbols or symbolic representations of alien DNA. Those who engage in such serious study and theorizing about crop circles are known as *cerealogists* (after Ceres, the Roman goddess of agriculture and fertility) or *croppies*.

Even scientifically minded people have been brought into this fray. They have wisely avoided the thesis that aliens have been carving out messages in crop fields. But they have stretched their imaginations to come up with theories of vortexes, ball lightning, plasma and other less occult explanations involving natural forces such as wind, heat, or animals. However, when looking for a naturalistic explanation of weird things we should never omit from our checklist the possibility that the phenomenon we are studying is a hoax, such as [Pitdown Man](#) and the [Cardiff Giant](#).

Had crop circles existed in the thirteenth century, they would have been attributed to [Satan](#), who was said to have been responsible for many weird happenings as well as for many unweird things, such as the construction of Stonehenge and Hadrian's wall between England and Scotland. It was believed by many that the ancients could not possibly have accomplished such feats on their own. Today, Satan's power as an explanation for weird or wondrous things has been usurped by [aliens](#).

See **related entries** on [alien abductions](#), [cattle mutilations](#), [flying saucers](#), and [UFOs and ETs](#).

"Earth is Missing"

flying saucers

On June 24, 1947, Kenneth Arnold claimed that he'd seen nine "crescent shaped" aircraft flying erratically at incredible speeds near Mount Rainier. He said they reminded him of saucers skimming over water. An editor of the *Eastern Oregonian* reported that Arnold saw "round" objects. Other reports noted "disc-shaped" objects. Within a few weeks, there were hundreds of reports nationwide of sightings of flying "saucers".

The fact that so many [UFO](#) and [alien](#) sightings conform to rather standard depictions is taken by some as evidence that the observers are not mistaken. They must be seeing the same things. It is more likely that they see what they see because of their expectations, which are based on stereotypes created largely by the mass media. In this respect, and maybe some others as well, UFO an alien sightings might be compared to [Santa Claus](#) sightings.

the Men in Black (M.I.B.)

The **Men in Black** are believed to be very strange creatures, perhaps aliens or government agents, who visit [UFO](#) witnesses and warn them not to tell anyone about their UFO experiences.

[John Keel in *The Mothman Prophecies*](#) (1975) talks about the M.I.B., as did Gray Barker in *They Knew Too Much About Flying Saucers* (1956). The M.I.B. are said to favor older model dark Cadillacs. They don't like to be photographed, though they have been reported to dress in black. Their mystique may soon wear off, however, as [a film, a TV series, a magazine and a video game](#) have been developed around their strange antics.

John Sherwood (a.k.a. Dr. Richard H. Pratt) has come clean about the role Gray Barker, head of Saucerian Publications, played in perpetuating the myth of the M.I.B. "*They Knew Too Much About Flying Saucers* made the Men In Black feared within UFO circles during the late 1950's and 1960's," claims Sherwood, but the book was impure fiction, written purely to make money with little concern for facts. It was Barker who published a 17-year old Sherwood's *Flying Saucers are Watching You*, which the author now claims was his "only corrupt journalistic experience," i.e., he wrote with little concern for the difference between fact and fiction. Sherwood admits that he encouraged the hoax by playing along when UFOers tagged him as having been silenced by the M.I.B.

Mass Media Bunk

1

February 27, 1996. *Nova*, Alien Abductions.

It wouldn't be fair to characterize the *Nova* program on [alien abductions](#) as pure bunk, but this program definitely did not live up to a very high standard of scientific scrutiny of extraordinary claims. It was to be expected that *Nova* would give advocates such as John Mack and Budd Hopkins a chance to state their case. What I did not expect was to see an hour-long program devoted mostly to the incompetent, if well-meaning, Mr. Hopkins. The cameras followed Hopkins through session after session with a very agitated, highly emotional "patient" and then on to Florida as he cheerfully helped a seemingly unstable Florida woman inculcate in her children the belief that they had been abducted by aliens. In between more sessions with more of Hopkin's "patients," we had to listen to him again and again give plugs for his books and his reasons for showing no skepticism at all at very bizarre claims of humans being experimented on by aliens.

Dr. Mack was also given a very good amount of time to defend his work as a Harvard psychiatrist who cannot come up with a better explanation than that these people who think they've been abducted by aliens have really been abducted by aliens. He lists as reasons for believing the accounts are true the fact that his patients are not mentally ill (why does he treat them, then?), that they are otherwise normal people (that's a debatable point I might have granted him before I heard some of Hopkin's patients tell their stories), that they have nothing to gain by making this stuff up (no mention was made of what he and Hopkins have to gain by encouraging these people to come up with more details of their "abductions" rather than start from the assumption that they are probably deluded), and that their stories are very similar (which could well be because they've all read the same stories and seen the same movies).

The skeptics did have their say, but my guess is that they were given one minute for every four or five given to the abductee advocates. Carl Sagan, looking very old and wan, spoke eloquently, if briefly, to the issue of scientific skepticism and the lack of good evidence that aliens from outer space are here amongst us, much less kidnapping some of our most imaginative and emotional citizens for reproductive experimentation. He noted that anecdotes are all we have for this belief and anecdotes are not good evidence for scientific proofs.

Elizabeth Loftus was brought in for a few minutes to comment on memory construction in patients by "therapists" and to evaluate Hopkin's method of "counseling" the children whose mother was encouraging them to believe they'd been abducted by aliens. Dr. Loftus noted that Hopkins did a lot of encouraging to

remember more details, as well as giving a lot of verbal rewarding when new details were brought forth. She characterized the procedure as "risky," because we don't know what effect this "counseling" will have on the children. I think we can safely predict one effect: they will grow up thinking they've been abducted by aliens and this belief will be so embedded in their memory that it will be practically impossible to get them to even consider the possibility that the "experience" was planted by their mother and cultivated by characters like Hopkins.

Several other skeptics were also interviewed. A psychologist offered the explanation that the abductees were deluded, but no attempt was made to explore very deeply why this particular delusion is so widespread. Another was a physicist who echoed some of Sagan's concerns about the lack of empirical evidence for the claim of alien visitation. (All these people over so many years in so many countries and not one souvenir! How inhuman!) Another skeptic interview was a Michael Persinger, a psychologist who offered an explanation in terms of brain states which he apparently was trying to duplicate in a lab.

I don't believe that everything in the universe can be explained, but I think the viewers of *Nova* deserve more than brief attempts of one or two skeptics to account for so many people having the same delusion. Otherwise, Mack's view will seem reasonable to many people: since there aren't any good explanations in terms of pathology, the best explanation is that the anecdotes of alien abduction are based on real experiences.

There was a beginning of an explanation in noting that the similarity of accounts counts *against* rather than for their being accounts of real events. Too much similarity indicates they've been influenced by the same written and visual sources, stories and movies. But the next step is to try to account for why these people are susceptible to these stories and why it is easy to get them to develop and expand them. It may seem to be begging the question to assume that a "normal" person would be skeptical of such stories and rather than be tempted to accept them and re-evaluate their own experience in terms of them, would find them unbelievable on their face. But I think it is a reasonable assumption to make. Thus, despite the fact that the abductees seem "normal," I would take as a working hypothesis that they are not normal, reasonable people, despite the fact that they may function well-enough in society or in their circle of family and friends. I would not go so far as to call such people functional psychotics, but I think the term "functional delusional" would be fairly accurate. That is a term I would also use to describe many religious believers. I do not think it is an accident that the beliefs of abductees and religious devotees seem very similar. A person can function "normally" in a million and one ways and hold the most irrational religious beliefs imaginable. Since religion is a culturally accepted delusion, this is not seen as being very strange and little effort is put forth to try to find out why people believe the religious stories they believe. But when someone holds a view outside of the culture's accepted range of delusional phenomena, there seems to be a need to "explain" their beliefs. There is, of course, one aspect of the abductees' beliefs that differs from most, but certainly not all, religious believers: the belief is based on an "experience." Here, the closest analogue in religion seems to be the mystical experience. Thus, it might be best to start with the assumption that abductees are like mystics: they believe they have experienced something denied to the rest of us. The only evidence for their experience is their own belief that it happened and the account they give of it. There is no other evidence.

The comparison of abductees with mystics is not as farfetched as it might at first seem. Think of the history of mysticism. The accounts of mystical experiences fall into two basic categories: the ecstatic and the contemplative. Each type of mysticism has its own history of accounts, its anecdotes and testimonials. And, like the stories of abductees, the stories of each type of mystic are very similar, too. Ecstatic mystics tend to describe their indescribable experiences in terms clearly analogous to sexual ecstasy. Going from darkness into the light recalls the birth experience. The contemplative mystics describe their experience of perfect peace and bliss in ways that anyone who has had a good night's sleep could identify with. Or, in the more advanced stages of mysticism, the experience is clearly analogous to death: a state of total unity, i.e., no diversity, no change, no anything. In short, the fact that mystical experiences are described in similar ways by mystics born in different countries and in different centuries, is not evidence of the authenticity of their experiences, but speaks more to the uniformity of human experience. Every culture knows of birth, sex and death.

On the other hand, the ecstatic and contemplative accounts of mystics may be similar due to similar brain states associated with bodily detachment and a sense of transcendence. The language and symbols of birth, sex and death may be nothing but analogues for brain states. Abductees may be describing similar hallucinations due to similar brain states.

Even more to the point might be the similarity of accounts given by those who have had [near death experiences \(NDE\)](#). It seems most reasonable to think that the accounts reflect similar beliefs before the experience rather than similar experiences in the "other world."

But there is more than just this similarity of how abductees's stories have common threads and so do the stories of mystics and NDE's. Still, this similarity helps see how the fact that stories are similar does not give very good evidence that the stories are therefore authentic accounts of actual similar experiences. More important, though, is the delusional nature of mysticism and out-of-body experiences ([OBE's](#)). If we can explain why people believe they have had mystical experiences or OBE's, we ought to be able to explain why people believe they've been abducted by aliens.

I don't think we should rule out good old-fashioned wishful thinking as being at work here. Although, it is a bit easier to understand why someone would wish to have a mystical experience than it is to grasp why anyone would want to be abducted by an alien. But, the ease with which we accept that a person might want to have a mystical experience is related to our cultural prejudice in favor of belief in God and the desirability of union with God. The desire to transcend this life, to move to a higher plane, to leave this body, to be selected by a higher being for some special task....each of these can be seen in the desire to be abducted by aliens as easily as in the desire to be one with God or to have an OBE.

If there are beings clever enough to travel around the universe today, there probably were some equally intelligent beings who could have done so in ancient or medieval times. The delusions of the ancients and the medievals are not couched in terms of aliens and spacecraft because these are our century's creations. We can laugh at the idea of gods taking on the form of swans to seduce beautiful women. We can laugh

at the idea because it doesn't fit with our cultural prejudices and delusions. We can laugh at the idea of devils impregnating nuns because it doesn't fit with our cultural prejudices and delusions. The ancients and medievals probably would have laughed at anyone in their times who would have claimed to have been picked up by aliens from another planet for reproductive surgery. The only reason anyone takes the abductees seriously today is because their delusions do not blatantly conflict with our cultural beliefs that intergalactic space travel is a real possibility and that it is highly probable that we are not the only inhabited planet in the universe. In other times, no one would have been able to take these claims seriously.

Abductees are analogous to mystics and OBE's, or to medieval nuns who believed they'd been seduced by devils, or to ancient Greek women who thought they'd had sex with animals, or even to women who came to believe they were witches after hearing their priest read from the Bull on witches of Pope Innocent VIII or from a book on how to identify witches such as *The Witch Hammer*. And their counselors and therapists are like the priests of old who are there not to challenge beliefs, but to encourage them, to nurture them, to do everything in their power to establish their stories as orthodox. My guess would be that it will very hard to find an abductee who has not been heavily influenced into their belief by reading stories of aliens, or books like *Communion* or *Intruders*, or by seeing movies featuring aliens. It will be even more difficult to find an abductee who hasn't been greatly encouraged in their delusion by a counselor like Hopkins or a therapist like Mack. Given a great deal of encouragement by a believing community, and reinforced by the high priests, is it really that difficult to understand why there are so many people today who believe they have been abducted by aliens? I don't think so.

The only question that I find interesting and challenging in all this is the question as to what makes certain people susceptible to such beliefs, while other people would never be tempted to have such delusions. We can list a few items we have good reason to believe are *not* at work here. Intelligence is probably not a significant factor. Abductees and their high priests seem to be as intelligent or unintelligent as the rest of us. Brain disease, or serious chemical imbalance, is not likely a factor in most cases. Brainwashing is an unlikely factor. Even childhood experiences or upbringing are not likely factors. But when we try to identify factors which are common to the "true believers" but absent from the "skeptics" and vice-versa, it is difficult to establish such lists of characteristics with confidence.

About the only characteristics which I think are common to the abductees are the qualities of "vivid imagination" and very strong emotional response to experience. However, many skeptics could be said to have both vivid imaginations and very strong emotions. So, those qualities in themselves don't seem to explain anything. However, one characteristic which seems apparent in abductees and is lacking in most, if not all, skeptics, is a strong tendency to be suggestible. It may well be the case that while abductees and skeptics might be described as having strong emotions, the way the emotions function in an abductee's life is quite different from how they function in a skeptic's life. A skeptic may get quite agitated at people who refuse to examine evidence or who don't seem to have a clue as to what counts as a controlled experiment. A skeptic may be overcome with sadness at the credulity and gullibility of others, especially people he or she loves. But I think it would be a rare skeptic whose emotions so dominate their experience that they become very suggestible or very vulnerable to ideas offered by simpatico fellow travelers or high priests who

seem to placate or explain their feelings. It may not be simply that the abductees have strong emotions; they may be much more self-conscious of their feelings and emotions, much more likely to say they are experiencing "vague" or "strange" or "inexplicable" feelings. This is not the same as being in tune with one's feelings. It is more like being constantly aware of being uneasy but without any sense as to why you should feel that way. And it certainly is not the same as having strong emotions.

I am obviously outside of my field of expertise in speculating as to what might explain thousands of people having a common delusion of being abducted by aliens. I am not nearly as sorry for having speculated on the matter, however, as I am that *Nova* made only a minimal effort to provide a skeptical psychologist's attempt to explain this phenomenon. I would have preferred a program that spend 45 minutes with Dr. Robert Baker, the skeptical psychologist, than one which spend 45 minutes with the likes of Hopkins and Mack from whom I learned nothing of value. I would also have preferred a program which would have included all of the footage *Nova* took of an interview with Philip Klass where he offered his analysis based on thirty years of investigating UFO reports. Instead, all the Klass footage ended up on the editing room floor.

Finally, I would have preferred to have heard more from Dr. Loftus regarding the role counselors and hypnotherapists play in creating memories in their patients. From the little that *Nova* showed us of Hopkins at work, it was apparent that Mr. Hopkins encouraged the creation of memories. A little comparison with the [Bridey Murphy](#) case or other past-life regression cases would have been in order, too.

Postscript. I have just finished reading the many responses to the *Nova* program on their [UFO Feedback Page](#). Apparently, I am only one of a very small number who thought the program was "too fair" to Hopkins and Mack. Most of the feedback was critical of the show for debunking the alien abduction notion and its advocates. Many of the critics of the show were dismayed that *Nova* did not examine the "scientific evidence" for abduction and spent all of its time promoting the hypothesis that all alien abduction stories are based on false memories implanted by therapists. I would agree that the show spent too much time dealing with therapy, but I think Hopkins and Mack were certainly given more than enough opportunity to make their case...much more opportunity than the false memory advocates Loftus and Baker.

The criticisms of the show (including my own) should remind us of how we want the media to be our advocates, to present things the way we see them, and when they don't we criticize them for being "biased" and "unfair" or, in this case, "unscientific." In addition, given the volume of specific criticisms they received, I think *Nova* might do well to consider doing another program on the subject which focuses on the "scientific" evidence for visitation and abduction, such as scoop marks on legs, scars and soil. Apparently, the program did include some footage of this "evidence" but it did not make its way to the final program. *Nova* has posted online some of the interviews it did for the program. The interviews, as well as other material *Nova* posts for teachers who might want to use the *Nova* program in the classroom, are located at their site called [Exploring the Alien Abduction Phenomenon](#). If I had read all the material posted, especially the stuff for teachers to use to get their students to

think about memory construction or evaluating the theories of von Daniken and Reichert about Peruvian land drawings (alien airport or native calendar), I would have viewed the program in a very different light. I would have seen it as many of the critics saw it: an attempt to explain alien abductions as hypnogogic hallucinations nurtured into false memories by therapists. I would also have better appreciated what I thought was going overboard to let Hopkins and Mack present their case. This was part of a lesson plan emphasizing the problem of evaluating competing explanations of the same phenomenon. If a skeptic views the entire package, the *Nova* WWW site and the TV program on alien abductions, he or she will probably see that the program is much more skeptical than if one viewed only the TV program.

Imagine what response *Nova* would have gotten if it presented another explanation that compared belief in having been abducted by aliens with belief in having had a mystical experience or having been blessed with a vision of the Virgin Mary.

February 25, 1996. NBC: [The Mysterious Origins of Man](#) by Dave Thomas. I have nothing to add to this review of a show featuring Charlton Heston spewing anti-science propoganda.

February 23, 1996. Ann Landers, (from the *Davis Enterprise*). Today, Ann Landers gave a boost to alternative medicine quackery by not responding to the illogical reasoning of P.W. from Taiwan regarding Western medicine men versus Chinese herbalists. P.W., a European married to a Taiwanese, wrote that while in Europe his wife had become pregnant three times and each time she miscarried due to fetal chromosomal abnormalities. Their European doctors declared the couple to be "healthy" and apparently gave them every indication that they were just unlucky. This evaluation was "depressing," says P.W.

The barren couple went East and in Taiwan their gynecologist gave them "a bag full of herbs" which they were instructed to take for a year. Halfway through the "treatment" Mrs. W. became pregnant. At the time the letter was written their son was 10 months old.

P.W. implored Ann: "Please, Ann, tell your readers in the West that couples who cannot have a child do not necessarily have a problem. The problem might be with their specialists, whose Western knowledge of the human body is sometimes quite limited." Now, I think most Western physicians would admit that their knowledge of the human body is often limited, but it hardly relates to P.W.'s situation. He assumes that the Chinese herbalist, who spoke of "harmony and balance in the body and mind," was instrumental in his wife's pregnancy. Furthermore, he assumes that the Western specialists were wrong in attributing their problem to bad luck. What evidence does P.W. have for these notions? The only "evidence" he has is the fact that his wife got pregnant after taking the herbs. This bit of [post hoc reasoning](#) is totally insufficient to warrant P.W.'s conclusions and Ann Landers should have let him know that. Instead, she replied:

I'm for whatever works. Considering the number of people who die from botched and unnecessary surgery and improper medication, herbal medicine could be a viable alternative.

Ann doesn't consider how many people die or continue to suffer when they take herbs instead of getting proper "Western" treatment with surgery, medicine, or drugs. But worse than that she seems oblivious to the insufficiency of evidence presented by P.W. The fact that his wife got pregnant after taking herbs does not prove the herbs had anything to do with her getting pregnant. It might have been "luck" [the luck of natural events taking their course] or divine intervention, for that matter, that explains the pregnancy. However, P.W. had ruled out divine intervention because his wife's father, an herbal doctor, told him "there are no miracles in healing." To which P.W. commented in a fitting non sequitur: "those so-called miracles just show how little some traditional doctors know."

Ann doesn't ask what herbs they took and she certainly indicates no interest in whether anyone has done a controlled study on the effectiveness of these herbs. She's for "whatever works." What does that mean? It seems to mean, "I'm for believing whatever you feel like believing when you are happy with some event." P.W.'s happy he has a son, so he is welcome to believe that the herbs did it and that the European physicians who told him he and his wife were healthy but unlucky didn't know what they were talking about. Furthermore, this proves herbalists with their notions of harmony and balance and other gibberish are not just valid, but superior notions to the Western notions of the body and cause-effect relations. What bunk!

February 11, 1996. *Parade Magazine*, "How to Control the Pain," by Earl Ubell.

This article presents a very misleading picture of the state of psychiatry's treatment of mental illness by drugs. The header for the article reads:

Every major mental illness--from schizophrenia to anxiety disorder-- is being successfully treated, using fresh insights and new drugs.

The statement is not false. Some mentally ill people are being treated successfully with drugs, but this and other statements scattered throughout the article make it sound like the vast majority of mentally ill people are either now being successfully treated or soon will be. The article produces no solid basis for such optimism. It is based primarily on anecdotes and [testimonials](#). The article never defines "successful treatment" as it applies to the mentally ill. No empirical research is cited, but the National Institute of Mental Health [NIMH] is cited as a source for such claims as "the success rate for the treatment of [obsessive- compulsive] disorder is almost 60 percent." Does that mean the failure rate is almost 40 percent? We are also told that "drugs have raised the success rate for treatment of anxiety disorder to 80 percent." What we are not told is what the success rate is for non-drug treatment of this disorder. Without a reference point for non-drug treatment, we can't adequately evaluate the 80 percent statistic.

No statistics are given for drug treatment of major depression, but the NIMH is cited to support the claim that "by treating a patient with a variety of medications, doctors have controlled the symptoms of bipolar mood disorder 80 percent of the time. The same source is used to support the claim that manic depression, if treated with the drug lithium, is controlled in 50 to 60 percent of patients. Does that mean it is not controlled in 40 to 50 percent of patients?

As for drugs and the successful treatment of schizophrenia, the article is very light. It gives one anecdote, no data, and a list of the drugs being used to treat this awful disease. I am glad that at least one person has been successfully treated with drugs for schizophrenia. But where is the rest of the story? Where are the accounts of those who have been treated with dozens of different drugs over many years, to no avail? Are these "failures" the vast majority of schizophrenic patients? If so, why is this not mentioned in the article? If not, why is there no evidence given in the form of scientific research which would back up the claim that schizophrenia is being successfully treated by drugs in the vast majority of cases?

The article is also misleading when it asserts that

Since the 1960s, NIMH reports, the number of Americans in mental institutions has fallen by 85 percent. The new drugs developed since then unquestionably have contributed to this.

The reason the number of patients in mental institutions has fallen so dramatically is mainly political: political leaders like Ronald Reagan, when he was governor of California, shut them down. All over the country, mental institutions were shut down because they were not being funded any more. They weren't shut down because many or most patients were being cured with drugs.

I would be the first to admit that some mentally ill patients have been successfully treated with drugs, with therapy and with a combination of the two. But to suggest that the vast majority will be cured with drugs in the near future because of these successes is grossly misleading. Today, scientists know a lot more about the brain and its relation to human behavior than they did 10, 20 or 30 years ago. However, despite the fact that researchers will continue to study brain and genetic systems, the optimism expressed by Mr. Ubell (whomever he may be....nothing about him is presented in the article) seems unwarranted and may give unjustified hope to millions of people who now suffer themselves or through a loved one afflicted with a brain disorder.

April 19, 1987. Alice Kahn, "Channeling for Dollars,"*The San Francisco Chronicle*. Channeling has become big business for New Agers. In the San Francisco Bay area, for example, \$15 gets you in to hear "Michael"--an entity said to have had 1,050 beings over time--give personal advice to enthusiastic young professionals. After the show, the customers are offered "Acu-Kinetic Repatterning." For \$520 anyone can become a "certified practitioner," and for \$150 anyone can purchase the program "Change Your Life Through Colors." The latter, the customers are told, is usually \$275, but this is a special introductory offer. Kahn's article was based on her attendance at one of the sessions. She also notes that for \$125 anyone could attend the 3rd annual Michael Retreat at Harbin Hot Springs for "shamanic rituals, dream-sharing, breakfast and dinner."

[alien abductions](#)

[UFOs & ETs](#)

reader comments:

alien abductions, UFOs and ETs

2 April 2003

A few years ago I began to suffer small strokes (Transient Ischemic Attacks or TIA's). They've stopped now due to diet, exercise and several stents. When I was experiencing the TIA's I also suffered from [sleep paralysis](#). This is the syndrome many think is the cause of people thinking they were abducted by aliens.

My first one occurred in a hotel room in Las Vegas. It wasn't aliens who attacked me though it was ghost wolves I remembered seeing in an old cartoon when I was a child. The experience seemed to be absolutely real at the time. The ghost wolves grabbed me and tried to drag me out the 6th floor window. I kicked, punched and wrestled with the wolves until I woke up. The room was a mess. Evidently I thrashed around and knocked over a lamp. I also sustained rug burns on my hands that looked exactly like the scoop marks alien abductees claim to have. Back home I experienced a half dozen more episodes, each with a different cast of characters. On one occasion I must have thrown myself out of bed trying to wake up. I awoke seemingly floating in the air, this was the sensation this condition caused. Naturally I crashed to the floor at 32 feet per second. The last one was the strangest of all. My son and my dog came into my bedroom when they heard me yelling in my sleep. My eyes were open and I could see both of them but they were standing not in my bedroom but in the strange dreamscape I had been trying to escape.

I suppose I could have gone along with the X-Files stuff, the dreams fit with the alien abduction hypothesis, but I've always been a rational person. These occurrences seem real but I know they were all in my mind. There's a saying, if you hear hoof beats outside your window it's probably horses not zebras. The people who think sleep paralysis is alien abduction are thinking zebras not horses. I hope anyone who has one of these episodes consults a doctor; they might be suffering from blood loss to the brain as I was. This condition can be fatal.

Sincerely,

Thomas Troon

Re: Betty and Barney Hill "Abduction" Scenario

*A former colleague of mine who studied ethnicity and race relations at Oakland University proposed the following alternative explanation for the famous "alien abduction" case. One of the facts of the case that many researchers, skeptics, and UFO buffs tend to overlook is that the Hills were an interracial couple, and that the "abduction" allegedly occurred in 1961, a time when racial tensions in America were high, and, to paraphrase author James W. Loewen, a couple such as the Hills might have reasonably feared being "killed or beaten by white racists simply for holding hands as an interracial couple or eating together in a restaurant" (*Lies My Teacher Told Me*, 228). According to my colleague's theory, the Hills fabricated the sensational tale of being kidnapped by alien beings in order to intentionally draw attention from the media, thus placing themselves somewhat "in the public eye," locally if not nationally. Their story gained them not only media coverage, but also the attention of a prominent psychiatrist, Dr. Benjamin Simon. Regardless of whether reporters, the public, or the doctors who examined the Hills actually believed them (Dr. Simon did not, stating that the story was a "fantasy"), the recognition the story brought the couple helped ensure that they would not become the victims of a racist attack. In other words, it's harder to get away with killing a famous person than it is to get away with killing a "nobody." The "fame" the Hills generated with their story might just have been enough to ensure that, if one or both of them ever met an untimely demise in a dark alley, they would be more likely to be missed, the crime would be more likely to be reported in the media, law enforcement would be less likely to "look the other way," etc. Thus, by "making themselves famous" with their alien abduction tale, the Hills were setting up a deterrent to any hate crimes that might be perpetrated against them. The Hills really were fearing for their lives, though not from the threat of alien abduction, but from the threat of racist violence.*

In closing, I'd like to point out that their strategy does seem to have worked. When Barney Hill died seven years later, it was of natural causes, and Betty Hill survived him for years afterward (neither ever reported any further "abductions"). Unfortunately, their story, born of desperation, seems to have been the inspiration for the hundreds of later accounts that make up the "alien abduction" phenomenon. If my colleague's theory is sound (and I think it has some merit), then how very ironic it is indeed that one couple's attempt to protect themselves during turbulent and dangerous times seems to have spawned an entire "movement" based on paranoia, irrationality, and delusions!

Rob Novak

reply: I wouldn't presume to be able to get inside the Hills' heads and pinpoint their motivation, conscious or subconscious. If this were there motivation, I think it might have been easier to have moved to Sweden.

26 Oct 1999

Dear professor:

reply: Oh, oh. Whenever anyone addresses me as "professor" I can feel the trouble. Reminds me of when my mother would call me "Robert" instead of Bobby.

Accepting the fact of alien existence and integrating it into our consciousness is perhaps the most important activity one can do in this life. Denying this would be akin to dogs imagining that humans are holograms created by other dogs. I suppose that hamsters have yet to integrate the pinkness of the presence that occasionally manifests itself in its world of wood chips and treadmills as that of a human hand, and I also suppose that humans have yet to integrate silver disks as craft from otherworldly beings. For the hamster the human hand is probably a deformed treadmill, or a funny kind of woodchip pile. For humans such as yourself, the silver disk is a story of insufficient evidence and "people who just don't know how to reason".

reply: I can understand why someone might find the meaning of life in alien existence, but how denying this is akin to dogs imagining humans are holograms created by other dogs is alien to me.

You write:

Another common tactic of UFOlogists is to claim that the skeptic cannot prove that what was seen was not an alien craft.

This is true, namely, that the skeptic cannot prove that what was seen was not an alien craft. It is also true that nothing outside of mathematics (logic) can be proven, and even within mathematics, a proof consists in showing that it follows from the axioms, which are themselves taken as unprovable. To prove something is to embed our ignorance in more primitive assumptions, i.e., the assumption that our axioms are true and that our rules of inference are truth-preserving. Interesting to note is that no mathematician produces proofs this way (through transitive closure of a rule of inference upon a set of axioms). Instead they 'know' their theorems before the proof is supplied, and then publish their theorem after coming up with a proof later. The words "proof" and "truth" as used in common parlance are quite different things. A good book on what a proof really 'proves' is "Proofs and Refutations" by Imre Lakatos. What we're doing in the real world when we 'prove' something is show that the contrary is extremely improbable.

You then write:

One is supposed to infer from this fact that the perception probably was of an alien craft. This kind of reasoning is known as the argumentum ad ignorantiam. A claim does not become true or reasonable if a contrary claim cannot be proved to be

true.

Sir, What you say is of course true, that is, that a claim does not become true because it cannot be disproven, but what does this have to do with the eye-witness account? I have read much of the available literature, and I have never read anyone trying to forward the kind of reasoning that you cite here. I think you must have heard this in a coffee-shop somewhere and slapped it up on your website.

reply: You can think that, but you'd be wrong. What I've read many times from UFOlogists is an account by an eyewitness and a question for the skeptic: *What else could it be but an alien spacecraft?* or *The only logical explanation is that this was a real experience of alien abduction.* The first is a type of argumentum ad ignorantiam; the latter is a false dilemma. Just because a true believer can't come up with a plausible alternative hypothesis, doesn't mean there isn't one. There are always other explanations that are equally or more logical.

If an eye-witness reports a UFO sighting you must either

1. Assume the witness is suffering from some sort of aberration, or has a mental disorder (which could be very likely!) 2. The witness saw what they saw, which may or may not be explicable conventionally.

Since I find it hard to believe that ALL of these people are insane, I must believe that at least one of them is telling the truth. If even one report is true, if even one report cannot be explained away with a "conventional" explanation (and what's conventional in assuming that all these people are publicity-seeking nuts?), if even one of these reports is true, the aliens are among us.

reply: There is another possibility which you have overlooked: eyewitnesses often make mistakes. They interpret their perceptions incorrectly. Sometimes they are assisted in reconstructing an experience by alien abduction "experts" and end up constructing "memories" of events that never happened. You seem to assume that perception does not involve interpretation.

You write:

The fact that some genius cannot come up with an explanation for something is irrelevant to whether the correct explanation should be couched in terms of visitors from outer space. The choice is not either (A) we know this conventional explanation is correct, or we must conclude that (B) aliens have visited us.

Sir, the fact that some genius cannot prove something is VERY relevant.

Geniuses do all sorts of things that are very relevant, such as finding cures for diseases and inventing nuclear bombs. If our greatest geniuses cannot explain UFO's away, then it's relevant.

It seems more reasonable to believe that the only reason we cannot explain these sightings by conventional means is because we do not have all the evidence; it not because these sightings are probably due to alien visitations. If we had all the evidence, we would probably be able to explain the sightings by some conventional means. The fact that we cannot prove that Mr. and Mrs. Barney Hill were not abducted by aliens, does not support the hypothesis that they were abducted by aliens.

reply: You mock me, sir. Surely, you recognize that I am being facetious when I refer to UFOologists as geniuses. No true genius would spend any more time on [Betty and Barney Hill](#) than on [Betty and Barney Rubble](#).

Sir, you have two choices:

- 1.Assume that Betty and Barney Hill were insane, or hallucinating, or both.*
- 2.They are telling the truth.*

There are no other possibilities, professor!

I wish you and your students the very best of luck, professor.

Matt Gould

reply: Wrong. I have a third choice. I can look at the evidence and conclude that the Hills case is a typical case of [confabulation](#).

I wish you the best of luck, too, Mr. Gould.

allopathy

Allopathy is a term used by American [homeopaths](#), [naturopaths](#), [chiropractors](#) and other advocates of [alternative health practices](#) to refer to conventional medicine. My Random House Dictionary of the English Language (unabridged edition) defines allopathy as "the method of treating disease by the use of agents that produce effects different from those of the disease treated (opposed to homeopathy)." The word was invented by homeopath Samuel Hahnemann as a term for those who are *other* than homeopaths. In America, the term has not caught on and is used mainly by "alternative" practitioners and some [osteopaths](#).

naturopathy

Naturopathy is a system of therapy and treatment which relies exclusively on [natural](#) remedies, such as sunlight, air, water, supplemented with diet and therapies such as [massage](#). However, [some naturopaths](#) have been known to prescribe such unnatural treatments as [colon hydrotherapy](#) for such diseases as asthma and arthritis.

Naturopathy is based on the belief that the body is self-healing. The body will repair itself and recover from illness spontaneously if it is in a healthy environment. Naturopaths have many remedies and recommendations for creating a healthy environment so the body can spontaneously heal itself.

Naturopaths claim to be [holistic](#), which means they believe that the natural body is joined to a supernatural [soul](#) and a non-physical [mind](#) and the three must be treated as a unit, whatever that means. Naturopathy is fond of such terms as "balance" and "harmony" and "energy." It is often rooted in mysticism and a metaphysical belief in [vitalism](#) ([Barrett](#)).

Naturopaths are also prone to make grandiose claims about some herb or remedy that can enhance the immune system. Yet, only medical doctors are competent to do the tests necessary to determine if an individual's immune system is in any way depressed ([Green](#)). Naturopaths assume that many diseases, including cancer, are caused by faulty immune systems. (The [immune system](#), in simple terms, is the body's own set of mechanisms that attacks anything that isn't "self." Although, in some cases rather than attack "foreign bodies" such as viruses, fungus, or bacteria, the immune response goes haywire and the body attacks its own cells, e.g., in [lupus](#) and [multiple sclerosis](#).) Naturopaths also promote the idea that the *mind* can be used to enhance the immune system and thereby improve one's health. "Yet, there are no credible reports in the scientific literature to support the contention that "alternative" methods operate--on cancer or on any other disease--through an immune mechanism" ([Green](#)). Furthermore, the evidence that such diseases as cancer occur mainly in people with compromised immune systems is lacking. This is an assumption made by many naturopaths but it is not supported by the scientific evidence. Immunologists have shown that the most common cancers flourish in hosts with fully functional and competent immune systems ([Green](#)). The notion that vitamins and [colloidal minerals](#), herbs, coffee enemas, colonic irrigation, Laetrile, meditation, etc., can enhance the immune system and thereby help restore health is completely bogus. On the one hand, it is not necessarily the case that a diseased person even has a compromised immune system. On the other hand, there is no scientific evidence that any of these remedies either enhance the immune system or make it possible for the

body to heal itself.

Naturopathy is often, if not always, practiced in combination with other forms of "[alternative](#)" [health practices](#). [Bastyr University](#), a leading school of naturopathy since 1978, offers instruction in such things as [acupuncture](#) and "spirituality." Much of the advice of naturopaths is sound, e.g., exercise, quit smoking, eat lots of fresh fruits and vegetables, practice good nutrition, etc. Claims that these and practices such as colonic irrigation or coffee enemas "detoxify" the body or enhance the immune system or promote "homeostasis," "harmony," "balance," "vitality," etc., are exaggerated and not backed up by sound research.

See related entries on "[alternative](#)" [health practices](#), [Ayurvedic medicine](#), [chiropractic](#), [homeopathy](#), [natural](#), and [Joel D. Wallach](#), "[The Mineral Doctor](#)".

[Treatment of Hypertension with Alternative Therapies \(THAT\) Study: a randomized clinical trial.](#)

chiropractic

The basic theory of chiropractic is that "[subluxations](#)" are the cause of most medical problems. A "subluxation" is a misalignment of the spine that allegedly interferes with nerve signals from the brain. Chiropractors think that by adjusting the misalignments they can thereby restore the nerve signals and cure health problems. This theory was first propounded in 1895 by [D.D. Palmer](#), a grocer from Davenport, Iowa. There is little scientific evidence to support the theory. Most support for the theory comes from [testimonials](#) of people who claim to have been helped by chiropractic. Whether they were helped because nerves were "unblocked" is not always that clear. Most of these have been people with back pain that has been alleviated by spinal manipulation. This is not to say that chiropractors don't help people with aching backs, including people with chronic back problems. It is the *theory* of subluxations that has not been supported by scientific studies.

The theory of subluxations maintains that all health problems are due to "blockage" of nerves. It is true that nerves from the spine connect to the organs and tissues of the body and it is true that damage to those nerves affects whatever they connect to, e.g., sever the spinal cord and your brain can't communicate with your limbs, though your other organs can still continue to function. Chiropractic is often [holistic](#) and is based upon the belief that the body is basically self-healing. Hence, drugs and surgery are not recommended except in extreme cases. Spinal manipulation allegedly unblocks nerves so the body can heal itself. Chiropractic seems like a materialistic version of Chinese [acupuncture](#) used to unblock [chi](#), or [therapeutic touch](#) to channel [prana](#). The chiropractor's "needles" are his or her hands and fingers, manipulating nerves rather than the flow of chi. However, the chiropractic theory of subluxations seems to be empirically testable, unlike the metaphysical theory of acupuncture unblocking chi. Why, then, has conventional medicine opposed chiropractic for the most part? Chiropractors rarely are in joint practice with medical doctors, and they are almost never on staff at hospitals. Is there a conspiracy on the part of the American Medical Association (AMA), who fear chiropractors will dip into their profits, as many chiropractors maintain?

The AMA, of course, is partly responsible for chiropractic's reputation as quackery. For years, the AMA made no bones about their disapproval of chiropractic, which was featured in their *Committee on Quackery*. But the chiropractors fought back and won a significant lawsuit against the AMA in 1976 for restraint of trade. Today, the American College of Surgeons has issued a [position paper](#) on chiropractic which sees the two professions as working together. Privately, many battles continue between the medical

profession and chiropractic, but publicly the AMA no longer attacks chiropractic. In fact, the AMA may have been shell shocked by the victory of the chiropractors in the courtroom. For, today numerous so-called "[complementary medicine](#)" techniques are being allowed to flourish in hospitals and medical clinics around the country without a word of protest from the AMA. The National Institutes of Health has a flourishing division for testing even the most unpromising of alternative health practices. Chiropractors and other "alternative" practitioners have learned one thing from the AMA: it pays to organize and to lobby Congress and state legislatures. The AMA is still the most powerful lobby among health care professionals, but it is no longer flying solo. Even so, the AMA's lobbying is not the only reason that chiropractic's public image has suffered.

For years chiropractors relied more on faith than on empirical evidence in the form of [control studies](#) to back up their claims about the wonders of nerve manipulation. This is changing and to some extent so is the relationship between the medical profession and chiropractic. There is a growing body of scientific evidence that chiropractic is effective in the treatment of many lower back ailments and neck injuries. There is some evidence that chiropractic is effective for the treatment of certain kinds of headaches and other pains. The chiropractor is one of the few alternative health practitioners that medical insurance will generally cover. However, the likelihood that diseases such as cancer, for example, will ever be attributed to nerve blockage seem extremely remote. Making extravagant claims about the wonders of chiropractic, or references to the flow of "life forces" which heal the body or to such notions as "bio-energetic synchronization," are not likely to contribute to the advancement of the discipline into mainstream medicine. Likewise, making claims such as that *germ theory is wrong*, a common chiropractic claim, does little to make chiropractors seem like advanced medical practitioners. To ignore bacteria and viruses, or to underestimate the role of microbes in infections, as chiropractors are wont to do, are not likely to advance their cause. Every misdiagnosis or mistreatment by a chiropractor undermines the whole profession, rather than only the individual malpractitioner, because of the contentious nature of the theory of subluxations.

There are, of course, horror stories featuring medical doctors. However, very few people take such stories as indictments of the entire profession. They are seen as aberrations, not typical. This is not likely due to the better lobbying efforts of the AMA or to a conspiracy to control the press. It is most likely due to the experiences most people have had with medical doctors and the generally positive effects of modern medicine. In many cases, medical doctors take much greater risks than any chiropractor ever will. Hence, failures by an M.D. can be disastrous or even fatal; rarely will that be the case for a chiropractor. Though this may well change if the current push by chiropractic to become primary care practitioners for infants and children is successful. Pediatrics is much riskier than manipulating the spine of an old man who is there because he doesn't want surgery and he wants to play golf that

afternoon.

In short, chiropractic remains controversial, though not in all areas of its practice. It has firmly established itself as an effective treatment for lower back pain. It is attractive because there is no danger from side effects of drugs, since chiropractors don't generally recommend drugs to their patients. It is also attractive because it is seen as an alternative to surgery. And it is attractive because it is generally less expensive than treatment by a physician with drugs or surgery. Though, it should not be assumed that all medical doctors are quick to prescribe drugs or surgery. Many, like their chiropractic brothers and sisters, will recommend selected exercises for specific back problems.

alphabiotics

Alphabiotics is an alternative medical practice based on the notion that "all disease is the result of an imbalance and lack of Life Energy." Health depends on "aligning" and "balancing" "Life [Energy](#)"--whatever that is.

Alphabiotics is the brainchild of Dr. V. B. Chrane who started practicing it in the 1920's near Abilene, Texas. It was "established as a unique new profession by Dr. Virgil Chrane, Jr., on December 28, 1971", according to Virgil Chrane, Jr., and the practice is still flourishing with Virgil Jr. and his son, Dr. Michael Chrane. The ducklings don't fall far from the quack.

energy

In physics, the basic idea of energy is the capacity of a physical system to do "work." In physics, "work" is defined as the product of a force times the distance through which that force acts. "Energy" is a term to express *the power to move things, either potential or actual*. New Age spiritualism is all about empowerment. The New Age is about enhancing your *energy*, tapping into the *energy* of the universe, manipulating *energy* so that you can be happy, fulfilled, successful, and lovable, so life can be meaningful, significant, and endless. In short, the New Age is about becoming like God, an omnipotent, eternal being capable of magic, having the power to move things at will.

Of course, New Age *energy* has nothing to do with mechanics, electricity, or the nuclei of atoms. New Age *energy* has more to do with things like [chi](#) or [prana](#). New Age Energy isn't measurable by any known scientific instrument and is believed to be not only the source of life, but of health as well. There are no ergs, joules, electron-volts, calories, or foot-pounds of New Age *energy*. This energy is outside the bounds of scientific control or study. Only healers with special powers at "unblocking," "harmonizing," "unifying," "tuning," aligning," "balancing," "channeling," or otherwise manipulating New Age *energy*, can measure this energy. How? They measure it by *feeling* it. Energy medicines are based upon variants of the metaphysical theory known as [vitalism](#), a theory that has been dead in the West for over a century. New Age [quackery](#) often maintains that the older a theory is the more one should have faith in it.

Few things are more intimidating to the non-scientist than modern physics. Even an educated person has difficulty comprehending the most basic claims made about the entities and possible entities of the sub-atomic world, not to mention the exotic claims about entities and possible entities at the edges of the universe. Even the concepts of "sub-atomic" and "edge of the universe" boggle the mind. Perhaps it is because of the obscurity and inaccessibility of modern physics that many uneducated people scoff at science and find solace in fundamentalist religious interpretations of the origin and nature of the universe.

Another response to the seemingly transcendental nature of concepts in modern physics has been to interpret those concepts in terms of ancient metaphysical doctrines popular for thousands of years in exotic places (to the Western mind) such as India and China. This notion of a "harmony" between ancient metaphysics and modern physics is attractive to those who accept science and reject the Christian sects they were raised in, but still have spiritual longings. Believing in this notion of "harmony" between the ancient East and the modern West has the virtue of allowing one to avoid appearing to

be an imbecile who rejects science in order to accept religion. As such, it shares in common at least one trait with "[scientific creationism](#)": it re-creates science in its own image for its own purposes. Science is the handmaiden of Religion and Metaphysics, as Philosophy had been for Theology in the Middle Ages.

Acting much like nuclear accelerators on atoms, the New Age theorists smash concepts into bits, only the bits are interfered with in ways Heisenberg never foresaw. We may as well talk about "alternative" physics; for, what they have done to the concepts of modern physics is to refashion them into a metaphysics with its own technology and product line. Nothing demonstrates this more clearly than the New Age conception of "energy."

In conclusion, 9-year old Emily Rosa tested 21 [therapeutic touch](#) (TT) practitioners to see if they could feel her life energy when they could not see its source. [The test was very simple](#) and seems to clearly indicate that the subjects could not detect the life energy of the little girl's hands when placed near theirs. They had a 50% chance of being right in each test, yet they correctly located Emily's hand only 44% of the time in 280 trials. If they can't detect the energy, how can they manipulate or transfer it? What are they detecting? Dr. Dolores Krieger, one of the creators of TT, has been offered \$1,000,000 by [James Randi](#) to demonstrate that she, or anyone else for that matter, can detect the human energy field. So far, Dr. Krieger has not been tested.

alpha waves

Alpha waves are oscillating electrical voltages in the brain. They oscillate in the range of 7.5-13 cycles per second. Because alpha waves occur in relaxed states such as meditation and under hypnosis, they have been mistakenly identified as desirable. Alpha waves also occur under unpleasant conditions and when one is not relaxed. They are not a measure of peace and serenity, nor are they indicative of an altered state of consciousness. Alpha waves are indicative of *lack of visual processing and lack of focus: the less visual processing and the more unfocused, generally the stronger the alpha waves*. If you close your eyes and don't do any deep thinking or concentrating on vivid imagery, your alpha waves will usually be quite strong.

There is no evidence that "[When asleep, the brain goes into a "repair and rebuild" mode under alpha wave energy,](#)" as an ad for a protein supplement claims. Nor is there evidence that the brain is more insightful, creative or productive while producing alpha waves. Some think that increasing alpha waves can enhance the immune system and lead to self-healing or prevention of illness. This belief seems to be based on the notion that since alpha waves increase while meditating and relaxed, they are indicative of lack of stress, which can only be good for you. However, alpha waves can occur when one is not relaxed. Hence, increasing alpha waves is no guarantee that one is reducing stress, much less is it proof that one is enhancing one's immune system.

You can, however, learn to [control a computer using your alpha and mu waves](#) (the latter appear to be associated with the motor cortex because they diminish with movement or the intention to move). And, you can even compose music with your brain waves, as [Dr. Miller](#) has done.

SkepDic.com

altered states of consciousness (ASC)

A state of consciousness that differs significantly from baseline or normal consciousness often identified with a brain state that differs significantly from the brain state at baseline or normal consciousness. However, it is not the brain state itself that constitutes an ASC. The brain state is an objective matter, but it should not be equated with an EEG or MRI reading. Otherwise, we would end up counting such things as sneezing, coughing, sleeping, being in a coma, thinking of the color red, and being dead as ASCs. Brain state readings reveal brain activity or inactivity, but are not a good measure of ASCs. [Alpha waves](#), for example, have been identified with an ASC, but they usually measure lack of visual processing and lack of focus, though sometimes they measure a state known as "the Zone" or "the Flow State." This latter state is experienced by some athletes and video-game players who go on "auto-pilot."[*](#)

The baseline brain state might be best defined by the presence of two important subjective characteristics: the psychological sense of a self at the center of one's perception and a sense that this self is identified with one's body. States of consciousness where one loses the sense of identity with one's body or with one's perceptions are definitely ASCs. Such states may be spontaneously achieved, instigated by such things as trauma, sleep disturbance, sensory deprivation or sensory overload, neurochemical imbalance, epileptic seizure, or fever. They may also be induced by social behavior, such as frenzied dancing or chanting. Finally, they may be induced by electrically stimulating parts of the brain or by ingesting psychotropic drugs.

Many think the [hypnotic state](#) is an ASC. It certainly often resembles one, but it is doubtful that it is truly an ASC. A hypnotized person closely resembles certain amnesiacs who can be primed by being shown certain words. Later they have no conscious recollection of having been shown the words but they give evidence of implicit memory of the words. It is doubtful that amnesia should be considered an ASC.

There is little evidence that ASCs can transport one into a transcendent realm of higher consciousness or truth, as parapsychologists [Charles Tart](#) and [Raymond Moody](#) maintain, but there is ample evidence that some ASCs bring about extremely pleasant feelings and can profoundly affect personality. Some religious experiences, for example, are described as providing a very pleasant sense of divine presence and of the oneness, interrelatedness and significance of all things. Drugs such as LSD and mescaline can induce similar feelings. Some patients suffering from temporal lobe epilepsy think of their disease as temporal lobe "ecstasy," since it leaves them with a feeling of

being united with God (Ramachandran 1998). Also, by electrically stimulating the temporal lobes, Michael Persinger has been able to duplicate the sense of presence, the sense of leaving the body, and other feelings associated with mysticism and alien abduction (Persinger 1987). Dr. Olaf Blanke of Geneva University Hospital in Switzerland found that electrically stimulating the right angular gyrus (located at the juncture of the temporal and parietal lobes) triggers out-of-body experiences.* (In a related matter, Dr. Stuart Meloy, an anesthesiologist and pain specialist in Winston-Salem, North Carolina, was testing his pain-relieving invention on a patient when he accidentally discovered that by electrically stimulating a woman's spinal column he could induce orgasm.)

Are the brain states that elicit the feelings of mysticism in the religious ecstatic, the epileptic, the one on an "acid" trip, and the one with electrodes attached to his cranium caused by God? Perhaps, but if so there is no way of finding this out. Most likely, however, the mechanisms that trigger these feelings are completely natural. They may be a pleasant side effect of some evolutionary adaptation, but as yet we do not know why such brain states are triggered. And while it is an extremely interesting discovery that religious experiences can be induced by disease, electrodes, and by drugs, it hardly seems a compelling reason for believing in God. Although it might be a compelling reason for taking drugs, for not seeking treatment, or for using a transcranial electromagnetic stimulator and hoping for Orgasmatron results like the Woody Allen character in "Sleeper." Most religions identify the ideal state as an ASC: losing one's body and one's self, uniting with some sort of Divine Being, and feeling ecstatic pleasure. In this sense, to seek an ASC is to seek to kill your sense of self while enjoying the ultimate orgasm.

Raymond Moody

A parapsychologist with a medical degree (from the Medical College of Georgia) and Ph.D.s in philosophy and psychology (from the University of Virginia). He has written several books on the subject of "life after life." He compiled the list of features many consider typical of the [near-death experience](#) (NDE): a buzzing or ringing noise; a sense of blissful peace; a feeling of floating out of one's body and observing it from above; moving through a tunnel into a bright light; meeting dead people, saints, Christ, angels, etc.; seeing one's life pass before one's eyes; and finding it all so wonderful that one doesn't want to return to one's body.

Moody conducts his paranormal studies at his private research institute in rural Alabama, which he calls The John Dee Memorial Theater of the Mind. Dee popularized crystal gazing in 16th century England. Moody is continuing in the spirit of Dee, trying to evoke apparitions of the dead under controlled conditions. Moody has a mirrored room where guests come to [scry](#), hoping for a visit from a dead loved one. ABC reporter Diane Sawyer tried it out for about 45 minutes but didn't have any visitors. Maybe she didn't have a strong enough desire to see a dead loved one. Maybe she didn't have a strong enough belief that gazing into mirrors can induce an [altered state of consciousness](#). Maybe she should have stayed in the room for a day or two.

There are many frauds who claim to be able to see into the past or future by various means of [divination](#) and there are many who hallucinate due to sensory deprivation, extreme concentration on a single item, or lengthy gazing at uniform or kaleidoscopic surfaces. But Moody and many of his guests claim success at having [spirits](#) visit them in the mirrored room. Moody, like [Charles Tart](#), is convinced that an [altered state of consciousness](#) is the gateway to the other world. Mirror gazing is just one of many methods Moody uses to try to induce an altered state.

Moody is also an advocate of [past life regression](#). He claims that he was skeptical about [reincarnation](#) until undergoing hypnotherapy during which he discovered that he had had [nine past lives](#). He claims that just about anyone can experience a "past-life journey" and that such trips help one overcome phobias, compulsions, addictions and depression, among other things.

On May 10, 1998, Moody succeeded Tart to the Bigelow Chair in Consciousness Studies at the [University of Nevada, Las Vegas](#). Upon his appointment, Moody was quoted as saying:

I am thrilled to have the opportunity to teach again, and believe

that UNLV should be applauded for its determination to adhere to the strictest standards of scientific rigor regarding claims of rational 'evidence' or 'proof' of the continuation of consciousness upon bodily death....the extraordinary states of consciousness commonly deemed paranormal are an enduring human concern that will not go away, and I have been hopeful that students with a serious interest in these topics would have a setting within which they could learn about paranormal phenomena from a non-ideological perspective.

He gave some indication of his non-ideological rigor by announcing that he has invited [Brian Weiss](#), M.D., "expert in past life regression," to conduct a community forum at UNLV. He also invited to UNLV [Dianne Arcangel](#) who, says Moody, is "an expert in the field of facilitated apparitions."

confirmation bias

"It is the peculiar and perpetual error of the human understanding to be more moved and excited by affirmatives than by negatives." --Francis Bacon

Confirmation bias refers to a type of [selective thinking](#) whereby one tends to notice and to look for what confirms one's beliefs, and to ignore, not look for, or undervalue the relevance of what contradicts one's beliefs. For example, if one believes that during a [full moon](#) there is an increase in accidents, one will take notice when accidents occur during a full moon, but be inattentive to the moon when accidents occur during other times of the month. A tendency to do this over time unjustifiably strengthens one's belief in the relationship between the full moon and accidents.

This tendency to give more attention and weight to data that supports our preconceptions and beliefs than we do to contrary data is especially pernicious when our preconceptions and beliefs are little more than prejudices. If our beliefs are firmly established upon solid evidence and valid confirmatory experiments, the tendency to give more attention and weight to data that fits with our beliefs should not lead us astray as a rule. Of course, if we become blinded to evidence truly refuting a favored hypothesis, we have crossed the line from reasonableness to closed-mindedness.

Numerous studies have demonstrated that people generally give an excessive amount of value to confirmatory information, i.e., data which is positive or which supports a position (Gilovich, ch. 3). Thomas Gilovich speculates that the "most likely reason for the excessive influence of confirmatory information is that it is easier to deal with cognitively." It is much easier to see how a piece of data supports a position than it is to see how it might count against the position. Consider a typical [ESP](#) experiment or a seemingly [clairvoyant dream](#): successes are often unambiguous or data is easily massaged to count as a success, while negative instances require intellectual effort to even see them as negative or to consider them as significant. The tendency to give more attention and weight to the positive and the confirmatory has been shown to influence memory. When digging into our memories for data relevant to a position, we are more likely to recall data that confirms the position (Gilovich).

Researchers are sometimes guilty of confirmation bias by setting up experiments or framing their data in ways that will tend to confirm their hypotheses. They compound the problem by proceeding in ways that avoid dealing with data that would contradict their hypotheses. For example, [parapsychologists](#) are notorious for using [optional starting and stopping](#) in

their [ESP](#) research. Many social scientists also are guilty of confirmation bias, especially those who seek to establish correlations between ambiguous variables, such as birth order and 'radical ideas', during arbitrarily defined historical periods. If you define the beginning and end points of data collection regarding the idea of evolution in the way Frank Sulloway did in *Born to Rebel*, you arrive at significant correlations between functional birth order and tendency to accept or reject the theory of evolution. However, if you start with [Anaximander](#) and stop with St. Augustine, you will get quite different results, since the idea was universally rejected during that period. Or if you use as an example of a "radical idea" something like that of Philip Henry Gosse in *Creation (Omphalos): an attempt to untie the geological knot* (1857), you won't get support for your hypothesis. Gosse was more radical than Darwin in his attempt to reconcile geological data with creationism, but Gosse is nearly forgotten because his radical idea that God created everything, including fossils, at one time, was universally rejected. Gosse tried to reconcile the scientific data, which indicated a very old earth, with what had become the orthodox view that God created everything in 4004 B.C., as calculated by [Archbishop Ussher](#). Both firstborns and laterborns seem to have been unimpressed with this radical idea.

Experimenters might avoid or reduce confirmation bias by collaborating in experimental design with colleagues who hold contrary hypotheses. Individuals have to constantly remind themselves of this tendency and actively seek out data contrary to their beliefs. Since this is unnatural, it appears that the ordinary person is doomed to bias.

See related entries on [ad hoc hypothesis](#), [communal reinforcement](#), [control study](#), [Occam's razor](#), [the post hoc fallacy](#), [selective thinking](#), [self-deception](#), [subjective validation](#), and [wishful thinking](#).

For examples of confirmation bias in action, see entries on ["alternative" health practices](#), [curses](#), [ESP](#), [intuitives](#), [lunar effects](#), [personology](#), [plant perception](#), [the Sokal hoax](#), [therapeutic touch](#) and [thought field therapy](#).

natural

Something *present in or produced by nature* is **natural**, such as an earthquake or typhoon, or a poisonous mushroom. Death is natural in the sense that to die is *to conform to the ordinary course of living things in nature*. For a diabetic to die from lack of insulin would be natural. It would be unnatural for a diabetic to inject natural or synthetic insulin, since injections are not natural. Rotting wood on your porch is natural in the sense that you have *not* used anything *artificial* to protect it. The smell of rotting garbage is natural. Meanness and cruelty are natural to some people; that is, they are *inherent, non-acquired personal traits*. Some people are apparently natural born killers. Squishing bugs and kicking cats is natural for some people, in the sense that they do such things *spontaneously, without reflecting* on their actions. Nudity is the only natural state for animals, even humans. All clothing is *artificial*, that is, *not natural*. So are the fillings in your teeth. So is all make-up and jewelry. Bearded men are natural. To shave is to do something unnatural. The present Pope commits an unnatural act every day!

Just because something is natural does not mean that it is good, safe or healthy. Herbs are natural but they are also drugs when used in the diagnosis, treatment, or prevention of a disease. The chemicals which comprise synthetic drugs are natural. [St. John's Wort](#) (*Hypericum perforatum*) is natural, but it is a drug. Why do some people say that they prefer St. John's Wort to drugs for depression? If someone said that he preferred Irish whiskey to alcohol, we'd think he was confused. St. John's Wort contains **hypericin**, which inhibits monoamine oxidase, a chemical associated with depression. In other words, St. John's Wort (hypericin) is an "MAO inhibitor". MAO inhibitors are commonly prescribed by medical doctors to treat depression. Other types of anti-depressants have become more popular because they have far fewer side effects. MAO inhibitors should not be used when a person eats substances containing the amino acid tyramine or bacteria with enzymes that can convert tyrosine to tyramine, viz., alcoholic beverages, products made with yeast, aged cheese, sour cream, liver, canned meats, salami, sausage, pickled herring, eggplant and soy sauce. Otherwise, convulsions, extremely high fever and death by natural causes may occur.

Some plants are lethal even though they are natural. But if you die from eating a lethal but natural plant, you will not be said to have died of natural causes. Ditto, if you die from being bitten by a poisonous snake whose venom is quite natural. If you die from lung cancer caused by smoking tobacco, a natural plant, you will, however, be said to have died of natural causes.

Fleas on dogs are natural. Flea collars are unnatural. Mosquitoes and flies are natural, though most people find them to be a nuisance and prefer the

unnatural comfort of mosquitoless nights and flyless barbecues. Eating meat might be a natural act, but eating cooked meat is unnatural. Most sauces put on meat are made with both natural and artificial ingredients. Salt is natural, but some healthy people avoid salt like the plague.

Civilization is unnatural. Indoor plumbing is unnatural. Corrective lenses are unnatural. So are automobiles. Think about that the next time you drive to the garden shop to get some natural fertilizer for your garden or to your naturalist herb shop for a little pick-me-up.

To have a broken arm set by a physician is unnatural. To let it heal spontaneously would be natural, even if debilitating for life. Getting a medical degree is unnatural. Foraging and experimenting by trial and error would be natural, even if often lethal. Children born with no brains or other monstrous deformities are natural. Brain surgery to remove a tumor is unnatural.

Anything supernatural is unnatural but is usually considered to be good by those who believe in the supernatural. Reading and writing are unnatural. Urinating whenever one has the urge is natural, but uncivilized. Marijuana is natural, so it must be good, right? LSD is unnatural, though mescaline is natural. Ergot is natural. Mold and bacteria and viruses are natural. Arsenic is natural. To strike back when struck is natural, but considered unchristian. Turning the other cheek when struck is considered Christian but it is unnatural.

Monogamy is natural among some mammals, but unnatural for most mammals. Reproduction is natural but marriage is unnatural. Using condoms is unnatural. Dying of AIDS is to die of natural causes. Herpes is natural. Raping women is natural to some men, but it is usually regarded as evil nonetheless. Pedophilia seems to be natural in some people, but does that make it good?

In fact, ultimately everything which is made is comprised of nothing but natural atoms, molecules, elements, or substances. So, if everything is basically natural, why do some people, such as the [naturopaths](#), make such a big fuss about using only what is natural? Such an obsession seems unhealthy, but it helps one avoid having to ask difficult questions about whether something really is good, safe or healthy. All you need to know is that something is "natural" and you don't have to think about its value.

sympathetic magic

Sympathetic magic is based on the metaphysical belief that like affects like. Sympathetic magic is the basis for most forms of [divination](#). The lines, shapes and patterns in entrails, stars, thrown dirt, folded paper, the palm of the hand (the longer the lifeline, the longer the life), etc., are believed to be magically connected to the empirical world--past, present and future. It is also the basis for such practices as sticking needles into figurines representing enemies, as is done in [voodoo](#). The pins and needles stuck in a doll are supposed to magically cause pain and suffering in the person the doll represents.

Sympathetic magic is the basis for [psychometry](#), the claim of [psychic detectives](#) that touching an item belonging to a victim gives magical contact with the victim. Barry Beyerstein believes that sympathetic magic is the basis for many New Age notions such as "resonance," the idea that if things can be mentally associated they can magically influence each other. Beyerstein also explains many notions of [graphologists](#) as little more than sympathetic magic, e.g., the notion that leaving wide spaces between letters indicates a proneness to isolation and loneliness because the wide spaces indicate someone who does not mix easily and is uncomfortable with closeness. One graphologist claims that a person betrays his sadistic nature if he crosses his t's with lines that look like whips.

Sympathetic magic is probably the basis for such notions as [karma](#), [synchronicity](#), eating the heart of a brave but defeated warrior foe, throwing spears at painted animals on cave walls, wearing the reindeer's antlers before the hunt, having rape rituals to increase the fertility of the crops, or taking Holy Communion to infuse the participant with Divinity. Sympathetic magic is surely the basis for [homeopathy](#) and remote healing.

Anthropologists consider magical thinking a precursor to scientific thinking. It is indicative of a concern with control over nature through understanding cause and effect. Nevertheless, the methods of magic, however empirical, are not scientific. Such thinking may seem charming when done by our ancestors living thousands of years ago, but today such thinking may indicate a profound ignorance or indifference towards science and a testable understanding of the world. Most of us, from time to time, undoubtedly slip into this primitive mode of thinking, but a bit of reflection should wake us up to the fact that oysters are not an aphrodisiac, having a bit of good luck is not likely to influence our chances of winning the lottery that day, and stabbing a photo of an enemy is not going to hurt her. It may be true that rubbing an amulet given you by your true love makes you feel her presence, but the feeling you have, however magical it may seem, has more to do with biology

and psychology than with metaphysics.

See related entry on [magick](#).

regression and the regressive fallacy

The regressive fallacy is the failure to take into account natural and inevitable fluctuations of things when ascribing causes to them (Gilovich 1993, 26). Things like stock market prices, golf scores, and chronic back pain inevitably fluctuate. Periods of low prices, low scores, and little or no pain are eventually followed by periods of higher prices, scores, pain, etc. To ignore these natural fluctuations and tendencies leads to [self-deception](#) regarding their causes and to [post hoc reasoning](#).

For example, a professional golfer with chronic back pain or arthritis might try a copper bracelet on his wrist or magnetic insoles in his shoes. He is likely to try such gizmos when he is not playing or feeling well. He notices that his scores are improving and his pain is diminishing or gone. He concludes that the copper bracelet or the magnetic insole is the cause. It never dawns on him that the scores and the pain are probably improving due to natural and expected fluctuations. Nor does it occur to him that he could check a record of all his golf scores before he used the gizmo and see if the same kind of pattern has occurred frequently in the past. If he takes his average score as a base, most likely he would find that after a very low score he tended to shoot not a lower score but a higher score in the direction of his average. Likewise, he would find that after a very high score, he did not tend to shoot a higher score but rather would shoot a lower score in the direction of his average.

This tendency to move toward the average away from extremes was called "regression" by Sir Francis Galton in a study of the average heights of sons of very tall and very short parents. (The study was published in 1885 and was called "Regression Toward Mediocrity in Hereditary Stature.") He found that sons of very tall or very short parents tend to be tall or short, respectively, but not as tall or as short as their parents.

The professional golfer could check his scores because records are kept of each game played. Professional golfers frequently are featured in testimonials for some gizmo guaranteed to improve your golf score. Never does the golfer refer to a proper study done on golf scores (one which doesn't use [optional starting and stopping](#)) which demonstrates that the improvement, if any, is not due to natural fluctuation and regression?

Many people are led to believe in the causal effectiveness of worthless remedies because of the regressive fallacy. The intensity and duration of pain from arthritis, chronic backache, gout, etc., fluctuates. A remedy such as a [chiropractic](#) spinal manipulation or a magnetic belt is likely to be sought when the pain is at its worst. The pain in most cases would begin to lessen after it has peaked. It is easy to deceive ourselves into thinking that the

remedy we sought caused our reduction in pain. It is because of the ease with which we can deceive ourselves about causality in such matters, that scientists do [controlled experiments](#) to test causal claims.

Even if a quack remedy does not work, it is often not blamed for its ineffectiveness. For example, when comedian Pat Paulsen sought "alternative" medical treatment for cancer in Tijuana, his daughter did not criticize the treatment as useless when her father died. Paulsen had reportedly had some good days while on the "alternative" treatments, which would have been expected by natural fluctuation. His daughter claimed that the treatment worked, but had failed in her father's case because they had sought the treatment too late. When he was diagnosed with brain and colon cancer, his wife Noma was quoted in press reports as saying that the doctor in Tiajuana "is confident it can be cured. The doctors here say it can't. We like the ones over there a lot better." An official press release on his death claimed he died from pneumonia, not cancer. A family spokesman was quoted as saying: "His cancer was under control after undergoing alternative treatment in Mexico. He succumbed at 2pm on Thursday after complications brought on by pneumonia and kidney failure after recent non-cancer related surgery." His wife did not think the alternative therapy was worthless. She said: "We want to thank our team of doctors in Mexico who treated my husband humanely and with respect, and who were with him 24 hours a day trying to save his life."*

See related entries on [ad hoc hypothesis](#), [cold reading](#), [communal reinforcement](#), [control study](#), [Occam's razor](#), [optional starting and stopping](#), [pathological science](#), [the placebo effect](#), [the post hoc fallacy](#), [selective thinking](#), [self-deception](#), [subjective validation](#), [testimonials](#) and [wishful thinking](#).

applied kinesiology

Applied kinesiology is a New Age theory and therapy created by [George Goodheart, D.C.](#) According to the [International College of Applied Kinesiology](#), applied kinesiology "is based on chiropractic principles and requires manual manipulation of the spine, extremities and cranial bones as the structural basis of its procedures." However, Goodheart and his followers unite chiropractic with traditional Chinese medicine (among other things) and not only accept the notion of [ch'i](#) and the meridians of [acupuncture](#), they posit a universal intelligence of a spiritual nature running through the nervous system. They believe that muscles reflect the flow of ch'i and that by measuring muscle resistance one can determine the health of bodily organs. For example, practitioners claim that they can determine nutritional deficiencies by testing muscle resistance. This is an empirical claim and has been tested (Kenny, "Applied Kinesiology Unreliable for Assessing Nutrient Status," *Journal of the American Dietetic Association*, 88:698-704, 1988.). The test showed that the claim is false. Other claims made by practitioners are supported mainly by anecdotes supplied by advocates. No reputable scientific journal has ever published a paper supporting the validity of applied kinesiology, according to [Janice Lyons, R.N.](#)

Applied kinesiology should not be confused with kinesiology proper, which is the scientific study of the principles of mechanics and anatomy in relation to human movement.

See **related entries** on [acupuncture](#), ["alternative" health practices](#), [ch'i](#), and [chiropractic](#).

aura therapy

Aura therapy is a type of New Age healing that detects and treats disease by reading and manipulating a person's [aura](#). According to aura therapists, the aura is an energy field surrounding the body and exhibits signs of physical disease before the body itself exhibits either signs or disease. There is no scientific basis for belief in auras, much less for the validity of aura therapy. Yet, like many other [alternative therapies](#), the popularity of such beliefs continues to grow.

The most popular form of aura therapy is [therapeutic touch](#). It is taught in many nursing programs and practiced in many hospitals, despite its lack of scientific support. There are many other forms of aura therapy that are just as valid as therapeutic touch, however.

[Aurasomatherapy](#) or [Aura-Soma](#) is described as "an holistic soul therapy in which the vibrational powers of colour, crystals and natural aromas combine with light in order to harmonise body, mind and spirit of mankind." Aura-Soma is allegedly an ancient healing practice that was re-discovered by [clairvoyant](#) Englishwoman Vicky Wall in the mid-eighties. She claims her special gift is the ability to see people's auras.

Beverli Rhodes uses [lazer-wand crystal energy](#) in her aura therapy. She says that crystals help in finding "disturbances in the auric field" and that

by using your laser crystal wand energies and your own energies, which will fuse with that of the wand, you can bring about relief and in time a cure. As crystals have their very own special electromagnetic field [the aura] this can be used to balance our own aura's. As disease appears firstly in the auric field, it would seem logical that one would begin to heal and clear the problem at the source.

Yes, very logical, indeed, in a world of assumptions such as that the proper way to assist stressed clients is by concentrating the lazer-wand on the 3rd eye (6th [Chakra](#)) area for 1 minute. Rhodes also claims that it is "necessary to re-programme your crystal first so that it may ready itself to clear the disharmony that exists in the auric field of the client in order to heal the specific illness." Do not try this at home alone! Reprogramming your crystal can be very dangerous!

Dr. J.M. Shah uses [Kirlian photography and gem therapy](#) to treat heart disease. Like other aura therapists, Dr. Shah believes that when disease enters

one of our [several bodies](#) there is reduction in energy. He takes Kirlian photographs of the fingers to discover disease. He assumes that changes in the [Kirlian](#) photos are due to changes in the aura rather than to changes in moisture or other natural phenomena. Once he has detected disease by photo misreading, he uses rubies to "open the heart" of those who have bad hearts. He advises, however, that the rubies have to be energized and their negativity removed before they can be effective in treatment. For supportive medical treatment, he puts photos of his patients in a "radiation cabinet" with rubies.

With such therapies available to help heal our many wounds, it is amazing that there is any sickness left in the world.

See related entries on [alternative therapies](#), [auras](#), [chakras](#), [crystals](#) and [Kirlian photography](#).

Ayurvedic medicine & Deepak Chopra

If you can wiggle your toes with the mere flicker of an intention, why can't you reset your biological clock?

If you could live in the moment you would see the flavor of eternity and when you metabolize the experience of eternity your body doesn't age.

Ayurveda is the science of life and it has a very basic, simple kind of approach, which is that we are part of the universe and the universe is intelligent and the human body is part of the cosmic body, and the human mind is part of the cosmic mind, and the atom and the universe are exactly the same thing but with different form, and the more we are in touch with this deeper reality, from where everything comes, the more we will be able to heal ourselves and at the same time heal our planet. --[Deepak Chopra](#)

Ayurvedic medicine is an "alternative" medical practice that claims it is the traditional medicine of India. *Ayurveda* is based on two Sanskrit terms: *ayu* meaning life and *veda* meaning knowledge or science. Since the practice is said to be some 5,000 years old, what it considers to be knowledge or science may not coincide with the most updated information available to Western medicine. In any case, most of the ancient treatments are not recorded and what is called traditional Indian medicine is, for the most part, something developed in the 1980s by the Maharishi Mahesh Yogi ([Barrett](#)) who brought [Transcendental Meditation](#) to the western world.

Ayurvedic treatments are primarily [dietary](#) and [herbal](#). Patients are classified by body types, or *prakriti*, which are determined by proportions of the three [doshas](#). The doshas allegedly regulate mind-body harmony. Illness and disease are considered to be a matter of imbalance in the *doshas*. Treatment is aimed at restoring harmony or balance to the mind-body system. [Vata](#), composed of air and space, allegedly governs all movement in the mind and body and must be kept in good balance. Too much vata leads to "worries, insomnia, cramps and constipation....*Vata* controls blood flow, elimination of wastes, breathing and the movement of thoughts across the mind." *Vata* also controls the other two principles, *Pitta* and *Kapha*. [Pitta](#) is said to be composed of fire and water; it allegedly governs "all heat, metabolism and transformation in the mind and body. It controls how we digest food, how we metabolize our sensory perceptions, and how we discriminate between right and wrong." *Pitta* must be kept in balance, too. "Too much [*Pitta*] can lead to

anger, criticism, ulcers, rashes and thinning hair." [Kapha](#) consists of earth and water. "Kapha cements the elements in the body, providing the material for physical structure. This dosha maintains body resistance....Kapha lubricates the joints; provides moisture to the skin; helps to heal wounds; fills the spaces in the body; gives biological strength, vigor and stability; supports memory retention; gives energy to the heart and lungs and maintains immunity...Kapha is responsible for emotions of attachment, greed and long-standing envy; it is also expressed in tendencies toward calmness, forgiveness and love." Too much *Kapha* leads to lethargy and weight gain, as well as congestion and allergies.

On the basis of the above metaphysical physiology, [Ayurveda](#) recommends such things as: *to pacify Kapha eat spicy foods and avoid sweet foods, except for honey but don't heat the honey. Avoid tomatoes and nuts. Turkey is fine but avoid rabbit and pheasant. If you've got too much Pitta then try this: eat sweet foods and avoid the spicy. Eat nuts. To reduce Vata: eat sweet, sour and salty foods; avoid spicy foods. Nuts are good and so are dairy products.*

How any of the above is known, or how anyone could possibly test such claims, is apparently of little concern to Ayurvedic advocates.

meditation & quantum physics

Quantum healing is healing the bodymind from a quantum level. That means from a level which is not manifest at a sensory level. Our bodies ultimately are fields of information, intelligence and energy. Quantum healing involves a shift in the fields of energy information, so as to bring about a correction in an idea that has gone wrong. So quantum healing involves healing one mode of consciousness, mind, to bring about changes in another mode of consciousness, body. -
[-Deepak Chopra](#)

Meditation is also a significant therapy in Ayurveda. Except for the benefits of relaxation and meditation, there is no scientific evidence to support any of the many astounding claims made on behalf of Ayurvedic medicine. Even the claims made for the significant health benefits of Transcendental Meditation have been greatly exaggerated and distorted ([Wheeler](#)).

What are some of the claims made for Ayurveda? For these we turn to [Deepak Chopra](#), a graduate of Harvard Medical School and a former leader of the Maharishi Mahesh Yogi's [Transcendental Meditation](#) program. Chopra claims that perfect health is a matter of choice and that he can identify your *dosha* and its state of balance or imbalance simply by taking your pulse. He claims that allergies are usually caused by poor digestion. He claims you can prevent and reverse cataracts by brushing your teeth, scraping your tongue,

spitting into a cup of water, and washing your eyes for a few minutes with this mixture. According to Chopra, "contrary to our traditional notions of aging, we can learn to direct the way our bodies metabolize time" ([Wheeler](#)). Chopra also promotes [aromatherapy](#) based on the Ayurvedic metaphysical physiology. He sells [oils and spices](#) specifically aimed at appeasing *Vata*, *Pitta* or *Kapha*. Actually, what Chopra and other "alternative" healers sell is hope. Chopra gives hope to the dying that they will not die and hope to the living that they can live forever in perfect health. But his hope seems to be a false hope based on an unscientific imagination seeped in mysticism and cheerily dispensed gibberish. Science is unnecessary to test Ayurvedic claims since "the masters of Ayurvedic medicine can determine an herb's medicinal qualities by simply looking at it ([Wheeler](#))."

Dr. Chopra has done more than any other single person to popularize the Maharishi's Ayurvedic medicine in America, including some New Age energy concepts that boldly and falsely assert a connection between quantum physics and consciousness. According to Chopra, "We are each a localized field of energy and information with cybernetic feedback loops interacting within a nonlocal field of energy and information." He claims we can use "quantum healing" to overcome aging. Chopra believes that the mind heals by harmonizing or balancing the "quantum mechanical body" (his term for [prana](#) or [chi](#)). He says that "simply by localizing your awareness on a source of pain, you can cause healing to begin, for the body naturally sends healing energy wherever attention is drawn." Or, as he also puts it, "If you have happy thoughts, then you make happy molecules." This "quantum mysticism" has no basis in physics and represents a leap of the metaphysical imagination ([Stenger](#)).

The notion that ancient Hindu mysticism is just quantum physics wrapped in metaphysical garb seems to have originated with Fritjof Capra in his book *The Tao of Physics: An Exploration of the Parallels Between Modern Physics and Eastern Mysticism* (1975). The book's first two parts are excellent expositions on ancient religions and modern physics. The third part, which tries to connect the two is an abysmal failure and about the purest poppycock this side of Bombay. Nevertheless, it has been this third part which has influenced numerous New Age energy medicine advocates to claim that quantum physics proves the reality of everything from chi and prana to [ESP](#). The idea that there is such a connection is denied by most physicists but books like Capra's and Gary Zukav's *The Dancing Wu Li Masters: An Overview of the New Physics* (1976) overshadow and are much more popular than more sensible books written by physicists.

Chopra and other defenders of Ayurveda, following Capra and Zukav, are fond of claiming that modern physics has substantially validated ancient Hindu metaphysics. However, physicist Heinz R. Pagels, author of [The Cosmic Code: Quantum Physics as the Language of Nature](#) vehemently rejects the notion that there is any significant connection between the

discoveries of modern physicists and the metaphysical claims of Ayurveda. "No qualified physicist that I know would claim to find such a connection without knowingly committing fraud," [says Dr. Pagels](#).

The claim that the fields of modern physics have anything to do with the "field of consciousness" is false. The notion that what physicists call "the vacuum state" has anything to do with consciousness is nonsense. The claim that large numbers of people meditating helps reduce crime and war by creating a unified field of consciousness is foolishness of a high order. The presentation of the ideas of modern physics side by side, and apparently supportive of, the ideas of the Maharishi about pure consciousness can only be intended to deceive those who might not know any better.

Reading these materials authorized by the Maharishi causes me distress because I am a man who values the truth. To see the beautiful and profound ideas of modern physics, the labor of generations of scientists, so willfully perverted provokes a feeling of compassion for those who might be taken in by these distortions. I would like to be generous to the Maharishi and his movement because it supports world peace and other high ideals. But none of these ideals could possibly be realized within the framework of a philosophy that so willfully distorts scientific truth ([Pagels](#)).

What Chopra is peddling is quantum gibberish.

deception and expanding the market

As would be expected of a guru spreading false hope, Chopras' trustworthiness has been compromised. In 1991, Chopra, when president of the American Association of Ayurvedic Medicine, submitted a report to the *Journal of the American Medical Association*, along with Hari M. Sharma, MD, professor of pathology at Ohio State University College of Medicine, and Brihaspati Dev Triguna, an Ayurvedic practitioner in New Delhi, India. Chopra, Sharma and Triguna claimed they were disinterested authorities and were not affiliated with any organization that could profit by the publication of their article. But

they were intimately involved with the complex network of organizations that promote and sell the products and services about which they wrote. They misrepresented Maharishi Ayur-Veda as India's ancient system of healing, rather than what it is, a trademark line of "alternative health" products and services marketed since 1985 by the Maharishi Mahesh Yogi, the Hindu swami who founded the

Transcendental Meditation (TM) movement ([Skolnick](#)).

Chopra spends much of his time writing and lecturing from his base in California where he is not licensed to practice medicine. He charges \$25,000 per lecture performance, where he spouts out a few platitudes and give spiritual advice while warning against the ill effects of materialism. His audiences are apparently not troubled by his living in a \$2.5 million house in La Jolla, California, where he parks his green Jaguar, which he can easily afford since he has amassed millions of dollars from the sales of his books, tapes, herbs, appearances, etc. Chopra is much richer and certainly more famous than he ever was as an endocrinologist or as chief of staff at New England Memorial Hospital. He left traditional medicine behind in 1981 when Triguna convinced him that if he didn't make a change he'd get heart disease. Shortly after that he got involved in Transcendental Meditation. In 1984 Chopra met the Maharishi himself and in 1985 Chopra became director of the Maharishi Ayurveda Health Center for Stress Management in Lancaster, Massachusetts. Soon he was an international purveyor of herbs and tablets through [Maharishi Ayurvedic products](#).

Perhaps the greatest deception of Ayurveda is that it cares for the person, not just the body as traditional medicine does. As Chopra puts it, "The first question an Ayurvedic doctor asks is not, 'What disease does my patient have?' but, 'Who is my patient?'"* That may be the question, but it is not a person that the doctor is healing. It is the "quantum body" or the "mind-body"; it is the *dosha* that needs balancing. Taking a person's pulse and telling them their dosha is unbalanced and they should eat more nuts or less spicy foods, etc., hardly shows concern for the patient as a person. Not using a current photo on your web site or on the jacket of your latest book, which would show how you are aging, is deceptive, especially since you claim to know how to overcome aging.

Self-deception is rampant in the alternative health arena, and Chopra has had his share. In *Return of the Rishi* he reveals what attracted him to Transcendental Meditation: it helped him overcome his dependence on alcohol, tobacco and coffee. The man was stressed by his job and his lifestyle contributed to that stress. He committed the [pragmatic fallacy](#) and became a true believer because he was now happy. Fine, but he since has gone on to try to confirm TM and Ayurveda with quantum physics, pseudoscientific writings and seminars. Even though his [patients died](#) while he was claiming he had given them perfect health, he maintained his position. And, when association with TM itself became too stressful and a hindrance to his success, he left.* (Chopra had heard that Bill Moyers wouldn't include him in his PBS series *Healing and the Mind* because of Chopra's association with a "cult.") He now runs the [Chopra Center for Well Being](#) in La Jolla, California, where the mission is "to heal, to love, to transform and to serve." It is not a medical center, for Chopra has no license to practice medicine in California. It is a spiritual center, where you can come to "better understand the power of

your body, mind and spirit connection to both your inner and outer universe." Because many of those who come to this center are sick, one might call it a *faith* healing center. There are a few other things one might call it, but they might arouse Chopra's legal staff, who are fond of [suing critics of their employer](#).

Chopra has also [admitted](#) in so many words that his *Ageless Body, Timeless Mind: The Quantum Alternative to Growing Old* plagiarized Professor Robert Sapolsky's contribution to *Behavioral Endocrinology*. Sapolsky is the author of chapter 10, "Neuroendocrinology of the Stress-Response." He [sued Chopra in 1997](#) for lifting large chunks of his work without proper attribution.

Of course, [Chopra has a web site](#) where he will be honored to take your money for one of his many books, tapes, or seminars. We should not be too harsh with our guru, however. It is understandable that he would give up working in medicine in favor of working in religion. In medicine you are surrounded by sick people and constantly reminded of your own mortality. It is difficult work, often very stressful and unrewarding. As Chopra himself put it: "It's frustrating to see patients again and again, and to keep giving them sleeping pills, tranquilizers and antibiotics, for their hypertension or ulcers, when you know you're not getting rid of the problem or disease."* Also, while taking care of others, a physician might fail to take care of himself and come to require sleeping pills, tranquilizers, something to lower the blood pressure and relieve the stress in himself. In religion, on the other hand, you can surround yourself only with sycophants who demand to be deluded and deceived because it makes them feel so *healthy* and *happy*. By turning to metaphysics instead of biology, one avoids the risk of being proved wrong. It is much easier to dispense hope based on nothing to miserable people than it is to accept harsh and sometimes brutal reality while maintaining health, optimism and happiness. It is much easier for some people to face life by deceiving themselves into thinking they alone are in charge of what is real and what is true. It is much easier to find [confirming evidence](#) for a worldview than it is to do nuts-and-bolts research. It is certainly much more enjoyable to chat with [Oprah Winfrey](#) and rub elbows with the rich and famous than to watch another cancer patient die.

why are Chopra and Ayurveda so popular?

The popularity of Chopra and Ayurveda is a testament to the failure of modern life and modern medicine to satisfy deep longings for simplicity, trust, a clean and wholesome environment, something to counteract the fragmentation, alienation and isolation that many people feel.* Hope is a powerful narcotic. Representing peace and love, caring and respect, as well as esoteric knowledge for the masses, "alternative" medicines will always be popular. And, the fact is that the "alternatives" often put people like Chopra on a much healthier track than they were on before they got involved with

Ayurveda, [qigong](#), Polar Reflex Quantum Energy Dynamics (it may not exist yet, but give it time), etc. Most people would be better off if they followed some of the sensible recommendations of the "alternatives": eat less and don't stuff yourself with fatty and sugary foods with near zero nutritional value, relax, don't smoke or drink or use other drugs to try to make you feel better, don't take things so seriously, treat other people kindly and with respect, spend more time with friends and family building relationships, quit worrying about being so successful and rich or famous, be concerned about what you put into your body and what all of us are putting into our air and water. Philosophy can serve these interests. But most people also want some sort of assurance that this is not all there is, that This is NOT It. They want to believe in immortality and "alternatives" like Ayurveda fulfill this need. The hypocrisy of a materialist advising them that materialism is the root of all evil easily slips by. But I would ask, if Ayurveda is so wonderful and has been practiced in India for thousands of years, why doesn't Dr. Chopra return to India to live? Likewise, why don't all those who praise the wonders of traditional Chinese medicine (TCM) return to China? The answer seems obvious: the wonders of Ayurveda and TCM have been greatly exaggerated. China and India are the two largest countries in the world but there has not been a run of people in the west immigrating to either country. Why? Because the chances of living a healthier, wealthier, richer life are better in America than in either India or China. Neither country is the place anyone would hold up as a paradigm of healthy people. [China](#) ranks 81st, [India](#) ranks 134th and the USA ranks 24th in overall level of health, according to the World Health Organization. [Life expectancy](#) is much greater in North America than in China or India. [In 1998](#), life expectancy in the United States was 72.9 years for men and 83.3 years for women. In India the figures are 62.3 years for men and 63.7 years for women. China's life expectancy in 1998 was 68.3 years for men and 71.1 years for women. Does Deepak Chopra really believe that nutritional deficiency is a bigger problem in North America than in India? Does he really believe that people live longer, happier, healthier lives in India and China than here? If so, why does he stay? Can he say with a straight face: *I have come from the promised land to this barren desert and I will stay here to lead you to perfect health in my new Jaguar.*

I'll let Dr. Chopra have the last word:

I in fact don't believe in the existence of time. That's one thing I have to tell you, and the other is that I don't take myself or what I am doing seriously.*

Chelation therapy
found useless in
first rigorous
study

chelation therapy

Chelation therapy consists of slow-drip IV injections of EDTA (ethylenediamine tetraacetic acid), a synthetic amino acid, combined with aerobic exercise, special diet and no smoking. EDTA treatment has been around since the 1940's, when it was developed to treat lead poisoning.. The word "chelate" is derived from the Greek word for claw and apparently refers to the alleged removal of plaque and calcium deposits from arteries and veins by EDTA. Advocates claim that there is ample evidence to support the claim that chelation can prevent and cure heart disease, stroke, senility, diabetic gangrene and many other vascular diseases. For example, the [unpublished Cypher report](#) collected data from several physicians who used chelation to treat patients with vascular diseases. Over 19,000 cases were studied and about 86% showed "a significant enhancement in the arterial perfusion of the upper and lower extremities, " according to James P. Carter, M.D., in *Racketeering in Medicine; Hippocrates Forsaken for Profit*. However, the treatments were carried out independently by different physicians and there were no [control groups](#). Lack of adequate controls in studies purporting to demonstrate the effectiveness of chelation has been a consistent criticism of skeptics. The evidence in favor of chelation as a cure for heart disease seems to consist mainly of [testimonials](#) and [subjective patient/physician reports](#). Advocates claim that it is too expensive to do scientifically controlled studies and that there is a conspiracy by the medical establishment to prevent such studies from being undertaken.

Critics of the therapy in the American Medical Association (AMA) and the Federal Drug Administration (FDA) claim that there is no good scientific evidence supporting the extravagant claims of advocates. Defenders of the therapy claim that the medical establishment has engaged in a half-century of deceit and conspiracy to suppress chelation because of fear it would cut into the profits made by drug therapy and surgery. Advocates claim that chelation is about 10 times cheaper than a coronary bypass with equal or better results. They also claim that scientific medicine bases treatment decisions on politics and economics, not on evidence from controlled studies.

Chelation therapy is not covered by Medicare nor will most insurance companies pay for it. The American Heart Association's Task Force on New and Unestablished Therapies reviewed the available literature on the use of chelation in treating arteriosclerotic heart disease. They found no scientific evidence to demonstrate any benefit from this form of therapy.

Chelation therapy is surely a testable therapy. Advocates maintain that it has been tested and proven to be an effective cure of vascular diseases. Skeptics, which includes the American Medical Association and the American Heart

Association, deny that studies support any such claims. Advocates claim that the medical establishment is more interested in making money than in curing diseases. They claim that EDTA is cheap and can't be patented, so there is no big money to be made by pharmaceutical firms. They also claim that surgery is preferred by the medical establishment because it is expensive. To accept the chelation advocates' argument is to accept the notion that the American medical establishment systematically suppresses evidence and persecutes anyone who challenges their monopoly. The conspiracy theory is argued at length by [Dr. James P. Carter](#).

Advocates of "[oral chelation](#)" claim it is much cheaper than traditional chelation therapy, but so far there is no charge of conspiracy by traditional chelation advocates, though they seem to consider "oral chelation" misleading and ineffective. One [advocate of "oral chelation"](#) claims it costs one tenth of what IV chelation costs and it can "Reduce Your Risk of Heart Attack by as much as 85%."

cranosacral therapy

Craniosacral therapy (a.k.a. craniopathy and cranial osteopathy) is a [holistic](#) therapy that involves the manipulation of the skull bones (the cranium) and the sacrum to relieve pain and a variety of other ailments, including cancer. (The sacrum is a bone between the lumbar vertebrae and tail vertebrae, composed of five fused vertebrae that form the posterior pelvic wall.) The therapy was invented by osteopath William G. Sutherland in the 1930s. Another osteopath, John Upledger is the leading proponent of craniosacral therapy today. Like other holistic therapies, this one emphasizes subjective concepts such as energy, harmony, balance, rhythm and flow.

Craniosacral therapists claim to be able to detect a craniosacral "rhythm" in the cranium, sacrum, cerebrospinal fluid and the membranes which envelop the craniosacral system. The balance and flow of this rhythm is considered essential to good health. The rhythm is measured by the therapist's hands. Any needed or effected changes in rhythm are also detected only by the therapist's hands. No instrument is used to measure the rhythm or its changes, hence no systematic objective measurement of healthy versus unhealthy rhythms exists. The measurement, the therapy and the declared cure are all subjectively based. As one therapist puts it:

During the treatment, the client is usually supine on a table. The therapist assesses the patterns of energy in the body through touch at several "listening stations" and then decides where to start that day and how to focus the treatment. [Woodruff]

The same therapist maintains that the therapy is "a waste of time and money" for people who do not have faith in the therapy. Successful treatments, however, may well be due to the [placebo effect](#) and [subjective validation](#).

Skeptics note that the skull does not consist of moveable parts (unlike the jaw) and the only rhythm detectable in the cranium and cerebrospinal fluid is related to the cardiovascular system. When [tested](#), several therapists were unable to consistently come up with the same measurements of the alleged craniosacral rhythm.

crystal power

A *crystal* is a solid formed by the solidification of chemicals, has a regularly repeating internal arrangement of atoms and molecules, and is bounded by external plane faces. Crystal particles form a variety of geometrical shapes due to their internal compressions. Crystals have aesthetic properties that have long made them attractive in jewelry. But they also have some properties that make them very important to the electronics and optical industries. Today, crystals are used in just about every type of modern technology.

For centuries, crystals and other gems have been desired for their alleged magical healing and mystical paranormal powers. This belief continues today among occultists and New Age healers, even though it is based on nothing more than [testimonials](#), [the placebo effect](#), [selective thinking](#), [wishful thinking](#), [the Forer effect](#), [sympathetic magic](#), and [communal reinforcement](#). There is no scientific evidence that crystals are conduits of magical energies useful for healing and protection, or for [telling the future](#).

We can dismiss the pre-scientific belief in the magical powers of crystals and gemstones as due to the lack of scientific knowledge. Modern occultists, however, distort and falsify scientific knowledge in order to promote belief in their crystal products. According to the purveyors of this crystalline [pseudoscience](#), crystals channel good "energy" and ward off bad "energy." They carry "vibrations" that resonate with healing "frequencies," work with the [chakras](#) and help balance [yin and yang](#). Crystals allegedly affect the emotions and can be used not only for physical healing, but for emotional problems as well. [Crystals can not only help with emotional healing, but with self-expression, creativity, meditation, and the immune system](#). None of these claims is backed by any scientific evidence.

Today, [crystal wands](#) are used to heal [auras](#) in [aura therapy](#). But one of the more egregious pseudoscientific claims regarding crystals is that, if arranged properly, they can provide protection against harmful [electromagnetic forces](#) such as those that are emitted from computer monitors, cellular phones, microwave ovens, hair dryers, power lines, and other people. The Bioelectric Shield was invented by a chiropractor from Montana, Charles Brown, who claims he heard voices in his head and had visions in his bed as to how to arrange crystals in the shape of a flying saucer in order to provide this protection. Marketed as "[Jewelry With A Purpose](#)," his bioelectric shields are sold for anywhere from \$139 to over a thousand dollars. Cherie Blair, the wife of England's prime minister, wears one of these magical pendants. They are said to be "medically proven" and "based on Nobel Prize winning physics." Even if the claims about the protective power of these pendants

were true, it would be necessary to envelop your entire body in one to achieve the desired result. By hanging a little piece of jewelry around the neck, you might be able to protect a small part of the throat, however.

The New Age idea that crystals can harness and direct energy seems to be based upon a misunderstanding of one of the more curious characteristics of certain crystals, namely, that they produce an electrical charge when compressed. This is known as the piezoelectric effect and was discovered in 1880 by Pierre and Jacques Curie. Other technological developments had to occur before the piezoelectric effect could be put to use, however, and it was not until the 1950s that the piezoelectric effect could be put to general use in record player needles and a variety of measuring devices. Nowadays, these devices ["are used in almost every conceivable application requiring accurate measurement and recording of dynamic changes in mechanical variables such as pressure, force and acceleration."](#)

The piezoelectric effect, however, does not give crystals healing or protective power, despite the claims of those who use and sell crystals in New Age and neo-pagan occultist shops. However, wearing crystals seems to give some people a *feeling* of protection. This, and their aesthetic qualities, seem to be the only virtues of crystal jewelry.

Nor do crystals work any better than animal organs for divining the future, although grinding crystals for fortune telling is more humane and sanitary than disembowelment of poor creatures who don't know yesterday from tomorrow.

See related entry on [crystal skulls](#).

DHEA

DHEA, i.e., dehydroepiandrosterone, is a natural steroid hormone produced from cholesterol by the adrenal glands. DHEA is chemically similar to testosterone and estrogen and is easily converted into those hormones. DHEA production peaks in early adulthood and declines in production with age in both men and women. Thus, many diseases which correlate with age also correlate with low levels of DHEA production. There has been no scientific evidence, however, that low levels of DHEA is a [significant causal factor](#) in the development of diseases associated with aging. Nor is there any evidence that increasing DHEA slows down, stops or reverses the aging process.

For years DHEA was promoted as a miracle weight loss drug, based upon some rodent studies which indicated that DHEA was effective in controlling obesity in rats and mice. Other rodent studies found similar promising results for DHEA in preventing cancer, arteriosclerosis and diabetes. Studies on humans have not yet validated these results.

Despite the lack of sufficient scientific evidence, DHEA supplements are being promoted as having therapeutic effects in many chronic conditions including ["cardiovascular disease, diabetes, hypercholesterolemia, obesity, multiple sclerosis, Parkinson's disease, Alzheimer's disease, disorders of the immune system, depression, and osteoporosis."](#) The healthy truth is that very little is known about DHEA. Long-term effects of self-medicating by using DHEA supplements may be beneficial, neutral or harmful, but it is unlikely that DHEA supplements will affect each individual in the same way. Increasing DHEA may well increase testosterone, which in men may lead to prostate enlargement and in women may lead to facial hair. Increasing estrogen may help prevent osteoporosis or heart disease but may increase the risk of breast cancer. In short, taking DHEA is a high-risk gamble based on insubstantial evidence.

Those doing research on DHEA, such as Dr. Samuel Yen of UC San Diego and Dr. John Nestler of Virginia Commonwealth University, advise caution and do not recommend taking DHEA. Dr. Arthur Feinberg, an associate editor of *HealthNews*, advises against taking DHEA. "The potential for irreversible side effects is real. So given that there's no convincing evidence for any benefit of DHEA, I feel strongly that people should not take it." The research of Dr. Elizabeth Barrett-Connor, professor and chair, department of family and preventive medicine at the University of California, San Diego, is cited by promoters of DHEA as evidence that DHEA is effective in fighting cardiovascular disease. However, Dr. Barret-Conner says "DHEA is the snake oil of the '90s. It makes me very nervous that people are using a drug we don't know anything about. I won't recommend it "

The main voices in favor of DHEA as a miracle drug are those who are selling it or who make a good living selling books or programs advocating "natural cures."

One advocate of DHEA, Dr. Ray Sahelian, warns that high doses (25-50mg daily) can be bad for your heart. It can trigger heart palpitations, irregular heartbeats and even heart attack. His advice is to take no more than 10mg a day and avoid it altogether for at least one or two weeks a month.

ear candling (coning)

Ear candling or coning is a method of cleaning the ears and the mind, which allegedly alleviates a host of physical, emotional and spiritual ailments. A hollow candle is stuck into the ear and lit, allegedly sucking out earwax and negative energy. The process is [ineffective](#) for earwax removal. I don't know how anyone knows whether it sucks out energy, positive *or* negative.

What wax appears in the cone is from the melted candle, not from the ears. The suction created by the coning flame is insufficient to remove wax, which, by the way, is good for you. [It traps dust and dirt and helps fight infections.](#)

Though some people fear that coning will leave them mindless, the only real dangers are from [burning, infection, obstruction of the ear canal and perforation of the eardrum.](#)

The origin of this unnatural practice has been given as ancient Tibet, China, India, Egypt, and pre-Columbian America. Even [Atlantis](#) is cited as a possible origin. In other words, we don't have a clue how this thing got started.

We also have no idea how far this will go, but [Butt Candling](#) could be the end. Another candle in the dark blown out by an ill wind?

Dr. Fritz

Dr. Fritz is a ghost who invades the bodies of Brazilians and turns them into healers. His first victim, Zé Arigó (1918-1971), informed the world that he was [channeling](#) Dr. Adolf Fritz, a German doctor who had died in World War I. The search for this Adolf Fritz has been even less successful than the search for [Bridey Murphy](#). In short, no proof of his ever existing has been brought forth. No matter. Faith healing is very big in Brazil and Arigó made quite a name for himself as a witch doctor or shaman. He was thought to be possessed by the devil but it turned out to be a dead German doctor who, for reasons known only to Arigó and the Lord, took over Arigó's body and started writing illegible prescriptions for sick people. Only Arigó's brother, a pharmacist, could read the prescriptions. People came from far and wide to be cured by Dr. Fritz. His reputation soared after it was alleged that he did a bit of [psychic surgery](#) and removed a cancerous tumor from the lung of a well-known Brazilian Senator. For twenty years Arigó's fame spread as he "cured" thousands of people, including the daughter of Brazil's president. Despite his fame, he was twice convicted of the illegal practice of medicine. Arigó died in an automobile crash in 1971.

Dr. Fritz was not done with his work, however, and soon slipped into the body of another Brazilian, and when he died in a violent crash, Dr. Fritz picked another body to invade. He has done this several times. Two of his most famous invasions have been in the bodies of Edson Queiroz from Recife and Rubens Farias Jr. (1954-) of São Paulo, the current channeler of Dr. Fritz. Rumor has it that [Christopher Reeve](#) has been treated by Rubens Farias Jr. The latest version of Dr. Fritz is well-educated and heals the [astral body](#). Rubens Farias Jr. seems to have abandoned his Catholic training for the teachings of Rudolf Steiner's anthroposophy or Madame Blavatsky's theosophy. Like them he favors a mysticism which maintains that the astral body, a duplicate of the physical body but comprised of a finer substance, is what needs to be treated when one is ill. The physical body can be cured by treating the astral body with "energy healing." But only special mystics can do this. Unfortunately, Dr. Fritz predicts a violent death for Farias Jr. so he won't be practicing his mystical magic for much longer.

Despite being accused of the illegal practice of medicine without a license, Farias Jr. has unending lines of people waiting to be cured. The strong belief in witch doctors in Brazil is traced to the African-Brazilian religion of Candomblé, but the latest Dr. Fritz has shown that Brazilians can be dazzled by New Age mystical notions as well.

Facilitated Communication (FC)

FC is amazing because it has surpassed all other junk science fads, affecting families, schools, universities, the law, and even the arts. --

Brian J. Gorman

Facilitated Communication (FC) is a technique which allegedly allows communication by those who were previously unable to communicate by speech or signs due to autism, mental retardation, brain damage, or such diseases as cerebral palsy. The technique involves a facilitator who places her hand over that of the patient's hand, arm or wrist, which is placed on a board or keyboard with letters, words or pictures. The patient is allegedly able to communicate through his or her hand to the hand of the facilitator which then is guided to a letter, word or picture, spelling out words or expressing complete thoughts. Through their facilitators, previously mute patients recite poems, carry on high level intellectual conversations, or simply communicate. Parents are grateful to discover that their child is not hopelessly retarded but is either normal or above normal in intelligence. FC allows their children to demonstrate their intelligence; it provides them with a vehicle heretofore denied them. But is it really their child who is communicating? Most skeptics believe that the only one doing the communication is the facilitator. The American Psychological Association has issued a [position paper on FC](#), stating that "Studies have repeatedly demonstrated that facilitated communication is not a scientifically valid technique for individuals with autism or mental retardation" and describing FC as "a controversial and unproved communicative procedure with no scientifically demonstrated support for its efficacy."

Facilitated Communication therapy began in Australia with Rosemary Crossley. The center for FC in the United States is Syracuse University, which houses the [Facilitated Communication Institute](#) (FCI) in their School of Education. The FC Institute was established in 1992. It conducts research, provides training to teach people to become facilitators, hosts seminars and conferences, publishes a quarterly newsletter and produces and sells materials promoting FC, including a six-part video series for \$50 per video (\$250 for the series).

While several studies have indicated that facilitated communication does tap into the mind of a person who heretofore had been incommunicado, most studies have shown that facilitated communication only taps into the beliefs and expectations of the facilitator. Many control studies have failed to produce strong evidence that facilitated communication works. Defenders of FC routinely criticize as insignificant or malicious those studies that fail to validate FC. Yet, it is unlikely that there is a massive conspiracy on the part of

all those who have done research on this topic and have failed to arrive at findings agreeable to the FCI.

There have been numerous critics of FC, including [Gina Green, Ph.D.](#), Director of Research at the New England Center for Autism, Southboro, Massachusetts, and Associate Scientist at the E.K. Shriver Center, Waltham, Massachusetts, and Howard C. Shane, Ph.D., Director of the Communication Enhancement Center, Department of Otolaryngology and Communication Disorders at Children's Hospital, Boston, and Associate Professor of Otolaryngology in the Harvard Medical School. A very damaging, detailed criticism was presented on PBS's "Frontline", October 19, 1993. The program was repeated December 17, 1996, and added that since the first showing, Syracuse University has claimed to have done three studies which verify the reality and effectiveness of FC, while thirty other studies done elsewhere have concluded just the opposite.

The *Frontline* program showed facilitators allegedly describing what their clients were viewing, when it was clear their clients' heads were tilted so far back they couldn't have been viewing anything but the ceiling. When facilitators could not see an object which their client could see (a solid screen blocked each from seeing what the other was seeing) they routinely typed out the wrong answer. Furthermore, FC clients routinely use a flat board or keyboard, over which the facilitator holds their pointing finger. Even the most expert typist could not routinely hit correct letters without some reference as a starting point. (Try looking away from your keyboard and typing a sentence using just one finger held in the air above the keyboard.) Facilitators routinely look at the keyboard; clients do not. The messages' basic coherence indicates that they most probably are produced by someone who is looking at the keyboard.

Nevertheless, there are many [testimonials](#) supporting FC, namely, letters from clients who are grateful to FC for allowing them to show to the world that they are not retarded or stupid. Some of them may be from people who have been genuinely helped by FC. It seems that the FCI treats the retarded, autistic and those with cerebral palsy. I have had several students with cerebral palsy. As students, they have been no better and no worse than most of my other students. They have used assistants who helped translate their communication for me. Usually, the student had a card (with letters or words or pictures) on his or her lap. The student would point to letters or words and sometimes speak; the assistant would translate for me. Anyone familiar with Helen Keller, Stephen Hawking or Christy Brown knows that blindness, deafness, cerebral palsy, multiple sclerosis, [amyotrophic lateral sclerosis](#) (ALS), or physical or neurological disorders, do not necessarily affect the intellect. There is no necessary connection between a physical handicap and a mental handicap. We also know that such people often require an assistant to facilitate their communication. But what facilitators do to help the likes of a Hawking or a Brown is a far cry from what those in the facilitated

communication business are doing.

It may well be that some of those helped by FC suffer from cerebral palsy and are mentally normal or gifted. Their facilitators help them communicate their thoughts. But the vast majority of FC clients apparently are mentally retarded or autistic. Their facilitators appear to be reporting their own thoughts, not their patient's thoughts. Interestingly, the facilitators are genuinely shocked when they discover that they are not really communicating their patient's thoughts. Their reaction is similar to that of [dowsers](#) and others with "special powers" who, when tested under controlled conditions, find they don't have any special powers at all.

If FC worked one would think that it would be easy to test by letting several different facilitators be tested with the same client under a variety of controlled conditions. If different "personalities" emerged, depending on the facilitator, that would indicate that the facilitator is controlling the communication. But, believers in FC claim that it only works when a special bond has been established between facilitator and patient. It is interesting that the parents and other loved ones who have been bonding with the patient for years are unable to be facilitators with their own children. FC needs a kind stranger to work. And when the kind strangers and their patients are put to the test, they generally fail. We are told that is because the conditions made them nervous. These [ad hoc](#) excuses sound familiar; they sound like the complaints of [parapsychologists](#).

Despite much criticism and many experiments demonstrating that the messages, poems, brilliant discourses, etc., being transmitted by the facilitators originate in the facilitators themselves, the FC Institute is going strong. With support groups all over the world and a respectable place at a respectable university, there is little chance that FC will soon fade away. Those within the FC movement are convinced FC "works." Skeptics think the evidence is in and FC is a delusion for the most part. It is also a *dangerous* delusion. Critics have noted a similarity between FC therapy and [repressed memory therapy](#): patients are accusing their parents and others of having sexually abused them. Facilitators are taught that something like 13% of their clients have been sexually abused. This information may unconsciously influence their work. The facilitator cannot imagine that he/she is the source of the horrible charges being expressed. Neither can school administrators or law enforcement authorities who believe FC is a magical way to tap into the thoughts of the autistic or the severely retarded. With repressed memory therapy the evidence emerges when a "[repressed memory](#)" is brought to light or when a child is interrogated by therapists trained to treat sexually abused children. There is overwhelming evidence that many repressed memories of sexual abuse, as well as many "memories" of interrogated children originate in the minds and words of therapists who suggest and otherwise plant them in their patients' minds. Similar findings have been made with FC: facilitators report sexual abuse and their messages have been used to falsely charge

parents and others with sexual abuse of mentally and physically handicapped persons.

The criticisms of FC as another therapy leading to a witch-hunt, turning decent parents into accused molesters of their handicapped children are not without justification. How is one to defend oneself against an allegation made by someone who can never be interrogated directly? Missy Morton, an expert from the FC Institute suggests the following:

One facilitator can in any given case be mistaken, or can be influencing the person, and as a precaution it is helpful to have the message repeated to a second facilitator. If this is not immediately feasible a decision has to be taken as to whether the situation will allow any decision to wait until a second facilitator can be introduced. If with a second facilitator the message is confirmed in detail then it may be taken as confirmed that an allegation has been made.

("Disclosures of Abuse through Facilitated Communication: Getting and Giving Support," Missy Morton, Facilitated Communication Institute Syracuse University Division of Special Education and Rehabilitation, May 1992.)

If there were evidence that facilitators were usually reporting the thoughts of their clients, there would still be concern for ensuring that the rights of the accused were not abused. But as the evidence is overwhelming that in most cases of FC, the facilitator is reporting his or her own thoughts, the effort to ensure against false accusations should be enormous. Yet, those in the forefront of the movement indicate how trivial they take the problem to be when they focus on problems of ambiguity. Here is Ms. Morton's warning issued to facilitators:

Facilitated communication is never as fast or as fluent as normal speech. Messages tend to be short, even telegraphic, and may omit grammatical bridges. It is not always clear what message the person is trying to get across with the words he or she has spelt out.

The message may be incomplete;

One person spelt out MY FATHER IS F...ING ME - clear enough, you would think, if the facilitator hadn't carried on to get MY FATHER IS F...ING ME AROUND.

The letters or words chosen may not be those that the student really intended.

This way of dealing with ambiguous communication seems hopelessly

inadequate. What is needed is some way to prevent facilitators from unjustly accusing parents of heinous acts against their children. It is likely that if most of the facilitators kept reporting sexual abuses, this movement would have gotten nowhere. The grieving, hopeful parents would never put up with such abuse.

holistic medicine

Holistic medicine refers to alternative health practices which claim to treat "the whole person." To holistic practitioners, a person is not just a body with physical parts and systems, but is a spiritual being as well. The mind and the emotions are believed to be connected to this spirit, as well as to the body. Holistic practitioners are truly *alternative* in the sense that they often avoid surgery or drugs as treatments, though they are quite fond of meditation, prayer, herbs, vitamins, minerals and exotic diets as treatments for a variety of ailments.

joy touch

Joy touch is a meditative technique developed by Pete Sanders. He says it can help people lose weight, feel good, relax, quit smoking, eliminate life-threatening diseases, face the dentist, overcome fear of paranoia, transcend the body, get off drugs, become indifferent to the daily urges to rage and vent, etc.

The technique is reminiscent of meditating on the third eye in the middle of the forehead while silently humming OM! Sanders' twist is to have you imagine a line from the center of your forehead to the center of your brain (the site of the septum pellucidum). Then, imagine gently brushing that region of the brain.

Sanders teaches his discovery of joy touch (\$25 for a 2.5 hour session) in Sedona, Arizona, a New Age mecca for those in search of higher forms of consciousness. He is one of a rare breed--a faith healer who does not claim to be a psychologist or psychotherapist. (He claims to have an undergraduate degree from MIT in biomedical chemistry.) He is also the author of *You Are Psychic!*

The "scientific" theory behind joy touch is explained this way by Sanders: the septum pellucidum is used as a remote control for the hypothalamus, generally considered the brain's pleasure center. The septum pellucidum has nerve connections to the hypothalamus and stimulates it directly. Exhilarating relief may come in 2 or 3 seconds and last as long as 5 to 30 minutes. Of course, any relief felt may be due to [the placebo effect](#).

The critical thinker might think of applying [Occam's razor](#) and consider a direct imaginary massage of the hypothalamus itself, eliminating the seemingly superfluous step of sending massage ripples from the septum pellucidum. A word of caution: Do not try this at home! Sanders warns that since the hypothalamus is very close to the rage and anxiety centers of the limbic system within the brain, trying to stimulate the hypothalamus directly might backfire. Instead of finding oneself in a state of stoic [ataraxia](#) you might find yourself catatonic or enraged beyond the point of recovery. This may be dangerous to your health, but it could lead to a new career on talkback radio or TV.

macrobiotics

Macrobiotics is a way of life characterized by a special diet said to optimize the balance of [yin and yang](#). George Ohsawa (1893-1966) started the macrobiotics movement with the publication of his *Zen Macrobiotics* in 1965. Michio Kushi popularized the movement in the United States. The basics of the diet itself were established by Sagen Ishizuka, a 19th century Japanese army doctor.

Ishizuka claimed that foods have *yinness* and *yangness*, and that a proper diet balances yin and yang. Ohsawa makes such claims as that schizophrenia is a yin disease and one who is so afflicted should drink yang fluids. Kushi makes such claims as that cancer "is the body's own defense mechanism to protect itself against long-term dietary and environmental abuse." How he knows this is a mystery. There is no reputable evidence that a macrobiotic diet is beneficial for cancer patients. The only reports of efficacy are testimonials by patients, many of whom received traditional medical treatment, according to the American Cancer Society.*

If a macrobiotic diet is healthy it is by accident, since foods are selected not for their physical or nutritional qualities, but for their metaphysical properties. Or, it is quite likely that many people, like its founders, improve physically on the diet not for what they take in but for what they discontinue, such as refined foods, meat, milk, and other animal products. All assignment of metaphysical properties to foods is arbitrary, but may be based on [sympathetic magic](#).

The macrobiotic diet consists mainly of whole grains, vegetables, and beans.

[Massage Therapy:
Riddled with
Quackery](#) by Stephen
Barrett, M.D.

massage therapy

A massage is the rubbing or kneading of parts of the body to aid circulation or to relax the muscles. Massage therapy is a massage which includes a metaphysical explanation usually couched in terms of "balancing" some sort of "energy."

A massage is usually relaxing and usually feels good. Most of us, however, could not explain the physical and physiological mechanisms causing the relaxation and pleasure. Most of us probably suspect it has something to do with the enjoyment of being touched by another person, and with the physical movement of muscles and other body parts.

Most of us know from experience how the touch of another person can be soothing and comforting. Massage therapists claim to understand the metaphysical reasons for the uplifting and relaxing effect of massage. Their explanations vary. Here are a few culled from an article in *The Davis Enterprise* [January 10, 1993, p. C-1 and C-3]. The article features local "**massage therapist**" Karen Khamashta using Ortho-Bionomy, [Reflexology](#), and [Polarity therapy](#).

[Ortho-Bionomy](#) works by contacting the body's "trigger points." According to this theory, when a trigger point is contacted, you "immediately relieve pain and restore the body's natural balance and rhythm."

[Reflexology](#) works by allegedly unblocking the 7,200 nerve endings in each foot so that they can respond to all of the glands, organs and other parts of the body and improve the blood supply as well. This supposedly helps the body "reach a balanced state."

[Polarity therapy](#) is based on "balancing the life energy that moves through every part of the body...and...moves in currents, or channels within and around the body." Polarity therapy "attempts to eliminate blockages in these channels which can cause imbalance and illness." The theory is that "if the body's currents are balanced, the person relaxes and is able to heal more efficiently." Polarity therapy is a kind of acupuncture without the needles. In acupuncture the metaphysical energy that gets blocked is known as [chi](#).

Another massage therapist, Christy Freidrich says "A lot of what I do is to try to help people with their structural balance. Over a period of time, people end up learning more about structure and how it works."

Massage therapy sounds as if it has as its goal something similar to

[therapeutic "touch"](#)--restoring harmony and balance to one's life energy. But the massage therapist uses "[palpation](#)" for assessment of ... energy blockages", while the therapeutic touch practitioner waves her hands over your [aura](#).

Massage therapists who are certified by the [National Certification Board for Therapeutic Massage and Bodywork](#) must take 500 hours of education classes and pass an examination. They must know some basic anatomy and physiology, as well as some first-aid. Despite the emphasis on balancing energy, none of the practice questions provided by the NCBTMB involve metaphysics.

[The American Massage Therapy Association](#) claims that

Research shows [massage] reduces the heart rate, lowers blood pressure, increases blood circulation and lymph flow, relaxes muscles, improves range of motion, and increases endorphins, the body's natural painkillers. Therapeutic massage enhances medical treatment and helps people feel less anxious and stressed, relaxed yet more alert.

They don't mention who did the research and where one might verify these claims. Nor do they mention that these effects are likely to be temporary or that similar results might be achieved by meditating, walking, exercising, having sex, or reading a good book, not necessarily in that order.

The AMTA also claims that therapeutic massage "can help" with

- allergies
- anxiety
- arthritis (both osteoarthritis and rheumatoid arthritis)
- asthma and bronchitis
- carpal tunnel syndrome
- chronic and temporary pain
- circulatory problems
- depression
- digestive disorders, including spastic colon, constipation and diarrhea
- headache, especially when due to muscle tension
- insomnia
- myofascial pain (a condition of the tissue connecting the muscles)]
- reduced range of motion
- sinusitis
- sports injuries, including pulled or strained muscles and sprained ligaments
- stress
- temporomandibular joint dysfunction (TMJ)

Something that "can help" with so many disorders and dysfunctions should be very popular. According to the AMTA, Americans spend from \$2 billion to \$4 billion per year on massage therapy. However, "can help" is an empty claim, and those with serious medical problems such as cardiac problems, depression, or sinusitis would do well to consult a physician.

Since massage therapy is essentially an unregulated profession, making claims that massage therapists are qualified to treat medical conditions such as allergies, infectious diseases, phlebitis, etc., seems like [quackery](#). This has not stopped the profession from expanding to the point where even [dogs](#) and [horses](#) can get a healing massage the [Linda Tellington-Jones](#) holistic way.

(New Age) psychotherapies

"It is possible that the most important decision in the history of therapy was the idea that it should be paid for by the hour." – Jay Haley

"To society's loss, there is an alarming laxity within the mental health professions when it comes to monitoring, commenting on, and educating the public about what is good therapy, what is negligent behavior by trained professionals, and what is or borders on quackery." –Singer and Lalich, "Crazy" Therapies

A **psychotherapy** is a treatment technique for mental or emotional disorders. There are many types of psychotherapy. Some have been empirically tested and are known to be very effective, such as [cognitive therapy](#). Many New Age therapies, however, are little more than a mixture of metaphysics, religion and pseudoscientific "insights". There may be reasonable disagreements over what constitutes successful therapy, but successful therapy should not require one to believe in God, reincarnation, alien abductions, possession by entities, inner children, Primal Pains, channeling, miracles, or any other metaphysical, religious or pseudoscientific notion.

For in-depth descriptions of some of the latest New Age therapies one should read *"Crazy" Therapies* by Margaret Thaler Singer and Janja Lalich, or view Ofra Bikel's "Divided Memories," first aired on *Frontline* on April 4, 1994, and available on video tape for \$133.50 (\$155 abroad) from:

**Journal Graphics, Inc
1535 Grant Street
Denver CO 80203
303-831-9000**

Bikel's documentary of therapists allows the practitioners to confidently display their arrogance and incompetence. The therapists are oblivious to the fact that they are being used to demonstrate the monstrosity of their pseudoscientific and self-deceptive work. Therapist after therapist talks freely about how uninterested they are in the truth and how indifferent they are to

the families they help destroy. They are uniform in their dismissal of critics as being "in denial". Patient after patient is paraded forth by the therapists as evidence of their good work, yet none of the patients seem better for the therapy and many seem hopelessly ill.

Trying to find a meaningful common thread in the therapies is not too difficult, but its meaningfulness does not enhance the position of those who think these therapies are scientific. One common thread is the belief that a person having problems is not likely to be responsible for those problems. Another thread is the belief that the cause of a problem is some traumatic past event, such as being stabbed in the stomach in a previous lifetime or being sexually abused as a child, the latter being the [repressed memory therapists'](#) one-size-fits-all explanation of every emotional disorder. Childhood sexual abuse is not only the cause of most problems, according to these therapists, it is the cause around which their lives revolve. The repressed memory therapists are not bothered that most of their patients do not remember being abused. [Repressed memory therapy](#) will help them recall the trauma. Several therapists in "Divided Memories" claim to have been abused themselves; one discovers her abuse while treating a patient who is remembering her abuse. That a therapist would inject his or her own problems into treatment and consider the beliefs about a past life of a patient to be relevant to the patient's illness makes these New Age therapies look more like [cults](#) than science.

Another common thread is the belief that the patient must discover the cause of his or her problem to be helped. This "insight" approach to psychotherapy is very old, but has never been scientifically tested or validated. Nor does there seem to be any clear idea as to what it means to be helped by psychotherapy. The only common thread regarding cure seems to be that the patient believes she knows what caused her problems. Believing you know who or what harmed you in the past is the cure. The quality of the patient's life, the interaction of the patient in significant social settings--such as with one's family, friends, and co-workers--is irrelevant. Having the patient trust the therapist is all-important. To gain this trust one of the common tactics of the therapists is to turn the patient against the patient's family. This is done by leading the patient to believe that the cause of the patient's problems is a family member or several family members. The family cannot help the patient because the family is the cause of the patient's problems. One or more family members abused the patient and is now either a liar or in denial; the other family members are deluded or in conspiracy to protect the evil family member. Of course, this demand that the therapist be trusted by the patient has its corollary: the patient puts all her faith in the therapist in return. The patient has been persecuted; the therapist is her savior.

lack of interest in truth or accuracy

The most appalling thread holding these therapies together is the profound lack of interest in truth or accuracy. Neither patient nor therapist is to be

concerned with facts or tangible evidence that the "believed cause" actually happened. In fact, whether the "believed cause" is the real cause is irrelevant to the therapy. The patient creates truth and it is as real to the patient as facts are to the skeptic. That's all that matters. We all live in a delusion, proclaims one therapist. So, it is of no concern to him that his patient's "believed cause" is pure delusion. Any first-year psychology student recognizes the projection in that claim. The viewer, however, needs no training to see that this therapist is clearly deluded when he claims that he did not induce his patient's bizarre tale of ritual abuse by her satanic cult parents and grandparents. His total lack of interest in corroborating evidence to his patient's story, his lack of concern for the family he was helping to destroy, his disingenuous claims about needing to accept on faith everything his patient tells him, his apparent obliviousness to the absurdity and cruelty of inducing his patient to file a \$20 million lawsuit against her family, his deluded claim that he can tell in the first session with a patient whether she has been abused as a child, all add up to the self-labeled therapeutic package: delusion.

The overwhelming impression left by Bikel's documentary is that there are a number of New Age therapists who are mixing metaphysics, religion and quackery. They have no interest in facts or truth, and, because they are pseudoscientific, have no way of testing whether they are valid or not.

Singer and Lalich's *"Crazy" Therapies* documents the wide range of pseudoscientific therapies popular among New Age therapists. The authors attribute part of the popularity of bizarre therapies to the rise in irrationality and the demand for such items on talk shows and the book circuit. Some therapists, like Sondra Ray, an advocate of ["rebirthing therapy,"](#) consider themselves to be spiritual guides, not scientists. They are proud of their lack of scientific support. Some claim that mental illness is caused by possession by spirit entities which must be placated. Others use [past-life regression](#) to find the cause of the problem. Some treat [alien abduction](#) claims as non-delusional. There are several cathartic therapies that involve primal screaming, rebirthing, or reparenting. None of these therapies has any scientific validity. Others, such as [facilitated communication](#) and [Eye Movement Desensitization and Reprocessing](#) (EMDR) appear scientific but at the expense of good sense and good science. None of these therapies have been proven effective by independent scientific studies, nor are they generally accepted as effective in the scientific community. Their support comes mainly from the "insight" and observations of their founders, and patient response, which is analyzed and evaluated by the therapists themselves. Most of the innovative therapists reviewed by Singer and Lalich seem uninterested in scientifically testing their theories, though most seem attached to technical jargon.

It is difficult to select the most egregious New Age therapy, but Neural Organization Technique (NOT) developed by chiropractor Carl Ferreri, is hard to top. Ferreri decided, without the slightest hint of scientific evidence,

that all mental and physical problems are due to misaligned skulls. Ferreri believes that as you breathe, the bones in your skull move, causing misalignments that can be corrected by manipulation. This theory was put into practice without the slightest proof that cranial bones move or that there is any sense to the notion of "standard alignment" of the cranial bones. Ferreri was not stopped by logic, however, but by lawsuits and criminal charges.

long list of "crazy" therapies

The list of "crazy" therapies is too long to reproduce here, but Singer and Lalich describe the following:

Leonard Orr developed energy breathing and rebirthing theory. According to Orr, if you learn how to breathe energy well, you can breathe away diseases and physical or emotional pain.

Marguerite Secheyahay and John Rosen practice the theory of regression and reparenting. The therapist becomes the patient's surrogate parent to make up for the terrible job her real parents did.

Jacqui Shiff's theory is that the patient must wear diapers, suck his thumb and drink from a baby bottle to be cured.

Sondra Ray and Bob Mandel believe that your problems are due to the way you were born. They will help "rebirth" you, properly this time.

John Fuller, Bruce Goldberg, Brian Weiss, Edith Fiore, Richard Boylan, David Jacobs, Budd Hopkins and John Mack use hypnosis to discover the patient's past or future lives as an alien abductee, in an effort to "help" them.

John Bradshaw's theory is that you have an "inner child" you must nurture and be good to, if you are to be healthy.

Arthur Janov practices Primal Therapy. According to Janov, the patient must rid herself of Primal Pain which can be eradicated only by learning the Proper Way to Scream and Capitalize.

Daniel Casriel's New Identity Process (NIP) involves screaming which allegedly unblocks what's blocked. Casriel's scream is apparently a better kind of scream than Janov's.

Nolan Saltzman practices Bio Scream Psychotherapy. His screaming is apparently better than both Casriel's and Janov's because it has more Love in it.

Finally, there is hypnotherapy. Hypnotherapy is extremely popular and is practiced by thousands of therapists who got their training in a weekend

seminar. Singer and Lalich note that

There are no licensing requirements, no prerequisites for training, and no professional organization to which those who hypnotize others are accountable. You can be a real estate agent, a graphic artist, an English teacher, or a hairdresser and also call yourself a hypnotherapist by hanging a certificate on your wall that states you took as few as eighteen hours of courses in hypnosis. (p. 53)

This lack of oversight leads to all sorts of abuses and malpractice.

priming

Many hypnotherapists seem unaware that they are priming their patients. The dangers of this practice are stated by [Martin Orne](#): "The cues as to what is expected may be unwittingly communicated before or during the hypnotic procedure, either by the hypnotist or by someone else, for example, a previous subject, a story, a movie, a stage show, etc. Further, the nature of these cues may be quite obscure to the hypnotist, to the subject, and even to the trained observer." (p. 96) Yet, many hypnotherapists seem oblivious to the dangers and pitfalls of using hypnosis in a therapeutic session.

Many New Age therapists seem oblivious to facts with which any competent therapist should be concerned. For example, all these therapists develop theories which exclude the possibility that a patient might either have a physical problem or a character flaw. No patient is physically ill. No mental disorder is biochemical. No patient is responsible for his or her problems. It is always someone else or something else which has the faults. Patients apparently never lie, manipulate, deceive, cheat, distort, rationalize, err, etc. If a patient has a "fault," it is that he or she is not completely trusting of the therapist. Patients have "mental diseases", "emotional problems", or "syndromes", not character flaws. It would be an astounding fact to discover that emotionally disturbed or mentally troubled persons are completely without flaws in their moral character. Yet, these advocates of "crazy" therapies seem to treat all patients as if they were innocent children, incapable of the slightest peccadillo.

Most of the therapists discussed by Bikel, Singer and Lalich seem oblivious or indifferent to their role in priming and prompting their patients. They condition their patients, prompt them, and in some cases, clearly plant notions in their patient's minds. They give their patients books to read or videos to watch, not to help the patient understand a problem but to prime the patient for belief in some crazy therapy. They plant notions during hypnosis, group sessions, etc., and then these planted notions are "recovered" and offered as validation of their therapeutic techniques and theories. Rather than provide

real therapy, these "crazy" therapists indoctrinate patients into their own worldviews. Perhaps most disturbing of all is that this surreal pseudoscience goes nearly unchallenged by professional mental health associations and the mass media.

psychic "surgery"

Psychic "surgery" is a type of non-surgery performed by a non-medical healer. The healer fakes an incision by running a finger along the patient's body, apparently going through the skin without using any surgical instruments. The healer pretends to dig his hands into the patient's innards and pretends to pull out 'tumors'. Using trickery, the healer squirts animal blood from a hand held balloon while discarding items such as chicken livers and hearts. The patient then goes home to die, if he or she was really dying, or to live if there was nothing seriously wrong in the first place.

Psychic "surgery" is big business around the world, but especially in the Philippines and Brazil, where "healers" like [Alex Orbito](#) and [Laurence Cacteng](#) ply their trade. Tony Agpaoa put psychic "surgery" on the map in Manila, where there are now several hundred practicing psychic "surgeons", many working out of hotels. In 1967, Agpaoa was indicted for fraud in the United States. He jumped bail and went home, forfeiting a \$25,000 bond.*

Some people find solace in psychic "surgeons" and other faith healers because they think the healers are divine agents. The practice is not restricted to third-world countries. [Chris Cole](#) practices psychic "surgery" in Sydney, Australia. One of the more popular psychic "surgeons" outside of the Philippines is [Stephen Turoff](#), who runs the Danbury Healing Clinic in Chelmsford, England. Turoff, a follower of [Sai Baba](#), performs [therapeutic touch](#) at no extra charge. Turoff also takes his show on the road. A Dutch group called [Inner Journey](#) reports on a weekend with Turoff where at least four people out of about 250 wrote two weeks after their visit to say they were healed.

Turoff has been performing for a quarter of a century and is popular enough to warrant a biographer, Grant Solomon. In 1998, Solomon published *Stephen Turoff - Psychic Surgeon: The Story of an Extraordinary Healer*. A revised edition appeared in 1999 with the extraordinary and remarkable revised title of *Stephen Turoff, Psychic Surgeon: The Extraordinary Story of a Remarkable Healer*. According to [Natural Healing](#), Turoff is "a 16-stone, six-and-a-half foot, middle-aged, Jewish-Christian former carpenter from Brick Lane in London's East End whom many believe to be an instrument of God." To [others](#), Turoff is just another [pious fraud](#). Nevertheless, the popularity of psychic "surgery" seems to be growing, despite the debunking work of people like James Randi.

[Psychic dentistry](#) is also available for those who prefer dentistry without anesthesia or dental drills performed by a faith healer. "Willard Fuller has supposedly healed more than 40,000 people since he began practicing in

1960. Those who flock to his healing ministry claim his magic touch can fill cavities, make bad teeth whole again, and even produce a new set of teeth in some elderly patients" (Nava). Many patients are afraid to admit they've been defrauded because that would imply that they lack true faith. According to George Nava True II who operates the "only Philippine skeptical website to challenge the claims of alternative healers, psychics, and other quacks," psychic dentistry "has never been demonstrated under controlled laboratory conditions and most practitioners are simply sleight-of-hand artists who can't produce a shred of proof of their alleged powers." For those who have faith, proof is not needed.

Rolfing

"Rolfing's foundation is simple: Most humans are significantly out of alignment with gravity, although we function better when we are lined up with the gravitation field." [[The "Online Boulder Guide"](#)]

Rolfing is a kind of [deep massage](#) and "movement education" developed by [Ida P. Rolf](#) (1896-1979), a biochemist and therapist. She authored several books on the relationship of form and structure in the human body, including *Rolfing: The Integration of Human Structures* (New York: Harper and Row, 1977). Her dissertation was on the chemistry of unsaturated phosphatides and was published by The Waverly Press in 1922.

Dr. Rolf claimed she found a correlation between muscular tension and pent up emotions. *Rolfing* is the name given to Dr. Rolf's method of massage, which transcends chiropractic in that it is based on the notion that *emotional* as well as physical health depends upon being properly aligned. In Rolfing, alignment must be of much more than just the spine. To be healthy, according to Rolfers, you must align your head, ankles, hips, thorax, pelvis, knees, shoulders, ears, etc., in just the right way or else the evils of gravity will be felt. By being properly aligned, gravity enhances personal energy leading to a healthy body and emotional state.

There is a Rolfer in my hometown who advertises that Rolfing brings "a sense of integration and well being." The ad even quotes an M.D. who says: "Rolfing works. Not only can it dramatically change people's bodies. It can transform their lives as well." Rolfing, according to the advertisement, has "evolved into a **gentle** deep muscle balancing process that structurally aligns your body." (The word "gentle" is boldfaced in the ad.) He also claims that after ten sessions there are long-term results, which include "Physical and Emotional Flexibility" and "A Sense of Integration and Well Being."

Has this claim of the muscular/emotional connection been demonstrated by any scientific studies? No, but the proof is that it works! There are tons of anecdotes and [testimonials](#) verifying Rolfing.

[Some Rolfers](#) claim that Rolfing is a 'scientifically validated system of body restructuring and movement education.' They claim that there is scientific proof that each of us has life-long patterns of tension and that realigning releases this tension, so that "overall personal functioning tends to improve."

The expression 'tends to improve' may sound like weaseling to you, but apparently it is crystal clear and scientific enough for Rolfers.

It takes one to two years to complete the Rolfing training at a cost of between \$10,000 and \$12,000. The Rolfing training can only be taken from the official Rolf Institute in Boulder Colorado. Although there is another outfit in Boulder called [The Guild for Structural Integration](#) which is dedicated to Ida Rolf and seems to be Rolfing in everything but the name. Another school of structural integration is [Hellerwork](#), which will not only align and integrate your body parts, it will do the same for your mind and soul.

shark cartilage

Powdered shark cartilage has been touted as a cancer cure, especially by William Lane, Ph.D., whose company produces the stuff under the name of BeneFin. Lane has written two books, both with the false claim that *sharks don't get cancer* in their title. Sharks do get cancer, even cancer of their cartilage. On June 29, 2000, Lane was prohibited by the Federal Trade Commission from claiming "BeneFin or any other shark cartilage product prevents, treats or cures cancer," until he has substantial evidence to support his claims.

Dr. Lane is an example of why alternative medicine is usually either useless or harmful. He took a little bit of knowledge, generalized from it, started a company to produce the miracle cure, wrote books and misleading promotional pieces supporting his company's research and product, got a major news show to do a shoddy, uncritical story which suggested that maybe there was something to the miracle cure, and responded to criticism with the claim that his critics were conspiring to stifle him because his research was somehow a threat to traditional medical practitioners.

There are no scientific studies done by independent researchers with proper controls which have substantiated the claim that shark cartilage is a useful treatment for cancer. In at least one such study, the treatment was found ineffective. Other studies are underway and their results should be available soon.

Lane got his inspiration from the work of real scientists who injected bovine and shark cartilage into the bloodstreams of rabbits and mice with cancer. The stuff greatly inhibited angiogenesis, the growth of blood vessels which supply nutrients to the cancerous cells. However, not all cancers rely on angiogenesis. Most researchers doubt that cartilage taken orally will result in significant quantities making it to the site of a tumor. They believe that it is a protein in cartilage that affects angiogenesis and that the protein would be digested rather than absorbed into the bloodstream where it might find its way to a tumor. However, injecting shark cartilage directly into the human bloodstream might result in an unfavorable immune system response.

The best that can be said for taking shark cartilage pills or powder is that *it is an unproven cancer cure*.

[A gift from the gods:
bottled cow's urine](#)

By Julian West in
New Delhi (Sept. 4,
2001)

urine therapy

Drink water from your own cistern, flowing water from your own well. (The Book of Proverbs 5:15)

More than three million Chinese drink their own urine in the belief it is good for their health, according to the official Xinhua news agency.

Urine therapy refers to one of several uses of urine to prevent or cure sickness, to enhance beauty or to cleanse one's bowels. Most devotees drink the midstream of their morning urine. Some prefer it straight and steaming hot; others mix it with juice or serve it over fruit. Some prefer a couple of urine drops mixed with a tablespoon of water applied sublingually several times a day. Some wash themselves in their own golden fluid to improve their skin quality. Many modern Japanese women are said to engage in urine bathing. The truly daring use their own urine as an enema. Urine is not quite the breakfast of champions, but it is the elixir of choice of a number of holy men in India where drinking urine has been practiced for thousands of years. The drink is also the preferred pick-me-up for a growing number of naturopaths and other advocates of "nature cures." The main attractions of this ultimate home brew are its cost, availability and portability. It is much cheaper than that other "water of life," [whisky \(uisge beatha\)](#), which also has been hailed for its medicinal qualities. Unlike whisky, however, urine is always available, everyone carries a supply at all times, and, for most people, there are no intoxicating side effects. Furthermore, the urge to overindulge is almost absent when drinking urine. The same can't be said for good single malt such as Highland Park or a good whiskey such as Black Bush.

Many advocates claim that urine is a panacea. There is practically nothing it won't cure. Urine is said to be effective against the flu, the common cold, broken bones, toothache, dry skin, psoriasis and all other skin problems. It is said to deter aging and is helpful with AIDS, allergies, animal and snake bites, asthma, heart disease, hypertension, burns, cancer, chemical intoxication, chicken pox, enteritis, constipation, and pneumonia. Urine is said to be effective against dysentery, edema, eczema, eye irritation, fatigue, fever, gonorrhea, gout, bloody urine, small pox, immunological disorders, infections, infertility, baldness, insomnia, jaundice, hepatitis, Kaposi's sarcoma, leprosy, lymphatic disorder, urticaria, morning sickness, hangover, obesity, papilloma virus, parasitoses, gastric ulcer, rheumatism, birth marks, stroke, congestion, lumbago, typhus, gastritis, depression, cold sore, tuberculosis, tetanus, Parkinson's disease, foot fungus, diabetes and other endocrine related diseases. Some enthusiasts see urine therapy as a divine manifestation of cosmic intelligence. They use urine to unleash their kundalini, sending it straight into the third eye, bringing instant

enlightenment.*

With such wondrous properties, it is amazing that science bothered developing medicine when it had the key to good health already in the bottle, so to speak. Each of us is a walking pharmacopoeia. Homer Smith (*Man and His Gods*) once wrote that "man is a machine for turning wine into urine." Little did he know that man is a machine for turning just about anything into a medicinal tonic. According to urinophiles, the medical establishment has conspired to keep us ignorant of the wonder drug we all carry in our bladders. One self-proclaimed expert on the subject claims

...the medical community has already been aware of [urine's] astounding efficacy for decades, and yet none of us has ever been told about it. Why? Maybe they think it's too controversial. Or maybe, more accurately, there wasn't any monetary reward for telling people what scientists know about one of the most extraordinary natural healing elements in the world.*

This is a common argument from defenders of alternative therapies: the greed of medical doctors leads them to conspire against chiropractors, chelation therapists, etc. The evidence for this conspiracy wouldn't fill a specimen beaker. Part of the alleged conspiracy to keep us ignorant of the wonders of our own wee wee is the fact that many people think urine is poisonous. Urine is generally not toxic and you will not die of uremic poisoning if you start your day off with a cup of your own golden fluid. However, it hardly seems fair to blame the medical establishment for the general public's ignorance on this matter. In any case, just because something is not toxic does not mean it is good for you. Hair is not toxic, either, and even though it might be a good source of roughage, it is generally not desirable to put hair in food.

Furthermore, while it is true that some of the constituents of urine are being used and tested for their potential or actual therapeutic value, it does not follow that drinking one's urine is therapeutic. It may be discovered that one of the chemicals in human urine is effective for fighting cancer. However, drinking one's own urine is not likely going to supply enough of any cancer fighting substance to do any good. It is also true that some of the substances in urine are good for you. For example, if you are ingesting more vitamin C (a water soluble vitamin) than your body needs or can process, you will excrete it in your urine. It doesn't follow that drinking your urine is a good way to get vitamin C into your body. An orange or a tablet might be preferable. However, if you are urinating excess vitamin C, what do you think your body will do with the vitamin C you ingest with your urine? If you guessed that it would get rid of it, you guessed right. The reason your urine contains vitamins and minerals is because your body didn't need them or couldn't use them. You might as well pour water into a full glass as reuptake your excess vitamins and minerals. Even urea, which can be toxic in very high doses, occurs in such minute quantities in the average person's urine that there is very little

chance of poisoning from drinking one's own urine.

Unfortunately, however, not everybody can just jump right in and start drinking their own urine without negative side effects. [The Chinese Association of Urine Therapy](#) warns that

Common symptoms include diarrhea, itch, pain, fatigue, soreness of the shoulder, fever, etc. These symptoms appear more frequently in patients suffering long term or more serious illnesses, and symptoms may repeat several times. Each episode may last 3-7 days, but sometimes it may last one month, or even worse over 6 months. It is a pity that many give up urine therapy because of such bad episode [sic]. Recovery reaction is just like the darkness before sunrise. If one persists and overcomes the difficulty, one can enjoy the eventual happiness of healthy life.

These same people advise that *"All kinds of throat inflammation can be helped by gargling with urine to which a bit of saffron has been added"* and *"drinking one ounce of urine . . . is more beneficial to the average person than a fully staffed multi-billion dollar medical center."* I was unable to find their evidence for these claims. Perhaps the evidence was produced at the First World Conference on Urine Therapy which took place in India in February 1996. Or maybe it came up in 1998 during the Second World Conference on Urine Therapy held in Germany.

religion and urine

The origin of this unusual practice seems to be certain religious rites among Hindus, where it is called *amaroli* in [tantric](#) religious traditions. The tantric tradition is known for flouting conventional behavior as a means of establishing the moral superiority of its practitioners. It is also possible that this practice is related to superstitions based on [sympathetic magic](#). Since urine is emitted from the same bodily organ used in sex, perhaps it was thought that by drinking one's urine one was swallowing some sort of sexual energizer. In any case, it is unlikely that Indians some 4,000 years ago had scientific reasons for drinking their own urine.

Another rather unscientific notion which seems to be accepted by urinophiles is that urine is really blood, since it is the byproduct of blood filtering by the kidneys. It is unlikely that if you need a blood transfusion that urine will work just as well.

Another misleading claim being made by urinophiles is that amniotic fluid is nothing but urine: fetal urine. If it is good for the fetus, it should be good for all of us. Here is what urine expert [Martha Christy](#) has to say on the subject:

... the amniotic fluid that surrounds human infants in the womb is primarily urine. Actually, the infant "breathes in" urine-filled amniotic fluid continually, and without this fluid, the lungs don't develop. Doctors also believe that the softness of baby skin and the ability of in-utero infants to heal quickly without scarring after pre-birth surgery is due to the therapeutic properties of the urine-filled amniotic fluid.

Some of the chemicals found in amniotic fluid are not going to be found in most urine samples. It is misleading, to say the least, to claim that amniotic fluid is "[primarily](#)" urine. It would be more accurate to say that they are both primarily water. I don't know what doctors she is talking about, but most parents will tell you that when their babies came out of the womb their skin was anything but beautiful. Comparisons to wrinkly prunes are quite common. So is comparison to one's skin after being in the swimming pool for a long time. The baby's skin becomes soft only after it has been out of its liquid environment for some time. There is a reason for that, according to Kim Kelly, a naturopathic doctor and nurse from Seattle. Newborns don't produce oil from their sebaceous glands until several weeks after their birth, which is why they often appear to have dry, flaky skin. Rather than amniotic fluid contributing to soft skin, according to Kelly, babies in the womb are protected by vernix, a creamy substance that serves as a barrier between the baby and the amniotic fluid. So, unless your urine is full of vernix, using it as a skin lotion is unlikely to work as a moisturizer.

the nature of urine

What is urine? Urine is usually yellow or clear, depending upon a person's health and diet. It usually has an ammonia-like odor due to the nitrogenous wastes that make up about 5% of the fluid (the remaining 95% is water). Certain foods can affect the odor, however. For example, asparagus breaks down into several sulfur-containing compounds and imparts a putrid odor upon excretion.*

Urine is a slightly acidic fluid which carries waste from the kidneys to the outside world. The kidneys have millions of nephrons which filter toxins, waste, ingested water and mineral salts out of the bloodstream. The kidneys regulate blood acidity by excreting excessive alkaline salts when necessary. The chief constituent of the nitrogenous wastes in urine is *urea*, a product of protein decomposition. Urea is, among other things, a diuretic. Average adult urine production is from one to two quarts a day. The bladder, where urine is stored for discharge, holds on average about 16-20 ounces of fluid, though the average discharge is about half that amount. In addition to uric acid, ammonia and creatine, urine consists of many other waste products in minute quantities.

Being a waste product does not mean that a substance is toxic or harmful. It means that the body cannot absorb the substance at the present time. We

might think of many of urine's constituents as if they were leftovers from a meal. We could throw the excess food away or we could eat it later after diluting it substantially with water and putting it in the blender. With urine, unfortunately, we cannot ingest waste products in the form they had when first ingested.

For most people most of the time, one's own urine is not likely to be harmful. However, it is not likely to be healthful or useful except for those rare occasions when one is buried beneath a building or lost at sea for a week or two. In such situations drinking one's own urine might be the difference between life and death. As a daily tonic, there are much tastier ways to introduce healthful products into one's blood stream.

Suburban myths are common misconceptions that are uncritically passed on as established truths by "experts" and non-experts alike. Suburban myths should not be confused with [urban legends](#).

[Becoming a Critical Thinker by Robert Todd Carroll](#)

Suburban Myths

[Myth 1.](#) We use only 10% of our brain.*

[Myth 2.](#) Prescription drugs are one of the leading causes of death.

[Myth 3.](#) Most medical treatments have never been clinically tested.*

[Myth 4.](#) Evolution is just a theory. Creationism is a theory, too. To be fair to our children, we should teach them both.

[Myth 5.](#) Jeane Dixon predicted President John F. Kennedy's assassination.

[Myth 6.](#) The brain is more insightful and productive in the alpha state.

[Myth 7.](#) There are Men in Black who are government agents whose function is to visit UFO witnesses and warn them not to tell anyone about their UFO experiences.

[Myth 8.](#) Kenneth Arnold saw a flying saucer in 1947.

[Myth 9.](#) Altered states of consciousness transport a person to a higher state of awareness and productivity.

[Myth 10.](#) There is a curse on the Kennedy family.

[Myth 11.](#) Demons can take possession of your soul.

[Myth 12.](#) There is a Jewish conspiracy to take over the world.

[Myth 13.](#) Walking on hot coals without burning one's feet requires

paranormal or supernatural powers.

Myth 14. The near-death experience is typically pleasant and blissful, involving a feeling of moving through a tunnel into a bright light.

Myth 15. We usually unconsciously repress traumatic experiences.

Myth 16. Edgar Cayce was illiterate.

Myth 17. Hypnosis is a gateway to the unconscious mind.

Myth 18. At the equinox, an egg will balance on its end.

Myth 19. Medical doctors typically know nothing about nutrition.

Myth 20. Physicists do not know how it is possible for the common housefly to fly.

Myth 21. Faith healing works.*

Myth 22. Dr. Randolph Byrd scientifically proved that prayer can heal.

Myth 23. Even if Dr. Byrd failed, others have succeeded in proving scientifically that prayer heals.

Myth 24. You can raise your I.Q., SAT score, and dissolve brain tumors by listening to Mozart.

Myth 25. Transplant organs carry personality traits which are transferred from donors to receivers.

Myth 26. More ships and aircraft have vanished without a trace in the waters between Miami, Bermuda, and Puerto Rico than anywhere else of

equal area.

Myth 27. The way a person makes marks on paper captures one's personality and hidden intentions.

Myth 28. The polygraph is a reliable device for telling when a person is lying or telling the truth.

Myth 29. Einstein believed in a personal Creator.*

Myth 30. Domestic violence significantly increases on Super Bowl Sunday.*

Myth 31. Crimes, mental illness, suicides, and emergency room visits increase when there is a full moon.

Myth 32. The second law of thermodynamics proves that evolution is wrong.

Myth 33. Darwin's theory of evolution, the theory of natural selection, implies inequality of sexes, races, and nations.

Myth 34. Creationism implies that evolution and the Big Bang theory are false.

Myth 35. In the year 2000, because of unusual planetary alignments on May 5th, the polar ice caps will melt and there will be great earthquakes caused by tidal forces.*

Myth 36. Lemmings commit mass suicide.

Myth 37. Militant fundamentalist (anti-evolution) Christians make up the majority of Christians.

Myth 38. Possessing a US Patent on a device means that one has a working device.

Myth 39. The Eisenhower Interstate Highway System requires that one mile in every five must be straight so they can be used as airstrips in times of war or other emergencies.

Myth 40. Subliminal messaging has been empirically proven to work.

Myth 41. False memories of abuse are always implanted by poorly trained therapists through hypnosis and recovered memories are more reliable if they occur outside of therapy.

Myth 42. Einstein believed in astrology.

Myth 43. Suicide increases over the holidays.

Myth 44. NASA faked the moon landings.

Myth 45. Scientists have proved that the brain is really two brains and each has its own domain: the left hemisphere is the seat of our logical, analytical, scientific self and our right hemisphere is the seat of our intuitive, creative, artistic, emotional self.*

Myth 46. Switching to a low-tar cigarette will reduce one's chances of being exposed to the carcinogens in cigarette smoke.

Myth 47. Vaccination* of children with the (MMR) vaccine* to prevent measles,* mumps and rubella causes autism.*

Myth 48. Christopher Columbus thought the earth was flat.

Myth 49. American girls are reaching puberty earlier because of hormones in cattle feed that gets into their fast food burgers and burritos.

Myth 50. Bernoulli's principle explains why all forms of flight are possible.

Myth 51. Thomas Crapper invented the flush toilet and his name is the origin of the vulgar expression for defecation.

Myth 52. Atheists are appealing to the Federal Communications Commission to ban religious broadcasting.*

Myth 53. Sugar causes hyperactivity in children.*

Myth 54. Alcohol, especially [red wine](#), is good for your health.

Myth 55. A migraine is a bad headache.

Myth 56. Kirlian photography has shown "phantom limbs", e.g., when a leaf is placed on the plate and then torn in half and "photographed", the whole leaf shows up in the picture, proving that things have auras.

Myth 57. Water runs down the drain clockwise in the northern hemisphere and counterclockwise in the southern hemisphere due to the Coriolus effect.

Myth 58. The moon can trigger [ovulation](#) and bring on fertility depending on what phase the moon was at when you were born.*

Myth 59. The mercury in dental amalgam is poisoning people.*

Myth 60. You should drink [eight glasses of water a day](#) for good health.* One study, however, does seem to have [good evidence](#) that drinking five glasses a day is better than drinking two or fewer with respect to fatal coronary heart disease.

Myth 61. The Declaration of Independence was signed by all signatories on July 4, 1776, as depicted in the painting by [John Turnbull](#).*

Myth 62. Charles Darwin renounced evolution and his theory of natural selection on his deathbed.

Myth 63. Snuff films are real: actresses are really killed in these films.

Myth 64. People who were present at the opening of King Tutankhamen's tomb were exposed to the "mummy's curse" and died soon afterward.

Myth 65. Women have more ribs than men do.

9

August 18, 1999. Dr. Bob Arnot of NBC reports on MSNBC.com that Dr. Harold Koenig of Duke University did a study of 4,000 elderly people [a week ago it was 2,000 people; see entry for Aug. 10) and found that those who went to church at least once a week were 28 percent less likely to die over a six-year period than those who did not. It apparently did not occur to either Dr. Koenig or to Dr. Arnot that people who go to church may be healthier than those who do not. Many who do not attend church do not attend because they are not well enough to attend. Thus, Drs. Koenig and Arnot are not justified in attributing all the differences in health between churchgoers and non-churchgoers to going to church and the healthy choices that churchgoers will make because of their religious beliefs.

August 10, 1999. MSNBC.com reports that "New research offers more evidence that religion is good for the body as well as the soul. The study found that churchgoers have lower blood pressure than those who don't attend services."

The International Journal of Psychiatry in Medicine published the work of Dr. Harold G. Koenig of Duke University Medical Center in Durham, N.C. Koenig based his conclusions on a randomly selected survey of more than 2,000 people ages 65 and older in a primarily Protestant area of North Carolina. Even though Koenig himself notes that those who watched religious television or listened to religious radio actually had higher blood pressure than those who did not, it apparently did not occur to him or the editors of the *Journal*, or the writers at MSNBC, that being healthy might be the important factor here, not going to church. Those who are over 65 and go to church are much more likely to be in better health than those who are over 65 and get their religion from the television or the radio.

July 28, 1999. Fox (Alien) Network's "[Signs From God: Science Tests Faith](#)" should have been called "Dollar Signs: Fox Tests Gullibility."

[Giselle Fernandez](#) and [Michael Willesee](#) took viewers on an uncritical tour through exotic places like Cochabamba, Bolivia, and Monterrey, Mexico, to "scientifically" examine an uneducated woman who writes books in Greek and Latin, dictated to her by Jesus, and who is filmed while apparently undergoing a [stigmata](#); weeping and bleeding statues; and rose petals with "miraculous" images of Jesus and Mary. The show was truly a worthy follow-up to Fox's presentation of the [Alien Autopsy](#) and [Miracles and Visions](#) films of a few years ago. (I especially liked the authentic touch of having a commercial for a film called "Stigmata.")

The program was mostly a rehash of "[For All Humanity](#)," a film produced several years ago by Ron Tesoriero, an Australian lawyer, about [Catalina "Catia" Rivas](#), the bleeding statue of Cochabamba, and [Nancy Fowler](#), a nurse who started having

visions in 1985 and began causing traffic jams near Conyers Hill in Georgia when word got out that the the Virgin Mary was appearing there on the 13th of the month. (The 13th is special for Maryvisions since she allegedly appeared to three children in [Fatima](#), Portugal, on the 13th of May, 1917.) One hoped that some mention would be made of [Our Lady of Watsonville](#) or of the "[victim soul](#)" of [Audrey Santo](#), but Willesee dumped the Tesoriero segment on Fowler and only added one on Mexican rose petals impressed with medals.

The program's credibility depends heavily upon the reputations of Fox and Willesee. Fernandez does not pretend to be anything more than the host, even if a gushing and fulsome one. Fox has shown repeatedly that it cannot be trusted. Thus, the credibility of the program rests with Willesee. Who is he?

Willesee is introduced by Fernandez as an "internationally respected journalist" and declares that it is "an honor to work alongside" him. She proclaims that he is renowned for his "skepticism and investigative abilities." That should soon change. He is not much of a skeptic, even though his reporting on such topics as psychic ability, dowsing, and acupuncture earned him the 1987 Responsibility in Journalism Award from [CSICOP](#). (He is a respected *broadcaster* in Australia.) The program demonstrates that he is not much of an investigator. His honesty might be questioned as well, based on the fact that he does not mention Tesoriero or his work by name, though Willesee's program is largely a rip-off of the lawyer's documentary on "scientifically inexplicable happenings." Willesee only says that "a lawyer" got him interested in the subject and states that his own film was "seven years in the making." The bulk of "Signs from God," however, revisits Tesoriero's work on Catia (identified as "Katya" by Fox), including interviews with the same "experts", such as Dr. Ricardo Castoñan, a Bolivian psychologist who claims he's investigated many miraculous claims and found that most of them were authentic. The credits for the program state that Michael Willesee Sr. is the executive producer and that he wrote the program with Brian Brown. [Mike Jr.](#) is listed as a supervising producer and Jo Willasee is listed as doing research. Tesoriero is listed as one of the "segment producers." That is the only recognition he is given.

Willesee was an Australian television broadcaster who did a [Current Affairs program](#) for some thirty years before quitting. He found God and returned to the Catholicism of his youth (though he's been divorced twice) due to his belief that God intervened and saved him from dying in a plane crash in 1998. In 1997, he was listed as one of the top 200 richest men in Australia by [Business Review Weekly](#). Things got even better in [1998](#). After making a few dollars in radio and real estate investments, he turned to film making. His first film was on "primitive tribes."

Willasee's critical skills were revealed early with his comment on the main proof that Jesus dictates books on theology in Greek to "Katya" Rivas: she has the "imprimatur" of the local bishop. Maybe he doesn't know what an imprimatur is. It is not a seal of approval that a miraculous claim has been authenticated. The imprimatur indicates only that the material is doctrinally sound, not heresy, according to an official censor. Later, he asserts that he believes that blood from a "bleeding" statue of Christ, which was determined by a scientific lab test to be the blood of a human female, was that of the Virgin Mary! Even Fernandez balked at that speculation. (He also had a CAT scan done of the "bleeding weeping" statue, but for what reason one can only guess.)

When two scientists reproduced holy images on rose petals by pressing holy medals into the petals, Willasee commented that they didn't "completely answer" the question of whether the Monterrey, Mexico, petals were authentic. He also claims that since the Mexican rose petals were not for sale, there was no possible motive for deceit. Hence, he believes God is involved in their production. This naive notion that if money is not a motive, the probability that the "miracle" is authentic increases, was stated at the top of the program by Willasee. (He also is impressed if the claimant does not have a "cult" following and is humble.) He seem completely oblivious to the possibility of [pious fraud](#) or mental disorders that might motivate a person to deceive for Jesus.)

Finally, Willasee's objectivity, skepticism, and critical skills should be questioned if only because the film is so one-sidedly Catholic. Not only do his alleged miracles that science can't explain only involve Catholics, his experts are Catholics, including the one expert he brings in as a skeptic, Fr. Peter Stravinskis, editor of "The Catholic Answer."

Nevertheless, even a pious though uncritical investigator who thinks he is doing God's work might stumble upon a true miracle. Does Willasee's film demonstrate anything of interest to those looking for a miracle? To me, the only miracle is that anyone takes his work seriously.

The program made it clear at both the beginning and the end that there is some connection between natural disasters and claims of apparitions of Jesus and Mary. I can understand the dramatic effect of trying to connect apparent apparitions with doomsday prophecies and the spate of bad weather we've had on this planet during the last decade. It is easy to get people to think of weather and natural disasters in terms of human time, rather than geologic time. Comparisons of one decade with another or even one century with another are, however, misleading. Which assumption do you prefer: an All-Good God created the world in such a way that floods, earthquakes, tornadoes, hurricanes, tidal waves, etc., would be a regular feature of life on earth; or, an All-Good God created the world as a benign place but intentionally destroys us on a regular basis to remind us to stop sinning? I think both views are absurd. Even more absurd, however, is the belief that God picks obscure people to reveal special messages to us, such as "repent" and "Remember: I came to save you."

The film itself does not provide anything of interest except as a lesson in how not to do a scientific investigation of such matters. For example, the main proof that the voices Katya hears (giving her theology lessons in Spanish, Greek and Latin) and the images she sees are not delusions or hallucinations or lies is that when she was given an EEG she produced measurable delta waves while awake. (Delta waves usually occur only during sleep.) If this segment was authentic, all it proves is that Katya has an abnormal brain. Where is the Rosetta stone that declares that God speaks in delta waves? (Note: the film was edited to make it appear that Katya and the doctor performing the EEG [who, for some reason, was in another room behind a soundproof glassed enclosure] were communicating [telepathically](#). We have Mr. Willesee's word that there was telepathic communication regarding whether Katya has epilepsy.*)

The segment of the film likely to persuade uncritical viewers that they have witnessed a miracle is the stigmata segment. Some effort went into priming the viewer by stating that the Catholic Church had authenticated some twelve cases of stigmata, including [St. Francis of Assisi](#) and Padre Pio. Without belaboring the point, Katya dictated the conditions for the event (telling everyone that Jesus was dictating when and where it would happen). The film showed her before, during and after the event. At the start, she has scars, but no bleeding wounds on her hands and feet. During the film she starts to show scratches on her face and hands, then bleeding from slashes, not punctures, from her hands and feet. A blood sample is taken and proves to be almost certainly her own blood. Willesee indicates that he expected the blood to be Christ's! He asserts "there's no way" [the wounds] were self-inflicted."

How thorough was this investigation? First, the film clearly shows that Katya has a rosary with a holy medal wrapped around her left hand and a white cloth clutched in her right hand. On each hand, she is wearing a ring with a protruding setting. Her first wounds are some scratches on her right temple. These are declared by an observer priest to be "consistent" with the crown of thorns wounds of Christ. Her largest facial wound, however, was on her left cheek. Is this a new wound that Christ had, that no one knew about until now? Could she have cut herself with her rings, fingernails, toenails, rosary, something concealed in the white cloth? Of course. Did the investigator make sure she had no sharp objects available to her? No. Did they use several cameras, focusing on her hands and feet at all times, to detect any self-mutilation? No. The cameras focused almost exclusively on her agonizing face and the agonized faces of those watching her suffer. Did they try to duplicate her wounds by using only rings, finger and toe nails, and a rosary? No. Did they even try to duplicate a single scratch using such primitive implements? No. Did they identify any medications Rivas takes and whether she took her meds that day? (Does she take blood thinners, diuretics, etc.?) What kind of investigation was this? If this was the "thorough expert analysis" promised us by Fernandez at the top of the show, then new meaning has been given to that expression. The only thing Willasee did that was remotely scientific was to have the blood tested. The results of that test? Well, they are consistent with self-mutilation. Where I come from self-mutilation is a symptom of a mental disorder. That does not mean that Rivas does not suffer real agony. Her suffering is most likely authentic, unlike the investigation of Michael Willasee.

(Note: Two Australian readers responded and both claim that Willesee left his current affairs program under less than honorable circumstances. They say he appeared on TV appearing to be drunk; Willesee claims he was on medication and was tired and emotional. Matt Crowe described the scene this way:

[Willesee] appeared one day looking very dazed. In between stories he was slurring, mumbling and giggling. Then it all became too much and he burst into uncontrollable laughter for several minutes. He kept trying to compose himself but it was no good. At one stage he had almost fallen off his chair.

Andrew Dare put it this way:

[Willesee] claimed to have taken some medicine, but the fact that he was on air, slurry, giggling and almost falling over ruined his credibility. That show was going downhill anyway into the "We

put a suit in to be dry-cleaned with \$50 in the pocket and 9/10 drycleaners took the money" and "New diet pills - do they really work - our scientific tests (i.e. they hire a guy in a lab coat with a clipboard) prove it" sort of stories.

Mr. Willesee is probably still giggling and falling off his chair at how gullible Americans are and at how ready the Fox Alien Network is to take advantage of that fact.

reader comments

One reader, Ermanno D'Annunzio of Adelaide, South Australia, thought the above critique was incomplete. He wanted to know how I could explain the "colored crystals" that appeared on a floor painting. I don't know why I should try to explain it, since Willesee didn't offer any explanation himself. We were told that the glitter miraculously appeared on a print of Our Lady of Guadalupe. Nevertheless, anybody can put glitter on a print. Nothing miraculous about that. Mr. D'Annunzio wants to know how pictures can cry and how a tear got on a print of the Virgin Mary that was under glass. There are many ways to make statues or prints appear to cry, none of them too miraculous. For example, you can surreptitiously dab, squirt or spray water or salt water on the object. We'll never know what method was used in this case because Willesee didn't follow anything resembling a scientific method to investigate the matter. We were asked to take it on faith, on the word of a person who says it's true. Finally, Mr. D'Annunzio is puzzled by how quickly the alleged stigmatic's wounds healed. Since we only have the word of Willesee that the after pictures were taken the day after the wounds appeared, we don't have a very reliable source for this claim. But even if he isn't lying, there is nothing miraculous about wounds healing quickly, especially if they are superficial wounds (mere scratches). Wounds can appear to be worse than they are in some people because they are taking medications that thin the blood. A tiny cut can emit a quantity of blood that indicates a larger wound. Also, makeup can do wonders to hide scratches, marks, blemishes and other signs of our humanity.

26 Dec 2000 (Fox Network re-ran the program just before Christmas, complete with "live" on screen during the showing!)

Re: your attempt to disprove the story of Katya Rivas aired on Fox.

Just wondering if you have actually looked at or read the writings of this woman? What do you make of a woman with a high school education writing things like this? In these languages etc. ? Her writings are located at www.greatcrusade.org. What is your explanation for this? So far, we really haven't seen hard core proof from you that any of this didn't occur. The public is not stupid. We all realize that there are elaborate hoaxes out there but the point of faith is believing in what we can see right?

reply: I took a look at the writing posted at the site you mention and found nothing unusual about them coming from a woman with a high school education. Anyone raised Catholic who has heard priestly devotees of Mary preach would be familiar with the messages of her "writings".

You are right. The public is not stupid, but the public's faith can be easily manipulated by a pious fraud with accomplices like [Giselle Fernandez](#) and [Michael Willesee](#).

update June 27, 2001. Rivas has been accused of plagiarizing her "messages" from God, taking them from José H. Prado Flores book *Formacion de predicadores (Training preachers)*, published six years before Catia's "messages." See [Funk 21](#).

July 22, 1999. KOVR, a CBS affiliate in Sacramento, California, featured reporter [Marcy Valenzuela going gaga](#) over Russell Targ (famed pseudoscientist whose specialty is [remote viewing](#)) and Marilyn Schlitz of the [Institute of Noetic Sciences](#) (IONS), a think tank devoted to rigorous scientific investigation of phenomena which fall outside of conventional scientific models. (That's what they say; you figure it out.) IONS considers traditional science "materialistic" and claims to have advanced beyond that to the level of the "subjective" and is indebted to "the perennial wisdom of the great religious traditions and gnostic groups."* IONS claims not to be a "spiritual sect" but its researchers base their "science" on a metaphysical belief in spiritual reality as the basis of subjective experience. IONS is fond of research into "psychic" phenomena, among other things.

In her report, Ms. Valenzuela offered not one shred of skepticism to balance Targ's and Schlitz's claims that there is very strong scientific evidence for [ESP](#), [psychokinesis](#), [remote viewing](#), etc. The lowlight of the show was when Targ invited her try remote viewing. She imaged and drew what looks like a hill with a line under it. Targ pulled out a little [spoked wheel](#) and she declared "That's amazing." Yes, it is amazing that she didn't see that her picture and Targ's object were not even remotely alike. Yet, she was able to fit the data into the hypothesis quite easily. How come? A good reporter might have launched into a discussion of [confirmation bias](#) or [pareidolia](#).

Schlitz threw out some unchallenged statistics about how successful [ganzfeld](#) experiments have been. Valenzuela concluded: "So researchers today, like those twenty years ago, believe that our senses extend beyond the five we know of into something we don't yet understand. No matter the form of ESP, laboratory studies have shown it's not chance or coincidence, it's something else. The challenge is to figure out what. On special assignment, Marcy Valenzuela, KOVR 13 News." (submitted by David Takemoto-Weerts)

May 10, 1999. The *Register Guard*, a daily newspaper in Eugene, Oregon, reprinted an article from the *Los Angeles Times* which claims that "more than 100,000 Americans are inadvertently killed every year by prescription drugs--one of the leading causes of death in the country." Gordon Kaswell, who alerted me to this article, claims to have found another reference to the research of J. Lyle Bootman and Jeffrey A. Johnson of the University of Arizona School of Pharmacy claiming that the number is 200,000.

The 100,000 figure originated in an article by Lazarou, Pomeranz, and Corey published in the *Journal of the American Medical Association* ("Incidence of adverse drug reactions [ADRs] in hospitalized patients: a meta-analysis of prospective studies," *JAMA*, 1998;279:1200-1205.) The authors claimed that "Fatal ADRs appear to be between the fourth and sixth leading cause of death. Their incidence has remained stable over the last 30 years."

As indicated in the title, the authors did not do original research, but studied the studies of others. Metastudies can be misleading, however, since the protocols used by the different researchers are often very different. You do not get one big study by adding the results of several smaller studies. In this case, the authors studied 18 studies, 14 of which were done between 1965 and 1981.

Gary R. Kravitz, MD, comments:

The results of the meta-analysis by Lazarou et al deserve a reality check. Lumping together voluminous mounds of archaic data with more recent data from a nonrepresentative sample of hospitalized patients and then extrapolating to the entire US patient population can lead to egregious errors.*

Kravitz believes that improvements in medical procedures have significantly reduced the problem of ADRs in recent years. Lazarou disagrees and claims that based on a study by Cullen et al. "a majority of ADRs were missed by most hospital monitoring systems, and therefore monitoring was not useful to improve quality of care." If so, then the only way to reduce ADRs is to stop giving prescription drugs altogether. This would not be very wise, especially since, as Tom Bush, MD, most deaths from ADRs are not preventable.

The Adverse Drug Event Subcommittee at Santa Clara Valley Medical Center has been intensively evaluating ADRs at our hospital through an active surveillance of all admissions. We have analyzed each ADR to determine whether it was preventable and have consistently found that only 30% of the ADRs that occur in

our inpatient wards are preventable. . . .This would decrease the authors' projection from 106,000 deaths per year to 35,000 deaths per year.*

The authors responded to Bush by saying that

we had a different goal: our purpose was to increase awareness of the dangers of drugs when properly prescribed and administered (i.e., excluding errors).*

I would have thought that scientific researchers would have had a different goal: to find out what the dangers are of properly prescribed and administered drugs. These authors indicate that they were looking for data to support their belief in the extreme danger of prescription drug use.

Other critics claim the numbers are unjustified based on the data, and that the actual number of ADR deaths in the U.S. is somewhere between 13,000 and 25,000.

David W. Bates, MD, M.Sc., for example, writes

One study that can serve as an external standard to address this issue and has the methodological advantage of being population based is the Harvard Medical Practice Study (MPS).[2] The MPS estimated the magnitude of iatrogenic injury in New York in 1984; when its data are extrapolated, the national mortality rate due to all types of adverse events was 180,000.[3] Drugs represented only 14.1% of serious injuries (those resulting in death, permanent disability, or disability lasting longer than 6 months), although the percentage resulting in death was not reported. Nonetheless, it would be surprising if there were actually 110,000 deaths annually from drugs alone; based on the MPS data, the expected figure would be approximately 25,000.

It is desirable to have knowledge about the risks of any medical protocol, but there is little benefit from exaggerating risks based on questionable inferences from data. It is also useful to put these numbers into perspective. Millions of Americans take billions of pills each year. Many who die due to adverse reaction to drug treatments are suffering from terminal cancer and other fatal disorders. There are some 30,000 fatalities a year that are [firearm-related](#), more than half of which are suicides. Though it is difficult to know for sure what our risk of death is in taking prescription drugs, some might take a small measure of comfort in knowing that it seems likely that the risk is less than that of dying by a firearm.

Mass Media Bunk

8

July 26, 1999. *Newsweek* was just one of many publications to resurrect the myth of the so-called Kennedy Curse in [AN AMERICAN DYNASTY Charmed Yet Cursed](#) by Kenneth Auchincloss. If one considers the size of the Fitzgerald/Kennedy clan, their wealth, their extraordinary achievements and their propensity for taking risks, then their misfortunes do not seem disproportionate. The media would have us believe, however, that if a member of this clan dies in war, gets cancer, has a mental disorder or causes harm to self or others because of poor judgment, it's because they're [cursed](#). If they are cursed, then so are the millions of others who suffer the same fate.

The FK clan is no more cursed than any African family destroyed by slavery or any Jewish family destroyed by Nazism was cursed. The media would have us believe that the FK clan have suffered a disproportionate amount of harm. Their harm is certainly disproportionately public, but that is because the clan is rich and famous, not because they are cursed. Their harm has been disproportionately influential because some members of the clan have been extremely influential.

If anyone in the family was cursed, it was Rose Fitzgerald Kennedy who lived to be 104.

(more on the curse at [US News & World Report](#))

June 1, 1999. Last night, ABC's "20/20" did a follow-up program on Audrey Santo, a Worcester, Massachusetts, teen who has been in a coma-like state known as *akinetic mutism* since a swimming accident when she was three years old. Audrey receives around the clock care from a staff of nurses and family. "The Miracle of Audrey" first aired on October 4, 1998, with host Lynn Sherr. In that program, Sherr asked: "Is this 14-year-old child a miracle worker, a messenger of God? Or is this all a cruel hoax, exploiting a sick and innocent girl?" Sherr still doesn't have an answer, but part 3 of the story will be presented after the Catholic Church finishes the next stage of its investigations into alleged miracles being worked through Audrey.

On August 9, 1987, Audrey fell into a backyard swimming pool. She suffered massive hypoxia: the oxygen supply to her brain was cut off for several minutes, killing numerous brain cells. Her mother Linda blamed the hospital staff at the University of Massachusetts Medical Center for Audrey's condition, claiming that they gave her a drug overdose and broke both her legs in physical therapy. Linda says that Audrey is in a "non-moving, non-speaking state," but she is not in a coma.

A year after the accident, Linda took Audrey to [Medjugorje](#) in Bosnia-Herzegovina (formerly part of Yugoslavia), a pilgrimage destination since 1981 after some local children claimed that the Virgin Mary had appeared and conversed with them (à la

[Fatima](#), where the Virgin allegedly appeared to some children named Santos). (The local bishop has denounced the Medjugorje apparition as a fraud, to no avail. The pilgrims keep coming.) Linda claims that at Medjugorje the Virgin Mary asked Audrey if she would agree to become a "victim soul," someone who takes on the sufferings and ailments of other people. According to her mother, Audrey agreed. How even a healthy child at age four would be expected to understand the concept of a "victim soul" is a mystery. What is not a mystery is that while on this pilgrimage Audrey suffered cardiac arrest and had to be evacuated to the U.S. so she could receive proper medical care. The evacuation is said to have cost \$25,000. Her mother, however, did not see the cardiac arrest as Audrey's first experience as a "victim soul." Instead, she blamed it on being near an abortion clinic.

According to [The Boston Phoenix](#)

The miracles started soon after her return to Worcester [from Medjugorje]. Since 1989, when nurses first spoke of an overpowering scent of roses, the reports have proliferated to include virtually every supernatural phenomenon in the Catholic repertoire: icons weeping blood; statues moving of their own accord; miraculous healing; bleeding communion wafers; the face of Jesus appearing in that blood; blood appearing spontaneously inside a tabernacle; the Virgin Mary appearing in cloud formations overhead; and, dripping down the walls of the garage, copious amounts of spontaneously appearing oil, which is collected on cotton balls and distributed in tiny Ziploc bags to the faithful, who have used it to treat things like tumors.

Eventually, the Catholic Church began an investigation of the alleged paranormal and miraculous events. In January of 1999, the Bishop of Worcester issued a [preliminary report](#). Some highlights from that report follow:

When one applies fundamental rules of logic to the situation, even if the presence of the oil cannot be explained, one cannot presume that the inability to explain something automatically makes it miraculous.

Many of the cases cited publicly concerning Audrey's intercession have had medical opinions, which did not rule out the potential for normal recovery (in whole or in part.)

We are not yet able to confirm claims of miraculous events occurring at Audrey's home or as a result of a visit to Audrey, or from the oils associated with her.

The most striking evidence of the presence of God in the Santo home is seen in the dedication of the family to Audrey.

Anyone who has seen the 20/20 piece on Audrey can attest to the the mother's devotion to her daughter. She has turned a tragedy and bitter event into a celebration. She has taken a life that would generally be regarded as over and useless, and turned

it into something purposeful. Is Linda Santo using her daughter, consciously or unconsciously, to assuage the guilt and pain associated with the backyard accident over a decade ago? In any case, she has turned the family house into a shrine. The garage is a chapel, a glass window has been placed in the bedroom wall so viewers can see Audrey in her bed, and the house is a veritable warehouse of statues, icons, chalices, rosaries, etc. [Every Wednesday there is a constant stream of visitors to the house](#), which has become a place of pilgrimage. And there is an annual Mass on August 9th at the local high school football field where Audrey is displayed in a glass walled house on the fifty-yard line.

If the case is a hoax and there is fraud going on, who is the one pouring the oil over the walls, statues, etc.? Who is putting a substance that appears to be blood on the eyes of paintings and on eucharistic bread wafers? [The blood has been analyzed](#) and found to be human, but not that of anyone in the immediate family. It could be the mother, but it is just as likely that it is one or more of the child's pious caretakers. Several nurses and therapists are needed to provide Audrey with 24-hour-a-day care.

The oil was analyzed for 20/20 and found to be 75% olive oil and 25% unknown. According to *The Washington Post* (July 19, 1998) who also commissioned a test of the oil, their sample was found to be "80 percent vegetable oil and 20 percent chicken fat." The concoction could be prepared in any kitchen, according to the chemist who did the test.

Many people seem to believe the paranormal and miraculous claims must be true since the Santo family is not getting rich from the constant stream of visitors and mail they receive from people around the world hoping for a miraculous cure. But, as [Joe Nickell notes](#), "Money is rarely the primary motive, the usual impetus being to renew the faith of believers and confound the doubters." The former goal has certainly been achieved, but the latter leaves much to be desired. [Pious frauds](#) are common and a proper investigation by skeptics looking for deception and trickery would probably uncover the source of the hoax, but it would probably not end the belief in a four-year-old making a compact with the Mother of God who could come up with no better way to work miracles than through an innocent "victim soul" who must lay mute for the rest of her life.

May 25, 1999. After Kosovo and school shootings, soft news goes down easier. Today, *The Sacramento Bee* ran a story from Booth Moore of the *Los Angeles Times* on the life and times of Naomi Tickle, a "practicing personologist." Tickle is the founder of the [International Centre for Personology](#), which, despite the spelling of 'centre' is centered in San Francisco. Also, despite the new name, *personology* is little more than a rehash of [physiognomy](#), the 16th century [pseudoscience](#) that has been resurrected several times over the ages.

Personology reveals such wondrous truths as that "People with big irises really feel emotions" and women with their eyelids exposed (like Hillary Clinton) are women who "like to get to the bottom line." According to Ms. Tickle, "Hillary has an oval forehead, so she's a maintainer....Her eyes are wide-set, which says she is also a very tolerant person.

[Personology](#) also reveals that people with large lips love to talk. Whereas, "people

with thin lips have a hard time expressing what they feel." Best of all, personology can help you pick the right mate. Just make sure that you have similar hair texture and that your faces have a similar width. Make sure your eyes are about the same distance apart as your prospective mate's eyes. And don't forget the most important bit of wisdom that personology has to offer: "Short-legged people like to run around, but long-legged people are content to be couch potatoes." I've noticed that myself while watching the NBA.

April 17, 1999. "[Star child](#) - A local freethinker believes he holds the skull of a young alien who was raised by an Earth mother," by Lynne Jensen in the New Orleans *Times-Picayune*. This article features [alien abduction](#) and [Zecharia Sitchin](#) devotee, Lloyd Pye, and a pair of skulls he is putting on display as those of an alien and its human mother's. The skulls were allegedly found near Chihuahua, Mexico, about 70 years ago. According to Pye, the alien "star child" was fathered by one of Sitchin's Annunaki, alien beings who used to propagate here until they had to go home for a nuclear war. According to Jensen, Pye was an Army intelligence specialist who has written a couple of futuristic novels and a book on human origins titled *Everything You Know Is Wrong*.

Near the end of the article, Jensen quotes Tulane University physical anthropologist John Verano as saying that the skull appears to be that of a child whose head was "cradle boarded." Some Indian cultures artificially reshaped the heads of their children by strapping the head to a board.

For some reason, throughout the article, Jensen refers to Pye as a "freethinker." She even touts his [WWW page](#) where you can read all about his star child.

February 10, 1999. "To handwriting expert, life slows to a scrawl," by Nadia Lerner (*Stamford Advocate*), in the *Sacramento Bee*, p. F4. Apparently the Bee was desperate for copy today. This article is little more than a promotional piece for [graphologist](#) Peggy Kahn, who charges \$200-\$400 to tell employers who to hire based on an analysis of the applicant's handwriting. Kahn claims she learned how to do this by studying graphology "for four and a half years at The New School for Social Research in New York." I wonder if she studied in the [philosophy department](#) with Hannah Arendt, Aron Gurwitsch, or Hans Jonas. She also claims she is a former psychologist. I suggest someone do a handwriting analysis of Kahn to determine her credibility.

Kahn claims that she has a long list of clients that includes not only businesses but people trying to decide if they are in the right job or have found the right mate. Kahn claims that your handwriting is a window to your identity and can reliably be used to screen out potential crooks and incompetents. Of course, she has no proof of these claims. She cites the 1986 book called [Scientific Aspects of Graphology: A Handbook](#) as claiming that some 3,000 American companies are using some form of handwriting analysis in their hiring process. She does not mention that the book is edited by Baruch Nevo of the National Institute for Testing and Evaluation in Jerusalem, Israel. Graphology is rampant in Israel. According to Kahn, "90 to 95 percent of all jobs in Israel require handwriting analysis for job candidates."

Also cited in the article is Janice Klein, widow of Felix Klein, founder of the National Society for Graphology (1972). She claims that in a study by her husband published by the Hunter College Psychology Department in 1973, "graphology is shown to have about a 95% success rate in recognizing depression and schizophrenia." I suppose one is to believe that the graphologists ignored the *content* of the writing in making their diagnoses.

The only balance in the article is a short digression on a very important issue: is graphology an infringement of a person's rights against invidious discrimination? Why wouldn't it be? If you cannot deny me a job or entrance into a school because of my race or religion, how can you be justified in discriminating against me on the basis of my handwriting? Nevertheless, Lerner claims that Lewis Malthby, director of the National Employment Rights Office at the American Civil Liberties Union in Princeton, N.J., claims it is legal to discriminate on the basis of handwriting. If this is true, why isn't the ACLU fighting it in our courts? Malthby agrees that graphology is "arbitrary, unfair and irrational" and shouldn't be used as a hiring tool, but apparently does not see discrimination on the basis of handwriting as unconstitutional. He claims that, in any case, it is not a big problem. He believes that "most employers are too sensible to use it." Another civil liberties leader--Joe Grabarz, executive director of the Connecticut Civil Liberties Union--is cited as noting that graphology is unreliable.

Whether it is a big problem or not, it seem apparent that the use of graphology by employers is a violation of our civil rights. If it isn't, it should be.

January 24, 1999. "Dangerous Doctors," by [Michael L. Millenson](#), in the Forum section of *The Sacramento Bee* (taken from *Washington Monthly*). Millenson is the author of [Demanding Medical Excellence: Doctors and Accountability in the Information Age](#) (1997). He is a respected writer on medical practices and care. Not everything he writes is bunk, but one statistic he frequently uses is troublesome. He claims: "Most patients would be very surprised to learn that more than half of all medical treatments, and perhaps as many as 85 percent, have never been validated by clinical trials." At the very least, this is a misleading claim. Millenson has had several chances to clear it up, but he just keeps repeating it for its polemical value.

Karen Burton, who hosts the Internet site [Shucks! A Heretic in the Heartland](#) and considers me to be a physician's advocate, has made me aware that Millenson's book (which I and, I assume, most readers of his newspaper and magazine articles have not read) cites as the source for this statistic page 5 of [The Impact of Randomized](#)

[Clinical Trials on Health Policy and Medical Practice](#) from the Office of Technology Assessment (OTA), available online. According to OTA, "It has been estimated that between ten and twenty percent of all current medical procedures have been shown efficacious in controlled trials." Who did the estimating? OTA cites itself in a 1978 study called [Assessing the Efficacy and Safety of Medical Technologies](#). On page 60 of the 1978 report OTA writes: "White (426) estimated that 80 to 90 percent of all [medical] procedures have been evaluated by informal methods." The reference is to Dr. Kerr. L. White's 1968 article, "International Comparisons of Health Services Systems," [Milbank Quarterly](#), 46:117. According to [The National Council Against Health Fraud](#), Dr. White claims this was an "armchair estimate" aimed at stimulating research to get more accurate information and he is upset that the statistic has been used in propaganda by enemies of science-based medicine and friends of so-called "alternative" medicine.

It is important to note that OTA cites White not disparagingly, but to remind the reader that most medical technologies are tested by informal methods, most often by personal experience. On page 60, the report notes that "It is important to point out that many medical advancements have properly and successfully proceeded without rigorous statistical methodology of investigation." As examples the report notes the use of vitamin B12 to treat pernicious anemia and cast application for forearm fracture. OTA also notes that "In some cases clinical trials may be prohibitively expensive. In other cases trials may pose difficult moral and ethical considerations (p. 75)."

It is clear from OTA's reports that it sees controlled clinical trials as just one method among several for assessing the safety and efficacy of medical procedures. In the 1978 study they note that randomized controlled clinical trials have become prominent in the past twenty years. OTA wisely reminds us that "No technique is universally applicable (p. 4)."

Thus, while Millenson did not pull his statistic out of thin air, he does not put it in perspective and tries to scare the reader by implying that physicians do not use reliable methods for determining what procedures to use.

managed care

Millenson's latest article is a lengthy defense of managed care under the guise of an attack on incompetent and ignorant physicians. Early on he promotes and defends "evidence-based medicine". He tells us that our personal physician probably doesn't know what the latest evidence is and then he throws in the stat about most treatments never having been validated. He backs up his claims with many statistics whose sources he rarely mentions. One of his favorites is the stat about the 50,000 annual hospital deaths due to infections incurred while in the hospital. He never mentions how many hospital patients this stat is in relation to, nor does he note how many people die annually of infections incurred outside of the hospital. [[In 1997, there were 33.6 million admissions to U.S. hospitals](#), which would make the death rate from hospital infection 0.001, or one tenth of one percent.] Nor does he hazard a guess at to what percentage of those people would have survived had they not gone to the hospital at all. [Nor is there any mention of the fact that overuse of antibiotics, combined with more and more invasive and daring procedures, are bound to lead to

more infections over time.] [Hospitals infection is a problem](#)--it may even be much greater than Millenson suspects--and the number of infections should be less than they are, but the issue isn't a simple one of incompetent and ignorant physicians.

Omitting relevant data seems to characterize Millenson's style of writing. He claims that since the survival rate of elderly heart attack patients is the same for those who get and those who do not get heart bypasses, angioplasties and catheterizations, that it is a complete waste to give these treatments. Survival rate is one measure, but not the only measure of why a treatment ought to be given. Reduction of pain is another, and if a treatment reduces pain and enhances the quality of life without lengthening it, so what? Millenson mentions no other measure of the value of such treatments.

Another curious feature of Millenson's article is that he sees economic and political agendas everywhere except with managed care. I find that a glaring omission. I have no particular quarrel with managed care, but one would have to be one edge shy of a dull blade not to recognize that managed care is a mighty big economic matter and its advocates have their economic and political agendas just like everyone else in the medical care business.

Another interesting omission is any discussion of patient responsibility for asking questions and doing research. He seems satisfied with blaming physicians for not being omniscient, or characterizing them as incompetent if, for example, they do not routinely prescribe aspirin to all heart attack victims.

I don't know what value Millenson's polemics have, but I do know that you don't need a crystal ball to know that given the large number of physicians out there, there must be a significant number who are incompetent. Why he seems to think that most of the incompetent physicians are likely to end up outside managed care, while most of the competent ones end up inside, is something I wasn't able to figure out from his labyrinth of statistics.

 [the Skeptic's Refuge](#)

[More bunk](#) 

Commentary on Sacramento City College Conference on Belief and Skepticism November 1997

Introductory comments: In addition to speakers on folklore and on pseudoscience in the media, the conference featured two speakers who focused on pseudoscience in their disciplines, psychology and medicine. While the speakers on psychology and medicine went into some detail about their subjects, I would like to introduce my comments on their presentations with one general comment.

There should not be a need for a person seeking treatment for an emotional, mental or physical problem to share the metaphysical beliefs of their therapist, psychiatrist or family doctor. A person's *right* to seek a shaman or alien abduction specialist should not be confused with the *need* to find a metaphysical match. I recognize that faith healing can affect anything which suggestion, diverted attention, and other agreed upon elements in any given sociocognitive structure can affect, such as weight loss or quitting smoking, temporary relief of minor pain, and a long litany of social behaviors. There is no scientific evidence that faith can cure cancer or schizophrenia or that it can restore a liver or brain damaged by years of alcohol abuse. For me, the most basic sign that a psychotherapy or health practice is questionable and to be avoided is the requirement that I must share the metaphysical belief system of the practitioner in order to be helped. I never discuss religion or metaphysics with my physicians. I assume some of them have been Catholics, Jews, Protestants, Muslims, Hindus, etc. It should not matter. When I had surgery, I didn't discuss my personal life with my surgeon and he didn't tell me about his personal life. To me, such things are irrelevant. He may have been a very spiritual man, but all I was interested in was his knowledge and experience as a surgeon. For him to have required me to share his faith, or for me to have required him to share my beliefs, would have been inappropriate and unnecessary. I realize my attitude would be different had I been born into a pre-scientific world of shamans, high priests and witch doctors. But I wasn't. I was born into a scientific culture, and I do not long for *the good old days* when the life expectancy was one-quarter of what it is now and the mentally ill were believed to be possessed by devils or gods.

Carol Tavris: "The Psychology Wars: What professionals and the public should know about the growing scientist-therapist conflict"

[Dr. Tavris is a social psychologist, lecturer, essayist and author of several books, including *The Mismeasure of Woman*]

Dr. Tavris opened the conference with a talk on the growing influence of psychotherapies which have not been scientifically tested (e.g., [repressed memory therapy](#)) or cannot be scientifically tested (e.g. projective tests such as the [Rorschach](#)) or which have been tested and shown to be false therapies (e.g., [facilitated communication](#)). According to Tavris, over 90 people are in prison today because of bad science, particularly in the area of allegations of child abuse and [satanic ritual abuse](#). Many therapists and social workers are not only practicing bad science, they are promoting it with unproved or false claims regarding the relationship of child abuse and adult behavioral problems.

For example, repressed memory therapists begin with a number of false or questionable assumptions. They start with the assumption that specific problems such as bulimia or depression are due to childhood sexual abuse which has been repressed and forgotten by the patient and that therapy must ferret out these repressed memories in order to "cure" the patient. Despite the fact that no scientific study has yet uncovered any specific set of symptoms in adults which are associated with childhood sexual abuse, the repressed memory therapists continue to maintain the following false notions:

- 1. Abused children become abusers.**
This is not true. Two-thirds of those abused as children do *not* become child abusers themselves.
- 2. Children who have been abused will reveal this abuse by the particular way in which they handle questions while presented with anatomically correct dolls.**
This is not true. Studies have shown that about 50 % of children who have not been touched, much less abused, claim they have been touched and will use the dolls to graphically display the way they were touched. (The children were video taped while being examined by a doctor who did not touch their genitals, yet the children under continued questioning eventually confabulated detailed stories of genital and anal touching and penetration.)
- 3. Children are too young and inexperienced to make up the stories of sexual abuse they tell.**
This is not true. Children have very vivid

imagination and can confabulate with the best of humanity. What is true is that children who initially deny having been touched in the genital or anal area will usually change their story if they are very young, repeatedly asked the same question, encouraged by the interviewer to fantasize, threatened if they don't agree they were touched and reminded that other children have already admitted they were touched.

It is not surprising that interviewers of children can get the most preposterous and incredible stories from their young wards, such as leaving day-care and taking airplane trips to the desert where giraffes are sacrificed along with human babies. What is surprising and frightening is that such [poor interviewing techniques and therapy can put people in prison.](#)

Two other false beliefs among many psychotherapists and the general public mentioned by Tavis are that children of alcoholics become alcoholics (the majority do not) and that subliminal messages influence behavior (there is no evidence that they do).

How does such bad science get established? According to Tavis, one major problem is that there is no connection between academic/scientific training and getting a certificate which allows one to legally practice psychotherapy. This is true. In some cases all it takes is a few dollars and a weekend seminar on AIDS counseling or hypnotherapy and the participant can become a certified therapist. Nevertheless, it seems to me that much of the bad science and misinformation about child abuse, psychological problems and proper treatment for those problems, arises from those with [Ph.D.s in psychology](#), who have been trained in accredited academic institutions. I tried to get Dr. Tavis to address this issue in the question and answer session, and I must say that I did not feel as if I had been given an adequate answer. There is something else going on besides inadequately trained therapists, since adequately trained psychologists and psychiatrists are often the greatest perpetrators of pseudoscience and false claims. She mentioned Dr. Bruno Bettelheim's claim that bad mothering causes autism, as well as Dr. Freud's claims about penis envy. This list is actually a very long one and deserves exploring, but this is not the time for it. Suffice it to say, that all this bad science cannot be blamed on bad therapist education or training and the tawdry way therapists are certified. A consumer cannot tell the difference between a good therapist and a quack therapist by looking at their degrees and certificates. If the popularity of junk science among therapists is due to poor education and training, then the best schools in the world ought to be scrutinized, for it is often their graduates who are advancing the cause of questionable science, science cloaked in metaphysics, and pseudoscience, e.g., Dr. John Mack (professor), Dr. Andrew Weil and Dr. Deepak Chopra (graduates), all of Harvard medical school.

Furthermore, as a profession, psychologists and psychiatrists (and the more degrees and credentials the better here) don't share the kind of tentativeness that characterizes most scientists. Witness their willingness to testify as to their "expert opinion" on human behavior. Where even the layperson recognizes it is dicey to predict what anyone will do in the future, these "experts" offer their contradictory opinions in the courtroom without hesitation. Granted, this indicates a major flaw in our legal system, nevertheless, if these experts expect the general public to have any faith in them, they ought to admit that they don't really know how a person will behave in the future .

She pointed out that there seems to be a great deal of [post hoc reasoning](#) among therapists who reason from certain symptoms to the cause of those symptoms as childhood sexual abuse. She also noted that many therapists are deluded by [confirmation bias](#) and [selective perception](#). They do not set out to falsify or disconfirm hypotheses, but are on the constant outlook for confirming "evidence." Many seem undisturbed with basing their therapies on non-falsifiable claims. They seem more interested in their personal insights than in scientific testing of hypotheses. Some, as those in facilitated communication, seem unmoved by empirical tests which repeatedly falsify the fundamental claims of FC. And these therapists seem oblivious to facts such as "70% of all abused children do not become abusers themselves." Why there is this preponderance of anti-scientific and pseudoscientific bias amongst so many therapists is intriguing, but I do not think the answer is to be found in who has the training and academic credentials and who doesn't.

Whatever the causes of the popularity of pseudoscience in psychology and psychiatry, it behooves the general public to become critical thinkers. We cannot trust the experts. We must be able to evaluate the claims of the experts and determine who is more credible. The stakes are too high to let ourselves be duped by claims which "sound true." That's not enough. We have to be willing to do some investigation ourselves. There is no other way. We may not be able to do scientific experiments ourselves, but we can read about the experiments of others. We can go to the library, use the internet, etc., to get information which we can evaluate. We have to learn how to tell when a study has been done properly, when the samples are too small, when the protocols are biased, etc. This is not easy, but it is not impossible, either. We bear the responsibility for our beliefs. If they are false, and we could have corrected them by being more critical in our thinking, we are responsible for any harm which accrues to ourselves or to others because of those false beliefs.

Dr. Tavis explored the notion that scientists seek impersonal explanations with predictive power, but therapists have as their goal "patient satisfaction" not objective truth. In fact, some therapists admit that they do not care what the objective truth is. Therapists try to come up with a narrative which makes sense of the patient's behavior and thoughts; whether the narrative bears any

relation to what is true doesn't matter for therapy. But it does matter. It matters not only to the parents who have been falsely accused of abuse by their child thanks to the probing of a therapist who has facilitated the "recovery" of a "repressed memory." It matters to therapy as well. How could a whole school of therapy develop around the notion that the truth doesn't matter? This is a philosophical position; it is a matter of values. The consequences of this belief are horrendous. It is one thing to acknowledge that what a person believes affects them and can affect them profoundly even if what they believe is false. It is quite another to hold that a therapist has no obligation to correct a false belief or delusion.

Even worse is the belief that a therapist should encourage a patient's false beliefs and delusions. Do these therapists think the patient is a monad? Don't they realize that the patient lives in the world with other people and if the delusions or false beliefs are about those other people, the objective truth does matter to the well-being of the patient? Very few human beings live without relationships to family and friends. The mental health of a person is affected by those relationships. We may not be totally dependent on each other, but a network of family and friends should not be replaced by the therapist. Unfortunately, that is exactly what many therapists strive for: they isolate the patient from family and friends and create a dependency upon themselves. These bad therapists do this whether they've been trained for eight years at Harvard or 8 hours in Monterey.

Focusing on the difference in the goals and methods of therapy and scientific research can be misleading to the general audience. I heard more than one participant grumble about the lack of concern for patient satisfaction. It seems that a general audience may need to be reminded that while patient satisfaction is a good thing, when it becomes the goal of therapy or treatment, and becomes either identified with or secondary to the health and well-being of the patient, focus on it can be dangerously misleading. One wants not only a satisfied customer but one you have really cured or made well. It will not do to send people happily to their graves or forward to wreak havoc on the lives of others.

Wallace Sampson: "Pseudoscience in Modern Alternative Medicine"

[Dr. Sampson is retiring as a professor of clinical medicine at Stanford Medical School. He will be editing a new journal, the *Scientific Review of Alternative Medicine*, a peer-reviewed medical journal.]

Dr. Sampson began his talk by blaming the popularity of alternative medicine on the "cultural relativism" of medical systems which resulted from "postmodernist deconstructionism." This may be true, but it is hardly of

interest to the general public. In any case, if he is right, there probably was little point in his noting that of the hundreds of papers on homeopathy, acupuncture and chiropractic, there is little evidence that these alternative health practices offer more than a [placebo effect](#). There may be a group of radical feminists who maintain that *science is just another way of knowing*, a *male* way at that, but the general public probably does not hold such an opinion. I think Dr. Sampson should give the general public credit: they're not cultural relativists; they simply recognize that scientific medicine is fallible and generally recommends either drugs or surgery for what ails you. The majority of those who choose chiropractic over standard medicine do so because they are afraid of surgery or do not want to take pain killers, not because of their epistemological stance. There may be other reasons besides epistemological ones which lead so many people to seek a "natural" cure for what ails them. It does little good to show people who are mistrustful of scientific medicine how scientific studies have shown the ineffectiveness of alternative medicine. They also know about the dangers of standard medicine. It really isn't an epistemological issue; it is a pragmatic and utilitarian one. Which method is cheapest, safest and least likely to harm me?

Accusing the alternative health advocates of anti-science bias--another of Sampson's claims--is about as likely to be true in general as the accusation that standard medical doctors are all cold, indifferent fiends just waiting to amputate the wrong leg. Personally, I believe it serves little purpose to cast a blanket shadow over all alternative health practitioners. The issue is not really one of differing personalities or attitudes towards science, especially since many of those practicing alternative medicine are well-trained in science and do not reject science outright.

Sampson also noted that many alternative health practitioners claim they are persecuted by the medical establishment. This may be true, but is probably of little interest to the general public. In any case, it has nothing to do with whether any particular alternative health practice is pseudoscientific.

Another topic Sampson took up was the National Institutes of Health Office of Alternative Medicine. I think this is a topic he might have focused on more, perhaps exclusively in a short talk; for the history and present status of this agency affords a careful exploration of how pseudoscience and junk science, supported by powerful political leaders, has infiltrated a basic government concern: the health and well-being of its citizens. Dr. Sampson did a pretty good job in explaining the role of some of the key figures in this fiasco, but again, to note that OAM is "stacked with quacks" (which I believe is true) needs to be fleshed out with evidence as to how they are replacing standard research techniques and testing methodologies in favor of junk science and pseudoscientific concerns. Dr. Sampson did give some examples of the watering down of scientific methodologies in OAM, but attention to a lot more detail might have been more persuasive.

I know that some in the audience cringed when Dr. Sampson said things like "chelation therapy *can't* work" or "homeopathy *can't* work." Here I think there was an epistemological problem. Some took this to mean that the modalities are metaphysically impossible, i.e., we can't imagine them working without contradiction. I don't think that is what Dr. Sampson meant. I think he meant to claim that these methods are *empirically* impossible. I think he is correct for homeopathy, i.e., given the way the empirical world is, a substance which is so diluted as to have no molecules remaining cannot be effective without a miracle taking place. Our standard understanding of cause and effect requires the cause to be present for the effect to occur. It would be empirically impossible, for example, for a vaccine to work which had been so diluted as to have no molecules of the vaccine remaining in the inoculation. However, I do not know what his argument is to support the claim that chelation can't work to cure vascular diseases. I have seen studies and arguments that support the claim that [chelation](#) *doesn't* work, but none that it *can't* work.

If Sampson plans to take his show on the road, he might want to consider a few changes in the way he makes his case against alternative medicine.

For example, he might want to soften his all-or-nothing approach: to be a rational skeptic one must accept all of conventional medicine and reject all of alternative health care. This might fly at a CSICOP meeting but is unlikely to be met with approval by the general public. It is much more seductive to praise shamans for their great wisdom gained by trial and error in the days before scientific testing could be done to explain why their remedies work. There is some value in studying shamanic recipes and testing bark, root, plants, etc., which seem promising. It is unlikely that shamans have been giving their patients lethal herbs for generations without detection. Much more dangerous are the untested remedies being proposed by medical doctors such as [Dr. Max Gerson](#) or naturopathic doctors such as [Dr. Kurt W. Donsbach](#) and [Dr. Harry R. Alsleben of the Hospital Santa Monica in Rosarito Beach, B.C., Mexico](#).

I know that I have been criticized by a number of alternative health advocates for my "broad brush" approach in criticizing alternative medicine. My format, however, gives me an advantage over Dr. Sampson. In a public talk the broad brush approach is dangerous. One can only cover so much. Hence, many broad claims will necessarily go unexplained and undefended. In the *Skeptic's Dictionary* I can flesh out my claims, not only with [individual entries on specific alternative therapies or practitioners](#), but through responses to reader comments. Also, I don't feel any need to defend standard medicine, as Dr. Sampson does. Many of my readers criticize me for not attacking standard medicine. I have tried to explain several times why I do not, but my explanations seem to fall on deaf ears. Dr. Sampson defended standard medicine on two main grounds: the profession is dominated by scientists and by people who follow the highest of ethical standards. I would have left out

the reference to ethical standards simply because it is not true: there is no scientific study which shows that medical doctors are any more ethical than any other group of people. Furthermore, many of those practicing bad science and engaging in unethical practices are medical doctors. I think if one wants to take the higher ground, one should stick to scientific methodologies, not personalities or professions. One does not have to defend standard medicine or medical practices by defending those who practice it as a higher sort of being.

I think it behooves the scientist and defender of science to be humble, not arrogant; to respect the fallible nature of scientific inquiry and knowledge, rather than gloss over errors or harms done in the name of science. Medical science is not only fallible, but skimpy. This should be admitted up front. If there is an argument in favor of medical science over alternative medicine, it ought to be in terms of the reasons for preferring control studies over intuition and insight. And, while it is probably pointless in a talk to the general public to hack through the jungle of metaphysical beliefs which underlie much of alternative medicine, one should not forget that one of the main reasons many alternative practices are attractive to many people is just because of the metaphysical baggage the alternative therapies carry with them. Dr. Sampson referred to a list of words and phrases which he said are "misused" by alternative advocates, e.g., *energy* and *life force*. These concepts have no place in scientific medicine, but many people base their lives upon such concepts. I think it is best to simply point out that metaphysical beliefs in the soul, or life forces or mysterious energies are not required for scientific medicine to work. Nor must they be denied for scientific medicine to work. They are not empirical concepts, cannot be subjected to scientific analysis and anyone who claims that science can be united with such concepts into some sort of harmonious new field of knowledge is deluded. Metaphysical claims are non-empirical, non-falsifiable and untestable by empirical methods. That does not mean they are inferior to scientific claims, but it does mean that they must be evaluated in ways differently from scientific concepts.

Many in the audience did not seem to understand the significance of Dr. Sampson's claim that concern with "patient satisfaction" is not a scientific concern, but it is a major concern of alternative practitioners. This makes it sound as if medical doctors practicing standard medicine don't care about their patient's satisfaction with their treatment. This misses Dr. Sampson's point. The scientific validity of a therapy or treatment should not be measured in terms of subjective reports because such reports are notoriously unreliable and self-validating. This does not mean that the scientist does not care about the happiness of his or her patients. It means that patients may feel they are better, when in fact they are not. If you are getting a cancer treatment and feel great, that does not mean the treatment is working. Likewise, if you are getting cancer treatment and feel awful, that does not mean that the treatment is not working. Objective tests are needed to determine whether the treatment is working. This doesn't mean that the scientist does not care how the patient feels; it simply means that how the patient feels is not a reliable measure of

the effectiveness of treatment.

Dr. Sampson spent a good part of his time listing the characteristics of pseudoscientific alternative medicine advocates: their anti-scientific bias; their demand for absolute proof from science but only requiring sincere belief for their own claims; their failure to acknowledge their limitations; their claim that it is unethical to do control studies because they are then depriving control groups of help; their claim that they are persecuted by the medical Establishment (with a capital E); etc. Again, the general public is probably not too interested in these complaints and is unlikely to feel much sympathy for a medical doctor complaining about others not acknowledging their limitations. Too many M.D.s think the letters stand for Medical Divinity.

Another feature of Dr. Sampson's talk was a run through a number of "medical myths." Most of these, he claims, originated with or are perpetuated by pseudoscientific defenders of alternative medicine. For example, there is the myth that medical doctors are ignorant about nutrition. This is not true, he says. Nutrition is studied in biochemistry courses and many physicians work with nutritionists closely. Anyone who has had diabetes knows that this is true. Endocrinologists work very closely with nutritionists in establishing a healthy diet for the diabetic. My physicians have often given me information on nutrition. I have no idea how this myth got started, but I have heard the claim made more than once. In fact, this myth seems closely related to another one which Dr. Sampson did not mention, namely, the myth that medical doctors do not know or care anything about prevention of disease. This claim is preposterous on its face, but it is still very common. Who do we think is behind all those inoculation programs? Who developed the polio vaccine? Etc. Who recommends that we quit smoking? That we exercise and eat our fruits and vegetables? Who does the studies to determine exactly what, if any, effect all this good living has on our bodies? Medical scientists. Yet, a recent article in the *Journal of the American Medical Association* publicized a study by the Health Institute at the New England Medical Center in Boston which claims that while medical doctors do know more than anybody else about preventive medicine, they're keeping it a secret from us! A report on this article appeared in the *Sacramento Bee* (Nov. 5, 1997). The headline on the front page reads "Study: Few doctors pushing prevention." There is a nice blurb from a local internist, Dr. Robert Charm, who says: "Time is money. Doctors don't have enough time to spend with patients to practice that most important part of medicine we don't learn in medical school--prevention." Well, Dr. Charm should have learned about prevention in medical school and if he didn't he wasn't paying attention. Why did he think they had him practice giving shots? Where was he when there was a discussion in biochemistry about how carbohydrates are turned into sugars and what effect this has on the body? The article also quoted an 80-year-old retired nurse, Alice Roche, who claimed that she lost a leg to amputation because her doctor did not warn her that her cholesterol level was "dangerously high until it was too late." She says her doctor should have told her not to eat hard-boiled eggs and cheese sandwiches, her favorite meals. The *Bee* reporter, Dorsey Griffith, lets these

claims pass without comment. No mention is made that changing her diet may have had no effect on her cholesterol. No mention is made that the blood clots the woman suffered were probably not due to her cholesterol level and that the woman may well have lost her legs if she had not eaten any eggs or cheese and had a "normal" cholesterol level. No mention was made as to whether Ms. Roche smoked, was obese, exercised regularly, abused alcohol, was diabetic or had a family history of circulatory problems. The reader was left to assume that this poor woman lost her leg because her doctor didn't give her instructions in preventive medicine. With journalists like Griffith on the loose, Dr. Sampson has his work cut out for him in his quest to correct some of the myths about medicine and medical doctors. Who does Griffith or Dr. Charm think did the studies on health and obesity, alcohol abuse and smoking? Homeopaths? Acupuncturists? Naturopaths? I don't think so. (Perhaps Dr. Charm should have attended the symposium on prevention of age-related diseases at UC Davis, held this week. It was not sponsored by alternative health advocates but by scientists at UC Davis's Center for Environmental Health Sciences.)

When the mass media is overpopulated with reporters who lack the education and knowledge needed to ask the right questions, is it any wonder why the general public often believes what is false or questionable regarding scientific matters? Another example of media incompetence I've witnessed recently was when a "reporter" for MSNBC was interviewing the research director of a company which sells herbal remedies. During the question and answer period, someone asked whether it was likely that many of the so-called cures due to herbal remedies weren't just due to [the placebo effect](#). The research director replied that no, that couldn't be the case because "that's illegal." She elaborated by noting that her company never puts placebos in its products. The interviewer demonstrated that she, too, had no idea what the placebo effect is, by nodding her head and *not* saying, "I think our caller wants to know whether the effects of herbal remedies are due to the beliefs of the users rather than to the herbs."

Related to the myth that medical doctors know little about nutrition or prevention of disease is the notion that they are against taking vitamins. Dr. Wallace pointed out that scientists are the ones who study vitamins and the diseases caused by lack of proper mineral or vitamin intake. Yet, because medical doctors do not blindly advise patients to take megadoses of vitamins, they are criticized. Vitamin and mineral supplements are no substitute for good nutrition. And there is no evidence that people who eat well need or can benefit from megadoses of vitamins and minerals. People who take supplements do not live longer than people who don't. The attitude of the medical profession towards vitamins and minerals is appropriate. The fact that a person who is taking vitamin supplements *feels great* is irrelevant to whether those supplements are needed by that person's body. Because of the placebo effect, a person might believe they have more energy and are thinking more clearly or are stronger, etc. But for anyone to recommend taking megavitamins because of the potential placebo effect would not be morally

right, even if naturopaths consider it good medicine because it produces patient satisfaction.

Another myth perpetuated by defenders of alternative health practices is that 90% of all conventional medical practices and treatments have not been tested. This claim is based upon a study published in Britain in 1948. Dr. Sampson asserts that the study is wrong and that over 90% of today's treatments have reasonable proof of their effectiveness. He did not say on what he based this claim; however, I think it is interesting to view this claim that most medical treatments are untested in light of a common criticism made by defenders of alternative therapies, namely, that it costs too much to do all the testing which the FDA and other demanding scientists require before they approve of a drug or treatment. The scientific testing of new drugs is very rigorous. The likelihood that most surgical techniques are untested is about zero. So, the claim that most medical treatments are untested seem false on its face.

Dr. Sampson also listed as another myth the claim that medical doctors ignore "mind" and deal only with the body in an impersonal way. I think he should have just admitted that unfortunately this is true for too many doctors. However, it does not follow from the fact that many physicians are indifferent to their patient's "mind" or "soul" that someone who is concerned about their "soul" is necessarily going to know how best to treat their body. Being metaphysically compatible with one's doctor may be a luxury most of us will have to do without if we are mainly concerned with good medical treatment. I for one would prefer a competent, knowledgeable physician to a loving, caring incompetent spiritwalker who hallucinates during surgery. Dr. Sampson refuted this myth by noting that standard medical training involves instruction in psychosomatic disorders. This is true, but I doubt if that is what the critics had in mind. What attracts people to Andrew Weil and Deepak Chopra is their inclusion of metaphysical entities, not their belief that some physical problems are "in your head." In fact, one gripe many people have with standard medicine is that if a physical cause for a problem can't be found, the patient is told that the problem is "in their mind."

Dr. Sampson discussed several other myths, but one thing he did not discuss is the claim that alternative practitioners are attacked by the medical Establishment because of the economic competition. This attack on the motives of physicians is an ad hominem attack but a very successful one and difficult to defend against. I think that when this criticism comes up I would just note that attacking a person's motives rather than his or her arguments is an ad hominem fallacy and it would be preferable to hear a response to the criticisms made of alternative medicine. On the other hand, we all know how enjoyable an ad hominem can be, especially when they are aimed at unorthodox gurus who take their vegetarian dogs to holistic, non-conventional veterinarians who give unorthodox treatments such as therapeutic touch for the pet in an unconventional setting based upon Eastern principles of energy and life forces hovering in the shadows of pyramids.

Allan Dundes: "The Psychological Approach to Legends and Other Forms of Contemporary Folklore"

[Dr. Dundes is professor of anthropology and folklore at UC Berkeley and the [author of many books on folklore.](#)]

Professor Dundes focused on folk legends (he dislikes the expression "urban" legends because they are not restricted to urbania). These are stories which are set in the real world and are told as if they are true. The folk legends are not true but they do reveal our true fears, prejudices, taboos and anxieties. Why do so many people believe stories like the Nieman Marcus cookie recipe story, the poodle in the microwave story or the secretary's coffee tray in the computer story? He didn't say or even offer a theory as to why there is so little skepticism about such stories. I think the answer has something to do with [selective perception](#), but folk legends are beyond my scope of interest.

Fritz Stevens

Mr. Stevens is the executive director of Center for Inquiry-West, Los Angeles, funded by CSICOP. He joined in a panel discussion and commented on the media's role in perpetuating junk science and pseudoscience. He praised the film *Contact* as a hopeful sign and compared it favorably to Stanley Kubrick's *2001*. (In my view, there is no comparison as a film or as a story. Arthur C. Clarke and Stanley Kubrick are light years ahead of Sagan's story.) Mr. Stevens made one comment I found most interesting. Contrary to what many of us think, Hollywood junk science is not made just to satisfy a hungry audience who craves such stuff. Rather, in Mr. Stevens' view, the movies reflect the very real interests and beliefs of those who make them. I must say that Mr. Stevens was rather convincing.

Mr. Stevens also promoted the *Skeptical Inquirer* and had for sale several copies of the September/October 1997 issue which is devoted to Alternative Medicine in a Scientific World and includes articles by Wallace Sampson, Robert Park ("[Alternative Medicine and the Laws of Physics](#)") and Barry Beyerstein ("[Why Bogus Therapies Seem to Work](#)").

The Audience

One man announced that "all the great scientists have been mystics." This is false, of course. Some have been: Newton, Boyle and Kepler, for example, were certainly very spiritual, even if one quibbles about whether they were mystics. But this man used Einstein as his paradigm of the mystical scientist. "God does not play dice," said Einstein. True. Einstein said it and New Age mystics and other spiritualists love to cite this passage as evidence of Einstein's spirituality. The truth is that Einstein wrote to Max Born on December 12, 1926, and said:

Quantum mechanics is certainly imposing. But an inner voice tells me that it is not yet the real thing. The theory says a lot, but does not really bring us any closer to the secret of the Old One. I, at any rate, am convinced that He does not throw dice.

What did he mean? Years later he wrote to James Frank:

I can, if the worst comes to the worse, still realize that the Good Lord may have created a world in which there are no natural laws. In short, a chaos. But that there should be statistical laws with definite solutions, i.e., laws which compel the good Lord to throw the dice in each individual case, I find highly disagreeable.

His point, in both cases, does not seem to be spiritual, but rather has to do with his reluctance to accept quantum mechanics. The fundamental laws of physical reality should not be couched in terms of statistical probabilities. Einstein did not waver in his reluctance to accept quantum mechanics. In 1937, he wrote to Herbert Samuel:

It is therefore an uncritical attitude to declare the statistical character of nature to be a fact. It may only be excused by the fact that up to now we do not have any other theory.

Thus, rather than relish Einstein's comments about God playing dice with the world, New Agers should cringe, since one of their favorite misconceptions is Quantum Mechanics, which many New Agers take to be a blank check allowing them to claim that since nothing is certain and all is energy, anything goes. Einstein didn't like Quantum Mechanics and he certainly didn't think that quantum mechanics was a gateway to the mind of God. Far from it.

What did Einstein believe about God, then? In 1929 he wrote to a rabbi that he believed "in Spinoza's God who reveals himself in the harmony of all that exists, not in a God who concerns himself with the fate and actions of men." Spinoza was excommunicated from the synagogue in Amsterdam for his belief in such a God, i.e., in identifying Nature with God and both with

Everything.

I have no problem with calling both Einstein and Spinoza mystics. They identified God with the Cosmos and found it comfortable to talk about becoming one with God by knowing more and more about the Cosmos. But it would be foolish to look in any of Einstein's scientific papers for appeals to God, to intuitions, to mystical visions or insights, to voices heard in the night or to channeled books from Cro-Magnon warriors or Atlantean demi-gods. When he argued *as* a scientist, he argued *like* a scientist.

In conclusion, this debate about mystics and science is a diversion from the real question: are science and spirituality irreconcilable? The answer is, of course not. But it does not follow from that fact that there are no boundaries which separate the two. There are. Some spiritual claims are irreconcilable with some scientific claims. It does not follow that both require equal acts of faith. It may be the case that I cannot prove with absolute certainty that I will die if I jump from an airplane at 30,000 feet without a parachute, but it is not an act of faith which keeps me from jumping. Or, if it is, the faith I would need to jump would be infinitely greater than the faith I would need to stay in my seat. The faith needed to believe in stories like that of Adam and Eve or Noah's Ark is much greater than the "faith" needed to believe in evolution. The faith needed to disregard your intellect and rational powers in order to believe something on authority is exceedingly greater than the "faith" needed to use your intellect and rational powers to evaluate information, arguments and the claims of authorities.

"The dice of God are always loaded."

Ralph Waldo Emerson

R. T. Carroll, November 7, 1997

cellular memory

"The idea that transplanting organs transfers the coding of life experiences is unimaginable."

--Dr. John Schroeder, Stanford Medical Center

Cellular memory is the speculative notion that human body cells contain clues to our personalities, tastes and histories, independently of either genetic codes or brain cells. Perhaps the idea for this nonsense began with films such as [Brian's Song](#). In that film, the 26-year old Piccolo (played by James Caan) is dying of cancer when Gayle Sayers (played by Billy Dee Williams), his friend and Chicago Bears teammate, visits him in the hospital. Piccolo had been given a transfusion and he asks Sayers if he had donated any blood. When Sayers says yes, Piccolo remarks that that explains his craving for chitlins.

Or perhaps the idea originated with L. Ron Hubbard. In [Dianetics](#), he speculated that cellular memory might explain how engrams work.

Maybe the idea came from *Les Mains d'Orlac* by Maurice Renard (1875-1939), a story of a concert pianist who loses his hands in an accident and is given the hands of a murderer in a transplant operation. Suddenly, the pianist has an urge to kill. Several variations of Renard's story have made it into film, including [Orlacs Hände](#), a 1935 silent Austrian film, [Mad Love](#) (1935), [Les Mains D'Orlac](#) (1960), and [Hands of a Stranger](#) (1962). A similar story is told by Pierre Boileau and Thomas Narcejac (authors of *Vertigo*) in *et mon tout est un homme* (1965), which was made into the film [Body Parts](#) in 1991. A prison psychiatrist loses an arm in an accident and is given the arm of an executed psycho-killer. The arm then develops a mind of its own.

More recently, Claire Sylvia, a heart-lung transplant recipient, explained her sudden craving for beer by noting that her donor was an 18-year old male who died in a motorcycle accident. She's even written a book about it, which will soon be made into a movie starring Sally Field. Paul Pearsall, a psychologist and author of *The Pleasure Principle*, also casts his vote for the theory of cellular memory and transfer. Pearsall goes much further in his speculations, however, claiming that "the heart has a coded subtle knowledge connecting us to everything and everyone around us. That aggregate knowledge is our spirit and soul. . . .The heart is a sentient, thinking, feeling, communicating organ." How he knows this is anybody's guess. It may have been channeled to him from aliens or wise persons from the East. Or perhaps he has been reading the fiction of Edna Buchanan, who asks: "What if the soul is contained in DNA? What if DNA is contained in the soul?"

Sylvia Browne teaches a course for an alternative education program in

Sacramento entitled *Healing Your Body, Mind & Soul*. In one two-hour session Ms. Browne will teach anyone "how to directly access the genetic code within each cell, manipulate that code and reprogram the body to a state of normalcy." Despite the preposterous nature of her claims, the course sold out.

And what if you eat too much chicken? Might you grow a beak, start clucking uncontrollably, and develop a craving for seeds? Are those squealing and mooing sounds you hear in the night your diabetic neighbors who are using porcine and bovine insulin? Pity the poor child who received a baboon's heart.

full moon and lunar effects

The full moon has been linked to crime, suicide, mental illness, disasters, accidents, birthrates, fertility, and werewolves, among other things. Some people even [buy and sell stocks according to phases of the moon](#), a method probably as successful as many others. Numerous studies have tried to find lunar effects. So far, the studies have failed to establish anything of interest, except that the idea of the full moon definitely sends some lunatics (after *luna*, the Latin word for moon) over the edge. (Lunar effects that have been found have little or nothing to do with human behavior, e.g., the discovery of a slight effect of the moon on global temperature,* which in turn might have an effect on the growth of plants.*)

[Ivan Kelly](#), [James Rotton](#) and [Roger Culver](#) examined over 100 studies on lunar effects and concluded that the studies have failed to show a reliable and significant correlation (i.e., one not likely due to chance) between the full moon, or any other phase of the moon, and each of the following:

- the homicide rate
- traffic accidents
- crisis calls to police or fire stations
- domestic violence
- births of babies
- suicide
- major disasters
- casino payout rates
- assassinations
- kidnappings
- aggression by professional hockey players
- violence in prisons
- psychiatric admissions
- agitated behavior by nursing home residents
- assaults
- gunshot wounds
- stabblings
- [emergency room admissions](#)
- behavioral outbursts of psychologically challenged rural adults
- [lycanthropy](#)
- [vampirism](#)
- alcoholism
- sleep walking

-epilepsy

If so many studies have failed to prove a significant correlation between the full moon and anything, why do so many people believe in these lunar myths? Kelly, Rotton, and Culver suspect four factors: media effects, folklore and tradition, misconceptions, and cognitive biases. I would add a fifth factor: [communal reinforcement](#).

the media perpetuates lunar myths

Kelly, et al., note that lunar myths are frequently presented in films and works of fiction. "With the constant media repetition of an association between the full moon and human behavior it is not surprising that such beliefs are widespread in the general public," they say. Reporters also "favor those who claim that the full moon influences behavior." It wouldn't be much of a story if the moon was full and nothing happened, they note. Anecdotal evidence for lunar effects is not hard to find and reporters lap it up, even though such evidence is unreliable for establishing significant correlations. Relying on personal experience ignores the possibility of [self-deception](#) and [confirmation bias](#). Such evidence may be unreliable, but it is nonetheless persuasive to the uncritical mind.

folklore and tradition

Many lunar myths are rooted in folklore. For example, an ancient Assyrian/Babylonian fragment stated that "A woman is fertile according to the moon." Such notions have been turned into widespread misconceptions about fertility and birthrates. For example, [Eugen Jonas](#), a Slovakian psychiatrist, was inspired by this bit of folklore to create a method of birth control and fertility largely rooted in astrological superstitions. The belief that there are more births during a full moon persists today among many educated people. Scientific studies, however, have failed to find any significant correlation between the full moon and number of births (See "Lunar phase and birth rate: A fifty-year critical review," by R. Martens, I. Kelly, and D. H. Saklofske, *Psychological Reports*, 1988, 63, 923-934, "Lunar phase and birthrate: An update," by I. Kelly and R. Martens, *Psychological Reports*, 1994, 75, 507-511). In 1991, Benski and Gerin reported that they had analyzed birthdays of 4,256 babies born in a clinic in France and "found them equally distributed throughout the [synodic](#) (phase) lunar cycle" (Kelly, et al. 1996, 19). In 1994, Italian researchers Periti and Biagiotti reported on their study of 7,842 spontaneous deliveries over a 5-year period at a clinic in Florence. They found "no relationship between moon phase and number of spontaneous deliveries" (Kelly, et al. 1996, 19).

Despite the fact that there is no evidence of a significant correlation between phases of the moon and fertility, some people not only maintain that there is, they have a "scientific" explanation for the non-existent correlation.

According to "Angela" of AstraConceptions at fertilityrhythms.com,

...photic (light) signals sent by the lens and retina of the eyes are converted into hormone signals by the pineal gland. It is the pineal gland which signals the onset of puberty in humans and plays a part in the fertility rhythms of all species.

In animals which reproduce seasonally, it is the changing light patterns which trigger the fertility cycle. The gradual change in both the length of day and the changing angle of the sun in the sky (caused by earth's motion) is interpreted by the pineal gland as a signal to commence the fertility season.

Of course, humans do not reproduce seasonally. Our fertility cycles exhibit an obvious monthly rhythm. The light source which has a monthly periodicity is, of course, the Moon.

It is interesting to note that menstruation is actually a shedding process. Just as the average menstrual cycle is 28 days in length, the human body sheds a layer of skin approximately every 28 days.

Yes, that is very interesting to note...if you are interested in [sympathetic magic](#). (The author also finds it noteworthy that animals which reproduce seasonally also shed their coats seasonally.) The author continues

...it is not only the changing day length but also the changing angular position of the sun which triggers this process; the pineal gland receives photic (light) impressions and converts these into hormonal messages which signal the onset of these cycles.

With humans the cycles of fertility (and shedding) are triggered by photic impressions as well. Yet our cycles have a monthly periodicity which is obviously synchronized with fluctuations of the lunar light.

Obviously. However, the light of the moon is a very minor source of light in most women's lives, and is no more likely than the moon's gravitational force to have a significant effect upon a woman's ovulation. Furthermore, the average menstrual cycle is 28 days but varies from woman to woman and month to month, while the length of the lunar month is a consistent 29.53 days.* Some of us have noticed that these cycles are not identical.

Furthermore, it would seem odd that natural selection would favor a method

of reproduction for a species like ours that depended on the weather. Clouds are bound to be irregularly and frequently blocking moonlight, which would seem to hinder rather than enhance our species' chance for survival.

Some mythmakers believe that long ago women all bled in sync with the moon, but civilization and indoor electric lighting (or even the discovery of *fire* by primitive humans) has messed up their rhythmic cycle. This theory may seem plausible until one remembers that there are quite a few other mammals on the planet which have not been affected by firelight or civilization's indoor lighting and whose cycles aren't in harmony with the moon. In short, given the large number of types of mammals on our planet, one would expect that by chance some species' estrus and menstrual cycles would harmonize with lunar cycles (e.g., the lemur). It is doubtful that there is anything of metaphysical significance in this.

What we do know is that there has been very little research on hormonal or neurochemical changes during lunar phases. James Rotton's search of the literature "failed to uncover any studies linking lunar cycles to substances that have been implicated as possible correlates of stress and aggression (e.g., serotonin, melatonin, epinephrine, norepinephrine, testosterone, cortisol, vasopressin [directly relevant to fluid content], growth hormone, pH, 17-OHCS, adrenocrotropic hormone)."^{*} One would think that this area would be well-studied, since hormones and neurochemicals are known to affect menstruation and behavior.

misconceptions

Kelly et al. note that misconceptions about such things as the moon's effect on tides have contributed to lunar mythology. Many people seem to think that since the moon affects the ocean's tides, it must be so powerful that it affects the human body as well. It is actually a very weak tidal force. A mother holding her child "will exert 12 million times as much tidal force on her child as the moon" (Kelly et al., 1996, 25). Astronomer George O. Abell claims that the moon's gravitational pull is less than that of a mosquito (Abell 1979). Despite these physical facts, there is still widespread belief that the moon can cause earthquakes. It doesn't; nor does the sun, which exerts much less tidal force on the earth than the moon.^{*}

The fact that the human body is mostly water largely contributes to the notion that the moon should have a powerful effect upon the human body and therefore an effect upon behavior. It is claimed by many that the earth and the human body both are 80% water. This is false. Eighty percent of the *surface* of the earth is water. Furthermore, the moon only affects *unbounded* bodies of water, while the water in the human body is bounded.

Also, the tidal force of the moon on the earth depends on its distance from earth, not its phase. Whereas the [synodic period](#) is 29.53 days, it takes [27.5](#)

[days](#) for the moon to move in its elliptical orbit from perigee to perigee (or apogee to apogee). Perigee (when the moon is closest to earth) "can occur at any phase of the synodic cycle" (Kelly et al. 1990, 989). Higher tides do occur at new and full moons, but not because the moon's gravitational pull is stronger at those times. Rather, the tides are higher then because "the sun, earth, and moon are in a line and the tidal force of the sun *joins that of the moon* at those times to produce higher tides" (Kelly et al. 1990, 989).

Many of the misconceptions about the moon's gravitational effect on the tides, as well as several other lunar misconceptions, seem to have been generated by Arnold Lieber in *The Lunar Effect* (1978), republished in 1996 as [How the Moon Affects You](#). Lieber incorrectly predicted a catastrophic earthquake would hit California in 1982 due to the coincidental alignment of the moon and planets.

cognitive biases and communal reinforcement

Finally, many believe in lunar myths because they have heard them repeated many times by members of the mass media, by police officers, nurses, doctors, social workers, and other people with influence. Once many people believe something and enjoy a significant amount of [communal reinforcement](#), they get very [selective](#) about the type of data they pay attention to in the future. If one believes that during a full moon there is an increase in accidents, one will notice when accidents occur during a full moon, but be inattentive to the moon when accidents occur at other times. If something strange happens and there is a full moon at the time, a causal connection will be assumed. If something strange happens and there is no full moon, no connection is made, but the event is not seen as counterevidence to the belief in full moon causality. Memories get selective, and perhaps even distorted, to favor a full moon hypothesis. A tendency to do this over time strengthens one's belief in the relationship between the full moon and a host of unrelated effects.

the moon, madness and suicide

Probably the most widely believed myth about the full moon is that it is associated with madness. However, in examining over 100 studies, Kelly, Rotton and Culver found that "phases of the moon accounted for no more than 3/100 of 1 percent of the variability in activities usually termed *lunacy*" (1996, 18). According to James Rotton, "such a small percentage is too close to zero to be of any theoretical, practical, or statistical interest or significance."[*](#)

Finally, the notion that there is a lunar influence on suicide is also unsubstantiated. Martin, Kelly and Saklofske reviewed numerous studies done over nearly three decades and found no significant association between phases of the moon and suicide deaths, attempted suicides, or suicide threats. In

1997, Gutiérrez-García and Tusell studied 897 suicide deaths in Madrid and found "no significant relationship between the synodic cycle and the suicide rate" (1997, 248). These studies, like others which have failed to find anything interesting happening during the full moon, have gone largely, but not completely*, unreported in the press.

update Feb 1, 2000: According to Allan Hall of the [*Sunday-Times*](#), German researchers Hans-Joachim Mittmeyer of the University of Tübingen and Norbert Filipp from the Health Institute of Reutlingen claim that "a study of police reports for 50 new and full Moon cycles" shows that the moon is "responsible for binge drinking."

According to Hall, Mittmeyer and Filipp claim in their paper "Alcohol Consumption and the Moon's Influence" to have studied police arrest reports and blood-alcohol tests of 16,495 people and Mittmeyer said "The results show there is a definite correlation between new and full Moons and the amount of alcohol consumed."

Hall writes:

More of those with an excess of 2ml of alcohol per 100ml of blood inside them - drunk, according to German law - were caught by police during the five-day full Moon cycle.

On average 175 drink[sic]-drivers per day were caught in two German states two days before a full Moon, 161 were caught during the full Moon cycle and the figure dropped to about 120 per day at other times.

This very unclear statement has to be interpreted. I took it to mean that an average of 175 drunk drivers were caught each day on days one and two of the five-day cycle. Thus, if the average for the whole five-day cycle was only 161, there were substantially fewer drunk drivers caught on the night of the full moon. Thus, it appeared to me that the researchers were not able to correlate the full moon with an increase in arrests, so they created 'the full moon cycle', a five day period, which gave them the statistical correlations they were looking for.

Apparently, however, I was wrong in my interpretation of Hall's meaning and Hall erred in his reading of a report from the German Press Agency DPA which erred in its reading of the original paper which erred in its interpretation of the data.

Jan Willem Nienhuys, a mathematician in the Eindhoven (Netherlands) University of Technology, claims that "Hall's story is a garbled version of

a story by the German Press Agency DPA." According to Nienhuys, *Hall* invented the notion of a five-day full Moon cycle; the expression is not used by Mittmeyer and Filipp in their paper. Furthermore, 668 of the 16,495 arrested and tested were found to be sober, leaving 15,827 with alcohol in their blood, but only 4,512 with more than 0.2 percent blood alcohol (i.e., drunk).

According to Nienhuys, the 161 figure refers to the average number of drunk drivers arrested on any given date in the lunar month; he believes this number was arrived at by dividing 4,512 by 28 (rather than 29.53, the length of a lunar month) and hence should be 153, not 161. About the only thing Hall got right, says Nienhuys, is that Mittmeyer and Filipp do claim to have found a significant correlation between the moon and excessive drinking. He notes that the pair provide graphs but no statistical analysis of their data. When such an analysis is done, says Nienhuys, one discovers that the study is "pompous pseudoscience." According to Nienhuys, a standard statistical test yields p-values which show that there is nothing to investigate.

Here is the data, according to Nienhuys. Day 0 is the day of the new moon and day 14 is the full moon.

day	drunks	drinkers, including drunks
0	145	551
1	160	528

alternative health practices

4 Sep 2000

I was just looking at your interesting web site, "Skeptics Dictionary". While it is of course beneficial to scrutinize every new idea; and while real scientists never publish anything until they are certain, with many hard reproducible facts; still we have to remain always open-minded to new possibilities, or else all progress would stop.

With those caveats in mind, there are two things in general I noticed about your web site, which you might wish to address.

reply: Let me guess. I'm not a real scientist and I'm not open-minded.

First, in the field of alternative medicine, it should be noted that our current choice of medical therapies and drugs is not purely scientific, but based partly on the profit motives of large multinational corporations, as well as certain medical organizations. One only has to do research in modern biology for a very short time, to reach that conclusion.

reply: I see. And all those in alternative medicine, including those who produce the products they sell and promote, are *not* partly motivated by profit? What's the point. Who cares if anybody is partly motivated by profit? Why do you think the big pharmaceutical firms are pumping out alternative remedies as fast as they can label them? It's a multi-billion dollar a year business. You don't have to do research in biology to know these things.

Indeed, certain accepted medical practices today are quite inefficient and harmful, and could immediately (or soon) be replaced by "alternative safe treatments", were it not for vested interests.

For example, one group here and others worldwide have found a safe, efficient way to test for prostate cancer, which would eliminate perhaps 2 / 3 of urological surgery, which causes pain and misery to millions of older men. But there is a large vested interest in continuing such surgery, and progress is slow. Similarly with surgery and chemo for breast cancer in women, which after 20 years of unneeded pain has shown no beneficial value in controlled studies.

reply: So? What makes you think I agree with current medical practices regarding prostate testing and treatment?

In terms of pharmaceuticals, if a US patent cannot be obtained on any kind of medicine, the big drug companies will never test it formally, and patients will never receive it except from alternative doctors.

reply: This is nonsense. Big drug companies are now testing traditional herbs and remedies as they sell them. Read this [article](#) from US Business reporter. It is because of the profit motive that the large pharmaceuticals are jumping on the alternative bandwagon. It is partly the profit motive that is driving many traditional physicians and hospitals to offer "alternative" or "complementary" care. Do you think they are doing this because they have evidence such things as [therapeutic touch](#) have been validated by scientific studies? I don't.

For example, [vitamin C](#) and [echinacea](#) have been very valuable to people's health, yet there is a vested interest in other cold-flu remedies. Personally I take those two, plus [glucosamine](#) for soft-tissue repair (a common animal drug), and [melatonin](#) occasionally for stress relief. Those and other alternative products, to my mind, work beyond any shadow of a doubt; and indeed there are new scientific tests which would prove such in a large-scale trial, yet funding has to come from large drug companies: qui custodies custodiere?

reply: Thanks for the free medical advice, but not everybody agrees with your assessment of [vitamin C](#). (update: Oct 11, 2001, a new study from Australia [*Medical Journal of Australia* 2001; 175:359-362] finds [vitamin C worthless in preventing colds](#).) Furthermore, as long as there is scientific testing of the substances you mention, they are not "alternative" remedies. Many folk remedies turn out to have some merit, but until scientific testing is done, to recommend them is "alternative."

Meanwhile other dangerous drugs (e.g. warfarin-coumarin for blood thinning, pain killers for back pain) are given routinely, often with 3-5% lethal side effects due to bleeding or long-term use (my father nearly died last year from an aneurysm caused by warfarin).

reply: So? What's your point? Do you expect medical science to be infallible? Do you expect me to evaluate every questionable medical practice as a matter of fairness and completeness? Some medical practices may be stupid and unjustified, but unless they make claims based on metaphysics or occult assumptions, they are outside the purview of my stated purpose and interest.

In summary, as a first point, your web site does not seem to reflect accurately the current situation in medical research, that professionals see every day.

There is no reason a priori to think that an "alternative cure" will be bad, while an "accepted cure" will be good. Every situation or therapy has to be judged on its own merits, as to how well it produces results without ill effect.

reply: I agree, but there is no reason my website should reflect the current situation in medical practice.

As a second brief point, I do not seem to see the same rigorous skepticism on your web site, when applied to "conventional" scientific theories as to "paranormal" ones. For example, as someone knowledgeable in the area, I would tend to believe in at least some paranormal phenomena, when compared to the "Big Bang" theory of cosmology or the "quark-gluon" theory of particle physics. If you are not familiar with such academic theories, or say with "renormalization" in QED, or "Lorentz covariance" in relativity, I advise you to investigate those well-accepted subjects further, in order to find additional evidence for poorly-supported group beliefs, which can add to the substance of your dictionary and make it more complete.

reply: I have not set out to be critical of "theories" or "medicine". I have set out to offer skeptical arguments and references to occult, supernatural, paranormal and pseudoscientific notions. Whenever a traditional medical treatment or theory is based on paranormal or metaphysical claims, I will be the first to rip into it. If you want a website that offers skeptical analyses of scientific theories and inferences from empirical data, you should start your own. That is not what I want to do. I have no idea why you think I should want to do this, except that you do not like the fact that I criticize "alternative", i.e., unscientific and pseudoscientific, thinking.

To conclude, as a second point: logical skepticism is fine, but it should be applied objectively to conventional peer-reviewed science, as well as that which appears less secure. Lack of research is no excuse, because I am sure you must have researched carefully all of the other subjects in your dictionary, before posting such severe criticisms!

reply: Get off your horse and get a life.

The motto of any true scientist is "nullia in verba": not to take anyone's word for it, no matter how authoritative they appear. Or alternatively, "there is no error which has not had its Professors." --John Locke, 1690.

Horace Drew, a professional scientist

reply: You're right about one thing, anyway.

02 Aug 1999

Perhaps it's not worth the effort, but an entry on the basic fallacy of the

"doctors and pharmaceutical companies are conspiring to keep my miracle cure off the market" bull that we hear all the time might be an idea.

1. Doctors and their families get cancer, low back pain, go bald, etc. at the same rate as everyone else. 2. So do pharmaceutical company employees and their families. 3. Both pay the same insurance rates as everyone else. 4. Both like to save money, same as everyone else. 5. Nobody gets issued a magic talisman to protect them from exposures to HIV, Hepatitis C, or any other hazards.

I know it seems obvious, but my conversations with people indicate that no one ever thinks thinks about such things.

Cheryl Hoffman

14 Aug 1999

I'm skeptical of your skepticism! On pseudosciences you failed to mention modern medicine. Correctly prescribed medicine is the 4th leading killer in America. Ok, homeopathy might seem like quackery to you, but how about some balance buddy? Spend some time being skeptical about what is in front of you. Are you paid by the American Medical Association?

Jahmbo

reply: Unfortunately, I'm not paid by anybody. The misleading statistic you mention has been irresponsibly passed on by the mass media. My comments on it may be found at: [Mass media bunk](#)

22 Apr 1998

Last night I heard about a new alternative treatment (or, as I call it, voodoo) that sounds like something for the Dictionary (of which I've been a follower for months).

My sister-in-law has a bone marrow disease called ITP [[Immune Thrombocytopenic Purpura is an autoimmune disorder](#)]. She is also obsessed with being thin, even though she's a rail already. Her traditional doctor prescribed cortisone, I believe, [corticosteroids are part of the first line treatment of IPP] which would have the side effect of causing weight gain. Since that is not acceptable, she is going to an acupuncturist who has her using some wacky therapy at home three times a day. She takes some herbs which, I'm told, smell somewhat like pot, rolls them into a joint, lights it, but instead of smoking it, she -- get this -- points the lighted end at certain parts of her body. With a straight face, she says that pointing this stinky joint at her big toe (right or left is irrelevant) will directly affect her spleen. She also named other extremities that "rule" internal organs. The herb is called amoxi-something.

Sorry my details are sketchy but I had to walk away from her before I started screaming at her. Any of this ring a bell with you?

Please don't use my name if you publish.

reply: My source (David Ehrensperger, an aromatherapist--see next letter) tells me that your sister-in-law is being treated with ["moxibustion."](#) My Webster's dictionary tells me that "moxa" is an escharotic (a caustic which produces scabbing or crusting when applied to a wound or burn). In Japan, mogusa (moxa) is made from the yomigi plant. Here, leaves from mugwort (*Artemisia vulgaris*) or the wormwood tree (*Artemisia chinensis*) are usually used, according to [Jack Raso](#). According to Mr. Ehrensperger, moxibustionists *do* touch the body with moxa, and do not, as you described, point the burning mass at various body parts. (Maybe your sister's "therapist" is practicing [sympathetic magic](#).)

Moxibustion is often used in conjunction with [acupuncture](#), another swell treatment for serious diseases. The chance that burning herbs will harm your sister-in-law are slim, but they are not likely to help her condition, either.

17 Nov 1997

*I was fascinated and refreshed by **The Skeptic's Dictionary**. My parents-in-law use only alternative medicine to treat their two young children who have muscular dystrophy, a concept which scares and angers me. I have been excluded from the family because of my lack of belief in these treatments which do not give any proof of their ability to heal. It was great to be able to read some published information to back up what I have always believed to be true.*

Their latest cure is called 'Neuro-skeletal dynamics', which consists of touching pressure points on the back in order to send messages to the brain's map of the body, which will then restore the body to the condition in which it functions best. They also see another alternative therapist who claims to be able to control all of the body's functions through pressing the navel.

What I find fascinating about these alternative therapies is that they all contain just a pinch of medical or scientific fact which, to the uneducated, is enough to convince them of their validity. Alternative medicines uses phrases like "the body system" which sound sort-of medical or scientific but which is "fuzzy."

Anyway thanks for giving me some concrete information on a topic which I have always found really infuriating.

Kristin

reply: Many believers in "alternative" health care become so devoted to their various herbs and practices that the herbs and plants become like sacraments and the practices like rituals in a religion.

19 Nov 1997

You are completely correct when you say that it's like a religion. In fact my in-law's have replaced their religion with spiritual healers, which seems to go along with their belief in the alternative medicines.

What I find most annoying about the whole situation is that I am a professional in the disability service field and also have a strong medical background, so I can pick the differences between medical science and quackery. It is incredible frustrating to me to see two young children who are going to have a shortened lifespan anyway be denied the medical help that could at least help to make their time more comfortable.

I have come to the conclusion that this is their coping mechanism, and that they are desperately clinging to any glimmer or hope that they can find. Ultimately they are avoiding the issue but for now these beliefs are the 'band-aid' which is their temporary solution.

Kristin

note: the following is one of several I've received from someone who identifies himself only as Doc6262@aol.com. From what he's said in some of his notes, I think he's a chiropractor...at least that's the only kind of doctor he's had kind words for so far.

22 Jan 1997

How come there aren't more articles on the ill effects of traditional medicine?? I'm willing to bet that most people don't realize that a person dies every 8 minutes directly due to Medical physicians!

reply: It would have been nice if you had provided the source of this startling statistic.

Let's do a piece on "Prozac" for instance.....

reply: You might be happy to know that today's [Jan 23, 1997] newspaper has a story about Prozac: a new study has found no sign that taking Prozac during pregnancy can harm a woman's unborn child. Contact Dr. Gideon Koren of the University of Toronto for more information. Or read the latest issue of the *New England Journal of Medicine*, if you're truly interested. I imagine, however, you are referring to stories about people who kill while on Prozac. It is true that there have reports in the mass media about the dangers of Prozac. However, there have also been reports

in the mass media about the dangers of silicon breast implants. There is another side to these reports which rarely gets reported. For instance, the scientific studies done on the health of women with breast implants versus those without them does *not* support the claim that breast implants are a significant causal factor in female ill health. People have killed while on Prozac. People have killed while not on Prozac. Prozac is taken by over 12,000,000 people a year. The percentage who go berserk and kill is rather small, just as it is in the population which does not take Prozac. Plus, those who are given Prozac are sometimes severely disturbed before taking it. Those who go berserk may have done so had they not taken Prozac and visited their local chiropractor or naturopath instead. Would you blame chiropractic or naturopathy for the berserk behavior just because it occurred *after* a visit to a chiropractor or naturopath?

...or maybe about getting the wrong leg cut off during surgery,

reply: These types of malpractice are mentioned in the article on alternative medicine.

....or possibly the removal of tonsils (the immune system's first line of defense).

reply: Your point, I take it, is that traditional medicine has frequently advocated procedures or practices which not only did not improve health but made matters worse. You are correct.

I mean come on let's show the tragedies that are caused daily, by MD's who could care less about the patient and more about the disease!!!

Doc6262@aol.com

reply: That seems like a job for someone of your disposition. Just remember, should you ever need brain or bypass surgery, or insulin for your diabetes, your doctor may not be a chiropractor or naturopath and may not look kindly upon your slanders. She may turn you into a self-fulfilling prophecy.

Here is another missive from Doc6262:

January 31, 1997, page 1 of the USA Today quotes sources at the U.S. Center for Disease Control and Prevention stating "Nearly all cases of polio since 1980 were caused by the oral polio vaccine".

The oral vaccine contains a weakened polio virus intended to stimulate immunity without causing the disease.

reply: I suppose the good doctor takes this as further proof of medical murder. Actually, it demonstrates a rather common error many people make: statistics need a reference point or standard in order to understand

their significance. How many cases of polio would there have been had the polio vaccine not been used?

9 Feb 1997

I think the only fair way to test the validity of "scientific" medicine is with double blind studies. Your use of a friend's name who died of a treatable form of cancer after submitting to a naturopath is not skeptical enough! How many cancer victims die every year while using the approved methods of the "scientific" community? Cancer is on the increase.

reply: The naturopath did not diagnose cancer. He diagnosed something benign and treated accordingly. Had he suspected cancer, he probably would have sent her to a traditional medical doctor. I have tried to explain this elsewhere, but here goes again. No doubt there are some naturopaths who are better healers than some MDs. But, naturopaths should not be compared to medical doctors when the issue is naturopathy vs. medical science. Naturopathy is based upon a questionable assumption: that healing should be by a "natural" process. Medical science is based upon the same assumptions all the sciences are based upon. To prefer naturopathy to medical science is to prefer quackery to science. I never claim that quackery can't sometimes have good results. Nor do I claim that science is infallible. To expect me to be as skeptical of medical science as I am of naturopathy, homeopathy, traditional Chinese medicine, therapeutic touch, aromatherapy, etc., is unreasonable. I am not skeptical of these alternative health practices because they are fallible, but because they are based upon false or questionable assumptions and generally do not follow scientific methods to establish beliefs. It does not follow from my criticism of alternative health practices that I think traditional medicine is flawless. I do not criticize alternative health practices because their practitioners err or misdiagnose. I criticize them because I believe they are fundamentally unsound. It does not follow that I believe traditional medicine is infallible. I would criticize traditional medicine if it were fundamentally flawed, i.e., if it were based upon false or questionable assumptions. Now, there may be specific procedures which most medical doctors follow or recommend which turn out to be harmful or useless. Nevertheless, I would not reject all medicine because of errors by medical doctors. It would be foolish to reject science because of errors by scientists. It is also foolish to accept alternative medicine because it "works." Yielding results you are satisfied with is not what is meant by "works" in science. Placebos "work." Cures of misdiagnoses "work." Like you say, the only fair way to test the validity of "scientific" medicine is with double blind studies. That's how we find out what "works" in science.

While I truly appreciate the skeptic's philosophy, it would seem that it may be more of a bias against "traditional" healing practices in favor of the "modern" university approach. Yet many of our prescription drugs are discovered by investigating the "traditional" folk remedies.

reply: Yes, and many folk remedies don't really work and science is a process of testing what does and doesn't work. Traditional medicine is not opposed to folk medicine, but it does not assume that the folk remedies are necessarily correct. If by "modern university approach" you mean the approach of science, of tentatively accepting claims and testing hypotheses, then by all means that is the approach of the skeptic.

The protective sanction of 'bad' medicine by the university/medical "profession" is the major force driving the alternative medicine market. The outrageous prices of the "services" offered by MDs, the pharmaceutical industry, and killing zones referred to as hospitals are the real problem. This inhuman "slaughter house" industry is regulated/driven by the profits of the insurance industry; not scientific medicine.

john pash

reply: I'm sure you can back up these claims with evidence. I'm also sure that when you need a liver transplant you won't check into a hospital nor will you take insulin if you develop diabetes. Anyway, I recently received a letter from a man worried about his 97 year old grandfather who was shelling out \$5,000 for chelation therapy. Does that sound reasonable to you? I think you should not overlook in your inventory of horrors the fact that traditional medicine cannot cure everybody's illnesses, much less even diagnose what is ailing many people. Those are reasons many seek alternatives. Science has no answers for them and they are understandably desperate and vulnerable.

[Amway Loses Court
Appeal With P&G](#)

[Becoming
a Critical Thinker](#)
by Robert T. Carroll

Amway ([Quixtar](#))

Amway is the largest multi-level marketing ([MLM](#)) organization in the world. It is a multi-billion dollar a year company based on the sale of products as varied as soap, water purifiers, vitamins, and cosmetics. Amway proponents are fond of asserting that their products are of the highest quality, their company is very large (several million distributors and several billion dollars in annual sales), and does business with such giants as Coca-Cola and MCI.

In Amway, one is recruited as an "independent" distributor of Amway products by buying a couple of hundred dollars worth of the products from the one who recruits you, known as your "upline." Every distributor in turn tries to recruit more distributors. Income is generated by sales of products by the distributor plus "bonuses" from sales of his or her recruits and their recruit-descendants.

Here is a description from an Amway distributor as to how it works.

It goes like this:

If I buy \$200 of stuff from Amway this month, I'll get a 3% bonus check (3% of \$200 = \$6). If I share the opportunity with nine others, and we each buy \$200 of stuff from Amway this month, they each were responsible for \$200 and will get \$6, but I'm responsible for \$2000, moving me to the 12% level. I get \$240. However, I'm responsible for paying the bonuses of the people right below me - \$54 - so I keep \$186. I make more because I did more, I found nine people who wanted to buy at a discount and get a bonus for doing it. After I reach the 25% bonus level there are other bonuses that kick in, but they're all based on the volume of product flow, not on signing people up or having lots of people (Bob Queenan, personal correspondence).

Amway defenders take offense at describing this method of sales and recruitment as akin to a [pyramid or chain letter scheme](#). It is true that MLM as practiced by Amway is not an *illegal* pyramid scheme. Amway has been taken to court for being an illegal pyramid and the courts have ruled that since Amway does not charge people either for joining Amway or for the privilege of recruiting others as distributors, it is not an illegal pyramid. Illegal pyramids and chain letters have no product. Amway has lots of household products: from laundry detergent to vitamins, from cosmetics to water filters. Amway is a *legal* pyramid scheme.

the legal pyramid

There are several distinct aspects of MLM schemes that justify calling them legal pyramid schemes. One is the aspect of the chain or line of distributors whose income depends primarily not on their own sales of Amway products but on sales made by others whom they've recruited. The actual practice gets fairly complicated. Here is how Bob Queenan, cited above, describes it:

Now we get into the actual mechanisms. While my product volume is low, it makes sense to combine my order with other orders to reduce the paperwork that Amway has to deal with. So the way I order from Amway is to call my "upline" and place my order. My upline combines my order with others and calls Amway directly. Amway would normally ship direct to the upline, and we'd all go over and pick up our products. In my actual case, I live too far away from my upline to make that practical, so I order through my upline, but get direct shipments from Amway.

Do I sell to other distributors? No, we all buy direct from Amway.

Do other distributors order their products through me? Yes, I combine the orders and send them to Amway.

Do I get money from my distributors? Yes, for the products they buy. I write a combined check to Amway.

Do I profit if my distributors buy more? Yes, I do -- so do they, but yes, I do.

Is my bonus from their money? It's from the bonus pot, which is filled with money saved by not paying middlemen.

Am I missing something here? Haven't the distributors become their own middlemen? Aren't the distributors selling to each other? Isn't income mainly generated by recruiting new members to the organization? Isn't Amway Corporation the big winner in this scheme?

An Amway customer is not just buying a detergent, but is recruited into being a minister of a faith with a complicated bookkeeping scheme. Why not just go to your local store and buy soap, you ask? Because the agent is someone you know, or who knows someone you know, who's invited you over for coffee to tell you about a great opportunity. Odds are good that you'll either buy something out of politeness or a genuine need for soap or vitamins, etc. Perhaps you will become an agent yourself. Either way, the agent (distributor) who sold you the soap or vitamins makes money. If you become an agent

(distributor) then part of every sale you make goes to your recruiter. The new recruit is drawn into the system not primarily by the attractiveness of selling Amway *products* door to door, but by the opportunity to sell *Amway* itself to others who, hopefully, will do the same. The products seem secondary to the process of recruitment. Yet, the distributors will learn to talk about little else than the product and its "quality." What justifies MLM schemes is the high quality of their products. What entices the recruit, however, is likely to be the attractiveness of making money from others' sales, not the products themselves.

Do the numbers add up?

According to [Amway](#), their annual sales amounts to about \$7 billion and there are 3 million distributors. Thus, the average distributor's sales amounts to about \$2,333/yr. If 30% of that is profit, the average distributor makes \$700/yr. Klebniov claims that the average income is \$780, but the average distributor buys \$1,068 worth of Amway goods himself and also has expenses such as telephone bills, gas, motivational meetings, publicity material and other expenses to expand the business. "The average active distributor sells only 19% of his products to non-Amway affiliated consumers," according to Klebniov. "The rest is either personally consumed or sold to other distributors." In the United States, the Federal Trade Commission requires Amway to label its products with the message that 54% of Amway recruits make nothing and the rest earn on average \$65 a month. No such labels are required in other countries, but the facts are clear. Most people who get involved in Amway will not make money.

Far from boosting their incomes, the vast majority of those who become Amway distributors, particularly those in 'the system', are likely to end up losing money.

The majority of the wealth of the tiny number of top-ranked distributors in this country comes not just from the sale of Amway products but from selling motivational materials and organizing seminars and rallies for the people below them (Thompson).

Amway has made a very few people very rich while paying its foot soldiers more in inspiration than in cash (Thompson). There is nothing particularly unique about this in the history of business. What is unique is the faith, devotion and hope that the foot soldiers have.

Is Amway a cult?

Critics of Amway have compared it to a cult whose main product is Amway itself. Amway folk do resemble religious devotees in some respects. They have great faith in their company, its products, and the hope for wealth and

early retirement. They attend seminars and meetings that are reminiscent of revivalist meetings, where the power of positive thinking replaces (or is accompanied by) faith in Jesus. Instead of a parade of souls healed by faith, Amway faithful are treated to testimonials of early retirement with plenty of money. While there have been some accusations of persecution of those who have left the flock, by and large Amway devotion seems harmless enough. Amway doesn't seem to differ much from other zealous big corporations which preach positive thinking about the business of business in endless motivation seminars and retreats, books, tapes, brochures, among other things (Klebniov).

Graham Baldwin of the United Kingdom compares an Amway motivational meeting to a revival or cult meeting. The former University chaplain tries to help people break away from religious cults with his program called "Catalyst." Soon after one of his broadcasts, he got a call from a man

who explained how the group he had joined a year earlier was slowly taking over his life. There were the huge monthly meetings at venues like Wembley Conference Centre where he and thousands of other followers were worked into a passionate frenzy then told to go out and find as many new recruits as possible; there was a powerful doctrine that frowned on television, newspapers and other 'negative' influences; there was the strict dress code and advice on how to bring up children and relate to loved ones; there was the fear that to quit would mean giving up hope of a happy future.

However, having seen the television show featuring Baldwin, the man now alleged that he was being subjected to [mind control](#) techniques and being manipulated by those above him. He wanted advice on making a possible break. Baldwin asked which cult the man was in.

"It's not a cult. It's not a religion. It's something called Amway" (Thompson).

To some of Amway's critics, Amway may look like a religious cult, but to others it just looks like a shell game. The ministers of the faith work their magic by constantly calling your attention to the quality of their products, their concern with ethics, the wealth of their company, their association with Coca-Cola or MCI, the claim that they don't have to pay the middleman or advertising costs, and the numerous testimonials of the faithful who have passed through the valley of death and have arrived on the mountaintop with buckets of gold. Meanwhile, you do not notice that the products are secondary to the process of recruiting new distributors of those products. You do not notice that the wealth and associations of the company are irrelevant to its

promises of wealth to the millions of distributors recruited. You do not notice that many costs, such as mailing, handling, doing forms, advertising, and driving personal vehicles to deliver or pick up products, are picked up by the distributors themselves. You do not notice that even though some people make a decent or more than decent living exclusively through Amway, the chances of all or most distributors making such wealth are absurdly small. You do not notice that while the leaders talk about ethics they are stimulating resentment and greed. And of course you never hear the testimonials of those who feel cheated by Amway; dissidents are not allowed to give their testimony at revival meetings.

The shell game gets even more complicated because when it is pointed out that most people who are Amway distributors either lose money (they buy more products from Amway than they sell) or make a very modest income, the ministers of the faith don't respond honestly and directly by saying that that is what should be expected from such a system. Instead they claim that no one said you would get rich quick at Amway, no one promised great wealth with little work. Those who fail do so because they are failures. They don't work hard enough. They don't devote enough time to their distributorship and recruitment. The failures need motivation!

the dissidents

Paul Klebniov writes that

Former distributors and Amway officials say that like many movements based on a cult of personality, Amway's attitude toward any insider critical of the organization has bordered on paranoia. Edward Engel was Amway's chief financial officer until 1979; he resigned over a disagreement with DeVos and Van Andel [the founding fathers of Amway] on how to run the Canadian operations. This apparently branded him a traitor; he says he and his family received threats for years after his resignation. "It was a Big Brother organization," says Engel today. "Everyone assumed that the phones were tapped, and that Amway had something on everybody."

In 1983 Engel's former secretary, Dorothy Edgar, was helping the Canadians in their investigation of the company. She was roughed up in Chicago, after she was told to "stay away from Amway." Engel, who picked her up after the incident, says he believes her story. Amway would not comment on the incident.

There was extremely bad publicity in 1982 when a former distributor, Philip Kerns, quit to write a damaging expose

called "Fake it Till You Make It." Kerns charges that Amway used private detectives to follow him and rough him up. Kerns' expose prompted the "Phil Donahue Show" and "60 Minutes" to run uncomplimentary pieces on Amway. Amway's recruitment dropped off; with it, sales plunged an estimated 30% in the early 1980s.

In 1984, another former Amway insider, Donald Gregory, says he started to write a book on Amway, but the company obtained a gag order against Gregory in a Grand Rapids court" (Klebniov).

Even so, the vast majority of Amway distributors are probably decent people who believe in the quality and value of Amway products and who are in it to make money in a legal and ethical way. They are not responsible for what the founders or "uplines" do. They are not making wild promises about making millions of dollars with just a few hours of work a week to their friends. The average Amway distributor is undoubtedly not like James Vagyi.

Amway comes to Hungary

Now that capitalism has come to many former communist nations in Europe, Amway has spread its ever-replicating roots into countries such as Hungary and Poland. James Vagyi, the lead recruiter in Hungary, tells potential recruits that the minimum income is about \$9,000 a month [700,000 forints]. Mr. Vagyi says to a group of potential recruits, "If 10 million people were persuaded for 40 years to build socialism in Hungary, you can each find six people to do this." If those six find six who find six who find six, you will be rich in no time. Mr. Vagyi shows his audience a videotape that ends with a message from Amway's co-founder, Richard DeVos: "Ethics and caring for people are the fundamentals of Amway's business." Maybe. But apparently some distributors have cynical views of ethics and the only people they seem to really care for are themselves. Still, isn't this true in every business? Aren't there always a few bad apples who give the whole group a bad reputation?

Is the appeal to greed or to need?

It isn't very likely that the majority of Amway's distributors follow Vagyi's example. Nor do they follow the example of Michael Aspel who used a curious recruitment video in London. The video "features couples who live in enormous detached houses and have luxury cars, talking about how much freedom and independence the Amway opportunity has given them. The narrative tells how the company is built on "ethics and integrity" and how it has helped "thousands improve the quality of their lives" (Thompson).

Furthermore, there is no doubt most Amway meetings are not like the one described by Paul Klebniov:

One weekend this summer over 12,000 enthusiastic people gathered for a rally in Richmond, Va. A handful were wealthy distributors of Amway Corp's products; the rest wanted to be. The meeting began with a prayer and a Pledge of Allegiance. On stage, Bill Britt, the master Amway distributor who organized the rally, introduced the other top distributors, who had arrived in their Cadillacs and Mercedes, flaunting expensive furs and jewelry. With the introduction of each of these role models, the crowd cheered.

Stories such as Klebniov's inevitably lead to the question, *Does Amway encourage fraud?* The answer is *No*. However, one of the main criticisms made of Amway and other MLM organizations, is that they inevitably encourage unscrupulous people to defraud the gullible into thinking that with a little hard work they can become rich beyond their wildest dreams. These unscrupulous people become rich themselves, not by selling Amway products but by selling the concept of Amway and "inspirational materials" such as books, tapes, seminars, etc., aimed at motivating a person to think positively. Critics argue that while it is possible to make a decent living selling Amway products, a realistic person should not expect more than a supplement to one's income from selling the products. The real money is in recruiting people into Amway. The really big money is in selling motivational materials, i.e., hope.

[Quixtar](#)

ZDNet has an [extensive article](#) on Amway's entry into e-tailing which is known as [Quixtar](#). All Amway agents (now to be known as IBOs: independent business owners) have been invited to open up their own e-mall, selling not only Amway products but products of other manufacturers as well. The emphasis, as with Amway, will be on [multi-level marketing](#), i.e., recruiting new Quixtar agents who are encouraged to recruit agents ad infinitum. Agents will get a cut of sales made by those they recruit, and by sales of recruits of recruits, ad infinitum theoretically.

Why would the 5th and 6th richest men in the world, Rich DeVoss and Jay Van Andel, founders of Amway, want to get involved with Internet sales? For one thing, there is a lot of money to be had in e-commerce: they're hoping for \$1.5-\$2 billion in sales the first year...better than Amazon.com or E-Bay. Secondly, sales at Amway have dipped recently (18.5% drop in 1998).

Why not call the new company E-Amway instead of Quixtar? That might have something to do with name repulsion.

Will it work? It will certainly work for Devoss and Van Andel. They will have millions of agents to sell products, including their Amway products, from the day they open on September 1, 1999. Unlike Amazon.com, who had to spend some time recruiting agents to sell their products, Quixtar will be able to bank on Amway agents to aggressively market their products from the getgo. How much money will the Quixtar agents make? They may think they will become nanosecond millionaires but my guess is that they will fare about as well as they did as Amway agents.

multi-level marketing (a.k.a. network marketing & referral marketing)

The idea behind multi-level marketing (MLM) is simple. Imagine you have a product to sell. A common MLM product is some sort of panacea, such as a vitamin or mineral supplement. You could do what most businesses do: either sell it directly to consumers or find others who will buy your product from you and sell it to other people. MLM schemes require that you recruit people not only to buy and sell your product, but who will also recruit people who will not only buy and sell your product but also recruit people....*ad infinitum*. Only there never is an *infinitum* to move towards. This may seem unusual to traditional business people. Why, you might wonder would you recruit people to compete with you? For, isn't that what you are doing when you recruit people to sell the same products you are selling? MLM magic will convince you that it is reasonable to recruit competitors because they won't really be competitors since you will get a cut of their profits. This will take your mind off the fact that no matter how big your town or market, it is finite. The well will go dry soon enough. There will always be some distributors who will make money in an MLM scheme. The majority, however, must fail due to the intrinsic nature of all pyramid schemes.

Multi-level marketing is system of marketing which puts more emphasis upon the recruiting of distributors than on the selling of products. As such, it is intrinsically flawed. MLM is very attractive, however, because it sells hope and appears to be outside the mainstream of business as usual. It promises wealth and independence to all. Unfortunately, no matter what the product, MLM is doomed to produce more failures than successes. For every MLM distributor who makes a decent living or even a decent supplemental income, there are at least ten who do little more than buy products and promotional materials, costing them much more than they will ever earn as an MLM agent. The most successful MLM scheme is [Amway](#). It has millions of distributors worldwide with sales in the billions. At the turn of the century, the average Amway distributor earned about \$700 a year in sales, but spent about \$1,000 a year on Amway products. Distributors also have other expenses related to the business, e.g., telephone, gas, motivational meetings, and publicity material ([Amway.com](#); [Klebniöv](#) 1991).

The reason MLM schemes cannot succeed is because MLM marketing is, in essence, a legal [pyramid](#) scheme. The basic idea is for a sales person to recruit more sales persons. This is very advantageous to those who own the company and supply the products, especially since the sales persons in MLMs are also customers. But it is puzzling why a sales person would think it is to his or her advantage to increase the number of competing sales persons.

This is not to say there is no benefit to MLM membership. You get certain tax write-offs. You get to buy products, some of which you will be happy with. You get to go to inspirational meetings, some of which will make you feel good. You may meet new friends and you may even make a few bucks. But more than likely you will end up alienating some family and friends. You will probably end up buying more stuff than you sell. And you will learn a lot about deceiving yourself and others. You won't be allowed to tell anyone how you are really doing, for example. You will always have to think positive, even if that means lying. You will have to tell anyone who asks that you are doing great, that business is wonderful, that you've never seen anything go so fast and bring you income so quickly, even if it isn't true.

The dangers of MLM schemes have been well articulated by others. If you are thinking of joining any MLM program, I advise you to first read Dean Van Druff's [What's Wrong With Multi-Level Marketing](#) or Robert Fitzpatrick's [False Profits - Seeking Financial and Spiritual Deliverance in Multi-Level Marketing and Pyramid Schemes](#) (Herald Press, 1997).

Profits](#)

pyramid schemes, chain letters and Ponzi schemes

A **pyramid scheme** is a fraudulent system of making money which requires an endless stream of recruits for success. Recruits (a) give money to recruiters and (b) enlist fresh recruits to give them money.

A pyramid scheme is called a pyramid scheme because of the shape of a pyramid: a three dimensional triangle. If a pyramid were started by a human being at the top with just 10 people beneath him, and 100 beneath them, and 1000 beneath them, etc., the pyramid would involve everyone on earth in just ten layers of people with one con man on top. **The human pyramid would be about 60 feet high and the bottom layer would have more than 4.5 billion people!**

A diagram might help see this:

```

1
10
100
1,000
10,000
100,000
1,000,000
10,000,000
100,000,000
1,000,000,000
10,000,000,000
    
```

Thus, in very short order, 10 recruiting 10 and so on would reach 10 billion, well in excess of the earth's population. If the entire population of earth were 5 billion and we all got involved in a pyramid scheme, the bottom layer would consist of about 90 percent of the planet, i.e., about 4.5 billion people. Thus, for 500 million people to be WINNERS, 4.5 billion must be LOSERS.

In a straightforward pyramid scheme, a recruit is asked to give a sum of money, say \$100, to a recruiter. The new recruit then enlists, say, 10 more recruits, to give up \$100 each. In the simplest example, the recruiter keeps all the money he gets from his recruits. In our example, each recruit gives up \$100 in exchange for \$900 (\$100 from each of his 10 recruits minus the \$100 he gave his own recruiter). In order for no one to lose money, the recruiting must go on forever. On a planet with a limited number of people, even if the planet is as large as Earth and has almost [6 billion potential recruits](#), one runs

out of new recruits rather quickly.

Thus, the result of all these schemes is inevitable: at best, a few people walk away with a lot of money, while most recruits lose whatever money they put into the scheme. In fact, the only way anybody can make money through a pyramid scheme or chain letter is if other people are defrauded into giving money upon a promise of getting something in return when it will be impossible for them to get anything at all in return. That is to say, in plain English, these schemes *always* constitute **fraud**. They use deception to get money. That is why they are illegal. They are not illegal because they involve recruiting people to recruit other people to recruit other people. That is perfectly legal and is done to some degree in many legitimate businesses. They are not illegal because they involve giving money to people. It is perfectly legal to give money to people. They are illegal because they involve deceiving people in order to get money from them: that is the legal meaning of **fraud**.

In actual fact, however, no pyramid scheme will ever work this way because the scheme will never get the number of recruits we've been speculating about. All pyramid schemes will begin to die when the later recruits don't sign on in numbers large enough to pay off the earlier recruits. There will always be enough people who will smell the scheme out. There will always be too many people who will say "if it sounds too good to be true that's probably because it is." There may even be a good number of people who will realize that though one person recruiting ten doesn't sound like much, it quickly adds up to unrealistic and improbable numbers. Also, all it takes is one person to stop the whole thing, either by adamantly persuading recruiters of their indecency, or by reporting them to the police.

greed and wishful thinking

Pyramid schemes are popular because people are greedy and greed can do wonders to a person's thinking. For a person desiring to make a lot of money from a small investment in a short amount of time, [wishful thinking](#) often takes over where critical thinking should step in. Wishes become facts. Skeptics become idiots for not getting on board. Desires become reality. Asking questions seems rude and unfriendly. Scam artists know how greed works and all it takes is one con man to get the thing started.

With the odds so stacked against a person, why would one gamble on a pyramid scheme? Greed is only part of the answer. Most pyramid people don't envision themselves anywhere near the bottom layer of the pyramid. Even the most greedy person on the planet would probably see that if one is near the bottom layer of recruits it will be very hard to get new recruits. They have to see themselves near the top in order to envision the immense wealth from minimal effort that is going to come their way.

Furthermore, if I hope to get people involved in a pyramid scheme, the first thing I must do is convince them they are **not** getting involved in a pyramid scheme. They may know they are illegal. Or they may realize that pyramid schemes are a losing proposition for at least 90 percent of those who get involved. So, I tell them they are joining a club. I give the club a nice name such as **The Friendly Investors Club** (FIC). I reassure them that the FIC is approved by the IRS and run by a CPA with a Ph.D. who is not an ASS. If I'm really good, my recruits will believe me and the police officers, secretaries, teachers, ministers, etc. whom I recruit. These well-respected, intelligent, honest people will pass on this line to others. If I am really, really good, I will have convinced my recruits not only that they are getting into a legitimate and lucrative Club, but that any earnings are tax-free. I would indicate to recruits that as long as their take in the scheme is less than \$10,000, it wouldn't be taxable because gifts aren't taxable until they exceed \$10,000. I would convince the recruits that, for legal purposes, they would be giving money away and others would be giving money to them.

even the police like pyramid schemes

In 1995-96, at least 67 employees of the Sacramento Police Department, including 45 officers, were investigated for their alleged involvement in a pyramid scheme (*Sacramento Bee* 10/28/95, 11/1/95 and 11/15 & 16/96). The scheme was similar to five others that had been operating in southern California, also involving police officers and support staff. The main suspect in the Sacramento scheme was a police captain's wife. The chief of police said that he would try to fire at least seven officers and discipline 60 other police department employees. Nine officers were placed on administrative leave and relieved of their guns and badges. According to a prosecutor, the scheme involved more than 200 people. However, only three of the accused faced criminal misdemeanor charges. Reportedly, some in the scheme made tens of thousands of dollars. The minimum amount lost by those who were on the bottom of the pyramid was \$500.

The police pyramid schemes are called "investment clubs" and have attractive names such as "The Friendship Investment Club" and "A Gift Network." They're sold to investors with the assurance that they are perfectly legal, approved by the IRS or a CPA, and that they definitely are **not** a pyramid scheme.

The Sacramento scheme was called **The Freedom Club** or something like that. And it was hyped by a police officer as being legal because it required people to sign a waiver claiming that they were making an unconditional gift to the Freedom Club. A local news reporter, Mike Boyd, asked an IRS agent if this waiver meant the Freedom Club wasn't a pyramid scheme. The IRS agent said that since the people who were signing the waiver expected to get back money for the money they were allegedly making a gift of, the money wasn't really a gift. An attorney, also interviewed by Boyd, agreed that just signing a paper saying you're making an unconditional gift didn't make it so if

your intention was not to make an unconditional gift. (*Receiving* gifts, of course, is legal, and tax free.) The cops and their recruits for the Freedom Club put in at least \$500 each and expected something like \$4,000 in return for their phony gifts, according to Boyd. The *Bee* reported that sources told them that some Police Department personnel got more than \$10,000 out of the scheme. The WINNERS in the scheme got their money from "gifts" to the Freedom Club from those who later joined the Club. Such schemes continue, if the participants are not caught, until there are not enough new recruits to pay off the old ones. That is, they would continue until there were a good number of people who had "given" away \$500 and got nothing in return because the scheme folded. The scheme would have to fold eventually, because there can't be an endless stream of recruits.

The Sacramento Police Pyramid scheme involved what we might call "pyramid pods". An organizer (Numero Uno) would start the pod by getting six others to join as organizers. Presumably, the six would be ranked depending on when they were recruited. The organizers pay nothing to join the pod but together they must recruit enough people into the pod to buy eight spots at the bottom of their pyramid. Each spot costs \$500. Numero Uno pockets the \$4,000. The pod splits into two pods of seven people (or spots) each, with a new Numero Uno in each pod (and a new number 2, 3, 4, 5, 6 and 7). Each pyramid pod recruits more people at \$500 for each of eight spots in the pyramid. The two new Numero Unos take their \$4,000 each and the two pods split into 4 pods and those 4 into 16, ad infinitum. To make even more money, some joined more than one pod.

How many in this scheme told the new recruits that 6.7% of those who join will get a 700% return on their investment (\$3,500 on a \$500 investment) as long as 93.3% get nothing? How many advised their recruits to "get in early"?

To have police involved adds a special dimension to this pyramid scheme because (a) officers have ranks and can use their rank for recruiting leverage over those beneath them; (b) officers and ex-officers have positions of authority and trust which will influence potential recruits, especially young people; and (c) police personnel are supposed to enforce the law; when the law enforcers become lawbreakers and encourage others to break the law for monetary gain, respect for law and law officers diminishes.

chain letters

In the money **chain letter**, the recruiter sends the new recruits a letter with a list of names on it, including the recruiter's name at the bottom of the list. The recruits are asked to send money to the person whose name is at the top of the list and to add his or her name to the bottom. Money is made solely by getting new recruits to join the chain, adding their names to the list and recruiting others to do the same. In theory, eventually each recruit's name will be at the top of millions of lists and receive millions of dollars. In practice, most people

will receive nothing. Anyone can break the chain, thus depriving all those on the list of any possible "earnings." But, even if no one broke the chain, 95% of those who sent money out will get nothing in return.

If pyramid schemes are a bad investment, how about chain letters? The principle is basically the same, except that with chain letters, you don't have to deceive yourself as much as with pyramid schemes. You probably know up front that the scheme depends on duping friends into giving money to strangers in exchange for the promise of riches coming to you later on from other strangers. You get a letter with a list of names on it. You are told to send money to the name at the top, delete that name and add your name to the bottom, and recruit 5 or 10 people to do the same by sending them the letter with your name at the bottom.

Ponzi schemes

A Ponzi scheme, named after [Charles Ponzi](#) who defrauded people in the 1920s using the method, involves getting people to invest in something for a guaranteed rate of return and using the money of later investors to pay off the earlier ones. Who will make money from such a scheme? Those who start it and those who get in early. Does anyone really make money from these schemes. They must, or they would have died off long ago. How? If I start the scheme, I just skim off the top and pay off enough people to make it look like it's working, even if that means buying in again at the bottom. I might even be stupid enough to think that I can keep the scheme going when the recruiting has dried up. I can try to get money quickly by some other scheme. For example, I can take a big chunk of money and go to Las Vegas and hope to hit it big. This happened to a fellow I played Little League Baseball with long before we both grew up. He took his investors' money to the craps table where he "invested" their funds. Unfortunately, his "investments" didn't pay off and he went to prison.

I don't know how many people lost money "investing" in my Little League buddy's scheme, but it could not have been as bad as what happened in Romania in 1993 or what happened in Albania in 1997.* In both cases, thousands of people with little opportunity for investment of capital were swindled by pyramid scheme operators. Romania's newspapers claimed that millions of Romanians lost their life savings in a scheme called *Caritas*. Reports from Albania claim that hundreds of thousands of Albanians "have invested their life savings or money they earned working abroad" in one of several outlawed pyramid schemes. "The schemes offered very high interest rates, with the first investors paid from later investors' deposits. They eventually failed when no new investors came in" ("Investment-scam protest turns violent in Albania," by Merita Dhimgjoka, *Sacramento Bee*, Feb. 6, 1977). Any such scheme is doomed to fail because there cannot be an endless line of "investors." Only greed and self-deception are endless.

mind control (brainwashing)

Mind control is the successful control of the thoughts and actions of another without his or her consent. Generally, the term implies that the victim has given up some basic political, social, or religious beliefs and attitudes, and has been made to accept contrasting ideas. 'Brainwashing' is often used loosely to refer to being persuaded by propaganda.

conceptions & misconceptions of mind control

There are many misconceptions about mind control. Some people consider mind control to include the efforts of parents to raise their children according to social, cultural, moral and personal standards. Some think it is mind control to use behavior modification techniques to change one's own behavior, whether by self-discipline and autosuggestion or through workshops and clinics. Others think that advertising and sexual seduction are examples of mind control. Still others consider it mind control to give debilitating drugs to a woman in order to take advantage of her while she is drugged.

Some of the tactics of some recruiters for religious, spiritual, or New Age human potential groups are called mind control tactics. Many believe that terrorist kidnap victims who convert to or become sympathetic to their kidnapper's ideology are victims of mind control (the so-called [Stockholm syndrome](#)). Similarly, women who stay with abusive men are often seen as victims of mind control. Many consider [subliminal](#) messaging in Muzak, advertising, or on self-help tapes to be a form of mind control. Many also believe that it is mind control to use laser weapons, isotropic radiators, infrasound, non-nuclear electromagnetic pulse generators, or high-power microwave emitters to confuse or debilitate people. Many consider the "brainwashing" tactics (torture, sensory deprivation, etc.) of the Chinese during the Korean War and the alleged creation of [zombies](#) in Voodoo as attempts at mind control.

Finally, no one would doubt that it would be a clear case of mind control to be able to hypnotize or electronically program a person so that he or she would carry out your commands without being aware that you are controlling his or her behavior.

clarification of the term

A term with such slack in its denotation is nearly useless. In narrowing down the denotation the first thing to do is eliminate as examples of mind control those activities where a person freely chooses to engage in the behavior.

Controlling one's thoughts and actions, whether by self-discipline or with the help of others, is an interesting and important topic, but it is not the same as brainwashing or programming people without their consent.

Using fear or force to manipulate or coerce people into doing what you want them to do should not be considered to be mind control. Inquisitions do not succeed in capturing the minds of their victims. As soon as the threat of punishment is lifted, the extorted beliefs vanish. You do not control the mind someone who will escape from you the moment you turn your back.

To render a woman helpless by drugs so you can rape her is not mind control. Using a frequency generator to give people headaches or to disorient them is not the same as controlling them. You do not have control over a person's thoughts or actions just because you can do what you want to them or render them incapable of doing as they will. An essential component of mind control is that it involves *controlling* another person, not just putting them out of control or doing things to them over which they have no control.

fiction and mind-control

Some of the more popular misconceptions of mind control originated in fiction, such as "The Manchurian Candidate." In that film, an assassin is programmed so that he will respond to a post-hypnotic trigger, commit a murder, and not remember it later. Other books and films portray [hypnosis](#) as a powerful tool, allowing the hypnotist to have his sexual way with beautiful women or to program her to become a robotic courier, assassin, etc. One such book even claims to be "based on a true story": *The Control of Candy Jones* (Playboy Press, 1976) by Donald Bain. To be able to use hypnosis in this powerful way is little more than [wishful thinking](#).

Other fictional fantasies have been created that show drugs or electronic devices, including brain implants, being used to control the behavior of people. It has, of course, been established that brain damage, hypnosis, drugs or electric stimulation to the brain or neural network can have a causal effect on thought, bodily movement, and behavior. However, the state of human knowledge on the effects of various chemical or electrical stimulation to the brain is so impoverished that it would be impossible using today's knowledge and technology to do anything approaching the kind of mind control accomplished in fantasy. We can do things that are predictable, such as cause loss of a specific memory or arousal of a specific desire, but we cannot do this in a way which is non-intrusive or which would have the significance of being able to control a large array of thoughts, movements, or actions. It is certainly conceivable that some day we may be able to build a device which, if implanted in the brain, would allow us to control thoughts and actions by controlling specific chemical or electrical stimuli. Such a device does not now exist nor could it exist given today's state of knowledge in the neurosciences. (However, two Emory University neuroscientists, Dr. Roy Bakay and Dr.

Philip Kennedy, have developed an electronic brain implant that can be activated by thoughts and in turn can move a computer cursor.)[*](#)

the government and mind-control

There also seems to be a growing belief that the U.S. government, through its military branches or agencies such as the CIA, is using a number of horrible devices aimed at disrupting the brain. Laser weapons, isotropic radiators, infrasound, non-nuclear electromagnetic pulse generators, and high-power microwave emitters have been mentioned. It is known that government agencies have experimented on humans in mind control studies with and without the knowledge of their subjects (Schefflin 1978). The claims of those who believe they have been unwilling victims of "mind control" experiments should not be dismissed as impossible or even as improbable. Given past practice and the amoral nature of our military and intelligence agencies, such experiments are not implausible. However, these experimental weapons, which are aimed at disrupting brain processes, should not be considered mind control weapons. To confuse, disorient or otherwise debilitate a person through chemicals or electronically, is not to control that person. To make a person lose control of himself is not the same as gaining control over him. It is a near certainty that our government is not capable of controlling anyone's mind, though it is clear that many people in many governments lust after such power.

In any case, some of the claims made by those who believe they are being controlled by these electronic weapons do not seem plausible. For example, the belief that radio waves or microwaves can be used to cause a person to hear voices transmitted to him seems unlikely. We know that radio waves and waves of all kinds of frequencies are constantly going through our bodies. The reason we have to turn on the radio or TV to hear the sounds or see the pictures being transmitted through the air is because those devices have receivers which "translate" the waves into forms we can hear and see. What we know about hearing and vision makes it very unlikely that simply sending a signal to the brain that can be "translated" into sounds or pictures would cause a person to hear or see anything. Someday it may be possible to stimulate electronically or chemically a specific network of neurons to cause specific sounds or sights of the experimenter's choosing to emerge in a person's consciousness. But this is not possible today. Even if it were possible, it would not necessarily follow that a person would obey a command to assassinate the president just because he heard a voice telling him to do so. Hearing voices is one thing. Feeling compelled to obey them is quite another. Not everyone has the faith of Abraham.

There seem to be a number of parallels between those who think they have been [abducted by aliens](#) and those who believe their minds are being controlled by CIA implants. So far, however, the "mind-controlled group" has not been able to find their John Mack, the Harvard psychiatrist who claims

that the best explanation for alien abduction claims is that they are based on alien abduction experiences, not fantasies or delusions. A common complaint from the mind-controlled is that they can't get therapists to take them seriously. That is, they say they can only find therapists who want to treat them for their delusions, not help them prove they're being controlled by their government. Thus, it is not likely that the "mind-controlled CIA zombies" will be accused of having delusions planted in them by therapists, as alien abductees have, since they claim they cannot get therapists to take their delusions seriously. In fact, many of them are convinced that their treatment as deluded persons is part of a conspiracy to cover-up the mind control experiments done on them. Some even believe that False Memory Syndrome is part of the conspiracy. They claim that the idea of [false memories](#) is a plot to keep people from taking seriously the claims of those who are now remembering that they were victims of mind control experiments at some time in the past. It is hard to believe that they cannot find a wide array of incompetent [New Age therapists](#) willing to take their claims seriously, if not willing to claim they have been victims of such experiments themselves.

subliminal advertising and mind-control

On a lighter note, one of the lesser myths about mind control is the notion that [subliminal messages](#) are effective controllers of behavior. Despite widespread belief in the power of subliminal advertising and messaging, the evidence of its significant effectiveness is based on anecdotes and unscientific studies by interested parties. You will search in vain for the scientific studies that demonstrate that playing inaudible messages such as "do not steal" or "put that back" in muzak significantly reduces employee or customer theft, or that subliminal messages increase sales of snacks at movie theaters.

disruption and harassment are not mind control

The above considerations should make it clear that what many people consider mind control would best be described by some other term, such as *behavior modification*, *thought disruption*, *brain disabling*, *behavior manipulation*, *mind-coercion* or *electronic harassment*. People are not now being turned into robots by hypnosis or brain implants. Furthermore, it should be obvious that given the state of knowledge in the neurosciences, the techniques for effective mind control are likely to be crude, and their mechanisms imperfectly understood.

Thus, if we restrict the term 'mind control' to those cases where a person successfully controls another person's thoughts or actions without their consent, our initial list of examples of what people consider to be mind control will be pared down to just five items: the tactics of religious, spiritual, and other New Age recruiters; the tactics of husbands who control their wives; the Stockholm syndrome; the so-called brainwashing tactics of the Chinese inquisitors of American prisoners during the Korean War; and the

alleged creation of [zombies](#) in Voodoo. The last, however, can be dismissed as based either on fraud or on the use of drugs to render people helpless.

Wives who are terrorized by their husbands or boyfriends are not victims of mind control, but of fear and violence. Still, there seem to be many cases where a battered woman genuinely loves her man and genuinely believes he loves her. She stays, beating after beating, not because she fears what he will do to her if she leaves, but because she really doesn't want to leave. Perhaps. But perhaps she doesn't leave because she is completely dependent on her lover/batterer. She doesn't stay just because she has nowhere to go. She needs him and stays because she is completely dependent on him. If a man can reduce a woman to a state of total dependency, he can control her. But is it true to say that he has controlled her mind? To what extent, if any, can a batterer take away the [free will](#) of his victim? He can reduce her choices so that staying with him is the only option she knows. What is the likelihood of this happening? It seems more likely that she will reduce her own choices by rationalizing his behavior and convincing herself that things will get better or that they really aren't that bad. If a man is not using brute force or the fear of violence to keep a woman around, then if she stays, it may be because of choices she has made in the past. Each time she was abused, she chose to stay. He may have used sweet and seductive talk to persuade her not to leave, but at some time in the relationship she was free to reject him. Otherwise, the relationship is based on fear and violence and mind control does not enter the picture. A woman who appears to be under the spell of a batterer is not a victim of mind control. She is a victim of her own bad choices. This is not to say that we should not sympathize with her plight or extend aid to her should she ask. She is where she is through bad luck and a series of bad choices, not because of mind control, assuming, of course, that the woman is not mentally ill. In that case, it is Nature, not her man, that has reduced her capacity for free choice. The abuser takes advantage of the situation, but he does not create it.

recruiters, kidnappings and inquisitions

That leaves recruiters for spiritual, religious, or personal growth groups; kidnappers; and inquisitors. First, the tactics of the recruiters differ substantially from those of kidnappers or inquisitors. Recruiters generally do not kidnap or capture their recruits, and they are not known to use torture as a typical conversion method. This raises the question of whether their victims are controlled without their consent. Some recruits are not truly victims of mind control and are willing members of their communities. Similarly, many recruits into mainstream religions should not be considered victims of mind control. To change a person's basic personality and character, to get them to behave in contradictory ways to lifelong patterns of behavior, to get them to alter their basic beliefs and values, would not necessarily count as mind control. It depends on how actively a person participates in their own transformation. You and I might think that a person is out of his mind for

joining [Scientology](#), [Jehova's Witnesses](#), or [Jim Roberts' The Brethren](#), but their "crazy beliefs and behaviors" are no wilder than the ones that millions of mainstream religious believers have chosen to accept and engage in.

Some recruits into non-mainstream religions seem to be brainwashed and controlled to the point that they will do great evil to themselves or others at the behest of their leader, including murder and suicide. Some of these recruits are in a state of extreme vulnerability when they are recruited and their recruiter takes advantage of that vulnerability. Such recruits may be confused or rootless due to ordinary transition difficulties (such as new college students), difficult life circumstances (such as failing in college or at a new job), or even tragic personal events (such as death to close friends or loved ones) or world events (such as war or terrorism). Some may be mentally ill or emotionally disturbed, greatly depressed, traumatized by self-abuse with drugs or abuse at the hands of others, etc. But it would not be to the advantage of the cult to actively recruit the emotionally disturbed. As one cult recruiter told me

Cults have complicated ideologies and practices that mentally or emotionally upset people have difficulty grasping. These structures are what allow the cult to control the person. Cults do not want people who are difficult to control.

Thus, while some recruits might be very vulnerable to those who would like to control their thoughts and actions, recruiters look for people they can make vulnerable. The recruiter quoted above also said

Cults seek out strong, intelligent, idealistic people. They also seek out the rich, no matter what their mental status is.

The goal is make the recruits vulnerable, to get them to give up whatever control over their thoughts and actions they might have. The goal is to make the cult members feel like passengers on a rudderless ship on a stormy sea. The recruiter or cult leader has a rudder and only he can guide the ship to safety.

The techniques available to manipulate the vulnerable are legion. One technique is to give them the love they feel they do not get elsewhere. Convince them that through you and your community they can find what they're looking for, even if they haven't got a clue that they're looking for anything. Convince them that they need faith in you and that you have faith in them. Convince them that their friends and family outside the group are hindrances to their salvation. Isolate them. Only you can give them what they need. You love them. You alone love them. You would die for them. So why wouldn't they die for you? But, love alone can only get you so far in winning them over. Fear is a great motivator. Fear that if they leave they'll be destroyed. Fear that if they don't cooperate they'll be condemned. Fear that

they can't make it in this miserable world alone. The manipulator must make the recruit paranoid.

Love and fear may not be enough, however; so guilt must be used, too. Fill them with so much guilt that they will want to police their own thoughts. Remind them that they are nothing alone, but with you and God (or some Power or Technique) they are Everything. Fill them with contempt for themselves, so that they will want to be egoless, selfless, One with You and Yours. You not only strip them of any sense of self, you convince them that the ideal is be without a self. Keep up the pressure. Be relentless. Humiliate them from time to time. Soon they will consider it their duty to humiliate themselves. Control what they read, hear, see. Repeat the messages for eyes and ears. Gradually get them to make commitments, small ones at first, then work your way up until you own their property, their bodies, their souls. And don't forget to give them drugs, starve them, or have them meditate or dance or chant for hours at a time until they think they've had some sort of mystical experience. Make them think, "It was you, Lord, who made me feel so good." They won't want to give it up. They have never felt so good. Though they look as if they are in Hell to those of us on the outside, from the inside it looks like Heaven.

What religion doesn't use guilt and fear to get people to police their own thoughts? Even some therapists use similar methods to control their patients. They prey on the vulnerable. They demand total loyalty and trust as a price for hope and healing. They often isolate their prey from loved ones and friends. They try to own and control their clients. The methods of recruiters are not much different. Are the recruits, the converts to the faith, and the patients willing victims? How would we tell the difference between a willing victim and an unwilling victim? If we cannot do that, then we can't distinguish any true cases of mind control.

Recruiters and other manipulators are not using mind control unless they are depriving their victims of their free will. A person can be said to be deprived of his free will by another only if that other has introduced a causal agent which is irresistible. How could we ever demonstrate that a person's behavior is the result of irresistible commands given by a religious, spiritual, or personal growth leader? It is not enough to say that irrational behavior proves a person's free will has been taken from them. It may be irrational to give away all one's property, or to devote all one's time and powers to satisfying the desires of one's divine leader, or to commit suicide or plant poison bombs in subways because ordered to do so, but how can we justify claiming such irrational acts are the acts of mindless robots? For all we know, the most bizarre, inhumane, and irrational acts done by the recruits are done freely, knowingly and joyfully. Perhaps they are done by brain damaged or insane people. In either case, such people would not be victims of mind control.

That leaves for consideration the acts of kidnappers and inquisitors: the acts of systematic isolation, control of sensory input, and torture. Do these

methods allow us to wipe the cortical slate clean and write our own messages to it? That is, can we delete the old and implant new patterns of thought and behavior in our victims? First, it should be noted that not everybody who has been kidnapped comes to feel love or affection for their kidnappers. It may be that some kidnapped or captured people are reduced to a state of total dependency by their tormentors. They are put in a position similar to that of infancy and begin to bond with their tormentors much as an infant does with the one who feeds and comforts it. There is also the strange fascination most of us have with bullies. We fear them, even hate them, but often want to join their gang and be protected by them. It does not seem likely that people who fall in love with their kidnappers, or who turn against their country under torture, are victims of mind control. There is certainly some explanation why some people act as Patricia Hearst did and why others under similar circumstances would not have become "Tanya". It is doubtful that mind control should play much of a role in the explanation. Some women are attracted to gangsters, but have few opportunities to interact with them. We do not need to revert to mind control to explain why Hearst became intimate with one of her terrorist captors. She may have thought she had to in order to survive. She may have been genuinely attracted to him. Who knows? Mind control is a better defense than "changed my mind about a life of crime" when facing bank robbery and murder charges.

Finally, it is widely believed that the Chinese were successful in brainwashing American prisoners of war during the Korean War. The evidence that their tactics of torture, isolation, sensory deprivation, etc., were successfully used to control the minds of their captives is non-existent. Very few (22 of 4,500 or 0.5%) of those captured by the Chinese went over to the other side (Sutherland 1979, 114). The myth of success by the Chinese is primarily due to the work of Edward Hunter, whose *Brainwashing in Red China: the Calculated Destruction of Men's Minds* (New York: Vanguard Press, 1951) is still referred to by those who see mind control tactics as [a major menace today](#). The CIA provided most of Hunter's fodder in their effort to inspire hatred of the North Koreans and communism, to explain why some American soldiers didn't hate the enemy, and "to aggrandize their own role by arguing that they themselves must investigate brainwashing techniques in order to keep up with the enemy" (Sutherland 1979, 114).

It seems then, that if we define mind control as the successful control of the thoughts and actions of another without his or her consent, mind control exists only in fantasy. Unfortunately, that does not mean that it will always be thus.

multi-level marketing (MLM) harassment

Multi-level marketing harassment is a form of economic harassment in the work place whereby a superior uses his or her power to recruit a subordinate into a multi-level marketing scheme. Like sexual harassment, MLM harassment can be subtle or blatant. The most blatant form would be using the direct threat of not hiring or promoting, or even firing someone for not agreeing to become an "independent" MLM agent. Of course, talented managers know many subtle ways to suggest to their subordinates that their success with the company depends upon their saying 'yes' to the boss.

One of the most successful MLM companies is [Amway](#). The basic formula is simple. First, there is the "Company", which has a product or array of products. Second, there are the independent distributors who (a) sell the Company product and (b) recruit new distributors who do the same, ad infinitum if possible. The reason distributors don't just sell the Company product is that they receive "bonuses" for sales made by their recruits. Theoretically, the richest independent distributor would have dozens, hundreds, thousands, even millions of subordinate distributors who would be doing the actual selling, while the Big One did little or no selling of the Company product at all. That is, the emphasis of MLM schemes is not selling the Company *product* but selling the *Company* itself.

It should be obvious, then, that the Big Cheese of a non-MLM company could stand to reap substantial economic rewards from having a little army of "independent distributors" (read "coerced employees who will buy the MLM Company products and recruit others to do so). MLM infestation is inevitable in non-MLM bureaucracies. The main bait may be the promise of extra cash to the subordinate, but superiors (managers, purchasers, personnel officers, supervisors, etc.) are really interested in their own extra cash. Superiors who have bought into the Unimagined Wealth Dream of most MLM schemes will not have many scruples recruiting their subordinates. It is possible that the superiors may even deceive themselves into thinking that they are offering bona fide economic opportunities to their subordinates. It is also quite likely that many employees will not feel coerced but will buy into the Unimagined Wealth Dream themselves. (Just as some bosses may delude themselves into thinking that they are really offering an opportunity to an employee's sexual happiness when they make sexual advances to a subordinate. And, just as some people who are seduced by their bosses, end up marrying the boss.) These facts complicate matters, and may sometimes make it difficult to prove harassment occurred. After all, if you are agreeable, how can anyone say you were harassed?

But it is not just large, bureaucratic businesses which may see MLM harassment. Schools, for example, may also be prone to MLM harassment. In fact, anywhere there is a person who has power over others, the opportunity for MLM harassment emerges. Fear of not being hired or re-hired and fear of not being promoted or of being fired can be powerful incentives to get on board the MLM bandwagon.

As far as I know, there are no laws prohibiting superiors of non-MLM organizations from recruiting inferiors into MLM schemes. Nor are there laws for discriminating against someone solely because they did not want to join an MLM scheme. Thus, even if you could prove beyond a reasonable doubt that the only reason you were fired from your last job as a structural engineer was because you refused to become an Amway agent when asked to do so by your superior, you may have no recourse in a court of law.

Because of the potential for abuse of power, one would think that companies and organizations would as a standard rule prohibit MLM recruitment. But how many of us have worked at a place which has a policy against MLM harassment? Very few, I think. The exception, of course, would be if you work for one of the Armed Services. Our military organizations know quite well how easy it is for superior officers to take advantage of those who are their juniors. And they have rules which forbid such behavior. For example, you will find the following rule in the *Code of Federal Regulations* (32 CFR Sec. 721.6)

Standards of conduct governing naval personnel

(c) Using naval position. Naval personnel are prohibited from using their official positions to improperly induce, coerce, or in any other manner improperly influence any person to provide any benefit, financial or otherwise, to themselves or others....

(e) Commercial solicitations by naval personnel. To eliminate the appearance of coercion, intimidation, or pressure from rank, grade, or position, all naval personnel are prohibited from making commercial solicitations or sales to DOD [Department of Defense] personnel who are junior in pay grade, or position, at any time or place.

Commercial sales, whether or not solicited, are prohibited between officer and enlisted military personnel....

(1) This prohibition includes, but is not limited to, the solicitation and sale of insurance, stocks, mutual funds, real estate, and other commodities or goods.

In fact, naval personnel are forbidden to engage in outside employment, with or without compensation, if that employment is

inconsistent with the requirements of this instruction, including the requirement to avoid actions and situations which reasonably can be expected to create the appearance of a conflict of interest.

How many private corporations include such protection against abuse of power in their employees' manual?

It should be emphasized that MLM harassment goes way beyond the kind of intimidation one feels when the boss brings in her kid's school candy bars and asks you buy them for the Save the World Fund. The one-time only or the once-in-a-while extortion is small change--however inconvenient--compared to having to become an MLM agent. The difference is like the difference between having to go to Church on Christmas and having to join a cult.

Amway

09 Aug 1999

I just wanted to thank you for the information that you have placed onto your web page and I thank God that there is such a thing as the Internet to provide such easy access to this information.

About a week ago I was introduced to the Amway corporation while looking around a Chapters Bookstore before heading out to see a movie later that night in Kitchener, Ontario, Canada. I had never heard of Amway before being introduced to it. I would consider my self to be a positive uplifting person who is not afraid to work and make a go at being prosperous so I found the information to be interesting. I am always looking for ways to better myself and increase my income so the Amway pitch sounded to see a really good opportunity to me. But I also consider myself to be an analytical person who simply wants the facts before making a decision as big as this. So right after I met with the mother/son team that introduced me to the business I was handed a lot of information with tapes and books to read during my one week of holidays. A lot of the information sounded good but I found that everything that was handed to me was vague and didn't give me what I wanted to know about the venture.

The day I came back from my holidays I drove with a few other people to a meeting to try and get more information "from the horses" mouth so to speak. I must confess that alot of the information that is given is actually good advice for anyone that wants to better themselves. They quoted may people that I have respect for and read about such as the Late Norman Vincent Peele, Dave Thomas (of the Wendy's franchise), etc. But something was still bothering me. I can be as emotional as the next person I felt that something was a bit "cultish" to the whole experience...I just couldn't put my finger on it. It felt like I was in a Religious Revival Meeting/Business Pep Rally where the "gods" of the business came down to walk among the mortals. I could see why alot of people get into this business. It is contagious to be around positive people and this is what the people were being fed at such meetings.

Anyway the main reason that I wanted to go to the meeting is because of the new development into the business....E-commerce. The company is supposedly coming together with Microsoft and IBM to market a new web site for buying products from Amway called [Quixtar](#), which, by the way is starting September 1st, 1999. The information presented to me sounded quit good and I thought to

myself that this is something that I could really sell to a lot of people.

But, as with anyone with common sense, I also realized that everything presented to me was bias. I wanted to have a good balance of facts. So I went onto the internet to see what other peoples had to say. Luckily I found what I needed to see and hear.

So to conclude I just wanted to thank you for your web site and for helping me come to a rational and right decision of "Thanks...but no thanks"

Sincerely, Robert Kloosterhuis

PS. Please keep up the good work by placing such information on your website...I REALLY is appreciated

reply: Thanks. The kind words are appreciated also.

6 Jul 1998

I have to put in my two cents on this one!! I was, and am, an Amway distributor. At this point I do not pursue it as a business, rather as a convenient method of shopping. I really like the products and the prices (yes they are lower if you consider cost per use (highly concentrated, my dishwasher soap lasts a year!) rather than cost per item. Check it out again! However, my husband and I determined over the course of three years that Amway was not the type of business we wanted to pursue. We knew that we were in search of being independent of a job but did not know what we wanted to do. We checked out Amway and discovered that through books (education), tapes (motivation) and functions (information) we were on the right track in pursuing our own business. Take a look at anyone who has a successful business of any kind and ask them how they got there. Most will say that it was very focused, hard work, meaning that at times it meant that they did not go to the movies with friends, and instead attended seminars, read business books and consulted with mentors or listened to tapes of people that are where you want to be. In my particular line of sponsorship it was always recommended that you have a balance of priorities in life. In order of importance 1) God (whatever that means to you), 2) Family, 3) country, and then 4) Amway. Perhaps the reason people ignore everything else in their life when they join Amway is that THEY feel like they need to. It's really simple, if you want to succeed at anything it takes A LOT of effort and balance.

Now let's clear some things up...

- 1. Amway is a manufacturing and distribution company. There primary function is to manufacturer products and offer cash incentives and bonuses for the distribution of their products.*

2. *Amway DOES NOT supply information about how to build a lucrative distributorship. Often times there are groups of individuals that set up a "plan" for how to build a business. These people are independent distributors creating their own methods. It would behoove anybody actively pursuing an Amway distributorship (or any other business for that matter) to thoroughly research and ask many questions of the group they are looking at. These groups are not affiliated with or promoted by the Amway corporation. The often seen "Christian connection" is not encouraged by Amway, rather, by specific groups of distributors. As in any arena of life, there are good and bad people everywhere. If you jump into anything without looking first you're pretty foolish.*
3. *Amway is an excellent example of good business practice. They are a multi-billion dollar business. If I remember correctly, 1/3 of their profit is returned to distributors in the form of cash bonuses. They are a privately held, debt-free corporation (almost unheard of in modern business). While it is true that at one time "upline" Direct Distributors were not required to pay "downline" distributors a bonus until they reach the Direct Level, or sell to them products at wholesale cost, this rarely happened. Most distributors were receiving their bonuses regularly and their products at wholesale. Amway corporation IS now in the process of shifting to direct order and all of the bonuses and product costs in my group are dealt with directly through Amway. And, by the way, they spend a lot of money on the community and charity (they are one of the largest yearly contributors to Easter Seals).*
4. *There is a legal precedent for determining if a multi-level business is an illegal pyramid type business. The business they use for comparison? Amway. Surprise. The legal community even regards Amway and its structure as a legal and viable way of creating income.*

Now my husband and I are creating a business in the field of massage therapy and bodywork. A huge jump from Amway? Not necessarily. It's a business and the basics still apply. We read, attend seminars and continuing education courses, listen to self-improvement tapes and speak to mentors and our business is progressing nicely. We thank Amway and INA (our line of sponsorship) for teaching us excellent methods of business building and personal development. We have never been humiliated, teased or bothered by anyone in Amway about our choice to pursue other business opportunities. I believe the difference is that we have taken responsibility for our lives. We don't put down Amway or the people in it. Frankly, there are lots of jerks in the world and why would Amway be any different. If you don't do well in Amway it's because YOU didn't do well in Amway. The fact is there are LOTS of people who do and are happy with it.

Why am I so strongly defending a business venture I don't pursue? I believe that people need to take responsibility for their own choices and actions. That there are people selling Amway that are not up front or are shady in their methods does not mean that Amway is a bad business. There is some responsibility to be taken by those of you that choose to pursue a business that makes you uncomfortable from the beginning. Thanks for the venting space.

Juli K.

16 July 1998

I was reading through many articles on the Amway Phenomenon. I came across the emails people have sent you. I was an Amway distributor 6 years ago. I fell into the trap of spending money on trips and tapes and books etc. I do NOT however blame anyone in the organization I was affiliated with for the money I spent. It was always my choice to attend functions or buy support material.

As a recovering alcoholic and drug addict I can compare this to my decision to try that first drug and to eventually stay away from drugs. No one ever forced me to do them, it was my choice. In twelve step programs I have learned how to stop doing drugs. I compare the positive things I learned while I was building my Amway business 6 years to my recovering. If you are familiar with 12 step programs, they only work if you work them!!! As with Amway it is not a get-rich quick scheme. It is a business opportunity that must be worked at in order to become successful.

The Amway business is an opportunity, just like going to college, or buying a new car. I am presently studying for my Master's Degree in counseling/psychology. I want to someday have a retreat center for families to come for counseling. My husband recently became an Amway distributor. This business will give us the opportunity to have the income to buy a large place to make that dream come true. My husband does not work for the Amway corporation, (we would have to live in Michigan, not CT) which is a misconception of many people. He too is a recovering addict. He finds the tapes motivational and positive, just as he does his 12 step meetings. I am very supportive of him building this business. He was injured on the job and is getting very little support from his employers. Amway is an opportunity for him to build a business and help other people start a business if they desire. He does not pressure anyone, or try to fool them. He is honest in his approach that he is offering them a service and an opportunity if they so desire. He does not say it is AMWAY and it is because of the negativity of websites and misinformed people that we do not say, "Would you like to look at AMWAY".

We are leaving tonight to go to NC for a function on building this business. I enjoy the functions and had spent a lot of money attending them before. But then again I spent a lot of money on drugs and associated with people I thought were my friends. It did me not good. I too have been injured on my job and do not have the support of the administration. This business DOES give people the opportunity to have a business and provide others with the same opportunity. It has given my husband hope that he can earn an income despite his injury. Instead of hearing the negativity and degrading influence of the "powers that be" at his work he is hearing people tell him he can do it! If Amway is a cult it is the most positive influence I have ever been around.

Sincerely,
SAB

I sent you an email, but am adding more to what I previously said. The Amway products, soap, vitamins etc. are only 15% of the product line. Have you ever looked over a flyer from the local Stop & Shop? Are there only Stop & Shop brands in there? Is that all the store promotes? Of course not! They have Campbell soup, and Healthy Choice, and Nestea, and the list goes on. Does a JC PENNEY catalog only have JC PENNEY clothing? No they have Lee's, London Fog etc. Try looking at an Amway personal shoppers catalog and you will see these same products and about 15,000 more. These manufacturers have no problem selling their products through Stop and Shop or through Amway. Why do people have such a negative attitude about a distribution company who also makes a few of their own products? They don't have a store... instead it is word of mouth advertising. AND an opportunity to distribute products and offer people the chance at entrepreneurship!!!!

Do people pick apart and criticizes SPRINT and AT&T because they call you at home and advertise on the TV? They may complain about being bothered at home, but has either company ever offered to give you the opportunity to start you own long distance phone company with possibility for a large income, if you are willing to "recruit" enough customers? NOT TO MY KNOWLEDGE!!!! If people want to know the facts about becoming a lawyer and the income potential, do they talk to their garbage man? OF COURSE NOT!!! They would talk to a LAWYER!!! Then why do people look for information about becoming an AMWAY distributor from people who don't know what it is to be one? I do know! It is a great opportunity, yes it takes some effort. But so does getting a Master's Degree. I know I am working on mine in an independent study program while I work full time, and I have Traumatic

Brain Injury!!! If you want something bad enough you find the time and the means to do it!

21 Aug 1998

As of noon today, I will walk my precious wife out the door of an Amway Diamond for whom she has worked for the past five years. We have had enough. She has been the administrative assistant and function coordinator managing the huge functions where 1000's of good people are bilked out of \$100,000' s every year.

We have seen so many lives wrecked, marriages destroyed and careers ruined because of the lies and deception that goes on and on and on. It is indeed a cult which preys on the unwary. Many claim that it is a Christian organization and it is true that Christianity is involved. However, the leadership in no way model Christian morality, principles, and conduct. They espouse Christian values but

lead lives of greed, selfishness, self-interest and are constantly involved in lawsuits amongst themselves and greedy infighting which hardly characterizes Christian conduct.

For most, Christianity is used to add nobility and creditability to their thwarted greedy cause. They are liars and hypocrites touting financial freedom when they themselves are under frightening and staggering debt loads caused by their insatiable appetite for more and more material gain regardless of the cost so they can demonstrate how financial freedom works when in reality they are digging a deeper and deeper hole for themselves and lying to those under them.

It is not a product distribution system. It is a system whereby the individual themselves become the consumer. No one really sells the products to people on the outside of Amway. Everyone who joins becomes the consumer that drives the organization. The products are sold at tremendously high prices, much higher than in commercial marketplace. The rank and file individual member is the sole support of the up line and spend huge amounts of money until some where along the line they wake up and drop out, bruised, beaten and much worse off than when they started, often having incurred debt that will have to be repaid.

Members are encouraged to hang in there at any cost until they "Make It Big" themselves. They are told to sell things so they can stay in. Pull the equity out of their homes, sell that second car that's paid for, sell the extra TV, sell old family jewelry, sell whatever they can so that they can hang in there and go to function. Of course; the functions are where the Diamonds really cleanup. Amway is something to be left alone and avoided. It is a dead end heartbreaker.

[Amway](#)

A unique business, Amway. A mass movement more than a corporation. It has made a very few people very rich while paying its foot soldiers more in inspiration than in cash.

THE POWER OF POSITIVE INSPIRATION

By Paul Klebniov

Sneered at in the media, investigated and fined by the authorities, Amway Corp keeps growing. The world's second largest door-to-door sales operation was conceived in a basement in Grand Rapids, Mich only 32 years ago and today boasts \$3.1 billion in retail sales (\$2.6 billion at wholesale prices) from around the globe.

To this day Amway is owned almost entirely by its founders - Richard DeVos, 65, and Jay VanAndel, 67 - and their immediate families. Forbes estimates the company earned \$300 million last year after tax and that DeVos and VanAndel are each worth close to \$3 billion - although it is admittedly difficult to value a business that, like Amway, is based on ephemeral human relationships.

Amway manufactures and sells soap, cosmetics, vitamins, food products and other household products and sells water filters, Coca Cola machines, MCI service, clothing and thousands of other items through its catalog. There is nothing unique about these mundane products. What is totally unique is the size of Amway's sales force, close to 600,000 strong in the U.S., 500,000 in Japan and several hundred thousands more in places like Germany, Mexico, Korea and Malaysia.

Although the average Amway distributor sells barely \$1,700 worth of goods a year, the sheer size of the sales army and its enthusiasm ensure success.

In an interview with Forbes at Amway's headquarters for its 300 acre manufacturing and distribution center just outside Grand Rapids, Mich., DeVos spoke at length about the marketing phenomenon he and VanAndel have created. "Amway is more than just a company, it's a movement to help people help themselves," says DeVos in a pleasant, low-pitched voice. "Nobody has ever traveled down the road that we have traveled."

The road has taken some odd twists. This year, for example, Proctor & Gamble successfully concluded the last of four suits against Amway distributors for spreading bizarre and damaging rumours that P&G and its products were instruments of Satan. ("Whenever you deal with a million people you're going to have people who overstep boundaries," says DeVos, defensively.)

Perhaps he can't keep his eye on a million distributors, but he does know how to inspire almost every last one of them. The underlying principle is simplicity itself: Persuade the distributors that their interests and Amway's are exactly the same. One must turn outside the world of business - to religion and politics - to find people who work as hard for as little financial reward as most Amway people do.

Cynics would compare the system to a chainletter; here's how it works.

Distributor A recruits distributors B, C, D each of whom recruits three more distributors to work for them. If this recruiting pattern continues ten times - that is, there are 11 levels in the distribution chain - then the fellow who started the network, distributor A, would have 88,572 distributors working for him. If each of these people sells, on average \$1,000 worth of products, you've got an \$89 million marketing organization stemming from that one distributor A.

At offices, health clubs, beauty salons, churches, Amway recruits. The basic pitch: Whatever your dream is - a boat? a fancy car? kid's education? - it is within your grasp if you just devote some of your spare time to selling Amway products and recruiting other people to sell them.

In itself, the pitch is honest enough. Some Amway people do become affluent, even rich. But not many of them. The lion's share of money earned by Amway distributors is pocketed by 2% of the sales force, the organization's 35,000 so-called direct distributors.

These distributors typically have about 50 downline distributors channeling orders up to them. Direct distributors gross a minimum of about \$35,000 a year. The really big money - bonuses of up to \$300,000 and more - is made by a handful of kingpins at the top of the heap.

And once a network has been created, what's to stop the organiser from selling other goods to the faithful? Indeed, the really successful operators sell self-help books, tapes and even investment schemes to their recruits to supplement their incomes.

Among the big distributors are people like Chapel Hill, N.C.'s Bill Britt and Charlotte's Dexter Yager. These two men each run networks of over 100,000 distributors and are each believed to net over \$10 million a year.

As with any army, the recruits are expendable. Amway is a fluid organization. Nearly half of the 1.8 million distributors who will be registered with Amway worldwide will drop out in the course of the year. For those who remain, the average distributor

in the US will net around \$780 a year in bonuses and markups from selling Amway products. But in addition to the products the distributor sells to others, he will also consume, on average, \$1,068 worth of Amway goods himself. And he may spend hundreds of dollars or even thousands more on telephone bills, gas, rallies, publicity material and other expenses to expand the business. Some of the distributors may end up dipping into their savings, and a few may even run up debts.

The real money is made not by peddling to the public but by recruiting for Amway's sales force. There is a great incentive for a new recruit to quickly recruit distributors reporting up to him. Which is why DeVos can say with some confidence: "We'll expand not by selling more per store but by opening more stores" - recruiting more distributors, that is.

Is Amway an illegal pyramid scheme? As far as the authorities have been able to discover, the answer is no.

The fact remains. The average foot soldier doesn't make much money for his or her efforts. This is where the inspiration comes in.

When he says, "Amway is more than a company; it's a movement" DeVos isn't just spouting propaganda. Amway promises, in effect: Join Amway, work hard and, with almost no capital investment, you too can become as rich as Bill Britt or Dexter Yager. It's up to you.

Few Amway distributors do not know by heart the inspiring rags-to-riches stories of the most successful distributors. Among the patron saints of the Amway movement is Charlie Marsh, a gravel-voiced former small-town policeman who built a hugely successful world-wide Amway network. There is Bernice Hansen, the grandmother who was an accountant in Grand Rapids before she joined Amway and discovered her talents for sales and recruiting. Perhaps most inspiring is Dexter Yager, the stout, bearded former beer salesman from Rome, N.Y.

In a world where many people find little satisfaction in the paychecks they receive from big companies or public agencies, such visions of financial independence are often compelling. But Amway goes a crucial step beyond mere money. It offers its recruits membership in a community of like-minded people - entrepreneurial, motivated, upwardly mobile people who believe in their country, in God and in their family. "This country was built on religious heritage, and we had better get back in it. We had better start telling people that faith in God is the real strength of America!", Richard DeVos writes in his book "Believe!".

Amway distributors are bound by a set of shared beliefs reinforced by myths, icons and documents. They are expected to read self-improvement books (popular titles include "Believe!" and "How to be Happy though Married"). They purchase and listen to Amway-sponsored inspirational

cassettes (usually live recordings of their "upline" leaders' speeches and seminars). And they are expected to use only Amway products in their personal lives. Internal Amway documents show that the average active distributor sells only 19% of his products to non-Amway affiliated consumers. The rest is either personally consumed or sold to other distributors.

It all adds up to this. When you sell Amway products, you're not working for a boss or a faceless organization and its shareholders. You're working for yourself and for Richard DeVos, Jay Van Andel, Charlie Marsh, Bill Britt, Dexter Yager, and all the other Amway people who struggled and made it. You're on the Amway team, and it feels good to be there.

Amway rallies typically resemble a mix between a rock concert and a religious revival meeting. The evenings are often kicked off with inspiring music - the theme from "Rocky" say, or "Chariots of Fire" - followed by much audience hand-holding, singing, swaying and listening to testimonials. Some Amway leaders, such as Dexter Yager, are famous for working their crowds into Amway chants and ... their audiences with inspirational speeches that last ***** [Sorry this is unreadable..]

If Amway sounds like a commercial version of fundamental religion, DeVos offers no apologies.

"For a lot of people Amway is their way out [of poverty]" he says, "so Amway relates right down to the grass roots, right down to where people live, you wonder why this mythology, why this rah rah, why they scream and yell. They scream and yell for the same reason they do at a football game. They have discovered that it is fun to be around people who cheer other people on, who encourage people".

One weekend this summer over 12,000 enthusiastic people gathered for a rally in Richmond, Va. A handful were wealthy distributors of Amway Corp's products; the rest wanted to be.

The meeting began with a prayer and a Pledge of Allegiance. On stage, Bill Britt, the master Amway distributor who organized the rally, introduced the other top distributors, who had arrived in their Cadillacs and Mercedes. flaunting expensive furs and jewelry. With the introduction of each of these role models, the crowd cheered.

Britt, 60, was a city manager in North Carolina before becoming an Amway distributor. An inspirational speaker, he might have made a great television evangelist had he not found Amway. He addresses his message not above or below but straight at the average Amway distributor's dreams "I got tired of my Mercedes and I'd heard that the Lexus was a nice car. So I went down and bought myself one - and, yes, it is a nice car."

Britt normally lectures the audience on living clean, traditional

lives. "Don't wear pants in the family," he admonishes the women, who make up half his audience. He glowers at the men: "Get rid of your pornography."

This time he focuses on the visions of financial security. Britt talks of the multimillion-dollar business he has built selling Amway products. Hundreds of average working people - barbers, policemen, truck drivers, car wash supervisors, dentists, middle managers - are introduced, and many of them recount how they became successful and became better people with Amway. After each story the audience roars its approval of the proud witnesses. ("We have two forms of reward in this world," says DeVos. "One is recognition, and the other is dollars. We employ them both in the Amway business.")

After two days the ceremonial part of the Britt rally ends as the audience joins hands and, swaying gently, sings "God Bless America". The attendees leave feeling good about Amway and good about themselves.

As DeVos puts it: "Our people are seeking inspiration all the time, as most people are. Some people find it in the Rotary Club, some people find it at church and some people like to go to Amway meetings."

How did DeVos and Van Andel get the idea for Amway? As great business ideas often do, this one came to them by accident, and without much indication that it would make them millionaires.

In the 1940s Van Andel and DeVos were next-door neighbors in a Dutch-American section of Grand Rapids, Mich. DeVos' father was a car dealer, Van Andel's a garage owner. Both men, says DeVos, inspired in their sons an entrepreneurial spirit and desire to start their own businesses.

During World War II the two friends served in the Army Air Corps. After the war they started a chartered air service, then a drive-in restaurant.

Then, in 1949, they joined a small direct-sales firm called Nutrilite. Nutrilite was started by an entrepreneur, Carl Rehnborg, who survived on cooked plants and animal bones in a detention camp in China in the 1920s and had gotten the idea for marketing a nutritional supplement.

DeVos and Van Andel developed a particularly successful Nutrilite distributor network that eventually grew to about 200 distributors in the Midwest. But the friends were not cut out to be rungs on someone else's distribution ladder. When Rehnborg and other Nutrilite leaders quareled in 1959, DeVos and Van Andel pulled their 200 distributors out of Nutrilite and struck out on their own.

Amway's first product was Frisk, a biodegradable soap whose distribution rights they bought from a struggling Detroit chemist. Using the sales methods and distributor network they brought from Nutrilite, DeVos and Van Andel sold so much soap that within two years they had opened their own soap manufacturing plant outside of Grand Rapids.

They added other products - cosmetics and cookware. Soon they were expanding across the country and over the border into Canada. The power of pyramid math was really working. Starting in the early 1970s, they expanded overseas, to Australia, the UK, France, Germany, Japan.

DeVos and Van Andel have become very powerful men. Former President Gerald Ford and Ronald Reagan have addressed Amway rallies. Some senators have been Amway distributors, as have celebrities like singer Pat Boone and former football coach Tom Landry. All of these roles help inspire the Amway movement with a patriotic and religious feeling.

There were setbacks for Amway - one of them nearly fatal - along the way. The Federal Trade Commission began investigating Amway in the 1970s to determine whether Amway was, among other things, an illegal pyramid scheme in which newly recruited distributors lose out unless they themselves recruit other members.

"That was really a 'go' or 'no go' situation for us," remembers DeVos. Finally, in 1979, the FTC ruled that Amway was not a pyramid, but found it did engage in restraint of trade and misleading advertising.

In the 1980s the Canadian government charged DeVos and Van Andel with customs fraud. Amway paid the Canadians \$58 million to settle criminal and civil charges.

Is there today a snake in Amway's paradise? There are several.

As with a church or a political party, Amway must constantly protect its image if it is to recruit new members. In some cases, Amway seems to have taken concern for its image to extremes.

Former distributors and Amway officials say that like many movements based on a cult of personality, Amway's attitude toward any insider critical of the organization has bordered on paranoia.

Edward Engel was Amway's chief financial officer until 1979; he resigned over a disagreement with DeVos and Van Andel on how to run the Canadian operations. This apparently branded him a traitor; he says he and his family received threats for years after his resignation. "It was a Big Brother organization," says Engel today. "Everyone assumed that the phones were tapped, and that Amway had something on everybody."

In 1983 Engel's former secretary, Dorothy Edgar, was helping the Canadians in their investigation of the company. She was roughed up in Chicago, after she was told to "stay away from Amway". Engel, who picked her up after the incident, says he believes her story. Amway would not comment on the incident.

There was extremely bad publicity in 1982 when a former distributor, Philip Kerns, wrote a damaging expose called "Fake it Till You Make It". Kerns charges that Amway used private detectives to follow

him and rough him up (see photo below). kerns' expose prompted the "Phil Donahue Show" and "60 Minutes" to run uncomplimentary pieces on Amway. Amway's recruitment dropped off; with it, sales plunged an estimated 30% in the early 1980s.

In 1984, another former Amway insider, Donald Gregory, says he started to write a book on Amway, but the company obtained a gag order against Gregory in a Grand Rapids court.

More bad publicity surfaced to hurt Amway in 1989, when it teamed with Minneapolis' remainder magnate Irwin Jacobs to buy work in Avon Products, Inc. as part of their respective takeover bids for Avon. Avon Chairman James Preston hired private investigating firm Kroll Associates to dig up some dirt on Amway, Kroll unearthed several lawsuits pending against William Nicholson, who was hired in 1984 as Amway's chief operating officer. Several days afterwards, Amway and Jacobs dropped their bid.

The fact that Amway is a loose confederation of hot-shot sales empires creates other thorny problems. In years past, several of Amway's wealthiest distributors created independent empires that published their own magazines, organized their own rallies and even published their own versions of the Amway sales and marketing plan.

Known inside Amway as the "Black Hats", these master distributors frequently indulged in excessively high-pressure methods of exploiting their foot soldiers, persuading them to shell out hundreds of dollars each for distributor-produced books, tapes and even unrelated products and investment schemes.

The problem: if Amway's distributors make a lot of money from selling such promotional materials (as opposed to actual products) to new recruits, then it again raises questions of an illegal pyramid scheme.

In 1985 two distributors sued Bill Britt, Dexter Yager and Amway Corp among others in the state of Washington, alleging they were "brainwashed" into purchasing enormous amounts of motivational materials. The case was settled out of court in 1988, but a gag order was placed on the court records and participants involved in the case.

Says DeVos: "We're dealing with many motivated entrepreneurial individuals who are actively seeking to improve their businesses. Through their own lack of knowledge they can run afoul of the law, or do thing they shouldn't do."

Why not fire the rascals? Says DeVos: "Whenever you terminate anybody in this business it sends tremors through the whole organization, because [the distributors] say 'Oh, oh, the company now has the power to kick me out.' And all those people with the sole idea of owning their own business and doing their own thing suddenly have a spike driven through their hearts."

The lawsuits, bad publicity and government scrutiny seem to have taken

a toll. Several of the old-line distributors now seem to have become ultraconservative in their recruitment of new distributors - bad news for an organization that grows with a constant influx of new recruits.

Says one colleague of kingpin distributor Bill Britt: "Britt has become very conservative. He's preoccupied with the FIC, with the legalese of what can and cannot be done. To listen to him these days, you'd think you were listening to a lawyer."

Fortunately for DeVos and Van Andel, there are fewer such problems overseas so far - where Amway has kept tighter control over its distributors. Amway Japan has expanded into a network with over 500,000 distributors accounting for \$734 million in sales last year.

Last April, DeVos and Van Andel sold a sliver - 8% - of Amway Japan to the Japanese public. The Tokyo market values Amway Japan at \$5 billion, a fanciful value based more on the tiny amount of stock outstanding than the business' inherent value. Next foreign targets: Brazil, Poland, Indonesia, China, the Philippines, and Czechoslovakia.

DeVos is convinced that motivating foreigners is no different from motivating people in the U.S. "In Mexico, people will ride a bus for hours to come to an Amway meeting because Amway will give them a shot at success. Most of these people have believed for generations that they would never be anybody, because the rich guy on the hill told them they'd never be anybody. But the Amway business has come to symbolize for great numbers of people their chance to get out of their rut".

As the sleep of centuries lifts from more and more people around the world, as the dead hand of socialism vanishes, this message should bring recruits flocking to the Amway banner all across the world.

Will the message continue to reverberate when DeVos and Van Andel are gone? There are simple signs that the company is preparing for that day. Several top executives have taken early retirement, and there are rumours that Nicholson is on his way out. DeVos and Van Andel each have four children; all but one - Richard DeVos Jr. - work for Amway. "My guess is that we will have professional management, at least initially", says Van Andel.

But can hired hands run a truly entrepreneurial business of this sort? Probably not. Amway may well decline when DeVos and Van Andel are gone. But there will be other Amways. The business is rooted in principles deeply rooted in human nature.

False Profits

Seeking Financial and Spiritual Deliverance in Multi-Level Marketing and Pyramid Schemes

by Robert L. Fitzpatrick and Joyce Reynolds

Charlotte, N.C.: Herald Press, 1997

The best thing about this book is its title, a clever play on the religious undercurrent of the main multi-level marketing (MLM) schemes such as Amway. But the authors' proposal to replace the false hopes of MLM and pyramid schemes with the vacuous platitudes and profound errors of the likes of M. Scott Peck and Marsha Sinetar is not one this reader has any sympathy for. I can't recommend this book in general, but I do recommend it to anyone contemplating joining an MLM business.

The authors argue that the apparent motive of greed, which drives the millions of people who are recruited into MLM schemes, is really a quest for spiritual fulfillment. Those seeking the City of Man are really seeking the City of God. It is true that much of the claptrap and ritual associated with MLM organizations more than vaguely resemble the trappings of evangelistic religions. And it is true that both religious and MLM devotees unabashedly identify financial success with spirituality. Pat Robertson, Jerry Falwell, and all the other hypocrites for Christ not only do not apologize for their materialistic ambitions, they seem to identify God's love for them with their worldly success. Personally, I liked the old-time religion of the Rev. Ike, a televangelist in the sixties who wore diamond rings on every finger and demonstrated the glories of God in a parade of testimonials of God-inspired money. Ike was no hypocrite. God wants you to be rich, he said. If you love God, he'll reward you with money. Prove you love God by sending Ike money. It was that simple. Falwell and Robertson make the same appeal, only they are much less straightforward about it.

The authors do a good job of comparing the tenets of the MLM faithful with that of New Age spiritual seekers and televangelists. But I think they overstate the case for their notion that seeking financial abundance is (a) identified with (a false) spiritual enlightenment, and (b) a substitute for real spiritual

enlightenment. It's true that many MLM advocates talk about "unimagined wealth" but most of those who are recruited into MLM schemes do it to make a few bucks on the side. They may be deluded into thinking that if there's big bucks to be made doing this, surely there will be some chump change left for me. But I don't think the majority join Amway, Shaklee, or any of the dozens of MLM programs selling vitamins and minerals, so that they can retire on easy street without working. Most of them join to supplement their income. They're not after any kind of salvation, financial or spiritual.

That's not to say that there are not MLM advocates who are seeking vast riches and think they're doing God's work as they get rich. When I first put an entry for Amway in my *Skeptic's Dictionary* it was a short piece based on a funny story I'd read in the *Wall Street Journal* about a guy who wanted to be the first Amway king of Poland. He told his potential recruits something like "hey, if ten million people can be talked into believing in communism, surely you can recruit six to believe in Amway!" Other than having been tricked into attending a recruiting party by my mother's next-door neighbor and buying some shoe polish from a friend of a co-worker, I didn't know much about Amway at the time. I was soon to learn that Amway people are not ordinary. The vitriolic mail I received was way out of proportion to the article. "Amway" soon became my number one entry: about 4,000 people a month were visiting my Amway page and it seemed like half of them were letting me know that I was a killer of dreams, a destroyer of lives, a negative force in a universe which needed positive light; I was attacked for having evil motives, for trying to ruin the lives of people who were doing their best to succeed. I got a lot of mail from people who told me they were Christians and wished me well as I spent my life working for others while they retired on easy street in their twenties. I got letter upon letter telling me my data was all wrong. They'd be rich while I stayed poor. I posted most of this mail. It now occupies five files, each as long as the current Amway entry, which I revised extensively after doing some more research. I can attest from the mail I've received from many Amway distributors that what Fitzpatrick and Reynolds claim is true about many MLMers seeking wealth and identifying their quest with endearment to God. But it is not true of all of them. Many, as I said, are just looking for way to supplement their income.

False Profits makes a convincing case that no MLM scheme is a good way to go about making money, either a little bit or a lot. That is the strength of this book: it details the economic absurdity of the concept of multi-level marketing. First, there is the comparison with [pyramid schemes](#). The authors examine the history and popularity of such schemes, even among the educated and literate, although they are illegal. Being illegal has never put a damper on these schemes, even among people in law enforcement, who can be as greedy and needy as the rest of us. One thing you will hear from Amway folk is that they are *not* a pyramid scheme. How do they know this? They know this because some agency of the federal government said so. Some court ruled that since Amway does not charge people either for joining Amway or for the privilege of recruiting others as distributors, it is not an illegal pyramid. What

Amway and all other legal MLM businesses are, then, are **legal pyramid schemes**. *False Profits* demonstrates the inexorable math, as well as the simple economics of the matter, that MLMs can only provide financial success at the expense of many who must fail. MLMs only sell products because they have to in order to be legal; otherwise, all they would sell is hope. The focus of any MLM is not on selling a product, but on recruiting more distributors who recruit more distributors ad infinitum, but of course there is no ad infinitum and that is why most who join in will not make money in either a pyramid scheme or an MLM scheme.

I would recommend this book only to those who are contemplating joining an MLM business. You should read this book before you get into the business. It will show you that all the positive thinking in the world, all the lies you will have to tell about what you do and how well you are doing it, are not worth it in the end. You will be asked to recruit your family and friends and you will probably end up losing both in your quest for wealth. You will gain a new family, a new community, of equally positive-sounding, energized people who admire millionaires and try to end world hunger, but it will not be worth it. You will buy motivational tapes, pay for motivational seminars, buy motivational books and attend motivational meetings. You will be motivated and energized, but it will not be worth it. You will end up losing friends, family, money and time. You may even be duped into thinking God wants you to be rich and MLM is God's way of rewarding those who love Him, but it will not be worth it. You will be deluded into thinking that the only thing keeping you from your dreams is your attitude. The only thing honest about multi-level marketing is its legality. To find out just how deep the dishonesty and deceit goes, read *False Profits*.

[Recommendations and Rejections](#)

HIDDEN PERSUADERS, by Tony Thompson, [Time Out](#), June 22 - 29 1994

(Amway says it can make you rich beyond your wildest dreams with its multi-level marketing system; critics say it only makes money for a very few at the top, and its techniques are worryingly cult-like. **Tony Thompson** asks if vulnerable Londoners are being misled by this and other groups promising to transform your life.)

It was two days after he had been seen on national television, helping a young girl break away from a religious sect, that the call came through to Graham Baldwin's office.

The former university chaplain who now runs Catalyst, a counselling and therapy service for those affected by cults, listened carefully as the man explained how the group he had joined a year earlier was slowly taking over his life.

There were the huge monthly meetings at venues like Wembley Conference Centre where he and thousands of other followers were worked into a passionate frenzy then told to go out and find as many new recruits as possible; the powerful doctrine that frowned on television, newspapers and other 'negative' influences; there was the strict dress code and the advice on how to bring up children and relate to loved ones; there was the fear that to quit would mean giving up hope of a happy future.

However, having seen the television show featuring Baldwin, the man now alleged that he was being subjected to mind control techniques and being manipulated by those above him. He wanted advice on making a possible break. Baldwin asked which cult the man was in.

"It's not a cult. It's not a religion. It's something called Amway".

At first glance, the Amway Corporation, one of the largest direct-sales companies in the world, couldn't be less cult-like. Founded by two school-friends in a basement in Michigan in the US in 1959 with a single soap product, the company has grown into a \$4.5 billion-a-year manufacturing and sales network employing some 11,000 workers in more than 50 countries across the world. Its founders, Jay Van Andel and Richard DeVos, are said to be worth at least \$3bn each.

Amway currently manufactures thousands of products from

cosmetics and cookware to household cleaners and vitamins. None of these is available in the shops - instead they are sold direct to the public, person-to-person, by a multi-level marketing network of two million independent distributors who earn a commission on everything they sell.

Amway came to the UK in 1973 and now has 73,000 British distributors, who sell mostly to friends and family in their spare time, on a self-employed basis. The company is highly respected in business circles - at a recent motivational seminar for distributors, former Chancellor Norman Lamont delivered a keynote speech. In the last financial year the British operation turned over £50 million, an increase of 56 per cent on the previous year. Projected turnover for 1993-94 is £70 million.

This phenomenal growth is not solely due to the company's products but more down to the fact that it offers virtually anyone and everyone a deal which many, especially those bitten by recession, find hard to resist. Join us, say Amway's distributors, and within two to five years you could be rich beyond your wildest dreams and spend your days 'walking the beaches of the world'.

A recruitment video, presented by Michael Aspel, features couples who live in enormous detached houses and have luxury cars, talking about how much freedom and independence the Amway opportunity has given them. The narrative tells how the company is built on 'ethics and integrity' and how it has helped 'thousands improve the quality of their lives'.

However, a major investigation by Time Out has uncovered evidence that:

- * Far from boosting their incomes, the vast majority of those who become Amway distributors, particularly those in 'the system', are likely to end up losing money.
- * Support groups headed by senior distributors within the Amway organization are adopting cult-style tactics to recruit and motivate those below them. Help groups such as Catalyst, the Cult Information Centre and Family Action Information and Rescue (FAIR) are increasingly receiving calls from worried Amway distributors and their families, concerned about the techniques being used to keep them in the organization.
- * The majority of the wealth of the tiny number of top-ranked

distributors in this country comes not just from the sale of Amway products but from selling motivational materials and organizing seminars and rallies for the people below them.

The basic principle of the multi-level marketing which Amway uses is that it is far easier to make a living by taking 1 per cent of the sales efforts of 100 people than it is to rely on 100 per cent of your own efforts.

Thus Amway distributors only spend a fraction of their time dealing with their customers - most of whom are friends and family. Instead, the majority of their time is spent trying to recruit others into the network. The basic scenario goes something like this: you recruit or 'sponsor' six friends into the organization. They in turn each sponsor three friends who in turn each sponsor two more friends. You then have a 'downline' of 60 people. If each one sells say a mere £140 worth of products each month, you earn a commission of £1000. The more people in your downline, the bigger your cut.

Furthermore, as the sales volume of your group grows, you can earn bonuses on top of your commission. Each new bonus level is given a title. Those on the bottom level of 'leadership' are known as 'direct' distributors while those above them - the 'upline' - are known in ascending order as Pearls, Emeralds, and Diamonds. Typically these 'jewels' have thousands in their downlines and the most successful are said to be millionaires.

Finding sponsors is known as 'showing the plan' and the keenest recruits will devote four or five evenings a week to building their networks. As rejection is common, recruits are urged to join the 'system' which helps to boost confidence, hone people skills and top up motivation. Those who are fed a near constant diet of positive mental attitude books, inspiring motivational audio tapes and invited along to regular training meetings and seminars all of which they are told will make their business grow faster and bring financial freedom all the nearer.

But in reality, few distributors go on to achieve their goals. The drop-out rate is around 50 per cent and even for those who remain, the dreams go unfulfilled. Colin, a former Amway direct distributor from Hackney, decided to quit after becoming disillusioned. He has since received help from the Cult Information Centre to help him get over the experience.

"When you go out showing the plan, it's less about explaining the business and more about finding out what the person really wants out of life, then showing how Amway can help them achieve it. You tell people this can help their dreams come true. You explain that they are caught in a rut. That they will work 40 years and once they hit 65, they will be either be broke, dead or dead broke.

"If they are not money-minded, you put the emphasis on how much the money can help others - "you can give to charities and make a real difference; you can pay your parents back for all the work they put into bringing you up." Otherwise you just play on their greed. "You can have that big house in the country, the BMW, you can buy your daughter that pony for Christmas, you can take that two-week holiday in the Far East"."

Colin and his wife would go out showing the plan four or five nights a week, often driving hundreds of miles to see potential prospects. Although their network and sales volume grew, they still found they were spending far more on petrol, telephone calls and other expenses that they were making.

Then there was the cost of the 'system' itself. "We'd get a tape each week and a book each month. Then we'd be expected to attend weekly training meetings and monthly rallies and seminars. Although it was only a few pounds at a time, it really did start to add up."

Although he was losing money, Colin stuck with the system, mainly because of the encouragement of his tremendously wealthy upline Diamond. After two-and-a-half years, Colin eventually reached the direct level and found that, after expenses, he and his wife were making around £400 a month for a job that seemed to be taking up virtually all their spare time.

"My Diamond kept saying that one day I'd see how the business worked. Once I did, I realised I couldn't stay in it any more."

Colin's Diamond explained that his real wealth came from selling books and tapes and from organizing the meetings. "I'd always been told to ensure my entire downline were completely plugged into the system and that they went to every meeting. You're told that books and tapes are the tools you need to build a successful business but in fact we were just lying to people to line the pockets of the jewels above us. I didn't feel right about joining in with that so I left".

One problem is that the 'system' itself is nothing to do with Amway. It is run by top-level jewel distributors who, once they have enough people in their downline, branch out. They become known as 'black hats' and all the wealth that comes out of the books and tapes goes straight to them, not the corporation.

In 1985, Don Gregory, a former speechwriter for Amway co-founder Jay Van Andel, told Forbes magazine: "Recruits are brainwashed into spending a fortune on peripherals while consuming Amway products. They either lose their shirts or begin making money by getting enough people underneath to do the same". In the same issue a major Amway black hat, Dexter Yeager, whose downline includes the majority of Britain's distributors, admits that two-thirds of his income came from tapes and books.

The individual cost of training materials may be low - a mere £3.40 for a tape for example. But if the tape itself costs only £1 to produce and you have 7,000 in your downline as Colin's Diamond does, and they buy one a week, then that's a clear profit of £16,800 per week. £873,600 a year. The Yeager downline is believed to be in excess of 150,000.

In 1985, Amway, Yeager and another black hat, Bill Britt, were taken to court by two former distributors who alleged they had been brainwashed into buying books and tapes. The case was settled out of court in 1988 with no admission of liability from the corporation.

In order to benefit from the book, tape and seminar profits - the hidden business within the Amway business - you first have to reach at least the direct level and above, something that only a tiny proportion of all those who join Amway actually achieve. The company has admitted to Time Out that the number of directs and above in Britain is between 1 and 2 per cent of the total number of distributors. At the most, this amounts to between 700 and 1,400 people out of the 73,000 currently signed to Amway. According to Amway's hypothetical models of how a distributor's network would grow, a direct distributor would earn a minimum of £1000 per month.

However, even reaching the direct level is no guarantee of financial freedom. In 1982, the Amway Corporation was taken to court by the State of Wisconsin on a charge of deceptive business practice. Assistant Attorney Bruce Craig had examined the tax records of the 20,000 Amway distributors in the state to see how many were actually making the money they joined for.

He too found the number of direct distributors was around 1 per cent but far more startling was the revelation that within that 1 per cent, the average direct distributor was, after the deduction of business expenses, making a net income of minus \$918 per year, despite a personal Amway turnover of \$14,000 per year.

As a result of the subsequent court case, Amway is now obliged to disclose details of average gross incomes - though only in America.

Internal Amway documents obtained by Time Out show the average distributor income last year was just \$65 per month gross, a figure that has actually dropped from an average of \$76 three years ago.

Time Out put its questions about the chances of making money, the suggestion of cult-style tactics and the wealth being generated by book and tape sales to Amway which wrote back at length with descriptions of its philosophies.

It did, however, admit that it intends to begin monitoring all books and tapes issued by independent distributors in the near future. It denied being cult-like (though Time Out's question refers not to the corporation but to the techniques employed by the black hat groups), stating that because the company rewards individual achievement, its concept is the opposite of a cult.

As is the case with virtually all multi-level marketing companies, at least half of all Amway distributors will quit in any given year but they are more than replaced by eager new recruits, keen to make their dreams come true. But for those who fail to strike it rich, there is often a feeling of disillusionment. "They are constantly told that anyone can succeed with Amway, if they do not, they can only feel downtrodden", says a spokeswoman at FAIR. "They don't realise they have been in a group which is cultic, they blame themselves for failing".

And for those distributors who remain loyal to the company whether they make money or not, one of the most popular in-jokes must ring painfully true: "Hear the one about the woman who was married to an Amway distributor for 15 years but was still a virgin? All he did was sit at the end of the bed and talk about how great it was going to be".

ancient astronauts and Erich von Däniken's *Chariots of the Gods?*

The term 'ancient astronauts' designates the speculative notion that aliens are responsible for the most ancient civilizations on earth. The most notorious proponent of this idea is Erich von Däniken, author of several popular books on the subject. His *Chariots of the Gods? Unsolved Mysteries of the Past*, for example, is a sweeping attack on the memories and abilities of ancient peoples. Von Däniken claims that the myths, arts, social organizations, etc., of ancient cultures were introduced by astronauts from another world. He questions not just the capacity for memory, but the capacity for culture and civilization itself, in ancient peoples. Prehistoric humans did not develop their own arts and technologies, but rather were taught art and science by visitors from outer space.

Where is the proof for von Däniken's claims? Some of it was fraudulent. For example, he produced photographs of pottery that he claimed had been found in an archaeological dig. The pottery depicts flying saucers and was said to have been dated from Biblical times. However, investigators from *Nova* (the fine public-television science program) found the potter who had made the allegedly ancient pots. They confronted von Däniken with evidence of his fraud. His reply was that his deception was justified because some people would only believe if they saw proof ("The Case of the Ancient Astronauts," first aired 3/8/78, done in conjunction with BBC's *Horizon* and Peter Spry-Leverton)!

However, most of von Däniken's evidence is in the form of specious and fallacious arguments. His data consists mainly of archaeological sites and ancient myths. He begins with the ancient astronaut assumption and then forces all data to fit the idea. For example, in [Nazca](#), Peru, he explains giant animal drawings in the desert as an ancient alien airport. The likelihood that these drawings related to the natives' religion or science is not considered. He also frequently reverts to false dilemma reasoning of the following type: "*Either* this data is to be explained by assuming these primitive idiots did this themselves *or* we must accept the more plausible notion that they got help from extremely advanced peoples who must have come from other planets where such technologies as anti-gravity devices had been invented." His devotion to this theory has not dwindled, despite contrary evidence, as is evidenced by still another book on the subject, *Arrival of the Gods: Revealing the Alien Landing Sites at Nazca* (1998).

There have been many critics of von Däniken's notions, but Ronald Story stands out as the most thorough. Most critics of von Däniken's theory point

out that prehistoric peoples were not the helpless, incompetent, forgetful savages he makes them out to be. (They must have at least been intelligent enough to understand the language and teachings of their celestial instructors--no small feat!) It is true that we still do not know how the ancients accomplished some of their more astounding physical and technological feats. We still wonder how the ancient Egyptians raised giant obelisks in the desert and how stone age men and women moved huge cut stones and placed them in position in dolmens and passage graves. We are amazed by the giant carved heads on Easter Island and wonder why they were done, who did them, and why they abandoned the place. We may someday have the answers to our questions, but they are most likely to come from scientific investigation not pseudoscientific speculation. For example, observing contemporary stone age peoples in Papua New Guinea, where huge stones are still found on top of tombs, has taught us how the ancients may have accomplished the same thing with little more than ropes of organic material, wooden levers and shovels, a little ingenuity and a good deal of human strength. [Nova's "Secrets of Lost Empires"](#) made no appeal to alien teachers in the attempt to figure out how the ancient Egyptians might have raised a giant [obelisk](#), how the medieval warriors built their [catapults](#) and how & why the sculptors of [Easter Island](#) did what they did.

We have no reason to believe our ancient ancestors' memories were so much worse than our own that they could not remember these alien visitations well enough to preserve an accurate account of them. There is little evidence to support the notion that ancient myths and religious stories are the distorted and imperfect recollection of ancient astronauts recorded by ancient priests. The evidence to the contrary--that prehistoric or 'primitive' peoples were (and *are*) quite intelligent and resourceful--is overwhelming.

Of course, it is possible that visitors from outer space did land on earth a few thousand years ago and communicate with our ancestors. But it seems more likely that prehistoric peoples themselves were responsible for their own art, technology and culture. Why concoct such an explanation as von Däniken's? To do so may increase the mystery and romance of one's theory, but it also makes it less reasonable, especially when one's theory seems inconsistent with what we already know about the world. The ancient astronaut hypothesis is unnecessary. [Occam's razor](#) should be applied and the hypothesis rejected.

Nazca lines

The Nazca lines are [geoglyphs](#) and geometric line clearings in the Peruvian desert. They were made by the Nazca people, who flourished between 200 BCE and 600 CE along rivers and streams that flow from the Andes. The desert itself runs for over 1,400 miles along the Pacific Ocean. The area of the Nazca art is called the [Pampa Colorada](#) (Red Plain). It is 15 miles wide and runs some 37 miles parallel to the Andes and the sea. Dark red surface stones and soil

have been cleared away, exposing the lighter colored subsoil, creating the "lines". There is no sand in this desert. From the air, the "lines" include not only lines and geometric shapes, but also depictions of [animals and plants in stylized forms](#). Some of the forms, including images of humans, grace the steep hillsides at the edge of the desert.

The Nazca lines are communal. Their creation took hundreds of years and required a large number of people working on the project. Their size and their purpose have led some to speculate that visitors from another planet either created or directed the project. [Erich von Däniken](#) thinks that the Nazca lines formed an airfield for alien spacecraft*, an idea first proposed by James W. Moseley in the October 1955 issue of *Fate* and made popular in the early sixties by Louis Pauwels and Jacques Bergier in *The Morning of the*

Magicians. If Nazca was an alien airfield, it must have been a very confusing airfield, consisting as it does of giant lizards, spiders, monkeys, llamas, dogs, hummingbirds, etc., not to mention the zigzagging and crisscrossing lines and geometric designs. It was very considerate of

the aliens to depict plants and animals of interest to the locals, even though it must have meant that navigation would be more difficult than a straight runway or a large clearing. Also, the airport must have been a very busy place, needing 37 miles of runway to handle all the traffic. However, it is unlikely spacecraft could have landed in the area without disturbing some of the artwork or the soil. There is no evidence of such disturbance.

The alien theory is proposed mainly because some people find it difficult to believe that a race of primitive "Indians" could have had the intelligence to conceive of such a project, much less the technology to bring the concept to fruition. The evidence points elsewhere, however. The Aztecs, the Toltecs, the [Inca](#), the Maya, etc., are proof enough that the Nazca did not need extraterrestrial help to create their art gallery in the desert.

In any case, one does not need a very sophisticated technology to create large figures, geometrical shapes, and straight lines, as has been shown by the creators of so-called [crop circles](#). The Nazca probably used [grids](#) for their giant geoglyphs, as their [weavers](#) did for their elaborate designs and patterns. The most difficult part of the project would have been moving all the stones and earth to reveal the lighter subsoil. There really is nothing mysterious about *how* the Nazca created their lines and figures.

Some think it is mysterious that the figures have remained intact for so many hundreds of years. However, the geology of the area solves that mystery.

Stones (not sand) comprise the desert surface. Rusted by humidity, their darkened color increases heat absorption. The resulting cushion of warm surface air acts as a buffer against the wind; while minerals in the soil help to solidify the stones. On the "desert pavement" thus created in this dry, rainless environment, erosion is practically nil - making for remarkable preservation of the markings.*

The mystery is *why*. Why did the Nazca engage in such a project involving so many people for so many years?

G. von Breunig thinks the lines were used for running footraces. He examined the curved pathways and determined that they were partially shaped by continuous running. Anthropologist Paul Kosok briefly maintained that the lines were part of an irrigation system, but soon rejected the notion as impossible. He then speculated that the lines formed a gigantic calendar. [Maria Reiche](#), a German immigrant and apprentice archaeologist to Julio Tello of the University of San Marcos, developed Kosok's theory and spent most of her life collecting data to show that the lines represent the Nazca's astronomical knowledge. Reiche identified many interesting astronomical alignments, which had they been known to the Nazca might have been useful in planning their planting and harvesting. However, there are so many lines going in so many different directions that *not* finding many with interesting astronomical alignments would have been miraculous.

modern anthropology and the lines

The Nazca lines became of interest to anthropologists after they were seen from the air in the 1930s. It is unlikely that a project of this magnitude was not religious in purpose. To involve the entire community for many centuries indicates the supreme significance of the site. Like pyramids, giant statues, and other monumental art, the Nazca art speaks of permanence. It says: we are here and we are not moving. These are not nomads, nor are they hunters and gatherers. This is an agricultural society. It is, of course, a pre-scientific agricultural society, who turned to magic and superstition (i.e., religion) to assist them with their crops. The Nazca had the knowledge to irrigate, plant, harvest, collect, distribute, etc. But the weather is fickle. Things might go smoothly for years, or even centuries, and then, in a single generation entire communities are forced to leave because of extended drought or because of floods or tidal waves, volcanic eruptions, earthquakes, fires, or whatever else Mother Nature might hurl their way.

Was this a site for worship? Was this the Mecca of the Nazca? a place of pilgrimage? Were the images part of rituals aimed at appeasing the gods or asking for help with the fertility of the people and the crops, or with the weather or with a good supply of [water](#)? That the figures could not be seen as those in the heavens might see them would not be that important for religious or magical purposes. In any case, similar figures to the giants at Nazca [decorate](#) the pottery found in nearby burial sites and it is apparent from their [cemeteries](#) that the Nazca were preoccupied with death. [Mummified remains](#) litter the desert, discarded by grave robbers. Was this a place for rituals aimed at bringing immortality to the dead? We don't know, but if this mystery is ever to be cleared up it will be by serious scientists, not by alienated pseudoscientific speculators molding the data to fit their extraterrestrial musings.

the face on Mars

The face on Mars is the image of some photographs of the Cydonia region of Mars taken in 1976 by the Viking Orbiter. The image is most likely of a natural formation but some people see a face or a building and are convinced that it was constructed by intelligent beings.

According to [Gary Posner](#), the one most responsible for the view that the face on Mars is an alien construction is Richard C. Hoagland, author of *The Monuments of Mars: A City on the Edge of Forever* (1987).

NASA claims that the photos are just a play of light and shadow. Some took this explanation as a sure sign of a cover-up. Some engineers and computer specialists digitally enhanced the NASA images. This soon gave birth to the claim that the face was a sculpture of a human being located next to a city whose temples and fortifications could also be seen. Some began to wonder: were these built by the same beings who built the [ancient airports in Peru](#) and who were now communicating to us through elaborate symbols carved in wheat [crop circles](#)? Others took the wonder to the level of belief, based on the flimsiest of evidence and the grandest of imagination. Carl Sagan's more down-to-earth explanation for the face on Mars is that it is the result of erosion and winds and other natural forces (Sagan, 52-55). Such a view seems most reasonable under the circumstances.

NASA's Mars Odyssey orbiter sent back some more detailed pictures in July, 2002 that seems to slap the face into the ground with a group of other slapped faces. Much to the dismay of mystery mongers, NASA says that the Cydonia region is a "normal geologic feature with slopes and ridges carved by eons of wind and downslope motion due to gravity."[*](#)

The Dogon and Sirius

The Dogon are a people of about 100,000 who dwell in western Africa. According to Robert Temple (*The Sirius Mystery*), the Dogon had contact with some ugly, amphibious* extraterrestrials, the Nommos, some 5,000 years ago. The aliens came here for some unknown reason from a planet orbiting [Sirius](#) some 8.6 light years from earth. The alleged visitors from outer space seem to have done little else than give the earthlings some useless astronomical information.

One of Temple's main pieces of evidence is the tribe's alleged knowledge of Sirius B, a companion to the star **Sirius**. The Dogon are supposed to have known that Sirius B orbits Sirius and that a complete orbit takes fifty years. One of the pieces of evidence Temple cites is a sand picture made by the Dogon to explain their beliefs. The diagram that Temple presents, however, is not the complete diagram that the Dogon showed to the French anthropologists Marcel Griaule and Germaine Dieterlen, who were the original sources for Temple's story. Temple has either misinterpreted Dogon beliefs, or distorted Griaule and Dieterlen's claims, to fit his fantastic story.

Griaule and Dieterlen describe a world renovation ceremony, associated with the bright star Sirius (sigu tolo, "star of Sigui"), called sigui, held by the Dogon every sixty years. According to Griaule and Dieterlen the Dogon also name a companion star, po tolo "Digitaria star" (Sirius B) and describe its density and rotational characteristics. Griaule did not attempt to explain how the Dogon could know this about a star that cannot be seen without telescopes, and he made no claims about the antiquity of this information or of a connection with ancient Egypt.*

Temple lists a number of astronomical beliefs held by the Dogon that seem curious. They have a traditional belief in a heliocentric system and in elliptical orbits of astronomical phenomena. They seem to have knowledge of the satellites of Jupiter and rings of Saturn, among other things. Where did they get this knowledge, he asks, if not from extraterrestrial visitors? They don't have telescopes or other scientific equipment, so how could they get this knowledge? Temple's answer is that they got this information from amphibious aliens from outer space.

Afrocentrists, on the other hand, claimed that the Dogon could see Sirius B without the need of a telescope because of their special eyesight due to quantities of melanin (Welsing, F. C. 1987. "Lecture 1st Melanin Conference,

San Francisco, September 16-17, 1987"). There is, of course, no evidence for this special eyesight, nor for other equally implausible notions such as the claim that the Dogon got their knowledge from black Egyptians who had telescopes.

a terrestrial source?

Carl Sagan agreed with Temple that the Dogon could not have acquired their knowledge without contact with an advanced technological civilization. Sagan suggests, however, that that civilization was terrestrial rather than extraterrestrial. Perhaps the source was Temple himself and his loose speculations on what he learned from Griaule, who based his account on an interview with one person, Ambara, and an interpreter.

According to Sagan, western Africa has had many visitors from technological societies located on planet earth. The Dogon have a traditional interest in the sky and astronomical phenomena. If a European had visited the Dogon in the 1920's and 1930's, conversation would likely have turned to astronomical matters, including Sirius, the brightest star in the sky and the center of Dogon mythology. Furthermore, there had been a good amount of discussion of Sirius in the scientific press in the '20s so that by the time Griaule arrived, the Dogon may have had a grounding in 20th century technological matters brought to them by visitors from other parts of earth and transmitted in conversation.

Or, Griaule's account may reflect his own interests more than that of the Dogon. He made no secret of the fact that his intention was to redeem African thought. When the Belgian Walter van Beek studied the Dogon, he found no evidence they knew Sirius was a double star or that Sirius B is extremely dense and has a fifty-year orbit.

Knowledge of the stars is not important either in daily life or in ritual [to the Dogon]. The position of the sun and the phases of the moon are more pertinent for Dogon reckoning. No Dogon outside of the circle of Griaule's informants had ever heard of *sigu tolo* or *po tolo*... Most important, no one, even within the circle of Griaule informants, had ever heard or understood that Sirius was a double star (Ortiz de Montellano).*

According to Thomas Bullard, van Beek speculates that Griaule "wished to affirm the complexity of African religions and questioned his informants in such a forceful leading manner that they created new myths by [confabulation](#)." Griaule either informed the Dogon of Sirius B or "he misinterpreted their references to other visible stars near Sirius as recognition of the invisible companion" (Bullard).

The only mystery is how anyone could take seriously either the notion of amphibious aliens or telescopic vision due to melanin.

Zecharia Sitchin and *The Earth Chronicles*

"...he's just another nut making a living selling books that treat folks to a tale they want to believe in."

---Rob Hafernik

Zecharia Sitchin, along with Erich [von Däniken](#) and Immanuel [Velikovsky](#), make up the holy trinity of [pseudohistorians](#). Each begins with the assumption that ancient myths are not myths but historical and scientific texts. Sitchin's claim to fame is announcing that he alone correctly reads ancient Sumerian clay tablets. All other scholars have misread these tablets which, according to Sitchin, reveal that gods from another planet (Niburu, which orbits our Sun every 3,600 years) arrived on Earth some 450,000 years ago and created humans by genetic engineering of female apes. Niburu orbits beyond Pluto and is heated from within by radioactive decay, according to Sitchin. No other scientist has discovered that these descendents of gods blew themselves up with nuclear weapons some 4,000 years ago. Sitchin alone can look at a Sumerian tablet and see that it depicts a man being subjected to radiation. He alone knows how to correctly translate ancient terms allowing him to discover such things as that the ancients made rockets. Yet, he doesn't seem to know that the seasons are caused by the earth's tilt, not to its distance from the sun.

Sitchin was born in Russia, was raised in Palestine, graduated from the University of London with a degree in economic history. He worked for years as a journalist and editor in Israel before settling in New York.

Sitchin, like Velikovsky, presents himself as erudite and scholarly in a number of books, including *The Twelfth Planet* (1976) and *The Cosmic Code* (1998). Both Sitchin and Velikovsky write very knowledgeably of ancient myths and both are nearly scientifically illiterate. Like von Däniken and Velikovsky, Sitchin weaves a compelling and entertaining story out of facts, misrepresentations, fictions, speculations, misquotes, and mistranslations. Each begins with their beliefs about ancient visitors from other worlds and then proceeds to fit facts and fictions to their basic hypotheses. Each is a master at ignoring inconvenient facts, making mysteries where there were none before, and offering their alien hypotheses to solve the mysteries. Their works are very attractive to those who love a good mystery and are ignorant of the nature and limits of scientific knowledge.

Sitchin promotes himself as a Biblical scholar and master of ancient languages, but his real mastery was in making up his own translations of Biblical texts to support his readings of Sumerian and Akkadian writings.

He's let us know he's going to twist the translations around to support his thesis. Indeed, a reader of Sitchin's book would do well to keep a couple of Bibles handy to check up on the verses Sitchin quotes. Many of them will sound odd or unrecognizable because they have been translated from their familiar form (this is made harder by the fact that Sitchin rarely tells you just which verse he is quoting). This would be much more acceptable if he wasn't using the twisted translations to support the thesis that led to the twisted translations (Hafernik).

Most of Sitchin's sources were obsolete. He received nothing but ridicule from scientific archaeologists and scholars familiar with ancient languages. His most charming quality seems to be his vivid imagination and complete disregard for established facts and methods of inquiry, traits that are apparently very attractive to some people.

Sitchin's ideas have been appropriated by Raël, another wise man, who has started his own religion ([Raëlian Religion](#)) around the idea that humans are the result of a DNA experiment by ancient visitors from outer space. Raël has even written a channeled book, dictated to him by extraterrestrials. It is called *The Final Message*. We can only hope it is.

Immanuel Velikovsky's *Worlds in Collision*

Reading something they can understand, that seems to make sense, that presents itself as technically competent, non-scientists are easily gulled by fake science. --Henry H. Bauer

The less one knows about science, the more plausible Velikovsky's scenario appears.... --[Leroy Ellenberger](#)

In 1950, Macmillan Company published Immanuel Velikovsky's *Worlds in Collision*, a book which asserts, among many other things, that the planet [Venus](#) did not exist until recently. Some 3500 years ago in the guise of a gigantic comet, it grazed Earth a couple of times, after having been ejected from the planet Jupiter some indefinite time earlier, before settling into its current orbit. Velikovsky (1895-1979), a psychiatrist by training, does not base his claims on astronomical evidence and scientific inference or argument. Instead, he argues on the basis of ancient cosmological myths from places as disparate as India and China, Greece and Rome, Assyria and Sumer. For example, ancient Greek mythology asserts that the goddess Athena sprang from the head of Zeus. Velikovsky identifies Athena with the planet Venus, though the Greeks didn't. The Greek counterpart of the Roman Venus was Aphrodite. Velikovsky identifies Zeus (whose Roman counterpart was the god Jupiter) with the planet Jupiter. This myth, along with others from ancient Egypt, Israel, Mexico, etc., are used to support the claim that "Venus was expelled as a comet and then changed to a planet after contact with a number of members of our solar system" (Velikovsky 1972,182).

Furthermore, Velikovsky then uses his Venus-the-comet claim to explain several events reported in the Old Testament as well as to tie together a number of ancient stories about flies. For example,

Under the weight of many arguments, I came to the conclusion--about which I no longer have any doubt--that it was the planet Venus, at the time still a comet, that caused the catastrophe of the days of Exodus (181).

When Venus sprang out of Jupiter as a comet and flew very close to the earth, it became entangled in the embrace of the earth. The internal heat developed by the earth and the scorching gases of the comet were in themselves sufficient to make the vermin of the earth propagate at a very feverish rate. Some of the plagues [mentioned in Exodus] like the plague of the frogs...or of the locusts, must be ascribed to

such causes (192).

The question arises here whether or not the comet Venus infested the earth with vermin which it may have carried in its trailing atmosphere in the form of larvae together with stones and gases. It is significant that all around the world people have associated the planet Venus with flies (193).

The ability of many small insects and their larvae to endure great cold and heat and to live in an atmosphere devoid of oxygen renders not entirely improbable the hypothesis that Venus (and also Jupiter, from which Venus sprang) may be populated by vermin (195).

Who can deny that vermin have extraordinary survival skills? But the cosmic hitchhikers Velikovsky speaks of are in a class all of their own. How much energy would have been needed to expel a "comet" the size of Venus and how hot must Venus have been to have only cooled down to its current surface temperature of 750° K during the last 3,500 years? What evidence is there that any locust larvae could survive such temperatures? To ask such questions would be to engage in scientific discussion, but one will find very little of that sort of discussion in *Worlds in Collision*. What one finds instead are exercises in comparative mythology, philology, and theology, which together make up Velikovsky's planetology. That is not to say that his work is not an impressive exercise and demonstration of ingenuity and erudition. It is very impressive, but it isn't science. It isn't even history.

What Velikovsky does isn't science because he does not start with what is known and then use ancient myths to illustrate or illuminate what has been discovered. Instead, he is indifferent to the established beliefs of astronomers and physicists, and seems to assume that someday they will find the evidence to support his ideas. He seems to take it for granted that the claims of ancient myths should be used to support or challenge the claims of modern astronomy and cosmology. In short, like the [creationists](#) in their arguments against evolution, he starts with the assumption that the Bible is a foundation and guide for scientific truth. Where the views of modern astrophysicists or astronomers conflict with certain passages of the Old Testament, the moderns are assumed to be wrong. Velikovsky, however, goes much further than the creationists in his faith; for Velikovsky has faith in *all* ancient myths, legends, and folk tales. Because of his uncritical and selective acceptance of ancient myths, he cannot be said to be doing history, either. Where myths can be favorably interpreted to fit his hypothesis, he does not fail to cite them. The contradictions of ancient myths regarding the origin of the cosmos, the people, etc. are trivialized. If a myth fits his hypotheses, he accepts it and interprets it to his liking. Where the myth doesn't fit, he ignores it. In short, he seems to make no distinction between myth, legends, and history. Myths may have to be interpreted but Velikovsky treats them as presenting historical

facts. If a myth conflicts with a scientific law of nature, the law must be revised.

If, occasionally, historical evidence does not square with formulated laws, it should be remembered that a law is but a deduction from experience and experiment, and therefore laws must conform with historical facts, not facts with laws (11).

One of the characteristics of a reasonable explanation is that it be a likely story. To be reasonable, it is not enough that an explanation simply be a possible account of phenomena. It has to be a likely account. To be likely, an account usually must be in accordance with current knowledge and beliefs, with the laws and principles of the field in which the explanation is made. An explanation of how two chemicals interact, for example, would be unreasonable if it violated basic principles in chemistry. Those principles, while not infallible, have not been developed lightly, but after generations of testing, observations, refutations, more testing, more observations, etc. To go against the established principles of a field puts a great burden of proof on the one who goes against those principles. This is true in all fields which have sets of established principles and laws. The novel theory, hypothesis, explanation, etc., which is inconsistent with already established principles and accepted theories, has the burden of proof. The proponent of the novel idea must provide very good reasons for rejecting established principles. This is not because the established views are considered infallible; it is because this is the only reasonable way to proceed. Even if the established theory is eventually shown to be false and the upstart theory eventually takes its place as current dogma, it would still have been unreasonable to have rejected the old theory and accepted the new one in the absence of any compelling reason to do so.

the scientific community's response to Velikovsky

Velikovsky was bitterly opposed by the vast majority of the scientific community, but the opposition may have been elicited mainly because of his popularity with "the New York literati" (Sagan 1979, 83). It is doubtful that many scientists even read Velikovsky, or read very much of *Worlds in Collision*. A knowledgeable astronomer and physicist would recognize after a few pages that the work is [pseudoscientific](#) twaddle. But the New York literary world considered Velikovsky a genius on par with "Einstein, Newton, Darwin and Freud" (Sagan, *ibid.*). To the scientific world it might be more accurate to say he was a genius on par with [L. Ron Hubbard](#). A number of scientists even threatened to boycott Macmillan's textbook division as a sign of their disgust that such twaddle should be published with such fanfare, as if the author were a great scientist. According to Leroy Ellenberger, "when the heat was applied by professors who were returning Macmillan textbooks unopened in protest and declining to edit new textbooks Macmillan gave the

book over to Doubleday, which had no textbook division."

Velikovsky is certainly *ingenious*. His explanations of parallels among ancient myths are very entertaining, interesting and apparently plausible. His explanation of universal collective amnesia of these worlds in collision is highly amusing and equally improbable. Imagine we're on earth 3,500 years ago when an object about the same size as our planet is coming at us from outer space! It whacks us a couple of times, spins our planet around so that its rotation stops and starts again, creates great heat and upheavals from within the planet and yet the most anyone can remember about these catastrophes are things like "...and the sun stood still" [*Joshua* 10: 12-13] and other stories of darkness, storms, upheavals, plagues, floods, snakes and bulls in the sky, etc. No one in ancient times mentions an object the size of earth colliding with us. You'd think someone amongst these ancient peoples, who all loved to tell stories, would have told their grandchildren about it. Someone would have passed it on. But no one on earth seems to remember such an event.

Velikovsky explains why our ancestors did not record these events as they occurred in a chapter entitled "A Collective Amnesia." He reverts to the old Freudian notion of [repressed memory](#) and neurosis. These events were just too traumatic and horrible to bear, so we all buried the memory of them deep in our [subconscious](#) minds. Our ancient myths are neurotic expressions of memories and [dreams](#) based on real experiences.

The task I had to accomplish was not unlike that faced by a psychoanalyst who, out of disassociated memories and dreams, reconstructs a forgotten traumatic experience in the early life of an individual. In an analytical experiment on mankind, historical inscriptions and legendary motifs often play the same role as recollections (infantile memories) and dreams in the analysis of a personality (12).

The typically unscientific theories and fanciful explanations of [psychoanalysis](#) seem even less credible when applied to the entire population, yet to the New York literati, in love as they were with all things Freudian, speculations such as these guaranteed one's genius.

It is not surprising that when one thumbs through any recent scientific book on cosmology, no mention is made of Velikovsky or his theories. His disciples blame this treatment of their hero as proof of a conspiracy in the scientific community to suppress ideas which oppose their own. Even now, more than fifty years later, after all of his major claims have been rejected or refuted, Velikovsky still has his disciples who claim he is not being given credit for getting at least some things right. However, it does not appear that he got anything of importance right. For example, there is no evidence on earth of a catastrophe occurring around 1500 B.C.E. Former Velikovsky disciple Leroy Ellenberger notes that

the Terminal Cretaceous Event 65 million years ago, whatever it was, left unambiguous worldwide signatures of iridium and soot. The catastrophes Velikovsky conjectured within the past 3500 years left no similar signatures according to Greenland ice cores, bristlecone pine rings, Swedish clay varves, and ocean sediments. All provide accurately datable sequences covering the relevant period and preserve no signs of having experienced a Velikovskian catastrophe.*

Current disciples think Velikovsky should get credit for anticipating catastrophism of the type that ended the reign of the dinosaurs some 65 million years ago. Critic David Morrison thinks otherwise.

Velikovsky focuses narrowly on encounters between the Earth and planets -- Mars and Venus. While he refers to Venus being accompanied by debris, the dominant agents of his catastrophes are tidal, chemical, and electrical interactions between planets, not meteoritic impacts. Remarkably, Velikovsky did not even accept (let alone predict) that the lunar craters are the result of impacts -- rather, he ascribed them to lava "bubbles" and to electric discharges. I see nothing in his vision that relates to our current understanding of interplanetary debris and the role of impacts in geological and biological evolution. I conclude that Velikovsky was fundamentally wrong in both his vision of planetary collisions (or near collisions) and in his failure to recognize the role of smaller impacts and collisions in solar system history.

If anything, says Morrison, "Velikovsky with his crazy ideas tainted catastrophism and discouraged young scientists from pursuing anything that might be associated even vaguely with him" (Morrison 2001, 70). Morrison polled 25 leading contemporary scientists who have played a significant role in the development of the "new catastrophism" and not one thought that Velikovsky had had any significant *positive* influence on "the acceptance of catastrophist ideas in Earth and planetary science over the past half-century." Nine thought he had had a negative influence (Morrison, *ibid.*).

Morrison points out several other misleading claims about Velikovsky being right. For example, Velikovsky was right that Venus is hot but wrong in how he came to that conclusion. He thought it was because Venus is a recent planet violently ejected from Jupiter and having traveled close to the sun. Venus is hot because of the greenhouse effect, something Velikovsky never mentioned. As to the composition of the atmosphere of Venus, Velikovsky thought it was hydrogen rich with hydrocarbon clouds. NASA put out an erroneous report in 1963 that said Mariner 2 had found evidence of

hydrocarbon clouds. In 1973 it was determined that the clouds are made mainly of sulfuric acid particles. Velikovsky was also right about Jupiter issuing radio emissions, but wrong as to why. He thought it was because of the electrically charged atmosphere brought on by the turbulence created by the expulsion of Venus. The radio emissions, however, are not related to the atmosphere but to "Jupiter's strong magnetic field and the ions trapped within it" (Morrison 65).

One of the few scientists to criticize Velikovsky's work on scientific grounds was Carl Sagan (Sagan 1979, 97), who was criticized even by Velikovsky's opponents for committing fallacies, making errors, and being intentionally deceptive in his argumentation. Henry Bauer does not even mention Sagan in his lengthy entry on Velikovsky in the *Encyclopedia of the Paranormal* (Prometheus 1996), unless he is making an oblique reference to Sagan when he writes about "some sloppy or invalid technical discussions by critics purporting to disprove Velikovsky's ideas." Whether Velikovsky's critics were fair-minded or not, there can be no denying the scientific indifference and incompetence of Velikovsky. He seemed satisfied that his study of myths established events which science must explain, regardless of whether those events clashed with the beliefs of the vast majority of the scientific community. In this he is like L. Ron Hubbard proposing *engrams*, which require [cellular memory](#), while not indicating that he was aware that such a hypothesis needed to be explained in light of current scientific knowledge about memory, the brain, etc. Both are like the so-called "creation scientists" who would create science anew if needed to justify the truth of their myths.

The essence of Velikovsky's unreasonableness lies in the fact that he does not provide scientific evidence for his most extravagant claims. His claims are based on assuming cosmological facts must conform to mythology. In general, he offers no support for the plausibility of his theory beyond an ingenious argument from comparative mythology. Of course, his scenario is logically possible, in the sense that it is not self-contradictory. To be scientifically plausible, however, Velikovsky's theory must provide some compelling reason for accepting it other than the fact that it helps explain some events described in the Bible or makes Mayan legends fit with Egyptian ones.

reader comments:

ancient astronauts and Erich von Däniken's *Chariots of the Gods*

12 Dec 1998

These stones were found in Peru after a river had changed course...I believe the name is Ica or Ika but anyway, these stones have detailed depiction's of dinosaurs, heart operations, a man watching the heavens with a telescope...literally thousands of these stones that I believe to be the depiction's of life in an advanced society that's now lost to history... so I believe Erich von Daniken was not taken to any cleaners...these stones exist.

Mark

reply: See the new entry on [the Ica stones](#).

Mark's reply:

..Oh please, this stuff again?

The existence of a superior technology existed thousands of years ago and the physical evidence supports that....whether Von Daniken is in the picture or not...you can be skeptical till the sun turns to dust and Earth freezes into oblivion...it's amazing how skeptics have it all figured out, but no evidence to support it....end of story.

reply: It's nice to see that Mark has thought this through to the end.

6 Nov 1998

Robert, I just read your entry regarding Erich Von Daniken. Regarding the pottery that he claimed was ancient, you wrote, "His reply was that his deception was justified because some people would only believe if they saw proof!"

I remember this episode of Nova vividly and while Von Daniken is a total fraud and liar, this was not what happened. I believe you were confusing his response with his response when confronted by the fact he never ventured into the cave he described in "Gold of the Gods."

What really happened is that the local carver, Bacilio, carved the rocks with heart transplants and the like for the local Mexican museum. Von Daniken claimed he found the rocks in the museum and asked the curator if they were for real. Von Daniken claims the curator answered, "Yes. Absolutely." By the time Nova caught up with the museum, the curator had died. But in fact, the rocks were donated by Bacilio. Bacilio even showed Nova the handwritten letter he received from the curator and it was written up in the local newspaper. So either Von Daniken was taken to the cleaners by the local curator or Von Daniken was lying again. I suspect the latter.

Pierre Stromberg
Pacific Northwest Skeptics

reply: I don't trust my memory and have no copy of the show to check. I will try to find a copy, however. In the meantime, continue distrusting von Däniken.

vitalism

Vitalism is the metaphysical doctrine that living organisms possess a non-physical inner force or energy that gives them the property of life.

Vitalists believe that the laws of physics and chemistry alone cannot explain life functions and processes. Vitalism is opposed to [mechanistic materialism](#) and its thesis that life emerges from a complex combination of organic matter.

The vitalistic principle goes by many names: [chi or qi](#) (China) [prana](#) (India and [therapeutic touch](#)), [ki](#) (Japan); Wilhelm Reich's [orgone](#), Mesmer's [animal magnetism](#), [Bergson's élan vital](#) (vital force), etc. American advocates much prefer the term *energy*. Many kinds of alternative therapies or *energy medicines* are based upon a belief that health is determined by the flow of this alleged energy. For examples, see [Ayurvedic medicine](#), [therapeutic touch](#), [reiki](#), and [qigong](#).

[Survey: Vast majority of Americans believe in angels](#)

angels

Angels are bodiless, immortal [spirits](#), limited in knowledge and power. God created angels to worship Him. Not all God's angels acted angelically, however. Some angels, led by [Satan](#), rebelled against a life of submission, and were cast out of Heaven. These bad angels were sent to Hell and are known as devils.

Not all angels are created equal. From top to bottom, the celestial hierarchy includes seraphim, cherubim, thrones; dominions, virtues, powers; principalities, archangels, and angels. Angels have different functions. Some do nothing but worship their Lord. Others are sent to deliver messages to creatures on earth. Some are sent as protectors of earthlings. Still others are sent to do battle with devils, who are viewed as initiators of evil temptations.

Even though angels are spirits and devoid of a physical nature, believers in angels have had no problem depicting and describing them. Angels, say their advocates, are invisible but can take the form of visible things. Angels are usually depicted with wings and looking like human adults or children. The wings are undoubtedly related to their work as messengers from **God**, who lives in the sky. The anthropomorphizing is understandable. Depiction enhances belief. But a *bodiless* creature cannot be depicted. A depiction of a creature of less than human stature would be undignified and unworthy of celestial creatures. Nevertheless, it is puzzling how a *bodiless* creature thinks and feels. To talk of a spirit as a *non-bodily creature* seems to be akin to talking of a "round square." Trying to imagine thinking or feeling occurring independently of a body is like trying to imagine the spherical shape of a ball occurring independently of the ball.

Since angels are invisible but capable of taking on visible forms, it is understandable that there have been many "sightings." Literally anything *could* be an angel and any experience *could* be an angel-experience. The existence of angels cannot be disproved. The down side of this tidy picture is that angels cannot be proved to exist, either. Everything that *could* be an angel could be something else. Every experience that *could* be due to an angel could be due to something else. Belief in angels, angel sightings and angel experiences is entirely a matter of faith.

Even if they exist only in the imagination, however, angels can be very useful. They can serve as monitors of behavior and protectors of children. A parent can try to control a child's behavior by convincing the child that an angel is

always watching over him or her. The angel is presented as being a kind of guardian, but the child will hopefully realize that the angel is also keeping track of all deeds, good and bad, even those done when mommy and daddy aren't around. The guardian angel is a comforting and versatile concept, and is the basis for many myths. Much entertainment in books, films and television programs is based on the concept of the guardian angel, often transformed into a superhuman master of occult powers.

Traditional religionists are not the only ones who love angels. New Age mythmakers have made an industry out of angels. Dozens of books connecting angels with everything from guidance in daily life to talking to the dead to psychic healing are published every year. Sales of angel figurines and other material products are brisk. As one [lofty soul](#) put it: "Gently guided by angels, we nurture and cherish the creative soul that heals itself."

soul or spirit

A soul or spirit is a non-physical entity capable of perception and self-awareness. Souls are often believed to be immortal.

If ever there were an entity invented for human wish-fulfillment, the soul is that entity. As Thomas Hobbes pointed out, the concept of a non-substantial substance is a contradiction. It is not possible to imagine a non-physical entity having life and perception. Even believers in souls always imagine them as being like human shaped clouds or fogs. It is a delusion to believe that the concept of soul is conceivable. Yet, billions of people have believed in a non-spatial perceiver which can travel through space and perceive and interpret vibrations and waves in the air without any sense organs.

Work done by philosophers and psychologists based on the assumption of a non-physical entity, which somehow inhabits and interacts with the human body, has not furthered human understanding of the working of the mind. Instead, it has furthered superstition and ignorance while hindering the development of any real and useful knowledge about the human mind. More promising is the work of those who see consciousness in terms of brain functioning and who try to treat 'mental' illness as primarily a physical problem. Two vast industries have been made both possible and lucrative by this belief in a non-entity in need of treatment from experts in non-entities: religion and [psychology](#). A third industry, philosophy, also flourishes in great part due to the concept of soul: a good many philosophers write books and articles based on the assumption of the existence of spirits, while a good many others make a living writing refutations and criticisms of those books and articles. It seems that the skeptic and the true believer need each other!

Satan

Satan is the adversary of God. Thus, Satan is evil personified. Many followers of the Bible consider Satan to be a real being, a spirit created by God. Satan and the other spirits who followed him rebelled against God. They were cast out from Heaven by their Creator. Theologians might speculate as to why the Almighty did not annihilate the "fallen angels," as He is said to have done to his other creations when they failed to be righteous (save [Noah](#) and his family, of course). Satan was allowed to set up his own kingdom in Hell and to send out devils to prowl the earth for converts. The demonic world seems to have been allowed to exist for one purpose only: to tempt humans to turn away from God. Why God would allow Satan to do this is explained in the *Book of Job*. When Job asks why God let Satan torment him the answer is blunt and final: *Hath thou an arm like the Lord?* The story of Job is interpreted in many different ways by theologians but my interpretation is that nobody knows why God lets Satan live and torment us. God is God and can do whatever He wants. *Ours is not to question why, ours is but to do and die.*

Satan, being a spirit, is neither male nor female. However, like his Creator, Satan is usually referred to as a masculine being. Many believe that Satan, or the Devil as he is often called, can "possess" human beings. Possession is bodily invasion by the devil. The Catholic Church still performs [exorcisms](#) on those considered to be possessed. Jesus is said to have cast out demons, i.e., performed exorcisms, and the Church considers itself to have been given this same power by Jesus. Throughout the centuries, many pious religious people have erroneously considered those with certain mental or physical illnesses to be possessed by Satan.

More frequent than outright possession, however, has been the accusation of being in consort with the devil. Satan is believed to have many powers, among them the power to manifest himself in human or animal form. The consorting has been recorded as often being purely physical and mostly sexual. For most of the history of Christianity there are reports of Satan having sex with humans, either as an incubus (male devil) or succubus (female devil). [Witches](#) and [sorcerers](#) were thought by many to be the offspring of such unions. They are considered especially pernicious because

From the frontispiece of Paul Carus's *The History of the Devil and the Idea of Evil* (1900)

they inherit some of the devil's powers.

According to Carl Sagan, accounts of diabolical intercourse are common cultural phenomena:

Parallels to incubi include Arabian [djinn](#) [jinn], Greek satyrs, Hindu bhuts, Samoan hotua poro, Celtic dusii... (Sagan 1995, 124).

However, as a child being instructed in the ways of Satan by Dominican sisters, stories of nuns being raped by incubi in a priest's clothing were assuredly not told. The Devil was there to tempt us to sin, pure and simple. He was not there to have sex with us or engage in reproductive experimentation or breed a race of witches and magi. To be sure, his main temptations would be sexual. There was no doubt that He spent a lot of time using girls to tempt boys into impure thoughts and deeds. He would invade our minds continuously during adolescence, planting desires for sexual experiences too evil to be mentioned much less performed. I suppose, to be fair, the girls should have been taught to be wary of boys trying to get them to yield to sexual temptation and that we would use every trick in the devil's arsenal to get them to go "all the way." But the girls were taught that *they* were the temptresses and were therefore the ones who needed to keep from harming the boys with their female charms. We were taught to pray constantly, implore the intercession of the saints and the Holy Mother of God, that they might give us protection against the snares of Satan. It must have occurred to many observers that the fear of Satan seems very much like fear of our own sexuality.

innocent angels

For all the instruction we were given on the Evil One, I don't remember ever being taught about Pope Innocent VIII and his persecution of witches and heretics. The Pope proclaimed in a Bull that "evil angels," i.e., devils, were having sex with many human men and women. He was not the first to have made this claim. Others before him, such as Thomas Aquinas, had explored this territory in great detail. Thomas reminds us that since the devil is not human, he can't produce human seed. So, he must transform himself into a woman, seduce a man, keep the seed, transform into a male, seduce a woman and transfer the seed. Something of the devil is captured by the seed along the way, so the offspring are not normal. Apparently it took Satan a long time to figure out that if he wanted to control the world, the best way to do it would be to breed with humans. Invading our bodies would be more efficient and effective than trying to invade our minds. But the Pope and many other pious men had a plan to exterminate the diabolical offspring: they would torture and burn them all! They would fight fire with fire! The Devil would not outdo them. In fact, the sadistic and monstrous behavior of the holy and pious inquisitors is almost enough to make a skeptic believe in Satan. The

inquisitors were nothing short of diabolical.

One of the more interesting aspects of Satanology is the recurring theme of humans making a pact with the devil. The Faust legend is the best-known of these: in exchange for one's soul, Satan will bestow one with wealth or power for a specified time. In most versions of the story, Faust tricks the devil and avoids payment. In the original, the devil mutilates and kills Faust at the end of the contract. His brains are splattered on the walls of his room, his eyes and teeth lay on the floor and his corpse rests outside on a dunghill (Smith, 269).

Today, there are still those who believe Satan is a real being, but we hear few stories of incubi and succubi any more. The closest thing we have to such stories are [alien abduction accounts](#) and [star children](#). Fortunately, for today's alien abduction victims with similar tales of sexual experimentation--the devil being replaced with aliens from outer space--there is no equivalent to the medieval Church to persecute, torture or exterminate them.

It is interesting, though, that most of these murderers and torturers feel some need to at least appear as if they are doing good while they commit their horrors. What drives the terrorist or ethnic cleanser today to their abominations, or the witch hunters to their destruction of families, seems to be the same forces that drove the pious enforcers of the [Inquisitions](#). Their behavior is almost enough to make a skeptic think that maybe Satan does exist--in the souls of these good people fighting for their noble causes.

From a philosophical perspective, the universal belief in evil demons is based on the need for an explanation of the enormous quantity of moral and physical evil pervading human existence for our entire history. I suppose, too, that devils in some way serve to excuse our own evil actions and mitigate our sense of responsibility for the harm we do. Psychologically, demons may well be a projection of ourselves, the worst part of our nature or the most feared part of our own nature. From a literary perspective, demons must exist. If they didn't, we'd have to invent them. They seem essential to so much of our storytelling. More essential, perhaps, than their goodly counterparts.

the waning of Satan's power

As the power of the Christian Church has waned, so too has the power of Satan. It is no accident that Satan reached the peak of his career at the same time the Church did, during the thirteenth century. During the Middle Ages, the Devil was said to have built Hadrian's wall between Scotland and England, moved huge stones to construct megalithic stone circles and dolmens, build bridges such as that at Saint-Cloud and the Pont de Valentre at Cahors, for the price of the soul of the first one who crossed the

bridge, etc. Satan could perform magic, but it must be remembered that the Christian religion is basically a religion of magic, of sacraments which protect one from Satan and which change bread and wine into Christ, of miracles which contravene the natural order for good or ill, of resurrection from the dead and of the promise of eternal life. Satan represents the obverse of that order: black magic, pacts with the devil, wonders done contravening the natural order, the promise of eternal youth and wondrous powers. The Satanic Order was the creation of the Church, necessary to establish its own power over the world. Heretics, witches and sorcerers were a threat to the world dominion of the Church. They had to be eradicated. As the enemies of the Church grew more numerous and more powerful, so did the reign of terror grow and so did the power of the Church get established more and more firmly.

As the power of Christianity waned as the dominant social and political force in western culture, so too did the power of Satan. By the eighteenth century, in Europe at least, witch and heretic burnings had all but ceased. Today, most of us in the Christian world would consider it primitive and barbaric to suggest that anyone be hounded or killed for communing with Satan. Even those who are allegedly doing evil in the name of Satan are usually pursued for the evil they do, not for their alleged association with the devil. It is likely that most police officers, if they had to deal with crimes committed by Satan worshippers, would view the criminals as deluded rather than as really communing with otherworldly beings.

If the rise of modern science had anything to do with the fall of the Christian Church from its position of supreme influence in western culture, then modern science can take partial credit for the exorcism of Satan from western consciousness. Of course, the Devil is not dead yet but he gets his power from God, and as God's power wanes so does Satan's. Someday, perhaps, both God and Satan will become impotent strangers to the human imagination. But don't count on it. Many theists today believe that the evils of today's world, and they are many as we all know, are due to the rise of Satan and the decrease of religious influence. If they had their way, we would all be praying more and working against the snares of the devil. I, however, think we have more to fear from these pious people than we do from the Devil or his admirers. Some might even go so far as to identify these pious advocates of constitutional amendments for prayer in schools as devils in disguise. I don't think so, though when you have God's children murdering people at abortion clinics, there really doesn't seem to be much need for Satan. In fact, if Satan and his crew returned to earth they'd find that all the good jobs for devils have been taken by the pious of the earth.

Finally, there are the modern day Satanists who find solace and power in occult [magick](#), but especially in anything anti-Christian. They draw their inspiration from the great works of imagination in art, literature, and policy created primarily by pious Christians in their zealous wars against their enemies, but also created by pre-Christian cults such as the Egyptian cult of

Set or by non-Christian occultists such as [Aleister Crowley](#) and [Anton LaVey](#). Today's Satanists have been blamed by pious Christians for [ritual murders of children](#), mutilation and sacrificial killings of animals, writing [backwards messages](#) on musical recordings instructing people to kill, sending [subliminal](#) or secret messages through diabolical symbols on pizza boxes or soap wrappers, causing the general decay of morals and civilization as we know it, etc. The Satanists deny it. The evidence is not very strong that the Satanists are either as evil or as powerful as their enemies say they are. There is strong evidence for the strength and wickedness of the pious. Witness their witch-hunts in recent years against child care workers and parents and relatives of children. The evidence is strong that the pious have frequently and unjustly accused many of [satanic ritual abuse](#) of children. And they have been aided in the witch-hunt by devoted [therapists](#) and [pious police and prosecutors](#).

angel therapy

Angel therapy is a type of [New Age Therapy](#) based on the notion that communicating with [angels](#) is the key to healing. Angel therapists believe they facilitate healing by helping their patients get in touch with angels who will guide the patient in the right direction.

Susan Stevenson, a hypnotherapist who practices [past life regressive therapy](#), sees angels everywhere.

My life seems to be teeming with angelic connections, and the momentum is building. Have you noticed this in your own life? Angelic reminders that they are with us- 'whispers' in our ear, 'taps' on the shoulder, brushes of air across your skin or changes in air pressure, 'flutters' from deep inside, glints of light and color- all these gentle hints to pay closer attention to their presence. Think back- have you been paying attention, listening, responding? I know I certainly have been. Doreen Virtue, Ph.D., in her newest book "Angel Therapy", says that this increased activity is directly related to the approaching millennium.

I assume Dr. Virtue is referring to the increased activity of New Age [millennial](#) thinkers whose presence is growing, whose momentum is building, and whose deep flutterings continue to slap reason in the face while the candle in the dark gets dimmer and dimmer.

astral projection

Astral projection is a type of [out-of-body experience \(OBE\)](#) in which the [astral body](#) leaves its other six bodies and journeys far and wide to anywhere in the universe. The notion that we have seven bodies (one for each of the seven planes of reality) is a teaching of theosophist [Madame Blavatsky](#). On its trips, the astral body perceives other astral bodies rather than their physical, etheric, emotional, spiritual, etc. bodies. In an ordinary OBE, such as [remote viewing](#) or the out-of-body [near-death experience](#), there is a separation of a person's consciousness from his or her body. In the near-death out-of-body experience, there may be the experience of hovering above and perceiving one's body and environs, and hearing conversations of surgeons or rescue workers tinkering with one's body. In astral projection, it is the astral body, not the soul or consciousness, that leaves the body. The astral body, according to Madame Blavatsky, is the one that has an [aura](#). It is also the seat of feeling and desire, and is generally described as being connected to the physical body during astral projection by an infinitely elastic and very fine silver cord, a kind of cosmic umbilical cord or Ariadne's thread.

There is scant evidence to support the claim that anyone can project their mind, soul, psyche, spirit, astral body, etheric body, or any other entity to somewhere else on this or any other planet. The main evidence is in the form of [testimonials](#).

angels

24 Apr 1999

Your description of angels is based on the writing "On the Celestial Hierarchy" by a 5th century author using the pseudonym of "Dionysius the Areopagite" (and others who expanded on his themes). These writings are only accepted by the Catholic Church (and only marginally), some cults, and various mystic organizations (as you mention).

Harold Joss

reply: I'm glad to hear there is not widespread belief in this celestial hierarchy.

[angels](#)

past life regression

Past life regression (PLR) is the alleged journeying into one's past lives while [hypnotized](#). While it is true that many patients *recall* past lives, it is highly probable that their memories are [false memories](#). The memories are from experiences in this life, pure products of the imagination, intentional or unintentional suggestions from the hypnotist, or [confabulations](#).

Some New Age therapists do [PLR therapy](#) under the guise of personal growth; others under the guise of healing. As a tool for New Age explorers, there may be little harm in encouraging people to remember what are probably [false memories](#) about their living in earlier centuries or for encouraging them to go forward in time and glimpse into the future. But as a method of healing, it must be apparent even to the most superficial of therapists that there are great dangers in encouraging patients to create delusions. Some false memories may be harmless, but others can be devastating. They can increase a person's suffering, as well as destroy loving relationships with family members. The care with which hypnosis should be used seems obvious.

Some therapists think [hypnosis](#) opens a window to the [unconscious mind](#) where memories of past lives are stored. How memories of past lives get into the unconscious mind of a person is not known, but advocates loosely adhere to a doctrine of [reincarnation](#), even though such a doctrine does not require a belief in the unconscious mind as a reservoir of memories of past lives.

PLR therapists claim that past life regression is essential to healing and helping their patients. [Some therapists](#) claim that past life therapy can help even those who don't believe in past lives. The practice is given undeserved credibility because of the credentials of some of its leading advocates, e.g., [Brian L. Weiss, M.D.](#), who is a graduate of Columbia University and Yale Medical School and Chairman Emeritus of Psychiatry at the Mount Sinai Medical Center in Miami. There are no medical internships in PLR therapy, nor does being a medical doctor grant one special authority in [metaphysics](#), the [occult](#) or the supernatural.

reincarnation and PLR

Psychologist Robert Baker demonstrated that *belief in reincarnation* is the greatest predictor of whether a subject would have a past-life memory while under past life regression hypnotherapy. Furthermore, Baker demonstrated that the subject's expectations significantly affect the past-life regressive session. He divided a group of 60 students into three groups. He told the first

group that they were about to experience an exciting new therapy that could help them uncover their past lives. Eighty-five per cent in this group were successful in "remembering" a past life. He told the second group that they were to learn about a therapy which may or may not work to engender past-life memories. In this group, the success rate was 60%. He told the third group that the therapy was crazy and that normal people generally do not experience a past life. Only 10% of this group had a past-life "memory."

There are at least two attractive features of past life regression. Since therapists charge by the hour, the need to explore centuries instead of years will greatly extend the length of time a patient will need to be "treated," thereby increasing the cost of therapy. Secondly, the therapist and patient can usually speculate wildly without much fear of being contradicted by the facts. However, this can backfire if anyone bothers to investigate the matter, as in the case of [Bridey Murphy](#), the case that started this craze in 1952.

See related entries on [cryptomnesia](#), [Bridey Murphy](#), [dianetics](#), [channeling](#), [hypnosis](#) and [memory](#).

Did you know?

A solar year is **365.2421199** days, more or less.

The Gregorian calendar gives each fourth year a 366th day, except for years divisible by 100 but not divisible by 400.

The New Millennium

A **millennium** is a period of one thousand years. **The New Millennium** begins in 2001. There was no year 0, so the first millennium began in the year 1 and ended one thousand years later in 1,001. Of course, the year 1 is arbitrary, as are the concepts of a millennium, a century, and a decade, although it is clear why members of our species prefer a numbering system with base 10.

There have been any number of millennia, depending on where you start counting. Today could be considered the end of a millennium. It could also be considered somewhere near the middle of the 12,000,000th millennia. So could tomorrow and the next day. Any moment could be considered both the beginning and the end of a millennium.

Another thing to consider is that not everybody in the world uses the Gregorian calendar, which places the beginning of the new millennium on January 1, 2001, and the *newfaux* millennium on January 1, 2000. In fact, some peoples still prefer lunar years to solar years. For example, it is 1420 according to the Egyptian Muslim (lunar) calendar, which marks the beginning of historical time from the day the Prophet Mohammed fled Mecca. The few Jews still living in Egypt consider Gregorian 1999 to be the year 5760. They use a Hebrew calendar, as do the Hebrews in Israel.

According to one group of Hindus in India, 1999 Gregorian is 2056. According to another group, it is 1921. In Iran, Shiite Muslims are in the year 1378. The Mayans consider this year to be 5119, while the Buddhist calendar says it is 2544.

Others accept the Gregorian calendar but don't celebrate New Year's Eve on December 31. The Copts (Egyptian Christians), for example, consider September 11 to be New Year's Day. Still others follow ecological, rather than solar or lunar, calendars, and pay no heed to such concepts as millennia.

something BIG will happen

The idea that something BIG will happen in the New Millennium is based on nothing worth considering, unless you consider New Age hype worth a minute of your time. Nevertheless, the belief that we are on the verge of something REALLY BIG is spreading. It could be the end of the world and the arrival of the Anti-Christ. It could be the elevation to cosmic consciousness of even the dopiest amongst us. Market economies may be abandoned for Universal Multi-Level Marketing. All aliens may be identifying themselves in the greatest OUTING in history. Then again, the

New Millennium could be just another delusion.

The only REALLY BIG thing that the New Millennium is likely to bring about is more hype about how REALLY BIG THINGS are about to begin or end. Will the New Millennium be a Great New Beginning for Humankind or will it be the End of the World? One thing is certain, however: the HYPE regarding the New Millennium will expand faster than the universe. The question is, *will there be enough brain matter to stop it?*

quackery

Quackery used to be a pejorative term describing medical charlatanism. As medical charlatanism became more popular and as using pejorative terms became politically incorrect except for the formerly oppressed classes, *quackery* evolved into [alternative medicine](#) and *complementary medicine* by those who practice it, and into *unproven therapies* and *questionable methods* by those who are critical of it. When *quackery* is mixed with scientific medicine, the latter is called a *mainstream modality* and the result is called *integrative medicine* by those who practice it.

Quackery usually involves integrating [metaphysics](#) and such things as [sympathetic magic](#) or [spiritualism](#) with healing. Often the major quality of quackery is fraud and the dispensing of useless or harmful treatments to vulnerable people who are dying. What quackery lacks in scientific study it makes up for by prescribing generous portions of caring and overdoses of false hope.

Quackery is short for *quacksalver*, and probably has nothing to do with the sound made by ducks. Quacksalver derives from two Middle Dutch terms and seems to mean *healing with unguents*. However, *quacken* means to boast, so a *kwakzalver* might be a healer who boasts, in which case *medical quackery* would be an oxymoron.

psychic

"When confidential information leaks out of an organization, people suspect a spy, not a psychic." --John Allen Paulos, *Innumeracy*

As an adjective, *psychic* refers to forces or agencies of a [paranormal](#) nature. As a noun, *psychic* refers to a [medium](#) or a person who has [paranormal](#) powers.

[James Randi](#), who has tested many people who think they have psychic abilities, has found that when he has tested the alleged paranormal powers of psychics (1) they had never before tested their powers under controlled conditions, and (2) those who don't offer preposterous rationalizations for their inability to perform seem genuinely baffled at their failure. Often, psychics are not frauds; they genuinely believe in their powers. But they've never tested their powers in any meaningful way. Randi offers [\\$1,000,000](#) to anyone who can demonstrate psychic powers. The [Australian Skeptics](#) will throw in an additional \$100,000 (Australian) for the psychic and \$20,000 for anyone "who nominates a person who successfully completes the Australian Skeptics Challenge." [B. Premanand of the Indian Skeptic](#) will throw in another 100,000 rupees.

To believe in the ability of a person to [channel](#) spirits, to "hear" or "feel" the voices or presence of the dead, to "see" the past, the future or what is presently in another's mind, to make contact with a realm of reality that transcends natural laws is to believe in something highly improbable. Psychics don't rely on psychics to warn them of impending disasters. Psychics don't predict their own deaths or diseases. They go to the dentist like the rest of us. They're as surprised and disturbed as the rest of us when they have to call a plumber or an electrician to fix some defect at home. Their planes are delayed without their being able to anticipate the delays. If they want to know something about Abraham Lincoln, they go to the library; they don't try to talk to Abe's spirit. In short, psychics live by the known laws of nature except when they are playing the psychic game with people. Psychics aren't overly worried about other psychics reading their minds and revealing their innermost secrets to the world. No casino has ever banned psychics from the gaming room because there is no need.

The improbability of there being a paranormal realm is argued for in many entries in the *Skeptic's Dictionary*. If it is improbable that the paranormal is real, then it is improbable that psychics are tapping into the paranormal realm. Why then are psychics so popular with young and old, stupid and intelligent, ignorant and wise alike?

The main reasons for belief in such [paranormal](#) powers as [clairvoyance](#) and [clairaudience](#) are (1) the perceived accuracy of psychic predictions and readings; (2) the seemingly uncanny premonitions which many people have, especially in [dreams](#); and (3) the seemingly fantastic odds against such premonitions or predictions being correct by coincidence or chance.

However, the accuracy of psychic predictions is grossly overrated. The belief in the accuracy of clairvoyants such as [Edgar Cayce](#) and [Jeanne Dixon](#) is due to several factors, including mass media error and hype. For example, it has been repeatedly reported in the mass media that Jeanne Dixon predicted the assassination of President Kennedy. She did not. The *New York Times* helped spread the myth that Edgar Cayce transformed from an illiterate into a healer when [hypnotized](#). One of the more egregious cases of mass media complicity in promoting belief in psychics is the case of "psychic" Tamara Rand, producer Dick Maurice, and talk show host Gary Grecco of KNTV in Las Vegas. All conspired to deceive the public by claiming that a video tape of a "Dick Maurice Show," on which Rand predicts the assassination attempt by John Hinkley on Ronald Reagan, was done on January 6, 1981. The tape was actually made on March 31, 1991, a day after Hinkley shot Reagan (Steiner).

Another reason the accuracy of psychic predictions is grossly overrated is because many people do not understand how psychics use techniques such as warm and [cold reading](#). Also, many people lack an understanding of [confirmation bias](#) and [The Law of Truly Large Numbers](#). The accuracy of premonitions and prophecies is also grossly exaggerated because of lack of understanding of [confirmation bias](#) and [The Law of Truly Large Numbers](#); their accuracy is also exaggerated because of ignorance about how [memory](#) works, especially about how [dreams](#) and premonitions are often filled in after the fact.

psychic performers

The strongest kind of evidence for psychic power comes from witnessing an alleged psychic perform. Some performers seem to be able to do things that require paranormal powers; these are the masters of the art of [conjuring](#). Others seem to be able to tell us things about ourselves and our departed loved ones that only we should know; these are the masters of [cold reading](#). Others surreptitiously gather information about us and deceive us into thinking they obtained their data by psychic means.

The success of numerous hoaxes by fraudulent psychics testifies to the difficulty of seeing through the performance. Psychologist Ray Hyman, who worked as a "psychic" to help pay his way through college, claims that the most common method used by psychics is "cold reading" and offers the following [Guide to Cold Reading](#):

1. **You must act with confidence. You don't need to be arrogant. In fact, you will probably benefit by pretending to be humble. James van Praagh and John Edward repeatedly warn their marks that they aren't always accurate, that they don't know how their power works, that they misinterpret things, etc. But they never give any sign that they are not really communicating with the dead.**
2. **You must do your research. You have to be up on the latest statistics (e.g., most plane crashes are in April; most planes have something red on their tails). You have to know what people in general are like from polls and surveys. Also, you must pick up in casual conversation before a performance any information that might be useful later, like talking to a cameraman in the afternoon and then during the evening performance you are "contacted" by his dead father, whom he told you all about that afternoon.**
3. **You must convince the mark that he or she will be the reason for success or failure. This is actually true because it is the mark who will provide all the vital information that seems so shocking and revealing. It is human nature to find meaning, so this is not a difficult chore. The mark will bring significance to much of what you throw at him or her. If you bring up "June" and get no response, you make the mark feel like they're not remembering properly. If you say "8, the 8th month, 8-years, August" and somebody bites by saying "Dad died in August" and the mark thinks it was *you* who told *her* that fact rather than the other way around. When you say "I see a watch, a bracelet, something on the wrist" and the mark says "I put my necklace in mom's casket." You say "Right. She thanks you for it, too." Everybody thinks you knew she put a necklace in the casket and they will forget that you were fishing for some jewelry on the wrist.**
4. **Be observant. Does the person have expensive jewelry on but worn out clothes? Is she wearing a pin with the letter 'K' on it. (You better know that 'Kevin' is a good guess here. But it doesn't matter, really. Since, when the mark tells you the name of the person, she'll think you are the one who told her the name!)**
5. **Use flattery and pretend you know more than you do.**

The list goes on, but you get the idea. What looks like psychic power is little more than a game of twenty-questions, or a fishing expedition, with *the mark providing all the relevant details and connecting all the dots*, while the "psychic" appears to be getting messages from beyond. Of course, sometimes the "psychic" is simply an observant, thoughtful person, who says things appropriate for the age and gender of the subject. For example, one of my students--right out of high school, tall, handsome, strong and athletic--was told by a "psychic" to stay away from the sex or he'd be having a baby. The student became an immediate convert. He'd already gotten a girl pregnant and had a daughter. Good advice became proof of psychic power in this young man's mind. She also told him other things "nobody could have known," such as that he had once thrown up all over himself and crapped in his pants. He

apparently had done this as a young man and didn't realize that she was describing a nearly universal situation for babies.

The deception can be more dramatic than cold reading, of course. According to [Lamar Keene](#), a "reformed psychic," some people seek psychic advice from professional psychics who exchange information on their marks. Some psychics do what is called a "warm reading," i.e., they have done research on you and that's why they know things they shouldn't know. Still others are magicians who try to pass off their conjuring skills as paranormal powers.

It has also been argued that if psychic power existed, to use it would be "a gross and unethical violation of privacy" and "professions that involve deception would be worthless" (Radford). There wouldn't be any need for undercover work or spies. Every child molester would be identified immediately. No double agent could ever get away with it. Psychics would be on demand for high paying jobs in banks, businesses and government. "Most psychics would be very, very rich...." (Radford) and since psychics are such altruistic persons, giving up their time to help others talk to the deceased or figure out what to do with their lives, they would be winning lotteries right and left and giving part of their winnings to help the needy. We wouldn't need trials of accused persons: psychics could tell us who is guilty and who is not. The [polygraph](#) would be a thing of the past. Of course, the operative word here is *if*. If psychic power existed the world would be very different.

It seems clear that psychics can be explained in one of three ways: (1) they truly are psychic; (2) they are frauds, taking advantage of people's gullibility and weaknesses; or (3) they're deluded and self-deceived. Of the three options, the least probable is option number one. "Psychics" who are honest about their deception call themselves [mentalists](#) and call their art magic or [conjuring](#). Yet, it is the "psychics," not the mentalists, who are the darlings of the mass media. Thus, when the mass media promote "psychics" for their entertainment or news value, they are either promoting fraud or encouraging delusions. Perhaps the media think that because most parties in the psychic game are consenting adults, that makes it ok. Perhaps the police agree and that is why telepsychics like [Miss Cleo](#) can practice without fear of arrest.

animism

Animism is the doctrine that things have [souls](#). (*Animus* is the Latin word for soul.) It is an ancient belief that may have been offered as an explanation for the difference between a thing that is alive and that thing when it is dead. It may have been offered also as an explanation for appearances of people in hallucinations or dreams. Animus, spirit, or [energy](#) exists independently of the thing, whether that thing be dead or alive.

Some people believe that the souls of humans exist before or after the body dies. Some believe that the souls of animals and plants are never extinguished. Some think that inanimate objects have souls.

In modern times, animism is popular with most religions and New Age folks. It is especially popular with people who find solace in traditions like [shamanism](#), perhaps because they find the modern world is too complex and meaningless to give them any sense of their own significance.

shamanism

Shamanism is an ancient religion that includes belief in [animism](#), deities, and demons. The shaman, or priest, is believed to have special powers that allow him to communicate with ancestral spirits, the gods, or their evil counterparts. Shamanism is still practiced by indigenous peoples in [Siberia](#).

The term "shaman" has come to refer to any priest or priestess who uses magic to heal the sick or communicate with spirits. Shamans are thought to possess magical powers and have esoteric knowledge, especially regarding the healing powers of certain plants. Shamanic healing centers, books, and programs are common New Age developments, growing in proportion to the complexity and indifference towards individuals of the modern world. For some people, shamanism is a window to a glorious, if illusory, past, when humans lived in harmony with nature and with each other. Shamanism offers not only an [alternative medicine](#), but an alternative reality.

[Some](#) modern folks have been attracted to shamanism because of its association with [altered states of consciousness](#) induced by drumming, fasting, wilderness vision questing, sweat-lodges, and especially by hallucinogenic plants. For such people, shamanism offers the hope of an experience that will not only give meaning and significance to their lives, but will also erase from consciousness, at least temporarily, the horrors of a world that at times seems to have gone mad.

Neither New Age shamanism nor Native American religions have any direct connection to the ancient religion of Siberia.

dualism

Dualism is the metaphysical doctrine that there are two substances, i.e., distinct and independent types of being, one material and the other spiritual. Material substance is defined as physical and is asserted to be the underlying reality of the empirical world, i.e., the world we see, hear, etc., and measure with our senses and technical instruments that extend the range of the senses, such as electron microscopes, telescopes, radar, etc.

The spiritual world is usually described negatively as the non-physical, non-material reality underlying the non-empirical world, variously called the psychological, the mental, or the spiritual world.

Dualists are fond of a belief in immortality. If there is another type of reality besides the body, this non-body can survive death. The *non*-body can conceivably exist eternally in a *non*-physical world, enjoying *non*-physical pleasures or pains distributed by a *non*-physical God. This notion seems to be *non*-sense, but it apparently gives many people great comfort and hope.

Some dualists are fond of drawing a significant inference from the fact that we use different kinds of language to talk about physical things and non-physical things. They note that when we talk about physical things we use language that locates or causally connects objects in space. When we talk about processes such as *thinking*, however, we don't use the language of things in space. We don't think of thinking as taking place in a particular place or of a thought as having physical dimensions. That is true; however, dualists infer from this fact about language that the non-physical is a substance, i.e., a type of reality capable of independent existence, not reducible to some other phenomenon. Most dualists would agree that colors, for example, are not substances because colors do not have independent existence: they are reducible to other phenomena, such as light, sensory apparatus, etc. Yet, many dualists would deny that *thinking*, *perceiving*, *willing*, *desiring*, etc., are reducible to material processes (e.g., brain states). They believe these psychological or mental activities are best explained as functions of a non-physical substance. They can certainly be coherently explained by dualism, but it is not necessary to bring in the belief in non-physical reality to explain everything that is hard to talk about *physically*.

In any case, it seems very presumptuous to assume that the way language has evolved and developed is a keen sign as to the nature of reality.

clairvoyance or second sight

Clairvoyance is an alleged [psychic](#) ability to see things beyond the range of the power of vision. Clairvoyance is usually associated with [precognition](#) or [retrocognition](#). The faculty of seeing into the future is called "second sight" if it is not induced by [scrying](#), drugs, trance, or other artificial means.

People can predict the future. We do it all the time, but we usually, if not always, do it by taking into account our experience, knowledge and surroundings. Some predictions by psychics come true. So do some predictions by non-psychics. No doubt much of our anticipation of the future is unconscious and second nature, but it is based on quite natural and mundane abilities not on mysterious or supernatural powers.

remote viewing

Remote viewing is the alleged psychic ability to perceive places, persons and actions that are not within the range of the senses. Remote viewing might well be called Psychic [Dowsing](#). Instead of a twig or other device, one uses psychic power alone to dows the entire galaxy, if need be, for whatever one wants: oil, mountains on Jupiter, a lost child, a buried body, a hostage site thousands of miles away, inside the Pentagon or the Kremlin, etc.

Ingo Swann and Harold Sherman claim to have done remote viewing of Mercury and Jupiter. Dr. Russell Targ and Dr. Harold Puthoff studied Swann and Sherman, and reported that their remote viewing compared favorably to the findings of the Mariner 10 and Pioneer 10 research spacecrafts. Isaac Asimov, however, did a similar comparison and found that 46% of the observation claims of the astral travelers were wrong. Also, only one out of 65 claims made by the remote viewers was a fact that either was not obvious or not obtainable from reference books [James Randi].

Targ and Puthoff were not put off by the fact that Swann claimed he saw a 30,000 ft. mountain range on Jupiter on his astral voyage when there is no such thing. It is hard to imagine why anyone would have faith in such claims. If I told you that I had been to your home town and had seen a 30,000 ft. high mountain there, and you knew there was no such mountain, would you think I had really visited your town even if I correctly pointed out that there is a river nearby and it sometimes floods? Swann, in a lovely [ad hoc hypothesis](#), now claims that astral travel is so fast that he probably wasn't seeing Jupiter but another planet in another solar system! There really is a big mountain out there on some planet in some solar system in some galaxy.

The CIA and the U.S. Army thought enough of remote viewing to spend millions of taxpayers' dollars on research in a program referred to as "Stargate." The program involved using psychics for such operations as trying to locate Gadhafi of Libya (so our Air Force could drop bombs on him) and the locating of a missing airplane in Africa. The mass media, ever watchful of wasteful government programs, did not exhibit much skepticism regarding remote viewing. Typical is the reporting in the Sacramento area. TV news anchors Alan Frio and Beth Ruyak led their nightly Channel 10 program on November 28, 1995, with a story on "exciting new evidence" that remote viewing really works. The same story had appeared that morning in the *Sacramento Bee* in an Associated Press article about "Stargate" by Richard Cole. "A particularly talented viewer accurately drew windmills when the sender was at a windmill farm at Altamont Pass," Cole wrote. The "talented viewer" was Joe McMoneagle, a former army psychic spy. Cole based his claim on the testimony of Dr. Jessica Utts, a statistics professor at the

University of California, Davis, who was hired by the government to do an assessment of "psychic functioning." Channel 10 interviewed Dr. Utts, who confirmed that there is good reason to believe that Joe McMoneagle does indeed have psychic powers.

McMoneagle was in the army for 16 years, apparently serving some or most of that time as a psychic spy. He claims he helped locate the U.S. hostages taken by Iran during Jimmy Carter's presidency. Now a civilian psychic consultant, McMoneagle has turned his talents to more significant feats, as Dr. Utts demonstrated. She held up a drawing allegedly done by McMoneagle and declared that it was done by remote viewing. Another scientific researcher had gone to the Altamont pass, known for its miles of funny looking windmills on acres of rolling hills. McMoneagle tried to use his psychic powers to "see" what the researcher at Altamont was seeing and then draw what he was seeing. The sum total of the evidence for the value of psychic spying consisted of only one drawing and Dr. Utts's word that it looks like the Altamont pass. I will testify that in fact the drawing did have a strong resemblance to the Altamont pass. It also had a strong resemblance to ships on a stormy sea and to debris in a cloudy, stormy sky.

McMoneagle was just one of the psychics studied by Targ and Puthoff at the Stanford Research Institute (aka SRI International) from 1973 through 1989 and by another outfit with the unassuming name of Science Applications International Corp., which did its research from 1992 through 1994. Utts and Dr. Ray Hyman, a psychologist at the University of Oregon and a skeptic, issued separate reports on these studies. Utts concluded that "psychic functioning has been well established." Hyman disagreed. In his AP article, Cole wrote that Utts and Ray Hyman stated that "the research was faulty in some respects. The government often used only one 'judge' to determine how close the psychics had come to the right answer. That should have been duplicated by other judges." I would assume that Hyman, if not Utts, would have required a bit more of these studies than that they have more judges.

As a public service, I notified both Channel 10 and Dr. Utts of [James Randi's challenge](#): \$1,000,000 to anyone who can prove he or she has psychic powers. I don't think a heartfelt [testimonial](#) from Dr. Utts or Mr. McMoneagle will qualify. As far as I know, the Randi money is still unclaimed.

CIA spokesman Mark Mansfield said: "The CIA is reviewing available programs regarding parapsychological phenomena, mostly remote viewing, to determine their usefulness to the intelligence community." He also notes that the Stargate program was found to be "unpromising" in the 1970s and was turned over to the Defense Department. At one time as many as sixteen psychics worked for the government and the Defense Intelligence Agency made them available to other government departments. One of the psychics, David Morehouse, was recruited when he took a bullet in the head in Jordan

and started having visions and vivid nightmares. He's written a book about it (*Psychic Warrior*) and it is sure to be better received by true believers than Mansfield's disclaimer.

telekinesis and psychokinesis

Telekinesis is the movement of objects by scientifically inexplicable means, as by the exercise of an occult power. Psychokinesis is the production of motion in physical objects by the exercise of psychic or mental powers. Uri Geller claims he can bend spoons and stop watches using only his thoughts to control the external objects. Others claim to be able to make pencils roll across a table by a mere act of will. The variety of parlor tricks used to demonstrate psychokinetic powers is endless.

[Quaking lights](#)
[Scientists drawn to legends of luminous displays that precede temblors](#) By Alberto Enriquez *Anchorage Daily News*
(Published: January 21, 2002)

anomalous luminous phenomena (alp)

Anomalous luminous phenomena (alps) are lights of various sizes which are generated by stresses and strains within the earth's crust preceding earthquakes, according to [Michael Persinger, Ph.D.](#) He developed the tectonic strain theory (TST) as an explanation for what is going on when people observe [UFOs](#).

According to Persinger,

[ALPs] display odd movements, emit unusual colors or sounds and occasionally deposit physical residues. When these phenomena closely approach a human observer, exotic forces and perceptions are frequently reported. Most ALPs display life times in the order of minutes and appear to show spatial dimensions in the order of meters. Despite their remarkably similar descriptions over time and across cultures, the transience and localized occurrence of these phenomena have limited their systematic investigation.*

Persinger claims that his TST is not meant to debunk UFO claims but to provide a means of [predicting earthquakes](#). "Persinger has apparently done a computer analysis of about 3,000 UFO sightings and has found that many of them occurred weeks or months before the start of earth tremors."*

The experience of an alp has a psychological side as well because of direct stimulation of the observer's brain and [communal reinforcement](#). Persinger believes that the energy from tectonic fractures causes some observers to hallucinate or lose consciousness. Those who share the experience confirm and reinforce the "reality" of each other's UFO observations.

anomaly

An anomaly (literally, *no law or rule*) is an irregular or unusual event which does not fit a standard rule or law. For example, a frog when dropped should move through the air towards the ground, according to the law of gravity. If the frog were to remain suspended in mid-air, such levitation would be an anomaly. If it were discovered, however, that the frog was being suspended in mid-air by [electromagnetic devices](#), the anomaly would dissolve.

Anything weird, abnormal, strange, odd, or difficult to classify is considered an anomaly.

In science, an anomaly is something which cannot be explained by currently accepted scientific theories. Sometimes the new phenomenon leads to new rules or theories, e.g., the discovery of x-rays and radiation.

Charles Fort

Charles Fort (1874-1932) fancied himself a true [Skeptic](#), one who opposes all forms of dogmatism, believes nothing, and does not take a position on anything. He claimed to be an "intermediatist," one who believes nothing is real and nothing is unreal, that "all phenomena are approximations one way or the other between realness and unrealness." Actually, he was an anti-dogmatist who collected weird and bizarre stories.

Fort spent a good part of his adult life in the New York City public library examining newspapers, magazines, and scientific journals. He was looking for accounts of anything weird or mysterious which didn't fit with current scientific theories. He collected accounts of frogs and other strange objects raining from the sky, [UFOs](#), [ghosts](#), [spontaneous human combustion](#), the [stigmata](#), [psychic](#) abilities, etc. He published four collections of weird tales and [anomalies](#) during his lifetime: *Book of the Damned* (1919), *New Lands* (1923), *Lo!* (1931), and *Wild Talents* (1932). In these works, he does not seem interested in questioning the reliability of his sources, which is odd, given that he had worked as a news reporter for a number of years before embarking on his quest to collect stories of the weird and bizarre. He does reject one story about a talking dog who disappeared into a puff of green smoke. He expresses his doubt that the dog really went up in green smoke, though he doesn't question its ability to speak.

Fort did not seem particularly interested in making any sense out of his collection of weird stories. He seemed particularly uninterested in scientific testing, yet some of his devotees consider him to be the founding father of modern paranormal studies. His main interest in scientific hypotheses was to criticize and ridicule the very process of theorizing. His real purpose seems to have been to embarrass scientists by collecting stories on "the borderland between fact and fantasy" which science could not explain or explain away. Since he did not generally concern himself with the reliability or accuracy of his data, this borderland also blurs the distinction between open-mindedness and gullibility.

Fort was skeptical about scientific explanations because scientists sometimes argue "according to their own beliefs rather than the rules of evidence" and they suppress or ignore inconvenient data. He seems to have understood that scientific theories are models, not pictures, of reality, but he considered them to be little more than superstitions and myths. He seems to have had a profound misunderstanding of the nature of scientific theories. For, he criticized them for not being able to accommodate anomalies and for requiring data to fit. He took particular delight when scientists made incorrect predictions and he attacked what he called the "priestcraft" of science. Fort

seems to have been opposed to science as it really is: fallible, human and tentative, after probabilities rather than absolute certainties. He seems to have thought that since science is not infallible, any theory is as good as any other. This is the same kind of misunderstanding of science that we find with so-called "[scientific creationists](#)" and many other [pseudoscientists](#).

Apparently, Fort was a prolific writer. He is said to have written ten novels, but only one was published: *The Outcast Manufacturers* (1906). At least twice in his life he is said to have burned thousands of pages of notes and writings while severely depressed. Two early works of fiction, both burned, entitled X and Y, dealt with Martians controlling life on earth and an evil civilization existing at the South Pole. When he was only about 25 years old, Fort wrote his autobiography, *Many Parts*. Fragments of it have been preserved, but Fort himself came to recognize that there is little to recommend it and described it as "the work of an immature metaphysician, psychologist, sociologist, etc."

One of Fort's amusements as an adult seems to have been to speculate about such things as frogs falling from the sky. He postulated that there is a Super-Sargasso Sea above the Earth (which he called Genesistrine) where living things originate and periodically are dumped on Earth by intelligent beings who communicate with secret societies down below, perhaps using [teleportation](#).

Fort had very few friends, but one of them, Tiffany Thayer, created the Fortean Society to promote and encourage Fort-like attacks on science and scientists. When Fort died in 1937, he left over 30 boxes of notes, which the Fortean Society began publishing in the *Fortean Society Magazine* (later *Doubt* magazine). In 1959 Thayer died and the Fortean Society came to an end. Others, however, took up the torch. [The Fortean Times](#) is advertised as exploring "the wild frontiers between the known and the unknown" and features articles on topics such as the government's alleged suppression of evidence regarding crashed UFOs, synaesthesia, a mysterious undersea structure, and other things the editors think are strange or weird. The International Fortean Organization publishes [INFO Journal](#) several times a year. It features stories on such topics as anomalous astronomical phenomena, anomalies in the physical sciences, scientific hoaxes and [cryptozoology](#). The [Society for the Investigation of the Unexplained](#) (SITU) collects data on unexplained events and publishes a magazine called *Pursuit*. The [Anomalist](#) magazine publishes articles on mysteries in science and nature. [Strange](#) magazine has articles, features and columns covering all aspects of the anomalous and unexplained. William R. Corliss founded the [Sourcebook Project](#) (a catalog of anomalies) and [Science Frontiers](#), a newsletter which has been providing digests of reports that describe scientific anomalies since 1976. There are [many other Fortean groups](#), as well, but it is worth noting that Fort opposed the idea of a Fortean Society. He thought that such a group

would attract [spiritualists](#) and crackpots.

Piltdown Hoax

Piltdown was an archaeological site in England where in 1908 and 1912 human, ape and other mammal fossils were found together. In 1913 at a nearby site was found an ape's jaw with a canine tooth worn down like a human's. The general community of British paleoanthropologists came to accept the idea that the fossil remains belonged to a single creature that had had a human cranium and an ape's jaw. In 1953, Piltdown 'man' was exposed as a forgery. The [skull](#) was modern and the teeth on the ape's jaw had been filed down.

To those who are skeptical of science, such as [Charles Fort and the Fortean's](#), such episodes as Piltdown are taken to be proof that science is, more or less, bunk. To those who have a better understanding of the nature and limits of science, Piltdown is little more than a wrong turn down a series of roads which, despite such detours, eventually arrives at the right destination.

How had so many scientists been duped? Stephen Jay Gould offers several reasons, among them [wishful thinking](#) and *cultural bias*. The latter, no doubt, played a role in the lack of critical thinking among *British* paleoanthropologists. But, above all, the Piltdown forgery demonstrates the *fallibility* of scientific knowledge. It demonstrates, too, the way theories and facts are related in science. Theories are the filters through which facts are interpreted (Popper). Theories try to explain and make sense of facts. On the other hand, facts are used to test theories. Gould notes that today a human cranium with an ape's jaw is considered to be extremely implausible and far-fetched. But in the early part of this century, anthropologists were imbued with the cultural prejudice which considered man's big brain as his ticket to rule, the main evolutionary feature that made it possible for man to develop all his other unique features. Since there was a pre-conceived notion that man's brain must have developed to its human size before other changes occurred in human structure, a human cranium with an ape's jaw didn't arouse as much suspicion as it would today. Fossil discoveries since Piltdown clearly show a progression from small-brained but upright, hence non-simian hominids, to larger-brained upright humans. Scientists "modeled the facts" and confirmed their theory, "another illustration," says Gould, "that information always reaches us through the strong filters of culture, hope, and expectation" (Gould 1982, p. 118). Once committed to a theory, we see what fits with the theory.

The main reason Piltdown was not spotted as a fraud much earlier was that scientists weren't allowed to see the evidence, which was kept securely locked in the British Museum. Instead of focusing their attention on examining the "facts" more closely with an eye to discovering the fraud, scientists weren't

even allowed to examine the physical evidence at all! They had to deal with plaster molds and be satisfied with a quick look at the originals to justify the claim that the models were accurate.

Another reason some scientists were duped was probably because it was not in their nature to consider someone would be so malicious as to intentionally engage in such deception. In any case, one of the main fallouts of Piltdown has been a virtual industry of detectives trying to identify the hoaxer. The list of suspects includes:

Charles Dawson, an amateur archaeologist who brought in the first cranial fragments from Piltdown;

Tielhard de Chardin, theologian and scientist who accompanied Dawson and Arthur Smith Woodward (Keeper of Geology at the British Museum [Natural History] in 1912) to Piltdown on expeditions where they discovered the mandible;

W.J. Sollas, a professor of geology at Oxford;

Grafton Elliot Smith, who wrote a paper on the find in 1913;

Arthur Conan Doyle, the creator of Sherlock Holmes; and

Martin A.C. Hinton, a curator of zoology at the time of the Piltdown hoax. A trunk with Hinton's initials on it was found in an attic of London's Natural History Museum. The trunk contained bones stained and carved in the same way as the Piltdown fossils.

The evidence in each case is circumstantial and not very strong. What is highly probable is that there will be more books speculating on the identity of the Piltdown hoaxer.

the moral of Piltdown

The moral of Piltdown is that science is a fallible, human activity which does not always take the most direct route in fulfilling its aim of understanding nature. When an [anomaly](#) such as the discovery of a human cranium with an ape's jaw occurs one must either fit it into a *new* theory, re-examine the evidence for error in discovery or interpretation, or show that the so-called anomaly is not really an anomaly at all but in fact fits with current theory. Which route a scientist takes may be guided more by personal hopes and cultural prejudices than by some mythical objectivity characterized by the collection and accumulation of colorless, impersonal facts to be pigeonholed dogmatically into a General Theory of Objective Truth and Knowledge.

But to characterize scientists as arrogant buffoons making claims that often turn out to be false, and to make a caricature out of science because it is not infallible and does not arrive at absolutely certain claims, belies a grave misunderstanding of the nature of science. The buffoons are those who demand absolute certainty where none can be had; the buffoons are those who do not understand the value and beauty of probabilities in science. The arrogant ones are those who think that science is mere speculation because scientists make errors, even egregious errors, or at times even commit fraud to push their prejudices. The arrogant ones are those who can't tell the difference between a testable and an untestable hypothesis and who think one speculation is as good as another. The buffoons are those who think that since both scientists and [creationists](#) or other [pseudoscientists](#) pose *theories*, each is doing essentially the same thing. However, all theories are not empirical, and of those that are empirical not all are equally speculative. Furthermore, those creationists who think that Piltdown demonstrates that scientists can't accurately date bones should remember that methods of dating such things have greatly improved since 1910.*

Because of the public nature of science and the universal application of its methods, and because of the fact that the majority of scientists are not crusaders for their own untested or untestable prejudices, as many pseudoscientists are, whatever errors are made by scientists are likely to be discovered by other scientists. The discovery will be enough to get science back on track. The same can't be said for the history of quacks and pseudoscientists where errors do not get detected because their claims are not tested properly. And when critics identify errors, they are ignored by true believers.

(note: Yet another book on the Piltdown hoax has been published since the Hinton trunk discovery. *Unraveling Piltdown: The Science Fraud of the Century and Its Solution* by John Evangelist Walsh (Random House, 1996) points the finger at Dawson once again.)

anthropometry

Anthropometry is the study of human body measurement for use in anthropological classification and comparison.

In the 19th and early 20th centuries, anthropometry was a pseudoscience used mainly to classify potential criminals by facial characteristics. For example, Cesare Lombroso's *Criminal Anthropology* (1895) claimed that murderers have prominent jaws and pickpockets have long hands and scanty beards. The work of Eugene Vidocq, which identifies criminals by facial characteristics, is still used nearly a century after its introduction in France.

The most infamous use of anthropometry was by the Nazis, whose Bureau for Enlightenment on Population Policy and Racial Welfare recommended the classification of Aryans and non-Aryans on the basis of measurements of the skull and other physical features. Craniometric certification was required by law. The Nazis set up certification institutes to further their racial policies. Not measuring up meant denial of permission to marry or work, and for many it meant the death camps.

Today, anthropometry has many practical uses, most of them benign. For example, it is used to assess nutritional status, to monitor the growth of children, and to assist in the design of office furniture.

craniometry (craniology)

Craniometry is the measurement of cranial features in order to classify people according to race, criminal temperament, intelligence, etc. The underlying assumption of craniometry is that skull size and shape determine brain size which determines such things as intelligence and capacity for moral behavior. Empirical evidence for this assumption is not very strong. This fact has not hindered small-headed people from claiming they are members of a superior race or gender because the head size of their racial or gender group is larger on average than the head size of some other racial or gender group. As members of superior races and gender, these small-headed people reason that they, too, must be superior to all members of races inferior to their own and of all members of the other gender. In logic, this is called the fallacy of division: reasoning that what is true of the whole or group must also be true of the parts or members of the group.

In the 19th century, the British used craniometry to justify its racist policies toward the Irish and black Africans, whom the British considered to be inferior races. Irish skulls were said to have the shape of Cro-Magnon men and were akin to that of apes, proof of their inferiority along with black Africans. In France, [Paul Broca](#) demonstrated that women are inferior to men because of their smaller crania. He argued against higher education for women because their small brains couldn't handle the demands.*

In the 20th century, the Nazis used craniometry and [anthropometry](#) to distinguish Aryans from non-Aryans.

"Forensic anthropologists believe that by taking some 90 measurements of a skull they can correctly assign its owner's continent of origin — broadly speaking, its race, though many anthropologists prefer not to use that term — with 80 percent accuracy."*

[Now we have
electronic
phrenology!](#)

phrenology (cranioscopy)

Phrenology is the study of the structure of the skull to determine a person's character and mental capacity. This [pseudoscience](#) is based upon the false assumption that mental faculties are located in brain "organs" on the surface of the brain and can be detected by visible inspection of the skull. The Viennese physician [Franz-Joseph Gall](#) (1758-1828) claimed there are some [26 "organs" on the surface of the brain](#)

which affect the contour of the skull, including a "murder organ" present in murderers. Gall was an advocate of the "use it or lose it" school of thought. Brain organs which were used got bigger and those which were not used shrunk, causing the skull to rise and fall with organ development. These bumps and indentations on the skull, according to Gall, reflect specific areas of the brain that determine a person's emotional and intellectual functions. Gall called the study of these cranial hills and valleys "cranioscopy." Others, such as [Johann Kaspar Spurzheim \(1776-1832\)](#) who spread the word in America and [George Combe \(1788-1858\)](#) who founded the Edinburgh Phrenological Society, followed with even zanier and more specious divisions and designations of the brain and skull, such as "metaphysical spirit" and "wit." In 1815, Thomas Foster called the work of Gall and Spurzheim "phrenology" (*phrenos* is Greek for mind) and the name stuck.

Phrenology advanced the correct notions that the human brain is the seat of character, emotions, perception, intellect, etc., and that different parts of the brain are responsible for different mental functions. However, in Gall's time it was only possible to study the brains of the *dead*; thus, phrenologists could only associate the different structures in the brain with supposed mental functions that were in turn associated with the contour of the skull. Little was done to study the brains or the behavior of persons known to have had neurological problems, which might have helped in the process of locating parts of the brain responsible for specific neurological functioning. Instead, mental faculty localization was arbitrarily selected. Gall's early work was with criminals and the insane and his brain "organs" reflected this interest. Spurzheim got rid of "theft organs" and "murder organs," but he mapped out areas for ["benevolence," "self-esteem," and "conjugal love."](#)

Although phrenology has been thoroughly discredited and has been

recognized as having no scientific merit, it still has its [advocates](#). It remained popular, especially in the United States, throughout the 19th century and it gave rise to several other pseudoscientific characterologies, e.g., [craniometry](#) and [anthropometry](#). Phrenology was highly praised by Ralph Waldo [Emerson](#), [Horace Mann](#), [Thomas Edison](#), and [Alfred Russell Wallace](#). The Boston Medical Society welcomed Spurzheim as a heroic figure when he arrived in 1832 for The American Tour. [The Fowler Brothers and Samuel Wells](#) published the [American Phrenological Journal and Life Illustrated](#), which lasted from 1838 until 1911. In Edinburgh, Combe's *Phrenological Journal* was published from 1823 until 1847. Another indication of the popularity of phrenology in the 19th century is that Combe's *The Constitution of Man* sold more than 300,000 copies between 1828 and 1868.

It is difficult to explain the early popularity of phrenology among scientists, since the empirical evidence for a direct relationship between the brain and character was scant. An unplanned experiment provided some solid evidence for such a relationship in 1848 when [Phineas Gage's](#) moral character changed dramatically after an explosion blew a tamping iron through his head (Damasio). Gage was leading a railroad construction crew near Cavendish, Vermont, when the accident occurred. "Before the accident he had been a most capable and efficient foreman, one with a well-balanced mind, and who was looked on as a shrewd smart business man." After the accident, he became "fitful, irreverent, and grossly profane, showing little deference for his fellows. He was also impatient and obstinate, yet capricious and vacillating, unable to settle on any of the plans he devised for future action."^{*} On the other hand, one might conclude that the Gage incident blew a hole through the theory that bumps on the head were the keys to the functions of the brain beneath.

Phrenology gave rise to the invention of the [psychograph](#) by Lavery and White, a machine which could do a phrenological reading complete with printout. It is said that this device netted its owners about \$200,000 at the 1934 Century of Progress Exposition in Chicago. Phrenological readings are not unlike [astrological](#) readings and many who have them done are satisfied that the results are uncannily accurate. The reason for this subjective satisfaction is probably due the [Forer effect](#) rather than to objective scientific data.

See **related entries** on [anthropometry](#), [craniometry](#), [the Forer effect](#), [metoposcopy](#) and [physiognomy](#).

karma

*"... good and evil fortunes fall to the lot of pious and impious alike . . .
." ---Spinoza*

Karma is a law in Hinduism which maintains that every act done, no matter how insignificant, will eventually return to the doer with equal impact. Good will be returned with good; evil with evil. Since Hindus believe in reincarnation, karma knows no simple birth/death boundaries. If good or evil befall you, it is because of something you did in this or a previous lifetime.

Karma is sometimes referred to as a "moral law of cause and effect." Karma is both an encouragement to do good and to avoid evil, as well as an explanation for whatever good or evil befalls a person.

On one level, karma serves to explain why good things happen to bad people and bad things happen to good people. The injustices of the world, the seeming random distribution of good and evil, are only apparent. In reality, everybody is getting what he or she deserves. Even the child brutalized by drugged adults deserves the horror. The mentally ill, the retarded, the homosexuals, and the millions of Jews killed by the Nazis deserved it for evil they must have done in the past. The slave beaten to within a breath of death deserved it, if not for what he did today, then for what he did in some previous lifetime. Likewise for the rape victim. She is just getting what she deserves. All suffering is deserved, according to the law of karma.

Despite the fact that there could be no evidence for a metaphysical belief in karma, the idea of karma is popular among many in western cultures where it has become detached from its Hindu roots. The [theosophists](#), for example, believe in karma and reincarnation. So does [James Van Praagh](#), who claims to be a psychic conduit for all the billions of people who have died over the centuries.

Let's say someone kills someone . . . at a bank machine.... It could be two things. It could be, the person who committed the crime used their free will to do that. Or this might sound weird, but it could have been a karmic situation where that person who was murdered had to be paid back for murdering the other person in a previous incarnation.

[Amazon.com interview with [James Van Praagh](#)]

Van Praagh makes it clear that he thinks it is karma, not free will, that leads people to kill one another. If Van Praagh is right, we may as well dismantle

our ethical and criminal justice systems. Everybody is just playing out his or her karma. Nobody is really good or evil. Nobody is really responsible for anything they do. We're all just karmic pawns doing a dance with destiny.

Why would such an amoral principle such as karma be paraded forth as if it explained the ultimate justice of an indifferent universe? Because, says Van Praagh, "We are on this earth to learn lessons. This is our schoolroom here. . . . We must go through certain lessons in order to grow." According to Van Praagh, life on earth is actually life in purgatory. We are here working out our sins, evolving our souls, burning off some karma. These are the same feeble reasons given for the existence of evil in a world allegedly created by an Omnipotent, All-Good God. Van Praagh's version of karma is not likely to be accepted by Hindus or Buddhists. They would maintain that when a person does evil, they are acting freely. And when a person suffers evil, it is because of some evil freely done by that person in the past.

Karma as understood by Van Praagh seems to make life trivial, a mere working out of a metaphysical "law" which reduces all humans to dehumanized creatures, devoid of morality and responsibility, mere causes and effects in a pointless system. Karma does not allow that the evil which befalls you may be undeserved.

Karma is a law for sheep. We should not wonder that the shepherds advocate it. It is a law for the passive, for those who will not disturb the status quo, who will accept whatever evil is done as "[natural](#)" and inevitable. Karma is a law for slaves, for the vanquished.

Christians wonder did Adam and Eve have navels; Hindus wonder did the first beings have karma?

[According to a Gallup poll of Americans, belief in reincarnation has increased from 21% to 25% over the past decade.](#)

reincarnation

Reincarnation is the belief that when one dies, one's body decomposes, but one is reborn in another body. It is the belief that one has lived before and will live again in another body after death. The bodies one passes in and out of need not be human. One may have been a Doberman in a past life, and one may be a mite or a carrot in a future life. Some tribes avoid eating certain animals because they believe that the souls of their ancestors dwell in those animals. A man could even become his own daughter by dying before she is born and then entering her body at birth.

The belief in past lives used to be mainly a belief in Eastern religions such as Hinduism and Buddhism, but now is a central tenet of such theories as [dianetics](#) and [channeling](#). In those ancient Eastern religions, reincarnation was not considered a good thing, but a bad thing. To achieve the state of ultimate bliss (nirvana) is to escape from the wheel of rebirth. In most, if not all, ancient religions with a belief in reincarnation, the soul entering a body is seen as a metaphysical demotion, a sullyng and impure rite of passage. In New Age religions, however, being born again seems to be a kind of perverse goal. Prepare yourself in this life for who or what you want to come back as in the next life. Belief in past lives also opens the door for New Age therapies such as [past life regression](#) therapy which seeks the causes of today's problems in the experiences of previous lives.

L. Ron Hubbard, author of [Dianetics](#) and the founder of Scientology, introduced his own version of reincarnation into his new religion. According to Hubbard, past lives need auditing to get at the root of one's "troubles." He also claims that "Dianetics gave impetus to [Bridey Murphy](#)" and that some scientologists have been dogs and other animals in previous lives ("A Note on Past Lives" in *The Rediscovery of the Human Soul*). According to Hubbard, "It has only been in Scientology that the mechanics of death have been thoroughly understood." What happens in death is this: the Thetan (spirit) finds itself without a body (which has died) and then it goes looking for a new body. Thetans "will hang around people. They will see a woman who is pregnant and follow her down the street." Then, the Thetan will slip into the newborn "usually...two or three minutes after the delivery of a child from the mother. A Thetan usually picks it up about the time the baby takes its first gasp." How Hubbard knows this is never revealed.

[J.Z. Knight](#) claims that in 1977 the spirit of a Cro-magnon warrior who once lived in Atlantis took over her body in order to pass on bits of wisdom he'd picked up over the centuries. Ms. Knight seems to be carrying on the work of Jane Roberts and Robert Butts, who in 1972 hit the market with *Seth Speaks*. Knight, Roberts and Butts are all indebted to [Edgar Cayce](#) who claimed to be

in touch with many of his past lives. One would think that channeling might muck things up a bit. After all, if various spirits from the past can enter any body at any time without destroying the present person, it is possible that when one remembers a past life it is actually someone else's life one is remembering.

From a philosophical point of view, reincarnation poses some interesting problems. What is it that is reincarnated? Presumably, it is the [soul](#) that is reincarnated, but what is the soul? A disembodied consciousness?

Reincarnation does seem to offer an explanation for some strange phenomena such as the ability of some people to regress to a past life under [hypnosis](#).

Also, we might explain *child prodigies* by claiming that unlike most cases of reincarnation where the soul has to more or less start from scratch, the child prodigy somehow gets a soul with great carryover from a previous life, giving it a decided advantage over the rest of us. Reincarnation could explain why bad things happen to good people and why good things happen to bad people: they are being rewarded or punished for actions in past lives ([karma](#)). One could explain [déjà vu](#) experiences by claiming that they are [memories](#) of past lives. [Dreams](#) could be interpreted as a kind of soul travel and soul memory. However, past life regression and déjà vu experiences are best explained as the recalling of events from *this* life, not some past life. Dreams and child prodigies are best explained in terms of brain structures and processes. And since bad things also happen to bad people and good things also happen to good people, one might well suppose that there is no rhyme or reason why anything happens to anybody.

Finally, since there is no way to tell the difference between a baby with a soul which will go to heaven or hell, and one with a soul which has been around before in other bodies, and one with no soul at all, it follows that the idea of a soul adds nothing to our concept of a human being. Applying [Occam's razor](#), both the idea of reincarnation and the idea of an immortal soul which will go to heaven or hell are equally unnecessary.

See related entries on [Bridey Murphy](#), [Edgar Cayce](#), [channeling](#), [dreams](#), [dualism](#), [karma](#), [mind](#), [memory](#), [Occam's razor](#), [past life regression](#) and [soul](#).

[Imagining Atlantis by Richard Ellis](#)

Atlantis

Atlantis is a legendary island in the Atlantic, west of Gibraltar, that sunk beneath the sea during a violent eruption of earthquakes and floods some 9,000 years before Plato wrote about it in his *Timaeus* and *Critias*. In a discussion of utopian societies, Plato claims that Egyptian priests told Solon about Atlantis. Plato was not describing a real place any more than his allegory of the cave describes a real cave. The purpose of Atlantis is to express a moral message in a discussion of ideal societies, a favorite theme of his. The fact that nobody in Greece for 9,000 years had mentioned a battle between Athens and Atlantis should serve as a clue that Plato was not talking about a real place or battle. Nevertheless, Plato is often cited as the primary source for the reality of a place on earth called Atlantis. Here is what the Egyptian priest allegedly told Solon:

Many great and wonderful deeds are recorded of your state in our histories. But one of them exceeds all the rest in greatness and valour. For these histories tell of a mighty power which unprovoked made an expedition against the whole of Europe and Asia, and to which your city put an end. This power came forth out of the Atlantic Ocean, for in those days the Atlantic was navigable; and there was an island situated in front of the straits which are by you called the Pillars of Heracles; the island was larger than Libya and Asia put together, and was the way to other islands, and from these you might pass to the whole of the opposite continent which surrounded the true ocean; for this sea which is within the Straits of Heracles is only a harbour, having a narrow entrance, but that other is a real sea, and the surrounding land may be most truly called a boundless continent.

Now in this island of Atlantis there was a great and wonderful empire which had rule over the whole island and several others, and over parts of the continent, and, furthermore, the men of Atlantis had subjected the parts of Libya within the columns of Heracles as far as Egypt, and of Europe as far as Tyrrenia. This vast power, gathered into one, endeavoured to subdue at a blow our country and yours and the whole of the region within the straits; and then, Solon, your country shone forth, in the excellence of her virtue and strength, among all mankind. She was pre-eminent in courage and military skill, and was the leader of the Hellenes. And when the rest fell off from her, being

compelled to stand alone, after having undergone the very extremity of danger, she defeated and triumphed over the invaders, and preserved from slavery those who were not yet subjugated, and generously liberated all the rest of us who dwell within the pillars. ([Timaeus](#))

The story is reminiscent of what Athens did against the Persians in the early 5th century BCE, but the battle with Atlantis allegedly took place in the 8th or 9th *millennium* BCE. It would not take much of an historical scholar to know that Athens in 9,000 BCE was either uninhabited or was occupied by very primitive people. This fact would not have concerned Plato's readers because they would have understood that he was not giving them an historical account of a real city. To assume, as many believers in Atlantis do, that there is a parallel between Homer's *Iliad* and *Odyssey* and Plato's *Critias* and *Timaeus* is simply absurd. And those who think that just as [Schliemann](#) found Troy so too will we someday crack Plato's code and find Atlantis are drawing an analogy where they should be drawing the curtains. Plato's purpose was not to *pass on* stories, but to *create* stories to teach moral lessons. What can we expect next from these lost scholars? A search for the grave of Cecrops, the serpent-tailed first king of Athens? The discovery of the true trident of Poseidon?

Different seekers have located the mythical place in the mid-Atlantic, Cuba, the Andes, and dozens of other places. Some have equated ancient [Thera](#) with Atlantis. Thera is a volcanic Greek island in the Aegean Sea that was devastated by a volcanic eruption in 1625 BCE. Until then it had been associated with the [Minoan civilization on Crete](#).

To many, however, Atlantis is not just a lost continent. It is a lost world. The Atlanteans were extraterrestrials who destroyed themselves with nuclear bombs or some other extraordinarily powerful device. Atlantis was a place of advanced civilization and technology. Lewis Spence, a Scottish mythologist who used "inspiration" instead of scientific methods, attributes Cro-Magnon cave paintings in Europe to displaced Atlanteans (Feder, 130). Helena Blavatsky and the [theosophists](#) of the late 19th century invented the notion that the Atlanteans had invented airplanes and explosives and grew extraterrestrial wheat. The theosophists also invented *Mu*, a lost continent in the Pacific Ocean. Psychic healer [Edgar Cayce](#) claimed to have had psychic knowledge of Atlantean texts which assisted him in his prophecies and cures. J.Z. Knight claims that [Ramtha](#), the spirit she channels, is from Atlantis.

The serious investigator of the myth of Atlantis must read Ignatius Donnelly's *Atlantis: the Antediluvian World* (1882). In the spirit of [von Däniken](#), [Velikovsky](#) and [Sitchin](#), Donnelly assumes that [Plato's myth](#) is true history. Much of the popularity of the myth of Atlantis, however, must go to popular writers such J.V. Luce (*The End of Atlantis*, 1970) and Charles Berlitz, the man who popularized the Bermuda Triangle and the discovery of Noah's Ark.

His *Doomsday, 1999 A.D.* (1981) comes complete with maps of Atlantis and drawings by J. Manson Valentine. [Graham Hancock](#) is doing much to keep alive this tradition of "alternative" and "speculative" history and archaeology which seeks a single source for ancient civilizations. [Scientists and the BBC](#) don't think too highly of Mr. Hancock's efforts.

Atlantis and the aliens

These "alternative" archaeologists have credited the Atlanteans with teaching the Egyptians and the Meso-Americans how to build pyramids and how to write, etc., arguing similarly to [von Däniken](#) that ancient civilizations burst on the scene in a variety of different places on earth and have a common source. Atlanteans or aliens, either way the case can be made for a common source for ancient civilizations only if one selectively ignores the gradual and lengthy development of those societies. One must also ignore that the writing of the Egyptians is no clue to the writing of the Mayans, or vice-versa, and that the purpose of their pyramids was quite different. The Meso-Americans rarely buried anyone in their pyramids; they were primarily for religious rituals and sacrifices. The Egyptians used pyramids exclusively for tombs or monuments over tombs. Why would the aliens or Atlanteans not teach the same writing techniques to the two cultures? And why teach step building in Meso-America, a technique not favored by the Egyptians? If you ignore the failures of the early pyramid builders and ignore their obvious development over time, including the development of underground tombs with several chambers, then you might be able to persuade uncritical minds that Giza couldn't have occurred without alien intervention.

Finally, one should wonder, I suppose, if the Atlanteans were such technological geniuses who shared their wisdom with the world, why did Plato depict them as arrogant warmongers?

Unfortunately for the New Age Atlanteans, there is no credible and convincing archaeological or geological evidence for either Atlantis or Mu. That has not stopped hundreds of people from concocting theories to the contrary. To paraphrase Whitehead, the belief in Atlantis, the ancient and great civilization, is another footnote to Plato.

pagans

'Pagan' is the term Christians use to designate all those who don't accept the God of the Bible. Jews after Christ, as well as all Muslims, are not pagans, but infidels, according to Christians. Jews before Christ are not really pagans, but they're not infidels either. But they were more like pagans than infidels. Infidels are destined to go to Hell. Good pagans such as Socrates, along with good Jews such as Moses, couldn't go to Heaven, but they shouldn't go to Hell, either. At some point in Christian mythology, "limbo" was invented to place these good souls who had not received Christ. Limbo has gone the way of St. Christopher, however, and has been declared by the Church not to exist.

The word 'pagan' is derived from the Latin word for country dweller. The pagans were the Greek and Roman polytheists who followed the cults of Mithras, Venus, Apollo, Demeter, etc. Today, however, Christians generally reserve the appellation for those who belong to no religion or who belong to one of the New Age nature religions or anti-Christian cults.

reader comments:

anthroposophy, Rudolf Steiner and Waldorf Schools

26 Aug 2000

I just read your article on Steiner, Waldorf, and Anthroposophy. Just wanted to quickly respond as it was very clear that you didn't really understand the esoteric Waldorf plan. The schools are an indoctrination into the cult of Anthroposophy. The curriculum is centered on the various occult initiates who Steiner absorbs into his pantheon. The children are given anthroposophical pictures and notions which will be of use in their next incarnation. The "individualism" that they advertise is a code word for the "Anthroposophical Being", a homogenous spirit made up of "Individual I's" that will dominate the world in Steiner's dreamed up future regime.

In Steiner's "Universal Human", p 16-17, he claims that the Initiate cannot have any personal ideas and views of his own, or he will never know objective truth. He states, "The person in whom anthroposophical wisdom appears must be completely unimportant compared to this wisdom; the person as such does not matter at all." He also says, "The anthroposophical view of the world develops in the most individual way, but at the same time it is the most unindividual thing you can imagine." On p 22-23 Steiner states that those that take in anthroposophical thoughts will have a spiritual substance that will help them penetrate the darkness when they die, they will then recognize the people that they worked with on earth. He discusses the deeper task of the anthroposophical movement which is to help those that developed their "individuality" to reincarnate and form core groups that will be scattered over the globe to rule those of us who are not anthroposophists. In his proposed Sixth Epoch he ominously asserts, "To put it bluntly, we can say that the earth and all it can yield will belong to those who now cultivate their individualities. Those, however, who do not develop their individual I will be dependent on joining a group that will instruct them in what they should think, feel, will, and do." [24] In the Seventh Epoch his cult will inhabit the earth in the form of the individual anthroposophical spirit, there will be no more sex, and "man will speak forth man."

Eurythmy is taken from the magical lodge tradition of gestures and signs. It has a secret language which Steiner lifted from the Cabbala, (via the Rosicrucians) and the children in Waldorf are made to communicate to the spirit world. Of course, some of the parents, (like myself at first) assume that it is a form of dance or movement. The Waldorf "art" is part of the system of rigid indoctrination, anthroposophical notions are copied off the board. There is no real free expression. The pictures in the early grade depict

faceless people to help the children conform to the group. The water color exercises are occult moral exercises to heal the children and help their astral bodies mesh with their hereditary bodies, etc. If you examine the children's drawings, you will find all sorts of anthroposophical notions such as gnomes in mines. Anthroposophists believe that gnomes are real, and that you can find them in mines. (There is a book recording Steiner's lectures on this subject.)

Thought you might like to know who the anthroposophists say Steiner was in his previous lives: Enkidu, Kratylos, Aristotle, Schiontiolander, St. Thomas Aquinas, Rudolf Steiner, and he is expected to return at the end of the 20th C, in a rural, hilly place in the USA. Perhaps as a woman, most definitely as a Waldorf student!

The curriculum is all based on alchemy, magic, astrology, and all the bizarre and weird ideas of the occult. It is set up as a secret society, and most of the parents go along with the program without a clue. Luckily, our family figured out the Waldorf lies, and we removed our daughter from their absurd program. I have spent the last year reading Steiner and books about the occult worldview, the schools are not the progressive, liberal, artistic image that they are very good at portraying. The myths, religions and everything taught, are all anthroposophical selections and notions.

The experts of coded language, secrecy and hiding, are 'pulling the wool' over many eyes. With Waldorf, you must look deeper. As written in their magazine, "Anthroposophy Worldwide" 4/2000, p 12, " The press agent has to convey the outer appearance of things rather than the essential core. A deep esoteric background is necessary to make the essential core comprehensible." (Referring to their new press agent, Ursa Krattiger who has been hired to help them further deceive the public.)

Sincerely, Sharon Lombard. (A Freethinker out to expose wacky Waldorf.)

reply: You are not the only one who is out to expose Waldorf schools. [Waldorf critics](#) have their own website.

apophenia

There is currently a controversial debate concerning whether unusual experiences are symptoms of a mental disorder, if mental disorders are a consequence of such experiences, or if people with mental disorders are especially susceptible to or even looking for these experiences. --[Dr. Martina Belz-Merk](#)

Apophenia is the spontaneous perception of connections and meaningfulness of unrelated phenomena. The term was coined by K. Conrad in 1958 (Brugger).

Peter Brugger of the Department of Neurology, University Hospital, Zurich, gives examples of apophenia from August Strindberg's *Occult Diary*, the playwright's own account of his psychotic break:

He saw "two insignia of witches, the goat's horn and the besom" in a rock and wondered "what demon it was who had put [them] ... just there and in my way on this particular morning." A building then looked like an oven and he thought of Dante's *Inferno*.

He sees sticks on the ground and sees them as forming Greek letters which he interprets to be the abbreviation of a man's name and feels he now knows that this man is the one who is persecuting him. He sees sticks on the bottom of a chest and is sure they form a [pentagram](#).

He sees tiny hands in prayer when he looks at a walnut under a microscope and it "filled me with horror."

His crumpled pillow looks "like a marble head in the style of Michaelangelo." Strindberg comments that "these occurrences could not be regarded as accidental, for on some days the pillow presented the appearance of horrible monsters, of gothic gargoyles, of dragons, and one night ... I was greeted by the Evil One himself...."

According to Brugger, "The propensity to see connections between seemingly unrelated objects or ideas most closely links psychosis to creativity ... apophenia and creativity may even be seen as two sides of the same coin." Some of the most creative people in the world, then, must be [psychoanalysts](#) and therapists who use projective tests like the [Rorschach test](#) or who see [patterns of child abuse](#) behind every emotional problem. Brugger notes that

one analyst thought he had support for the penis envy theory because more females than males failed to return their pencils after a test. Another spent nine pages in a prestigious journal describing how sidewalk cracks are vaginas and feet are penises, and the old saw about not stepping on cracks is actually a warning to stay away from the female sex organ.

Brugger's research indicates that high levels of dopamine affect the propensity to find meaning, patterns, and significance where there is none, and that this propensity is related to a tendency to believe in the paranormal.*

In statistics, apophenia is called a *Type I error*, seeing patterns where none, in fact, exist. It is highly probable that the apparent significance of many unusual experiences and phenomena are due to apophenia, e.g., [EVP](#), [numerology](#), [the Bible code](#), [anomalous cognition](#), [ganzfeld "hits"](#), most forms of [divination](#), the prophecies of [Nostradamus](#), [remote viewing](#), and a host of other paranormal and supernatural experiences and phenomena.

pentagram (pentacle, pentangle)

A pentagram is a five-pointed figure used as a magical or occult symbol by the [Pythagoreans](#), [Masons](#), [Gnostics](#), [Cabalists](#), [magicians](#), [Wiccans](#), [Satanists](#), etc. There is apparently something attractive about the figure's geometry and proportions. In many symbolizations, the top point represents either the human head or a non-human spirit. To invert the figure is considered by some as a sign of relegating Spirit to the bottom of the metaphysical heap. Others take inversion to be Satanic and on par with alleged mockeries such as inverting the cross or saying the Mass backwards. Still others find nothing particularly diabolical about inversion and use the inverted pentagram without fear of accidentally invoking the forces of evil.

The Pentagram From Eliphas Levi's (1810-1875) *Transcendental Magic*

Some say the pentagram is mystical because 5 is mystical. It's a prime number, the sum of 2 and 3, as well as of 1 and 4. Christ had five wounds, they say, if you don't count those inflicted by the crown of thorns; and he distributed five loaves of bread to five thousand people. Most importantly, we have five fingers, toes and senses.

Some Christian watchdogs apparently think the pentagram is the devil's hoof print. They are especially on the lookout for inverted pentagrams as proof of Satanism, but any pentagram will suit most of these caretakers of decent symbology in their never-ending quest to identify evil. Of course, it can be bad for business if rumors are spread that one's company uses the pentagram or any other symbol deemed to be diabolical. [Proctor and Gamble was once accused](#) by [Amway](#) competitors of being run by devil worshippers who flaunted their satanic religion with a diabolical logo. The logo consisted of an old man's bearded face in the crescent moon, facing thirteen stars, all set within a circle. Some saw 666, the number of the Beast in Revelation (usually identified with Satan by the Christian watchdogs), lurking in the old man's beard and in the arrangement of the stars. Others saw a goat, surely a sign of the devil.

To the Wiccan, the five points of the pentagram represent Air, Fire, Water, Earth and Spirit. Wiccans usually put the symbol in a circle, which has traditionally represented the endless or eternity. The ancient Chinese believed there were *five* elements (wood, fire, earth, metal, and water), *five* planets, *five*

seasons, *five* senses, as well as *five* basic colors, sounds and tastes. However, the number six seems to have been more enchanting to them than five, for the [I Ching](#) uses *six* as its base number. So does the [Star of David](#), which has six points and is made by overlapping two equilateral triangles. The Star of David is a hexagram but is not used to cast a hex on you. That kind of hex comes from the German word for witch, *Hexen*, which is related to the Old High German word *hagzissa*, a hag. Personally, if proportion and geometry are the basis for mystical figures, the hexagram seems much preferable to the pentagram.

Occultists of all sorts wear pentagram [talismans](#) to protect them from evil or to help them get occult knowledge and power. They even draw pentagrams on the ground and stand within them to better call upon occult powers. If the point is aimed north, they are *not* worshippers of Satan. However, if the point is aimed south, they are. So say the Christian watchdogs.

For some reason, the pentagram has become the symbol for a star, though no star in the sky looks like a pentagram, unless perhaps it is seen from inside the five corners of the earth when one is five sheets to the wind. Furthermore, some mystics claim that if one stares at a small pentangle long enough one will see that all triangles end in a circle with five sides.

psychoanalysis & Sigmund Freud

"I am actually not at all a man of science, not an observer, not an experimenter, not a thinker. I am by temperament nothing but a conquistador-an adventurer, if you want it translated-with all the curiosity, daring, and tenacity characteristic of a man of this sort" (Sigmund Freud, letter to Wilhelm Fliess, Feb. 1, 1900).

"By the 1950' and '60s, the master's warning had been drowned in a tumult of excited voices. Psychoanalysts and psychiatrists could cure even schizophrenia, the most feared mental disease of all, they claimed, and they could do it simply by *talking with their patients*" (Dolnick, 12).

Psychoanalysis is the granddaddy of all [pseudoscientific](#) psychotherapies, second only to [Scientology](#) as the champion purveyor of false and misleading claims about the mind, mental health and mental illness. For example, in psychoanalysis [schizophrenia and depression](#) are not neurochemical disorders, but *narcissistic* disorders. Autism and other brain disorders are not brain chemistry problems but mothering problems. These illnesses do not require pharmacological treatment. They require only "talk" therapy. Similar positions are taken for anorexia nervosa and Tourette's syndrome. (Hines 1990, 136) What is the scientific evidence for the psychoanalytic view of these mental illnesses and their proper treatment? There is none.

Freud thought he understood the nature of schizophrenia. It is not a brain disorder, but a disturbance in the unconscious caused by unresolved feelings of homosexuality. However, he maintained that psychoanalysis would not work with schizophrenics because such patients ignore their therapist's insights and are resistant to treatment (Dolnick 1998, 40). Later psychoanalysts would claim, with equal certainty and equal lack of scientific evidence, that schizophrenia is caused by smothering mothering. In 1948, Frieda Fromm-Reichmann, for example, gave birth to the term "schizophrenogenic mother," the mother whose bad mothering causes her child to become schizophrenic (*ibid.* 94). Other analysts before her had supported the notion with anecdotes and intuitions, and over the next twenty years many more would follow her misguided lead.

Would you treat a broken leg or diabetes with "talk" therapy or by interpreting the patient's dreams? Of course not. Imagine the reaction if a diabetic were told that her illness was due to "masturbatory conflict" or "displaced eroticism." One might as well tell the patient she is possessed by demons, as give her a psychoanalytic explanation of her physical disease or

disorder. Exorcism of demons by the shaman or priest, exorcism of childhood experiences by the psychoanalyst: what's the difference? So why would anyone still maintain that neurochemical or other physical disorders are caused by *repressed* or *sublimated* traumatic sexual childhood experiences? Probably for the same reason that theologians don't give up their elaborate systems of thought in the face of overwhelming evidence that their systems of belief are little more than vast metaphysical cobwebs. They get a lot of institutional reinforcement for their socially created roles and ideas, most of which are not capable of being subjected to empirical testing. If their notions can't be tested, they can't be disproved. What can't be disproved, and also has the backing of a powerful institution or establishment, can go on for centuries as being respectable and valid, regardless of its fundamental emptiness, falsity or capacity for harm.

The most fundamental concept of psychoanalysis is the notion of the unconscious mind as a reservoir for repressed memories of traumatic events which continuously influence conscious thought and behavior. The scientific evidence for this notion of unconscious [repression](#) is lacking, though there is ample evidence that conscious thought and behavior are influenced by unconscious memories.

Related to these questionable assumptions of psychoanalysis are two equally questionable methods of investigating the alleged memories hidden in the unconscious: free association and [the interpretation of dreams](#). Neither method is capable of scientific formulation or empirical testing. Both are metaphysical blank checks to speculate at will without any check in reality.

Scientific research into how memory works does not support the psychoanalytic concept of the unconscious mind as a reservoir of repressed sexual and traumatic memories of either childhood or adulthood. There is, however, ample evidence that there is a type of memory of which we are not consciously aware, yet which is remembered. Scientists refer to this type of memory as *implicit memory*. There is ample evidence that to have memories requires extensive development of the frontal lobes, which infants and young children lack. Also, memories must be encoded to be lasting. If encoding is absent, amnesia will follow, as in the case of many of our dreams. If encoding is weak, fragmented and implicit memories may be all that remain of the original experience. Thus, the likelihood of infant memories of abuse, or of anything else for that matter, is near zero. Implicit memories of abuse do occur, but not under the conditions which are assumed to be the basis for repression. Implicit memories of abuse occur when a person is rendered unconscious during the attack and cannot encode the experience very deeply. For example, a rape victim could not remember being raped. The attack took place on a brick pathway. The words 'brick' and 'path' kept popping into her mind, but she did not connect them to the rape. She became very upset when taken back to the scene of the rape, though she didn't remember what had happened there (Schacter, 232). It is unlikely that [hypnosis](#), free association,

or any other therapeutic method will help the victim remember what happened to her. She has no explicit memory because she was unable to deeply encode the trauma due to the viciousness of the attack which caused her to lose consciousness. The best a psychoanalyst or other [repressed-memory therapist](#) can do is to create a [false memory](#) in this victim, abusing her one more time.

Essentially connected to the psychoanalytic view of repression is the assumption that parental treatment of children, especially mothering, is the source of many, if not most, adult problems ranging from personality disorders to emotional problems to mental illnesses. There is little question that if children are treated cruelly throughout childhood, their lives as adults will be profoundly influenced by such treatment. It is a big conceptual leap from this fact to the notion that *all* sexual experiences in childhood will cause problems in later life, or that all problems in later life, including sexual problems, are due to childhood experiences. The scientific evidence for these notions is lacking.

In many ways, psychoanalytic therapy is based on a search for what probably does not exist (repressed childhood memories), an assumption that is probably false (that childhood experiences caused the patient's problem) and a therapeutic theory that has nearly no probability of being correct (that bringing repressed memories to consciousness is essential to the cure). Of course, this is just the foundation of an elaborate set of scientifically sounding concepts which pretend to explain the deep mysteries of consciousness and behavior. But if the foundation is illusory, what possibly could be the future of this illusion?

There are some good things, however, which have resulted from the method of psychoanalysis developed by Sigmund Freud (1856-1939) a century ago in Vienna. Freud should be considered one of our greatest benefactors if only because he pioneered the desire to *understand* those whose behavior and thoughts cross the boundaries of convention set by civilization and cultures. That it is no longer fashionable to condemn and ridicule those with behavioral or thought disorders is due in no small part to the tolerance promoted by psychoanalysis. Furthermore, whatever intolerance, ignorance, hypocrisy and prudishness remains regarding the understanding of our sexual natures and behaviors cannot be blamed on Freud. Psychoanalysts do Freud no honor by blindly adhering to the doctrines of their master in this or any other area. Finally, as psychiatrist Anthony Storr put it: "Freud's technique of listening to distressed people over long periods rather than giving them orders or advice has formed the foundation of most modern forms of psychotherapy, with benefits to both patients and practitioners" (Storr 1996, 120).

Rorschach Inkblot Test

The Rorschach inkblot test is a psychological projective test of personality in which a subject's interpretations of ten standard abstract designs are analyzed as a measure of emotional and intellectual functioning and integration. The test is named after Hermann Rorschach (1884-1922) who developed the inkblots, although he did not use them for personality analysis.

The test is considered "projective" because the patient is supposed to project his or her real personality into the inkblot via the interpretation. The inkblots are purportedly ambiguous, structureless entities which are to be given a clear structure by the interpreter. Those who believe in the efficacy of such tests think that they are a way of getting into the deepest recesses of the patient's psyche or subconscious mind. Those who give such tests believe themselves to be experts at interpreting their patients' interpretations.

What evidence is there that an interpretation of an inkblot (or a picture drawing or sample of handwriting--other items used in projective testing) issues from a part of the self that reveals true feelings, rather than, say, creative expression? What justification is there for assuming that any given interpretation of an inkblot does not issue from a part of the self bent on deceiving others, or on deceiving oneself for that matter? Even if the interpretations issued from a part of the self which expresses desires, it is a long jump from having desires to having committed actions. For example, an interpretation may unambiguously express the desire to have sex with the therapist, but that does not imply either that the patient has had sex with the therapist or that the patient, if given the opportunity, would agree to have sex with the therapist.

Rorschach testing is inherently problematic. For one thing, to be truly projective the inkblots must be considered ambiguous and without structure by the therapist. Hence, the therapist must not make reference to the inkblot in interpreting the patient's responses or else the therapist's projection would have to be taken into account by an independent party. Then the third person would have to be interpreted by a fourth ad infinitum. Thus, the therapist must interpret the patient's interpretation without reference to what is being interpreted. Clearly, the inkblot becomes superfluous. You might as well have the patient interpret spots on the wall or stains on the floor. In other words, the interpretation must be examined as if it were a story or dream with no particular reference in reality. Even so, ultimately the therapist must make a judgment about the interpretation, i.e., interpret the interpretation. But again, who is to interpret the therapist's interpretation? Another therapist? Then, who will interpret his? etc.

To avoid this logical problem of having a standard for a standard for a standard, etc., the experts invented standardized interpretations of interpretations. Both form and content are standardized. For example, a patient who attends only to a small part of the blot is "indicative of obsessive personality;" while one who sees figures which are half-human and half-animal indicates that he is alienated, perhaps on the brink of schizophrenic withdrawal from people (Dawes, 148). If there were no standardized interpretations of the interpretations, then the same interpretations by patients could be given equally valid but different interpretations by therapists. What empirical tests have been done to demonstrate that any given interpretation of an inkblot is indicative of any past behavior or predictive of any future behavior? In short, interpreting the inkblot test is about as scientific as interpreting [dreams](#).

To have any hope of making the inkblot test appear to be scientifically valid, it was essential that it be turned into a non-projective test. The blots can't be considered completely formless, but must be given a standard response against which the interpretations of patients are to be compared as either good or bad responses. This is what John E. Exner did. The Exner System uses inkblots as a standardized test. On its face, the concept seems preposterous. Imagine admitting people into med school on the basis of such a standardized test! Or screening candidates for the police academy! ("I didn't get in because I failed the inkblot test.")

The Rorschach enthusiast should recognize that inkblots or dreams or drawings or handwriting may be no different in structure than spoken words or gestures. Each is capable of many interpretations, some true, some false, some meaningful, some meaningless. It is an unprovable assumption that dreams or inkblot interpretations issue from a source deep in the subconscious which wants to reveal the "real" self. The mind is a labyrinth and it is a pipe dream to think that the inkblot is Ariadne's thread which will lead the therapist to the center of the patient.

electronic voice phenomenon (EVP)

Electronic voice phenomenon is the alleged communication by spirits through tape recorders and other electronic devices. The belief in EVP in the United States seems to have mushroomed thanks to Sarah Estep, president of the [American Association of Electronic Voice Phenomena](#), which claims to have members in some 40 states and publishes a newsletter. Estep claims that in the 1970s she started picking up voices on her husband's Teac reel-to-reel recorder. She is sure that the voices are spirits, proving there is life after death. Estep also claims to hear [voices of aliens](#) on some of her tapes. She says she has taped some 20,000 ghosts and aliens. Aliens don't speak English, however, so she is not sure what they are saying.

Interest in EVP apparently began in the 1920s. An interviewer from *Scientific American* asked Thomas Edison about the possibility of contacting the dead. Edison, a man of no strong religious views, said that nobody knows whether “our personalities pass on to another existence or sphere” but

it is possible to construct an apparatus which will be so delicate that if there are personalities in another existence or sphere who wish to get in touch with us in this existence or sphere, this apparatus will at least give them a better opportunity to express themselves than the tilting tables and raps and ouija boards and mediums and the other crude methods now purported to be the only means of communication. (Clark 1997: 235)

There is no evidence, however, that Edison ever designed or tried to construct such a device. And he probably did not foresee spirits communicating with our tape recorders and television sets.

While it is impossible to prove that all EVPs are due to natural phenomena, skeptics maintain that they are probably due to such things as [interference](#) from a nearby CB operator or [cross modulation](#).

numerology

Numerology is the study of the occult meanings of numbers and their influence on human life. Some alleged [psychics](#), like [Uri Geller](#), claim that numerology helps them understand events such as the terrorist attacks on September 11, 2001.

According to an advertisement in *Parade* magazine (Feb.25, 1996), the definitive text on numerology was written by Matthew Goodwin, an MIT graduate who once worked in the personnel department of an architectural firm. He learned "this science of numbers" (as he calls it) from a clerk at the office. The ad is a pseudo-article, a print "infomercial," allegedly authored by J.J. Leonard, who is probably Goodwin himself, since the ad is nothing more than an invitation to send him \$9 for a numerological reading worth "\$80 or more." In his advertisement, he explains how numerology works.

It all starts with your name and birth date. They are the data base from which a numerologist is able to describe you, sight unseen. Number values are assigned to the letters in your name. By adding these--with the numbers in your birth date--in a multitude of combinations, a numerologist establishes your key numbers. He then interprets the meaning of these key numbers, which results in a complete description of your personal characteristics.

According to Mr. Goodwin, through numerology you can "see all the diverse parts of your personality and how they uniquely come together to make the person you are." This will enable you to "make the most of your strengths in a way that wasn't possible before."

Just what do you think the numerical odds are either (a) that a set of numbers associated with the letters of your name and your birth date will reveal who you are and what you should do with your life, or (b) that someone in personnel has figured out how to read those numbers? I'd say the odds are about zero. Nevertheless, numerology shouldn't be brushed off without a thorough examination of its underlying theory. Unfortunately, there doesn't seem to be any. We are just supposed to take Mr. Goodwin's word for it that numerology works, even though we have no idea how it works. That is, numerologists can produce a "reading" for you, just as [astrologers](#), [biorhythmists](#) and [Myers-Briggs](#) can. And you will be amazed at how "accurate" the reading is! You may not even be aware at how [selective your thinking](#) has become as you are dazzled by the accuracy of your reading.

When you get your reading, you may find yourself ignoring the parts that don't fit you at all, and focusing on those parts that do seem to fit. They may actually fit you or they may fit your image of how you would like to be. No matter; if they fit, you may fall for it. You may even be tempted to go one step further and call your own personal psychic on one of the "friends" psychic hotlines. (I think the \$9 numerology reading might be cheaper, though.) The [testimonials](#) for numerology and the telephone psychics are quite similar. Marriages are saved, jobs are landed, personal problems are resolved and love is found.

Some of the attractiveness of numerology and psychics comes from the desire to find somebody who will tell you that you are full of hidden strengths and powers, and who will reinforce your deepest needs and emotions. Yet, one must be desperate if one doesn't mind that the encouragement comes from a total stranger with no knowledge of who you are. Of course, some people are simply waiting for somebody else to tell them what to do with their lives. On the other hand, at times, each of us is vulnerable. We feel unloved, misunderstood, confused, or rudderless. The testimonials sound good or a friend is a satisfied customer, so we give it a try.

But the real attractiveness of numerology, over say [palm](#) or [crystal](#) reading or other non-numerical personality analysis and prophecy, is that numbers give the quackery an aura of both scientific and mystical authoritativeness, especially if complex statistical analysis is involved. The ad mentioned above for Mr. Goodwin's \$9 numerological reading, cites Pythagoras as the father of numerology. Certainly, the Pythagoreans were a cult with esoteric notions about the universe and numbers, including the notion of the harmony of the spheres. No doubt they found something mystical about the relations of sides of triangles, which we have come to know as the Pythagorean theorem. But there is no evidence that Pythagoras thought he could analyze his disciples' personalities by assigning numbers to the letters of their names and their birth dates. For one thing, he would have realized the unreasonableness of such a notion. Different languages have different alphabets; different cultures use different calendars. It is unreasonable enough to think the universe is arranged according to numerical transcriptions of names, but to think that there are several equivalent transcriptions to accommodate cultural differences stretches the limits of credibility almost to infinity. Even if the universe were so unreasonably designed, how would we ever know which "reading" of a person's numbers is the "correct" one? Does the concept of "correct reading" even have meaning in this so-called discipline?

It is one thing to recognize that many things in the universe can be explained by reduction to mathematical formulae. The formulae can be tested and demonstrated to be accurate or not. It is quite another to claim that somehow the name you are given at birth was preordained to coincide with the date of your birth and to be coordinated with certain numbers so that certain special people (the numerologists!) could calculate from this data who you are, what

you will be, what you need and feel, and what you should do. It is a long, long way from Plato's admonition to those entering his Academy that they should know geometry, or from Galileo's assertion that Nature is written in the language of mathematics, to the notion that numbers related to my name are a key to who I am pre-destined to be. It is a misrepresentation of history to cite mathematical mystics or scientists who have been enamored of mathematics, as fellow travelers. In any case, even if Pythagoras, Plato, Kepler, Galileo, and Einstein were all numerologists it would not make the theory of numerology one iota more plausible.

The Bible (or Torah) Code

The Bible (or Torah) Code is a code alleged to have been intentionally embedded in the Bible. The code is revealed by searching for equidistant letter sequences (ELS). For example, start with any letter ("N") and read every n^{th} letter ("D") thereafter in the book, not counting spaces. If an entire book such as *Genesis* is searched, the result is a long string of letters. Using different values for "N" and "D", one can generate many strings of letters. Imagine wrapping the string of letters around a cylinder in such a way that all the letters can be displayed. Flatten the cylinder to reveal several rows with columns of equal length, except perhaps the last column which might be shorter than all the rest. Now search for meaningful names in proximity to dates. Search horizontally, vertically, diagonally, any which way. A group of Israeli mathematicians did just this and claimed that when they searched for names in close proximity to birth or death dates (as published in the *Encyclopedia of Great Men in Israel*) they found many matches. Doron Witztum, Eliyahu Rips and Yoav Rosenberg published their findings in the journal *Statistical Science* (1994, Vol. 9, No. 3, 429-438) under the title of "[Equidistant Letter Sequences in the Book of Genesis.](#)" The editor of the journal commented:

When the authors used a randomization test to see how rarely the patterns they found might arise by chance alone they obtained a highly significant result, with the probability $p=0.000016$. Our referees were baffled: their prior beliefs made them think the *Book of Genesis* could not possibly contain meaningful references to modern-day individuals, yet when the authors carried out additional analyses and checks the effect persisted.

That is, the probability of getting the results they did was 16 out of one million or 1 out of 62,500. The authors state: "Randomization analysis shows that the effect is significant at the level of 0.00002 [and] the proximity of ELS's with related meanings in the Book of Genesis is not due to chance." Harold Gans, a former cryptologist at the US Defense Department, replicated the work of the Israeli team and agreed with their conclusion. [Witztum](#) later claimed that, according to one measure, the probability of getting these results by chance is 1 in 4 million. Though he has apparently changed his mind and now claims that the probability is $p = 0.00000019$ (1 out of 5.3 million). Jason Browning, a [creation scientist](#), claims that the first *five* books of the Bible contain hidden word patterns that have been "shown mathematically to be impossible to have occurred by chance." Browning does not mention who did the math for him.

As further evidence of the statistical significance of their results, the Israeli team analyzed the Hebrew version of the *Book of Isaiah* and the first 78,064 characters of a Hebrew translation of Tolstoy's *War and Peace*. They found many names in close proximity to birth or death dates, but the results were statistically insignificant. (The *Book of Genesis* used in their study, the Koren version, has 78,064 characters.)

What does this all mean? To some it means that the patterns in *Genesis* are intentional and that God is the ultimate author of the code. If so, should the *Book of Isaiah*, and any other book in the Bible that fails the ELS test, be dumped? Should we conclude that these statistics verify the claim that the Jews are the chosen people of God or that no more names should be added to list of Great Men in Israel unless they pass the ELS test? Unless other religions can duplicate such statistically improbable results, the mathematically minded supernaturalist might well consider them to be imposters. Should we translate all the sacred books of all the religions of the world into Hebrew and see how many great men of Israel are encoded there? Many of us are at a loss at what to make of such astounding numbers.

Can a computer really read the mind of God? Apparently. For on this theory God dictated in His favorite language, Hebrew, a set of words which are more or less intelligible if taken at face value, containing stories of creation, floods, fratricide, wars, miracles, etc., with many moral messages. But this Hebrew God chose his words carefully, encoding the Bible with prophecies and messages of absolutely no religious value.

Many, however, are not at a loss at all. Some Christian "creation scientists" are claiming the Bible Code provides [scientific proof](#) of God's existence. If they are right, they should convert to Judaism. Doran Witztum can't do that, since he is already a Jew. But he has taken the work done on *Genesis* a bit further than his colleagues. Witztum went [on Israeli television](#) and claimed that the names of the sub-camps on a map of Auschwitz appeared remarkably close to the phrase "in Auschwitz." The odds of such occurring, he said, are "one in a million." Some of his students did the math and claim their mentor was off by "a factor of 289,149." Witztum's math may not be as good as his intentions, but it is difficult to see what those intentions might be. Was God revealing in an odd way that the sub-camps of Auschwitz are in Auschwitz?

Michael Drosnin and admirers of his popular book, *The Bible Code*, are claiming that decoding the Bible allegedly leads to the discovery of prophecies and profound truths of a secular nature, not all of which are related to the Jews. Drosnin claims that the Bible is the only text in which these encoded phrases are found in a statistically significant pattern, and that the chance of this being a random phenomenon is unlikely. Using the ELS method, Drosnin claims that the assassination of Yitzhak Rabin was foretold in the Bible. He also claims that the assassinations of Anwar Sadat and the Kennedy brothers are encoded in Biblical ELS. At last, someone has found a

truly useful purpose for computers: doing ELS analyses of Biblical texts in search of hidden messages of a secular nature. The Lord loveth a puzzle.

Not everybody agrees with the Drosnin hypothesis, including Harold Gans, the retired Defense Department cryptologist who corroborated the work of Witztum, Rips and Rosenberg. Gans has [published a statement](#) regarding *The Bible Code* and other similar books. In part, the statement reads

The book states that the codes in the Torah can be used to predict future events. This is absolutely unfounded. There is no scientific or mathematical basis for such a statement, and the reasoning used to come to such a conclusion in the book is logically flawed. While it is true that some historical events have been shown to be encoded in the Book of Genesis in certain configurations, it is absolutely not true that every similar configuration of "encoded" words necessarily represents a potential historical event. In fact, quite the opposite is true: most such configurations will be quite random and are expected to occur in any text of sufficient length. Mr. Drosnin states that his "prediction" of the assassination of Prime Minister Rabin is "proof" that the "Bible Code" can be used to predict the future. A single success, regardless of how spectacular, or even several such "successful" predictions proves absolutely nothing unless the predictions are made and evaluated under carefully controlled conditions. Any respectable scientist knows that ["anecdotal" evidence](#) never proves anything.

Dr. Eliyahu Rips, one of the authors of the study that started the Bible Code craze, has also made a [public statement](#) regarding Drosnin's *Bible Code*.

I do not support Mr. Drosnin's work on the Codes, nor the conclusions he derives....All attempts to extract messages from Torah codes, or to make predictions based on them, are futile and are of no value. This is not only my own opinion, but the opinion of every scientist who has been involved in serious Codes research.

Professor [Menachem Cohen](#), a celebrated Bible scholar at Bar-Ilan University, has criticized Witztum et al. on two counts: (1) there are several other Hebrew versions of *Genesis* for which ELS does not produce statistically significant results; and (2) the appellations given to the Great Men in Israel was inconsistent and arbitrary. The Professor makes some good points, but perhaps this just proves that the Koren version is the correct one and that the appellations chosen are the most fitting for these great men of Israel.

Other critics, such as [Brendan McKay](#), have done their own analysis of *War and Peace* with remarkably different results than those reported by Witztum et al. Many critics, however, have done little more than use ELS to find names, dates, etc., in various books, a feat already [known by even the puniest of statisticians to be unremarkable](#). However, Drosnin seemed to ask for such when he said "When my critics find a message about the assassination of a prime minister encrypted in *Moby Dick*, I'll believe them." McKay promptly produced [an ELS analysis of *Moby Dick*](#) predicting not only Indira Ghandi's assassination, but the assassinations of Martin Luther King, John F. Kennedy, Abraham Lincoln, and Yitzhak Rabin, as well as the death of Diana, Princess of Wales. Mathematician David Thomas [did an ELS on *Genesis*](#) and found the words "code" and "bogus" close together not once but 60 times. What are the odds of that happening? Does this mean that God put in a code to reveal that there is no code? The way of the Lord is mysterious, indeed.

See related entries on [divination](#), the [cabala](#) and [numerology](#).

ganzfeld experiment

*Most sciences try to explain observable phenomena;
parapsychology tries to observe unexplainable phenomena.*
RTC

The ganzfeld ("total field") experiment uses a kind of sensory deprivation to test for [psi](#). Ping-Pong balls are put over each subject's eyes and headphones are placed over the ears. While white noise is played through the headset, a bright red light is shown through the ping pong balls. It doesn't take long before the subject begins to hallucinate. At this point, others in another room are shown a visual stimulus such as a short video clip. They try to transmit telepathically what they are seeing to the subject in the ganzfeld.

The video clips or other visual stimuli are selected randomly from a large set of items. While the sender concentrates on the target, the receiver provides a continuous verbal report of his or her images. Images seen by the viewers are compared with the images seen by the subjects. Finally, "at the completion of the ganzfeld period, the receiver is presented with several stimuli (usually four) and, without knowing which stimulus was the target, is asked to rate the degree to which each matches the imagery and mentation experienced during the ganzfeld period. If the receiver assigns the highest rating to the target stimulus, it is scored as a "hit." Thus, if the experiment uses judging sets containing four stimuli (the target and three decoys or control stimuli), the hit rate expected by chance is .25" [Bem and Honorton].

The hypothesis of parapsychologist Charles Honorton, the creator of the ganzfeld experiments, is that if psi exists, there should be a greater than chance match between the images of the senders and receivers. Honorton has reported studies such as one with 240 subjects who were right 34% of the time. This is not likely due to chance. The question is, is it due to psi? It could be. It could also be due to something else, something which correlates strongly with the selection of the video clips or other selected visual stimuli, such as age or gender of the subjects, or content or theme of the visual images. Chance could be involved, though it is very unlikely. In any case, before Honorton gets his Nobel Prize, others need to replicate the study and make very persuasive arguments that the only plausible explanation is psi.

Rick E. Berger, Ph.D., the creator of the [automated ganzfeld](#) (and coauthor with Honorton on several ganzfeld papers) objects to the above conclusion, which he claims is "seriously outdated or you are unaware of the replications and published meta-analyses of this literature." Dr. Berger quotes the

illustrious [Dean Radin](#):

From 1974 to 1997, some 2,549 ganzfeld sessions were reported in at least forty publications by researchers around the world. After a 1985 meta-analysis established an estimate of the expected hit rate, a six-year replication was conducted that satisfied skeptics' calls for improved procedures. That "autoganzfeld" experiment showed the same successful results.

"The overall hit rate for the 2,549 sessions was 33.2% (where 25% was expected) yielding odds against chance of a million billion to one," says Berger. This sounds impressive until you examine the claim ever so slightly. The Ganzfeld is set up so that an interpretation must be made of a verbal report from the test subject to be matched against an image allegedly sent telepathically to the subject. Thus, even if an image bears little or no resemblance to the verbal description, if it is selected as the one most closely resembling the image verbally described, then it counts as a hit. For example, here is a verbal description taken from Dr. Berger's website on the ganzfeld:

**I see the Lincoln Memorial...
And Abraham Lincoln sitting there... It's
the 4th of July... All kinds of fireworks...
Now I'm at Valley Forge... There are
fireworks... And I think of bombs
bursting in the air... And Francis Scott
Key... And Charleston...**

There are quite a few images that would "match" this description, since the description itself contains at least eight distinct images (the Lincoln memorial, Lincoln, 4th of July, fireworks, Valley Forge, bombs, Francis Scott Key, Charleston) to which one could easily add a couple more, such as the American flag, the star spangled banner, and, oh yes, George Washington, which was the image selected as most closely resembling the verbal description. We're not told what the other three choices were.

One wonders why, if this 8.2%, million billion to one, difference is evidence of telepathy, the verbal descriptions are not more precise. For example, why didn't the psychic "see" George Washington, since that was what the image was? Why did he see the Lincoln memorial and a bunch of other things? How can they be sure of what they are measuring? Why isn't the subject allowed to choose "none"? Shouldn't the experimenters have some cases where the sender doesn't really send anything? And shouldn't the receiver be able to say "I'm not getting any message at all"? If Berger and Honorton would do a ganzfeld where the sender sends no messages at all throughout the entire experiment, my guess is that the receiver would still "receive" and give a verbal description of his vision. What would his vision be of? Would these

scientists say that the vision is one of the imagination or would they say that someone, somewhere, sent some message and the subject picked it up? How can they be sure, in fact, that their subjects are not picking up messages from others besides the sender? Perhaps the reason the subjects fail 66.8% of the time is because they are picking up messages from the wrong senders. Maybe there is 100% telepathy. Or maybe something else is going on besides telepathy.

In any case, [Julie Milton and Richard Wiseman](#) recently published their own meta-analysis of ganzfeld studies and concluded that "the ganzfeld technique does not at present offer a replicable method for producing ESP in the laboratory" (1999).

divination (fortune telling)

Divination is the attempt to foretell the future or discover occult knowledge by interpreting omens or by using paranormal or supernatural powers. The list of items that have been used in divination is extraordinary. Below are listed just a few. Many end in 'mancy', from the ancient Greek *manteia* (divination), or 'scopy', from the Greek *skopein* (to look into, to behold).

- aeluromancy (dropping wheatcakes in water and interpreting the result)
- aeromancy (divination by examining what the air does to certain things)
- alectoromancy or alectryomancy (divination by a cock: grains of wheat are placed on letters and the cock "spells" the message by selecting grains)
- alphitomancy (dropping barleycakes in water and interpreting the result)
- anthropomancy (divination by interpreting the organs of newly sacrificed humans)
- astragalomancy or astragyromancy (using knucklebones marked with letters of the alphabet)
- [astrology](#)
- axinomancy (divination by the hatchet: interpreting the quiver when whacked into a table)
- belomancy (divination by arrows)
- bronchiomancy (divination by studying the lungs of sacrificed white llamas)
- capnomancy (divination by the smoke of an altar or sacrificial incense)
- [cartomancy](#)
- [catoptromancy or crystallo-mancy \(using mirrors or lenses\)](#)
- cephalomancy (divination by a donkey's head)
- [chiromancy \(palmistry\)](#)
- cleidomancy (divination by interpreting the movements of a key suspended by a thread from the nail of the third finger on a young virgin's hand while one of the Psalms was recited)
- coscinomancy (divination by a balanced sieve)
- cromniomancy (divination by onions)
- dactylomancy (divination by means of rings put on the fingernails or the number of whorls and loops on the fingers)
- daphnomancy (divination using the laurel branch: how did it crackle when burned?)
- [dowsing](#)
- extispicy (divination by examining entrails)
- fractomancy (interpreting the structures of fractal geometric patterns)

- [geomancy](#)
- gyromancy (divination by walking around a circle of letters until dizzy and one falls down on the letters or in the direction to take)
- haruspicy (inspecting the entrails of slaughtered animals)
- hydromancy (divination by examining what certain things do in water or when taken out of water, such as coffee grounds or tea leaves); hydatoscopy (if rainwater is used); pegomancy (if spring-water is used)
- hepatoscopy or hepatomancy (divination by examining the liver of sacrificed animals)
- kephalomancy (burning carbon on the head of an ass while reciting the names of suspected criminals; if you're guilty, a crackling sound will be heard when your name is spoken)
- lampadomancy (interpreting the movements of the flame of a lamp)
- libanomancy (interpreting the smoke of incense)
- lithomancy (divination using precious stones)
- lecanomancy (dropping precious stones into water and listening for whistles)
- margaritomancy (divination by the pearl: if it jumps in the pot when a person is named, then he is the thief!)
- [metoposcopy](#) (interpreting frontal wrinkles)
- molybdomancy (divination by melted lead: interpreting its noises and hisses when dropped into water)
- myrmomancy (divination by watching ants eating)
- necromancy (communicating with spirits of the dead to predict the future)
- oinomancy (divination by wine)
- omphalomancy (interpretation of the belly button)
- [oneiromancy](#) (interpretation of dreams)
- onychomancy (interpreting the reflection of sun rays off fingernails)
- ornithomancy or orniscopy (interpreting the flights of birds)
- ovomancy or oomancy or ooscopy (breaking eggs into a container of water and interpreting the shape of the egg white)
- [papyromancy](#) (divination by folding paper)
- pyromancy or pyroscopy (divination by fire)

pareidolia

Pareidolia is a type of illusion or misperception involving a vague or obscure stimulus being perceived as something clear and distinct. For example, [in the discolorations of a burnt tortilla one sees the face of Jesus Christ](#).

Or one sees the image of [Mother Theresa or Ronald Reagan in a cinnamon bun](#) or [the face of a man in the moon](#).

Under ordinary circumstances, pareidolia provides a psychological explanation for many delusions based upon sense perception. For example, it explains many [UFO sightings](#), as well as the hearing of sinister [messages on records played backwards](#). Pareidolia explains Elvis, [Bigfoot](#), and [Loch Ness Monster](#) sightings. It explains numerous religious [apparitions](#) and visions. And it explains why some people see a face or a building in a photograph of the [Cydonia region of Mars](#).

Under clinical circumstances, some psychologists *encourage* pareidolia as a means to understanding a patient. The most infamous example of this type of clinical procedure is the [Rorschach ink blot](#) test.

Astronomer Carl Sagan claimed that the human tendency to see faces in tortillas, clouds, cinnamon buns, etc. is an evolutionary trait. He writes:

As soon as the infant can see, it recognizes faces, and we now know that this skill is hardwired in our brains. Those infants who a million years ago were unable to recognize a face smiled back less, were less likely to win the hearts of their parents, and less likely to prosper. These days, nearly every infant is quick to identify a human face, and to respond with a goony [sic] grin (Sagan, 45).

I think Sagan is right about the tendency to recognize faces, but I don't see any reason to think there is an evolutionary advantage in seeing replicas of paintings, ghosts, demons, etc. in inanimate objects. It seems more likely that the mind is making associations with shapes, lines, shadows, etc., and that these associations are rooted in desires, interests, hopes, obsessions, etc. Most people recognize illusions for what they are, but some become fixated on the reality of their perception and turn an *illusion* into a *delusion*. A little bit of critical thinking, however, should convince most reasonable persons that a

cinnamon bun that looks like mother Teresa or a burnt area on a tortilla that looks like Jesus are accidents and without significance. It is more likely that the Virgin Mary one sees in the reflection of a mirror or on the floor of an apartment complex or in the clouds has been generated from one's own imagination than that a person who has been dead for 2,000 years should manifest herself in such a mundane and useless fashion.

Carl Jung (1875-1961), synchronicity & the collective unconscious

Carl Jung was a Swiss psychiatrist and colleague of Freud's who broke away from Freudian [psychoanalysis](#) over the issue of the [unconscious mind](#) as a reservoir of repressed sexual trauma which causes all neuroses. Jung founded his own school of analytical psychology.

Jung believed in [astrology](#), [spiritualism](#), [telepathy](#), [telekinesis](#), [clairvoyance](#) and [ESP](#). In addition to believing in a number of occult and paranormal notions, Jung contributed two new ones in his attempt to establish a psychology rooted in occult and [pseudoscientific](#) beliefs: *synchronicity* and the *collective unconscious*.

Synchronicity is an explanatory principle; it explains "meaningful coincidences" such as a beetle flying into his room while a patient was describing a dream about a scarab. The scarab is an Egyptian symbol of rebirth, he noted. Therefore, the propitious moment of the flying beetle indicated that the transcendental meaning of both the scarab in the dream and the insect in the room was that the patient needed to be liberated from her excessive rationalism. His notion of **synchronicity** is that there is an acausal principle that links events having a similar meaning by their coincidence in time rather than sequentially. He claimed that there is a synchrony between the mind and the phenomenal world of perception.

What evidence is there for synchronicity? None. Jung's defense is so inane I hesitate to repeat it. He argues that "acausal phenomena must exist...since statistics are only possible anyway if there are also exceptions" (1973, *Letters*, 2:426). He asserts that "...improbable facts exist--otherwise there would be no statistical mean..." (ibid.: 2:374). Finally, he claims that "the premise of probability simultaneously postulates the existence of the improbable" (ibid. : 2:540).

Even if there were a synchronicity between the mind and the world such that certain coincidences resonate with transcendental truth, there would still be the problem of figuring out those truths. What guide could one possibly use to determine the correctness of an interpretation? There is none except intuition and insight, the same guides that led Jung's teacher, [Sigmund Freud](#), in his interpretation of dreams. The concept of synchronicity is but an expression of [apophenia](#).

According to psychiatrist and author, Anthony Storr, Jung went through a period of mental illness during which he thought he was a prophet with "special insight." Jung referred to his "creative illness" (between 1913-1917) as a voluntary confrontation with the unconscious. His great "insight" was that he thought all his patients over 35 suffered from "loss of religion" and he had just the thing to fill up their empty, aimless, senseless lives: his own metaphysical system of *archetypes and the collective unconscious*.

Synchronicity provides access to the archetypes, which are located in the collective unconscious and are characterized by being universal mental predispositions not grounded in experience. Like Plato's Forms (*eidos*), the archetypes do not originate in the world of the senses, but exist independently of that world and are known directly by the mind. Unlike Plato, however, Jung believed that the archetypes arise spontaneously in the mind, especially in times of crisis. Just as there are meaningful coincidences, such as the beetle and the scarab dream, which open the door to transcendent truths, so too a crisis opens the door of the collective unconscious and lets out an archetype to reveal some deep truth hidden from ordinary consciousness.

Mythology, Jung claimed, bases its stories on the archetypes. Mythology is the reservoir of deep, hidden wondrous truths. Dreams and psychological crises, fevers and derangement, chance encounters resonating with "meaningful coincidences," all are gateways to the collective unconscious, which is ready to restore the individual psyche to health with its insights. Jung maintained that these metaphysical notions are scientifically grounded, but they are not empirically testable in any meaningful way. In short, they are not scientific at all, but [pseudoscientific](#).

[Becoming
a Critical Thinker](#)

by Robert T. Carroll

appeal to authority

The appeal to authority is a fallacy of irrelevance when the authority being cited is not really an authority. E.g., to appeal to Einstein to support a point in religion would be to make an irrelevant appeal to authority. Einstein was an expert in physics, not religion. However, even if he had been a rabbi, to appeal to Rabbi Einstein as evidence that God exists would still be an irrelevant appeal to authority because religion is by its very nature a controversial field. Not only do religious experts disagree about fundamental matters of religion, many people believe that religion itself is false. Appealing to non-experts as if they were experts, or appealing to experts in controversial fields, as evidence for a belief, are equally irrelevant to establishing the correctness of the belief.

The irrelevant appeal to authority is a type of *genetic fallacy*, attempting to judge a belief by its origin rather than by the arguments for and against the belief. If the belief originated with an authoritative person, then the belief is held to be true. However, even authoritative persons can hold false beliefs.

Appeals to authority do not become relevant when instead of a single authority one cites *several* experts who believe something is true. If the authorities are speaking outside of their field of expertise or the subject is controversial, piling up long lists of supporters does not make the appeal any more relevant. On any given controversial matter there are likely to be equally competent experts on different sides of the issue. If a controversial claim could be established as true because it is supported by experts, then contradictory beliefs would be true, which is absurd. The truth or falsity, reasonableness or unreasonableness, of a belief must stand independently of those who accept or reject the belief.

Finally, it should be noted that it is not irrelevant to cite an authority to support a claim one is not competent to judge. However, in such cases the authority must be speaking in his or her own field of expertise and the claim should be one that other experts in the field do not generally consider to be controversial. In a field such as physics, it is reasonable to believe a claim about something in physics made by a physicist that most other physicists consider to be true. Presumably, they believe it because there is strong evidence in support of it. Such beliefs could turn out to be false, of course, but it should be obvious that no belief becomes true on the basis of who believes it.

[According to a Gallup poll, belief that some people can hear communications from the dead has increased from 18% to 26% over the past decade.](#)

medium

In [spiritualism](#), a medium is one with whom spirits communicate directly. In an earlier, simpler but more dramatic age, a good medium would produce voices or [apports](#), ring bells, float or move things across a darkened room, produce [automatic writing](#) or [ectoplasm](#), and, in short, provide good entertainment value for the money.

Today, a medium is likely to write bathetic inspirational books and say he or she is [channeling](#), such as J.Z. Knight and the *White Book* of her [Ramtha](#) from Atlantis. Today's most successful mediums, however, simply claim the dead communicate through them. Under a thin guise of doing "spiritual healing" and "grief counseling," they use traditional [cold reading](#) techniques and surreptitiously gathered information about their subjects to give the appearance of transmitting comforting messages from the dead. Using the information provided them by their clients either during the cold reading or from other sources, such as conversations with the subjects before the readings or during breaks from studio sessions, they are able to convince many clients that they are getting messages from their dead loved ones. The medium passes on messages from the dead such as "he forgives you" or reveals things that are already known but leave the client wondering *how did the he know that?* In the good old days of [séances](#) and elaborate trickery, a spiritualist fraud would be more likely to pass on the message "give more money to me and my group" (Keene 1997).

Today, it is unnecessary to be so crude as to directly ask for money or prey upon elderly persons who have lots of cash and little time. People are literally waiting for years to give money to those who give hope that a dead loved one will communicate with them. There is also a lucrative book business for those who have messages from the dead and there is good money to be made by doing live shows for hundreds or thousands of people, each of whom pays \$25 to \$50 for the chance to connect with a lost child, spouse, or parent. George Anderson, a former switchboard operator and author of *Lessons from the Light: Extraordinary Messages of Comfort and Hope from the Other Side* (2000), got his own ABC special featuring celebrities who wanted to contact the dead. Some mediums even get their own syndicated television programs, such as John Edward and [James Van Praagh](#), although the latter's show was canned by Tribune Media Services after only a few episodes.

See related entry on [psychics](#).

argument from design

The argument from design is one of the "proofs" for the existence of God. In its basic form, this argument infers from the intelligent order and created beauty of the universe that there is an intelligent Designer and Creator of the universe. The argument has been criticized for begging the question: it *assumes* the universe is designed in order to prove that it is the work of a designer. The argument also suppresses evidence: for all its beauty and grandeur, the universe is also full of, well, to be delicate, let us say that the universe is also full of *nasties*. I suppose I should be more specific, but I think the reader knows the kind of thing I mean: babies born without brains, good people suffering monstrous tortures such as neurofibromatosis, evil people basking in the sun and enjoying power, reputation, etc. Volcanoes erupting, earthquakes rattling the planet, hurricanes and tornadoes blindly wiping out thousands of lives a day. Is it unfair to call these things the *nasties*, what is blithely referred to by theists as *non-moral evil* or *physical evil*? To say, as many defenders of Design do, that these nasties only seem nasty to us but we are ignorant of God's plan and vision and cannot know how good these nasties really are, is self-refuting. If we can't know what's good and what's not, we can't know whether the design, if any, is good or bad.

Paley's argument

One of the argument's more famous variations involves an analogy with a watch. William Paley (1743-1805), the Archdeacon of Carlisle, writes in his *Natural Theology* (1802):

In crossing a heath, suppose I pitched my foot against a stone and were asked how the stone came to be there, I might possibly answer that for anything I knew to the contrary it had lain there forever; nor would it, perhaps, be very easy to show the absurdity of this answer. But suppose I had found a *watch* upon the ground, and it should be inquired how the watch happened to be in that place, I should hardly think of the answer which I had before given, that for anything I knew the watch might have always been there.

The reason, he says, that he couldn't conceive of the watch having been there forever is because it is evident that the parts of the watch were put together for a *purpose*. It is inevitable that "the watch must have had a maker," whereas the stone apparently has no purpose revealed by the complex arrangement of its parts.

Darrow's response

One could, of course, attack Paley's argument at this point and say, as Clarence Darrow did, that some stones would be just as puzzling as a watch; for, they are complex and could easily have been designed by someone for some purpose we are unaware of, and, in any case "on close inspection and careful study the stone...is just as marvelous as the watch." Be that as it may, Paley's point was not that watches are inherently more interesting than stones. His point was that a watch could be seen to be analogous with the creation of the universe. The design of the watch implies an intelligent designer. This fact, says Paley, would not be diminished even if we discovered that the watch before us was the offspring (no pun intended) of another watch. "No one," he says, "can rationally believe that the insensible, inanimate watch, from which the watch before us issued, was the proper cause of the mechanism we so much admire in it--could be truly said to have constructed the instrument, disposed its parts, assigned their office, determined their order, action, and mutual dependency, combined their several motions into one result, and that also a result connected with the utilities of other beings."

Paley then goes on to claim that "every manifestation of design which existed in the watch, exists in the works of nature, with the difference on the side of nature of being greater and more, and that in a degree which exceeds all computation." The implication is that the works of nature must have had a designer of supreme intelligence to have contrived to put together such a magnificent mechanism as the universe. According to Darrow, this 'implication' is actually an *assumption*.

To say that a certain scheme or process shows order or system, one must have some norm or pattern by which to determine whether the matter concerned shows any design or order. We have a norm, a pattern, and that is the universe itself, from which we fashion our ideas. We have observed this universe and its operation and we call it order. To say that the universe is patterned on order is to say that the universe is patterned on the universe. It can mean nothing else.*

The problem with Paley's analogy is that the belief that the universe shows orderliness and purpose is an *assumption*. One quality of a good analogical argument is that the characteristics cited as shared characteristics must be truly shared characteristics. If there is doubt that one of the items being compared (the universe) possesses the most significant shared characteristic (of being orderly and purposive), then the analogical argument is not a sound one.

Hume's argument

Another philosopher, David Hume (1711-1776), took up the design analogy a few years before Paley, in his *Dialogues Concerning Natural Religion*. One of the characters, Philo, suggests that "If the universe bears a greater likeness to animal bodies and to vegetables than to the works of human art, it is more probable that its cause resembles the cause of the former than that of the latter, and its origin ought rather to be ascribed to generation or vegetation than to reason or design." (Book VII) "The world," says Philo, "plainly resembles more an animal or a vegetable than it does a watch or knitting-loom. Its cause, therefore, it is more probable, resembles the cause of the former. The cause of the former is generation or vegetation. The cause, therefore, of the world we may infer to be something similar or analogous to generation or vegetation." Hume, apparently thought the analogy was a joke, but perhaps Paley is still laughing from that Great Carrot Patch in the Sky.

I might find this watch analogy more convincing of Divine Purpose if, while observing it in his imaginary scenario, Paley's watch suddenly and for no reason shot a lightning bolt through his forehead. That would be more in harmony with the universe I have come to know and love. If the watch could give AIDS to anyone who touched it, or contaminate his progeny for endless generations, then I might be convinced that this watch is like the universe and indicative of a Grand Designer.

the apparent designed order

Finally, there is a [common and popular argument](#) that lists facts about nature that, if they were different, would mean that our planet or life on our planet would not exist. We wouldn't be here, it is noted,

- **if the sun were just slightly farther away or half as powerful**
- **if the axis of the earth were slightly different**
- **if the moon were larger or closer or farther away**
- **if gravity weren't such a weak force**
- **if DNA didn't replicate**
- **if molecules were larger or smaller**
- **if there were sixty planets in our solar system**
- **if carbon didn't exist**
- **if the speed of light were half what it is**
- **if genetic mutation did not happen**
- **if the rotation of the earth were one-tenth of what it is**

Furthermore, look at all the signs of design:

- **salmon, eels, birds, butterflies and whales are able to migrate and find the same breeding and feeding grounds year after year**
- **human reason which can conceive God**
- **natural ecological systems**

One cannot deny the facts. If things were different then things would be different. But they aren't different, so what is the point of this argument? The sun will be unable to support life on this planet some day. It is already unable to support life on several other planets. What does this fact prove about design? Nothing. The axis of the earth has been different and will be different again. Someday this planet will be uninhabitable. What does that prove about design, intelligent or otherwise? Nothing. We can't deny that if millions of factors did not occur, we wouldn't be here. So what? Many of these factors did not exist in the past and will not exist in the future on this planet. There was a time when there was no life on this planet and there will be a time when no life exists here in the future. There was a time when this planet did not exist and there will be a time in the future when it will not exist. What does that prove about design? Nothing. There are countless planets that exist which do not have the conditions necessary for life. What do they prove about design? Nothing.

One might argue that the odds are a billion billion to one that all these circumstances just happened to coincide that makes life on earth possible. But since we're here, the odds are 100% that it can happen. [Cressy Morrison](#) once argued

Suppose you put ten pennies, marked from one to ten, into your pocket and give them a good shuffle. Now try to take them out in sequence from one to ten, putting back the coin each time and shaking them all again. Mathematically we know that your chance of first drawing number one is one in ten; of drawing one and two in succession, one in 100; of drawing one, two and three in succession, one in 1000, and so on; your chance of drawing them all, from number one to number ten in succession, would reach the unbelievable figure of one in ten billion.

By the same reasoning, so many exacting conditions are necessary for life on the earth that they could not possibly exist in proper relationship by chance. The earth rotates on its axis 1000 miles an hour at the equator; if it turned at 100 miles an hour, our days and nights would be ten times as long as now, and the hot sun would likely burn up our vegetation each long day while in the long night any surviving sprout might well freeze.

Morrison begs the question. The earth with life on it is here. The odds are 1/1 of its existing. In any case, if I had 20 billion years to pull ten numbered pennies out of my pocket, the odds of me drawing out the coins in sequence at least once are very good.

But why chip away at this argument from rarity when we can use the

sledgehammer?

... rarity by itself shouldn't necessarily be evidence of anything. When one is dealt a bridge hand of thirteen cards, the probability of being dealt that particular hand is less than one in 600 billion. Still, it would be absurd for someone to be dealt a hand, examine it carefully, calculate that the probability of getting it is less than one in 600 billion, and then conclude that he must not have been dealt that very hand because it is so very improbable. --John Allen Paulos, [*Innumeracy: Mathematical Illiteracy and its Consequences*](#)

Are there naturalistic and mechanistic explanations for ecological systems and what is called "animal wisdom"? Of course. Does this prove they were not designed? Of course not. Nor does their existence prove design. Do we have to posit a God to explain how human reason came to exist with its ability to conceive of an infinite being? Of course not. Does this mean there is no God? Of course not. But it does mean that this argument from design is little more than an exercise in begging the question. It has to assume design in order to prove it.

The Meaning of Life

The theist thinks that life only makes sense if God exists. Why then does it seem obvious to atheists that everything makes just as much if not more sense if there is no God? Why does the universe seem perfectly intelligible to the atheist as an undesigned mechanism governed solely by natural, impersonal forces?

An atheist looks at the universe and what is known about it and sees that its alleged perfect order and design is pretty imperfect. They look at individual items which are wonderful in function but ridiculous in design and are led to think no omniscient being would design it this way. As Russell put it: who couldn't come up with a better world if given omnipotence, omniscience and billions of years to do it? An omniscient, omnipotent being might well be expected to use a much simpler and more effective design for the universe and most of the things in it. The very complexity and inherent defects of structures indicate, as Clarence Darrow noted, the lack of design and the result of natural forces working with no particular purpose in mind. You can use a complicated clamp to hold a few sheets of paper, but a paper clip is a much more elegant device for such a purpose. The orbits of the planets around our sun are a wonder to behold, but the asteroid belt, meteors, and comets crashing into planets is a strange touch for an omnipotent, all-good Creator. A healthy child has no match for exultation and hopefulness, but [conjoined twins](#) and other "freaks" of nature, as well as myriad [genetic birth defects](#), seem unworthy of benevolent design. The atheist sees a woman with a 200 pound tumor and thinks such a grotesque evil can't be allowed by an

omnipotent, all-Good God. But the patient and her parents think God helped the surgeons remove it and save her life. They don't blame God for the tumor but credit Him with its removal. They may even maintain that God had some fine and noble purpose in causing such suffering. The atheist finds such rationalization to be little more than [ad hoc hypothesizing](#).

The typical theistic response to the previous line of reasoning is to consider it impertinent. God is not bound by human conceptions of perfection or adequate design. What may appear inelegant, inefficient or imperfect to us may be just right according to God. But if one takes this line of reasoning to its logical conclusion, then we can safely say nothing about God at all. I maintain that the minimum standard God should be held to is what a reasonably competent group of intelligent humans could come up with. If this God can't do any better than that, then "perfection" has no meaning when applied to this being. If one maintains that the ways of God are essentially inscrutable, then anything goes. God could be anything, even pure evil, in that case.

intelligent design

...the odds against DNA assembling by chance are $10^{40,000}$ to one [according to Fred Hoyle, *Evolution from Space*, 1981]. This is true, but highly misleading. DNA did not assemble purely by chance. It assembled by a combination of chance and the laws of physics. Without the laws of physics as we know them, life on earth as we know it would not have evolved in the short span of six billion years. The nuclear force was needed to bind protons and neutrons in the nuclei of atoms; electromagnetism was needed to keep atoms and molecules together; and gravity was needed to keep the resulting ingredients for life stuck to the surface of the earth.
--Victor J. Stenger*

Intelligent design is nothing more than creationism dressed in a cheap tuxedo. --Dr. Leonard Krishtalka, director of the University of Kansas Natural History Museum and Biodiversity Research Center

Intelligent design (ID) refers to the theory that intelligent causes are responsible for the origin of the universe and of life in all its diversity.*

Advocates of ID maintain that their theory is scientific and provides empirical proof for the existence of God or superintelligent aliens. They believe that design is empirically detectable in nature and in living systems. They claim that intelligent design should be taught in the science classroom because it is an alternative to the [scientific](#) theory of *natural selection*.

The arguments of the ID advocates may seem like a rehash of the [creationist](#) arguments, but the defenders of ID claim that they do not reject evolution simply because it does not fit with their understanding of the Bible. However, they present natural selection as implying the universe could not have been designed or created, which is nonsense. To deny that God has the power to create living things using natural selection is to assert something unknowable. It is also inconsistent with the belief in an omnipotent Creator.

One of the early-birds defending ID was UC Berkeley law professor [Philip E. Johnson](#), who seems to have completely misunderstood Darwin's theory of natural selection as implying (1) God doesn't exist, (2) natural selection could

only have happened randomly and by chance, and (3) whatever happens randomly and by chance cannot be designed by God. None of these beliefs is essential to natural selection. There is no inconsistency in believing in God the Creator of the universe and in natural selection. Natural selection could have been designed by God. Or, natural selection could have occurred even if God did not exist. Thus, the first of several fallacies committed by ID defenders is the false dilemma. The choice is not either natural selection or design by God or some other superintelligent creatures. God could have designed the universe to produce life by random events following laws of nature. God could have created superintelligent aliens who are experimenting with natural selection. Superintelligent aliens could have evolved by natural selection and then introduced the process on our planet. There may be another scientific theory that explains living beings and their eco-systems better than natural selection (or intelligent design). The possibilities may not be endless but they are certainly greater than the two considered by ID defenders.

Two scientists often cited by defenders of ID are Michael Behe, author of *Darwin's Black Box* (The Free Press, 1996), and William Dembski, author of *Intelligent Design: The Bridge between Science and Theology* (Cambridge University Press, 1998). Dembski and Behe are fellows of the [Discovery Institute](#), a Seattle research institute funded largely by Christian foundations. Their arguments are attractive because they are couched in scientific terms and backed by scientific competence. However, their arguments are identical in function to the [creationists](#): rather than provide positive evidence for their own position, they mainly try to find weaknesses in natural selection. As already noted, however, even if their arguments are successful against natural selection, that would not increase the probability of ID.

Behe is an Associate Professor of Biochemistry at Lehigh University. Behe's argument is not essentially about whether evolution occurred, but how it had to have occurred. He claims that he wants to see "real laboratory research on the question of intelligent design."^{*} Such a desire belies his indifference to the science/metaphysics distinction. There is no lab experiment relevant to determining whether God exists.

In any case, Behe claims that biochemistry reveals a cellular world of such precisely tailored molecules and such staggering complexity that it is not only inexplicable by gradual evolution, but that it can only be plausibly explained by assuming an intelligent designer, i.e., God. Some systems, he thinks, can't be produced by natural selection because "any precursor to an irreducibly complex system that is missing a part is by definition nonfunctional (39)." He says that a mousetrap is an example of an irreducibly complex system, i.e., all the parts must be there in order for the mousetrap to function. In short, Behe has old wine in a new skin: the [argument from design](#) wrapped in biochemistry. His argument is no more scientific than any other variant of the argument from design. In fact, most scientists, including scientists who are Christians, think Behe should cease patting himself on the back. As with all

other such arguments, Behe's begs the question. He must assume design in order to prove a designer. The general consensus seems to be that Behe is a good scientist and writer, but a mediocre metaphysician.

His argument hinges upon the notion of "irreducibly complex systems," systems that could not function if they were missing just one of their many parts. "Irreducibly complex systems ... cannot evolve in a Darwinian fashion," he says, because natural selection works on small mutations in just one component at a time. He then leaps to the conclusion that intelligent design must be responsible for these irreducibly complex systems. Biology professor (and Christian) Kenneth Miller responds:

The multiple parts of complex, interlocking biological systems do not evolve as individual parts, despite Behe's claim that they must. They evolve together, as systems that are gradually expanded, enlarged, and adapted to new purposes. As Richard Dawkins successfully argued in *The Blind Watchmaker*, natural selection can act on these evolving systems at every step of their transformation.*

Professor Bartelt writes

if we assume that Behe is correct, and that humans can discern design, then I submit that they can also discern poor design (we sue companies for this all the time!). In *Darwin's Black Box*, Behe refers to design as the "purposeful arrangement of parts." What about when the "parts" aren't purposeful, by any standard engineering criteria? When confronted with the "All-Thumbs Designer" - whoever designed the spine, the birth canal, the prostate gland, the back of the throat, etc, Behe and the ID people retreat into theology.* [I.e., *God can do whatever He wants, or, We're not competent to judge intelligence by God's standards, etc.*]

H. Allen Orr writes:

Behe's colossal mistake is that, in rejecting these possibilities, he concludes that no Darwinian solution remains. But one does. It is this: An irreducibly complex system can be built gradually by adding parts that, while initially just advantageous, become- because of later changes-essential. The logic is very simple. Some part (A) initially does some job (and not very well, perhaps). Another part (B) later gets added because it helps A. This new part isn't essential, it merely improves things. But later on, A (or something else) may change in such a way that B now becomes indispensable. This process continues as further parts get folded into the system. And at the end of the day,

many parts may all be required.*

Finally, Behe's argument assumes that natural selection will never be able to account for anything it cannot account for now. This begs the question. In fact, some of the things that Behe and other ID defenders have claimed could not be explained by natural selection have in fact been explained by natural selection.

Dembski

[William Dembski](#) (*Intelligent Design: The Bridge between Science and Theology*, 1998) is a professor at Baylor University. Dembski claims that he can prove that life and the universe could not have happened by chance and by natural processes; therefore, they must be the result of intelligent design by God. He also claims that "the conceptual soundness of a scientific theory cannot be maintained apart from Christ (209)," a claim which belies his metaphysical bias.

According to physicist Vic Stenger in "[The Emperor's New Designer Clothes](#)," Dembski uses math and logic to derive what he calls *the law of conservation of information*. "He argues that the information contained in living structures cannot be generated by any combination of chance and natural processes....Dembski's law of conservation of information is nothing more than "conservation of entropy," a special case of the second law [of thermodynamics] that applies when no dissipative processes such as friction are present." However, the fact is that "entropy is created naturally a thousand times a day by every person on Earth. Each time any friction is generated, information is lost."

pseudoscience

ID isn't a scientific theory and it isn't an alternative to natural selection or any other scientific theory. The universe would appear the same to us whether it was designed by God or not. Empirical theories are about how the world appears to us and have no business positing *why* the world appears this way, or that it is probably designed because of *how unlikely it is* that this or that happened by chance. That is the business of metaphysics. ID is not a scientific theory, but a metaphysical theory. The fact that it has empirical content doesn't make it any more scientific than, say, [Spinoza's](#) metaphysics or so-called [creation science](#).

ID is a pseudoscience because it claims to be scientific but is in fact metaphysical. It is based on several philosophical confusions, not the least of which is the notion that *the empirical is necessarily scientific*. This is false, if by 'empirical' one means *originating in or based on observation or experience*. Empirical theories can be scientific or non-scientific. Freud's

theory of the Oedipus complex is empirical but it is not scientific. Jung's theory of the collective unconscious is empirical but it is not scientific. Biblical creationism is empirical but it is not scientific. Poetry can be empirical but not scientific.

On the other hand, if by 'empirical' one means *capable of being verified or disproved by observation or experiment* then ID is not empirical. Neither the whole of Nature nor an individual eco-system can be proved or disproved by any set of observations to be intelligently or unintelligently designed. A design theory *and* a natural law theory that makes no reference to design *can* account for Nature as a whole and for individual eco-systems.

[Science](#) does have some metaphysical assumptions, not the least of which is that the universe follows laws. But Science leaves open the question of whether those laws were designed. That is a metaphysical question. Believing the universe or some part of it was designed or not does not help understand *how* it works. If I ever answer an empirical question with the answer "because God [or superintelligent aliens, otherwise undetectable] made it that way" then I have left the realm of science and entered the realm of metaphysics. Of course scientists have metaphysical beliefs but those beliefs are irrelevant to strictly scientific explanations. Science is open to both [theists](#) and [atheists](#) alike.

If we grant that the universe is *possibly* or even *probably* the result of intelligent design, what is the next step? For example, assume a particular eco-system is the creation of an intelligent designer. Unless this intelligent designer is one of us, i.e., human, and unless we have some experience with the creations of this and similar designers, how could we proceed to study this system? If all we know is that it is the result of ID, but that *the designer is of a different order of being than we are*, how would we proceed to study this system? Wouldn't we be limited in always responding in the same way to any question we asked about the system's relation to its designer? *It is this way because of ID*. Furthermore, wouldn't we have to assume that since God, the intelligent designer, designed everything, even us, that no matter what happens, it is always a sign of and due to intelligent design. The theory explains everything but illuminates nothing.

The ID proponents are fighting a battle that was lost in the 17th century: the battle for understanding Nature in terms of final causes *and* efficient causes. Prior to the 17th century, there was no essential conflict between a mechanistic view of Nature and a teleological view, between a naturalistic and a supernaturalistic view of Nature. With the notable exception of [Leibniz](#) and his intellectual descendents, just about everyone else gave up the idea of scientific explanations needing to include theological ones. Scientific progress became possible in part because scientists attempted to describe the workings of natural phenomena without reference to their creation, design or ultimate purpose. God may well have created the universe and the laws of nature, but

created Nature is a machine, mechanically changing and comprehensible as such. God became an unnecessary hypothesis.

reader comments:

argument from design & intelligent design

14 Dec 2001

Just one minor quibble:

"On the other hand, if by 'empirical' one means capable of being verified or disproved by observation or experiment then ID is not empirical. Neither the whole of Nature nor an individual eco-system can be proved or disproved by any set of observations to be intelligently or unintelligently designed."

Suppose, for example, we found in some of the junk DNA in a human genome a pattern that decoded to the first 100 significant figures of pi in base 4. Or better yet, a coded message that read, "No shit, I really did create the Universe in seven days, yours truly, Yahweh." That would be some pretty convincing evidence of ID, at least in my mind.

Best regards... Stuart

reply: I'm sure someone working on the [Bible Code](#) will find pi in junk DNA several times over. It may take some work to create the code to find pi, but if it were easy even George Bush could do it. On the other hand, I doubt if Yahweh uses words like *shit*. But, if every sunset spelled out "on your knees and worship me or I will destroy everything on the planet except for the guy that runs Noah's Bagels" in large Gothic letters visible to everyone on earth, then I'd believe in design and I'd be afraid to use any adjectives to describe that design.

14 Sep 1997

How would you explain the global migrations of birds and fish?

Robert

reply: Well, Robert, I suppose your question is intended to imply that if I can't explain to your satisfaction how birds and fish find their ways to their traditional migratory areas that God must be giving them maps. Or perhaps God busies himself by directly intervening and guiding the animals to their breeding grounds. On the other hand, maybe God gave the

animals some intelligence to go along with their brains and senses, so the dumb animals wouldn't get lost. On the other hand, maybe God didn't have anything to do with it. Maybe these animals evolved and their global migrations are part of their evolutionary process. I don't know, but the migratory habits of birds and fish is a bit outside of my field of expertise. However, you might like to look at these sources:

1. Gould, Stephen J. 1996. "Fly (almost) south young bird." *Nature*. 383(Sept. 12):123
2. Kerlinger, Paul. *How birds migrate* (Mechanicsburg, PA : Stackpole Books, 1995).
3. *Orientation in birds* edited by P. Berthold ; with a foreword by Rudiger Wehner. (Basel ; Boston : Birkhauser Verlag, 1991).
4. Alerstam, Thomas. *Bird migration* translated by David A. Christie (Cambridge [England] ; New York : Cambridge University Press, 1990).
5. [*The Sibley Guide to Bird Life and Behavior*](#) by David Allen Sibley

As for the fish, well, Robert, I suggest you go to the library and check out a book on the subject. You are asking the wrong person when you ask me to explain the global migration of fish. But you might try

argument to ignorance (argumentum ad ignorantiam)

The argument to ignorance is a logical fallacy of irrelevance occurring when one claims that something is true only because it hasn't been proved false, or that something is false only because it has not been proved true. A claim's truth or falsity depends upon supporting or refuting evidence to the claim, not the lack of support for a *contrary* or *contradictory* claim. (*Contrary* claims can't both be true but both can be false, unlike *contradictory* claims. "Jones was in Chicago at the time of the robbery" and "Jones was in Miami at the time of the robbery" are *contrary* claims--assuming there is no equivocation with 'Jones' or 'robbery'. "Jones was in Chicago at the time of the robbery" and "Jones was not in Chicago at the time of the robbery" are contradictory. A claim *is* proved true if its contradictory is proved false, and vice-versa.)

The fact that it cannot be proved that the universe *is not* designed by an Intelligent Creator does not prove that it is. Nor does the fact that it cannot be proved that universe *is* designed by an Intelligent Creator prove that it isn't.

The argument to ignorance seems to be more seductive when it can play upon [wishful thinking](#). People who want to believe in immortality, for example, may be more prone to think that the lack of proof to the contrary of their desired belief is somehow relevant to supporting it.

[argument from design](#)

[aromatherapy](#)

[SkepDic.com](#)

Search the Skeptic's Dictionary

Bach's flower therapy

"Bach's flower therapy" is a type of homeopathic aromatherapy developed in the 1930s by British physician Edward Bach (1886-1936). Bach claimed to have psychically or intuitively discovered the healing effects of 38 wildflowers. His "discoveries" were arrived at by "inspirations." For example, while on a walk he had an inspiration that dew drops on a plant heated by the sun would absorb healing properties from the plant. He claimed that all he needed to do was hold a flower or taste a petal and he could intuitively grasp its healing powers. From these intuitions he went on to prepare "essences" using pure water and plants.

Bach claimed that these wildflowers have a soul or energy with an affinity to the human soul. The flower's spiritual energy is transferable to water. Devotees drink a homeopathic concoction of flower essence, mineral water and brandy in order to get the flower soul to harmonize their own soul's energy. According to Desde San Felipe y Santiago de Montevideo of Uruguay, flower remedies "do work." Bach thought that illness is the result of "a contradiction between the purposes of the soul and the personality's point of view." This internal war leads to negative moods and energy blocking, which causes a lack of "harmony" which leads to physical diseases. "Each of the 38 flowers of the Bach system is used to balance specific emotional pains or, in advanced stages of the lack of balance, to remit physical symptoms" [personal correspondence]. I have no idea what is meant by saying that this therapy "works," but I do not see how it could be tested since its main claims are metaphysical not empirical.

Dr. Bach seems tame compared to the pioneering work of others who have followed in his petals. In California it has been discovered that the humble Forget-Me-Not is good for "increasing your awareness of karmic relationships beyond the threshold." And Mugwort is good "for awareness of dreams and conscious control of one's psychic life."*

aromatherapy

11 Nov 2002

Hmmmm. It's funny that whenever you need an aromatherapist, there never is one, especially at the scene of a serious road accident. It's very rare in such an event, with blood, snot and severed limbs everywhere, that someone doesn't come charging through offering their services announcing, "Let me through, I'm an aromatherapist."

Cheers, Michael

20 Jul 2000

*I was slightly insulted by your statement that believers or practitioners of aromatherapy would not want to read your article. Id est, people who are involved in aromatherapy are a bunch of unscientific hippy dolts. Or perhaps I read too much into your innocent cynicism. Or skepticism rather. It **is** skepticism, and **not** cynicism you are basing your dictionary on, right? Regardless, I **did** read your article; it's actually one of the first pro/con articles I've read on aromatherapy. Up until now I have only read information on what essential oils are used for what malady or to which desired effect, and the variety of ways in which essential oils can be administered. I am more interested in the skepticism than the testimonials, as is obvious from my choice of reading. Your article has inspired me to attempt to acquire an allocation of funds to research aromatherapy scientifically (id est experiments with control groups, etc). I have my doubts as to how effective a "blind" study would be <GRIN>. Another statement you made that troubled me was in regards to claims made that pharmaceutical companies and the like were the ones with the money and it was not in their best interests to promote aromatherapy (and I would add other alternative healing methods to this as well). You countered this statement by denouncing it as "unscientific whining". I would like to note that slurs are no more scientific than testimonials or conspiracy theories. I was still left with questions: Is it or isn't in their best interests to study aromatherapy? If it is, then why don't they do the research? If it's a fraud, they could disprove it. If it has value, then is it best for them to simply ignore it and hope it goes away? Why couldn't they sell essential oils? Is there a smaller profit there than in pharmaceuticals? Perhaps pharmaceuticals are cheaper to make. There are many questions I would like answered that require scientific research. But aromatherapy works for a great many people, placebo or no. It is amusing that*

you, a "man of the mind" as it were, might never know the full power of the mind. Life is full of paradox. P.S. sorry for being so long winded...

Bear Palomo-

reply: According to [US Business Reporter](#)

Many consumers have chosen alternative forms of medicines as health remedies. These alternative medicines collectively known as herbal medicine supposedly offer faster healing without the after effects of traditional medicines. Some large pharmaceutical manufacturers have capitalized on this trend by producing their own herbal medicinal solutions. Herbal medicines have the added advantage of less government regulation than traditional medicines.

In short, the major pharmaceutical firms are businesses and will go where they think there is good money to be made. Why bother doing research on ginkgo biloba, shark cartilage, donkey hair, rhino horn, etc., when the people who buy it don't care if there is any scientific proof it works?

08 Nov 1999

Just to let whomever wrote that know that tea tree oil is an antiseptic containing the similar constituents as Eucalyptus oil. This is what caused the "healing" to occur. Although I do not think breathing oils in can be the whole cure to any disease studies do indicate that changes in bio chemistry of the brain do occur with odours and this can have an effect on the mood and emotions. Eucalyptus oil, containing Eucalyptol; basically terpene and cymene is a powerful microbacterialcide. I do not know why this account would be mentioned in an aroma therapy book because it is obvious that the application was topical to the wound and the action was a direct effect of the oil on the site itself, not the breathing in of the volatile oil.

Navotny

PS I do not practice aroma therapy but do not condone it either for further tests on the power of scent and the effect on brain chemistry needs to be done. Most viable are probable uses for the regulation of serotonin as we know smell causes involuntary reaction like hunger and fear to occur, who is to say it does not effect other emotions as well.

08 Nov 1999

I use tea tree oil on occasions for treating minor cuts and scratches, and I believe it is effective. It definitely relieves inflammation and soreness, and

seems to accelerate healing. Particularly for cold-sores around the mouth, which I am prone to, it is preferable to other over-the-counter preparations I have tried.

I am retired after a career in biomedical research and technology transfer, and am decidedly of the "Doubting Thomas" school regarding "alternative medicine" therapies. For more serious abrasions, I am a firm believer in triple antibiotic ointment. But I do think tea tree oil has some beneficial effect.

I remember reading somewhere that it has identified ingredients which are known to have weak antibiotic activity.

I find your SkepDic page extremely interesting and useful. Keep up the good work.

Larry Bonar

16 Aug 1999

Just reading the "what's new" entry and noticed this statement:

It is interesting that you mention Gattefosse, but you cease to mention his experience with lavender oil when you talk about that oil later on. Gattefosse was badly burned in a laboratory explosion at one point and stuck his burned arm into the nearest vat available to cool the burn. This happened to be a vat of lavender oil and his burns healed without scarring as well as much more quickly than normal.

As I recall, the modern use of ice and other cooling substances happened after anecdotal evidence of a dairy farmer plunging his burned arm into a container of chilled milk. The physical cooling of the burn was the mechanism, and I imagine lavender oil is a somewhat less-effective heat transfer substance than milk, but still adequate to forestall severe tissue damage.

Later on, one of your correspondents, David Ehrensperger, talks of Otto of Rose. Presumably he means attar of rose. These guys can't even get their "facts" straight.

John Renish

24 Apr 1998

I read a few of the entries in your Skeptic's Dictionary and, since I have worked with essential oils for the last 7 years or so, I decided to read your entry on aromatherapy. While I cannot offer a controlled study, I can offer my own experience. Below, I will list some of your claims and my responses to those

claims:

1. "Furthermore, only in some cases of aromatherapy are vapors used. In most cases, the oil is rubbed onto the skin or ingested in a tea or other liquid"

I have not come across these claims at all. Having worked with an aromatherapist and read various materials in the field, I have found the majority of practitioners do recommend inhalation and discourage ingestion (at least in the U.S).

reply: You may be right, but it all depends on what counts as aromatherapy. Some people count cooking with herbs as aromatherapy, in which case, ingestion is typical. What I was trying to emphasize is that though it is called *aroma* therapy, rubbing on oils or adding them to the bath, etc., are a major part of the practice.

2. "Aromatherapy is a term coined by French chemist René Maurice Gattefossé in the 1920's to describe the practice of using essential oils taken from plants, flowers, roots, seeds, etc., in healing."

It is interesting that you mention Gattefossé, but you cease to mention his experience with lavender oil when you talk about that oil later on. Gattefossé was badly burned in a laboratory explosion at one point and stuck his burned arm into the nearest vat available to cool the burn. This happened to be a vat of lavender oil and his burns healed without scarring as well as much more quickly than normal.

While I have not gone through anything quite so dramatic, I have burned myself many times in my life, both before and after I discovered lavender oil. I am very much attuned to the way my body heals or does not heal (most people are) and I have found, for minor burns, that lavender oil does wonders. My burned skin has healed at greatly accelerated rates due to lavender oil--much less pain and no scarring. Have you tried this at all? If not, I highly suggest it.

reply: I never denied that rubbing on various natural (and artificial) ointments can assist the healing process. Aromatherapists, however, are prone to such anecdotes in lieu of scientific studies. Testimonials are not scientific evidence. If aromatherapy wants to become scientific, aromatherapists must become scientists.

3. "This kind of post hoc reasoning abounds in the literature of alternative health care. What would be more convincing would be some control studies."

You made this comment in reference to the use of tea tree on an individual's

septic finger. Now, I have not had the drama of a septic finger, but I have had several recalcitrant minor infections that have cleared up under application of tea tree. This is direct, personal experience. What do you suggest for a controlled study?

reply: It's not my job to design or do controlled studies for aromatherapeutic claims. It's your job. My job is to evaluate the studies, if and when they are done.

4. "Such testimonials are never met with skepticism or even curiosity as to what evidence there is for them. They are just passed on as if they were articles of faith."

The above comment was made in reference to rose as a cure for frigidity. How much do you use your sense of smell? When working around essential oils, I found that one's smell is keener the more it is exercised. Thus, one's experience with scent is almost entirely subjective.

For example, Otto of Rose is pure and very expensive. To those who have a keen sense of smell, there is nothing else like it in the world and it is worth every penny. The scent is a euphoric experience to be cherished. The quote you provided was this:

"Marguerite Maury prescribed rose for frigidity, ascribing aphrodisiac properties to it. She also considered rose a great tonic for women who were suffering from depression.(Daniele Ryman, Aromatherapy, p, 205)"

This makes perfect sense to me since I have been able to experience rose the way to which it is referred above. I have offered this same scent to others only to have them say (to my utter disbelief), "Gee, that smells nice." To me, it is hardly an article of faith, but simply something that is.

Will you grant that some individuals have keener senses of smell than others? If so, call this "scent intelligence" for the sake of argument. It would seem that some individuals have greater "scent intelligence" (or keener senses of smell) than others and, given that, it would follow that those with keener senses of smell would be more able to reap the benefits of aromatherapy--a practice based on scent in many cases (i.e., especially rose). Does this make sense to you? It has been the case in my experience. You are looking for quantified data--how does one quantify this?

reply: Of course, people have different "scent intelligence," as you call it. What needs to be measured is not keenness of sense, but effect on the health of the body. We're not talking perfume here. Or, are we? If so, the whole field is subjective and about all we can hope to measure is the subjective response (attraction, repulsion) to the perfumes.

5. "Of course, one should not forget that aromatherapy is also used to enhance beauty, but I'll leave that topic to others who might wish to examine the role of the placebo effect in New Age healthcare and cosmetology."

What can I say to this one? My experience is directly opposed to what you are saying above. I have seen the effects of essential oils on skin, my own and others', and those effects were hardly what one would call a placebo effect. Your attitude of disbelief might very well be blocking any fair sense of inquiry.

reply: It is precisely the skeptical attitude that is required to do a proper scientific study of these claims.

6. For further reading, you suggest 3 books. 1 is by Stephen Barrett, MD, the 2nd is by Val Lariviere, and the 3rd is about the life of Edward Bach. I have not read any of these, but I would guess that Dr. Barrett already had his mind made up before beginning his exploration of aromatherapy. I can't comment on the book by Val Lariviere and the Bach remedies to which you refer are viewed with skepticism by the aromatherapists I know.

To offer a more balanced selection, you might refer to works by Robert Tisserand, Jeanne Rose, and Christine Wildwood (to name a few). I would be happy to send you specific titles if you like.

Also, try some of this yourself. This does not mean go try something once (especially in the area of scent) and, when it doesn't work given an underdeveloped sense of smell, proclaim loudly to the academic world (and anyone else who will listen) that aromatherapy is all nonsense.

reply: I don't say aromatherapy is all nonsense. I say that it is not clearly defined and that it is not a science. I like nice aromas as much as the next person, and am repulsed by certain odors, including tobacco smoke and certain perfumes that irritate the membranes of my nostrils and are very reminiscent of certain insecticides.

With things like lavender and tea tree (and other things applied the skin), sense of smell will not matter. With Otto of Rose and other inhaled scents, however, you will need to do some work--simply put, it will take time.

To end, I would like to say that I do not find all claims of all aromatherapists to have merit. Some of the claims conflict. Some claims, I have not been able to verify personally. Still other claims have not worked in my experience. For other claims pertaining to essential oils, the jury is still out for me. I approach each claim with a healthy dose of skepticism, waiting for the essential oil to prove its claim to me. More often than not, the oils have proven themselves to me via experience (not through rumor, 2nd hand account, etc.). I suggest you

try the same approach.

Respectfully,
David Ehrensperger

reply: Unfortunately, I don't have enough money to try the various oils available at my local Co-Op. In any case, this trial and error method of testing hypotheses is very primitive and is not very effective at ruling out [confirmation bias](#) and [subjective verification](#), which is why we would like to see a clear definition given of 'aromatherapy' and some [controlled studies](#) to test its various empirical claims.

06 May 1998

Your Skeptic's Dictionary was brought to my attention by a friend and client of mine who was angered to see that you had harsh words about aromatherapy. I have read your article and find that although your sources are legitimate, I don't think you have taken much time to thoroughly investigate the subject. I have been a practicing aromatherapist for 13 years. I also work with herbs and call myself an herbalist.

reply: I gave it as much time as I thought it deserved.

I'd like to raise several points here. 1) There ARE studies done on essential oils. Read [Aromatherapy: Scent and Psyche](#) by Peter and Kate Damian and you'll find plenty of them. 2) OK, there are not MANY studies done on essential oils, but WHY? Because the AMA and the pharmaceutical companies have all the money to fund such studies, and it is not in their interest to do so.

reply: Really, where is your proof for this often repeated charge by the pseudoscientific whiners of the world?

3) It is becoming more and more common for reputable suppliers of essential oils to have all their oils tested using gas chromatography. Generally, NOBODY who has experience with essential oils trusts their nose entirely to figure the relative purity of an oil. They generally have a GC done. 4) European aromatherapists suggest internal use of essential oils. American aromatherapists generally do not. ALL cases of severe toxicity involving essential oils result from internal use. I must agree with your assessment of the Bach flower remedies though. I really think they're bunk personally. I also invite you to visit my Web page: www.kamala.com

I don't give a lot of the scientific information you're looking for on it (I find most of my clients are confused and mystified by it, so I save it for those who ask), but you might take a look at some of the other books I recommend.

Cheers!

Dana M. Gass owner, Kamala Perfumes, Inc.

reply: We wouldn't want to confuse or mystify anyone with scientific information, now. Maybe you could get a job with one of our (Sacramento City College) nursing programs. The head of one of the programs (Rae Woods) said much the same thing to me about twenty years ago when I offered to develop a medical ethics course for nursing students. By the way, this person still heads the program and teaches [therapeutic touch](#) to her students. It wouldn't surprise me if she teaches aromatherapy as well.

July 05, 1998

I read with interest you comments on aromatherapy especially those that apply to me. I just want to make a few comments. The article you quoted from was a short introduction to aromatherapy in a magazine provided free of charge to health food stores. The article was aimed towards people who are interested in finding out a little bit more about a term they have only heard about. It wasn't ever intended to be anything more. It was not intended as a scientific proof for a sophisticated readership. You might have been better off critiquing works by Valerie Ann Worwood or Jean Valnet as they are leaders in the field and have a strong research and science base.

reply: You are probably right.

Also I have never called myself (anointed or otherwise) an aromatherapist. I however do use aromatherapy in my practice with quite beneficial results. If it didn't work, I wouldn't use it.

reply: As I understand it, your business is called Gateway Aromatherapy and you practice a "healing art" which uses essential oils, among other things. And you say you use aromatherapy. Why would you object to being called an aromatherapist?

I would also recommend that you place the Bach Flower critique separately since Bach flower remedies are not nor have they ever been part of Aromatherapy. They are flower essence therapy, taken internally, created differently for rather different purposes.

reply: This is a good suggestion and I plan to move the Bach Flower stuff to its own entry.

I think skepticism is healthy but I think you need to have a rather large knowledge base for a critique. And that knowledge base should probably involve the best that a field has to offer rather than a one page, extremely

general article on a topic. But hey, thanks for thinking of me.

Val Lariviere

reply: As you know, I selected one quote from your essay and noted that it was typical of the kind of non-testable claims made by aromatherapists. What is "balance," "imbalance," "the centre," etc.? These are not empirical terms referring to observable, measurable qualities. They are subjective evaluations. [Subjective validation](#) is typical of most pseudosciences.

mind

The mind is thought to be the seat of perception, self-consciousness, thinking, believing, remembering, hoping, desiring, willing, judging, analyzing, evaluating, reasoning, etc.

[Dualists](#) consider the mind to be an immaterial substance, capable of existence as a conscious, perceiving entity independent of any physical body. Dualism is popular with those who believe in life after death. The brain may decay, disintegrate, and be forever annihilated, but the mind (or [soul](#)) does not depend on the body for its existence and so may continue to flourish in another world. This belief in the mind as a substance which exists independently of the brain, however implausible, seems to be required for most religious doctrines, as well as for many New Age notions and therapies. Whereas dualist philosophers have long struggled with what is known as [the mind-body problem](#), New Age gurus are calling for mind-body harmony in [medicine](#), [therapy](#) and [science](#). In short, philosophers have realized that there is a problem in explaining how two fundamentally different kinds of reality can affect one another, while New Age pundits think the problem has been caused by treating the two--mind and body--as if they do not interact.

[Metaphysical materialists](#), on the other hand, consider the mind to be either the brain itself or an *emergent reality*, i.e., an entity separate from but brought into being by the workings of the brain. The latter doctrine is known as *epiphenomenalism*. For the materialist, 'mind' is a catchall term for a number of processes or activities which can be reduced to cerebral, neurological and physiological processes.

[Behaviorists](#) consider 'mind' to be a catchall term for a set of behaviors.

There is probably no more fascinating topic in philosophy or neurology than *mind* or *consciousness*. Yet, despite the fact that the human mind has made it possible to gain all the understanding of the world and ourselves which we now possess, it has done precious little to help us understand the mind itself. For example, [memory](#) is something we all have to some degree or another. Yet, we do not fully understand the nature of memory, and several models of memory are equally plausible.

Models of mind or consciousness continue to occupy the brains of some of our best philosophers and scientists. Yet, despite the fact that the key to understanding the human mind is likely to be found in the study of the functioning human brain, many [philosophers](#) and [psychologists](#) continue to be guided by the belief that the mind can be adequately understood

independently of the brain.

Philosophers of mind have never considered the fact that rarely does anyone have direct perception of either one's own or another person's brain to be a major philosophical problem. Yet, one of the major problems in philosophy is the 'other minds' problem. One can know one's own mind directly, but how do I know that other minds exist? This problem is known as the problem of [solipsism](#), but it might well be called *the mind leading the mind problem*.

See **related entries** on [astral projection](#), [dualism](#), [free will](#), [materialism](#), [memory](#), [souls](#), [Charles Tart](#), and [p-zombies](#).

reader comments:

astral projection

17 Jan 1997

I am impressed by the expanse of your work. For what it's worth, you've done a lot of work. May I make just a few notes? Astral projection is not constrained by time. It is quite possible, strictly speaking, for a projector to see land formations on, say, Mars, that do not appear today. The projector has merely gone behind--or ahead--of the present. Do your homework!

reply: Oh, my, I'm sorry. I really should do more study on this subject. Of course the projector may, strictly speaking, have gone forward or backward or even taken the sidereal entrance into unknown dimensions of time. Time is not only precious, but relative. A projector is never really late for work; they are just early for a job in the next lifetime.

AP is not like dreaming. Even with a veteran, it is likely to be a relatively brief experience. There are many factors that will pull the projector's consciousness back to his/her body. The oversoul (if you are willing to believe in such nonsense) might detect danger from a person in the physical or spiritual world. The projector might accidentally verbalize a thought. The act of AP can be very stressful and is not a natural environment for us mortals, so we can't remain but for a few minutes.

reply: But what's a few minutes to one who can go backwards or forwards in time? Nothing, since each direction cancels the other out.

The silver cord is not indefinitely extendable. It will be, however, if you are convinced as such. It all depends on your frame of mind and expectations.

reply: I had a hunch the length of the astral cord depended on the breadth of the imagination!

This same cord (again, bear with me) is that which pulls us back into our rightful bodies. And I doubt you'd want to enter into a body you wouldn't recognize.

reply: I don't know. There are a few bodies I wouldn't mind possessing, no pun intended. Anyway, you must admit that it is amazing that more cords don't tangled up. Most people can't even wind up the yard hose or an extension cord without getting it tangled. Imagine millions of these cords from many different time zones, past, present and future. I envision thousands of fly fishers all casting towards each other and the

ensuing mess would make me want to cut the cord.

Lastly, unless your dead, you don't remain and get lost in the non-spatial world. Period. There are beings that will guide the lost soul back to its rightful location.

reply: These special beings must be friends of yours. If you ever return to this planet, maybe you could introduce us to them.

That said, feel free to think of all of these facts as conveniences to fill potholes in the AP theory, if you have not done so already. The truth is, Mr. Carroll, the higher dimension is far more complex than you or I could encompass.

reply: All I know about the higher dimension is that it is higher. I think somebody else may be high, too. For the time being I prefer to stay outside the compass of the high and mighty.

When your time comes to retire into that long sleep (and may it not come for a while) you will see for yourself, and all of my treatise will be irrelevant. But not inaccessible. You see, all objects in this world have a non-spatial counterpart. They become more solid to the projector's eyes the farther one goes back along the time line. For example, the Pyramids of Giza will be a lot easier for the projector to see than last week's issue of Time. But of course, you already knew that, having thoroughly explored the data available.

superfli

reply: Now that I have a guide for the perplexed, I feel I do know the higher truth. I'm beginning to see the eye of the pyramid. It's as clear as Newsweek, I mean Time. It's green. It's freemasonry embedded in the dollar bill! Free at last, thank Giza, free at last!

astrotherapy

The value of astrology. . .is not its power to predict what the gods have in store for humans, but its ability to reveal the god-like powers that reside in the depths of every human being.

--[Glen Perry, Ph.D.](#)

Questions of truth or falsity belong to the realm of the rational and are irrelevant to the value of the imaginal. . . .To insist that Moon/Saturn contacts must needs be depressive or Mars/Pluto explosive (in other words, actually true) is to kill the imaginal and rob it of its power to be therapeutic. . . .Astrology viewed as an imaginal discipline conveniently avoids all questions of whether it is true or not, diffusing much of its critics [sic] furor.

--[Brad Kochunas](#)

I do not know why I believe what I believe, as it comes from the heart and not the head.

--[Brad Kochunas](#)

Astrology is part of our past, but astrologers have given no plausible reason why it should have a role in our future.

--[I. W. Kelly](#)

Astrotherapy uses [astrology](#) as a guide to the transformation of personality, to self-actualization and self-transcendence. Astrology is studied for its power to aid in psychological healing and growth. As far as I know, there are no licenced "astrotherapists." The term is used to refer to counselors and therapists of all sorts who use astrology in their counseling and therapy.

According to defenders of astrotherapy, most critics of astrology misunderstand how human destiny is actually linked to the heavens. Frederick G. Levine, author of *The Psychic Sourcebook: How to Choose and Use a Psychic* (New York: Warner Books, 1988), claims that modern astrologers are more [holistic](#) than their ancient counterparts. The contemporary astrologer doesn't believe in anything so crude as direct causal connection between the heavenly bodies and a person's destiny. He or she believes in the interrelatedness of all things.

[T]here are larger patterns of energy that govern all interactions in the universe and...these patterns or cycles are reflected in the movements of stars and planets in the

same way they are reflected in the movements of people and cultures. Thus it is not that planetary motions cause events on earth, but simply that those motions are indicators of universal patterns.

To back up his claim, Levine cites Linda Hill, whose credentials he establishes by noting that she has been "a New York astrological consultant of 14 years' [sic] experience." Says Ms. Hill, "I don't think anyone knows exactly why it works; it just works. Carl Jung used the term synchronicity. It's simply a synchronization....We are somehow synchronized to the celestial patterns that were present at our birth."

In short, astrotherapy uses astrology as a kind of projective personality test, useful for unleashing one's hidden creative powers, for delving into the [subconscious mind](#) to discover hidden beliefs, drives, truths, and perhaps even one's [cosmic synchronicity](#)!

Dane Rudhyar is seen as the father of astrotherapy. In the 1930s he applied Jungian psychological concepts to astrology. He liked Jung's notion that the psyche seeks psychic wholeness or "individuation," a process Rudyhar believed is evident in the horoscope.

Rudyhar's work is carried on today by Glen Perry, who boasts a Ph.D. in clinical psychology from the [Saybrook Institute](#) in San Francisco, a regionally accredited (WASC) graduate school "dedicated to fostering the full expression of the human spirit and humanistic values in society." In astrotherapy, says Dr. Perry, "astrology is used to foster empathy for the client's internal world and existing symptoms, and promote positive personality growth and fulfillment." He thinks astrology is both a theory of personality and a diagnostic tool, yet he provides neither arguments nor evidence to support this notion. Here is an example of how astrotherapy uses astrology:

...Saturn opposed Venus in the natal chart indicates not simply "misfortune in love," but the potential to love deeply, enduringly, and responsibly along with the patience and determination to overcome obstacles. While realization of this potential may require a certain amount of hardship and suffering, to predict only hardship and suffering with no understanding of the potential gains involved is shortsighted at best and damaging at worst.

How Perry knows this is not made clear. Other claims, equally profound, do not require argument or evidence because they are vacuous: "the horoscope symbolizes the kind of adult that the individual may become." Still other claims are nearly unintelligible: "What the individual experiences as a problematic situation or relationship can be seen in the chart as an aspect of

his or her own psyche. In this way, the horoscope indicates what functions have been denied and projected, and through what circumstances (houses) they will likely be encountered." "Simply put," says Perry, "the goal is to help the client realize the potentials that are symbolized by the horoscope." What systematic analysis and methodological tools he used to arrive at this notion are not mentioned, much less how one could go about verifying the specific symbolizations of any given horoscope. He does, however, seem to rely heavily upon questionable psychological concepts promoted by Jung and Freud.

Another astrotherapist, [Brad Kochunas](#), makes it clear that one of the chief virtues of applying astrology to the inner life rather than to outward patterns of behavior, is that it takes astrology out of the realm of the scientific, where it has not fared too well when it has been thoroughly examined. Kochunas calls this concern with the psyche "the imaginal perspective" and says it

is not concerned with whether something is true or not but rather with its usefulness for the task at hand. Questions of truth or falsity belong to the realm of the rational and are irrelevant to the value of the imaginal. It is the functional validity and not the factual validity which is primary for the imaginal perspective. Does something work for a person? Is it useful in the sense of providing depth, meaning, value, or purpose to an individual or community? If so, then there is little call for its cultural degradation, it has power.

Here he proudly cites Barbara Sproul's *Primal Myths* (San Francisco: Harper & Row, 1979). At least Kochunas, unlike Perry, firmly locates astrotherapy in mythology and proudly proclaims it to be outside of the realm of science. His message seems to be very simple and straightforward: If you can find satisfied customers, you have a valid myth.

[Max Heindel](#), on the other hand, extends astrotherapy to all forms of healing and calls it a science, declaring it to have two basic laws: "the Law of Comptability [sic]" and "the law of Systemic Receptibility." A brief quotation from Heindel's work will demonstrate to the astute reader why I will not bother to review these "laws."

At the time of conception the Moon was in the degree which ascends at birth (or its opposite); the vital body was then placed in the mother's womb as a matrix into which the chemical elements forming our dense body are built. The vital body emits a sound similar to the buzz of a bumblebee. During life these etheric sound waves attract and place the chemical elements of our food so that they are formed into organs and tissues. So long as the etheric sound waves in our vital body are in harmony with the keynote of the

archetype, the chemical elements wherewith we nourish our dense body are properly disposed of and assimilated, and health prevails no matter whether we are stout or thin, of rosy complexion or sallow, or whatever the outward appearance. But the moment the sound waves in the vital body vary from the archetypal key-note, this dissonance places the chemical elements of our food in a manner incongruous with the lines of force in the archetype. . . .

The general rule is: From the time of the New Moon to that of the Full Moon stimulants produce the greatest effect and sedatives are weakest. Decrease the dose of stimulants and increase that of sedatives. The exception is: When the Moon increasing approaches a conjunction to Saturn give larger doses of stimulants and smaller doses of sedatives.

We are not told from what ancient spirit these theories were channeled and we are left to guess at the origin of such thoughts. One will search in vain for anything resembling ordinary science in Heindel's writings. One will find, however, a belief in [the music of the spheres](#).

What is one to make of the new astrology which seems to place itself outside of the realm of empirical testing and outside of a concern for empirical truth or falsity? This is seen as progress by the astropsychologists, but for those of us who prefer our delusions to be rooted in terra firma, astrotherapy is just one more in a long line of ["crazy" therapies](#).

the "Mars Effect"

The "Mars Effect" is the name given to Michel Gauquelin's "astrobiological" claim that when Mars is in certain sectors of the sky great athletes are born in numbers indicative of a non-chance correlation. If this were true, [astrologers](#) believe that it would provide support for their theories that the things in the sky are actively influencing who and what we become. However, such correlations are notoriously slippery. They are ambiguous (who counts as a "great" athlete?), and significant correlations between variables that are not significantly related are expected to occur occasionally.

In any case, what Gauquelin claims about Mars and athletes isn't true, according to a study by seven French scientists. They took a sample of 1,066 French athletes and compared them to 85,280 others for birth times, dates and location of Mars at birth. The study didn't support the "Mars Effect."

Gauquelin preferred to call his work in this area "astrobiology" rather than astrology. He also claimed to find a significant correlation between Jupiter and military prowess, as well as between Venus and artists.

law of truly large numbers (coincidences)

"That a particular specified event or coincidence will occur is very unlikely. That some astonishing unspecified events will occur is certain. That is why remarkable coincidences are noted in hindsight, not predicted with foresight."--

David G. Myers

The law of truly large numbers says that with a large enough sample many odd coincidences are likely to happen.

For example, you might be in awe of the person who won the lottery twice, thinking that the odds of anyone winning twice are astronomical. The *New York Times* ran a story about a woman who won the New Jersey lottery twice, calling her chances "1 in 17 trillion." However, statisticians Stephen Samuels and George McCabe of Purdue University calculated the odds of someone winning the lottery twice to be something like 1 in 30 for a four month period and better than even odds over a seven year period. Why? Because players don't buy one ticket for each of two lotteries, they buy multiple tickets every week (Diaconis and Mosteller).

Some people find it surprising that there are more than 16 million others on the planet who share their birthday. At a typical football game with 50,000 fans, most fans are likely to share their birthday with about 135 others in attendance. (The notable exception will be those born on February 29. There will only be about 34 fans born on that day.)

You may find it even more astounding that "In a random selection of twenty-three persons there is a 50 percent chance that at least two of them celebrate the same birthdate" ([Martin](#)).

On the other hand, you might say that the odds of something happening are a million to one. Such odds might strike you as being so large as to rule out chance or coincidence. However, with over 6 billion people on earth, a million to one shot will occur frequently. Say the odds are a million to one that when a person has a dream of an airplane crash, there is an airplane crash the next day. With 6 billion people having an average of 250 dream themes each per night (Hines, 50), there should be about 1.5 million people a day who have dreams that seem [clairvoyant](#). The number is actually likely to be larger, since we tend to dream about things that legitimately concern or worry us, and the data of dreams is usually vague or ambiguous, allowing a wide range of events to count as fulfilling our dreams.

Finally, clusters of coincidences can seem designed or the result of a preordained pattern to someone who is very [selective](#) in his thinking, such as [Uri Geller](#). After the anti-American terrorist attacks on September 11, 2001, Geller posted his thoughts on the number 11. He asked everyone to pray for eleven seconds for those in need. Why? He was convinced that there was a cryptic, [numerological](#) message in the events that occurred that day. In fact, he admits that he has had a long-term relationship with [the number 11](#). He thinks that 11 "represents a positive connection and a gateway to the mysteries of the universe and beyond." But here is what he had to say about the terrorist attack and how 11 relates to this day of infamy:

Geller's Mysterious Number 11

<p>The date of the attack: $9/11 - 9 + 1 + 1 = 11$</p> <p>*September 11th is the 254th day of the year: $2+5+4 = 11$</p> <p>*After September 11th there are 111 days left to the end of the year.</p> <p>*119 is the area code to Iraq/Iran. $1 + 1 + 9 = 11$ (reverse the numbers and you have the date) [not true: Iran's country code is 98 ($9+8=17$), Iraq's is 964 ($9+6+4=19$)]</p> <p>*Twin Towers - standing side by side, looks like the number 11</p> <p>*The first plane to hit the towers was Flight 11 by *American Airlines or AA - A=1st letter in alphabet so we have again 11:11</p> <p>*State of New York - The 11th State added to the Union</p> <p>*New York City - 11 Letters</p> <p>*The USS Enterprise is in the gulf during the attack; its ship number is 65N $6+5=11$</p>	<p>*Afghanistan - 11 Letters</p> <p>*The Pentagon - 11 Letters</p> <p>*Ramzi Yousef - 11 Letters (convicted or orchestrating the attack on the WTC in 1993)</p> <p>*Flight 11 - 92 on board - $9 + 2 = 11$</p> <p>*Flight 77 - 65 on board - $6 + 5 = 11$</p> <p>*The # of story is 110 (2x) 110 - 110 Remember that the zero "0" is not a number, so we have 11:11</p> <p>*The house where they believed to have lived had # 10001 again don't count the zero....</p> <p>Names that have eleven letters *Air Force One, *George W. Bush, *Bill Clinton, *Saudi Arabia, *ww terrorism, *Colin Powell U.S. Secretary of State</p> <p>*Remembrance day is November 11....</p> <p>*November is also the 11th month</p> <p>*Mohamed Atta, the pilot that crashed into the World Trade Centre.</p> <p>*Skyscrapers, American Airlines AA = 11</p>
---	--

Geller also claimed that "there will be more information coming in" and urged readers to e-mail him with more findings of this kind. Geller also wrote: "I

would encourage everyone to send out this message to all your family, friends or business acquaintances and try to put this in the right perspective."

Let me try to put this in the right perspective.

Accumulating more findings like these coincidences between the number 11 and other things should be easy, since there are countless items that can be made to relate in some fashion to the number 11 (or 12, 13, or just about any other number *or word*). E.g. the country code for Pakistan is 92 ($9+2=11$), a Boeing 757 holds about 11,000 gallons of fuel and the wingspan is 155 feet ($1+5+5=11$), [Nostradamus](#) and *Billy Graham* have 11 letters, any word with 8 letters just put 'the' in front of it; any word with 9 letters, just put 'ww' or any two-letter word in front of it, any word with 10 letters, just put 'a' in front of it or add an s to the end of it, etc. It is especially easy to do this since there is no specific guide before we begin our hunt for amazing facts as to what will and what won't count as being relevant. We have a nearly boundless array of items that could count as hits. Unfortunately for Geller and others who are impressed by these hits, there is also an even larger array of items that could count as misses. Geller doesn't see them because he isn't looking for them.

If we start hunting for items that seem relevant but don't fit the pattern, we will soon see that there is nothing special about Geller's list or the number 11. Only by focusing on anything that we can fit to our belief and ignoring everything that doesn't fit ([confirmation bias](#)) can we make these coincidences seem meaningful.

Carroll's List of Meaningless Coincidences

- the planes hit a little before and a little after 9 am
- there were 4 flights that crashed with 266 people in them; $2+6+6=14$
- one plane was a 767 ($7+6+7=20$)
- the other a 757 ($7+5+7=19$)
- the 767 has 20,000 gal fuel capacity
- the 757 has a 124 foot wingspan ($1+2+4=7$)
- a 767 has a 156 foot wingspan; $1+5+6=12$
- one tower was 1,362 feet high; $1+3+6+2=12$
- the other was 1,368; $1+3+6+8=18$
- the supports are 39 inches apart; $3+9=12$
- the buildings were leased for 3.25 billion; $3+2+5=10$
- the other flights were AA 77 ($7+7=14$) and UA 93 ($9+3=12$) and UA 175 ($1+7+5=13$)
- flight 11 had 81 passengers ($8+1=9$)
- flight 77 had 58 passengers ($8+5=13$), 4 crew members and 2 pilots (total=64)
- Boston has 6 letters
- Massachusetts has 13 letters
- Pennsylvania has 12 letters

- Washington D.C. has 12 letters
- Los Angeles has 10 letters
- The number of hijackers was 19 ($9+1=10$)
- Names and words that don't have eleven letters in them: Osama bin Laden, [Khalid Al-Midhar](#), [Majed Moqed](#), [Nawaq Alhamzi](#), [Salem Alhamzi](#), [Satam Al Suqami](#), [Waleed M. Alshehri](#), [Wail Alshehri](#), [Abdulaziz Alomari](#), Dick Cheney, Laura Bush, Iraq, Iran, Pakistan, Muslim, Islam, Pentagon, World Trade Center, terrorism, jihad, Taliban, Koran, United States, anti-American, murder, fire, hell, stupid.

What Geller and other numerologists are doing is a game, a game played with numbers and with people's minds. Sometimes it is amusing. Sometimes it is pathetic.

cosmobiology

Cosmobiology is a method of [astrology](#) developed by [Reinhold Ebertin](#) in the 1920's. Cosmobiology eschews the use of traditional house systems and uses a complicated charting method to develop a cosmogram of heavenly objects that places special importance on midpoints. A midpoint is a point half way between two planets (or other notables). For example, "the distance between 0 degrees Aries and 0 degrees Cancer is 90 degrees. Half of 90 is 45, so the midpoint would be located at 15 degrees Taurus."* [Cosmobiologists](#) consider "indirect midpoints" to be important, too. "The point opposite 15 degrees Taurus is 15 Scorpio: this is an indirect midpoint. In fact, it is common to use all indirect midpoints at 45 or even 22.5 degree intervals. Indirect midpoints carry nearly the same energy as a direct midpoint."* (It should be noted that cosmobiologists may still refer to what they eschew.)

Ebertin's influence increased astronomically after the publication of [The Combination of Stellar Influences](#) in 1940*, in which he gives interpretations for all possible planetary combinations and midpoints.

Cosmobiologists, like other astrologers, are consulted for advice in personal and business matters, assisting in medical diagnoses, and in [matters regarding fertility](#).

There are several reasons for the popularity of [pseudosciences](#) such as cosmobiology. The [pragmatic fallacy](#) is often committed in such matters because of the relative ease with which one can fit just about any piece of data to the theory. Analogies and metaphors are easy to see and are used to validate predictions. Also, many predictions will have a 50/50 chance of being right: *you'll have a boy (or girl), your business will succeed (or fail)*. Many will be vague: *you will come into some unexpected money; you will be traveling in the near future*. Finally, there is no way to disprove such theories. Whatever happens, either it can be made to fit the theory or an [ad hoc hypothesis](#) can be constructed to explain away the apparent refuting evidence.

Other factors likely to be involved in such belief systems are [the Forer effect](#), [selective thinking](#), [confirmation bias](#), [self-deception](#) and [wishful thinking](#).

See related entries on [astrology](#), [biorhythms](#), [crystals](#), [cold reading](#), [communal reinforcement](#), [the Forer effect](#), [fortune telling](#), [palmistry](#), [the placebo effect](#), [selective thinking](#), [self-deception](#), [sympathetic magic](#), [testimonials](#), and [wishful thinking](#).

reader comments:

astrology

09 Nov 2000

I read your criticism of Astrology with great interest. You appear to attack it primarily from one angle that the positions of the stars at the time of ones birth do not have a causal effect on the outcome of ones life. I think the argument is slightly flawed for discrediting Astrology and misses some important points.

Is it truly Astrologer's belief that there is a causal relationship from the positions of massive bodies in the universe to what happens to small bodies? Could it not be the opposite way around that the sum of states of small bodies at a given time dictate the positions of larger bodies? Isn't more likely that the sum of states of infinitesimally small "bodies" - sub-atomic particles, electromagnetic waves, gravitational waves, whatever - affect the states of large bodies - stars, galaxies etc, and vice versa continuously and simultaneously, a magnificent ebb and flow of constant energy throughout the universe, and is this not basically what Astrology is trying to say.

Surely the Grand Unified Theory that some of the world's greatest minds are dedicated to discovering is little more than a extension of Astrology, a theory that would enable us to say that given the precise states of every particle/wave in the universe bar one we could predict the state the remaining particle/wave with dead certainty - even though Heisenberg wouldn't allow us to demonstrate it.

Is not the universe a giant clock with the stars and galaxies for hands and the sub-atomic particle/waves teeth on the clock wheels. Knowing the position of the hands we should be able to predict the positions of individual teeth, and knowing how the hands move we can predict where the teeth will be at a future time.

I would have thought that the position of the stars at the time of your birth (using whatever criteria for defining that moment) would be intrinsically linked to the outcome of your life.

The snag appears when we consider whether it has been possible for Astrologers through the generations to have discerned an accurate correlation between the positions of stars and the way a person's life turns out. I suspect this to be quite impossible, and to follow the analogy further, akin to predicting the position of teeth on clock wheel knowing only the position of the second

hand.

So as I said at the start I believe your arguments against Astrology to be slightly flawed, but the result is essentially the same that Astrology is misguided at best criminal at worst.

The irony I guess is that your attempts to discredit the practice through reason are futile as these people and their ways of thinking are mere ticks of a clock that can't be stopped, but then again, I guess you can't help yourself.

An Eternal Fatalist.

Stephen Ross

Nov 2000

Thank you for providing us with the Skeptic's Dictionary, I find it an invaluable source of information and entertainment. Something which occurred to me whilst reading your astrology article: My partner is an identical twin. They were born within a few minutes of each other. One is heterosexual and one is homosexual. One is upbeat and positive, while the other is invariably depressed and negative. One is single and one (obviously) is in a relationship. Their lives, in other words, are quite different. Their destinies also, are unlikely to be very similar. I'd be interested to know the astrological explanation for this. I have become increasingly surprised by peoples ability to take what seems to be relevant to themselves from astrological readings (not hard, because of the vague way such statements usually seem to be constructed), and ignore the rest. As a test of this (as well as for my own, somewhat malicious, amusement), I have now begun to enthusiastically read people the wrong horoscopes from my newspaper, and it is quite amazing how relevant it is to their everyday lives. Another triumphant proof of astrology. I can't help smirking.

Cheers,

Danny

reply: If you find that amusing, take a look at this [article](#) with various predictions by astrologers about tomorrow's national election. It is hilarious.

[thanks to Ivan Kelly]

4 Jul 2000

Hi, I read your review of the "Astrology" entry and I would like to share with you some comments. As a philosophy student interested in logic and philosophy of science, I found that some of your reasoning was deficient. Let's see.

I- you say that

Astrologers emphasize the importance of the positions of the sun, moon, planets, etc., at the time of birth. But why are the initial conditions more important than all subsequent conditions for one's personality and traits? Why is the moment of birth chosen as the significant moment rather than the moment of conception? Why aren't other initial conditions such as one's mother's health, the delivery place conditions, forceps, bright lights, dim room, back seat of a car, etc., more important than whether Mars is ascending, descending, culminating or fulminating? Why isn't the planet Earth, much closer to us at birth, considered a major influence on who we are and what we become?

You seem to believe that since Astrologers cannot answer these questions satisfactorily, Astrology is wrong. However, you should notice that "why" questions (in the sense you are employing the word 'why') cannot be answered satisfactorily by anyone. Indeed, if I were to ask you, "Why are mass and distance relevant to the gravitational force, and not other properties, such as color, texture, etc.", or "Why does light propagate at 300.000 km/sec", what would you reply? This is what David Hackett Fischer in his "Historian's Fallacies" calls the fallacy of metaphysical question. You are asking a question that cannot be answered by empirical means. You, a skeptic, are, in fact, asking for metaphysical answer!

reply. Not really. My questions are rhetorical. I don't expect any answers or attempts at answers. I was trying to make two points. Obviously, you missed them. Perhaps others have missed them, too. So, let me try to clarify the points.

If heavenly bodies influence us, they should influence us continually with equal importance. No one moment should be any more significant than any other. I am trying to call attention to the arbitrary nature of astrology. Astrologers arbitrarily select birth as absolutely more significant than any other moment. I don't expect them to be able to explain why they pick this moment rather than any other, because I know any moment they select is arbitrarily selected. In no other field that I am aware of do significant causal events have arbitrary beginning points.

I was also trying to call attention to the apparent absurdity of holding that the more remote and distant something is, the more influential it is.

2- you say that

Correlation is not causality.

You seem to believe that there is something which IS causality. In other words, you are assuming that the distinction between accidental correlation and scientific law can be made. However, this is not a simple issue, and philosophers so far have not found a satisfactory answer to the task of giving

an acceptable criterion that separates correlation from causation. Some criteria have been proposed. For example, the notion of contrary to fact conditionals was once thought to be useful, but it has also showed some insurmountable problems. Besides, the notion of correlation is extensively used, for example, in medicine. Whether this is "causality" or not is unimportant. What matters is that if you are willing to accept this procedure as a valid test for, say, a drug, then you must also accept it in the field of astrology.

reply: I must say, you have lost me here. What do contrary to fact conditionals have to do with this issue. (For those who are wondering, a contrary to fact conditional is a conditional statement that cannot be proved false because the antecedent is false. In sentential logic, if the antecedent of a conditional statement is false, then the conditional statement itself is considered true. For example, if a student says "If I had studied, I would have aced the logic test." But the student didn't study, so we'll never know if studying would have led to acing the test. Like I said, I have no idea what this has to do with the 'correlation is not causality' issue.)

I don't know what you mean by 'accidental correlation.' Perhaps you mean correlation where there is no causality involved. Scientific laws are a different matter altogether from causal claims, so, yes I do think there is a distinction here. Most scientists do recognize that some correlations are not likely due to chance, and that in such cases it is reasonable to say things like "smoking causes cancer."

By the way, I'm not willing to take a drug on the grounds that 65% of those who have taken the drug say it makes them feel better.

Again, I was trying to make a point that was missed. So, let me try to clarify it. It is expected by the laws of chance that there will be some significant correlations (i.e., those not likely due to chance), which are, in fact, not indicative of a causal connection. Thus, finding a significant correlation between Mars and soldiers does not necessarily indicate a causal connection. If only one study found a significant correlation between smoking and lung cancer, the scientific community would not find it reasonable to insist on a causal connection there.

3- to demolish astrology I would have used a different and simpler strategy. It suffices to ask, "Is it falsifiable?" In other words, "Is it possible to predict an event that would refute the theory". If not, it is metaphysical, and Astrologers should not make any claims whatsoever regarding its empirical value, since Astrology does not speak about the world. If yes, it is scientific, and Astrologers should make their main hypotheses explicit. If they can't, they were lying, and either Astrology is metaphysical or it has not been proven to be scientific. That's it.

reply: I agree. However, astrologers do not agree on whether what they are doing is science or not. Some think it is and I think they've been refuted. Others think it is purely metaphysical. They can't be refuted, but they can still be criticized for having beliefs that are inane, useless, harmful, stupid, etc.

4- All throughout your articles (especially in your article about Transcendental Meditation) I see the fallacious tendency to label the conclusion of an argument as false when the reasoning that supports it is invalid. But this is a cross [sic?] mistake. Surely, there are plenty of cases in the history of science of scientists giving an invalid explanation of a phenomenon that could afterwards be explained correctly. Of course, I believe you know the difference between truthfulness and validity, but you should remember that the distinction also applies to those theories you don't like.

Pablo Stafforini

reply: I wish you'd be more specific. I don't think I ever label a conclusion of an argument as false *because* the reasoning supporting it is invalid. I hope either I have argued that the *reasons* given were false or questionable, and thus did not provide adequate support for their conclusions, or I have given independent reasons to support the claim that the conclusion of the argument is false.

16 May 1999

Your insights are brilliant, thought provoking, honest, sincere...and dare to make us look at reality, logic, sanity, reason and all the other little factors of being human that have allowed us to move forward and not gravitate into a quivering puddle and remain in a cave. I am an astrologer, I have been doing this for 25 years and have seen every nuance and facet of this new age spiritual pseudoscience hocus pocus that has come barreling into our lives...I am an astrologer..and I am a skeptic. I have NEVER felt it was a science...it should not BE a science....I am absolutely against it ever getting into a school system, if astrology belongs there then so does tarot, tea leaf reading, crystal balls and I-ching. The way it is currently used...applied in many cases to psychology by Jungian astrologers and archetypical astrologers, applied through psychic phone lines and intuitive astrologers is a weakening influence..not the strengthening influence many deceive themselves into believing. Anything that takes away our ability to be free-thinking, responsible individuals is weakening.

So what is it? It is a way to focus your mind into using COMMON SENSE. Nothing more, nothing less. I LOVE it....it is a passion...it has allowed me to find an interest in learning about our history as humans...it is colorful..entertaining....it allows me to deeply reflect....I enjoy the way it has woven through history...splashing color and drama now and then across our lives...it is a simple escape....it allows me to have an interest in other people and to try to see things through their eyes....it opens ME to finding MY own way

to deal logically, rationally with MY world. I could use...ANYTHING...or NOTHING..and come to the same conclusions....some people write their thoughts out, some seek quiet solitude, some listen to music, some doodle....all the same thing...a way to focus. It has always been my opinion that when the question is posed to astrologers that if their 'science' were literal why are they so dismally inaccurate judging HUGE current events...(note: not ONE big astrologer saw the current Kosovo crisis with their 1999 predictions..not ONE..saw the Columbine nightmare) and their reply is always.."because the future is a set of potentials and astrology can only highlight them". This IS..the answer in itself...astrology is merely a tool to give estimated guesses...which really only pulls on their own subconscious rationality.

Astrological, psychic and other metaphysical prophecy methods may actually weaken our ability to use our best judgment in these issues as estimated guessing gives an accuracy rate of about 53% while the others vary from 52% to 10%. There is rather large astrological society at this time that is now bombarding newspapers and other agencies trying to get grants, recognition and acknowledgement by using a convoluted stand that if astrologers had been taken seriously the tragedies at Columbine COULD have been prevented. This was horrifying to me and was when I decided I could not and would no longer even acknowledge that astrology was one of my creative interests. This is being done by the well known and respected astrologers in our country. They went on to say that astrologers had known long before that this generation of children had been born, that this kind of soul would be coming into the world and needed...'special'..guidance (from astrology of course). I reacted angrily and sent a long, overly emotional letter to them...basically asking.."if astrologers KNEW this was going to happen, why did they just sit there and WAIT for it to happen, are we not the people who RAISED this generation????? If astrologers KNEW it was going to happen doesn't that then make them RESPONSIBLE for letting it happen?? And can a group PROVE astrology is valid by condemning an entire generation of children??" Their reply was that they had been TRYING to warn everyone...by writing books...and that they weren't condemning anyone, they were merely trying to 'help'. I wonder what the world would be like if everyone wrote a book instead of using their minds and their compassion and energy to bring about needed changes in the world...? Hmmm...actually...I think we're living that question..and its answer.

Anyways.....I didn't mean to ramble..I just wanted to applaud and cheer you on. Many thanks...for having the guts..to do this.

Linda Rankin

reply: I didn't know what to say in response six months ago when I received this e-mail from Ms. Rankin. I still don't, except that I suppose anything can be entertaining and a means to self-discovery if used properly, but some things seem more likely to be misleading and potentially dangerous. I still consider astrology to be one of them and think that as light as she tries to be, her [website](#) and readings will be taken very

seriously by many.

17 Aug 1998

I saw the damdest thing on our local TV-news last night, they had a segment of a really hot new trend on Wall-street, they have brokers who can predict changes in the market down to the hour, by using astrology Ellen Jamieson is a stockbroker with a difference, she heads up a firm who specialise in Astro-Brokerage. She is apparently doing handsomely

I suppose we will have to follow suit and have some Sangoma throwing bones on Diagonal-street, why hell, that's probably what our Minister of finance does already!

Maybe that's why our prime rate has hit 28%

Pass them knuckle-bones baby!

Matthew Loxton
South Africa

reply: The Astrobrokers are big in the U.S., too.

30 Dec 1998

Up until now science has not agreed with astrology, but it is now beginning to do so. In coming to this increasing agreement, some new experiments have been helpful.

reply: I think it is just wishful thinking on your part that science is now in agreement with astrology in any significant matter.

For example, when we launched man-made satellites into space, we discovered that a wide range of radioactive rays from space, and the constellations are continuously bombarding the Earth. Nothing on the Earth is unaffected by this phenomenon. We know that the ocean is influenced by the moon, but we have not taken into consideration the fact that the same proportion of water and salt that occurs in the ocean also occurs in the human body -- the same proportion. Seventy percent of the human body consists of water, and the proportion of salt contained in that water is the same as is contained in the Arabian Sea. If the water in the ocean is affected by the moon, then how could the water inside the human body remain unaffected?

reply: Being bombarded by rays does not mean we are affected by them in

any significant way, much less that they affect our personalities, as astrologers believe. If we all have the same amount of salt and water, why aren't we all the same? Because that fact is irrelevant to our personalities and life histories. You are right that the moon affects the tides, but did you know that study after study has found absolutely no significant correlation between any phase of the [moon](#) and any human trait or activity? And did you know that of the [top ten scientific discoveries](#) made by the Apollo exploration of the moon, not one of them supports astrology?

Did you know that the Earth's chemical composition (by mass) is:

34.6% Iron
29.5% Oxygen
15.2% Silicon
12.7% Magnesium
2.4% Nickel
1.9% Sulfur
0.05% Titanium

Aren't you glad that your body is not 34.6% iron?

Did you know that the Earth's atmosphere is 77% nitrogen, 21% oxygen, with traces of argon, carbon dioxide and water?

Aren't you glad that your body is not 77% nitrogen?

Did you know that sea water has several other chemicals besides salt? Yes, [you can look it up](#). Salt water is about 3.5% salts (by weight). 30.62% of the salt is sodium and 55.07% chloride. Thus, the oceans contain 1.1 % sodium and 1.9% chloride. Sulfates make up 7.72% of the oceans' salts or 0.27% of the ocean is made of sulfates. The human body, on the other hand, is made of less that 0.25% each of sodium, chlorine, and sulfur. [You can look that up](#), too. (By the way, the average adult human body contains about 0.008% iron and about 3% nitrogen.)

Did you know that the oceans are about 0.04% calcium, but the human body contains about 2% calcium?

Now in this connection, two or three facts emerging from recent investigations must be kept in mind. For example, as the day of the full moon approaches, the amount of insanity in the world increases, whereas on the last day of the darker fourteen days, the least number of people go insane. As the moon grows brighter the level of insanity also begins to increase. On the day of the full moon, the greatest number of people enter madhouses; and on the last day of the moon's waning period, the greatest number of people are discharged from madhouses. Statistics are now available....

reply: Statistics might be available to support your claims, but they are inaccurate. There have been numerous studies on this topic and all of them have concluded that there is no significant correlation between [the full moon and madness](#).

In English there is the word lunatic; in Hindi we have the word chaandmara. Chaand refers to the moon, just as lunar does in English. Chaandmara is a very ancient term, and the word lunatic also is some three thousand years old. Some three thousand years ago, people realized that the moon affects the insane. But if it affects the insane, then how can it avoid affecting the sane?

Kira Reed

reply: I agree that the moon affects the sane and insane equally.

11 Jan 1999

Thanks for responding to my letter on astrology. The way you answered is very interesting.

You wrote:

**"Did you know that the Earth's chemical composition (by mass) is: 34.6% Iron

What do these facts have to do with whether or not the planets and stars affect our psyche? Do you think that because I am an astrologer I believe the planets are made of cheese or something? I'm sure we have both been educated in the same manner, by the same educational system.

reply: I brought up these material facts because you brought up the fact about how the human body and the sea are alike and must be equally affected by the moon. My point is that coincidences are often given significance they do not deserve because we ignore other data which would quickly reveal the insignificance of a coincidence.

So you're no idiot and I'm no idiot. So let's really discuss the difference of our opinions here. We cannot prove there are psychological archetypes, but the science of psychiatry assumes they are there, and that archetypal symbols affect our personalities. (<http://www.jungindex.net/neher/>)

reply: I agree that archetypes can't be proved, but I disagree that psychiatry is a science (unless you are talking about biopsychiatry). Jung was a pseudoscientist, passing off his religious and metaphysical intuitions as if they were empirically based.

Archetypes have been symbolized for thousands of years by the planets and stars, as well as by mythological characters. Astrology is a science of symbols, a science that explores the psyche. Perhaps the planetary archetypal symbols affect our psyche, or the collective unconscious, causing changes in behavior.

reply: Astrology is a pseudoscience. It is either not empirically testable or it is and has been shown to be false (depending on which astrologer you talk to). I don't doubt that symbols affect the psyche, if we believe in the symbols. The evidence for a "[collective unconscious](#)" is about zero.

Symbols, like archetypes, are not thoughts. We must not "think" about them. Symbols evoke sensory and feeling responses. Consider this word picture "water." Ask your self, what do I feel on the surface of my skin when I imagine water? What do I hear? What taste does the image of water leave in my mouth? What smell comes to mind? What associations do I notice hovering around the fringes of my awareness? These are the questions we must ask if we wish to respond fully and consciously to symbols. Now that you have contemplated water, try this "cool, clear water." Ask the same questions? How does your experience change?

My answers are as follows. My skin feels lighter as if supported. It feels cool. I can feel reassuring undulations as if I am floating. I can smell the sea, watch the moon, and hear the gentle roar of the waves breaking on shore. Hawaiian music wafts on the air. It is warm and peaceful. If I contemplate the "cool"

water, the sense of well being intensifies. I can hear the incomplete but reassuring popular song from my childhood sung by a male singer but all I can make out is the phrase "cool, clear water." Healing, wholeness, peace, unity with nature, the womb are terms that come to mind. But there is another side. I start to move on writing; I see the image of drowning flash across my vision. Darkness falls, waves churn and roar, fear and death suggest themselves. Water is clearly a multi-valent symbol. The sensations, feelings, and associations evoked change with the context that I find. Water is life, at the beach on vacation and I am re-created. Water is death in the storm at sea and I am destroyed. Water, like the moon which is so closely associated with the sea, suggests the mystery of death and rebirth. Can we really say that the planets that symbolize so much to us have no effect on our behavior?

reply: From what you have just written, I would conclude that it is not planets but *symbols* that have influences on us. This is not a revolutionary idea and it goes nowhere toward validating astrology or Jung.

As C.G. Jung, a preeminent psychoanalyst, states:

"I have no answer to the multitude of problems that arise when we seek to harmonize the oracle [astrology]...with our accepted scientific cannons...The irrational fullness of life has taught me never to discard anything, even when it goes against all our best theories (so short lived at best) or otherwise admits of no immediate explanation. It is of course disquieting, and one is not certain whether the compass is pointing true or not; but security, certitude, and peace do not lead to discoveries... Clearly the method aims at self-knowledge, though at all times it has also been put to a superstitious use."

Kira Reed

reply: Those who prefer the "irrational fullness of life" are welcome to it, but we'd all be better off if such people were kept out of our hospitals, boardrooms and schools. I have learned to discard what is likely to be false, useless or harmful. Those who believe we should not discard anything, even the false or the contradictory, are lost at sea without a rudder, in my view. The meager amount of self-knowledge likely to emerge by being open to such things as astrology, biorhythms, channeling, chiromancy, [etc.](#), is not worth a life seeped in superstition. Life is fascinating enough without requiring childish superstition to jazz it up.

16 Jan 1999

I just read your exchange with the astrologer Reed. She claims that archetypes have been connected to the planets for a long time. This is false. The planets were connected to outward behaviors and associated feelings and closely tied to prediction for almost all of its history, and only recently (in this century) with Alan Leo, Rudyhar and Jung have attempts been made to make a more psychological astrology. This move was made in light of the devastating negative results of research (catalogued in Eysenck and Nias (1982) and Dean and Mather (1977)).

Furthermore, the statement "Perhaps planetary archetypes affect our personality" suggests that an empirical statement is being made here. It is not. The connections made by the recent, so-called psychological astrologers are contradictory and made by fiat. Astrologers have not published research studies attempting to connect planetary positions with psychological states. They have just tried to fit whatever seems to fit into the categories used by traditional astrologers. Different psychological astrologers imagine different connections.

Also, most of psychiatry does not use Jungian psychology and no appeals to archetypes are made, just as Jung plays a minor role in modern psychology (consult any intro psycho textbook). The long quote from Jung is counterproductive to Reed since it can be used against the theory of archetypes. He is saying don't be too cocksure about your theories, something perhaps astrologers should apply to their own beliefs. But, of course, how could they ever find error in their system? There is no methodology of investigation in astrology that astrologers as a community use to investigate and discard problematic tenets.

It is interesting to note how Reed shifts ground in her two e-mails. The first refers to empirical and testable claims regarding lunar and human fluid compositions and the second changes the subject to talk about symbols. This shifting of topics by astrologers was noticed by St. Augustine over one and a half millennia ago. He pointed out that astrologers will talk in physical, causal terms when it suits them, e.g. "Mars caused that man's violence", but if challenged, will retreat to "Mars was a symbol". Later one can catch them talking in causal terms again. Augustine pointed out that this slipping between different discourses was a way of always avoiding challenge and refutation.

Some astrologers are aware of the game that astrologers have been playing here. Cornelius, a prominent British astrologer, in his presentation at the United Astrology Congress last summer (1998) pointed out:

Intelligent critics of astrology maintain that astrologers have always managed to use the prevailing culture and ethos of the times in which they live (science and philosophy of the period) to disguise themselves and cunningly continue with

their practices. This is absolutely true. That is how our extraordinary form of symbolic consciousness has survived. We disguised ourselves as Aristotelian science for the better part of two millennia. Then we tacked ourselves onto modern science in the revival of two centuries ago when astrology disguised itself as magnetism and electricity, and later as radio waves. Depth psychology [i.e. Jung] is just the latest disguise. Perhaps we can do nothing else, for how can this form of symbolism survive without being in the corrupt position of lying about itself in some way in order to get by?

Cornelius contends astrologers have to re-think many of their basic assumptions and public deceptions.

The views of astrologer Prudence Jones

Guest Editor in the *Astrological Journal* 1996, 38(5), 281-284

Would Venus still bring experiences of love, beauty and pleasure to our horoscopes if it was called "Saturn"? Would Mars still make us decisive if it was called "Neptune"? That is, are the significances of the planets based on dispassionate observation of their effects, or on dogmatic symbolism which forces our observations to conform to our expectations? On what basis do we claim that the movements of particular planets are associated with events of various kinds? In the modern age we assume that the association of planets with particular qualities is based on centuries of empirical observation, of the ancients looking out and observing that for example Mars generally rose or culminated at the time of conflicts. But is it? Preliminary research (e.g. that of Michael Baigent in *From the Omens of Babylon*) indicates that this was not what the early Mesopotamians were doing at all, that the original meanings of the planets were not based on observation but on the conventional interpretation of a celestial script, the symbolic language of the gods. This was modified later on, but it still leaves the twentieth century mind with an uneasy feeling. How well founded, in our modern sense of being based on observation or experience, are the traditional meanings of the planets which we so confidently take as given?

In the modern age, the latest planet to be discovered was named after Mickey Mouse's dog. Yet Pluto predictably makes his appearance in our charts in his ancient guise as Lord of the Underworld, bringer of upheavals and guardian of buried treasure. How on earth can we justify this by normal scientific method? If the underworld effects are real, how do we explain them? Or do they not occur so reliably, and are we deluding ourselves with pious dogma? If the latter, does it matter? Can we defend a version of astrology which is not based on regularly observed correlations, on the famous "empirical method" of normal scientific procedure? A few years ago Geoffrey Cornelius (in *The Moment of Astrology*) put a strong case for reclaiming the divinatory aspect of our art. But with this and other rare exceptions, ever since the formulation of the laws of nature around the 7th century BCE, astrologers have tried on the whole to present themselves as scientists. But should we do so?

Such questions are part of any enquiry into the foundations of astrology. Foundations - the basic presuppositions we make in practicing our art - are what this issue is about (not history, as mistakenly stated in the last *Journal*). Questions about basics are often felt to be uncomfortable and often we don't want to ask them, dismissing them as trivial or time-wasting. But without facing them, we have no chance of knowing what place we should occupy in the world, much less of defending it against sceptics who ask precisely these questions. If answered thoroughly on the other hand, such questions can set our discipline on a firm basis and enable us to practice it responsibly and to defend it against uncomprehending attacks.

This issue presents astrologers' encounters with such fundamental questions. Nick Campion's article gives an actual example of how modern astrologers are interpreting a new planet right now: astrological method in action. The intricacies of publishers' deadlines prevent me from listing all this issue's articles in the editorial, but here are some more of the questions we are looking at. What, first of all, do we mean by "astrology"? Do we include the applied astronomy of cosmobiology, weather

forecasting and the practice of agriculture according to planetary positions? If so, it looks quite scientific. Do we include the study of planetary cycles, with its insight into social and economic change? Or do we continue ourselves strictly to the study of birth charts and their various directions? Do we include horary? Sun-sign astrology? Why - or why not?

The birth horoscope is one of the most difficult parts of astrology to justify to a non-astrologer. Why should the planetary positions of a moment in the past describe the supposedly continuing nature of an entity in the present? In the case of a living being we might appeal to the idea of imprinting by the birth trauma, and the idea of a personal character which endures throughout life is so well-entrenched in popular thought that even psychologists seldom think twice about it. But no birth trauma occurs at the "birth" of a country, a company, a resolution, a domicile and so on, all of which astrologers confidently take as having their own natal charts. Here we are decisively entering the realm of the occult even by claiming that such entities come into existence, let alone saying that they are described by the transits of the time of their emergence. How do we justify our use of the birth chart?

Similarly with the zodiac signs; they rest on shaky foundations from the modern point of view. How in heaven do twelve 30° sectors of the ecliptic, measured from the vernal equinox but named after now-far-distant constellations, impart any qualities at all to the planets, houses, parts and nodes which we view against their background? Do they do so in fact, or is this wishful thinking? Some astrologers justify the signs (taking, usually without explanation, the Sun in the signs as their exemplar) as shorthand for seasonal characteristics. But this implies that their order should be reversed in the southern hemisphere, which seldom happens. And what, in any case, of horoscopes for equatorial latitudes, where seasonal change is minimal, but where, of course, astrology was invented? The signs remain a particularly sticky problem for astrologers, let alone for outsiders.

The houses are easier to explain if not to justify, and as I argued in several articles a few years ago (e.g. in Annabella Kitson's anthology, *History and Astrology*), they probably have their origin in the static division of local space, the fixed sphere of the observer defined by the horizon, meridian and prime vertical, rather than in the motion of the ascendant. But the problem remains of how we should choose and project such divisions onto the ecliptic. Are the quadrant systems of division only applicable to the Mediterranean latitudes where they were invented, and should we adapt one of the local time-measuring systems for more extreme latitudes (as I have argued elsewhere), or not?

In day-to-day practice, most astrologers give up any pretense to empirical methods when they assert the truth of symbolic associations such as the planetary rulership of signs, their faces, terms, triplicates and so on, all of which, however well-attested in giving answers to questions, belong in a completely different universe of thought from scientific method, the observed correlation of certain planets with certain types of event. We easily forget that it requires some hard thinking to justify both sorts of associations in one system. A non-astrologer might be prepared to consider planetary transits across the mundane sphere as a possible area of empirical investigation, but would surely have some difficulty with the symbolic significance of dispositors and other planetary dignities. Fr Laurence Cassidy touches on this discrepancy in his closely-argued article - including a Platonic dialogue! Nick Kollerstrom too presents a dialogue arguing the differences between science and astrology - differences which many astrologers glide over.

We can of course set up camp with the theologians and psychoanalysts as interpreters of meaning to the bemused, rather than casting ourselves as quasi-experimental scientists. Astrology then would be a symbolic system, complete in that it explains (interprets) everything, consistent in that it does not (significantly) contradict itself, though it might contradict other people's deeply-held beliefs. But why throw away mundane predictions, the stock market and the test of natural astrology, as well as the few but significant experimental results which indicate that astrology does have an objective, sharable, replicable component? Professor Eysenck's review [of the Ertel/Irving book] in this issue concerns just one of the parts of "natural astrology" we would be foolish to ignore. Notice however that psychoanalysts, who have little or no empirical backing for their dogmas, are seen by society at large as honorary scientists, and even theologians cling onto intellectual respectability by the skin of their teeth, when even more than us they stand completely outside the materialistic paradigm. Only a few mavericks like Richard Dawkins dare grasp the nettle and link all three anomalous disciplines together.

Even within astrology, our various systems don't agree either. In horary astrology the Moon's north node is a point of ill-fortune, but in humanistic astrology it is the direction of personal growth. A planet may be in Cancer in sidereal astrology but in Leo in tropical astrology. Serious astrologers often decry Sun-sign forecasts as some sort of unfounded gibberish, but Sun-sign techniques (turning the chart, transits to "turned" house rulers, lunations in "turned" houses etc.) are in fact part and parcel of standard astrological method. The rules of traditional, modern (post-Theosophical), sidereal, and local space astrology (with its sidereal ancestor Vastu-Shastra) are quite different. Yet how many of us have decided that we would be tropicalists rather than siderealists, traditional rather than modern astrologers (or vice versa) after any process of sober reasoning? Philosophers, who in modern academe have claimed the study of "foundations" for their own, might observe in their own jargon that our subject seems to be in the "paradoxical", "pre-revolutionary" stage of competing theories before a fixed paradigm of "normal" astrology establishes itself as the One Truth, in the way that, for example, modern chemistry pushed out alchemy and the search for phlogiston, the combustible gas. Astrologers, on the other hand, might perfectly well retort that they don't want to follow the monotheistic pattern of the One Truth anyway and are happier to develop a pluralistic version of reality, in which different views of the universe are appropriate for different occasions. That, however, would be a philosopher's reply. In this issue, Jeff Meddle goes further than that and takes the ultimate astrologer's revenge, arguing that the philosophy of philosophers is actually a product of their natal astrology.

Astrology, nevertheless, remains a thorn in the side of modern thought, a way of thinking entirely outside the modern paradigm. This journal, produced in haste to a very short deadline, can only touch on a few of the issues involved, though it is probably fortunate that you have been spared long and thoughtful essays on ontological relativity or developments in the philosophy of science since 1953, if recent comments on the undesirability of philosophical articles are anything to go by. The AA Journal has touched on foundational issues before, especially in 1991-3, but here I have commissioned a series of articles in the spirit of standard Anglo-American language-and-logic philosophy, inviting people to examine their most basic presuppositions and see what remains of them after thorough dismantling. This approach might just be due (according to Jeff Meddle's article) to my natal Jupiter in Taurus, but I think you will find most of the outcome unstuffy and rather exciting, even, perhaps, controversial and infuriating. My thanks are due to Suzi Lilly-Harvey for originally inviting me to be a guest editor, and to Robin Heath for honouring her invitation. Happy reading, and I hope that some

readers might even feel stimulated to investigate the fifth AA Philosophy Day next spring.

the unconscious mind

The **unconscious** or **subconscious** mind, according to classical [Freudian psychoanalysis](#), is a "part" of the mind which stores [repressed memories](#). The theory of repression maintains that some experiences are too painful to be reminded of, so the mind stuffs them in the cellar. These painful, repressed memories manifest themselves in neurotic or psychotic behavior and in dreams. However, there is no scientific evidence either for the unconscious repression of traumatic experiences or their causal agency in neurotic or psychotic behavior.

The unconscious mind is also thought by some, such as [Jung](#) and [Tart](#), to be a reservoir of transcendent truths. There is no scientific evidence that this is true.

It would be absurd to reject the notion of the unconscious mind simply because we reject the Freudian notion of the unconscious as a reservoir of repressed memories of traumatic experiences. We should recognize that it was Freud more than anyone else who forced us to recognize unconscious factors as significant determinants of human behavior. Furthermore, it seems obvious that much, if not most, of one's brain's activity occurs without our awareness or consciousness. Consciousness or self-awareness is obviously the proverbial tip of the iceberg. But most interest in the unconscious mind has been restricted to potentially harmful memories that might be stored or stirring there, memories of bad experiences that influence our conscious behavior even though we are unaware of their impact.

It is assumed that the unconscious is distinguished from the conscious by the fact that we are aware of conscious experience, but unaware of the unconscious. However, there is ample scientific data to establish as a fact that some conscious perception goes on without self-consciousness. It is possible to be unaware of having experienced something and unable to remember the experience, but still give evidence that one has had the experience. Several examples should suffice to establish this point.

- 1. blindness denial.** There are cases of brain-damaged people who are blind but who are unaware of it.
- 2. jargon aphasia.** There are cases of brain-damaged people who speak unintelligibly but aren't aware of it.
- 3. blindsight.** There are cases of brain-damaged people who see things but are unaware of it.

4. oral/verbal dissociation. There are cases of brain-damaged people who cannot orally tell you what you just said, but they can write it down correctly. Furthermore, they can't remember what they wrote down or what it refers to.

Somehow it does not seem appropriate to speak of these cases as involving the unconscious mind, even though the perceivers are not aware of what they are perceiving. It might be less confusing to abandon talk of the unconscious mind and refer instead to "lost memory" or "fragmented memory" or "implicit memory" (a term coined by Daniel Schacter and Endel Tulving). It is not *repression* of traumatic experiences which causes memories to be lost. Memories are lost because of inattentiveness in the original experience and because the original experience occurred at an age when the brain was not fully developed. Memories are also lost because we have no recognizable need to reference the original experience. (Many fragments of pleasant experiences, such as the name of a place or a product, may be influencing present choices without one's being aware of it.) Memories are lost because of brain damage, loss of consciousness during an experience, neurochemical imbalance, cognitive restructuring, and sensory, emotional or hormonal overload. On the other hand, all the empirical evidence indicates that the more traumatic an experience the *more* likely one is to remember it. Novel visual images, which would frequently accompany traumas, stimulate the hippocampus and left inferior prefrontal cavity and will generally become part of long-term memory.

Neuroscience tells us that a memory is a set of connections among groups of neurons that participate in the encoding process. Encoding can take place in several parts of the brain. Neural connections go across various parts of the brain; the stronger the connections, the stronger the memory. Recollection of an event can occur by a stimulus to any of the parts of the brain where a neural connection for the memory occurs. If part of the brain is damaged, access to any neural data that was there is lost. On the other hand, if the brain is healthy and a person is fully conscious when experiencing some trauma, the likelihood that they will forget the event is near zero, unless either they are very young or they later experience a brain injury.

Long-term memory requires elaborative encoding in the inner part of the temporal lobes. If the left inferior prefrontal lobe is damaged or undeveloped, there will be grave difficulty with elaborative encoding. This area of the brain is undeveloped in very young children (under the age of three). Hence, it is very unlikely that any story of having a memory of life in the cradle or in the womb is accurate. The brains of infants and very young children are capable of storing fragmented memories, however. Such memories cannot be explicit or deeply encoded, but they can nevertheless have influence. In fact, there are numerous situations--such as [cryptomnesia](#)-- where memory can be

manifested without awareness of remembering. But such unconscious memories, even though pervasive, are not quite what Freud or Jung meant by the unconscious. "In Freud's vision, unconscious memories are dynamic entities embroiled in a fight against the forces of repression; they result from special experiences that relate to our deepest conflicts and desires. . . . [I]mplicit memories . . . arise as a natural consequence of such everyday activities as perceiving, understanding, and acting." (Schacter 1996, 190-191) Implicit memory may be far more mundane than Freud's dynamic 'unconscious mind', but it is more significant since it reaches into every aspect of our lives. As Daniel Schacter notes: "If we're unaware that something is influencing our behavior, there is little we can do to understand or contradict it." (191)

Most lost memories are lost because they were never elaborately encoded. Perception is mostly a filtering and defragmenting process. Our interests and needs affect perception, but most of what is available to us as potential sense data will never be processed. And most of what is processed will be forgotten. Amnesia is not rare but the standard condition of the human species. We do not forget in order to avoid being reminded of unpleasant things. We forget either because we did not perceive closely in the first place or we did not encode the experience either in the parietal lobes of the cortical surface (for short-term or working memory) or in the prefrontal lobe (for long-term memory).

To those whose lives are devoted to getting into the unconscious mind, either to find out why they have problems or to find some transcendent truth, I say you will be looking for a long, long time. You might better spend your time reading a book on memory or neuroscience.

"Crazy" Therapies

What are they?

Do They Work?

by Margaret Thaler Singer and [Janja Lalich](#)

San Francisco: Jossey-Bass Publishers, 1996

There are very few sure things in life, but the following guide to recognizing an incompetent, immoral or quack therapist is about 99.9% guaranteed.

You should not trust your therapist, regardless of his or her reputation, fame, diplomas, certificates, etc., if

1. **He or she tries to have sex with you or claims that having sex with one's therapist is "good therapy." Intimate sexual behavior, including erotic kissing, fondling or lovemaking, between therapist and patient is always inappropriate. (The Sexual Predator)**
2. **He or she tries to have you move in and do chores, keep the books, work the farm, have sex, etc. (The Exploiter)**
3. **He or she spends a lot of time during your sessions talking about his or her own personal problems, such as her husband's illness, his wife's frigidity, another patient's hang-ups, his sexual needs. (The Neurotic)**
4. **He or she requires as a condition for therapy that you cut off all relations with your spouse, children, parents and other loved ones. (The Cult Guru)**
5. **He or she claims to know what your problem is and how to fix it, even though no thorough history of you has been taken. (The Savant Idiot)**
6. **He or she claims that you must be hypnotized in order to discover either hidden memories or hiding entities which are causing your problems. (The Exorcist)**
7. **He or she specializes not in treating people for**

- specific problems such as depression or anxiety, but rather in treating people as if all problems have an identical cause. (The Johnny-One-Note)
8. He or she claims to have a technique which works miracles or works like magic, curing those who had heretofore been considered hopeless. (The Miracle Worker)
 9. He or she has a checklist which is claimed to be an excellent way to find out if you suffer from whatever the therapist specializes in, and you have enough checks to qualify. (The Scientist)
 10. He or she requires as a condition for therapy that you accept certain religious, metaphysical or pseudoscientific notions. To have good therapy you should not be required to believe in God, reincarnation, alien abductions, possession by entities, inner children, Primal Pains, channeling, miracles, or any of the many pseudoscientific theories popular among therapists. (The New Age Pseudoscientist)¹

Any potential patient should be able to identify all of the above traits, except for the last. How is the average person supposed to know what is scientifically accepted therapeutic practice and what is pseudoscientific rubbish? The patient needs a guide through the wonderland of fantasies, myths and untested hypotheses flourishing in the helping professions. Singer and Lalich provide such a guide in *"Crazy" Therapies*. They guide the reader through the various types of helpers: *psychologist, psychiatrist, psychoanalyst, various social workers, hypnotherapists, personal "coaches", seminar leaders, spiritual advisors, psychics, massage therapists, shamans, gurus* and every type of *New Age healer* imaginable. The authors also guide the reader through a maze of therapies that left me wondering why we have jails if these "healers" are not in them. Many of these therapies are not just useless; they are harmful. Reading this book may even encourage some people now considering a career in therapy to go into law instead. You may do more good that way--if you devote yourself to suing or prosecuting "crazy" therapists.

Those thinking of entering therapy and those in therapy who have some serious doubts about their therapists might want to jump to the section on "Consumer Guidelines" in the last chapter. Singer and Lalich provide much practical advice for those who are being asked to put a great deal of faith in a stranger who will be meddling with your mind, your emotional well-being and your life. They remind the reader/patient that you will be revealing very personal things about yourself and other people in your life. The decision to hire a therapist can be a monumental one. It should not be taken lightly. In 1987 "nearly eighty million psychotherapy visits were made at a total cost of \$4.2 billion" and, according to a 1994 survey, "a great portion of clients are satisfied with their psychotherapy." The authors provide a number of

questions to ask, as well as noting certain signs which should make you run for the nearest exit, such as therapists who try to humiliate you when you ask them questions about themselves or their practice.

In general, if your therapist is telling you that you have to get worse before you get better, is tearing you apart rather than building you up, is letting group members insult and ridicule you, is insisting that you must go deeper and deeper and deeper to feel the feeling, or is doing anything that smacks of old-fashioned ventilation theories, get out as fast as you can and look for a supportive therapist who will listen and respond with human decency. (p. 131)

If you are treated with disdain for asking about what you are buying think ahead: how could this person lead you to feel better, plan better, or have more self-esteem if he begins by putting you down for being an alert consumer? Remember, you may be feeling bad, and even desperate, but there are thousands of mental health professionals, so if this one is not right, keep on phoning and searching. (p. 205)

Most of *"Crazy" Therapies*, however, is devoted to describing the therapies and offering explanations for how such foolishness became so widespread. In a nutshell, the authors blame the popularity of crazy therapies on three things: the therapeutic relationship is by nature vague and ambiguous; the general increase in demand for instant gratification and the abdication of personal responsibility; and the flight from rational thought. There is no clear expectation of exactly how any particular therapy should progress. For all the client knows, the crazy notions of the therapist are considered general truths in psychotherapy. Blaming others for our problems seems natural. The master of therapy, Sigmund Freud, worked by insight and from the assumption that patient insight into the cause of his or her problem was the key to cure, so why shouldn't the modern therapist accept these unproved notions? Finally, the more bizarre a theory is, the more likely it will get a wide hearing in books and on talk shows. A claim is often valued not for its truth but for its being "exciting" or "mysterious". We want entertainment and excitement, not dry, rational discourse.

Most therapy and psychology bashers begin with hammering Freud, blaming him for all the zaniness that has flourished in the "helping professions." Singer and Lalich engage in their share of Freud-bashing, too. But blaming Freud for the faults of his followers is misguided at best and irresponsible at worst. Freud didn't wrap people in blankets or carpets and have them pretend they were in the womb, nor does anything he wrote suggest that such behavior would be proper. He never claimed he could cure any and all illnesses, nor did he blame his patients' parents for all their problems. He made a study of the irrational; he did not advocate glorifying irrationality. Freud may have been wrong about many things, but crazy therapists should take responsibility for

their own craziness. Freud is no more to blame for their crazy therapies than parents, aliens, spirit entities, etc. are to blame for patient problems, or that Jesus is to blame for Jim Jones. I would place Freud's *Civilization and Its Discontents* and his *Future of an Illusion* on any short list of books an educated person should read. To encourage the general public to believe that Freud was as moronic as some of his followers is to do a great disservice, for such notions will feed a popular prejudice as well as discourage the study and reading of one of the most creative and critical minds of all time. Freud recognized that spiritual beliefs are based on wishes and desires, not facts, evidence and rational argument. He would have disapproved of therapies which are thinly disguised metaphysical or spiritual belief systems. I don't think we have to guess at what Freud would have thought of therapist Sondra Ray's claim that "Rebirthers consider themselves to be spiritual guides, not scientists."

I wonder which of the crazy therapies discussed by Singer and Lalich would have annoyed Freud the most. I don't think Freud would have considered it very professional to have a patient suckle at your breast, as some therapists do. It is difficult to say which kind of therapist is the worst, but I cast my vote for the 10% who have sex with their patients. Maybe these are therapists who confused "Freud's the one who said *Everything is Sex*" with "he's the one who said *Sex is Everything*" while studying their *Cliff Notes*. Anyone seeking therapy is likely to be vulnerable, trusting and troubled, as well as ignorant of what is accepted therapeutic practice. He or she is easy pickings for a ruthless and unscrupulous therapist. To take advantage of one's power in that situation in order to satisfy one's narcissistic lust is unethical and criminal. All therapeutic professional associations condemn it and many states consider it a criminal offense for a therapist to engage in sexual acts with his or her patient.

On the other hand, I am tempted to say that there is more to fear from therapists who are well-intentioned and believe in possession by spirit entities, [past-life regression](#), [alien abduction](#), primal screaming and other unverified cathartic therapies, reparenting, [rebirthing](#), [neurolinguistic programming](#) (NLP), [facilitated communication](#) (FC), [Eye Movement Desensitization and Reprocessing \(EMDR\)](#), Neural Organization Technique (NOT) and a host of other unscientific notions. Singer and Lalich discuss the origins and dangers of each of these "crazy" therapies. One thing they all have in common is that they have not been proven effective by any independent scientific studies, nor are they generally accepted as effective in the scientific community. Their support comes mainly from the "insight" and observations of their founders, and patient feedback which is analyzed and evaluated by the therapists themselves. Most of the innovative therapists reviewed by Singer and Lalich seem uninterested in scientifically testing their theories, though most seem attached to technical jargon.

The "crazy" therapies examined all claim to be miracle cures and to work like magic. All except facilitated communication claim that their one approach

will work for just about everybody, no matter what their problem or situation. It is unlikely that *all* these cookie cutter theories--one size fits all--are correct, but none of their practitioners seem interested in any scientific studies which might prove once and for all which theory, if any, is correct.

Is it Leonard Orr's [energy breathing and rebirthing](#) theory?

Learn how to breathe energy well and you can breathe away physical and emotional pain, as well as diseases.

Is it Marguerite Sechehaye's and John Rosen's theory of [regression and reparenting](#)? Does your therapist have to become your surrogate parent to make up for the terrible job your real parents did?

Is it Jacqui Shiff's theory which requires to you to wear diapers, suck your thumb and drink from a baby bottle?

Is it Sondra Ray's and Bob Mandel's theory that your problems are due to the way you were born? They will help "[rebirth](#)" you, properly this time.

Is it John Fuller's, Bruce Goldberg's, [Brian Weiss's](#), Edith Fiore's, Richard Boylan's, David Jacobs' or John Mack's theory? They use hypnosis to discover your past or future lives as an [alien abductee](#), in an effort to help you.

Is it [John Bradshaw's theory of the "inner child"](#) you must nurture and be good to?

Is it [Arthur Janov's Primal Therapy](#)? You can eradicate all your Primal Pain if only you can learn the Proper Way to Scream and Capitalize.

Is it Daniel Casriel's [New Identity Process \(NIP\)](#)? Screaming unblocks what's blocked, but you need a better kind of scream than Janov's.

Is it Nolan Saltzman's Bio Scream Psychotherapy? His screaming is better than Casriel's or Janov's because it has more Love in it.

Is it Bhagwan Shree Rajneesh's [laughter](#) and meditation therapy?

Is it [repressed memory therapy](#)?

Is it [facilitated communication](#), [neurolinguistic programming](#) or [EMDR](#)?

Or perhaps the winner is Dr. Carl Ferreri, chiropractor, who invented NOT: [Neural Organization Technique](#). This man decided, without the slightest hint of scientific evidence, that all mental and physical problems are due to misaligned skulls. That's right. Other chiropractors are deluded for thinking that it is the spine which is malaligned and needs adjustments. No, it is the skull. Ferreri believes that as you breathe, the bones in your skull move, causing misalignments which can be corrected by manipulation. This theory was put into practice without the slightest proof that cranial bones move or that there is any sense to the notion of "standard alignment" of the cranial bones. Ferreri was not stopped by logic, however, but by lawsuits and criminal charges. His methods of pressing on eye sockets, skulls and jaws were described as "torture" by the parents of children he was treating for dyslexia. His methods were put into practice by the Del Norte School District in northern California after someone there had attended a seminar and came back full of enthusiasm for this wonderful new method of helping children with learning disabilities.

Which of the above has been scientifically shown to be superior to the others? None. Though their advocates claim their theories work for everyone, none of the theories has been put through any scientifically meaningful tests. Their evidence is in the self-validating analyses of their own observations and of their patient's claims.

Singer and Lalich go through the basic assumptions for each type of theory and find them all wanting.

Past-life regression and entity theories are based on the notion that if you discover the cause of your troubles you will be cured. There is no proof for this notion, despite its popularity since at least the time of Freud. Alien abduction therapy would seem to disprove insight and blame theories, since those who think their problems are due to having been abducted by aliens are not relieved and cured by this knowledge. To the contrary, they are made even more disturbed. Past-life regression therapy is considered "pure quackery" by the American Psychiatric Association. Singer and Lalich blame the spate of [alien abduction](#) claims on "[sleep paralysis](#)", therapist prompting, [source amnesia](#) and the popularity of the notion. (p.102) According to the authors:

"Age regression, reparenting, and rebirthing are not proven helpful techniques. There is no scientifically established objective clinical evidence showing them to be

beneficial." (p. 45)

"Because objective research on regression techniques is limited, the assumptions about regression remain merely myths based on anecdotal reports from enthusiastic proponents." (p. 26)

"Rather than helping clients to become stronger and more independent, most regression therapies, and in particular the rebirthing-reparenting sort, induce in the client an abdication of responsibility and a state of sickly dependence on the therapists. " (p. 26)

Cathartic theories are based on the notion that if you express your emotions you will purge yourself of your troubles. There is no proof for this notion, despite its popularity since the time of Aristotle. This notion would seem to have been disproved by experiments with children which find that rather than sublimate aggression when encouraged to be aggressive, the children become more aggressive. It also seems to be disproved every week during football and soccer season, where fans seem to increase their aggression levels while viewing their favorite teams in action. (My favorite story in the book is about the couple who go to a catharsis therapist to help them with their anger. He prods them until they physically assault each other and demolish his office. He sends them a bill for \$3,000 and tells them he won't have them as patients!) Singer and Lalich note that "The human organism learns as it acts; the more a certain behavior is practiced, the more it becomes a part of the person's automatic acts." (p. 129) Catharsis therapists seem oblivious to this notion and seem surprised when previously calm patients begin making life miserable for others by becoming more and more aggressive. According to the authors, "...rational therapies assist clients to find ways to talk with others, to change situations, and to identify socially useful and mature means to reduce anger-producing interactions and situations." (p. 130)

Reparenting and rebirthing theories are based on the notion that adults have problems because their parents were inadequate. There is no proof of this notion, despite its popularity since the time of Cain and Abel.. "During the course of the therapy, clients regress, become dependent, have their self-esteem and sense of self attacked and diminished, and to some degree lose touch with their previous everyday reality orientation." (p. 130)

Hypnotherapy is extremely popular and is practiced by thousands of therapists who got their training in a weekend seminar or a short course. Singer and Lalich note that

There are no licensing requirements, no prerequisites for training, and no professional organization to which those who hypnotize others are accountable. You can be a real

estate agent, a graphic artist, an English teacher, or a hairdresser and also call yourself a hypnotherapist by hanging a certificate on your wall that states you took as few as eighteen hours of courses in hypnosis.

This lack of oversight leads to all sorts of abuses and malpractice. (p. 53)

The authors quote Martin Orne: "The cues as to what is expected may be unwittingly communicated before or during the hypnotic procedure, either by the hypnotist or by someone else, for example, a previous subject, a story, a movie, a stage show, etc. Further, the nature of these cues may be quite obscure to the hypnotist, to the subject, and even to the trained observer." (p. 96) Yet, many hypnotherapists seem oblivious to the dangers and pitfalls of using hypnosis in a therapeutic session.

In fact, many therapists seem oblivious to facts with which any competent therapist should be concerned. For example, it is amazing that all these therapists develop theories which exclude the possibility that a patient might either have a physical problem or a character flaw. No patient is physically ill. And no patient is responsible for his or her problems. It is always someone else or something else which has the faults. Patients apparently never lie, manipulate, deceive, cheat, distort, rationalize, err, etc. If a patient has a "fault," it is that he or she is not completely trusting of the therapist. Patients have "mental diseases" or "syndromes," not character flaws. It would be an astounding fact to discover that emotionally disturbed or mentally troubled persons are completely without flaws in their moral character! Yet, these advocates of crazy therapies seem to treat all patients as if they were innocent children, incapable of the slightest peccadillo.

If there is a major weakness in *"Crazy" Therapies*, it is that the book does not address the issue of neurochemical disorders (aka mental illness). The authors do not attempt to distinguish people who are having "life problems" but not major neurochemical problems. If you are schizophrenic or bipolar, you will not find this book useful in trying to decide what therapist to see. If you are a family member or loved one of a person with a major neurochemical problem, this book will not help you figure out what you can do to help. Only a person without paranoid delusions, without mania, who is taking his or her medication and is no longer in denial about their illness, could possibly use a check list such as the authors present to help evaluate a potential therapist. It is the family members of the ill person who need guidance. It might be unrealistic to expect a person who needs therapy to be a rational consumer in choosing a therapist, but I don't think it would be too much to ask for some guidance for loved ones of those needing therapy or medical treatment.

Unfortunately, the guidance needed by loved ones of the mentally ill is not a check list for choosing a therapist but a handbook for combat with the mental

health professionals who often seem to be little more than obstacles to treatment and recovery. They often seem more interested in following rules, especially rules about "the patient's rights," than they are in making a decision as to what would be the best treatment for a person with a mental illness. The duty to help the patient get well has been obfuscated by officious minions of the court who have misleading titles such as Patient Advocate. Getting through to doctors and social workers is roadblocked by "privacy" issues. Trying to find out what is being done to help your loved one or what you can do to help or provide vital information (such as the discovery of a suicide note) are made difficult rather than easy. Some advice on how to deal with officials whose job is to see that if your mentally ill loved one does not want to take his or her medicine, then by God it is his or her right not to do so and the State will fight to protect this vital individual freedom to the death, or to a contrary court decision, whichever comes first. These petty officials will not care that your non-rich and usually thrifty loved one has just spent her entire life savings on philanthropic enterprises, several cars and trucks she does not need and can't afford, and is sure she is being transported to a higher place of being. The patient may reduce herself to homelessness during a manic explosion, but your tax dollars will not be spent trying to prevent this or minimize the damage. Your tax dollars will be spent for the salary of a Patient Advocate who will know nothing about the patient, but will go to court for her to make sure her "rights" are protected. One right that won't be protected, however, is the right to get well. Maybe in their next book, Singer and Lalich can give some guidance for people seeking care for their mentally ill loved one.

Finally, it is quite amazing that most of the therapists discussed by Singer and Lalich seem oblivious or indifferent to their role in priming and prompting their patients. They condition their patients, prompt them, and in some cases, clearly plant notions in their patient's minds. They give their patients books to read or videos to watch not to help the patient understand a problem but to prime the patient for belief in some crazy therapy. They plant notions during hypnosis, group sessions, etc., and then these planted notions are "recovered" and offered as validation of their therapeutic techniques and theories. Rather than provide real therapy, these "crazy" therapists indoctrinate patients into their own worldviews. This is surreal pseudoscience at its worst. Singer and Lalich have done a great service by exposing some of the worst psychotherapy has to offer. They write: "To society's loss, there is an alarming laxity within the mental health professions when it comes to monitoring, commenting on, and educating the public about what is good therapy, what is negligent behavior by trained professionals, and what is or borders on quackery." (p. 21) *"Crazy" Therapies* is a first-rate attempt to make up for this deficiency.

Margaret Thaler Singer has been a clinical psychologist, researcher and teacher for over fifty years. She is currently an emeritus adjunct professor of psychology at the University of California, Berkeley. For the past twenty years, she has also done work on [cults](#) and is considered an expert in the field

of cult menaces.

[Janja Lalich](#) is an educator, author and consultant in the field of cults and psychological persuasion.

Their book is humorously illustrated by cartoonist [Jim Coughenour](#).

[Recommendations and Rejections](#)

enneagram

All knowledge can be included in the enneagram and with the help of the enneagram it can be interpreted. And in this connection only what a man is able to put into the enneagram does he actually know, that is, understand. What he cannot put into the enneagram makes books and libraries entirely unnecessary. Everything can be included and read in the enneagram. --P.D. Ouspensky, *In Search of the miraculous**

I teach it in conjunction with a psychiatrist who has a deep interest in the Enneagram. The psychotherapists want it as a very useful, hot tool to work with normal, high-functioning people. You see, there is no psychology for the normal and high functioning person....

I've had ONE's who have so repressed their anger that they don't think they're angry....

...the spiritual agenda is paramount, which is this conversion process. Whether we know it or not, we're all transforming, because we're hungry for the opposite of our vice. Even if we don't know about our vice, we suffer from lack of its opposite tendency.

----Helen Palmer, of the Oral Tradition

The fundamental premise of the enneagram is that each of us has one dominant (not exclusive) energy that drives us in everything we do. This dominant energy is our greatest gift so we use it too much and it becomes our chief fault - or sin. This energy, like a prevailing wind that bends a tree permanently, sculpts our interior geography and shapes our entire life. --[Enneagram Central](#)

An enneagram is, literally, a drawing with nine lines. Figuratively, however, the enneagram is a New Age mandala, a mystical gateway to personality typing. The drawing is based upon a belief in the mystical properties of the [numbers 7](#) and [3](#).^{*} It consists of a circle with nine equidistant points on the circumference. The points are connected by two figures: one connects the number 1 to 4 to 2 to 8 to 5 to 7 and back to 1; the other connects 3, 6 and 9. The 142857 sequence is based on the fact that dividing 7 into 1 yields an infinite repetition of the sequence 142857. In fact, dividing 7 into any whole number not a multiple of 7 will yield the infinite repetition of the sequence 142857. Also, $142857 \times 7 = 999999$. And of course 1 divided by 3 yields an infinite sequence of threes. The triangle joining points 3, 6 and 9 links all the numbers on the circle divisible by 3. To ascribe metaphysical or mystical significance

to the properties of numbers is mere superstition and a throwback to an earlier time in human history when ignorance was considered a point of view (apologies to "Dilbert" and Scott Adams).

The enneagram represents nine personality types. How the types are defined depends on whom you ask. Some define them by a *fundamental weakness or sin*. Others define them by a fundamental *energy* that drives one's entire being. Some follow classical [biorhythm theory](#) and classify the nine types according to three types of types: *mental, emotional and physical*. Others classify the nine types according to three types of instinctual drives: the Self-Preserving drives, the Social drives and the Sexual drives.* Some follow [Gurdjieff](#), who claims to have followed Sufism, and type the types as *mental, emotional and instinctual*.

The one who seems to be the father of the enneagram, Oscar Ichazo (b. 1931), spoke of *enneagons* (nine-pointed figures, enclosed in a circle, with straight lines connecting each point to two others) and *ego fixations* corresponding to each of the nine points. (Ichazo learned of the enneagram through [Ouspensky's](#) writings of [Gurdjieff](#).) He called his system *Arica*, after the coastal city in northern Chile, near the Peruvian border, where he opened his first school. In the early nineties, there were "forty or so Arica training centers, located in the United States, South America, Europe and Australia."*

The Arica system constitutes a body of practical and theoretical knowledge in the form of a nine-level hierarchy of training programs aimed at the total development of the human being.... The Arica system observes that the human body and psyche is composed of nine independent yet interconnected systems. Particular imbalances within these systems are called "fixations".... These nine separate components are represented by enneagons-- nine pointed figures that map the human psyche....[T]here are seven fundamental enneagons associated with the nine ego fixations. Thus, the enneagons constitute the structural maps of a human psyche ... [and] provide a guide through which a person may better understand oneself and one's interactions with others.... An ego fixation is an accumulation of life experience organized during one's childhood and which shapes one's personality. Arica training seeks to overcome the control and influence of the ego fixations so that the individual may return to the inner balance with which he or she was born.

Ichazo would make claims like 'the dominant passion of the *Indolent* fixation is *Sloth*; the dominant passion of the *Resentment* fixation is *Anger*; and the dominant passion of the *Flattery* fixation is *Pride*.' In short, he developed a typology of "ego fixations" based on the classical Christian notion of the

[seven capital sins](#) plus *fear* and *deceit*.

Ichazo claims to have been trained in the mystical arts of Sufism, the [cabala](#) and Zen, and to have studied martial arts, yoga, Buddhism, Confucianism, the [I Ching](#) and [alchemy](#). He was called the "continuation of [Gurdjieff](#)" by filmmaker Alexandro Jodorowsky ("El Topo," "The Holy Mountain"), who claims to have spent a weekend expanding his consciousness with Ichazo and LSD. Ichazo claims he began teaching the enneagram after spending a week in a "[divine coma](#)" (Keen). Ichazo never claimed to have a scientific basis for his theory of personality types, ego fixations, etc. His notions were based on visions and insights taken from numerous eclectic sources and freely mixed into an amalgam of mystical psychobabble.

Ichazo claimed to have discovered the personality type meaning of the enneagram while in some kind of ecstatic state or trance under the influence of some spirit or angelic being: the Archangel Gabriel, the "Green Qu'Tub" [a Sufi spiritual master] or Metatron, the prince of the archangels.*

Like Gurdjieff, he claimed we are born with an essence (nature) which conflicts with our personality (nurture), and we must struggle to harmonize the two and return to our true essence. He founded his [Arica Institute](#) in the late 1960s. The Institute continues to exist, though it has contracted somewhat from its heyday in the early 1990s, and now offers training in "Nine Hypergnostic Systems" and *T'ai chi chuan* in centers in New York and Europe.

Several former disciples have modified Ichazo's teachings during the past twenty years. [Claudio Naranjo](#) attended Ichazo's lectures on enneagram personality types in Santiago, Chile, in the 1970's and published a book called *Enneatypes in Psychotherapy* in 1995. A Jesuit priest named Bob Ochs got the enneagrams from Naranjo and taught courses on enneagrams at Loyola University in Chicago in 1971. Naranjo also taught [Helen Palmer, who claims to be carrying on the esoteric oral tradition in her writings](#). By the time the enneagram got to Palmer it was imbedded with western psychological notions. Nevertheless, it remained a set of teachings without any scientific foundation.

[Helen Palmer](#) is the author of *The Enneagram: Understanding Yourself and the Others in Your Life* (1988). [Arica sued Palmer for copyright violations but lost](#). Nevertheless, she seems to have based her work upon Ichazo's but changed the terminology. *Enneagram* replaced *enneagon* and *personality type* replaced *ego fixation*, for example.

Palmer says that the "Enneagram is a psychological and spiritual system with

roots in ancient traditions." She types people by fundamental weakness or sin: *anger, pride, envy, avarice, gluttony, lust, sloth, fear, and deceit*. She calls these weaknesses "capital tendencies." Each of us has a personality that is dominated by one of the nine capital tendencies. Knowing what type you, and what type others are, will put you on the road to "self-understanding and empathy, giving rise to improved relationships," says Palmer.

Each personality type is numbered and labeled.

The Nine Personality Types and the Nine Capital Tendencies

The Perfectionist	One	anger
The Giver	Two	pride
The Performer	Three	deceit
The Romantic	Four	envy
The Observer	Five	avarice
The Trooper	Six	fear
The Epicure	Seven	gluttony
The Boss	Eight	lust
The Mediator	Nine	sloth

Personality typing is somewhat arbitrary. The classification systems used by Ichazo, and modified by Palmer and others according to their own idiosyncratic beliefs, are not without merit. For example, one certainly could learn much of importance about oneself by focusing on one's central fault or faults, but those who advocate using the enneagram seem to be interested in much more than a bit of self-knowledge. Entire metaphysical systems, psychologies, religions, cosmologies and New Age springboards to higher consciousness and fuller being are said to be found by looking into the enneagram. There is seemingly no end to what one can find in these nine lines.

Some, for example, have developed personality profiles for different "styles" of personalities.

Style Five

The life of the style Five centers on their thinking. Healthy Fives are both highly intellectual and involved in activity. They can be, if not geniuses, then extraordinarily accomplished. As the most intellectual of the nine types, they are often superb teachers and/or researchers. Many healthy Fives are fine writers because of their acute observational skills and a developed idealism. They are

highly objective and able to see all sides of a question and understand them.

When Fives become less healthy, they tend to withdraw. Instead of dealing with their sensitivity by being emotionally detached from results, they split off from reality, living in worlds of their own creating and not answering the demands of active living. Their natural independence as a thinker degenerates into arrogance. They can become quite arrogant or eccentric. In the movies, Fives are the "mad professors."

Fives you may know: Bill Gates, Scrooge, Buddha, T. S. Eliot, John Paul Sartre, Rene Descartes, Timothy McVeigh, Joe DiMaggio, Albert Einstein, H. R. Haldeman, Ted Kaczynski, Jacqueline Onassis and Vladimir Lenin.*

What this typology is based on is anybody's guess. But it is reminiscent of astrological forecasts and is probably best evaluated in terms of the [Forer effect](#). There does not seem to be any way to validate this typology. At the heart of this New Age spiritual psychology are a number of concepts vaguely reminiscent of [biorhythms](#), [numerology](#), [astrology](#), [tarot card reading](#), and [Myers-Briggs](#) personality inventories. Nothing in the typology resembles anything approaching a scientific interest in personality.

The above Style was said to be mine as a result of a test I took. However, the test came with the following advisory:

Does this fit you? If it does not, go back over the test, rethink some of your answers and see if you come up with your style. This is not easy. Your enneagram style is an energy you have been using without knowing all your life. You have a vested interest in not knowing this energy because it may slightly alter what you have considered your motivation for many things. Besides, this energy has a down side you may not like to acknowledge.

If the style doesn't fit, go back and change some answers until it fits but be careful because you may be deceiving yourself when you answered the questions the first time or you may be deceiving yourself with your revisions! Note also how the profile contains several weasel words: 'can be', 'are often', 'tend to', 'can become'. The central feature of the Five is *thinking*. Nobody needs a personality test to determine if his or her dominant *energy, drive, fixation, passion*, etc., is the intellectual. Thinkers are observers and intellectuals are often arrogant. This is not a scoop. Nor is it very useful, as is evident by the listing of people who are allegedly all Fives.

The limits of the enneagram are the limits of the imagination of those who work with them. One [master](#) claims that the Five's "primary passion is avarice in terms of their time and possessions, and their chief feature is withdrawal from experience." Another "[expert](#)" describes the Five as The Thinker and identifies this type by its dominant fear: *fear of being overwhelmed by the world*. We are told that if we want to get along with a Five

Be independent, not clingy. Speak in a straightforward and brief manner. I need time alone to process my feelings and thoughts. Remember that if I seem aloof, distant, or arrogant, it may be that I am feeling uncomfortable. Make me feel welcome, but not too intensely, or I might doubt your sincerity. If I become irritated when I have to repeat things, it may be because it was such an effort to get my thoughts out in the first place. Don't come on like a bulldozer. Help me to avoid my pet peeves: big parties, other people's loud music, overdone emotions, and intrusions on my privacy.

This is good advice for getting along with just about anybody, except for those who would rather be at a big party after spending the afternoon alone with a book.

We are also told that for a Five to reach his potential he must go against the grain and strive to be like an Eight, whose main vice is lust. The scientific studies supporting this claim seem to have been lost, however.*

Some think there are sixteen basic personality types and use [The Myers-Briggs Type Indicator®](#). As Jung said, there could be any number of types, even 360 (McGuire 342), if we wished. Who is right? Maybe they're both wrong. Perhaps we need only think of two types, [those from Mars and those from Venus](#), as John Gray, [Ph.D.](#), claims.

See related entries on [astrotherapy](#), the [Forer effect](#), the [Myers-Briggs Type Indicator](#), [numerology](#), and [tarot cards](#).

[Rationalists Doubt
Mother Teresa's
Miracle](#) Oct 8, 2002

miracles

A miracle is "a transgression of a law of nature by a particular volition of the Deity, or by the interposition of some invisible agent" (Hume, 123n). Theologians of the Old & New Testament religions consider only God-willed contravention of the laws of nature to be true miracles. However, they admit others can do and have done things which contravene the laws of nature; such acts are attributed to diabolical powers and are called "false miracles." Many outside of the Biblical based religions believe in the ability to transgress laws of nature through acts of will in consort with [paranormal](#) or [occult](#) powers. They generally refer to these transgressions not as miracles, but as [magick](#).

All religions report numerous and equally credible miracles. Hume compares deciding amongst religions on the basis of their miracles to the task of a judge who must evaluate contradictory, but equally reliable, testimonies. Each religion establishes itself as solidly as the next, thereby overthrowing and destroying its rivals. Furthermore, the more ancient and barbarous a people is, the greater the tendency for miracles and prodigies of all kinds to flourish.

...it forms a strong presumption against all supernatural and miraculous relations that they are observed chiefly to abound among ignorant and barbarous nations; or if a civilized people has ever given admission to any of them, that people will be found to have received them from ignorant and barbarous ancestors, who transmitted them with that inviolable sanction and authority which always attend received opinions (Hume, 126).

While there are still many people today who believe in miracles, no modern historian fills his or her books with accounts of miraculous events. It is improbable that the report of even a single miracle would find its way into such texts today. Indeed, only those who cater to the superstitious and credulous, such as the *National Enquirer* and a good portion of the rest of the mass media, would even think of reporting an alleged miracle without taking a very skeptical attitude towards it. No scholarly journal today would consider an author rational if he or she were to sprinkle reports of miracles throughout a treatise. The modern scholar dismisses all such reports as either lies or cases of [collective hallucination](#).

Hume was aware that no matter how scientific or rational a civilization became, belief in miracles would never be eradicated. Human nature is such that we love the marvelous and the wondrous. Human nature is also such that we love even more to be the bearer of a story of the marvelous and the wondrous. The more wondrous our story, the more merit both we and it attain.

Vanity, delusion and zealotry have led to more than one [pious fraud](#) supporting a holy and meritorious cause with gross embellishments and outright lies about witnessing miraculous events (Hume, 136).

Hume's greatest argument against belief in miracles, however, was modeled after an argument made by John Tillotson, Archbishop of Canterbury. Tillotson and others, such as William Chillingworth before him and his contemporary Bishop Edward Stillingfleet, had argued for what they called a "commonsense" defense of Christianity, i.e., Anglicanism. Tillotson's argument against the Catholic doctrine of [transubstantiation](#) or "the real presence" was simple and direct. The idea contradicts common sense, he said. The doctrine claims that the bread and wine used in the communion ceremony is changed in substance so that what is bread and wine to all the senses is in fact the body and blood of Christ. If it looks like bread, smells like bread, tastes like bread, then it is bread. *To believe otherwise is to give up the basis for all knowledge based on sense experience.* Anything could be other than it appears to the senses. This argument has nothing to do with the skeptical argument about the uncertainty of sense knowledge. This is an argument not about certainty but about reasonable belief. If the Catholics are right about transubstantiation, then a book might really be a bishop, for example, or a pear might actually be Westminster Cathedral. The accidents of a thing would be no clue as to its substance. Everything we perceive could be completely unrelated to what it appears to be. Such a world would be unreasonable and unworthy of God. If the senses can't be trusted in this one case, they can't be trusted in any. To believe in transubstantiation is to abandon the basis of all knowledge: sense experience.

Hume begins his essay on miracles by praising Tillotson's argument as being "as concise and elegant and strong as any argument can possibly be supposed against a doctrine so little worthy of a serious refutation." He then goes on to say that he fancies that he has (118)

discovered an argument of a like nature which, if just, will, with the wise and learned, be an everlasting check to all kinds of superstitious delusion, and consequently will be useful as long as the world endures; for so long, I presume, will the accounts of miracles and prodigies be found in all history, sacred and profane.

His argument is a paradigm of simplicity and elegance (122):

A miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined.

Or put even more succinctly (122):

There must...be a uniform experience against every miraculous event, otherwise the event would not merit that appellation.

The logical implication of this argument is that (123)

no testimony is sufficient to establish a miracle unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavors to establish.

What Hume has done is to take the commonsense Anglican argument against the Catholic doctrine of transubstantiation and applied it to miracles, the basis of all religious sects. The laws of nature have not been established by occasional or frequent experiences of a similar kind, but of *uniform* experience. It is "more than probable," says Hume, that all men must die, that lead can't remain suspended in air by itself and that fire consumes wood and is extinguished by water. If someone were to report to Hume that a man could suspend lead in the air by an act of will, Hume would ask himself if "the falsehood of his testimony would be more miraculous than the event which he relates." If so, then he would believe the testimony. However, he does not believe there ever was a miraculous event established "on so full an evidence."

Consider the fact that the uniformity of experience of people around the world has been that once a human limb has been amputated, it does not grow back. What would you think if a friend of yours, a scientist of the highest integrity with a Ph.D. in physics from Harvard, were to tell you that she was off in Spain last summer and met a man who used to have no legs but now walks on two fine, healthy limbs. She tells you that a holy man rubbed oil on his stumps and his legs grew back. He lives in a small village and all the villagers attest to this "miracle." Your friend is convinced a miracle occurred. What would you believe? To believe in this miracle would be to reject the principle of the uniformity of experience, upon which laws of nature are based. It would be to reject a fundamental assumption of all science, that the laws of nature are inviolate. The miracle cannot be believed without abandoning a basic principle of empirical knowledge: that like things under like circumstances produce like results.

Of course there is another constant, another product of uniform experience which should not be forgotten: the tendency of people at all times in all ages to desire wondrous events, to be deluded about them, to fabricate them, create them, embellish them, enhance them, and come to believe in the absolute truth of the creations of their own passions and heated imaginations. Does this mean that miracles cannot occur? Of course not. It means, however, that when

a miracle is reported the probability will always be greater that the person doing the reporting is mistaken, deluded or a fraud than that the miracle really occurred. To believe in a miracle, as Hume said, is not an act of reason but of [faith](#).

reader comments:

Atheism

29 Sep 2000

First, let me thank you for devoting so much time to cataloguing and refuting many of the more destructive myths of the modern world. I find the Skeptic's Dictionary extremely interesting and valuable, as much as a tool of understanding scientific practices and thought as for the specific information it contains.

Let me preface the following by saying that I do not believe in god, and tend to alternate between atheistic and agnostic thought. I read today your article on atheism, and was somewhat surprised at it's contents. It seems to be the only writing in the Skeptic's Dictionary that is not particularly skeptical. In fact, it seems largely to be an apology for atheism, and an attack on the belief of god, rather than skepticism about atheism. I believe that there is the same lack of empirical evidence for the non-existence of god as there is for the existence of god. I would submit that while there is no problem with taking the non-existence of god as an article of faith (as I do), it may be somewhat misleading to include it in a body of work called The Skeptic's Dictionary. Again, thank you for providing such a good resource.

Peter Darley

reply: As I say on the front page of the SD: we have *skeptical definitions and essays on occult, paranormal, supernatural and pseudoscientific ideas and practices with references to the best skeptical literature.* I state in the Introduction that "The reader is forewarned that The Skeptic's Dictionary does not try to present a "balanced" account of occult subjects." If you want a book skeptical of atheism, logic, scientific methodologies such as using controlled experiments, empirical and materialistic philosophies, common fallacies of reasoning, naturalistic explanations, etc. (all of which have entries in the SD), then write it yourself.

14 Jul 1999

I am writing to you concerning your article regarding atheism. I wish to comment on the arguments that you presented against the existence of God and furthermore the way in which you approached the topic.

1. God is metaphysical, and as such, if he does exist, it is impossible to empirically prove his existence. It is therefore ridiculous to claim that he does not exist because there is no empirical proof.

reply: I have a feeling this is about the only thing we are going to agree on.

2. the whole article was written from the perspective of an atheist, and thus most the arguments tended to come from the perspective of an atheist attempting to justify their position. This is a poor technique to adopt, as it attempts to win the debate not by arguing, but rather putting down your opponents. After reading your article someone who was undecided about the existence of God would probably be swayed against belief in his existence, not by the power of your arguments, but by patronizing believers.

reply: Read the [introduction](#) to the SD. My purposes are stated there. As to your evaluation of how a reader would respond: is that how you responded? I don't think so. What does that imply?

3. the claim that we are imperfectly designed is not valid for two reasons. Firstly relies on the claim that we know the purpose for which we were designed, a claim which can not be substantiated. Secondly it assumes that we know what all the parts of an individual organ are for (to use the example of the ear, a long time ago people might have questioned what was the purpose of some of its components for an organ that was required for hearing. We now know that the ear also is responsible for maintaining balance).

reply: God is inscrutable. We can't know why he does anything. Yet, we can be sure that he has a purpose for everything. How? If we can't know the mind of God, then how can we know that there is a purpose to everything? Logically, the inscrutability of God implies that we can't have a clue as to God's purposes or lack of purpose. All these messages and signs that humans think they are getting from God may be nothing but delusions. God may really have nothing to do with your team's victory. In fact, God may not give a hoot about sports. God may not have saved your child. God may not be rational, if we allow that God is inscrutable. However, if we can't assume that God should be at least as nice and as intelligent as a moderately moral human of average intelligence, then we might as well abandon the topic of God and purposes.

4. science will never be able to determine the origins of this universe. This universe must have begun at some stage, therefore firstly space had to be created, and secondly matter had to be created. This means that something had to come from nothing, which violates one of the most basic laws of physics. Whilst this does not prove the existence of God (who being metaphysical, can not be empirically proved), it does make one less sure in their atheism.

Duncan Gill

reply: Your concept of space is very naive, but let's cut to the chase. If God is something and nothing can come from nothing then who made God ... ad infinitum. It may be mind boggling to you to imagine a world without a beginning, but it should be no less difficult to imagine any other thing, God included, as existing without a beginning.

Mr. Gill replies:

The idea that something supernatural did not have a beginning is not nearly as mind boggling as this universe not having a beginning. Mainly because one must rely on a scientific standpoint which states that the laws of physics remain constant over time (and therefore something couldn't have come from nothing), or must say that the laws of physics can change overtime, a claim that presents rather large problems for science seeing as one of the main aims of science it to have retest reliability, and furthermore opens itself up to the problem of what causes the laws to change? Which then leads us back to something external from the universe.

reply: Your logic escapes me. But if there is a God, what caused God to be and what causes God to create, etc.? You say God is uncaused and created the universe. Yet, God is immutable. How can an immutable being, who by definition is everything that is, bring anything into being without bringing about change? If God is unchangeable, then creation is impossible. Obviously, if there is a God, God is mutable. Nature is mutable. Who needs God to explain anything?

Metaphysical entities are necessarily subject to "time" in the same way as entities in the physical world are. There is nothing to suggest that a metaphysical entity such as consciousness has a beginning - the only thing that can be claimed is that we remember being conscious up to a certain point in our past. Therefore it is not impossible that a metaphysical entity could have always existed.

reply: Is Mickey Mouse or Hamlet "subject to time", whatever that means? Every birth of every conscious creature proves (it doesn't just suggest) that consciousness has a beginning. Your concept of time is as naive as your concept of space.

What is a "metaphysical entity"? Do you mean non-physical being? If so, your point has already been granted: any kind of being *could* have always existed. Nature could have existed for eternity; God could have existed for eternity. We can't ignore the existence of Nature. We have no need to posit the existence of God.

11 May 1999

It has been awhile since I last emailed you, and I have finished my book, "And God made a mop, and it was good!"

I have put together a very strong (logical) argument for the mind of God, and the spiritual influence of God's mind on us through love and knowledge. Please consider the following:

1. Particle physicists allow for existence of virtual particles based solely on their effects as observed in particle accelerators. No different than the mind of God as seen through Alcoholic's Anonymous and its growth and proliferation into numerous spiritual treatments for obsessive behavior and continued mental health after the behavior is under control.

Reply: I beg to differ. The two cases are quite different. They share only the superficial similarity of being explanations. We have empirical methods of evaluating scientific explanations and eliminating the vast majority of them. We have nothing analogous with metaphysical claims. (Both types of explanations can be eliminated as unreasonable if they are logically flawed, i.e., self-contradictory or contradicted by experience.)

2. Quantum theory allows for matter to exist in multiple states, and the state depends on the method used to measure. The mind of God as measured by individuals will always reflect the state of the individual's mind. Therefore, God's effects are not individually and scientifically repeatable, but on a macroscopic scale generalizations can be made about the direction that God moves both individuals and society.

reply: Your analogy to quantum theory is inappropriate. That theory is proposed to account for what is actually observed under different conditions and for what seems to be implied by other (accepted) notions in physics. Believing that there is a God and that God has a mind are unnecessary hypotheses for the explanation of anything. The claim that any human idea of God is subjective is true but trivial. In this sense, every idea anyone has is subjective. Your conclusion seems to me to be a non sequitur.

Proof: changes in individual behavior after spiritual experiences that are out of the norm (assumes only physical human intervention is accepted as normal). Peace felt by parents after death of a child. Both parents independently received telepathic communication from dying child while in hospital telling them that she would be OK. Proof: commonality of religious beliefs. Proof: Commonality of society's desire to organize in govts. Proof: Social movements by spiritual leaders like Ghandi or Martin Luther King.

reply: Proof of what? That people believe they are in communication with spirits? We already knew that.

3. *Statistical results from [Ganzfeld](#) type experiments open the door for the brain to be a source of perception independent of the physical senses. Quantum teleportation proves that the vehicle for tremendous knowledge transfer exists in minute states over infinite distances. Thus, the mind of God can communicate directly with the individual human brain, and supply information that is not directly available to the individual through their own perception. Proof: the death of my mom over 400 miles away!*

reply: ? Are you saying you killed your mom by paranormal means?

4. *Tremendous amounts of moneys spent on Alternative Therapies only validate man's gut feeling that spirit-mind-body connection is real. Mind body connection is already accepted through relaxation and stress reduction techniques and their resultant influence on the immune system. Spirit mind connection is established above. So why doesn't it makes sense that the knowledge and love that God can provide would promote physical healing if a good relationship between man and God exists. My college experience is proof. My body was paralyzed as I carried on a telepathic conversation with God. No scientific theory exists to explain that other than the obvious. The voice was not of my own making, and I was not in a hypnopompic (whatever) state. I was totally conscious except that I could not move, and I had free will to choose to say whatever I felt. The brain has a tremendous capacity to create all sorts of chemical reactions in the body, so it only makes sense that if a force external of us can affect the brain then our health could be affected too. Fraudulent faith healings, crystal therapy, etc. clouds the spiritual argument with a lot of noise, but logic can see the spiritual influence in the human experience.*

Ray Wilcox

reply: It seems that from your own comments you recognize that all the phenomena you attribute to God could be due to nothing more than biochemistry.

15 Apr 1998

*This is in response to many of the entries I've read in your **Skeptic's Dictionary** regarding religion vs. atheism: I am glad being an atheist brings you comfort because that is one of the main purposes to beliefs, in my opinion. That is why I don't quibble, as many Christians do, between the branches of Christianity. If a person feels like they have a more comfortable relationship with God in a Catholic Church than a Protestant Church, a Baptist Church than in a Pentecostal Church, or a Methodist Church rather than a Lutheran Church, then who am I to tell them they are worshiping God the wrong way? How am I supposed to know which way God prefers? We will all find out the "truth" for ourselves when we die and I have faith that God is forgiving and merciful, just as the scripture promises.*

reply: I don't know what gave you the idea that I find *comfort* in being an atheist. I find neither comfort nor discomfort in atheism. You are apparently not alone in believing that one should choose his or her beliefs according to how much comfort they provide. I don't subscribe to this view. I have a feeling that many of your fellow Christians would chastise you for encouraging people to relate to Christianity in whatever way feels comfortable.

As I'm sure you can tell by now, I am not comforted by the idea that everything is an accident and there is no purpose to life. Please allow me to explain the method to my madness, or delusion if you prefer.

I don't understand how there can be morals when there is no God. I don't understand how a person can determine a "right" or a "wrong." You seem to believe these concepts exist since you have written that pornography that teaches men that women enjoy being raped and mutilated is a lie. Why does a lie offend you? Why does it even matter whether or not it is a lie? Why does it matter what women or anyone else in the world enjoys? What makes it matter?

reply: It is for people who believe as you do that we have laws. You apparently would not refrain from murdering children unless you believed God ordered you to refrain from such behavior. Even if God unequivocally peeked through the clouds and revised the ten commandments to allow murder and theft, our laws would still require you to refrain from such behavior. Or do you think that the only reason we have such laws is because God requires us to honor other people's lives and property?

You obviously are not a student of philosophy or you would know that the majority of ethical theories and arguments in Western philosophy are not based on a belief in God. In fact, most of them have been developed specifically to establish moral values on non-religious grounds. This is not the place to try to explain [Aristotle's ethics](#), or [Bentham](#) and [Mill's Utilitarianism](#), or [Kantian ethics](#), etc. I suppose I find it just as difficult to understand why you or anyone needs God to define morals for them. Would you really not be offended by rape if God said it was ok? Would murder not seem wrong to you if God did not forbid it? Could you live in a world where lying was as valued as telling the truth, even if God permitted lying?

You may think you are living according to God's word when you "love your neighbor as yourself" but it is you who has to put an interpretation on those words in a specific human context. It is you who decides how to act in a concrete situation. Such rules, even if they come from God, don't interpret themselves. You have to take full responsibility for how you act. If you want to believe that God inspires believers to interpret the rules "correctly" then you will have to explain why so many people who claim to be inspired by God contradict one another and often seek each other's

destruction. In the final analysis, all moral rules are interpreted and applied by humans, which makes them *human* rules, whatever their origin. Your view makes it sound like we are all children who have to be told right from wrong because we will never grow up and figure it out for ourselves.

Whether a person believes that God took up clay and breathed life into it or amino acids were mixed together in the primordial soup, either way all life on this planet is dirt. Living matter is made up of iron, carbon, calcium, water, all elements found in the earth. So if a person is an atheist, and believes that it is purely chance that life exists, then what does it matter what these elements feel? It was purely chance that these elements were imbued with feelings in the first place, who cares if they are hurt? A person is just going to die and go into the grave and become nothing but elements again anyway, why does it matter what they did or what was done to them when they were alive?

reply: Life may be dirt, but it is not *only* dirt, any more than Beethoven's *Ninth Symphony* is *only* sounds or the Grand Canyon is *only* rocks. The sperm and egg which gave rise to your existence came together purely by chance. Do you think that had your parents been atheists they would have thought less of your uniqueness? The sentiment you express--that since none of us gets out of here alive we might as well just kill ourselves--doesn't make sense to me. If this is all there is, then why not make the best of it? You might as well argue that since we all live forever, what difference does it make what we do while we are alive? If you believe this is all there is, it makes it all the more special and deserving of our interest.

What does life matter? It was an accident. It's not a gift. It's not a right. It just happened. So what makes murder wrong? A person is going to die anyway. What does it matter if it's today or 10 years from now? What does it matter if it hurts their family? Their family is just breathing dirt and they will die and not have feelings any more either.

reply: If the only reason you are not harming people is because you believe God forbids it, then I encourage you to continue in this "comforting" belief. Don't ever change. But consider that the family is no more *just* breathing dirt than a galaxy is *just* atoms. Life may not be a right, but neither is the taking of life. It may not matter to you whether I die today or ten years from now, but it matters to me. Just because something does not matter to you, does not give you the right to destroy it.

It has been my observance that many people, perhaps even most, will try to get away with anything they can if they believe they won't get caught. So if there is no God keeping an eternal tote board, if we are just elements that accidentally started breathing and thinking, then what does it matter what we do? It doesn't matter if a baboon steals another baboon's food, it doesn't matter if a guppy eats its own babies, why should it matter if a human being does the same things? What makes it wrong if there's no God to tell us it's wrong and punish

us?

reply: You must hang around with a rough crowd. My experience has not been that most people do whatever evil they can get away with. I would be the last to say that most members of the human species are saints. Most are neither great sinners nor saints. It might give you comfort to believe that all the cruel and evil persons on the planet are atheists and all the good ones are theists, but your belief is false. By the way, where does God say "Thou shalt not eat thy children"?

We're supposed to be better than animals because we have a conscience. The guppy doesn't care if she swallows all her offspring. The baboon doesn't care if his neighbor starves. We're supposed to be above that. Why? Why does our conscience matter if there is no soul attached to it that will be made to pay for its wrongs? Why should anyone feel guilt?

reply: It is true that we don't usually think other animals have moral obligations because they don't have the ability to understand right from wrong or the power to control their behavior. But there is no need to posit a soul in order to understand either conscience or guilt. These are socially and biologically induced. Sociopaths and psychopaths, who behave as your baboon or guppy, are not to be explained by their lack of souls or lack of belief in God (some of them even think they are divine themselves). The answer is more likely social and biochemical than theological.

You can argue that an atheist doesn't commit "wrongs" because he doesn't want someone to do the same things to him ("Do unto others as you would have them do unto you," in other words), but why does an atheist care what happens to him? Why is self-preservation important? It was an accident that he is alive, that he has feelings, and he's going to go into the grave where he won't have feelings or memories of what caused them anymore. How egotistical to care about yourself when you are just dirt.

reply: I can't speak for other atheists, but I know why I don't want others to harm me: it hurts and I don't like being hurt. Do you only refrain from killing yourself because you believe God says suicide is a no-no? Such a belief hardly seems comforting.

That's my opinion, anyway. If life is an accident, then we are just like rats and cockroaches. Rats and cockroaches don't care for each other, just as we don't care for them. We have a conscience, but it must be an accident too if there was no God to lay down the guidelines for "right" and "wrong." If we have no soul or God keeping track of us, then humans aren't any more important than rats and cockroaches. Why should we care for each other then? Rats and cockroaches will probably outlast human beings, why not emulate them?

reply: In a very real sense, humans *aren't* more important than rats and

cockroaches. Every living thing is an equal, evolutionally speaking: we've all proved we are fit to survive. We are like rats and cockroaches in the way you mention: we're all the result of accidental and purposeless processes. But, unlike rats and cockroaches, we can choose to make our lives meaningful or not. Life is meaningless, but lives are not. How meaningful your life is depends on you and the choices you make. Why would you think that your life could only be meaningful if you were created to play a role in a Divine Comedy?

I read on your web page that Christians are egotists. It seems to me that atheists are egotists as well. Atheists don't have a "higher power" or anyone to answer to but themselves. They are the centers of their own universes. Please tell me if you honestly think I am wrong. Please explain to me the basis for the atheist moral code. Please explain to me how anything can be important if everything is just an accident. Please tell me how you can stand the idea of an existence that will culminate in nothingness. I don't think I could get out of bed in the morning knowing that, upon my death, I will live only in the memories of people who knew me, and when they die I will cease to exist altogether. Then why even bother living? In the vain hope that I accomplish something great that will immortalize me in the history books? How egotistical. Please tell me, what is your motivation to live if you are going to be dust?

reply: I think you may be referring to my claim that concern for one's own eternal salvation as the ultimate goal in life is the ultimate in selfishness. The goal of existence is to achieve eternal bliss for oneself. On the other hand, I don't see how it follows that because atheists do not recognize a higher power we must believe that we are each the center of our own universes. I take you to think that this means that we only care about ourselves. Nothing could be further from the truth. Atheists have families, jobs, communities, interests, etc.

You ask about my own personal motivations for not killing myself. I'll die soon enough. I have a lovely family. I have a job I find very satisfying. I enjoy writing pieces like this one. I enjoy the company of a good book or a good friend. I have many interests and find many things very interesting and enjoyable. Do I ever stop and ask myself, *why don't you kill yourself right now, since you're going to die anyway?* No, I can't say that such questions plague me.

I doubt you will persuade me to adopt your beliefs any more than I will persuade you to adopt mine.
(name withheld by request)

reply: Well, we agree on one thing at least.

1 May 1998

I have read your point of view on Atheism and God. You defend your points well. However, your "imperfect universe" argument doesn't seem to hold water. Like Nitzan Herzog said, God would know what the best design of systems is. Your counterargument was that you "don't try to disprove the existence of God by pointing out inefficiencies and imperfections of design." This seems to a weak response, sort of a cop-out. You respond that we are "abandoning reason" by saying that God uses different standards. Why is that abandoning reason? I imagine my standards on good music and beautiful women are different than yours. Why does this argument bother you? At the very least you should give some reasons why the "imperfect universe" argument is still a convincing argument for atheism. And if it's not ... I recommend you remove that portion from the page.

reply: I grant that a perfect Being would know what is the best design of a universe. If God is perfect, then anything emanating from God must be perfect. Maybe God is not perfect. Or maybe God does not exist.

On a different note, what is your view on Jesus Christ? You probably agree that he was a man who preached, etc. in the first century, so I'll take that for granted, although I suppose you could believe he never existed.

reply: My view does not differ substantially from [Bertrand Russell's](#) ("Why I Am Not a Christian").

According to your arguments, all of his miracles must have been delusions by all who viewed them. He claimed to be God - since you don't believe in God, you must believe he's a liar. So do you think Christ was a creator of mass delusion? A master of deception?

Donald Lowe

reply: If he claimed to be God, as you claim he claimed, he could have been deluded or he could have been a liar. But I don't think he claimed to be God. He did claim that the end of the world was at hand, and he was wrong. If anyone was a creator of a mass delusion, it was [Paul of Tarsus](#). As for my view on miracles, see my entry on [miracles](#).

Ramtha (a.k.a. J.Z. Knight)

Ramtha - Cromagnon Warrior
from Atlantis
disguised as J.Z. Knight

Ramtha is a 35,000 year-old spirit-warrior who appeared in J.Z. Knight's kitchen in Tacoma, Washington in 1977. Knight claims that she is Ramtha's [channel](#). She also owns the copyright to Ramtha and conducts sessions in which she pretends to go into a trance and speaks Hollywood's version of medieval or Elizabethan English in a guttural, husky voice. She has thousands of followers and has made millions of dollars performing as Ramtha at seminars (\$1,000 a crack) and at her Ramtha School of Enlightenment, and from the sales of tapes, books, and accessories (Clark and Gallo 1993). She must have hypnotic powers. Searching for self-fulfillment, otherwise normal people obey her command to spend hours blindfolded in a cold, muddy, doorless maze. In the dark, they seek what Ramtha calls the 'void at the center.'

Knight says she used to be "spiritually restless," but not any more. Ramtha from [Atlantis](#) via Lemuria has enlightened her. He first appeared to her, she says, while she was in business school having extraordinary experiences with [UFOs](#). She must have a great rapport with her spirit companion, since he shows up whenever she needs him to put on a performance. It is not clear why Ramtha would choose Knight, but it is very clear why Knight would choose Ramtha: fame and fortune, or simple delusion.

Knight claims to believe that she's lived many lives. If so, one wonders what she needs Ramtha for: she's been there, done that, herself, in past lives. She ought to be able to speak for herself after so many reincarnations.

Knight claims that spirit or consciousness can "design thoughts" which can be "absorbed" by the brain and constructed "holographically". These thoughts can affect your life. If this means what I think it means, then Knight has taken the notion of proving the obvious to new heights: she has discovered that one's thoughts can affect one's life.

Knight not only has rewritten the book on neurology, she has also rewritten the book on archaeology and history. The world was not at all like the scholars of the world say it was 35,000 years ago. We were not primitive hunters and gatherers who liked to paint in caves. No, there were very advanced civilizations around then. It doesn't matter that there is no evidence for this, because Knight has rewritten the book of evidence as well. Evidence is what appears to you, even in visions and hallucinations and delusions. Evidence is anything you feel like making up. So, when you are told that

Ramtha came first from Lemuria in the Pacific Ocean, do not seek out scholars to help you understand that ancient civilization because the scholars of the world do not believe Lemuria existed except as a fantasy. When you are told that the Lemurians were a great civilization from the time of the dinosaurs, do not expect to be burdened with evidence. There isn't any evidence. The only mammals around at the time of the dinosaurs were primitive and non-hominid, very much like lemurs. Maybe the Lemurians were really lemurs. No, the Lemurians came from "beyond the North star," according to Knight, which may explain why all humans ever since have looked to the sky with longing.

But as cool as Lemuria was, it could not compare with its counterpart in the Atlantic Ocean. Knight's story of Ramtha in Atlantis is too bizarre to retell. Let's just say that Ramtha was a warrior who appeared to [Edgar Cayce](#) and leave it at that. Her story is appealing to those who are not comfortable in today's world. The past *must* have been better. It must have been *safer* then, and people must have been *nobler*. This message is especially appealing to people who feel like misfits.

Ramtha, like Christ, ascended into heaven, after his many conquests, including the conquest of himself. He said he'd be back and he kept his promise by coming to Knight in 1977 while she was in her [pyramidiot](#) phase. She put a toy pyramid on her head and lo and behold if that wasn't a signal for Ramtha to return to the land of the living dead:

And he looked at me and he said: "Beloved woman, I am Ramtha the Enlightened One, and I have come to help you over the ditch" And, well, what would you do? I didn't understand because I am a simple person so I looked to see if the floor was still underneath the chair. And he said: "It is called the ditch of limitation", and he said: "And I am here, and we are going to do a grand work together."*

Apparently, the first rule of the wise is: *beware the ditch of limitation*. Knight's husband-to-be must have fallen into the ditch. He was there at the time Ramtha first invaded his girlfriend's body, but he was so busy lining up pyramids with a compass that he didn't see Ramtha. He did feel The Enlightened One's magnetic charm, however; for, according to Knight (and who wouldn't believe her?), the compass needle was spinning around madly and they saw "ionization" in the kitchen air.

Ramtha then became Knight's personal tutor for two years, teaching her everything from theology to quantum mechanics. He taught her how to have [out-of-body experiences](#). The experience was so extraordinary she had to dig very deep for a metaphor to try to convey the bliss she felt: *"I felt like....like a fish in the ocean."*

Her big break came when her son, Brandy, developed "an allergic reaction to life." He had to have a few shots but he was allergic to the allergy shots. Fortunately, "the Ram" (as Knight calls her spirit invader) came to the rescue and taught her [therapeutic touch](#). She healed Brandy with [prayer](#) and her touch "in less than a minute," greatly reducing her medical bills. She had performed a [miracle](#) and now nothing would stop her from entering the public arena.

Ramtha the feminist

Perhaps the reason J.Z. Knight is so successful in getting followers and students is that Ramtha is a feminist. (Although, the fact that Knight is quite attractive herself might have something to do with her success.) He recognized that if he appeared in his own masculine body, he would perpetuate the myth that God is male and further contribute to the eternal abuse of women.

That's what he said. So women have been abused by men, and herded by men through religion to perform according to those religious doctrines, and in fact, women were despised by Jehovah. So, he said: "It is important that when the teachings come through, they come through the body of a woman."*

This feminization of God must be pleasing to people who are tired of masculine divinities. According to Knight, Ramtha will help people master their humanity and "open our minds to new frontiers of potential."

Refuge](#)

In Mass Media Funk, you will find articles about news stories, magazine articles or TV programs of interest to skeptics, which do not pander to the public's appetite for the occult and supernatural.

Note: because many of the sites linked to here are newspapers or magazines, it is impossible to maintain the links.

Mass Media Funk

22

July 26, 2001. Every time I see a TV ad for the ubiquitous [Miss Cleo](#), the phony [Tarot psychic](#) with the [phony Jamaican accent](#), I wonder why she isn't in prison. [Fraud](#) is illegal, as far I know. False and misleading advertising are illegal, I think. If a fellow goes to prison for falsely claiming he made millions in real estate using his special program and for running TV ads with testimonials from "actors" claiming they too made millions by following the first liar's advice, then [why is Miss Cleo free?](#) It is not even worthwhile to [expose her](#); she should be prosecuted. The phony testimonials from people who have just been told their lovers are unfaithful may be amusing but they're lies intended to get the viewer to call her psychic hotline and spend \$4.99 a minute for "advice." These lines are open 24 hours a day and handled by a coven of [hirelings](#) who are probably making minimum wage. Just because her ads note that her services are "for entertainment purposes only" shouldn't absolve her from charges of fraud. If a gangster put a gun to your ribs and demanded your cash while holding up a sign that says "for entertainment purposes only," you'd still call it armed robbery.

Cleo also uses the [Internet](#) to perpetrate her psychic scam: she sends strangers e-mail claiming she's had a dream about them and that they need to contact her immediately. Or is it Access Resources Services Inc.'s scam? That's the name of the company which promotes Miss Cleo. Access Resources Services, Inc. was located in Delaware last year when they were [sued by the attorney general of Oklahoma](#). The company has also had enough complaints made against them in the state of Michigan to warrant being listed in the dropdown menu of companies listed on the complaints page of the [Michigan Public Services Commission](#). (Eleven complaints have been filed since January 1997.)

Today, Miss Cleo and Access Resources Services Inc. (now based in Florida) were [sued in Missouri](#) by Attorney General Jay Nixon who said: "It doesn't take a crystal ball to realize that ripping off consumers isn't without consequences." Unfortunately, neither one is being charged with the kind of fraud that involves lying about knowing the future from Tarot cards. No, they're being charged with [violating a "no call" law](#) which prohibits a telemarketing company from calling people who have requested to be put on a "no call" list. The state of Missouri claims [Miss Cleo violated this law 94 times](#) and could be fined nearly half a million dollars. They were also sued for customer fraud because customers "were billed for free services" and "the company misrepresented reduced rates and waiver fees." There were other billing irregularities, such as deceased people being billed for calls to Miss Cleo and minors calling in without parental consent. This is not exactly what I have in mind when I envision the police knocking on Miss Cleo's door. Did the customer really get her full three free minutes as promised? Who cares? What has happened to law

enforcement in this country? Are they so afraid of Access Resources Services Inc.'s lawyers that they won't arrest these people for fraud? Or are they afraid that if they go after the psychics they'll be pressured to go after the TV evangelists who extort money from their flocks by phony stories of miracle cures and blessings? Or is the law just [too bloody complicated](#)?

The way I look at it, every day that passes and Miss Cleo is free to advertise her Tarot psychic claims, using her phony testimonials and cheap tricks, the more reasonable it will be for people to think that maybe she's legitimate. After all, if she and her cohorts were really lying about all the stuff they say, wouldn't the police arrest them?

Apparently not.

July 12, 2001. Law enforcement practices are featured almost daily in the mass media, so much so that we often forget how irrational some of these practices are. Lately, congressman Gary Condit's conduct with women has been much in the news. Condit, a co-sponsor of legislation that would encourage posting the Ten Commandments in public buildings, has been accused by a woman and the [father of another woman](#) of trying to intimidate the women into not revealing his affairs with them. A third woman the married Condit had an affair with went missing shortly after their affair ended. What do the police want to do? *Give him a "lie detector" test!* Does the media choke at this request and show the least hint of skepticism about the [polygraph's](#) reliability at detecting lies? No, instead they insinuate that if Condit doesn't submit to a "lie detector" test then he must be guilty of something.

The President of the United States and most members of Congress believe that we can ferret out spies and potential traitors with the polygraph. Does the media cry out that belief in this pseudoscientific device is unjustified? Does it even remind us that *only by lying* can the continued use of this contraption be defended? One exception can be found in the [Skeptical Inquirer](#) (July/August 2001) in an article by Alan P. Zelicoff, a senior scientist in the Center for National Security and Arms Control at [Sandia National Laboratories](#). "Many innocent people have had their lives and careers ruined by thoughtless interrogation initiated during polygraphy," says Zelicoff. And what about all the tax dollars and work hours wasted on these machines and [other questionable devices](#)? Does the government care? Does the mass media care?

Another practice of law enforcement was in the news today as well. This one involves a search for two missing children in the Chicago area. Some minister claimed he had a [psychic](#) vision of their bodies at the bottom of a lagoon, so the police brought in divers and searched the lagoon. They didn't find the little girls. When the police use psychics, do the media howl about how absurd this is? No. They are more likely to rouse up some old story about [Sylvia Browne](#) who seems to have fabricated some whoppers about her crime-solving psychic powers. (One exception is [Brill's Content](#).) Or they make some reference to [Jeane Dixon](#) and her alleged clairvoyance regarding Kennedy's assassination.

The ease with which law enforcement can prove to a jury that just about anybody is guilty of just about anything, especially if the mass media goes along for the ride and the issue feeds on the community's fears, was brought home by [the news](#) that Gerald Amirault could be freed after spending 15 years in prison for child abuse. Amirault worked at the [Fell's Acres daycare center](#) in Massachusetts when the witch hunts for [Satanists who were abusing and murdering children](#) was at its height. Last week, the Massachusetts's state Parole Board unanimously found that the evidence presented (and not presented) at his trial left "real and substantial doubt" as to his guilt. He would not be the first person [falsely charged and imprisoned](#) during the frenzied search for people who were bringing in zebras and giraffes to have sex with children who had had sharp knives inserted into their private orifices after taking airplane rides to the desert to eat other children before returning to the underground tunnels where they were forced to eat feces and drink urine. Did the media wonder about the validity of ["repressed memory therapy,"](#) a hodgepodge of [pseudoscientific](#) techniques allegedly able to root out the truth hidden in children's [subconscious](#) minds? Did they challenge the accuracy of these memories or the methods used to evoke them? Did they wonder what harm might be done to a child, or adult for that matter, if horrible "memories" were implanted by so-called therapists? Did they care whether innocent people would be sent to prison? For the most part, it doesn't seem so.

This same point about convicting innocent people is brought home frequently these days as more and more men are freed from prison when DNA evidence is used to prove they couldn't have committed the crimes they were accused of.

Finally, there is the matter of [police brutality](#) and use of excessive force. I have no idea how much of this goes on, but all it takes is a couple of cases like that of [Amadou Diallo and Abner Louima](#) to set back police/community relations by a century or two. [Diallo](#) is the West African immigrant who, though unarmed, was shot 41 times by the police. [Louima](#) is the Haitian immigrant sodomized by a cop with a broken broomstick in a police station bathroom. [Louima](#) recently settled his lawsuit for \$8.7 million. Here the media does make sure its voice is heard, but how much courage does it take to say it's irrational and immoral to use torture and shoot anything that moves and is black?

July 11, 2001. The current issue of [JAMA](#) (vol 286 no 2) has an article warning patients about to have surgery of the dangers of taking herbs before surgery. I find this interesting since many people take herbs as an alternative to surgery. They think herbs like ginkgo biloba and ginseng can prevent diseases which might require surgery otherwise. The main danger is that the herbs might lead to excessive

bleeding. The authors are not campaigning to eliminate herbs from the diets of millions of Americans, which would be fruitless since the numbers who believe in the magical nutritional and healing power of their herbs is growing exponentially, it seems. Rather, the authors are encouraging patients to inform their doctors of any herbs they might be taking. Many patients are not telling their doctors about their herbal intake, either because they don't realize that herbs contain chemicals that might react with anesthesia or other drugs given before or after surgery or because they don't want their doctor to know that they are hedging their bets with [alternative medicine](#). For purposes of the law, herbs are called "dietary supplements" and are not subject to the same kind of scientific scrutiny as prescription or non-prescription drugs. So, perhaps herb users think of their herbs as "alternative vitamins and minerals."

The concern is not new and was reported on over a year ago by [CNN](#), [ABC](#), and [HealthCentral](#). I reported on this concern last [October](#). [WebMD](#) took up the issue last September. A report on the *JAMA* study can be found at the [CNN](#) site.

The mystical belief in the power of herbs has carried over from consenting adults who should be allowed to ingest whatever useless remedy they wish, to marketing herbs for our [children](#) and our [dogs](#) and [cats](#). Andrea Candee, MH, i.e., "master herbalist", claims to know what herbs are "child-friendly." You can find out what they are if you buy [her book](#). I can understand an Aborigine, with 40,000 years of tradition behind him or her, claiming to be a master herbalist. But I wonder where Candee got her title. The fact is that herbs have pharmacological properties, have been used in [traditional drugs](#) for years, and are being used by millions of self-medicators today. Those who produce and market herbs should do less to make people think their products are safe just because they are [natural](#), and do more to inform people that herbs are drugs. When one's doctor asks what drugs you or your children or pets are taking, one should list not just prescription drugs but herbs as well. Your life or the life of those you love may depend on it.

June 27, 2001. John Derbyshire, a columnist for the [National Review](#), has posted his July 9, 2001, column entitled "Stars Above!" in which he laments the rise of [astrology](#) and ponders what it all means. He begins by noting that [Kepler College](#) is in its second year. We lamented the founding of this college, devoted exclusively to astrology, in this column a couple of years ago. Derbyshire then notes that Mme. Elizabeth Teissier, astrologer to the late French socialist president François Mitterrand, has been granted a Ph.D. from the Sorbonne sociology department for a 900-page thesis on astrology. And India plans to create astrology departments in 24 public universities next year.

Derbyshire does not mince words in his wholesale condemnation of astrology.

It hardly needs saying, I hope, to a readership as intelligent as NR's that astrology is twaddle. An astrologer can tell you nothing useful, though one with a good bedside manner can, of course, cheer you up a bit. The perfect emptiness of astrology has been demonstrated countless times. The Dutch investigator Rob Nanninga, for example, took seven subjects, extracted from them

all the information necessary for an astrologer to make up a full horoscope, and gave that information to 50 astrologers. He then administered to the same seven subjects a set of questions, supplied by the astrologers themselves, about their personality and life experiences. The completed questionnaires were passed to the astrologers, who were then asked to match horoscope to questionnaire. Their failure to do so was total: results were exactly what one would expect from a random pairing of horoscopes with questionnaires. If you don't like that experiment, any number of others have been done, with different methods but identical results — Skeptical Inquirer magazine can supply a full list. Astrology is pure flapdoodle.

Ah, if only intelligence were the key here! I'd love to see what kind of reader response Derbyshire gets.

Derbyshire even goes after [Valerie Vaughan](#), a professional astrologer we ripped into a couple of years ago. She wants astrology in the public schools as part of the multi-cultural curriculum. Derbyshire thinks that the rise of astrology is a symptom of our loss of reverence for reason. Liberals think the election of George W. Bush is a similar symptom. I disagree. Valerie Vaughan is probably as intelligent as Derbyshire or Dubbya and she uses her reason in a way that indicates she has as much respect for reason as either of them does. What she lacks is [skepticism](#) and an understanding of the workings of [science](#), [controlled experiments](#), [confirmation bias](#), [communal reinforcement](#), [the pragmatic fallacy](#) and [self-deception](#). In short, she is ignorant. Such ignorance will not be replaced by knowledge as long as politicians and academics grant degree-giving power and degrees to astrologers.

Somebody should have slapped her up the side of the head and told her to shut up when she first spouted one of her astrological confirmations. Instead of encouraging the girl to delve deeper into the mystical drivel of astrology by either agreeing with her or telling her she might just be right, her friends and family should have stopped her in her tracks and set her straight. On the other hand, her family and friends, and I daresay Mr. Derbyshire himself, probably believe equally ridiculous gibberish about angels and devils, Incarnations and Trinities, and who knows what else. One person's flapdoodle is another's Truth. Our President says he can look into a man's eyes and see his soul. As long as there are enough people who don't whack you silly for saying such stupid things, you are probably going to believe you make sense and continue to be enamored of your own twaddle and flapdoodle.

Just think of how different the world would be if G.W.'s parents had hit him with a cane when he told them that he could see their dog's soul by looking into her eyes. Instead, they probably humored him, thinking that if they didn't he might grow up weird or troubled. Or, perhaps they wondered along with their prodigy if it might not be auntie Hildy in there.

June 27, 2001. "The Thirty Years' War" is the title of an article by [Jerome Groopman](#) in the June 4, 2001, issue of "The New Yorker (52-63)." The article is essentially about the failures of the war against cancer declared by President Richard M. Nixon at the behest (mainly) of Mary Lasker. Despite the frequent headlines over

the years claiming that the cure is here, about all we know for sure today is that the best way to beat cancer is to prevent it from occurring in the first place. Well, we also know that DNA replication has a high error rate and that mutations in genes are probably the main reason cells start dividing rapidly and destructively. (Maybe the [Intelligent Design](#) proponents will explain that little quirk in divine engineering. If a human engineer created something with as high an error rate as DNA replication, we'd fire him.) In 1972, the cancer mortality rate in the U.S. was 163 per 100,000 population. In 1992, it was 172 per 100,000.* Today, it is about 190 per 100,000.

This year alone, more than a million new diagnoses of major cancers will be made and about five hundred and fifty thousand Americans will die of cancer, an average of fifteen hundred a day. [One of every four deaths is due to cancer.]

Why has the war on cancer failed as miserably as the war on drugs? Groopman's view is that we've failed precisely because we declared war. Nixon and his conservative allies were able to see that throwing money at social problems like poverty were doomed to fail. Why couldn't they see that throwing money at medical research was also doomed to fail? If you open the public coffers at point X in time to "solve this problem" you invite leadership from those who are currently using methods and working from theories that are wrong or failures. Researchers spent years looking for the cancer virus and trying cures on patients that were little more than unscientific tortures. Groopman's view is that we'd probably be a lot farther ahead in cancer research had the process not been politicized and centralized. Scientific research might need cooperation but advances in medical research are more likely to be made according to what Groopman thinks might be called "the law of unintended consequences." Even the search for a cancer cure has led to unintended consequences that have been beneficial for other areas of medical health.

By the nineteen-eighties, a huge superstructure had resulted from the government's war on cancer. Some eight billion dollars had been spent. About thirty government-funded comprehensive cancer centers and major regional cooperative treatment groups linked virtually all university hospitals and community-based specialists.

This wasteful approach to research could not have happened without the support of both our elected officials in Washington and the medical establishment. The former are to be forgiven because they are generally ignorant of matters on which they legislate. They like to look good to the voters at home as staunch fighters in the war on crime, indecency, drugs, cancer, whatever. But the medical establishment should have fought against a bureaucracy for basic research. Too much money, big egos,

desire for fame and fortune, the usual list of suspects, can be listed to explain why it did not make it clear to the nation that progress was much more likely to occur if independent basic research was supported and success rewarded. Instead, we have encouraged hype and hoopla.

If you had demanded that the N.I.H. solve the problem of polio not through independent, investigator-driven discovery research but by means of a centrally directed program, the odds are very strong that you would get the very best iron lungs in the world--portable iron lungs, transistorized iron lungs--but you wouldn't get the vaccine that eradicated polio. --[Samuel Broder](#)

Things are changing, however. The current director of the National Cancer Institute, Dr. Richard Klausner, believes it is time to call off the war on cancer, quit claiming that a new miracle cure has just been discovered, and get off that phony pony that claims cancer is a single disease. He thinks of cancer "as an intricate puzzle--one that we currently lack both the knowledge and the tools to solve." He also believes that clues to solving the puzzle could come from any field. "The only people who now are saying we know enough," says Klausner, "are people who don't know enough."

June 23, 2001. The Learning Channel aired "Atlantis Uncovered" last night and it was excellent. [The BBC program](#) debunks the [Atlantis myth](#) (as well as [von Daniken's myth](#)) in what should satisfy most rational people as definitive. The program exposed the selective use of evidence by supporters of theories that ancient Atlanteans or aliens taught primitive peoples how to build monumental structures such as pyramids or how to plant crops and other basic features of civilization. To give plausibility to theories that are universally rejected in academia one must ignore any refuting evidence. For example, anything that would indicate slow and incremental development, rather than sudden and unprecedented work, is ignored. Hundreds of years of experimentation with building large pyramidal structures are ignored by "alternative archaeology." The failures of the Egyptians in their early attempts at pyramid building indicates that they arrived at the Giza level of construction through trial and error. The thousands of underground tombs with many chambers antedates the patterns used in the pyramids. Ignore their history, and you can make a case that the people who build Giza needed help from Atlantis or outer space. Then, of course, there is the problem that the pyramids in Mexico are all step pyramids and had a totally different purpose from those in Egypt. Furthermore, intimate knowledge of Egyptian hieroglyphics will not help you read the pictoglyphs on a Mayan temple. Why would the aliens not teach the Egyptians and the Meso-Americans the same form of writing or give them the same plans and purpose for their buildings?

The evidence is overwhelming that things like agriculture, writing, architecture, etc., developed independently in several parts of the world. The evidence is underwhelming that a single source, either earthly or extraterrestrial, led to the various ancient civilizations.

However, after an hour of debunking myths and providing empirical evidence for the view that ancient peoples created their own civilizations, The Learning Channel aired a program called "Atlantis in the Andes." A review of this program may be found in [Mass Media Bunk](#).

Atlantis

28 Feb 1997

Here is the real story of Atlantis.

It is the name of a lost continent, taken from one of Plato's myths. Inhabitants of Atlantis - called Atlanteans - created an extraordinary advanced civilization. Unfortunately, they were not able to transmit their knowledge to us. Maybe, they did not know how, or it maybe they were forbidden by cosmic civilizations which were in contact with them.

Atlantis disappeared either as a consequence of nuclear war or due to a collision with the Moon, which fortunately sprang back away from the Earth. A part of the survivors settled the city of Atlanta, which carries the name up to modern times. Skeptical geologists are not enthusiasts for the Atlantis idea, and they even stupidly argue for the fact that the whole oceanic bottom is covered by old sediments, and that nothing so large has sunk into the sea over the last several thousand years.

Personally I suggest that the surviving Atlanteans, as soon as they made sure of the irreversible sinking of their continent, spread old sediments anywhere they considered it was suitable.

Atlantis is also connected with the dawning of alchemy and the Hermetic sciences; esotericism has its roots there, as well.

**Vojtech Mornstein Associate Professor of Biophysics Medical Faculty,
Masaryk University Jostova 10, 662 43 Brno, Czech Republic**

reply: Professor Mornstein tells me has a book coming out on this and other subjects. He claims it is satire, but I'm not sure!

28 Aug 1997

I am fifty, and have been studying Atlantis and related historical violations of the doctrine of uniform cultural evolution, on and off, for most of my life now. Just a few thoughts on Atlantis in particular:

Donnelly's contribution to the discussion is that he is one of the few authors on the subject to have actually published a decent translation of what Plato

actually said, something that few modern writers have bothered to read.

First of all, since there are no other references to "Atlantis," per se, in what survives of classical Greek literature, it must be assumed that the word is a back formation from "Atlantes," the inhabitants of the Atlas mountain range in northwestern Africa. Robert Graves figured this much out.

The reference to "beyond the pillars of Herakles" is the ancient Greek way of describing what one found upon sailing past Gibraltar while hugging the coast of North Africa. I remind you that the Greek definition of "island" paralleled that of their "continent." To the Greeks, Europe was a continent. West Africa was an island, especially since it was cut off from the rest of what we now call "Africa" by a river that ran south from the Atlas mountains and then west to what is now the Western Sahara. This now dry river was explored by Byron Khun de Prorok in the 1920's.

The extensive water works described by Plato were, of course, controlled by a dam upriver from the plain. Whatever tectonic event led to the destruction, it caused the collapse of the dam and Plato's description of a "sea of mud."

reply: You don't think you are speculating a bit here?

Plato's chronology is a bit screwy. What we seem to be looking at is that two thousand year, or so, period from about 5000 to 3000 BC that preceded the rise of the great old world civilizations, when global temperatures were warmer than they are now, and northern Africa was rainy and fertile.

reply: His "chronology" is 'screwy' only if you assume he is trying to provide such.

As for whether there was any kind of "high technology" in this pre-classical civilization, I am not at present willing to speculate, except to suggest that if we lay this two thousand year period upon our own, current civilization, we are left with the following:

Starting from about 500 BC, the founding of the school of Pythagoras in southern Italy, and ignoring the period of the Dark Ages, a period of about 800 years, we are left with a technological level equivalent to that of our own civilization 300 hundred years from now.

reply: You must be using some New Math here. I don't follow your argument.

Even you must admit: That there is no archaeological evidence for the existence of this civilization is not surprising. It is buried under the Sahara Desert. And, since no one recognizes its existence, it will never be found, save by accident.

**reply: Ah! Now I see. I can't see because it is all buried and can't be found.
Thanks for the revelation.**

Which is not to say that there is anything wrong with maintaining a skeptical attitude. Except that sometimes you tend to miss the whole point.

Steve Franklin

reply: I fear this must be one of those times. Maybe someday I can dig my way to the truth of the matter.

chakras

According to [Tantric philosophy](#) and Yoga, chakras are points of [energy](#) in the [astral body](#). There are [seven primary chakras](#), which are associated with various parts of the body, emotions, desires, thoughts, powers, and health.* New Age gurus think chakras have [colors](#) and give rise to [auras](#), which reveal one's spiritual and physical health, as well as one's [karma](#). The alleged energy of the chakras is not scientifically measurable, however, and is at best a metaphysical chimera and at worst an anatomical falsehood.

Kirlian "photography"

In 1939, Semyon Kirlian discovered by accident that if an object on a photographic plate is subjected to a high-voltage electric field, an image is created on the plate. The image looks like a colored halo or coronal discharge. This image is said to be a physical manifestation of the spiritual aura or "life force" which allegedly surrounds each living thing.

Allegedly, this special method of "photographing" objects is a gateway to the paranormal world of [auras](#).

Actually, what is recorded is due to quite natural phenomena such as pressure, electrical grounding, humidity and temperature. Changes in moisture (which may reflect changes in emotions), barometric pressure, and voltage, among other things, will produce different 'auras'.

Living things...are moist. When the electricity enters the living object, it produces an area of gas ionization around the photographed object, assuming moisture is present on the object. This moisture is transferred from the subject to the emulsion surface of the photographic film and causes an alternation of the electric charge pattern on the film. If a photograph is taken in a vacuum, where no ionized gas is present, no Kirlian image appears. If the Kirlian image were due to some paranormal fundamental living energy field, it should not disappear in a simple vacuum (Hines).

There have even been claims of Kirlian photography being able to capture "phantom limbs," e.g., when a leaf is placed on the plate and then torn in half and "photographed," the whole leaf shows up in the picture. This is not due to paranormal forces, however, but to fraud or to residues left from the initial impression of the whole leaf.

[Parapsychologist](#) Thelma Moss popularized Kirlian photography as a diagnostic medical tool with her books *The Body Electric* (1979) and *The Probability of the Impossible* (1983). She was convinced that the Kirlian process was an open door to the "bioenergy" of the [astral body](#). Moss came to UCLA in mid-life and earned a

doctorate in psychology. She experimented with and praised the effects of LSD and was in and out of therapy for a variety of psychological problems, but managed to overcome her personal travails and become a professor at UCLA's Neuropsychiatric Institute. Her studies focused on paranormal

topics, such as [auras](#), [levitation](#) and [ghosts](#). One of her favorite subjects at UCLA was [Uri Geller](#), whom she "photographed" several times. She even made several trips to the Soviet Union to consult with her paranormal colleagues. Moss died in 1997 at the age of 78.

Moss paved the way for other parapsychologists to speculate that Kirlian "photography" was parapsychology's Rosetta stone. They would now be able to understand such things as [acupuncture](#), [chi](#), [orgone energy](#), [telepathy](#), etc., as well as diagnose and cure whatever ails us. For example, [Bio-Electrography](#) claims to be

...a method of investigation for biological objects, based on the interpretation of the corona-discharge image obtained during exposure to a high-frequency, high-voltage electromagnetic field which is recorded either on photopaper or by modern video recording equipment. Its main use is as a fast, inexpensive and relatively non-invasive means for the diagnostic evaluation of physiological and psychological states.

The reliability of diagnosing illnesses by photographing auras is not very high, however. Bio-Electrography should not be confused with [Esogetic Colorpuncture](#), [Peter Mandel's](#) therapy, which unites [acupuncture](#) and Kirlian photography "to detect energy imbalances."

None of these Kirlian methods of diagnosis should be confused with other types of medical photography, e.g., [roentgen-ray computed tomography](#), [magnetic resonance imaging](#), [single photon/positron emission computed tomography](#) and other useful types of medical imaging, none of which have anything to do with [auras](#).

[Big Bucks for Psychics - Will Any Medium Win the \\$1 Million Challenge? By Buck Wolf, ABC news, July 30, 2002](#)

[Skeptic: Magic is just fakery By GREG SMITH Norwich Bulletin](#)

[Debunking Seeing Without Sight A Russian girl accepts James Randi's \\$1 million challenge to prove she has paranormal powers](#)

The Randi Paranormal Challenge

James Randi, a.k.a. The Amazing Randi, magician and author of numerous works skeptical of paranormal, supernatural and occult claims, has had for many years a standing offer of \$10,000 to anyone who can prove he or she has paranormal powers. Recently, due to a sponsor gift, the prize has increased to \$1,000,000 and is now offered through the [James Randi Educational Foundation](#). The applicant must state clearly what the claim is, and the applicant and the Foundation must agree on test parameters, which will be worked out between the two. Randi's rules are little more than what any reasonable scientist would require

If you are a mental [spoon bender](#), you can't use your own spoons. If you are going to see [auras](#), you will have to do so under [controlled conditions](#). If you are going to do some [remote viewing](#), you will not be given credit for coming close in some vague way. If you are going to demonstrate your [dowsing](#) powers, be prepared to be tested under controlled conditions. If you are going to do [psychic surgery](#), expect to have cameras watching your every move.

For more information on the [James Randi Paranormal Challenge](#) see www.randi.org, or send e-mail to randi@randi.org or snail mail to

JREF
201 S.E. 12th St (E. Davie Blvd)
Fort Lauderdale, FL 33316-1815
U.S.A.

After collecting the million, successful psychics should contact [B. Premanand of the Indian Skeptic](#), who will pay 100,000 rupees (ca. \$2,300) "to any person or persons who will demonstrate any psychic, supernatural of paranormal ability of any kind under satisfactory observing conditions." Also, the [Australian Skeptics](#) will throw in an additional \$100,000 (Australian), \$80,000 for the psychic and \$20,000 for anyone "who nominates a person who successfully completes the Australian Skeptics Challenge." If you nominate yourself, and are successful, you get the whole hundred grand.

auras

06 Jan 2000

It always amazes me, having taught physics for many years, how the critics of the paranormal, including yourself, never use real science when critiquing it. In addition, very judgmental statements concerning those who engage in paranormal activities are also included, as do you in your web article.

Certainly good science and objectivity of descriptions are the minimum that one should expect from the self proclaimed savants of science. If the major proof that auras can not be seen is the inappropriate flawed test instituted by the Amazing Randi, then you had better reject the belief that atoms exist as well.

reply: The major proof that auras can't be seen is that ordinarily people don't see them. The difference between believing in atoms and believing in auras is that nobody claims to be able to see atoms with the naked eye. As a physicist you know how atoms are detected, but there is no similar detection of auras by scientific equipment that I am aware of.

The photographic evidence for the existence of atoms is no more or less valid than Kirlian photography of the human energy field. In both instances the interaction of light with another field of energy at a different frequency is recorded on a photographic plate. What one sees in the developed print is the resultant interaction.

reply: The difference is that Kirlian photography can be better explained in terms of known electromagnetic forces than in terms of "human energy fields," an expression that is without scientific meaning.

In order to see an aura at the present level of human capability it is necessary for light to be passing through the vital and subtle energy field that surrounds the human body. Randi's staged drama did not meet this requirement. The same that is required for photographing atoms.

The fact that the aura reader agreed to an inappropriate experiment does not make it valid science. Rather it demonstrates once again the human egos desire for attention and publicity.

reply: I suggest that at "the present level of human capability" the "vital and subtle energy field that surrounds the human body" is a figment of your imagination. Randi got the aura reader to agree to a fair test of the

ability to read auras. If you can read auras with a light passing through them, then contact Randi, set up an appointment, demonstrate your powers and [collect your million dollars](#).

For publicity purposes it is in the self interest of James Randi not to pay out his \$10,000. The mere fact that his criteria for so doing are based on: 1) His structuring the test; 2) His judging the result; based on 3) His criteria automatically excludes him as an objective observer. Were he to put up his money in escrow to be controlled by a board of real scientists both skeptical and from within the discipline being examined then his offer would begin to have some validity.

reply: He's already done most of what you ask and the prize has been upped to \$1 million for a couple of years now.

Having developed many electron micro photographs of atomic structure as well as black and white Kirilian photography both utilising the same process of registering the interaction of two fields of vibrational energy, for me auras are just as real as atoms.

**Jerome Whitney
London, England**

reply: Maybe you should clarify what you mean by an "aura", since I don't think most other physicists would agree that auras are just as real as atoms.

I've practiced psychometry and the like for quite a while but I don't believe that I have any special 'power'. More or less, I just have what we all do, a psyche. One I've learned to manipulate.

Anyhow, I've seen auras, not in full color and only about two inches or so, I asked a friend if he could see it too, and he could.

What I'm trying to say is that anyone could probably see auras if they tried just not as well as the more talented ones. Thank you.

--Stephen Mosher

reply: I'm still trying, without success.

22 Aug 1996

I find the skeptic a curious bird indeed. In many cases it appears we are

merely playing a word game. We do not have "auras", ahh but we do have "electromagnetic fields." Now the difference just seems to be simply a matter of words. A person's health is very likely to be reflected either way.

reply: The difference between 'aura' and 'electromagnetic field' is just a matter of words but the difference between auras and electromagnetic fields is as great as the difference between lightning and lightning bugs.

What makes it likely that electromagnetic fields are an indication of a person's health? Do you know this a priori? If so, you are quite special; for this is clearly an empirical matter.

And speaking of electromagnetism anyway. Just what is it? In truth we really don't have a clue do we? It appears that the more physicists play with the subject, the more confused they become. So what is an electron anyway? Matter? Energy? And just where are they? Why they go around the nucleus of an atom -- well they don't really go around it -- they only have a tendency to be in one particular place at a particular time. Of course they are really never there, especially at any particular time because time doesn't really exist as we imagine it to.

reply: However confused scientists may be regarding electromagnetism, matter, energy, etc., has no bearing on auras. In any case, I don't think physicist are as confused as you think they are.

I find this all ironic and amusing. Science is doing a better and better job understanding "How" things work. We are better and better able to use this knowledge and technology (for better or worse). But we haven't moved a bit closer to understanding what a "force" or "energy" really is -- tis still an utter "Mystery." Oh my gosh! So auras or electromagnetic field -- call it whatever you choose. The way I look at it every new discovery science does make only confirms that this universe is spectacular and magical.

reply: I agree.

And as for god, is not the question, by its definition beyond the realm of science. I mean we cannot exactly run a controlled experiment on this subject can we. I glanced over your section on "atheism" and noted that you limited your definition of god to the more or less traditional Judeo-Christian-Islamic concept. That seems rather unscientific don't you think? That is, if we could prove that there is not a great grey bearded patriarch living in the sky then of course there is no god. What of other possibilities?

reply: It may be narrow, but I don't think there is anything scientific or unscientific about it. I realize there are other possibilities, but the Judeo-Christian God is the major one in this part of the world.

Personally I don't buy the old creator theory, but I can't disprove it, nor am I inclined to spend too much energy trying to. So in the beginning there was the "Big-Bang" --- so what banged?

Michael A Torre

reply: The Unbanged Banger, of course!

03 Jan 1997

Thank you for a wonderful website, it's one of my favourites. I especially enjoy reading the readers' comments, many of which are quite funny, belying an almost unbelievable ignorance. My only complaint: you often seem to let these ignoramus off the hook far too easily. What I mean is that, while you rightly point out flaws in their logic, you often leave unchecked the farfetched, bizarre, and usually plain wrong claims they make from modern science. The reason I bring this up is that I believe ignorance and faulty understanding of scientific principles (in other words: 'science illiteracy') is one of the main forces perpetuating belief in pseudoscience. Correcting conceptual errors from your correspondents should, therefore, be one of your priorities, in my opinion. But, perhaps, that's in part what the reader comments are for?

A case in point is one Michael Torre who, while writing on auras, makes some rather strange observations regarding the state of knowledge in modern physics. Now, I am not a physicist, and don't know terribly much about these things, but neither, apparently, does Mr. Torre.

On electromagnetism, Mr. Torre has this to say: "Just what is it? In truth we really don't have a clue do we?" This is dead wrong, we have several clues. Gathering clues is what science is all about. What Mr. Torre is probably trying to say is that he doesn't understand the clues. Well, join the club. I don't understand very much about electromagnetism either, but I do understand this much: electromagnetism is not an object. Mr. Torre seems to be under the mistaken impression that in order to 'have a clue' as to the nature of natural phenomena we have to be able to describe them fully in everyday terms. A moment's thought, however, will convince Mr. Torre that this is not invariably the case. In fact, most phenomena outside our everyday world of tangible objects, including electromagnetism, can only be described in terms of models and approximations. That is by no means equivalent to saying these phenomena are not understood. In fact, electromagnetism is so well understood that we are able to put it to practical use in a number of ways, as you pointed out in your reply. Much of Mr. Torre's confusion stems, I think, from the fact that physicists, electrical engineers, and others interested in electromagnetism have at their disposal several models for explaining electromagnetism, some of which may appear contradictory at first glance. That does not imply that they disagree, to any significant extent, on 'what'

electromagnetism 'really is'. They don't. What model they choose to work with is simply a matter of convenience, determined, largely, by how deep an understanding they need have of the phenomenon to carry out their project (the 'deeper' the understanding, the more complex the model, is the general rule of thumb).

Mr. Torre goes on to say about electrons: " they only have a tendency to be in one particular place at a particular time". Now, that is precisely what they don't do. I had the impression that Mr. Torre was trying to make some sort of profound statement based on Heisenberg's uncertainty principle, which is very popular among the True Believers, and, quite typically of these strange creatures, has got it all backwards. One of the implications of Heisenberg's principle, if I remember my high school physics correctly, is that the electron (and other subatomic particles) doesn't have the property of position, it simply can't 'be in one particular place at a particular time'. This marvelous property (or lack thereof) of the electron is so well understood (in spite of Mr. Torre's claim that it really isn't) that it is put to practical use in such marvelous devices as the Scanning Tunneling Electron Microscope.

I wont belabor any more of Mr. Torre's numerous misconceptions, tempting as it is, but will close this letter by saying that if Mr. Torre and his ilk want to make useful contributions to discussions on scientific, or, for that matter, pseudoscientific, matters, they should bother to acquaint themselves with the subject. There are numerous excellent 'popular science' books on the market which provide a far more exciting read, resplendent with mystery and awe, than any pseudoscientific or mystical claptrap.

Oddur Vilhelmsson

P.S. Sorry about my broken English, but I am a foreigner.

reply: I'll make it my New Year's resolution to be more hardnosed and not so benign.

automatic writing (trance writing)

Automatic writing is writing allegedly directed by a [spirit](#) or by the [unconscious mind](#). It is sometimes called "trance" writing because it is done quickly and without judgment, writing whatever comes to mind, "without consciousness," as if in a trance. It is believed that this allows one to tap into the subconscious mind where "the true self" dwells. Uninhibited by the conscious mind, deep and mystical thoughts can be accessed. Trance writing is also used by [some psychotherapists](#) who think it is a quick way to release [repressed memories](#). There is no scientific evidence that trance writing has any therapeutic value.

Advocates of automatic writing claim that the process allows one to access other intelligences and entities for information and guidance; to recall previously irretrievable data from the subconscious mind; and to unleash spiritual energy for personal growth and revelation. According to psychic [Ellie Crystal](#), entities from beyond are constantly trying to communicate with us. Apparently, we all have the potential to be as [clairaudient](#) as [James Van Praagh](#).

One 19th century [medium](#), H  l  ne Smith, specialized in automatic writing and even invented a Martian alphabet to convey messages from Mars to her clients in the Martian language, which apparently had a strong resemblance to Ms. Smith's native language French (Randi 1995, 22).

Modern skeptics consider automatic writing to be little more than a parlor game, although sometimes useful for self-discovery and for getting started on a writing project. It is likely that many unconscious desires and ideas are expressed in automatic writing, but they are unlikely to be any more profound than one's conscious notions. Personal growth may be enhanced by automatic writing if it is evaluated reflectively and with intelligence. By itself, automatic writing is no more likely to produce self-growth or worthwhile revelation than any other human activity. Some people have even had such [bad experiences doing automatic writing](#) that they are convinced that [Satan](#) is behind it. For some minds, apparently it is better not to know what's lurking in the cellar. Others may be disappointed to find that the cellar is empty.

repressed memory

A repressed memory is the memory of a traumatic event unconsciously retained in the mind, where it is said to adversely affect conscious thought, desire, and action.

It is common to *consciously* repress unpleasant experiences. Many psychologists believe that *unconscious* repression of traumatic experiences such as sexual abuse or rape is a defense mechanism which backfires. The unpleasant experience is forgotten but not forgiven. It lurks beneath consciousness and allegedly causes a myriad of psychological and physical problems from bulimia to insomnia to suicide.

The theory of *unconsciously* repressing the memory of traumatic experiences is controversial. There is little scientific evidence to support either the notion that traumatic experiences are typically unconsciously repressed or that unconscious memories of traumatic events are significant causal factors in physical or mental illness. Most people do not forget traumatic experiences unless they are rendered unconscious at the time of the experience. No one has identified a single case where a specific traumatic experience in childhood was repressed and the *repressed memory* of the event, rather than the event itself, caused a specific psychiatric or physical disorder in adulthood.

The strength of the scientific evidence for repression depends on exactly how the term is defined. When defined narrowly as intentional suppression of an experience, there is little reason to doubt that it exists. But when we talk about a repression mechanism that operates unconsciously and defensively to block out traumatic experiences, the picture becomes considerably murkier.

Evidence concerning memory for real-life traumas in children and adults indicates that these events--such as the Chowchilla kidnappings, the sniper killing at an elementary school, or the collapse of skywalks at a Kansas City hotel--are generally well remembered....complete amnesia for these terrifying episodes is virtually nonexistent (Schacter 1996, 256).

Psychologist [Lenore Terr](#), a defender of [repressed memory therapy](#), argues that repression occurs for *repeated* or *multiple* traumas, such as a repeatedly abused child. Schacter notes that "hundreds of studies have shown that repetition of information leads to improved memory, not loss of memory, for that information." He also notes that people who have experienced repeated

traumas in war, even children, generally remember their experiences. A person who suffers a great trauma often finds that she cannot get the event out of her mind or dreams. Terr's theory is that the child becomes practiced at repression to banish the awful events from awareness, and forgetting might aid in the child's survival. Her [dissociative](#) theory, however, is based on speculation rather than scientific evidence.

Most psychologists accept as fact that it is quite common to *consciously* repress unpleasant experiences, even sexual abuse, and to spontaneously remember such events long afterward. Most of the controversy centers around recovered memories during [repressed memory therapy](#) (RMT). Critics of RMT maintain that many therapists are not helping patients recover repressed memories, but are suggesting and planting [false memories](#) of [alien abduction](#), sexual abuse, and [satanic rituals](#).

clairaudience

Clairaudience is an alleged [psychic](#) ability to hear things that are beyond the range of the ordinary power of hearing, such as voices or messages from the dead. Alleged clairaudients such as [James Van Praagh](#) and John Edward consider themselves 'grief counselors'. They believe they give comfort to the living by providing "messages from the dead," even if the messages are sometimes absurd ("Someone's nickname is Miss Piggy" or "Your dog wishes you hadn't given away his favorite dish").

Van Praagh Lives With Dead -

miniseries with Ted Danson playing Van Praagh

According to a Gallup poll, belief that some people can hear communications from the dead has increased from 18% to 26% over the past decade.

James Van Praagh

"...we [psychics] are here to heal people and to help people grow...skeptics...they're just here to destroy people. They're not here to encourage people, to enlighten people. They're here to destroy people."

--James Van Praagh on "Larry King Live," March 6, 2001

"Aren't you a bit surprised that the only message that the dead seem to be able to give to us is someone had a nickname Miss Piggy? And they can only tell us that, you know, I had a heart condition?...I want to hear just one of the psychics today tell me when is there going to be the next bus bombing in Tel Aviv so we can avoid going on that bus."

--Rabbi Shmuley Boteach, on "Larry King Live," March 6, 2001

"Death is a part of life, and pretending that the dead are gathering in a television studio in New York to talk twaddle with a former ballroom-dance instructor is an insult to the intelligence and humanity of the living." --[Michael Shermer](#)

James Van Praagh is a self-proclaimed [medium](#). He claims that he has a gift which allows him to hear messages from just about anyone, provided he or she is dead. According to Van Praagh, all the billions and billions and billions of dead people are just waiting for someone to give him their names. That's all it takes. Give Van Praagh a name, any name, and he will claim that some dead person going by that name is contacting him in words, fragments of sentences, or that he can feel their presence in a specific location. He has appeared on "Larry King Live," where he claimed he could feel the presence of Larry's dead parents. He even indicated where in the room this "presence" was coming from. He took phone calls on the air and, once given a name, started telling the audience what he was "hearing" or "feeling". Van Praagh plays a kind of twenty-questions game with his audience. He goes fishing, rapidly casting his baited questions one after the other until he gets a bite. Then he reels the fish in. Sometimes he falters, but most of the fish don't get away. He just rebaits and goes after the fish again until he rehooks. The fish love it. They reward Van Praagh's hard work by giving him positive feedback. This makes it appear to some that he is being contacted by spirits who are telling him that being dead is good, that they love those they left behind, and that they are sorry and forgive them

everything.

[Michael Shermer](#) of *Skeptic* magazine calls Van Praagh "the master of [cold-reading](#) in the psychic world." Sociologist and student of [anomalies](#), Marcello Truzzi of Eastern Michigan University, is less charitable. Truzzi has studied characters like Van Praagh for more than 35 years and he describes Van Praagh's demonstrations as "extremely unimpressive." ("A Spirited Debate," Dru Sefton, Knight Ridder News Service, *The San Diego Union-Tribune*, July 10, 1998, p. E1.) Truzzi says that most of what Van Praagh gives out is "twaddle," but it is good twaddle since "what people want is comfort, guilt assuagement. And they get that: Your parents love you; they forgive you; they look forward to seeing you; it's not your fault they're dead."

In *Why People Believe Weird Things* Shermer describes Van Praagh's success and how he wowed audiences on NBC's New Age talk show *The Other Side*. Shermer also tells us how he debunked Van Praagh on *Unsolved Mysteries*. Yet, no one in the audience was sympathetic to Shermer. One woman even told him that his behavior was "inappropriate" because he was destroying people's hopes in their time of grief.

[Van Praagh](#) has books out with can't-miss titles: *Talking to Heaven* and *Reaching to Heaven*, as well as *Healing Grief*. (*Talking to God* and *Talking to Angels* have already been taken.) His website keeps us informed of his books, tapes (e.g., *Develop Your Psychic-Self*), upcoming products (e.g., a series of meditation tapes), [tours and appearances](#). Van Praagh's success will continue as long as he never, never tells a mark that his parents forgive him for torturing them while they were alive or that it's time to admit to the murder. There is little chance of that happening, however. In an interview with Dru Sefton, Van Praagh states that "there is no death, there is only life....every person is psychic or intuitive to a degree," and most spirits end up in heaven (Sefton 1998). These claims seem to be based on nothing more than the belief that this is what many people want to hear.

Another devotee of Van Praagh is Charles Grodin, whose talk show on CNBC was cancelled shortly after Van Praagh's second appearance. Grodin demonstrated how open-minded, gullible, and devoted to his dead mother he is, as he fawned over the man who talks to heaven. Van Praagh's performance on Grodin's show was less than heavenly, but it was enough to satisfy Grodin and at least one couple in the audience who seemed to believe that their dead daughter was talking to Van Praagh. The only skepticism shown by Grodin was in wondering whether Van Praagh wasn't really reading the minds of the audience and the callers, rather than getting his messages from "the other side". The only person on the show who stated her doubts about the authenticity of Van Praagh's contact was a woman who lost a daughter to murder by terrorist Timothy McVeigh in the Oklahoma City bombing. She stated that nothing Van Praagh said rang true about her daughter except some generalities. The woman also claimed that her daughter communicates to her

directly.

When Van Praagh can't get a good bite, he reminds his audience that sometimes the message is in fragments, sometimes he doesn't understand it, sometimes he misinterprets it, etc. If he's wrong, don't blame him since he never claimed to be perfect. Van Praagh seemed particularly inept on the Grodin show. He was not very artful. He used his usual bait: questions about girls and grandmothers, changes in the home, unresolved feelings, etc. He claimed to get messages about the usual stuff: angels, cancer, the heart, newspapers. What saves him much of the time is [shotgunning](#) which ends with the ambiguous question "am I right?" and the client saying "yes," though we have no idea what the "yes" is in response to.

Van Praagh's shows are unimpressive to a skeptic, but to someone like Charles Grodin, who obviously is still deeply grieving his mother's death, he is a saint. Grodin practically asked for Van Praagh's blessing as he thanked him for his wonderful work. Hopefully, some in the audience were left wondering why there wasn't more skepticism shown.

Currently, there is a three-year wait for a private session with Van Praagh. However, there may be some dissatisfaction in Heaven, as several others on earth have got the message are now getting messages from the dead, too.

[George Anderson](#) (*Lessons from the Light*), a former switchboard operator featured on CBS news and an [ABC special](#), says the dead talk to him all the time. [John Edward](#)

established himself as the first [clairaudient](#) to have his own talk-to-the-dead show: "Crossing Over with [John Edward](#)" on the Sci Fi Channel. Edward has been exposed as a fraud by [James Randi](#) [*Skeptic*, v. 8, no. 3] and [Leon Jaroff](#) [*Time*, March 5, 2001], to no avail. He may be a fraud, but he is an attractive and impressive one. Edward's show is now syndicated, his popularity is expanding almost as fast as the universe, and he has joined Xena the Warrior Princess and Jerry Springer on the [USA Network](#).

[According to a Gallup poll, belief in channeling has increased from 11% to 15% over the past decade.](#)

channeling

Channeling is a process whereby an individual (the "channeler") claims to have been invaded by a spirit entity which speaks through the channeler. The channeling craze began in earnest in 1972 with the publication of *Seth Speaks* by Jane Roberts and Robert Butts, her husband. They claim that "Seth," a very wise "unseen entity," communicated his wisdom to Jane, who dictated to Butts while she was in a trance. Though Roberts, a somewhat accomplished poet, was obviously very literate and widely read in many religious and occult traditions (including [Jung](#)), her advocates portray her as communicating ideas beyond her ability. They take this as proof she was inspired. This is true: Roberts and Butts were probably inspired by the depth of human credulity.

Actress [Shirley MacLaine](#) and the ABC television network gave this modern version of [ghosts](#) speaking through a [medium](#) a modicum of credibility. In 1987, ABC showed a mini-series based on MacLaine's book *Out on a Limb*, which depicts MacLaine conversing with spirits through channeler [Kevin Ryerson](#). One of the spirits who speaks through Ryerson is a contemporary of Jesus called "John." "John" doesn't speak Aramaic--the language of Jesus--but a kind of Elizabethan English. "John" tells MacLaine that she is co-creator of the world with God. MacLaine, a consummate egoist, becomes ecstatic to find out that she is right about a belief she'd expressed earlier, viz., that she IS God (Gardner, 1987).

One of MacLaine's favorite channelers is [J.Z. Knight](#) who claims to channel a 35,000 year-old Cromagnon warrior called Ramtha. This preposterous notion has made her famous and wealthy. Some of her patrons pay as much as \$1,000 to attend her seminars where she dispenses such wisdom as "[we must] open our minds to new frontiers of potential."

Ouija board

A Ouija board is used in [divination](#) and [spiritualism](#). The board usually has the letters of the alphabet inscribed on it, along with words such as 'yes,' 'no,' 'good-bye' and 'maybe.' A planchette (a slidable 3-legged device) or pointer of some sort is manipulated by those using the board. The users ask the board a question and together or one of them singly moves the pointer or the board until a letter is "selected" by the pointer. The selections "spell" out an answer to the question asked.

Some users believe that paranormal or supernatural forces are at work in spelling out Ouija board answers. Skeptics believe that those using the board either consciously or unconsciously select what is read. To prove this, simply try it blindfolded for some time, having an innocent bystander take notes on what letters are selected. Usually, the result will be unintelligible non-sense.

The movement of the planchette is not due to paranormal forces but to unnoticeable movements by those controlling the pointer, known as the [ideomotor effect](#). The same kind of unnoticeable movement is at work in [dowsing](#).

The Ouija board was first introduced to the American public in 1890 as a parlor game sold in novelty shops.

E.C. Reiche, Elijah Bond, and Charles Kennard ... created an all new alphanumeric design. They spread the letters of the alphabet in twin arcs across the middle of the board. Below the letters were the numbers one to ten. In the corners were "YES" and "NO."

Kennard called the new board Ouija (pronounced 'wE-ja) after the Egyptian word for good luck. Ouija is not really Egyptian for good luck, but since the board reportedly told him it was during a session, the name stuck.*

Kennard lost his company and it was taken over by his former foreman, William Fuld, in 1892.

One of William Fuld's first public relations gimmicks, as master of his new company, was to reinvent the history of the Ouija board. He said that he himself had invented the board and that the name Ouija was a fusion of the French word "oui" for yes, and the German "ja" for yes.*

Although Ouija boards are usually sold in the novelty or game section of stores, many people swear that there is something occult about them. For example, Susy Smith in *Confessions of a Psychic* (1971) claims that using a Ouija board caused her to become mentally disturbed. In *Thirty Years Among the Dead* (1924), American psychiatrist Dr. Carl Wickland claims that using the Ouija board "resulted in such wild insanity that commitment to asylums was necessitated." Is this what happens when amateurs try to dabble in the occult? Maybe, if they are suggestible, not very skeptical and a bit disturbed to begin with. However, even very intelligent people who have not gone insane are impressed by Ouija board sessions. They find it difficult to explain the "communication" as the ideomotor effect reflecting unconscious thoughts. One reason they find such an explanation difficult to accept is that the "communications" are sometimes very vile and unpleasant. It is more psychologically pleasing to attribute vile pronouncements to evil spirits than to admit that one among you is harboring vile thoughts. Also, some of the "communications" express fears rather than wishes, such as the fear of death, and such notions can have a very visible and significant effect on some people.

Observing powerful messages and the powerful effect of messages on impressionable people can be impressive. Yet, as experiences with [facilitated communication](#) have shown, decent people often harbor indecent thoughts of which they are unaware. And the fact that a person takes a "communication" seriously enough to have it significantly interfere with the enjoyment of life might be a sufficient reason for avoiding the Ouija board as being more than a "harmless bit of entertainment," but it is hardly a sufficient reason for concluding that the messages issue from anything but our own minds.

See related entries on [the ideomotor effect](#), [dowsing](#), [facilitated communication](#) and [the unconscious mind](#).

repressed memory therapy (trauma-search therapy)

Repressed memory therapy (RMT) is a type of psychotherapy which assumes that problems such as bulimia, depression, sexual inhibition, insomnia, excessive anxiety, etc., are due to unconsciously [repressed memories](#) of childhood sexual abuse. RMT assumes that a healthy psychological state can only be restored by recovering and facing these repressed memories of sexual abuse.

Any amount of sexual abuse of children is intolerable. Nevertheless, there is little scientific evidence supporting the notions that (a) childhood sexual abuse almost always causes psychological problems in adults; or that (b) memories of childhood sexual abuse are *unconsciously* repressed; or that (c) recovering repressed memories of abuse leads to significant improvement in one's psychological health and stability.

[The Royal College of Psychiatrists](#) in Britain has officially banned its members from using therapies designed to recover repressed memories of child abuse. The British Psychological Society, on the other hand, does not ban its members from such therapy, but in a 1995 report urged them to "avoid drawing premature conclusions about memories recovered during therapy." The report noted that a patient's recovered memory may be metaphorical or emanate from dreams or fantasies. The report also denied that there is any evidence suggesting that therapists are widely creating false memories of abuse in their patients, a charge levied by members of the [False Memory Syndrome Foundation](#).

In the U.S.A., [The American Psychological Association's](#) Working Group on the Investigation of Memories of Childhood Abuse also issued a report in 1995. The report notes that recovered memory is rare. It also states that "there is a consensus among memory researchers and clinicians that most people who were sexually abused as children remember all or part of what happened to them although they may not fully understand or disclose it....At this point," according to the APA, "it is impossible, without other corroborative evidence, to distinguish a true memory from a false one." Thus, says the APA report, a "competent psychotherapist is likely to acknowledge that current knowledge does not allow the definite conclusion that a memory is real or false without other corroborating evidence."

the RMT checklist

Many of the more prominent RMT advocates use a [checklist approach](#) to

diagnose repressed memories of childhood sexual abuse as the cause of a patient's problems, despite the fact that "there is no single set of symptoms which automatically indicates that a person was a victim of childhood abuse" ([APA report](#)). Works on child abuse promoting such a notion have been very popular among therapists and talk show hosts featuring [Ellen Bass, Laura Davis \(*The Courage to Heal*\)](#), Wendy Maltz, Beverly Holman, Beverly Engel, Mary Jane Williams and E. Sue Blume. Through [communal reinforcement](#) many empirically unsupported notions, including the claim that about half of all women have been sexually abused, get treated as facts by many people. Dr. Carol Tavris writes

In what can only be called an incestuous arrangement, the authors of these books all rely on one another's work as supporting evidence for their own; they all endorse and recommend one another's books to their readers. If one of them comes up with a concocted statistic--such as "more than half of all women are survivors of childhood sexual trauma"--the numbers are traded like baseball cards, reprinted in every book and eventually enshrined as fact. Thus the cycle of misinformation, faulty statistics and invalidated assertions maintains itself (Tavris).

One significant difference between this group of experts and, say, a group of physicists is that the child abuse experts have achieved their status as authorities not by scientific training but by either (a) experience [they were victims of child abuse or they treat victims of child abuse in their capacity as social workers], or (b) they wrote a book on child abuse. The child abuse experts aren't trained in scientific research, which, notes Tavris, "is not a comment on their ability to write or to do therapy, but which does seem to be one reason for their scientific illiteracy."

Here are a few of the unproved, unscientifically researched notions that are being bandied about by these child abuse experts: (1) If you doubt that you were abused as a child or think that it might be your imagination, this is a sign of "post-incest syndrome" [Blume]. (2) If you can't remember any specific instances of being abused, but still have a feeling that something abusive happened to you, "it probably did" [Bass and Davis]. (3) When a person can't remember his or her childhood or has very fuzzy memories "incest must always be considered a possibility" [Maltz and Holman]. (4) "If you have any suspicion at all, if you have any memory, no matter how vague, it probably really happened. It is far more likely that you are blocking the memories, denying it happened" [Engel].

As a point of reference, the U.S. Bureau of Justice Statistics reports that a survey done of female state prison inmates in 1996-97 found that some 36 percent said they had been sexually or physically abused at age 17 or younger. The terms 'sexual abuse' and 'physical abuse' were not clearly defined;

however, one-third reported they had been raped before incarceration. By comparison, 16 studies of child abuse in the general population found that from 12 percent to 17 percent reported they had been "abused" as children.

Furthermore, people who have experienced traumatic events usually do not forget them. Severely traumatic experiences are typically forgotten only if (a) the person is rendered unconscious at the time of the trauma; (b) the person is brain damaged before or by the trauma; or (c) the person is too young to make the necessary neural connections needed for long-term memory. Memories are not stored in some mysterious dark cellar, but in a complex network of neural connections involving several parts of the brain. Memories are lost because neural connections are lost, not because some homunculus stores them in the basement of the mind and let's them haunt the people upstairs in the room where clear consciousness dwells.

memory and repression

Before discussing the methods and techniques of RMT, it should be noted that very few recovered memories of childhood sexual abuse first occur spontaneously. When they do, they are usually more likely to be corroborated by evidence than those evoked in RMT therapy. In fact, in some cases corroborative evidence serves as the [retrieval cue for the repressed memory](#). RMT, however, seems to be able to produce recovered memories of sexual abuse in most of its clients. To those practicing RMT, this is proof of its power and effectiveness. To skeptical critics this is warning sign: the memories are [confabulations](#) suggested by prodding, suggestive therapy.

Daniel Schacter notes that the scientific evidence for repression is weak. Even weaker is the evidence that specific disorders are caused by repression. He notes the case of a rape victim who could not remember the rape, which took place on a brick pathway. The words 'brick' and 'path' kept popping into her mind, but she did not connect them to the rape. And she became very upset when taken back to the scene of the rape, though she didn't remember what had happened there ([Schacter 1996, 232](#)). One could posit that the victim really does have a full-fledged memory of the rape, but she has repressed it. Hypnosis could help bring forth this repressed memory. However, hypnosis or other methods starting with this assumption are risky as well as unfounded. The concept of *implicit memory*, i.e., memory without awareness, which is due to the fact that some neural connections have been made during a trauma, but not enough for a full-fledged recollection, could explain this rape victim's incomplete memory without assuming that she was recording memories while she was unconscious. The concept of implicit memory explains everything that is known about memory without making assumptions about what is not known.

Furthermore, even if traumatic memories are repressed sometimes, they are probably done so consciously and deliberately. Many of us choose not to

dwell on unpleasant experiences and make a determined effort to wipe them from our memories as far as possible. We hardly desire some hypnotist or therapist to dredge up memories of experiences we've chosen to forget. In short, limited amnesia is best explained neurologically, not metaphysically. We forget things either because we never encoded them strongly enough in the first place or because neural connections have been destroyed or because we choose to forget them.

RMT techniques

RMT uses a variety of methods--including [hypnosis](#), visualization, group therapy, and [trance writing](#)--to assist the patient in 'remembering' the traumatic event. Hypnosis is risky because it is easy to lead and encourage the patient by suggestive or leading questions. Trance writing has never been proven to have any therapeutic value (Schacter 1996, 271). Group therapy, on the other hand, can become [communal reinforcement](#) of delusions, if the therapist is not careful. People in the group can encourage others to share bizarre tales without fear of ridicule. The group might not originate the repressed memory, but they might facilitate the birth and nourish the growth of horrendous fantasies.

Using guided imagery or visualization in therapy can also be dangerous. Sherri Hines describes how her therapist used this method to help her retrieve a memory of being abused by her father:

My father would give me a bath and he used to draw on the mirror, draw on the steam, and he would draw cartoon characters. And that was the seed for a memory; we would start with that.

And [my therapist] would tell me, 'You're in the bathtub. Your dad is there. He's drawing in the mirror. What is he drawing?' Then he'd say, 'OK, now your father's coming over toward you in the bathtub. He's reaching out to touch you. Where is he touching you?' And that's how the memories were created (Hallinan 1997).

Hines came to believe she was molested by her father and became so depressed she attempted suicide. She is now out of therapy and believes the memories were false and created in therapy.

The case of Diana Halbrook also brings into question the reliability of RMT methods. In a trance writing session, Hallbrook had written that her father had molested her. This was shocking news to her! She went into group therapy and heard bizarre tales of satanic ritual sacrifices. Soon the same kinds of bizarre events appeared in her trance writings, including the recovered memory that she'd killed a baby.

Because Diana Halbrook's ritual abuse memories seems so outlandish, her doubts about the reality of these and her other recovered recollections continued to grow. But these doubts met resistance from the people in her support group and her therapist. "I continually questioned the memories, doubted them, but when I questioned the therapist, he would yell at me, tell me I wasn't giving my 'little girl within' the benefit of the doubt. Tell me that I was in denial. I didn't know what to believe. But I trusted him" (Schacter 1996, 269).

Halbrook got out of the therapy, characterized by Daniel Schacter as "toxic," and no longer believes the outlandish memories. Schacter comments that "the most reasonable interpretation is that the events [recovered in therapy] do not have any basis in reality."

Each of the various methods described above has been very successful in getting patients to "remember" many things of which they were unaware before therapy. The "memories" include not just memories of being sexually abused as children, but of some very bizarre things, such as being [abducted by aliens](#) for sexual experimentation or breeding, being forced to participate in [satanic rituals](#), or being traumatized in a [past life](#).

Psychologist Joseph de Rivera claims that in RMT "rather than help the patient separate truth from fantasy, the therapist encourages the patient to 'remember' more about the alleged trauma. And when the patient has an image--a dream or a feeling that something may have happened--the therapist is encouraged, praises the patient's efforts and assures him or her that it really did happen." This kind of therapy, he says, "confuses the differences between real and fantasized abuse and encourages destruction of families" (de Rivera 1993).

The [False Memory Syndrome Foundation](#) claims to have hundreds of such cases on file. Several cases have gone to court and therapists have been found liable for the harm caused by planting false memories. Despite the claims of hundreds of successful expeditions to recover lost memories by RMT therapists, some judges will not accept memories recovered in therapy as evidence. Judge William J. Groff of New Jersey wrote in case he heard in 1995 that

...the phenomenon of memory repression, and the process of therapy used in these cases to recover the memories, have not gained acceptance in the field of psychology, and are not scientifically reliable (quoted in Schacter 1996, 267).

It is true that another New Jersey judge, Linda Dalianas, did allow such

testimony in a later case but she also stated that

...[t]he Court will not allow expert evidence regarding either the process or the plausibility of 'recovering' an allegedly repressed memory, because the experts have not offered any data either supporting or refuting any theory of how or whether a 'lost' memory might be recovered (Schacter 1996, 267).

In California, where a recovered memory not only was allowed but served as the [basis for a murder conviction](#), the case was eventually overturned because of failure to reveal to the jury that the source of nearly every detail remembered about the murder could have been readily accessible newspaper accounts. It was also revealed that the person who claimed she had had a spontaneous flashback of the crime, lied about that, as well as about whether she had recovered her memories of the crime during hypnotherapy.

Are RMT therapists creating false memories of abuse?

"The Memory Wars" is the apt title of Daniel Schacter's chapter on repressed memory in his 1996 book *Searching for Memory*. To enter the controversy over repressed memory and the psychotherapies used to "recover" memories of childhood sexual abuse is to enter a war zone. On the one side--The Recovered Memory side--are those who maintain that patients with certain kinds of physical and mental disorders have repressed memories of childhood sexual abuse which must be recovered during therapy. The other side--The False Memory side--maintain that the memories recovered in therapy are not recollections of actual childhood sexual abuse but are constructed memories built out of materials suggested to the patient or implanted by the therapist during therapy.

On the recovered memory side are [Lenore Terr](#), [Laura Brown](#), [Kenneth Pope](#), [Laura Davis](#) and [Ellen Bass](#) among others. On the False Memory side are [Elizabeth Loftus](#), [Carol Tavris](#), [Richard Ofshe](#) and the [False Memory Syndrome Foundation](#), among others. Opponents in this war are not seen as colleagues in quest of the same truth, but as demons, villains or frauds. Schacter seems to tiptoe on glass as he presents what is known, not known, guessed at, etc., in this area. His conclusions seem pretty weak, if not contradictory, given the evidence he presents (272).

First, there is no conclusive scientific evidence from controlled research that false memories of sexual abuse can be created--nor will such evidence ever exist, because of ethical considerations. Second, there is likewise no definitive scientific evidence showing that therapy per se or specific suggestive techniques are alone responsible for the creation of inaccurate memories. Third, several separate strands,

when considered together, support the conclusion that some therapists have helped to create illusory recollections of sexual abuse....

On the other hand, Schacter presents strong evidence from controlled research that memories can be created, and he makes a strong argument that [repression](#), the conceptual basis for RMT, has little scientific support. This concept has widespread acceptance in the psychological and psychiatric communities--as does the related theory of [dissociation](#)--but scientific studies demonstrating such mechanisms are lacking. Those in the RMT movement begin with the assumption that the demonstration of any of a number of *symptoms* is evidence of childhood sexual abuse. Many of the symptoms would not necessarily indicate any deep psychological problems, much less a traumatic source. Many could be symptomatic of a number of disorders having no basis in sexual trauma. Therapists who assume their patients have been sexually molested, and assume that any memories they have, no matter how fantastic or delusional, are either accurate memories of abuse or *symbolic* of abuse, do not need to plant memories in their patients to find that they've been abused. The therapists have determined *a priori* that whatever mental artifacts they uncover will lead the way to childhood sexual abuse as the cause of their patient's problems.

Studies by Marcia Johnson et al. have shown that the ability to distinguish memory from imagination depends on the recall of source information (Schacter 1996, 116). Thus recovered memories of abuse might be very vivid and accurate in many details, but incorrect about the source of the memory. For example, in the case of Diana Halbrook it is very probable that the source of her satanic ritual memories is to be found in her group therapy.

memories of abuse as symbolic

One thing the RMT group has accomplished in these Memory Wars is to divert attention from the questionable mechanism of repression and their predetermined, unscientific methods of interpreting symbolic meanings of recollections, to the issue of whether the RMT therapists are planting memories in their patients. This was not intentional, but the result of a number of lawsuits against RMT therapists by former patients, all of whom recanted the memories of childhood abuse uncovered in therapy and blamed their therapists for ruining their lives by planting false memories of abuse in their minds. But the issue over whether a particular memory has been planted by a particular therapist is mainly of importance because the alleged memories are of horrible things and they are very disruptive and destructive of peoples' lives. If therapists were planting all kinds of good memories in patients' minds, helping them enjoy more satisfying lives and relationships, it is doubtful that there would be such an uproar.

Some of the memories recovered in RMT are extraordinarily bizarre, so

bizarre that one would think that a reasonable person could hardly take them at face value. But RMT therapists are not put off by bizarre "recollections." They either take them at face value (as [John Mack](#) does of his alien abduction patients and others do when interrogating children). Or they take them as "artifacts" of the mind, which therapists must analyze as if they were archaeologists who must infer the real truth from the artifacts. Or they take fantastic memories as *symbolic* of real experiences.

Laura Brown, for example, a Seattle psychologist in the forefront of RMT says that fantastic memories are "perhaps coded or symbolic versions of what really happened." What really happened, she's sure, was sexual abuse in childhood. "Who knows what pedophiles have done that gets reported out later as satanic rituals and cannibalistic orgies?" asks Dr. Brown (Hallinan 1997).

In the past, Brown has criticized the False Memory Syndrome Foundation for being unscientific, but her emphasis on the symbolic nature of fantastic memories has little scientific credibility itself. Where is the scientific evidence that a fantastic memory can be distinguished from a delusion? How do we distinguish memories of real cannibalism from symbolic memories? We usually know what a crucifix or a swastika symbolizes, but what does eating an infant symbolize? Symbols might be ambiguous. How can we be sure that a memory is a symbol of child abuse and not of adult abuse by co-workers, or by other children who tormented the patient years ago, or by the therapist him- or herself? How can we be sure it is not a symbol of self-abuse? How can we be sure it is a symbol of *any* kind of abuse at all? What would distinguish a symbol of abuse from a symbol of *fear* of abuse? For that matter, what would distinguish a symbolic representation of fear of *being abused* from one representing fear of *abusing someone else* in the present, or a *regret* of having abused someone else in the past? The dangers and imminent probabilities of misinterpretation of symbolic memories should be obvious, especially when it is not always that clear that a memory really is a symbolic expression at all.

Are we to accept without question the notion that any memory, true or false, reflects some truth, objective or subjective, which only the trained therapist can determine? That seems to be the view of some RMT advocates. If so, we are being asked to accept mysticism instead of science. How could one possibly disprove the claim that a memory which is incredible on its face is a symbolic message? Can anyone imagine any empirical test for this notion? If the issue were simply whether a memory is accurate, there would be some hope of establishing in some cases that the probability is that the memory is true or that it is false. But if the issue is whether a memory *has a meaning*, that point will probably soon be granted, since we don't like to think of ourselves as doing anything without there being some reason for it.

How do we determine the real reason for a confabulation? Don't therapists

and those of us who interpret memories or dreams become storytellers ourselves? As storytellers, isn't it reasonable to assume that *our* stories may not be literally true, but are symbolic and must be interpreted by another storyteller, ad infinitum? Perhaps "repression" is not to be taken literally, but symbolically. Perhaps each therapist must develop a subjective truth for concepts such as "repression" and "therapy." If this is so, then therapy is a dangerous weapon to be feared by everybody rather than a blessing to be sought by those with psychological problems. History is replete with examples of what happens when any group of authorities do not have to answer to empirical evidence but are free to define truth as they see fit. None of the examples has a happy ending. Why should it be otherwise with therapy?

spiritualism (spiritism)

Spiritualism or spiritism is the belief that the human personality survives death and can communicate with the living through a sensitive [medium](#). The spiritualist movement began in 1848 in upstate New York with the Fox sisters who claimed that spirits communicated with them by rapping on tables. (The "raps" were actually made by cracking their toe joints.) By the time the sisters admitted their fraud some thirty years later, there were tens of thousands of mediums holding séances where spirits entertained with numerous magical tricks such as making sounds, materializing objects, making lights glow, levitating tables and moving objects across the room. The mediums demonstrated every variety of psychic power from [clairvoyance](#) and [clairaudience](#) to [telekinesis](#) and [telepathy](#). Repeated charges of fraud did little to stop the spiritualist movement until the 1920's when magicians such as [Houdini](#) exposed the techniques and methods of deceit used by mediums to fool even the wisest and holiest of men and women.

The Hollywood version of [séances](#) is fairly accurate: people sitting around a table, holding hands in a darkened room, a faked trance by the medium who passes on to the group any information given by the spirit, often accompanied by tricks such as the levitating table, mysterious sounds, materializing objects, etc. For many, spiritualism was "scientific proof" of life after death, which didn't involve any of the superstitious non-sense of religion.

avatar

An avatar is a variant phase or version of a continuing basic entity, such as the incarnation in human form of a divine being. [Avatar](#) is also the name of a New Age self-help course based upon changing a person's life by training the person to manage his or her beliefs. According to [Jack Raso](#), "Avatar's fundamental doctrine is that people have a natural ability to create or 'discreate' any reality at will. This alleged ability stems from a hypothetical part of consciousness that proponents call 'SOURCE.'"

According to their promotional material,

Avatar awakens you to a natural ability you already have to create and discreate beliefs. With this skill, you can restructure your life according to the blueprint that you determine. One discovery many people on the Avatar course make is that what you are believing is less important than the fact that you are believing it. Avatar empowers you to realize that there aren't "good" beliefs and "bad" beliefs. There are only the beliefs that you wish to experience and the beliefs you prefer not to experience. Through the tools that the course presents you with, you create an experience of yourself as the source, or creator, of your beliefs. From that place, it's very natural and easy to create the beliefs that you prefer.

These notions seem so obviously a mixture of the true, the trivial and the false that one hesitates to comment on them. If there are no good or bad beliefs then how did the people at Avatar come upon the belief that their course has any value? And what difference does it make whether anyone believes in Avatar belief management techniques?

the pragmatic fallacy

The pragmatic fallacy is committed when one argues that something is true because *it works*. For example, [astrology works](#), [numerology works](#), [therapeutic touch works](#). What 'works' means here is not clear. At the least, it means that one perceives some practical benefit in believing that it is true, despite the fact that the utility of a belief is independent of its truth-value. At this level "works" seems to mean "I'm satisfied with it," which in turn might mean "I feel better" or "It explains things for me." At most, "works" means "has beneficial effects" even though the evidence may be very weak for establishing causality.

The pragmatic fallacy is common in ["alternative" health](#) claims and is often based upon [post hoc reasoning](#). For example, one has a sore back, wears the new magnetic or takionic belt, finds relief soon afterwards, and declares that the magic belt caused the pain to go away. How does one know this? Because *it works!*

There is a common retort to the skeptic who points out that customer satisfaction is irrelevant to whether the device, medicine, or therapy in question really is a significant causal factor in some outcome. Who cares *why* it works, as long as it works? You can argue about the theory as to why it works, but you can't argue about the customer satisfaction. They feel better after using the product. That's all that matters.

It isn't all that matters. [Testimonials](#) are not a substitute for scientific studies, which are done to make sure that we are not deceiving ourselves about what appears to be true. It is especially necessary to do controlled studies of alleged pain relievers to avoid [self-deception](#) due to the [placebo effect](#), [post hoc reasoning](#) or the [regressive fallacy](#). We may not want to question too deeply the felt relief, but we must question the *cause* of that relief.

It is easy to understand why someone with "terminal" cancer who seeks out an "alternative" treatment and finds the cancer goes into remission soon afterwards would attribute miraculous causal efficacy to the "alternative" treatment. However, if the "alternative" treatment is *not* really the cause of the remission, then others who seek the treatment will be filled with false hope. Of course, those patients who try the same treatment but who die anyway are not around to tell their story. Their surviving loved ones may even claim that the only reason the treatment did not work was because the patient came to it too late. The only way to know for sure whether the treatment has causal efficacy is to study its application under [controlled conditions](#). Testimonials regarding how well the treatment works may be heartfelt, but they can be

| dangerously misleading.

bioharmonics

If someone is eating a disharmonic diet then there is no harmony in the bioenergy.--Linda Townsend

If [non-physical] bioenergetic fields exist, then some two hundred years of physics, chemistry, and biology has to be re-evaluated.--Victor J. Stenger

Bioharmonics is a New Age [pseudoscience](#), which [Linda Townsend](#) claims is "the science that studies bioenergy motions and interactions with other energy sources." She should know; she invented it, more or less.

Bioharmonics is one of many "[energy](#)" [medicines](#) to have emerged in recent years. All have in common the belief in energies distinct from heat, electromagnetic, nuclear, and other measurable energies. New Age energy is not detectable by modern scientific equipment, though some advocates employ useless gadgets touted as scientific machinery capable of harnessing, collecting, distributing, etc. some mysterious energy. Some are also fond of jargon and attempt to relate this energy to [quantum physics](#). These energies are either indistinguishable from or related to [chi](#) or [prana](#) or [chakras](#). Some claim they can feel this energy ([therapeutic touch](#)). Some claim they can see it ([auras](#)) and that it can be photographed ([Kirlian](#) photography). Some have claimed they could harness energy and promote healing or sexual prowess ([Reich](#)). Many have claimed that these energies are related to the spirit world.

bioharmonics and bioenergy

Townsend's writing indicates that she does not understand bioenergy the way biochemists do. In conventional biochemistry, bioenergy refers to "the readily measurable exchanges of energy within organisms, and between them and their environment, which occur by normal physical and chemical processes."[*](#) She writes:

In my personal research with bioenergy testing, I always find an irregularity that seems to be related to the physical condition whatever that condition may be. This has raised some questions about bioenergy being an expression of biochemistry. Therefore, if bioenergy and biochemistry have a mutual influence on each other, correcting bioenergy irregularities may also effect balancing the biochemistry.

These are not the claims of someone knowledgeable of biochemistry.

Townsend never quite defines 'bioenergy,' but her theory is that it needs to be "harmonized." She will even sell you a Harmonizer for \$1,295, which will help "to retune those weaken [sic] disharmonious areas of the body commonly found over sites of illnesses." She also recommends polarizers (\$80-\$120) and magnets. The polarizers are "non-magnetic devices filled with kelp, other plant life and minerals specifically chosen for their ability to attract cosmic light energy, also called '[chi](#)' or 'life force' energy." How she knows kelp attracts chi is not clear.

While Townsend does not define 'bioenergy', she does claim that there are three layers of bioenergy fields: the outer layer, the mid layer, and the inner layer.

The outer layer of the bioenergy field of a healthy person begins about six inches or more out from the body. The left side would be an overall counterclockwise motion and the right would be clockwise motion with a one way motion pulling another non-magnetic energy up the vertical mid lines in the front and back of the body. This is the same pattern as found over a bipolar magnet. This layer reveals [sic] the overall bioenergy health condition which is categorized into the bioenergy stages.

The mid bioenergy layer begins about two inches from the body and extends to the outer layer. It reveals the one way motions of main meridian line systems or what some might call "chi" flows at the hands and feet. In a healthy person this one-way energy motion comes into the left side and out the right. This is the layer that tends to show the most abnormalities found over organs and tissues.

The inner bioenergy layer reveals the one way motions of the lesser meridian line systems. It also reveals the unique patterns of energy stored in bone marrow, where physical regeneration and healing begin.

Ms. Townsend hasn't published any studies but she implies that the Harmonizer can "help" with many ailments, including cancer, diabetes, heart conditions, Parkinson's disease and paralysis. She says she has testimonials to back up these claims, though she is careful to disclaim any medical benefit for her products:

We do not claim that any medical conditions have been improved by BioHarmonics; we only have seen that bioenergy imbalances can be improved....This research is not medically related in any way and should not be considered in any matter to be beneficial for medical conditions....There are no

guarantees offered expressed or implied.

Presumably, she thinks such disclaimers protect her from lawsuits or from being criminally charged with practicing medicine without a license. She does claim, however, that

Frequency in BioHarmonics is merely a catalyst that influences energy motions. In my research, it is the bioenergy motion reactions to other energy sources that is the most important part...there is no one frequency that will work on every person with the same disease....What is really needed is the missing harmonics of bioenergy motions for the individual person because it is this weakness that hinders natural healing.

She also claims that her Harmonizer is better than others because her harmonics are in twos and other devices are in threes and "the main harmonics of the bioenergy of the body are in twos." How she knows this, or what it even means, is not clear.

Townsend makes numerous unsubstantiated, meaningless, or inane claims such as the color blue "dominates the left side of a healthy body in the outer bioenergy layer and is found in the blood bioenergy. It is also found at the nerve branches of several vertebra in the spine." And, "Red dominates the right side of the body in the outer bioenergy layer. It is opposite and attracting to Blue." She seems to have derived these notions from one of the great American quacks, [Dinshah P. Ghadiali](#), who invented Spectro-Chrome Therapy. She claims he influenced her early theories.

On the side, Ms. Townsend sells organic dog food, apparently to enhance canine bioharmonics. She also will be selling vitamins, minerals, flower essences, and homeopathics soon.

The danger, of course, of all such energy medicine is that people with real and treatable diseases will not get proper care. It is true that alternative practitioners can help some people by the [placebo effect](#) and by providing attention, love and care. However, there is no evidence that any of these energy medicines or quack medical devices has cured anyone's arthritis, cancer or other serious disorder.

24 Jul 2002

I see that Ayurveda and Dr Chopra are listed together. This is basically wrong! Dr Chopra might have used (or even misused) Ayurveda to popularize and make money using his 'theories and medicines', but Ayurveda has nothing to do with Dr Chopra or Maharishi Mahesh Yogi.

Many godmen especially from India are using and quoting the old Indian books to substantiate their claims. Indian books do contain some ancient wisdom as existed in those days. The fact that godmen are misusing them, should be a bad mark on them. Similarly, Ayurveda is an old system of Indian medicine. Dr Chopra has wrongly connected that with Quantum Physics and mysticism etc. Ayurveda should be treated on its own - without any reference to Dr Chopra or Maharishi.

One can add that a lot of modern gurus and TV yogis are using and misusing it. Ayurvedic medicines do work for several diseases. It is because of the power of herbs, nothing holy about it. You can't use it for quick remedy. But long-term effects are proven. The material and herbs used for various diseases are medically correct. For example pepper and clove mixture is indeed good for cough. No magic about it. Ginger water is good for stomach. No magic here. Simple medical value.

There are some modern medicines which have its origin in Ayurveda. One of them is SERPASIL which comes from the root of Rauwolfia Serpentina known as "sarpgandha" in Sanskrit. Used for high blood pressure here we have a medicine originating in Ayurveda and today mass produced by big firms. Of course in recent years so many pseudo gurus have misused Ayurveda to make money. That should not be a blemish on the system at all. I suggest you remove the connection between Ayurveda and Chopra in the next edition. Briefly mentioning is alright, but Ayurveda was not founded nor enriched by Chopra.

Best regards,

Gopi Nathan

Norway

PS: I am not a believer or supporter of godmen or miracle healers.

reply: I think my readers understand that Chopra and the Maharishi Mahesh Yogi are using Ayurveda for their own purposes.

Aztec (New Mexico) UFO Hoax

The Aztec UFO Hoax was the work of *Variety* columnist Frank Scully who was hoaxed by two con men, Silas M. Newton and Leo A. Gebauer. Scully liked the hoax so much he wrote a book based on it: *Behind the Flying Saucers*. Scully claimed that a UFO had landed in Hart Canyon 12 miles northeast of Aztec in March of 1948 and sixteen humanoid bodies were discovered at the crash site inside a metal disk that was 99.99 (not 100) feet in diameter. A conspiring military secretly removed the craft and the bodies for their sinister research. No one in the area noticed the crash or the military activity, however. With no witnesses, Newton and Gebauer could play wildly with the truth.

Newton and Gebauer were involved in oil exploration finance schemes. Their hoax was perpetrated to get investors. They claimed they had built a machine that would find oil and natural gas deposits using alien technology. J.P. Cahn of the *San Francisco Chronicle* had some of the "alien" metal tested and determined it was aluminum. Cahn's account of the phony alien ship appeared in *True* magazine in 1952. Several people who had been swindled by Newton and Gebauer came forward. One of their victims, Herman Glader, a millionaire from Denver, pressed charges and the pair was convicted of fraud and related charges in 1953. (They had charged \$18,500 for a "tuner" which could be bought at surplus stores for \$3.50 at the time.)

The Aztec story was revived in 1986 by William Steinman and Wendelle Stevens in their privately-published book called [UFO Crash at Aztec](#). It was revived again in 1998 when Linda Mouton Howe, a UFO and Art Bell mainstay, claimed she had government documents that proved the Aztec crash. What she had was a rumor eight times removed from the source, Silas Newton, that eventually ended up in a memo written to J. Edgar Hoover. Newton told George Koehler about 3-foot tall aliens and their saucer; Koehler told Morley Davies who told Jack Murphy and I. J. van Horn who told Rudy Fick who told the editor of the *Wyandotte Echo* in Kansas City where it was read by an Air Force agent in the Office of Special Investigations who passed on the story to Guy Hottel of the FBI who sent a memo to his boss (Thomas).

The citizens of Aztec have seen how [Roswell](#) has turned UFO mania into a profitable tourist attraction and have followed suit. In March of 2000 they celebrated their 3rd annual Aztec [UFO Festival](#). The festival was started as a way to raise money for the town's library. There must be a better way.

Bach's flower therapy

15 May 1999

As an author and internationally certified Bach Flower Essence Practitioner, I must question your description of the Bach Flower Essences as a "type of homeopathic aromatherapy."

In what regard do you mean it is a form of aromatherapy? Although the Bach Flowers can be used integratively with Aromatherapy (Essential Oils), the flower essences do not affect the sensory organs in any way...neither by smell or by massaging on the skin using a carrier oil.

By using the expression "homeopathic aromatherapy" the reader may get a false impression.

reply: You are probably right, but since I cannot find a consistent use of the term 'aromatherapy' by those who practice it, and since much of what goes by the name of aromatherapy involves rubbing "essential oils" that may be eaten, used in a bath, drunk, rubbed on, and, for all I know, intuited, I have used this infelicitous expression. It is difficult to classify Bach's therapy, but I think it differs from much of what is called aromatherapy in that it is homeopathic. Hence, my description as it being a type of homeopathic aromatherapy. Perhaps it should be called a type of homeopathic mysticism.

[Jack Raso](#) describes your art as a "quasi-homeopathic system of pseudodiagnosis and pseudotherapy." Would that be more accurate?

The Bach Flower Essences are homeopathically-prepared liquids...with no direct relation to aromatherapy as far as I know. The flower essence liquids contain no physical components of the plant or flower from which it comes. It is therefore much safer than essential oils (aromatherapy).

reply: This is probably true. In fact, both are probably safer than drinking the tap water in my town.

The Bach Flower Essences are the only flower essences in the world approved for sale by the US FDA. They are listed in the US Homeopathic Pharmacopoeia.

Alicia Sirkin

Certified Bach Flower Essence Practitioner Registered with the Edward Bach Foundation

reply: Why would the FDA approve what it cannot test? Or does the FDA now believe that plants have souls?

Backster effect

The alleged power of plants to understand human thought by reading bioenergetic fields. It is named after Cleve Backster for his work on [plant perception](#).

Last updated 09/19/02

[backwards Satanic messages](#)

plant perception (a.k.a. the Backster effect)

Plants are living things with [cellulose](#) cell walls, lacking nervous or sensory organs. Animals do not have cellulose [cell](#) walls but do have nervous or sensory organs.

It would never occur to a plant or animal physiologist to test plants for consciousness or [ESP](#) because their knowledge would be sufficient to rule out the possibility of plants having feelings or perceptions on the order of human feeling or perception. In layman's terms, *plants don't have brains or anything similar to brains.*

However, a person completely ignorant of plant and animal science has not only tested plants for perception and feeling, he claims that he has scientific proof that plants experience a wide range of emotions and thoughts. He also claims that plants can read human minds. His name is [Cleve Backster](#) and he published his research in the *International Journal of Parapsychology* ("Evidence of a Primary Perception in Plant Life," vol. 10, no. 4, Winter 1968, pp. 329-348). He tested his plants on a [polygraph](#) machine and found that plants react to thoughts and threats.

[Dr. Backster](#) claims to have a D.Sc. in Complementary Medicine from Medicina Alternativa (1996). He has parlayed his doctorate into a position at the [California Institute for Human Science Graduate School and Research Center](#), an unaccredited institution founded by Dr. Hiroshi Motoyama for the study of "the human being as tridimensional." Dr. Motoyama is said to be a scientist and Shinto priest who "has awakened to states of consciousness that enable him to see beyond the limits of space and time."[*](#)

Backster's claims were refuted by Horowitz, Lewis, and Gasteiger (1975) and Kmetz (1977). Kmetz summarized the case against Backster in an article for the *Skeptical Inquirer* in 1978. Backster had not used proper controls in doing his study. When controls were used, no detection of plant reaction to thoughts or threats could be found. These researchers found that the cause of the polygraph contours could have been due to a number of factors, including static electricity, movement in the room, changes in humidity, etc.

Nevertheless, Backster has become the darling of several [occult](#), [parapsychological](#) and [pseudoscientific](#) notions. His work has been cited in defense of [dowsing](#),[*](#) various forms of "energy" healing,[*](#) [remote viewing](#),[*](#) and the [Silva mind control](#) program (now known as the Silva method). In

1995, Backster was invited to address the [Silva International Convention in Laredo, Texas](#). Nearly thirty years after his original "discovery," he is still telling the same story. It is a very revealing story and worth repeating. It shows his curious nature, as well as his apparent ignorance of the dangers of [confirmation bias](#) and [self-deception](#). Backster clearly does not understand why scientists use [controls](#) in causal studies.

the "lab" & the Eureka! experience

Backster tells us that it was on February 2, 1966, in his "lab" in New York City that he did his first plant experiment. His "lab" was not a science lab. In fact, it wasn't much of a lab at all in the beginning. It was just a place where he conducted training in the use of the [polygraph](#). There was a plant in the room. He recalls the following:

For whatever reason, it occurred to me that it would be interesting to see how long it took the water to get from the root area of this plant, all the way up this long trunk and out and down to the leaves.

After doing a saturation watering of the plant, I thought, "Well gee whiz, I've got a lot of polygraph equipment around; let me hook the galvanic skin response section of the polygraph onto the leaf.*"

The [galvanic skin response](#) (GSR) section of the polygraph measures the resistance of the skin to a small electrical current. Defenders of the polygraph think that galvanic skin responses are related to anxiety, and therefore to truthfulness. The theory is that when a person lies they are anxious and the amount of sweat increases slightly but measurably. As sweat increases, the resistance to electrical current decreases. Clearly, Backster is a very curious individual. A less inquisitive person would probably not care how long it would take water to get from the root to the leaves in an office plant. Not only did Backster care but he put his polygraph equipment to use as a measuring device. He reasoned as follows:

I felt that as the contaminated water came up the trunk and down into the leaf that the leaf becoming more saturated and a better conductor it would give me the rising time of the water....I would be able to get that on the polygraph chart tracing.

Why would the polygraph indicate this? Because, he says, he was using a "whetstone bridge circuit that is designed to measure resistance changes." Presumably, resistance changes would be picked up by the polygraph as the water reached the leaf. He predicted that the resistance would slowly drop and

the tracings on his polygraph paper would rise as the water reached the leaf. Instead, the opposite happened, which, he says, "amazed me a little bit."

Apparently, he moved the electrodes and saw that the contour of the polygraph chart was "the contour of a human being tested, reacting when you are asking a question that could get them in trouble." Backster claims that he then gave up his interest in measuring how long it takes water to get from the roots to the leaves of his plant. He says he believed that the plant was trying "to show me people-like reactions." He claims his next thought was: "What can I do that will be a threat to the well-being of the plant, similar to the fact that a relevant question regarding a crime could be a threat to a person taking a polygraph test if they're lying?" This is truly amazing. The contour of the graph triggered in him an immediate identification of the plant with one of his subjects. Until that moment, apparently, Backster had never suspected that the plants in his office were just like people and would respond similarly. Why he thought of threatening the plant isn't quite clear. I doubt that he threatened his human subjects. It also is not quite clear why the response to a threat to one's well-being would result in the same kind of response as being caught in a lie. At least Backster seems not to have considered seriously the notion that the plant might try to deceive him.

Backster says he tried for 13 minutes and 55 seconds to get a reaction out of the plant by doing such things as dipping a leaf in warm coffee, but he got no response. A less devoted inquisitor might have given up and gone home at this point, but not Backster. He concluded that the plant seemed like it was bored. Then, he had his Eureka! experience: "I know what I am going to do: I am going to burn that plant leaf, that very leaf that's attached to the polygraph." Now, why he would burn the leaf isn't clear, since burning it would (a) eliminate its moisture, making measurement of galvanic response impossible, and (b) it might damage his equipment attached to the leaf. Anyway, he tells us that there was a problem with carrying out his plan: he didn't have any matches. He claims, however, that while standing there some five feet from the plant the polygraph "went into a wild agitation." Rather than conclude that maybe the water finally got to the leaf or some other natural event was causing the polygraph needle movements, Backster became convinced that the plant was reading his mind and was reacting to his intent to burn it. This is indeed an interesting inference to make at this point. He gives no indication that he even considered that there might be other possible explanations for the movement of his polygraph. This may strike some readers as a good thing, that a gifted mind immediately grasps the truth. But actually this is a bad thing because your intuition could be wrong. What is very curious is that after more than thirty years of experiments, there is still no evidence that Backster and his many supporters see the importance of using controls in their studies of alleged plant perception.

Anyway, to return to the original experiment: Backster admits that he committed a bit of petty larceny in the name of science: he went to another office, went into a secretary's desk drawer and retrieved some matches. When

he got back to his experiment, he lit a match, but careful and observant scientist that he was, he realized that the machine was so agitated he wouldn't be able to measure any additional agitation. So, he left the room. When he returned "the thing just evened right out again, which really rounded it out and gave me a very, very high quality observation." What he meant by "a very, very high quality observation" is not clear. Backster's true genius is exhibited in his final remark on the remarkable experiment:

Now when my partner in the polygraph school we were running at the time came in, he was able to do the same thing also, as long as he intended to burn the plant leaf. If he pretended to burn the plant leaf, it wouldn't react.

It could tell the difference between *pretending* you are going to, compared to when you actually intend to do it, which is quite interesting in itself from a plant psychology standpoint.*

Plant psychology? I think Backster invented it that night. Had he just a smattering of understanding regarding the importance of using controls for studies which try to establish causality, he might have proceeded differently. The first step is to clearly define what you are testing and what each step in the procedure consists of. Backster and his partner don't have a clear notion of the difference between intending to burn the plant and pretending to be intending to burn the plant. Next, it might have occurred to them that there might be a better way to measure electrical current in plants than using a polygraph. They might have consulted with some experts and set up an experiment with proper equipment. Once they clarified what they were testing and how they would test it, they might have done twenty runs with the secretary doing the intending or pretending, them not knowing which, and them collecting the polygraph data. They would tell a third party which runs indicated pretending and which runs indicated intending. The third party would compare their claims with the secretary's data. That third party would also make sure that the polygraphers wouldn't be able to see what the secretary was doing during the experiment, lest they be influenced by something in her behavior. Then, just to be sure that it wasn't some movement the secretary made when she intended to burn the plant that caused the polygraph reaction, she should be made to make exactly the same movements when she intended and when she pretended to burn the plant. He should have done several trials with several different plants. And he probably should not have watered his plant just before doing the experiment. He should have known that moisture or humidity changes would affect the GSR readings. The fact is that Backster has never done anything like a controlled experiment and is no closer today than he was in 1966 to understanding why his polygraph made the contours it did when it was attached to his plant. Backster's admirers can truthfully say that his experiment has been repeated thousands of times around the world. Unfortunately, repeatability justifies claiming an outcome is probably true only if the original experiment was done properly.

sowing and reaping

Backster's claims have been publicized and supported by several people with qualifications and knowledge equal to his own: [journalist](#) Peter Tompkins and [gardener](#) Christopher O. Bird authored *The Secret Life of Plants* published in 1989, a presentation of the work of Backster and other "scientists" which allegedly proves that plants perceive [telepathically](#) and experience emotions such as fear and love. Bird is the author of *Modern Vegetable Gardening* and Tompkins has several "secrets" books: *Secrets of the Great Pyramid* (1997), *The Secret Life of Nature: Living in Harmony With the Hidden World of Nature Spirits from Fairies to Quarks* (1997) and *Secrets of the Soil: New Solutions for Restoring Our Planet* (1998).

Another supporter and expositor of Backster's work is Robert B. Stone, Ph.D., member of [Mensa](#), and author of *The Secret Life of Your Cells* published in 1994. Stone is also the author of the [Silva Method](#) (Jose [Silva's](#) mind control and self-healing program) and the [Silva Method: Unlocking the Genius Within](#). Stone and Silva authored one book together: [You the Healer](#). However, if one searches the literature of science, one searches in vain for support for the notion that plants are telepathic and feel emotions.

Despite the lack of scientific support for the notion of plant perception, the idea is accepted by many as not only true but as having been verified by numerous scientific studies! In fact, the power of plants to understand human thought by "reading" our "bioenergetic fields" is known among parapsychologists as *the Backster effect*.*

Typical of the testimonials in defense of Backster's claims are the following. Notice how they echo the claim that Backster's experiment has been duplicated many times by many different people. Notice, too, that like good storytellers these advocates embellish the tale with some interesting exaggerations. None of these testimonials, however, mentions the critical studies that both failed to verify Backster's claims and also explained why his studies were flawed.

Cleve Backster used a polygraph (lie-detector) to test plants, attaching electrodes to the leaves. By recording electrical impulses he found the plants to be extremely sensitive to his thoughts, particularly thoughts that threatened their well-being. Backster also observed a reaction in a plant when even the smallest cells were killed near it. He noted that they have a kind of memory, reacting to someone who earlier had done harm to another plant nearby: in a line-up of anonymous people the plant could pick out the one who had performed the act (John Van

Mater, theosophist).*

Cleve Backster was also famous, notorious in fact, and had been since about 1968 when he first claimed that plants have primary perceptions which can sense human thoughts and respond to them. This was the same as saying that PLANTS have sentient consciousness, are telepathic, and can process non-physical information. This, of course, absolutely shocked, angered and horrified scientists of all kinds, and Backster was pilloried in the media -- much to the enjoyment of hard-core parapsychologists who, back then, had nothing good to say about him.* To help correct this dismal rejection of Backster, it wasn't until the late 1980s that neurobiologists discovered and confirmed that plants do possess "primary perceptions" because they have "rudimentary neural nets."* [This claim from Ingo Swann is pure codswallop. Neurobiologists do not study plants and you will search in vain through the annals of neurobiological literature for verification of the Backster effect.]

....[map dowsing](#) has just as simple an explanation as on-site dowsing. Map dowsing seems to be related to what is sometimes called the "Backster Effect." Backster is a lie detector specialist and what he did was to attach a galvanic skin response device to the top leaf of a plant. This device measures the electrical resistance of the skin. He then watered the plant, fully expecting to measure how long it would take for the water to reach the leaf and change its resistance. Instead the lie detector immediately indicated, what would be a happy effect in humans. This puzzled him so he decided to traumatize the plant by burning, a leaf. The plant showed a fear response on the lie detector as soon as he had this thought. Backster's experiments have been duplicated thousands of times by many persons using many variations and have been well publicized on TV and in many books (Walt Woods, map dowser and author of the 20-page booklet *Letter to Robin: A Mini Course in Pendulum Dowsing*).

Backster's work in the late '60s and early '70s was an

important impetus for the best selling *The Secret Life of Plants* by Peter Tompkins and Christopher Bird. In the '80s, his work was chronicled by Robert Stone in *The Secret Life of Your Cells*. His research journey started with the 1966 almost accidental rediscovery that plants are sentient and respond to the spontaneous emotions and strongly expressed intentions of relevant humans. (J. Chandra Bose* of India had demonstrated a similar principle in the early part of the 20th century.) Using an instrument to measure galvanic skin responses (GSR), a part of his polygraph or lie detector stock-in-trade, Backster attempted to determine whether it would measure the moment of rehydration of a plant whose roots were freshly watered. It did not but to his surprise, the GSR meter registered his threat to burn the plant leaf when he spontaneously thought of the idea....

Over the last thirty years literally hundreds of experiments have proved the existence of this biocommunication known as the "Backster Effect." My own personal participation in one of these experiments left me without a doubt that a culture of yogurt in a shielded cage showed extraordinary reactions to feeling that were stirred up in me and two female colleagues as we discussed controversial gender and power issues. Interestingly, the yogurt did not react to periods of intellectual discussion about the same issues; it only became agitated when our comments were charged with emotion (Paul Von Ward, MPA and M.S., researcher and writer in the fields of "consciousness and frontier science").*

In 1969 Marcel [Joseph Vogel] gave a course in creativity for engineers at IBM. It was at this time that he read an article in Argosy magazine entitled "Do Plants Have Emotions?" about the work of polygraph expert Cleve Backster into the responsiveness of plants to human interaction. Despite initial rejection of the concept of human-plant communication, he decided to explore these strange claims.

He was able to duplicate the Backster effect of using plants as transducers for bio-energetic fields that the human mind releases, demonstrating that plants respond to thought. He used split leaf philodendrons connected to a Wheatstone Bridge that would compare a known resistance to an unknown resistance. He learned that when he released his

breath slowly there was virtually no response from the plant. When he pulsed his breath through the nostrils, as he held a thought in mind, the plant would respond dramatically. It was also found that these fields, linked to the action of breath and thought, do not have a significant time domain to them. The responsiveness of the plants to thought was also the same whether eight inches away, eight feet, or eight thousand miles! Based on the results of the experiments the inverse square law does not apply to thought. This was the beginning of Marcel's transformation from being a purely rational scientist to becoming a spiritual or mystical scientist.

Basically it was found that plants respond more to the thought of being cut, burned, or torn than to the actual act. He discovered that if he tore a leaf from one plant a second plant would respond, but only if he was paying attention to it. The plants seemed to be mirroring his own mental responses. He concluded that the plants were acting like batteries, storing the energy of his thoughts and intentions. He said of these experiments: "I learned that there is energy connected with thought. Thought can be pulsed and the energy connected with it becomes coherent and has a laser-like power."(Rumi Da, purveyor of fine crystals).*

In the seventies, a best-selling book called *The Secret Life of Plants* presented scientific research from around the world that explored plant intelligence. The chapter which made the biggest impression on me described a retired policeman in New York City, Cleve Backster, who trained people how to use lie detectors. As a lark, he hooked up his plants to a polygraph so he could monitor their responses.

One day, Backster approached his *Dracaena Massangeana* with a lighted match and acted as if he were going to burn it. Not only did the plant go wild on the graph but every other plant in the place did, too. He could hardly believe it. Continuing to experiment, he discovered that the plants responded to his thoughts even when he was miles away. One day, on the New Jersey Turnpike, he decided to let them know, through thought, that he was on his way home. When he arrived, he found that the plants had responded excitedly on the graph at the exact time he was communicating to them. Proximity was not a factor in their ability to sense him!

Everyone can develop this skill and ability. We all have it within us. All we have to do is acknowledge the possibility of it being true and then proceed with an open mind and heart (Judith Handlesman, spiritual gardener and vegetarian).*

Clearly, Backster has his followers and they think he has done fundamental and extraordinary work in science. Why hasn't he been awarded his Nobel Prize? Why does nearly the entire scientific community ignore him? The answer should be obvious. Nevertheless, Backster continues his work at the Backster Research Center in San Diego, California, where he claims to be able to demonstrate that his plants respond to his loving thoughts and even obey his thought commands.*

Ingo by jingo!

One of Backster's greatest admirers and defenders is [remote viewing](#) promoter [Ingo Swann](#) ("Remote Viewing - The Real Story"). Swann is the one quoted above who falsely claims that Backster's work was vindicated in the 1980s by neurobiologists when it was discovered that plants have neural networks. In 1971, according to Swann, Backster invited him to his plant lab and polygraph school. There Ingo claims he, too, made the polygraph needle hooked up to the plant "go haywire" when he thought of burning the plant with a match. He was able to repeat the event several times and then he couldn't get a response. Swann recalls the event and comes up with what he and Backster think must be the logical conclusion. Of course, neither one of them thinks they could be mistaken or deceived. It does not occur to either of them that they had better set up some controls.

"What does THAT mean," I asked. "You tell me." Then a very eerie thought occurred to me, so astonishing that it caused goosebumps. "Do you mean," I asked, "that it has LEARNED that I'm not serious about really burning its leaf? So that it now knows it need not be alarmed."

Backster smiled. "YOU said it, I didn't. Try another kind of harmful thought." So I thought of putting acid in the plant's pot. Bingo! But the same "learning curve" soon repeated itself. Now I already understood in my own "reality" that plants are sentient and telepathic, as all plant lovers know who talk to their plants. But that plants could LEARN to recognize between true and artificial human intent came as a thunderbolt! Among all this astonishment I came across the concept of the "learning curve" which ultimately was to play THE feature role in the development of remote viewing.

But Backster was moving on. "Do you think you could

influence some kind of metal or chemical?" "I don't know how to influence anything. But I could try." So for several weeks I went to the Times Square lab to try to zap metals and chemicals -- and the march of what I was unknowingly being sucked into moved into October, 1971.*

This kind of amateur approach to experiment and naive reinforcement of speculations as if they were facts established by incontrovertible evidence is typical of Backster and his supporters. A knowledgeable scientist would never be taken in by such rudimentary reasoning and speculation. But a scientifically ignorant person could easily be duped by these experiments.

the Backster effect and primitive religion

Jim Cranford is another defender of Backster, whom he sees as providing proof that animistic religions truly did involve communicating with vegetation.

Although similar experiments [to Backster's] have been repeated thousands of times, all over the world, for more than 15 years, we have failed to grasp the implications. Part of the problem is that Backster is not a "scientist" and those guys don't like to admit that anyone else knows anything. That's pride and arrogance at its worst, but not so unusual in the laboratory. Even the rest of us find it hard to believe that the "primitives" were actually communicating with their plants through rituals and sacrifice. We simply refuse to believe that there could be any "intelligence" around here but us, while we live in a world smarter than us at every turn. It is obvious that our collective view of primitive religion is in need of some revision.*

At least Cranford recognizes that Backster is not a scientist. "Those guys" would require controls when they do causal studies.

Backster and theosophy

Another advocate of Backster's ideas is [theosophist](#) John Van Mater, Jr., who thinks that Backster's work supports the notion that

...there is a life force, a cosmic energy surrounding living things, shared by all kingdoms including the human....Nature is a great brotherhood of beings, a symbiosis on many levels, most of it beyond our detection and ordinary understanding. The vegetable kingdom is an essential layer of the living planet's vitality or [prana](#),

helping to provide in its metabolism a breathing, intelligent organ that produces and regulates the atmosphere as well as transfers energy into the biosphere. Plants are also a link in the chain of beings, in which each kingdom or level needs the others in order to function and evolve. (See "[Our Intelligent Companions, the Plants,](#)" John Van Mater, Jr., *Sunrise* magazine, April/May 1987 published by [Theosophical University Press](#).)

Thus, Backster's shoddy science is brought in to support metaphysical notions to go along with his support for dowsing, energy healing, telepathy, remote viewing and who knows what else.

scientific support?

Although mainstream science has shunned Backster's claims about [telepathic](#) plants and their "primary perception," [Earthpulse.com](#), a New Age UFO/Environmentalist site that sells "frontier science" books, allegedly found a botanist named Richard M. Klein from the University of Vermont to provide a blurb for *The Secret Life of Plants*.

If I can't 'get inside a plant' or 'feel emanations' from a plant and don't know anyone else who can, that doesn't detract one whit from the possibility that some people can and do....

Truer words were never spoke. However, a search of the University of Vermont's web site failed to find any member of the botany department or any other other department named Richard M. Klein. Maybe Mr. Klein has been abducted by aliens. Or perhaps he is working with Mr. Backster on how to properly conduct a double-blind controlled study. After all, Backster may have finally found a proper use for the polygraph.

***note1: It is interesting that John Kmetz had a different reading of the media. Kmetz writes: "It is unfortunate that the popular press has taken Backster's experiments and presented the results to the public in such a way that many people now believe plants can do something that, in fact, they cannot. The press, for the most part, never mentions that articles on the Backster effect are based on observations of only seven plants. Perhaps they need to be reminded, again, that they are making exaggerated claims from an experiment that no one, including Backster, by his own refusal to do so, has been able to replicate."**

backward satanic messages (backmasking)

An alleged practice of certain evil people, especially rock musicians, of saying or singing words which, when listened to backward contain evil messages such as "My sweet Satan"* or "Kill yourself."

Since most people do not listen to their music backward, the belief in such messages seems to be predicated upon one or two false notions. Either [1] the brain can be influenced subliminally by garbled words whose meaning is directly grasped by the subconscious or [2] the conscious mind translates clear speech into [reverse speech](#) where the "true" meaning is understood by the subconscious mind. In either case, the subconscious mind allegedly then directs the conscious mind to believe bad things or do bad deeds. There is no evidence that such mechanisms exist.

The belief in the existence and efficacy of backward satanic messages probably derives from the ancient practice of mocking Christianity by saying prayers backward at the witch's Sabbath. The belief is mainly popular among certain fundamentalist preachers who cannot look at anything without wondering how [Satan](#) is involved.

The Beatles used tapes played backward for musical effect in some of their recordings, though they allegedly put in backward or subliminal messages announcing Paul McCartney's death when he was much alive. Jimmy Page, guitarist and occultist, is said to have inserted the backward message "here's to my sweet Satan" into his "Stairway to Heaven." The former was clearly intentional; the latter is said to be accidental by many of those who have listened but have not heard. It is likely that many listeners are hearing what they want to hear or are hearing what others tell them they will hear.

One practical problem emerged with using this backhanded way to communicate: the only way to hear the messages is to destroy your record. There were at least two benefits to such destruction, however: the increased sales of records and the birth of rap music. Nowadays, however, computers come with standard programs like Sound Recorder for Windows that let you play any .wav file in reverse, thus making it simple to listen to your favorite tunes backward if you are so inclined.

reverse speech

"The implications are mind boggling because reverse speech opens up the Truth. " --David John Oates (a.k.a. *Stone Adjective* or *Stow Nods-of-aid*.)

***The truth is a lie told backwards.*--Llorrac Trebor**

Reverse speech is a form of communication arising from the unconscious mind, according to [David John Oates](#). The unconscious mind, says Oates, is a seat of deep truths, inexorable honesty and hidden meanings. Oates, who credits himself with the discovery of reverse speech, says that the unconscious mind sends out backwards messages to the conscious mind every 10 to 15 seconds. The conscious mind then reverses the reverse message and directs us to speak in forward speech. To grasp the real meaning of our speech we must tape it and play it backwards.

Oates claims that reverse speech is a

form of human communication that is automatically generated by the human brain. It occurs every time we speak and is imbedded backwards into the sounds of our speech. This previously undiscovered function of the mind is the mind's own independant [sic] voice speaking from the deepest regions of consciousness ... forward speech is from the left brain and Reverse Speech is from the right brain.

Mr. Oates claims to have made many discoveries, including that children learn to speak backwards before they learn to speak forwards. He believes that what most of the world has taken to be babbling is actually deep thought from the unconscious minds of infants

Oates is an Australian who calls himself Reverse Speech Enterprises™. He started on his road to discovery by dropping a tape recorder in the toilet while shaving. He "fixed" the recorder, but henceforth the recorder would only play in reverse. However, this electronic incompetence was not without its rewards. He was ready, he says, when teenagers asked him about backwards Satanic messages in rock music. He could play tapes for them and search for the hidden messages. The rest, as they say, is history. Oates not only found Satanic messages in rock music, he found that if one listens very carefully, one can hear reverse messages in every bit of communication that uses words. For twelve years he labored at uncovering the secret of reverse speech. Now

he is ready to share his discoveries with the rest of the world--for a price.

Mr. Oates has immigrated to Bonsall, California, where he offers to train anyone to be a reverse speech analyst for a mere \$4,500, plus a few hundred more for a Reversing Machine™, several tapes, and a study guide which must be purchased separately. (He's now back in Australia, still charging [hefty fees for his courses.](#))

Mr. Oates sells tapes for about \$10 each with examples of reverse speech from O.J. Simpson, rock music stars, celebrities, and politicians. He also sells books with catchy titles like Beyond Backward Masking: Reverse Speech and the Voice of the Inner Mind (which, in reverse, sounds something like Dante Rentifor: anchovy tulip server by Stone Adjective). This book has an appendix on UFOs, as well.

Oates claims that "reverse speech is the voice of truth" and "If a lie is spoken forwards, the truth may be spoken backwards....It can be used as a truth detector. It will reveal the truth if a lie is spoken and it will reveal extra facts if they are left out, for example, the name of an accomplice in crime or the location of evidence." This claim is reminiscent of certain advocates of [neurolinguistic programming](#) who claim they can tell when a person is lying by that person's eye movements. At least with Oates we can avoid detection by speaking only in palindromes.

He also claims 95% of our thoughts are "are below consciousness" and

reverse speech can describe unconscious subjects such as personality patterns and behavioral agenda, it can reveal hidden memory and experiences, and it can also describe the state of the physical body. At the deepest levels of human consciousness, Reverse Speech also describes the state of the human soul and our relationship with God.

He also claims most reverse speech is metaphorical and is communicated in pictures or parables, "similar to dreams."

Furthermore, reverse speech analysis

...can be used as a therapeutic tool for psycho analysis [sic]. Its metaphors will give a detailed map of the mind and often pinpoint precise reasons and cause [sic] for problems experienced. Used in conjunction with hypnosis it can be used as an extremely powerful and permanent [sic] form of behavioral change.

Employers can use it for employee selection, lawyers for deposition analysis, reporters for politicians [sic] speeches. Its applications are endless.

As with his other claims, Oates provides no support for these notions. However, there is considerable evidence against him.

Some of his claims are empirical and can be checked against what neuroscientists and physiologists have discovered in their study of the brain and speech development. For example, his notion about reverse speech occurring in the right brain is not supported by empirical study. In any case, if the right brain were a source of reverse speech functioning, as Mr. Oates claims, one would expect to see brain activity in the right brain just prior to the activity in the left brain when speech occurs. Where is the evidence that this happens? And where is the evidence for his claims about infants and speech, claims which contradict everything that is known about the development of the human brain and speech in children? To believe Mr. Oates is to reject science or, at the very least, it is to reveal one's ignorance about some fundamental neurological and physiological facts.

One must also wonder what evolutionary value reverse speech would have. It is estimated that it was about 100,000 years ago that humans developed spoken language. One has no difficulty in seeing the utility of speech to the survival of the species. But what possible utility could there be in reverse speech? It is difficult to imagine something so useless taking up a good portion of the history of the evolving brain. Furthermore, if there is a reverse speech, there must be a reverse speech grammar. What is it and how is it known?

Some of Oates' claims are quasi-empirical. For example, his beliefs about the unconscious mind seem to have an empirical grounding in the fact that a person's behavior can be affected by memories of which the person is unconscious. There is substantial evidence of implicit memory in the neuroscientific literature. But the claim that 95% of our thoughts are below the level of consciousness--which implies that most of our memories are implicit memories--seems non-falsifiable. How would one test such a claim? The claim that the unconscious mind contains data which reveal hidden truths about a person's behavior and personality, as well as one's physical and spiritual health, is highly questionable. It seems to be based on wishful thinking rather than scientific evidence.

Nevertheless, Mr. Oates gives some specific examples of how his theory works. For example, he claims that when Bill Clinton says "I try to articulate my position as clearly as possible" he really means "She's a fun girl to kiss." How does Oates know this? He "knows" this because that is how it sounds to him in reverse, or that is what the metaphors mean. We cannot prove him wrong. If it does not sound like that to us or if we don't grasp the metaphors, it

is because the messages "are very quick and fast and are often hidden in the high tones of speech. For this reason speech reversals are very easily missed by most researchers." Furthermore, he says the untutored are not familiar with the language of metaphor. (He has two books that can help us here.) These are not [ad hoc hypotheses](#), according to Oates. Furthermore, once he has told you that the reverse speech you are about to hear is "She's a fun girl to kiss", you are likely to "hear" that, regardless of how garbled the message sounds. Call it the power of suggestion or [pareidolia](#) for the ears. Call it anything but worth investigating much further. If Mr. Oates went on Larry King or Oprah and claimed that their speech revealed that they were actually child molesters, Oates would have no audience and people would recognize him for what he is. Yet, he will be taken seriously when he says that Patsy Ramsey's forward speech "We feel that there are at least two people on the face of the earth that know who did this [i.e., murdered her daughter] and that is the killer and someone else that person may have confided in" is actually reverse speech for "I'm that person. Seen that rape." (On December 26, 1997, Oates had his first daytime TV appearance on the Geraldo show discussing the Ramsey case.) Oates is taken seriously because he is an entertaining novelty feeding the lust for trash gossip which passes as news and information in our society.

The academic world has so far ignored his great discoveries, though he claims that he has the support of some academics who fear to speak out. Mr. Oates bemoans his fate: "Have we not yet learned from the lessons of history? Many of our great discoveries have come from outside of mainstream [sic]. Einstein, for example, was a high school-drop out." (Actually, Einstein was kicked out of high school and eventually finished his schooling in Zurich, including a Ph.D. from the University of Zurich.) His proposals to test his theory have been rejected by universities not because the university establishment is closed-minded, but because Oates' theories belie a profound ignorance of fundamental matters in neuroscience and physiology. Furthermore, a good chunk of his theory is untestable metaphysics, psychobabble and gobbledygook.

Mr. Oates resembles a person who is modeling himself after Bandler™ and others in the [neurolinguistic](#) programming movement. They have found that self-confidence and the ability to understand is so diminished in so many people that the more unintelligible a person's communication is the more likely it becomes that that communication can be trademarked and profitably marketed as a gateway to the secret of life.

Aleister Crowley (1875-1947)

Crowley was a self-proclaimed drug and sex "fiend", i.e., a person of great wickedness; a mostly self-published author of books on the occult; a poet and mountaineer; a leader of a cult called [Ordo Templi Orientis \(OTO\)](#) whose tenets he detailed in one of his many writings, *The Book of the Law*, which contains his version of [the Law of Thelema](#). Crowley claimed he [channeled](#) the book for a "praeterhuman intelligence" called Aiwass.

Do what thou wilt shall be the whole of the Law is his motto for OTO. In practice, for Crowley this meant rejecting traditional morality in favor of the life of a drug addict and womanizer. ("I rave; and I rape and I rip and I rend" is a line from one of his poems. *Diary of a Drug Fiend* is the title of one of his books.) He claimed to identify himself with the [Great Beast 666](#) (from the *Book of Revelation*) and enjoyed the appellation of "wickedest man in the world." He had two wives; both went insane. Five mistresses committed suicide. According to Martin Gardner, "scores of his concubines ended in the gutter as alcoholics, drug addicts, or in mental institutions" (Gardner, 198). However, Crowley should not be blamed for destroying the virtue of saintly young girls. His allure was such that the women who were attracted to him tended already to be alcoholics, drug addicts or emotionally disturbed. His allure seems to have consisted of two main qualities: he inherited a fortune and he worked hard at being strange.

Crowley's *Magick in Theory and Practice* is a very popular book among occultists. When Dover publishing was about to release a reprint of the book in 1990, an editor asked Martin Gardner to write a foreword for the reprinting. The 1976 Dover edition had been one of their best sellers. Gardner was an unlikely choice to write the foreword for Crowley's book since he had already written that Crowley was a no-good fraud in his classic *Fads and Fallacies in the Name of Science*. Gardner wrote the foreword and painted a picture of such a cruel, despicable, egotistical mountebank that Dover decided not to reprint the book. The foreword has been published in Gardner's *On the Wild Side*.

Crowley has had little influence on anything significant except perhaps the popularity of putting [backwards messages](#) into musical recordings. The occultist guitarist for Led Zeppelin, Jimmy Page, owns a large collection of Crowley memorabilia and bought Crowley's mansion, Boleskine House, near Foyers, Scotland. Crowley's face is also one of many on the album cover of the Beatles' *Sergeant Pepper's Lonely Hearts Club Band*. While occultists

such as Page are said to have put backwards "satanic" messages into recordings such as "Stairway to Heaven" ("Here's to my sweet Satan"), the Beatles used backwards musical riffs in some of their recordings, apparently more for the musical effect than as an expression of their admiration of Satan.

Says Gardner: "His reputation had been that of a man who worshipped Satan, but it was more accurately said that he worshipped no one except himself."

reader comments:

backwards satanic messages

07 May 2000

Reading your section on backmasking reminded me of my teenage experiments with backmasking... since the advent of sound cards, scanning songs into a .wav file and using a tool to reverse them is easy. There is a LOT more backmasking out there than most people realize. Intentional, and usually humourous. The example often quoted is the Floyd backmasking in Empty Spaces, which for clarification from the other comments, contains this amusing message just before the lyrics start:

"Congratulations! You have just discovered the secret message. Please send your answer to Old Pink, care of the Funny Farm, Charlesfort."

In response to Mr. Starr's comments about the other Floyd song, the song is "Several Species of Small Furry Animals Gathered Together in a Cave and Grooving with a Pict", on the second disk of 1969's "Ummagumma". The entire song is nothing but Roger Water's voice recorded saying a variety of things and having them sped up and slowed down to sound like chattering chipmunk creatures. I never found anything backwards in it, and deciphering it is difficult. One piece that can be heard is a reverbed, highly sped up voice (not backwards) just before the "pict" begins his story in an almost incomprehensible Scottish brogue. It says "That was pretty avant-garde, wasn't it?". It should be noted the second disk of "Ummagumma" was nothing but each of the 4 members being given half a side to fiddle around and do anything they felt like, and Roger was just having fun with that new, sexy late 60's recording gear.

The quote often attributed to Stairway to Heaven occurs during the phrase "Yes there are two paths you can go down, but in the long run there's still time to change the road you're on." Supposedly, backwards it says "It's my sweet Satan, the one whose little path would make me (sad/mad/glad?) whose power is Satan." Yes, if someone tells you about it and points it out, it's quite clear. Especially the "One whose little path" part, sometimes said to say "One who made the path". Nobody in their right mind would attempt to suggest that this was intentional. It's certainly NOT clear enough to hear without coaching. The lyrics and music forwards are clear, intelligible and not garbled in any way to make them take on this meaning backwards. Just an odd coincidence.

Examples of real backmasking include the beginning of "Rocket" on the Def

Leppard album "Hysteria" ("We're fighting with the gods of war", a line from a later song on the album), ELO's song "Fire on High" which contains voices backwards that say "The song is reversible! Is not! Turn it back, turn it back!", Ozzy Osbourne's "Bloodbath in Paradise" in the intro music says "Your mother sells whelks in Hull" backwards (a personal joke, he later mentioned), the last track on Prince's "Purple Rain" which contains the message "Hello. How are you? I'm fine, 'cause I know the Lord is coming soon, coming, coming soon.", and Cheap Trick's "How Are You?" which includes a female reciting the Lord's Prayer on a tape being rewound at high speed in the right channel. There are dozens more. They are all quite clearly some form of backwards or garbled speech when the song is listened to normally.

Examples of backmasking one would have to be very inventive to hear include the message "Marijuana, marijuana, marijuana is fun to smoke" in Queen's "Another One Bites the Dust", "We shot John Lennon" in Yoko Ono's "Kiss Kiss Kiss", "Son of Satan, son of Satan" in Jefferson Starship's "A Child is Coming", and "Yes, Satan had help, he organized his own religion" in The Eagles' "Hotel California". None of these are even remotely clear, and unlike Stairway, are almost impossible to hear even with coaching. It's obvious that puritanical-minded folks who are attempting to convey the evils of rock and heavy metal music with these claims... oh, and those who hate Yoko. :)

Putting backwards or otherwise garbled messages in song is an old and favourite trick of many musicians. It's not for some devious purpose or an attempt to influence the listener subliminally. Usually, it's a joke... sometimes, something done just for fun, and on rare occasion (such as Prince's song) a testimony of faith or delivery of a message... Roger Water's "Amused to Death" contains backwards speeches and news broadcasts throughout, for instance, used to reinforce the message of the album. In all cases where it was placed intentionally into the music, the backwards messages form background noise and not any comprehensible lyrics when heard forwards, and with a little experience backwards messages will jump out at you. Scan it in and reverse the .wav - I guarantee 9 times out of 10 it will give you a laugh.

I'm aware the comments aren't a forum, so I didn't want to include this in my informational message, or the comments section... I don't know WHAT Starr was talking about with that laser audio graphic imaging or whatever, but that fellow deeply disturbs me. I love his stuff about audio tones corresponding to exact color hallucination while under the influence of LSD, "scientifically". One note, yes, if someone puts a vibrating pager or other monotone sound and waves it around in front of your closed eyes, you can figure out what they're spelling, but that's due to our ability to hear in three dimensions, which an album can only duplicate if the listener makes pains to set up their system correctly and a special recording method is used (eg. Roger Waters's "Pros and Cons of Hitchhiking", which has sound effects of buzzing flies and so on that are eerily real when listened to on headphones).

All I can say, is when I was much younger than I am now, I did LSD around

200 times... I bet I listened to "The Wall" and other Floyd albums damn near every time, and never did I see a pink laser pen writing secret messages in the air or on the back of my eyelids. I only wish. :) And "Several Species" doesn't sound any clearer drunk, stoned or otherwise incapacitated. To think someone so obviously disturbed and paranoid working with and "educating" the nation's youth gives me a sick feeling in the pit of my stomach.

Chris Walsh

30 May 1999

Please excuse the last letter if it was not fully clear, but this letter clarifies a few points.

reply: The last letter is not much different from the "clarification", so I have not reprinted it here.

I know you are a busy man so I will make this brief.

My references are available if you find the following worth checking out.

I run a ministry called "Christ's Ministry for Freedom" that publicizes not only backmasking but also more sophisticated forms of recording hidden information and the delivery there of to the human mind for the specific purpose of manipulating the human mind to decisions and beliefs that it would not have normally encountered, been exposed to or held in the minds normal course of editing within its realm of freewill.

I know you want hands on evidence so I will give you a backmasking that is so plain that it is undeniable and it has never been published. If you find it credible then I will show you in the album and others where it is possible that whole books of information are being delivered to the subconscious during one song once a simple key or code has been learned by the mind. It is all documentable and there now in Pink Floyd "The Wall".

During the song, "What shall we use to fill the empty places", you will hear a very hypnotic beat going back and forth from left to right, building in thrust. During this song listen and you will hear the garbled backmasking in the background and if you listen to it backwards it will be a man saying, "Send all answers in care of ole' Pink to (then the address is given but it is distorted and stops)".

This backmasking message is in reference to the info being feed through the other means, such as audio laser graphic imaging or audio holographic imaging. Through this info a psychological game is introduced to the listeners mind that has the victim searching for an answer to a game introduced by the

computer programmer. The address to send the answer to, in the backmasked, is garbled as a cruel joke.

Sound crazy, try me.

Also, look at another album by Floyd, I believe "Metal" and listen to "four small furry animals" and it will sound like someone speaking in tongues, backmasking or just garbled speech. But, if you listen closely, the speech is swirled. Imagine if you were inside of a tornado looking at the swirling wind around you. This is how the speech is recorded so that when you are on drugs or drunk and your mind can be brought into that light-headedness mind swirl you can actually understand the speech. And remember, even if someone is on drugs, they are still Gods children and he wants them set free!

Another method of relaying info is in "The Wall" by Floyd. Listen to the whole album and any time you hear what sounds like a "laser" "buzzing" sound, such as a pager on its vibrate mode being waved around in the air in front of your closed eyes, that moves around in a swirling motion, or circular motion, you have discovered what I call audible "laser graphic imaging". If you use a computer to trace out the motion of this "laser" pen point, writing cursively in the air, you will find that it is not moving around in random circles, but is actually tracing out cursive words in the air. Specifically the title to the album, "Pink Floyd, The Wall" at one point. Once your mind learns how to follow this laser pen in the air you can follow what is being written. Add LSD and you will hallucinate, scientifically, certain colors to specific tones and the tracers will illuminate the laser pen writing in the air in a visible colored "pink" cursive hand writing. Remember, in one song Floyd states "for I have seen the writing on the Wall" and that is exactly what I propose is happening. Books of info is being transferred to the listeners. (Have a person take a pager on its vibrate mode and spell out words in front of your closed eyes and you will be able to pick up on the words being spelled out)

Yes, what I am suggesting is that there can be a holographic album recorded within an audible album. And whatever info is being delivered without the hearers knowledge is limited to the COMPUTER PROGRAMMERS beliefs, values, etc...

I will save the rest of the info for your response. I would ask that you not publish the specific songs and albums yet in that people would expose themselves to this manipulative material and I have not completely gave you everything involved. I believe that if you have any one you know involved in the music industry that can use a computer to analyze music it should not be hard to validate what I have given you here.

I await your answer. Once you have validated my material, I can take you further into a computerized Satanic trip recorded underneath and through the audible music, but with more advanced technology. My purpose is that I am

developing a deprogramming counseling program to deliver people out of the "game" that is placed within their mind through Floyd's albums.

If it sounds crazy, please check out the leads listed and then my references which are available upon request. I hope you are a true scientific critic, for I love the scientific method. Hopefully by challenging you with the scientific method to validate my research, you will use your contacts that have the expensive equipment to validate my findings, save me money and get you a good story and my research out.

In the end, my goal is for a Christian organization that analyzes new and old albums and video's for hidden technical material, not just backmasking, to protect the rights of the individual to be free from coercive methods of recording. Especially entering into the 21st century with all the new technology and the lagging behind, and also lack thereof, of moral and religious ethics and principles.

Check it out and God Bless,
Scott Starr

References from juvenile probation, wilderness program, high school "troubled class" security coordinator, upon request.

reply: Children, avoid *Christ's Ministry for Freedom* and Mr. Starr at all costs. I have no idea why Mr. Starr sent this to me instead of to Art Bell. It frightens me that someone whose brain is in an unknown gear might be working with juveniles.

9 Aug 1999

That was a very interesting letter from Scott Starr regarding subliminal messages in music. He begins by pointing out the Pink Floyd message (which I already mentioned in an earlier letter, further down on the same page), but then goes on to describe how the same album contains holographic writing in the sound effects.

This guy is obviously a left-wing wingnut, and you're right to tell folks to steer clear of him. But don't be so quick to dismiss his "writing" claim. New technologies such as Dolby Surround Sound, AC-3, DTS and Q-Sound are allowing sound engineers to mix audio tracks in such a way as to make sounds appear to emanate from specific locations. So, in theory, it could be possible to "write" a message, similar to the way he describes it. He may have just invented the new 90's version of backwards masking.

There's only a few problems with his theory.

First of all, those technologies were not available when Gilmour and Waters recorded "The Wall", and even if they were, the album isn't published in a format that would allow that sort of playback. It's just in stereo, not in surround sound. I'm a musician, and I know the sort of equipment that was used to record that album. They got those effects using leslies, flangers, delays, tape reversals, and manual panning. None of those techniques allows an engineer to place the audio into a 3-D space. They give a wonderful stereo swirling sound, but only between two channels. So although Scott is discussing an interesting theory, he's used a terrible example.

Secondly, he claims that you can "see" the images of these writings. Tell me, have you ever played the game where you use your finger to draw an image or word on someone's back, then they try to guess what you just drew? It's very difficult to visualize anything that way, let alone something as complex as cursive writing. The audio imaging would be even less distinct to the listener than the back-drawing game. Even if you could pick out the exact locations of each sound, it would be difficult to see any sort of a pattern to the writing. He seems to imply that taking drugs would help, and I don't doubt that taking certain drugs could make you "see" things...

Finally, as with backwards masking, there is no mechanism by which this hidden information could affect the listener. It's assumed that a subliminal message in an audio track could somehow worm its way into the subconscious of the listener, but there's no proof that this can happen. If you can't hear or understand the subliminal information even when you're actively listening for it, then how can it affect your subconscious mind?

Still, it's a fascinating concept. Artists could put written messages into their recordings, and the messages could be decoded with the proper software. It would be like a high-tech version of backwards messages, with many of the same features: There would be deliberate versions, where the artist inserts some kind of satirical message into the sound effects. Then there would be the accidental versions, caused by random combinations of audio effects. People would try to find the messages hidden in the random ones, coming up with results that, like the backwards masking, say more about the listener than about the artist.

18 Aug 1999

I'd like to add some information about Scott Starr's comments on backwards satanic messages. Indeed his belief that the band Pink Floyd put backwards messages in their music is justified. As you mention in your own article, several musicians in the 60s/70s started doing this, and Pink Floyd - who I'd loosely describe as experiential [?] musicians with a sense of humour - were no exception.

What I find interesting is that Scott Starr may not have even heard the backwards messages that he is talking about, since the information he supplies is only partially correct.

The first item he refers to is a message in a song from the album "The Wall". The song is actually called "Empty Spaces", and the backwards message is clearly planted there to parody the whole backwards message idea! The full text of the message, which is a recording of band bassist and chief songwriter Roger Waters, goes like this:-

Roger:

*"Congratulations, You have just discovered the secret message.
Please send your answer to old pink, care of the funny farm,
Chalfont"*

Another voice:

"Roger, Carolyn's on the phone!"

Roger:

"Okay!"

There is nothing sinister here. There are various interpretations of who "old pink" is (supposedly original band member Syd Barrett, who became mentally unstable) but that's hardly satanic. If Scott or anyone else would like to hear the backwards message, it is available all over the web, including at this URL:

<http://members.aol.com/ZyboMan/backward/indexnet.html>

As for the second example given by Scott, I assume the album he refers to when he says "Metal" is the 1971 album titled "Meddle". However, the song he mistakenly refers to as "four small furry animals" (actual title is "Several species of small furry animals gathered together in a cave and grooving with a pict") is not on the Meddle album at all, but from an earlier release called Ummagumma. While the track in question is certainly an unusual piece, there is nothing particularly satanic about it. In fact, the title actually describes the piece quite accurately. The so-called "speaking in tongues" is just someone with a particularly heavy Scottish(?) accent raving almost incoherently. (An attempt to decipher the gibberish is also available at the above web address). There is no backmasking here. The "swirling" noise Scott refers to is a simple analog reverb unit (it was recorded in 1969). The band played a lot with sound effects. This is just one example of such experimentation.

I cannot comment on Scott's "laser graphic imaging". Certainly this is the first I've ever heard of it.

While I'm sure this information will not change the minds of people such as Scott, he could at least research what it is he's condemning. A simple web

search for "Pink Floyd" and "backwards message" reveals a plethora of web sites.

Keep up the good fight,
Chris Solnordal

22 Sep 98

I just read the entry on backwards lyrics in rock music and remembered the following, which I thought you might enjoy.

A few years ago I was at a concert featuring the very fine singer Laura Love. Introducing a song called "The Devil Inside," she confessed to the audience that, "If you play it backwards on your turntable, it says 'Attend church regularly.'"

Eric Brody

17 Dec 1996

Are you sure backwards messages of any kind are in "Stairway to Heaven", or is that one of those sneaky little tacit assumptions that has managed to slip through? [kinda like a lie repeated newt style becomes believable...]

Years ago when I was involved doing Planetarium Laser shows for Laserium, <http://www.laserium.com>, in Pittsburgh at the time, someone on the staff was slightly weirded out at our choice of "Stairway to Heaven" in a Laser Show, because members of his church had heard the dreaded "backwards satanic messages" demonstrated to them by pushing an LP backwards...needless to say, I said far out, let me hear it, or something like that, and took the staff member along for my version of a demo on the planetarium mega sound system after hours. The show tapes were dubs [analog in those days] a few generations directly downstream from the record company masters [Laserium paid royalties for this privilege], and being four channel format [teac a3340s], could be easily reversed. What a disappointment...nada, nothing, no whispers of anything...several playings later we were rolling on the floor laughing, besides the revelation [ha--what a word] it was funny as heck listening to music backwards. This evolved to "after hours backward music gatherings"---disco is indeed improved when played backwards.

Anyhow, long story for the punchline: I would suspect that if anyone has heard backwards messages in "Stairway to Heaven" they are either imagining or somebody further up the chain of their particular church/cult/organization is mixing in something to a demo tape, just to keep the faithful hopping or hoping.

Thoroughly enjoyed my visit to the Skeptic's Dictionary....appreciate the level-

headed approach.

Hans

reply: As you have probably figured out by now, I'm not sure of anything. Maybe if Laserium paid more royalties they might have gotten the bonus messages! Anyway, I think you'll have to ask Martin Gardner; I understand he listens to Jimmie Page in his spare time. Or better yet, read the next letter.

26 Dec 1996

I love the Skeptic's Dictionary. I wanted to comment on the section referenced by the subject "backward (satanic) messages". One of your readers commented:

"Are you sure backwards messages of any kind are in "Stairway to Heaven", or is that one of those sneaky little tacit assumptions that has managed to slip through?"

He continued to describe trying to actually find the alleged backwards section, and was unable to. He asserts that the backwards section of Stairway to Heaven does not exist. I'm not surprised he didn't find it, for reasons I will explain below. But the backwards section does exist.

Well, It does exist and it doesn't. It does exist because there -is- a section of the song, where if you listen to it backwards, and you strain really hard, and somebody points it out to you ahead of time, you can almost hear Plant saying "Here's to my sweet satan". Problem is, it's not deliberately inserted, it's not very intelligible, and it's a purely coincidental assemblage of syllables that results from playing the normal, sung lyrics in the wrong direction. I forget which exact line of the song it occurs on, but if you listened to it, you'd understand why it's pure coincidence. (I'm pretty sure it was this line: "There's still time to change the road you're on.")

Now. Here is why I say it -doesn't- exist: When I was in high school, a local radio station played a few tapes of alleged backmasking, and the "Stairway" snippet was part of the show. They had the "forward" phrase and the "backward" phrase played a couple of times. I taped this section off of the radio, and played the "backward" phrase to several people. The catch: I didn't tell them what it was "supposed to" say. I played it several times, and -no one- was able to discern any intelligible english words from it. -Then- I told them what it was supposed to say, and then they said "oh yeah, I can hear that. Yeah, ok."

My point is this: There are two kinds of alleged "backmasking" in recording. One is the deliberate kind where there is obvious backwards stuff buried in the mix. Play it forward, and you hear a normal recording of a normal voice

speaking words. And example of this deliberate backmasking is on Pink Floyd's The Wall, where there is a humorous message about finding some secret, and writing to Floyd Pink care of The Funny Farm (or something like that).

The other kind of alleged backmasking is the "accidental" kind, like in Stairway to Heaven. The songwriter did not deliberately write lyrics so that they say intelligible phrases in both directions. It's hard enough just writing lyrics that work in one direction. Anyone finding backwards messages in those lyrics is finding them because they're -looking- for them. If you squint hard enough, you could find backwards messages in the Gettysburg Address, for God's sake. The funny thing is, the Christians like to hunt for backwards things that sound like "Satan" in rock records and then run with it. But you could find as many occurrences of a backwards "Satan" in gospel hymns, because, as I assert, the message is coincidental. For that matter, you could probably find as many occurrences of "Jesus is lord" as "Here's to my sweet satan" in any recording. If you squint.

I'm not saying Page and Plant -didn't- put deliberate backwards stuff in other songs. They probably did. But in "Stairway to Heaven" the backwards message, while present, is completely coincidental.

I wish I remembered the exact phrase so you could hear it yourself. These days it's so easy to sample a phrase from your CD-ROM then "flip" it in Sound Recorder. Anyone who's already done this might want to post it on his Web site for all to see...

Tony Fabris

12 Jun 1997:

I have never heard the fundamentalists explain a mechanism by which backwards satanic messages are supposed to do their dastardly work. Without a mechanism, quite apart from all the other objections, the claim is a nonsense. Do they corrupt the innocent listener by stealth as he listens frontwards? Or are satanists supposed to gather in little covens to play their music backwards? When I first heard of this 20 years ago, there was no widely accessible technology which could play music backwards; we tried placing the stylus on a record and rotating the platter backwards with a finger. The results were hilarious rather than sinister and the consensus was that we were ruining the LPs.

You might like to track down the transcript of a court case a few years ago in which the heavy metal band Judas Priest was unsuccessfully sued by the family of a teenage fan who died in a suicide pact with a friend. (The friend lived, albeit literally defaced by a shotgun blast.) My only knowledge of the case comes from a TV documentary, but as I recall it was somewhere in the

American Mid-West.

The cameras were allowed in the court, where jurors spent much time listening intently to backwards music attempting to hear some alleged satanic phrase, and the lead singer sang in the witness box to demonstrate some glottal-stop artefact in his singing style which apparently featured in the naughty bit. Then the sister of the dead boy took the stand; she was hot, she was angry, and she had no doubt it was their music which caused him to kill himself. She, on the other hand, listened to that wholesome country music.

But then the defence raised the little matter of her own history of suicide attempts, which she had no choice but to confirm under cross-examination, visibly stunned that they even knew of it. Case dismissed. Country music, now, there's a reason to top yourself - all that yowling steel gitter and those laments that my dog died and my woman left me. But I digress...

ball lightning

Ball lightning is described as a luminous sphere which seems to appear out of nowhere and vanish into thin air. It varies in size from two to ten inches in diameter. It usually is seen shortly before or after, or during, a thunderstorm. Its duration varies from a few seconds to a few minutes. "The lifetime of ball lightning tends to increase with size and decrease with brightness. Balls that appear distinctly orange and blue seem to last longer than average....Ball lightning usually moves parallel to the earth, but it takes vertical jumps. Sometimes it descends from the clouds, other times it suddenly materializes either indoors or outdoors or enters a room through a closed or open window, through thin nonmetallic walls or through the chimney."*

Some have speculated that ball lightning is a plasma ball, but that theory has been dismissed because a "hot globe of plasma should rise like a hot-air balloon" and that is not what ball lightning does. Many physicists have speculated that ball lightning must be due to electrical discharges. For example, Russian physicist Pyotr Kapitsa thinks ball lightning is an electrodeless discharge caused by a standing UHF waves of unknown origin present between the earth and a cloud.* According to another theory, "outdoor ball lightning is caused by an atmospheric maser-- analogous to a laser, but operating at a much lower energy--having a volume of the order of many cubic kilometers."*

Two New Zealand scientists, John Abrahamson and James Dinniss, believe ball lightning consists of "fluffy balls of burning silicon created by ordinary fork lightning striking the earth."

According to their theory, when lightning strikes the ground, the minerals are broken down into tiny particles of silicon and its compounds with oxygen and carbon. The tiny charged particles link up into chains, which go on to form filamentary networks. These cluster together in a light fluffy ball, which is borne aloft by air currents. There, it hovers as ball lightning, or a burning orb of fluffy silicon emitting the energy absorbed from the lightning in form of heat and light, until the phenomenon burns itself out.*

Ball lightning has been observed since ancient times and by thousands of people in many different places. Most physicists seem to believe that there is little doubt that it is a real phenomenon. But there is still disagreement as to what it is and what causes it.

[begging the question](#) 

begging the question

Begging the question is what one does in an argument when one assumes what one claims to be proving.

An argument is a form of reasoning whereby one gives a reason or reasons in support of some claim. The reasons are called premises and the claim one tries to support with them is called the conclusion.

If one's premises entail one's conclusion, and one's premises are questionable, one is said to beg the question.

The following argument begs the question.

We know God exists because we can see the perfect order of His Creation, an order which demonstrates supernatural intelligence in its design.

The conclusion of this argument is that God exists. The premise *assumes* a Creator and Designer of the universe exists, i.e., that God exists. In this argument, the arguer should not be granted the assumption that the universe exhibits intelligent design, but should be made to provide support for that claim.

The following argument also begs the question.

Abortion is the unjustified killing of a human being and as such is murder. Murder is illegal. So abortion should be illegal.

The conclusion of the argument is entailed in its premises. If one assumes that abortion is murder then it follows that abortion should be illegal because murder is illegal. Thus, the arguer is assuming abortion should be illegal (the conclusion) by assuming that it is murder. In this argument, the arguer should not be granted the assumption that abortion is murder, but should be made to provide support for this claim.

The following is another example of begging the question.

Paranormal phenomena exist because I have had experiences that can only be described as paranormal.

The conclusion of this argument is that paranormal phenomena exist. The

premise assumes that the arguer has had paranormal experiences, and therefore assumes that paranormal experiences exist. The arguer should not be granted the assumption that his experiences were paranormal, but should made to provide support for this claim.

Here is a final example of begging the question.

Past-life memories of children prove that past lives exist because the children could have no other source for their memories besides having lived in the past.

The conclusion of this argument is that past lives exist. The premise assumes that children have had past lives. The arguer should not be granted the assumption that children have had past lives but should made to support the claim. (Saying the memories could have no other source than a past life is to assume that past lives exist. This should not be granted but argued for.)

[Is handwriting
analysis legit science?
April 18, 2003 - The
Straight Dope](#)

graphology

Graphology is the study of handwriting, especially when employed as a means of analyzing character. Real handwriting experts are known as *forensic document examiners*, not as *graphologists*. [Forensic \(or questioned\) document examiners](#) consider loops, dotted "i's" and crossed "t's," letter spacing, slants, heights, ending strokes, etc. They examine handwriting to detect authenticity or [forgery](#).

Graphologists examine loops, dotted "i's" and crossed "t's," letter spacing, slants, heights, ending strokes, etc., but they believe that such handwriting minutiae are physical manifestations of [unconscious mental functions](#).

Graphologists believe such details can reveal as much about a person as [astrology](#), [palmreading](#), [psychometry](#), or the [Myers-Briggs](#) personality type indicator. However, there is no evidence that the [unconscious mind](#) is a reservoir of truth about a person, much less that graphology provides a gateway to that reservoir.

Graphology is claimed to be useful for everything from understanding health issues, morality and past experiences to hidden talents and mental problems.* However, "in properly controlled, blind studies, where the handwriting samples contain no content that could provide non-graphological information upon which to base a prediction (e.g., a piece copied from a magazine), graphologists do no better than chance at predicting... personality traits...." ["The Use of Graphology as a Tool for Employee Hiring and Evaluation," from the [British Columbia Civil Liberties Association](#)] And even non-experts are able to correctly identify the *gender* of a writer about 70% of the time (Furnham, 204).

There are a variety of techniques used by graphologists.* Even so, the techniques of these "experts" seem to be reducible to impressions from such things as the pressure exerted on the page, spacing of words and letters, crossed t's, dotted i's, size, slant, speed and consistency of writing. Though graphologists deny it, the *content* of the writing is one of the more important factors in graphological character assessment. The content of a message, of course, is independent of the handwriting and should be irrelevant to the assessment.

Barry Beyerstein (1996) considers many of the notions of graphologists to be little more than [sympathetic magic](#), e.g., the notion that leaving wide spaces between letters indicates a proneness to isolation and loneliness because the wide spaces indicate someone who does not mix easily and is uncomfortable with closeness. One graphologist claims that a person betrays his sadistic

nature if he crosses his t's with lines that look like whips.

Since there is no useful theory as to how graphology might work, it is not surprising that there is no empirical evidence that any graphological characteristics significantly correlate with any interesting personality trait.

Adrian Furnham writes

Readers familiar with the techniques of [cold reading](#) will be able to understand why graphology appears to work and why so many (otherwise intelligent) people believe in it. [p. 204]

Add to cold reading, the [Forer or Barnum effect](#), [confirmation bias](#), and [communal reinforcement](#), and you have a fairly complete explanation for graphology's popularity.

Graphology is another pipe dream of those who want a quick and dirty decision making process to tell them who to marry, who did the crime, who they should hire, what career they should seek, where the good hunting is, where the water, oil, or buried treasure is, etc. Graphology is another in a long list of quack substitutes for hard work. It is appealing to those who are impatient with such troublesome matters as research, evidence analysis, reasoning, logic and hypothesis testing. If you want results and you want them now and you want them stated in strong, certain terms, graphology is for you. If, however, you can live with reasonable probabilities and uncertainty, you might try another method to pick a spouse or hire an employee.

If on the other hand, you don't mind discriminating against people on the basis of pseudoscientific non-sense, then at least have the consistency to use a [ouija board](#) to help you pick the right graphologist.

See related entries on [crystals](#), [palmistry](#), the [polygraph](#) and [rorschach](#) testing.

Myers-Briggs Type Indicator®

An instrument for measuring a person's preferences, using four basic scales with opposite poles. The four scales are: (1) extraversion/introversion, (2) sensate/intuitive, (3) thinking/feeling, and (4) judging/perceiving. "The various combinations of these preferences result in 16 personality types," says [Consulting Psychologists Press, Inc.](#), which owns the rights to the instrument. Types are denoted by four letters to represent one's tendencies on the four scales. For example, [INTJ](#) stands for "Introversion, Intuition with Thinking and Judging."

According to CPP, the MBTI® is "the most widely used personality inventory in history." According to the [Center for Applications of Psychological Type](#), approximately 2,000,000 people a year take the MBTI. [CPP](#) claims that it "helps you improve work and personal relationships, increase productivity, and identify leadership and interpersonal communication preferences for your clients".

Many schools use the MBTI® in career counseling. A profile for each of the sixteen types has been developed. Each profile consists of a list of "characteristics frequently associated with your type," according to CPP. The INTJ, for example, is frequently

- insightful, conceptual, and creative
- rational, detached, and objectively critical
- likely to have a clear vision of future possibilities
- apt to enjoy complex challenges
- likely to value knowledge and competence
- apt to apply high standards to themselves and others
- independent, trusting their own judgments and perceptions more than those of others
- seen by others as reserved and hard to know

The people at CPP aren't too concerned if the list doesn't seem to match your type. They advise such persons to see the one who administered the test and

ask for help in finding a more suitable list by changing a letter or two in your four-letter type. (See the [report](#) CPP publishes on its Web site.) Furthermore, no matter what your preferences, your behavior will still sometimes indicate contrasting behavior. Thus, no behavior can ever be used to falsify the type, and any behavior can be used to verify it.

Jung's Psychological Types

The MBTI is based on [Carl Jung's](#) notions of psychological types. The MBTI was first developed by Isabel Briggs Myers (1897-1979) and her mother, Katharine Cook Briggs. Isabel had a bachelor's degree in political science from Swarthmore College and no academic affiliation. Katharine's father was on the faculty of Michigan Agricultural College (now Michigan State University). Her husband was a research physicist and became Director of the Bureau of Standards in Washington. Isabel's husband, Clarence Myers, was a lawyer. Because Clarence was so different from the rest of the family, Katherine became interested in types. She introduced Isabel to Jung's book, *Psychological Types*. Both became avid "type watchers." Their goal was a noble one: to help people understand themselves and each other so that they might work in vocations that matched their personality types. This would make people happier and make the world a more creative, productive, and peaceful place in which to live.

According to Jung, some of us are extraverts (McGuire and Hull 1997: 213). (The spelling of "extravert" is Jung's preference. All cites are to McGuire and Hull.) They are "more influenced by their surroundings than by their own intentions" (302). The extravert is the person "who goes by the influence of the external world--say society or sense perceptions (303). Jung also claims that "the world in general, particularly America, is extraverted as hell, the introvert has no place, because he doesn't know that he beholds the world from within" (303). The introvert "goes by the subjective factor...he bases himself on the world from within...and...is always afraid of the external world...He always has a resentment" (303). Jung knows these things because he is a careful observer of people. He did only one statistical study in his life, and that was in [astrology](#) (315). In fact, Jung disdained statistics. "You can prove anything with statistics," he said (306). He preferred interpreting anecdotes.¹

Jung also claimed that "there is no such thing as a pure extravert or a pure introvert. Such a man would be in the lunatic asylum. They are only terms to designate a certain penchant, a certain tendency...the tendency to be more influenced by environmental factors, or more influenced by the subjective factor, that's all. There are people who are fairly well balanced and are just as much influenced from within as from without, or just as little" (304). Jung's intuition turns out to be correct here and should be a red flag to those who have created a typology out of his preference categories. A typology should have a bimodal distribution, but the evidence shows that most people fall

between the two extremes of introversion and extraversion. Thus, “although one person may score as an E, his or her test results may be very similar to those of another person’s, who scores as an I” (Pittenger 1993).

Jung claimed that *thinking/feeling* is another dichotomy to be used in psychological typing. “Thinking, roughly speaking, tells you *what* [something] is. Feeling tells you whether it is agreeable or not, to be accepted or rejected” (306). The final dichotomy, according to Jung, is the *sensation/intuition* dichotomy. “Sensation tells you that there is something....And intuition--now there is a difficulty....There is something funny about intuition” (306). Even so, he defines intuition as “a perception via the [unconscious](#)” (307).

Jung claims that it took him a long time to discover that not everybody was a thinking (or intellectual) type like himself. He claims that he discovered there are “four aspects of conscious orientation” (341). He claims he arrived at his typology “through the study of all sorts of human types” (342). These four orientations cover it all, he claims.

I came to the conclusion that there must be as many different ways of viewing the world [as there are psychological types]. The aspect of the world is not one, it is many--at least 16, and you can just as well say 360. You can increase the number of principles, but I found the most simple way is the way I told you, the division by four, the simple and natural division of a circle. I didn’t know the symbolism then of this particular classification. Only when I studied the archetypes did I become aware that this is a very important archetypal pattern that plays an enormous role. (342)

Jung’s evidence, from his clinical observations, is merely anecdotal. He talks about the extravert and the introvert as types. He also talks about the thinking type, the feeling type, the sensation type, and the intuition type. His evidence for his claims is not based on any [controlled studies](#). He said he “probably would have done them” if he had had the means (315). But as it was, he says, “I had to content myself with the observation of facts” (315).

Jung’s typology is more intuition and speculation than [science](#). If it *is* science, it is *bad* science because he didn’t do controlled studies and relied too heavily upon his own insights and evaluations of what he observed. His terminology is imprecise and equivocal. Finally, there is no meaningful way to falsify his claims about psychological types. Contrary behaviors can be made to fit any type. Jung believed that an extravert could have an introverted unconscious and that an introverted thinker might compensate by an extraverted feeling, further complicating the typology (311). It would also make it impossible to test his claims about types since any behavior could be [shoehorned](#) to fit the theory. A similar ambiguity pervades the astrology that Jung loved.

Jung seems to have realized the limitations of his work and may not have approved of the MBTI had he lived to see it developed in his name. “My scheme of typology,” he noted, “is only a scheme of orientation. There is such a factor as introversion, there is such a factor as extraversion. The classification of individuals means nothing, nothing at all. It is only the instrumentarium for the practical psychologist to explain for instance, the husband to a wife or vice versa” (305).

However, his typology seems to imply that science is just a point of view and that using intuition is just as valid a way of seeing and understanding the world and ourselves as is careful observation under controlled conditions. Never mind that that is the only way to systematically minimize [self-deception](#) or prevent identifying causes where there are none.

Isabel Briggs Myers made similar mistakes:

In describing the writing of the Manual, she mentioned that she considered the criticisms a thinker would make, and then directed her own thinking to find an answer. An extravert to whom she was speaking said that if he wanted to know the criticisms of thinkers, he would not look into his own head. He would go find some thinkers, and ask them. Isabel looked startled, and then amused.*

This anecdote typifies the dangers of self-validation. To think that you can anticipate and characterize criticisms of your views fairly and accurately is arrogant and unintelligent, even if it is typical of your personality type. Others will see things you don't. It is too easy to create straw men instead of facing up to the strongest challenges that can be made against your position. It is not because of type that one should send out one's views for critical appraisal by others. It is the only way to be open-minded and complete in one's thinking. To suggest that only people of a certain type can be open-minded or concerned with completeness is to encourage sloppy and imprecise thinking.

pre-Jungian typologies

Psychological typology did not originate with Jung, of course. Remember the four temperaments? Each of us, at one time, would have been considered to be either *melancholic*, *sanguine*, *phlegmatic*, or *choleric*. These classifications go back at least as far as the ancient physician [Hippocrates](#) in the middle of the fifth century B.C.E. He explained the four temperaments in terms of dominant "humors" in the body. The melancholic is dominated by yellow "bile" in the kidneys; the sanguine by humors in the blood; the phlegmatic by phlegm; and the choleric by the black bile of the liver. Hippocrates was simply adding to the ancient Greek insight that all things reduce to earth, air, water, and fire. Each of the four elements had its dualities: hot/cold and

dry/moist. A person's physical, psychological, and moral qualities could be easily understood by his temperament, his dominant 'humors,' the four basic elements, or whether he was hot and wet or cold and dry, etc. This ancient personality type-indicator "worked" for over one thousand years. Of course, cynics might attribute this success to [confirmation bias](#). It also "put a heavy brake on physiological research since there were few phenomena for which the humors could not be made to yield some sort of easy explanation."*

Today, most of us have abandoned Hippocrates' personality scheme because we do not find it to have any meaningful use. However, it must have been useful to have lasted for so long. How is the utility of such conceptual schemes measured? Perhaps by the same criteria we use today. *How does the scheme help one understand oneself and others?* Knowing these things can help us achieve our main goals in life and assist us in establishing good relationships with others. For example, a typical medieval choleric might see that his temperament suited him for work as a holy inquisitor. He could find the best path in life suited to him as he tried to achieve his main goal in life: the salvation of his eternal soul. Knowing his own temperament could help him plan his life. He might want to choose a cold and wet wife (a phlegmatic) as a counterbalance to his own hot and dry nature. He would know what obstacles he would have to overcome because of his intrinsic disposition, and he would be guided as to what occupation might suit him best. Knowing the four temperaments could help him understand others, even those unfortunate cold and dry melancholics on his rack or in his thumbscrews. In short, he could easily confirm that the theory "works."

The Myers-Briggs Instrument

Isabel Briggs Myers learned test construction by studying the personnel tests of a local bank. She worked up her inventories with the help of family and friends, and she tried her early tests on thousands of schoolchildren in Pennsylvania. Her first longitudinal study was on medical students, who she followed up after 12 years and found that their occupations fit their types. She eventually became convinced that she knew what traits people in the health professions should have ("accurate perception and informed judgment"). She not only thought her tests could help select who would make good nurses and physicians, but "she hoped the use of the MBTI® in training physicians and nurses would lead to programs during medical school for increasing command of perception and judgment for all types, and for helping students choose specialties most suited to their gifts."

Others eventually helped her modify and develop her test, which was taken over by CPP in 1975. CPP has turned it into the instrument it is today. "I know intuitive types will have to change the MBTI," she said. "That's in their nature. But I do hope that before they change it, they will first try to understand what I did. I did have my reasons."*

As noted above, the Myers-Briggs™ instrument generates sixteen distinct personality profiles based on which side of the four scales one tends toward. Technically, the instrument is not supposed to be used to spew out personality profiles and pigeonhole people, but the temptation to do so seems irresistible. Providing personality tests and profiles has become a kind of entertainment on the Internet. There is also a pernicious side to these profiles: They can be used to justify discriminatory behavior and to give bad advice to those seeking career counseling. For example, employers may base important decisions regarding hiring, firing, and assignment of personnel based on personality type, even though the evidence shows that the MBTI® is unreliable at identifying one's type. Several studies have shown that when retested, even after intervals as short as five weeks, as many as 50 percent will be classified into a different type. There is scant support for the belief that the MBTI® would justify such job discrimination or would be a reliable aid to someone seeking career guidance (Pittenger 1993).

Here are some excerpts from Myers-Briggs™ profiles. Note how parts of each profile could fit most people.

1. Serious, quiet, earn success by concentration and thoroughness. Practical, orderly, matter-of-fact, logical, realistic and dependable. See to it that everything is well organized. Take responsibility. Make up their own minds as to what should be accomplished and work toward it steadily, regardless of protests or distractions.
2. Usually have original minds and great drive for their own ideas and purposes. In fields that appeal to them, they have a fine power to organize a job and carry it through with or without help. Skeptical, critical, independent, determined, sometimes stubborn. Must learn to yield less important points in order to win the most important.

The first profile is of an ISTJ (introversion, sensation, thinking, judgment), a.k.a. "The Trustee." The second is of INTJ (introversion, intuition, thinking judgment), a.k.a. "The Scientist." The profiles read like something from Omar the astrologer and seem to exemplify the [Forer effect](#).

Psychological tests such as the Myers-Briggs Type Indicator® seem to be little more than sophisticated parlor games. They will be validated by their seemingly good fit with the data, in the same way that astrologers and [biorhythmists](#) find predictive patterns fitting their readings and charts, i.e., by [confirmation bias](#) and the ambiguity of basic terms and the Byzantine complexity that ultimately allows any kind of behavior to fit any personality type. The big difference, of course, is that psychological testing has the backing of a community of university statisticians to reinforce its notions. It is a cottage industry.

uses of the MBTI®

The MBTI® is used in business to decide whom to hire and it is frequently used by managers as some sort of productivity tool. By getting people to "understand" themselves and their co-workers better by knowing their personality types, it is hoped that people will be more productive. As mentioned above, Isabel Myers thought her work could be used to develop medical school programs that would train the appropriate types in the appropriate ways.* This idea, too, has caught on. Some have recommended changes in the "goals, activities, instructional methodologies, and types of instructional programs within technology education" based on the belief that instruction should "fit" the average (in the sense of 'mode', most frequently occurring type) personality type of technology students.* Still others have recommended 16 different types of instruction, one for each of the 16 types, based on the notion that there must be 16 learning styles if there are 16 personality types.*

Some think there are only *nine* basic personality types and follow the [enneagram](#). As Jung said, there could be any number of types, even 360, if we wished. Who is right? Maybe they're both wrong. Perhaps we need only think of two types, [those from Mars and those from Venus](#), as John Gray, [Ph.D.](#), claims.

1. For example, to support his notion that "intuitive types very often do not perceive by their eyes or by their ears, they perceive by intuition" (308), Jung tells a story about a patient. She had a nine a.m. appointment and said to Jung: "you must have seen somebody at eight o'clock." She tells him she knows this because "I just had a hunch that there must have been a gentleman with you this morning." She knows it was a gentleman, she says, because "I just had the impression, the atmosphere was just like a gentleman was here." Jung seems uninterested in critically examining her claims. The anecdote seems to support his picture of the intuitive type. He doesn't consider that she may have seen the gentleman leave but failed to mention this to Jung, perhaps to impress him with her power of intuition. Jung notes that the room smelled of tobacco smoke and there was a half-smoked cigar in an ash tray "under her nose." Jung claims she didn't see it. He doesn't even consider that she may have seen it and smelled the stench of the cigar but did not call attention to it.

The reason scientists do [controlled studies](#) rather than rely solely on their clinical observations and memories as Jung did is because it is easy to [deceive ourselves](#) and [fit the data](#) to our hypotheses and theories. Another Jungian anecdote will help exemplify this point. A male "sensation type" and a female "intuitive type" were in a boat on a lake. They were watching birds dive after fish. According to Jung, "they began to bet who would be the first to see the

bird [when it emerged from the water]. Now you would think that the one who observes reality very carefully--the sensation type--would of course win out. Not at all. The woman won the bet completely. She was beating him on all points, *because by intuition she knew it beforehand*" (306-307, emphasis added). One couple, one try. That's it. No more evidence is needed. The truth is that Jung doesn't know any more than I do why the woman was better at the game than the man. Perhaps the man lost on purpose as part of a misguided plan to seduce the woman. Who knows? But Jung is clearly begging the question with this and most of his other "observations of facts," as he calls these stories.

Some of his anecdotes may have been entirely fictional. For example, to support his notions of intuition and [synchronicity](#), he says:

For instance, I speak of a red car and at that moment a red car comes along. I hadn't seen it, it was impossible because it was behind the building until just this moment when the red car appears. Now this seems mere chance. Yet the Rhine experiments [on [ESP](#)] proves that these cases are not mere chance. Of course many of these things are occurrences to which we cannot apply such an argument, otherwise we would be superstitious. We can't say, "This car has appeared because some remarks had been made about a red car. It is a miracle that the red car appears." It is not, it is chance, just chance. But *these "chances" happen more often than chance allows, and that shows there is something behind it* (315, emphasis added).

Again, had Jung an understanding of statistics he would know that what he thinks happens more often than chance allows, in fact happens in accordance with what chance not only allows but also expects.

begging the question

Fri, 12 Nov

Hi And welcome to your 1738th email of the day, which is about Begging the Question :-) I don't think all your examples work. For example:

*A1.Abortion is the unjustified killing of a human being and as such is murder.
A2.Murder is illegal. A3.So abortion should be illegal.*

This has the same structure as:

S1.All men are mortal. S2.Socrates is a man. S3.So Socrates is mortal.

which for quite some time has been seen as a model of logic, not as an example of begging the question.

reply: Begging the question is not a formal fallacy. There is nothing wrong with the form of the examples I have used. They are all valid arguments, or can be made so quite simply. Being valid only means that they commit no formal fallacy. Begging the question is often referred to as a fallacy of presumption or a fallacy of assumption because the error is in assuming what one asserts to be proving. The example you give is not a model of logic, but a model of a valid argument in predicate logic. This model does beg the question. Validity is independent of the truth of the premises and vice-versa.

Look at this one step at a time.

A1 is the unsupported assertion that abortion is murder. S1 is the unsupported assertion that all men are mortal. The support for these assertions, if any support is to be found, lies outside the syllogism. In A1, the speaker perceives abortion to be a kind of murder; in S1, the speaker perceives men to be a kind of mortal creature.

Steps A2 and S2 don't seem to be very contentious.

reply: Neither does S1.

Steps A3 and S3 are interesting. Step S3 seems irrefutable, while I could well imagine an alternate A3:

A3': So we should legalise some kinds of murder.

reply: We call that a non sequitur.

Hmm. Now that I've reached this conclusion, I don't know what to make of it! I wasn't expecting this at all. I still don't think it has anything to do with question-begging. Perhaps the topic of argument A is less cut-and-dried than the topic of argument S, which is why we spend more time discussing abortion than whether Socrates is, or was, mortal.

reply: If by *topics*, you mean the assumptions that abortion is murder and that all men are mortal, and if by *cut-and-dried* you mean *warranted as an assumption*, then you are right. Few people would be unwilling to grant the assumption that all men are mortal. (There are some, however, and you may read about them elsewhere in the *Skeptic's Dictionary* or seek them out on the Internet, e.g., [Alex Chieu](#).) While many would call the assumption that *abortion is murder* unwarranted.

The "paranormal experiences" argument also does not seem to be circular. Substitute "reality" for "paranormal phenomena" to get:

"Reality exists because I have had experiences that can only be described as real."

Is that really circular? It seems to be no different from "reality exists because I can see and touch it, and it does not appear to be a dream" - which is roughly my day-to-day definition of reality. (Not that I need a definition, most days.)

reply: To continue this discussion would be circular. But....begging the question is not a formal fallacy and is not a claim as to the invalidity of the reasoning, etc. etc.

Anyhow, keep up the good work!

Norman Paterson, University of St Andrews

reply: You've been hanging around the Central Bar, haven't you?

Bermuda (or "Devil's") Triangle

The Bermuda Triangle (a.k.a. the Devil's Triangle) is a triangular area in the Atlantic Ocean bounded roughly at its points by Miami, Bermuda, and Puerto Rico. Legend has it that many people, ships and planes have mysteriously vanished in this area. How many have mysteriously disappeared depends on who is doing the locating and the counting. The size of the triangle varies from 500,000 square miles to three

times that size, depending on the imagination of the author. (Some include the Azores, the Gulf of Mexico, and the West Indies in the "triangle.") Some trace the mystery back to the time of Columbus. Even so, estimates range from about 200 to no more than 1,000 incidents in the past 500 years. [Howard Rosenberg](#) claims that in 1973 the U.S. Coast Guard answered more than 8,000 distress calls in the area and that more than 50 ships and 20 planes have gone down in the Bermuda Triangle within the last century.

Many theories have been given to explain the extraordinary mystery of these missing ships and planes. [Evil extraterrestrials, residue crystals from Atlantis, evil humans with anti-gravity devices or other weird technologies](#), and vile vortices from the fourth dimension are favorites among fantasy writers. Strange magnetic fields and [oceanic flatulence](#) (methane gas from the bottom of the ocean) are favorites among the technically-minded. Weather (thunderstorms, hurricanes, tsunamis, earthquakes, high waves, currents, etc.) bad luck, pirates, explosive cargoes, incompetent navigators, and other natural and human causes are favorites among skeptical investigators.

There are some skeptics who argue that the facts do not support the legend, that there is no mystery to be solved, and nothing that needs explaining. The number of wrecks in this area is *not* extraordinary, given its size, location and the amount of traffic it receives. Many of the ships and planes that have been identified as having disappeared mysteriously in the Bermuda Triangle were not in the Bermuda Triangle at all. Investigations to date have not produced scientific evidence of any unusual phenomena involved in the disappearances. Thus, any explanation, including so-called scientific ones in terms of methane gas being released from the ocean floor, magnetic disturbances, etc., are not needed. The real mystery is how the Bermuda Triangle became a mystery at all.

The modern legend of the Bermuda Triangle began soon after five Navy planes [[Flight 19](#)] vanished on a training mission during a severe storm in 1945. The most logical theory as to why they vanished is that lead pilot Lt. Charles Taylor's compass failed. The trainees' planes were not equipped with working navigational instruments. The group was disoriented and simply, though tragically, ran out of fuel. No mysterious forces were likely to have been involved other than the mysterious force of gravity on planes with no fuel. It is true that one of the rescue planes blew up shortly after take-off, but this was likely due to a faulty gas tank rather than to any mysterious forces.

Over the years there have been dozens of articles, books, and television programs promoting the mystery of the Bermuda Triangle. In his study of this material, Larry Kushe found that few did any investigation into the mystery. Rather, they passed on the speculations of their predecessors as if they were passing on the mantle of truth. Of the many uncritical accounts of the mystery of the Bermuda Triangle, perhaps no one has done more to create this myth than Charles Berlitz, who had a bestseller on the subject in 1974. After examining the 400+ page official report of the Navy Board of Investigation of the disappearance of the Navy planes in 1945, Kushe found that the Board wasn't baffled at all by the incident and did not mention alleged radio transmissions cited by Berlitz in his book. According to Kushe, what isn't misinterpreted by Berlitz is fabricated. Kushe writes: "If Berlitz were to report that a boat were red, the chance of it being some other color is almost a certainty." (Berlitz, by the way, did not invent the name; that was done by Vincent Gaddis in "The Deadly Bermuda Triangle," which appeared in the February, 1964, issue of *Argosy*, a magazine devoted to fiction.)

In short, the mystery of the Bermuda Triangle became a mystery by a kind of [communal reinforcement](#) among uncritical authors and a willing mass media to uncritically pass on the speculation that something mysterious is going on in the Atlantic.

Bermuda Triangle

22 Feb 2000

Love your site at skepdic.com. I want to bring a small error to your attention. The Bermuda Triangle is generally accepted (myth logically speaking) to have as its Florida vertex the city of Ft. Lauderdale, not Miami as in your myth #26. Specifically, it is anchored at Fort Lauderdale/Hollywood international Airport, where, when it was a US Navy training base, that infamous flight of training planes took off never to be seen again. Many of the original buildings of the Navy base are still standing. We folks who are residents of Ft. Lauderdale and surrounding communities are proud of this bit of folklore. Miami may be the bigger city, but we think it gets too much "credit" in this regard.

Joel Vergun

reply: Really? You're proud of this? Well, give credit where credit is due. However, the Bermuda or Devil's Triangle is not an actual place and does not have actual boundaries. All points of reference are rough, including Bermuda and Puerto Rico. D. Trull lists Ft. Lauderdale instead of Miami as one point of the triangle. But the U.S. Navy lists Miami and specified San Juan, Puerto Rico, as does Bubba the Salty Dog. James Knickelbein puts Miami as one of the points. If it were called the Ft. Lauderdale Triangle I'd be concerned about where to put this point of the triangle, but since it isn't, I'm not.

28 Oct 1998

This may or may not be of interest to you, but I thought I'd toss it your way anyway. My late mother was a U.S. Navy WAVE during World War II, posted at a small naval air station near Orlando. She was a Link Trainer Instructor (she taught instrument navigation to Navy pilots), so she knew a great deal about navigation, naval aircraft, and the men who flew them.

She was still living when all the hype about the Bermuda Triangle and the loss of Flight 19 hit the news, and she was astonished and disgusted at the outrageous claims that were made about the incident. First, she pointed out the fact that during World War II, MANY, MANY planes went down all over the

world, leaving no trace, and there have been virtually no attempts to attribute these losses to anything but military action, mechanical failure, or human error. World War II had ended by the time Flight 19 disappeared, but that only eliminated the possibility of military action.

The other causes could still apply. Most naval aircraft were equipped with automatic distress signal transmitters that were supposed to float free and start sending a radio signal when a plane made a forced landing in water, providing search and rescue craft with a "fix" on the location. The proponents of the Bermuda Triangle nonsense have made much of the fact that not a single signal was received from the transmitters that had been aboard the planes of Flight 19. This may not be EXACTLY what she said, but a pretty close quotation of my mother's reaction to this argument was "Those damned things didn't even WORK most of the time, and even when they did, it wasn't for very long!" We also know that the seas were heavy, and radio transmission conditions were poor, so it should come as no surprise that no automatic distress signals were picked up.

Depending on which sources you read, most of the planes were missing some or all of their navigation equipment, and one essential instrument (a clock) was missing from the planes of the student pilots. It appears that from something else my mother told me that there was no evil plan or design behind this omission. The simple fact was that the Navy had a major problem with clocks being stolen out of planes. These clocks were massive instruments costing hundreds of dollars (even in the 1940's), and were designed to keep very accurate time. I have in my possession at least one letter my mother wrote to her mother mentioning this problem of theft, and further describing how a surprise search of the entire base turned up several clocks in personal lockers and other locations they were not intended to be. So, maybe it's just possible that they were short of clocks the day Flight 19 took off.

I realize that this doesn't add much to the material we already have which debunks the Bermuda Triangle, but perhaps it does add one more opinion of someone versed in navigation and naval aviation to the others which saw nothing mysterious about the disappearance of Flight 19

[Secrets of a celebrity
sect](#)

[By David Rowan,
Evening Standard](#)

Cabala (also *caballa*, *kabala*, *kaballa*, *Kaballah*, *qaballah*, etc.)

Kabbalah is Hebrew for *tradition*. But the Cabala has come to refer to a collection of mystical and ethical Jewish writings, mostly dating from the medieval period. It consists in good part of speculative and symbolical interpretations of Hebrew Scriptures.

There are several cabalistic traditions, some of which are noted for their [messianic](#) leanings. One of the more well-known messiahs was [Sabbatai Zevi](#), who, in 1666 convinced a large part of the Jewish, Muslim, and Christian world that he was the Messiah. His conversion to Islam is seen variously as a cowardly pseudo-conversion aimed at saving his life or as a necessary step in the redemption of the world.

See **related entry** on the [Bible Codes](#).

the Bible code

19 Aug 2001

Dear Professor Carroll,

Allow me to use this opportunity to congratulate and thank you for the excellent resource that I found in the SkepDic. However, the actual motive behind this letter lies in some thoughts I deem myself to have to share about the method behind the so called "Bible Code". Forgive me for my possible arrogance; but I have not found the same ideas mentioned in SkepDic article on the matter (or elsewhere), and I couldn't know whether they were not previously known to you and merely omitted for some considerations. Still I think they are worth voicing, so here they are. If you find them to be useful, I'd be delighted. If you do not, I beg your pardon for taking up your time beforehand.

*Leaving aside the validity of the actual method the authors of "the Code" are using to select their patterns, I couldn't help commenting on the method they are using to *read* them. And that is extremely questionable (IMHO) and might account for the reason why the Hebrew translation of "War and Peace" did not yield the same results as the book of Genesis (assuming that it really did not).*

I am not a native Hebrew speaker, but I have lived in Israel for seven years, and have sufficient command of the language (sufficient for academic studies, at least, having passed the Technion tests for the foreign students successfully), so I hope I am qualified to say that modern-use Hebrew and Biblical Hebrew do not share the same orthography. In Hebrew, vowels have grammatical meaning, and change with grammatical role of the word according to fixed patterns, while the actual radical is formed solely by the unchanging consonants. The standard Hebrew radical consists of three consonants (some modern words may have four, but I am not aware of any four-letter radicals that originate in ancient times). The old writing system was lacking any vowels whatsoever, relying on the grammatical knowledge of the reader. Later on the system had been enhanced with vowel modifiers that are written under the alphabetical consonants, in form of sets of dots and dashes. E.g. the word 'sefer' "book" and the word 'sofer' "author" would be written the same 'SFR' in the old method, and the addition of the vowel marks would eliminate the ambiguity. The Torah is written this latter way, using vowel marks under the text; its lines consist purely of consonants. The modern-use writing system, however, is applying a different system of hints, in which the vowel marks are used only in ambiguous cases, and the letters "yod" [j] and "waw" [w] are used to designate the [i] and [o] or [u], respectively. The [a] and [e] are still omitted. Thus, the "book" will still remain 'SFR' while "author" becomes "SWFR" ("SOFR") which is enough to avoid the ambiguity. In cases where "yod" and "waw" must be read as consonants, they are simply doubled.

What does this have to do to Bible Code? Two things.

First, the translation of "War and Peace" was most likely done in the modern orthography, which means that its symbol composition is not similar to that of the Bible because of a much larger occurrence of "yod"s and "waw"s, at the very least.

Second (and much more scandalous) is the fact that even a casual glance at the "Code" reveals: the authors prefer to use the modern orthography (not yet invented in Biblical time, suffice to say) interchangeably with the old one, and prefer to totally ignore the vowel marks in the Biblical text unless the pattern is an actually occurring word. I have not conducted an extensive study, but here's a random "prediction" claim, taken just because it was the first I stumbled upon that contained the Hebrew text with vowel marks, found at <http://asalizaki.freesevers.com/kursk.htm>. The words that were allegedly found by the authors are "sunk", "Kursk" and "of his sepulchre". The latter I would rather translate as "his tomb", and it is clearly a regular word in a line of the Torah text, in proper grammatical position, preceded with a preposition of genitive case; the whole phrase it is taken out of reads "the man knows of his tomb". This is the only word whose vowels are all right. The rest are read not by the rule, but as the authors desire. What they interpret as "Kursk", read with the vowel marks, becomes phonetically impossible "keurisk", so they prefer to omit the vowel marks and read the "KWRSK" pattern by the rules of modern grammar as "kursk", not as equally plausible "korsak", "kursek" etc. (With the word they read as "sunk" I unfortunately am not familiar.)

Another reading at <http://asalizaki.freesevers.com/taiwan.htm> does not have vowel marks, but it does contain the word "Taiwan" - in modern orthography with double "yod"s and "waw"s ("TYWWAN") except that the ending "nun" is in improper form that cannot stand at the end of a Hebrew word. The use of "aleph" before "nun" is also quite questionable. In the same reading we find a word "number" taken out of the line just like "of his tomb" was in the previous example. Why didn't they pick other words with matching meanings from the relatively long excerpt is quite a mystery, but they did interpret one of the patterns as numbers, getting a date. (Any pattern of Hebrew letters can be read as a number.) The "Taipei" claim in reality is "TYYPH", which at best would be read "taipe" by modern rules. Unfortunately, there are no vowel marks in the table, so we cannot see what the patterns would read properly.

Yet another vowel-marked sample at <http://asalizaki.freesevers.com/aids.htm> shows more of the beautifully elective reading. What they read "badamot" ("in the bloods") with proper vowels becomes an impossible "badamiwt". Other patterns exhibit no possible phonetical reading at all for lack of vowels! Especially nice is the one they read as "subsistence", which has one vowel per four consonants.

In conclusion, whatever the method they are using to pick the patterns, their Code appears to be wonderfully "flexible" in terms of proper writing. Either it was encoded by someone illiterate, or whoever does the reading is not very picky. As long as the pattern fits the fact, it will go in. If it does not, they would throw out the vowels and try to reinterpret the reading of the consonant radical. If it still does not, they try variants written in modern orthography, or even ignore the obvious misplaced letters (like that outrageous "nun" in mid-word form at the end of a word). In short, whoever interprets the code seems to do so much twisting to make it fit, that it does not matter much what method of pattern generations they may use initially; not even mentioning that their

statistical analysis is much devaluated, because they are not only picking only a few patterns from relatively long excerpts, but they also tend to throw out half the letters in the text before they start. The "mathematical and scientific" method turns out to rely on an astonishing amount of personal interpretation, alas.

HWMCHCNBRDNLNGTBTBTHRWNGLLTHVWLSPOCKNGFWPTTRNSTWLL? ("How much can be read in a long text by throwing out all the vowels and picking a few patterns at will?" Or is it

..BReaD..NyLoN..TaX..TiBeT..BaTHeR/RoWiNG..TaLL/LiTe..SPoCK/KiNG..PoTTeR/TRaNSiT WaLL"... and I haven't even tried reading it backwards or dropping every second letter! The miraculous occurrence of "Potter" in such proximity to "Row[l]ing" is a stunning prediction of Harry Potter's success, isn't it? And if we read every third letter, we find "lives" intersecting with "Spock", clearly predicting the slogan used by "Star Trek" fans. Sapienti sat.)

I sincerely hope that this little piece of rather trivial observation may be of some help in debunking the "reading" of absent meanings. I wouldn't even bother you with something this trivial, unless I weren't aware that knowledge of Hebrew ancient and modern does not seem to be widespread among the pursuers of arithmancy.

With best regards, Eugene Arenhaus

24 Mar 1998

Not really claiming any religious affiliation, I hope you understand, I was extremely surprised to find the existence of 'codes' in the Torah. I have found patterns numeric and alphabetic in nature. Now granting that the Torah text has some 305,000 + letters with the patterning and coding I have located (some 50 plus in just one scripture of 42 letters) it is enough to bring one to wonder, what is going on? I am not an anti-Semite and do not believe it is a Jewish conspiracy... I have been in possession of a resource since 1990 that has of recent come to light and explanation that lead me to a single scripture, Genesis 5:2. From there I have started a study of theoretical physics, astrophysics, calculus, quantum theory, Torah and various creation myths... I am presently of the mind that there is a 'source' that has been in contact with many cultures for many many many years of human existence. I do not wish to convert or try to convince any one of anything... but I do know without the shadow of a doubt, humanity is on the verge of either waking to our place in the Universe or allowing crude thinking religionists and absolute axe-grinding atheists from taking us all off the face of the earth. There has to be a mid point struck. And opening up all facets to inspection by clear thinking non-prejudicial minds is a must. Respectfully,

Manuel Colunga-Hernandez

reply: May the Source be with you and all your brethren who believe that contact has been made and we are being watched over by benign beings from another world. Whether they be angels or aliens, I do not know, but if they come to you in your dreams, let us know and we'll sharpen our axes.

03 Apr 1998

Hey Bob,

Nice job trying to disprove the Bible code, close but no cigar. I don't quite understand why you used the King James Bible to find Bill Gates. I believe I recall you saying that you removed all of the vowels since the Hebrew language doesn't contain vowels. How did you find the name "Bill Gates" without vowels, must've really came up Bll Gts. This was not even half way clever. Was this an attempt at humor? If so then ha, ha, ha. So funny that I almost forgot to laugh.

How about something clever on my part, maybe even mystifying. I am psychic and I'm going to tell you about yourself even though I've never met you or read anything about you related to my psychic reading on you.

- 1.) *You are a liberal.*
- 2.) *You are a socialist at heart, maybe in reality too.*
- 3.) *You believe that the government is the savior of the us all.*
- 4.) *You are a big believer in the United Nations system of governing the world.*
- 5.) *You have fewer than three children.*
- 6.) *You believe that Gorby tore down the wall because he's a great guy.*
- 7.) *You believe Ronald Reagan was probably the worst leader the US has ever had.*
- 8.) *You believe that a hole in the ozone is a serious threat to life on earth.*
- 9.) *You are an atheist.*
- 10.) *You recycle and are very concerned about the environment.*
- 11.) *You drive a BMW or a Mercedes.*

These came through pretty clear but psychics, such as myself, are usually not 100% accurate. Let me know how accurate I've been.

Ron

reply: Hey Ron,

Your psychic powers must be waning. I assume that is what you used, since you obviously didn't read my entry on The Bible Code. Not only don't I try to disprove The Bible Code by using versions of the Bible, I don't use any version to do anything, much less find Bill Gates' name therein. Your recall must have taken you to some past or future life, for in this life I never removed any vowels from any book, though I may have noted somewhere that ancient Hebrew lacks vowels. I can see that it does not take much to make you laugh, since you can entertain yourself with your hallucinations.

I'm not psychic and I've never met you either, but let me tell you about yourself.

- 1) You are conservative.**
- 2) You are a capitalist.**
- 3) You distrust the government.**
- 4) You distrust the United Nations.**
- 5) You have three or more children.**
- 6) You believe that it was Ronald Reagan's tough policies which brought down the**

Berlin wall.

- 7) You believe Ronald Reagan was one of the greatest leaders the U.S. ever had.**
- 8) You don't believe there is hole in the ozone that is a serious threat to life on earth.**
- 9) You are a theist and do not believe in evolution.**
- 10) You don't recycle and think the environment cleans up after us while we sleep.**
- 11) You drive a Ford.**

These came through pretty clearly. I only hope I am wrong about number 5.

p.s. Your psychic reading of me got four out of eleven right. A blind monkey could have done better. How did I do in my psychic reading of you?

28 Nov 1997

Thanks for your thoughts, though I humbly disagree with your conclusions. Your arguments that the codes are a fraud hinge on three general premises:

First, that Drosnin focuses on the predictive nature of the codes. Second, that the "codes" are created by theologians in need of new income sources. Last, that Dr. Rips denies the work product of Drosnin.

reply: First, I neither claim nor argue that the codes are a fraud. I imply that it is foolish to think that the Omnipotent One would conceal non-spiritual messages for cryptologists to decipher. I nowhere deny that names of people and places can be found using statistical formulae. I argue that Drosin is deliberately misleading in his presentation of the work of Rips, et. al. I can add here that Drosin is wrong in his claim that this process only works for the Hebrew version of the Bible. Others have applied it to *Moby Dick* and *War and Peace* with similar useless results. (The author's second point refers to an attempt at humor that has been edited out.)

All three arguments are invalid. In brief, Drosnin, who remains a Secular Jew, claims that "the only thing I can state with certainty is that there is a code". He at times stretches beyond this position, but never departs from its truth. Even if Drosnin were to mistakenly claim that the codes are predictive, his position would not negate the code's existence (the message exists even if the messenger is a lunatic).

reply: If he claims that he can state "with certainty" that there is a code, then he overstates his case. The presence of a code would imply *purposive* behavior on the part of the author. Since we can retrodict any number of names and places in just about any book we choose using statistical formulae and spending enough time to search for something "meaningful", we would have to assume that just about every author wrote in code. This position is absurd.

In this vein you raise the issue that Rips states that no messages can be extracted from the code, and that this position is shared by all serious code scientists. Again, regardless if the codes are not predictive, they exist. Many theologians who are familiar with the codes do not reach to conclusions about the goals or predictive nature of the codes. Their existence is enough to be of importance.

I caution you to not ignore Drosnin's position that the text of the Old Testament, in Hebrew, is the only text in which these historical and biblical phrases are found in a statistically significant pattern.

reply: I nowhere say that no messages can be extracted from applying the method of Rips et. al. to the Bible. We can't know a priori whether there are other books which show statistically significant results using ELS analysis. So far, the only evidence is for Genesis, not the complete Torah.

I am unaware of anyone who has offered any evidence (though many have tried) showing any other works to have a scintilla of similar statistical correlation with letter sequencing to names, places, dates, events, and historical figures, both of the time of the old/new testament and today

Rips himself, who you use in your argument, states that in his opinion that "even today the codes could not have been created by man & machine." By agreeing that the codes exist, whether for G-d's purpose or by some totally bizarre random cosmic event, you will be taking a huge step. As there is no scientifically proven (nothing beyond the hypothetical) contrary position, it's a step you should take.

Bradley A. Barros

reply: I see no reason to take any steps. The code doesn't work for all Hebrew versions of Genesis. I think there is still some more math to be done.

[The real truth about Bigfoot](#)

[Lovable trickster created a monster with Bigfoot hoax By Bob Young](#)

[Bigfoot hoaxer dies](#)

[Grover Krantz, foremost Bigfoot expert, dies at 70 By Mark Rahner Seattle Times staff reporter](#)

Bigfoot [a.k.a. Abominable Snowman of the Himalayas, Mapinguari (the Amazon), Sasquatch, Yowie (Australia) and Yeti (Asia)]

An apelike creature reportedly sighted hundreds of times around the world since the mid-19th century. The creature is variously described as standing 7-10 ft (2-3 m) tall and weighing over 500 lb (225 kg), with footprints 17 in. (43 cm) long. The creature goes by many names, but in northern California it is known as “Bigfoot.” (It is also known as the Abominable Snowman of the Himalayas, Mapinguari [the Amazon], Sasquatch, Yowie [Australia] and Yeti [Asia]). The creature is big business in the Pacific Northwest along a stretch of US-101 in southern Humboldt County known as the Redwood Highway. Numerous shops line the roadway, each with its own Bigfoot chainsaw-carved out of majestic redwood.

Most scientists discount the existence of Bigfoot because the evidence supporting belief in the survival of a prehistoric bipedal apelike creature of such dimensions is scant. The only notable exception is Grover S. Krantz (1931-2002), an anthropologist at Washington State University. For nearly forty years, Krantz argued for the probable existence of Bigfoot,* but was unable to convince the majority of scientists. The evidence for Bigfoot’s existence consists mainly of testimony from Bigfoot enthusiasts, footprints of questionable origin, and pictures that could easily have been of apes or humans in ape suits. There are no bones, no scat, no artifacts, no dead bodies, no mothers with babies, no adolescents, no fur, no explanation for how a species likely to be communal has never been seen in a family or group activity. There is no evidence that any individual, much less a community of such creatures, dwells anywhere near any of the “sightings.” In short, the evidence points more towards hoaxing and delusion than real discovery. Some believers dismiss all such criticism and claim that Bigfoot exists in another dimension and travels by [astral projection](#). Such claims reinforce the skeptic’s view that the Bigfoot legend is a function of passionate fans of the [paranormal](#), aided greatly by the mass media’s eagerness to cater to such enthusiasm.

In addition to the eyewitness testimonials of enthusiastic fans, the bulk of the evidence provided by proponents of Bigfoot consists of footprints and film. Of the few footprints available for examination in plaster casts, there is such great disparity in shape and configuration that the evidence “suggests many independent pranksters” (M. Dennett, 1996).

Probably the most well-known evidence for belief in Bigfoot's existence is a film shot by Bigfoot hunters Roger Patterson and Bob Gimlin on Oct 20, 1967, at Bluff Creek in northern California. The film depicts a walking apelike creature with pendulous breasts. Its height is estimated at between 6' 6" and 7' 4", its weight at nearly one ton. Over thirty years have passed, yet no [cryptozoologist](#) has found further evidence of the creature near the site except for one alleged footprint.

The [North American Science Institute](#) claims it has spent over \$100,000 to prove the film is of a genuine Bigfoot. However, according to veteran Hollywood director [John Landis](#), “that famous piece of film of Bigfoot walking in the woods that was touted as the real thing was just [a suit made by John Chambers](#),” who helped create the ape suits in [Planet of the Apes](#) (1968). [Howard Berger](#), of Hollywood's KNB Effects Group, also has claimed that it was common knowledge within the film industry that Chambers was responsible for a hoax that turned Bigfoot into a worldwide cult. According to [Mark Chorvinsky](#), Chambers was also involved in another Bigfoot hoax (the so-called “Burbank Bigfoot”). According to [Loren Coleman](#), however, Chambers denied the allegations about the Patterson hoax in an interview with [Bobbie Short](#) and claimed that Landis had in fact started the rumor about him (i.e., Chambers) making the suit. Apparently, Short did not ask Chambers about the “Burbank Bigfoot” incident, nor did he interview Landis for his version of the story ([Chorvinsky 1996](#)). Short and Coleman remain convinced that the film is not of a man in an ape suit but is footage of a genuine Bigfoot.

According to David J. Daegling and Daniel O. Schmitt, “it is not possible to evaluate the identity of the film subject with any confidence” (Daegling 1999). Their argument centers on uncertainties in subject and camera positions, and the reproducibility of the compliant gait by humans matching the speed and stride of the film subject.

According to Michael Wallace, Bigfoot is a hoax that was launched in August 1958 by his father [Ray L. Wallace](#) (1918-2002), an inveterate prankster. Shortly after Ray's death, Michael revealed the details of the hoax, which were reported widely in the press. Ray had a friend carve him 16-inch-long feet that he could strap on and make prints with. Wallace owned a construction company that built logging roads at the time and he set the prints around one of his bulldozers in Humboldt County. Jerry Crew, a bulldozer operator, reported the prints and *The Humboldt Times* ran a front-page story about “Bigfoot.” The legend was born. However, a former logger, 71-year-old John Auman, [claims](#) Wallace left the giant footprints to scare away thieves and vandals who'd been targeting his vehicles. His hoaxes didn't began until after he'd seen what a stir he'd created.

Ray Wallace's nephew Dale with the carved feet

Copyright 2002 [Dave Rubert Photography](#)

Over the years, Ray Wallace produced Bigfoot audio recordings, films, and photographs. At one time, he even put out a press release offering \$1 million for a baby Bigfoot. He published one of his photos as a poster depicting Bigfoot having lunch with other animals. He also published photos and films of Bigfeet eating elk, frogs, and cereal. Michael Wallace claims that his mother told him that she participated in some of the pranks and had been photographed in a Bigfoot suit. Chorvinsky claims that Ray told him that the Patterson film was a hoax and that he had alerted Patterson of the sighting at Bluff Creek. According to Chorvinsky, Ray knew who was in the Patterson suit, but said he had nothing to do with it (Young, Bob. 2002. "Lovable trickster created a monster with Bigfoot hoax," [The Seattle Times](#), December 5).

The news of Wallace's 1958 hoax did not daunt Bigfoot enthusiasts such as [Loren Coleman](#) or Idaho State University anatomy professor [Dr. Jeff Meldrum](#), who has casts of 40 to 50 big footprints. Coleman asks

Why is the testimony of an admitted liar, now being feted by a skeptical magician as the truth, having the newspapers believe it all? The media mixing of the lies and rumors with a few facts in the Wallace story is pushing this one to the edge. This is Ray Wallace's ultimate hoax and bitter seed.

Meldrum believes such a large number of casts couldn't all be hoaxes (ibid.). The same has been said about the large number of [crop circles](#), but it appears that hoaxers are not deterred from their activities by the belief that their numbers are small.

The interest in Bigfoot seems to have been succinctly captured in the saying of an old Sherpa: *There is a Yeti in the back of everyone's mind; only the blessed are not haunted by it.*

paranormal

An event or perception is said to be paranormal if it involves forces or agencies that are beyond scientific explanation. Many paranormal events are said to be experienced only by those with [psychic](#) powers, such as [extrasensory perception](#) or [psychokinesis](#).

Some events are perceived as paranormal due to ignorance. For example, parapsychologist [Charles Tart](#) explains how he first got interested in the paranormal:

There was a time, years ago, when I was highly skeptical of any paranormal claims of any kind. One of the things that convinced me that there must be something to this is a strange experience that I personally went through. It was wartime. I was at Berkeley, California, and everybody was working overtime....the young lady who was my assistant at the time worked with me until very late this one night. She finally went home; I went home. Then the very next day she came in, all excited....She reported that during this night she had suddenly sat bolt upright in her bed, convinced that something terrible had happened. "I had a terrible sense of foreboding," she said, but she did not know what had happened. "I immediately swung out of bed and went over to the window and looked outside to see if I could see anything that might have happened like an accident. I was just turning away from the window and suddenly the window shook violently. I couldn't understand that. I went back to bed, woke up the next morning and listened to the radio." A munitions ship at Port Chicago had exploded. It literally took Port Chicago off the map. It leveled the entire town and over 300 people were killed....She said she had sensed the moment when all these people were snuffed out in this mighty explosion. How would she have suddenly become terrified, jumped out of bed, gone to the window, and then - from 35 miles away, the shock wave had reached Berkeley and shook the window?

There is no need to perceive this event as paranormal, according to [James Randi](#), who recorded this story. A shock wave travels at different speeds through the ground and through the air. The difference over 35 miles would be 8 seconds. Most likely the shaking earth woke up the young lady in a fright and 8 seconds later the window shook. She and Tart assumed that the explosion took place when the window shook, making her experience

inexplicable by the known laws of physics. This explanation only makes sense, however, if one is ignorant of the known laws of physics.

cryptozoology

Cryptozoology is, literally, *the study of hidden animals*. It is the study of such creatures as the Australian [bunyips](#), [Bigfoot](#), [the chupacabra](#), and the [Loch Ness monster](#). It is not a recognized branch of the science of zoology.

Cryptozoology relies heavily upon testimonials and circumstantial evidence in the form of legends and folklore, and the stories and alleged sightings of mysterious beasts by indigenous peoples, explorers, and travelers. Since cryptozoologists spend most of their energy trying to establish the *existence* of creatures, rather than examining actual animals, they are more akin to [psi](#) researchers than to zoologists. Expertise in zoology, however, is asserted to be a necessity for work in cryptozoology, according to Dr. Bernard Heuvelmans, who coined the term to describe his investigations of animals unknown to science.

reader comments:

Bigfoot

18 Sep 2000

Hello..my name is Rick. In the early 70s my sister and I saw 2 bigfoot. We were about 15 yrs. old and were not bigfoot enthusiasts. We saw them up close. Being skeptical doesn't mean you're looking for the truth..it usually just means your coming up with alternative explanations..bigfoot has been reported for hundreds of years.. it must be some hoax! What galls me the most is your hiding behind pseudo science to "prove" what you don't believe anyway..don't make science the universal pill for your ignorance and beliefs. You can sit in an office all day and "think" of very plausible explanations for anything. This doesn't make them true or untrue. Now tell me this..If sometime in the near future it becomes fact that bigfoot is real, what will all your explanations amount to? I've never heard of a bigfoot being reported in or near the city. Why? Why do people see these things only where they would really be? If someone tells me they saw a bigfoot downtown, even I would be skeptical. And why, for example, do bigfoot sightings all come from the southeastern part of Ohio? No sightings in western Ohio. Does that mean easterners are prone to hallucinations? What a theory you'd have there. Now suppose someone from western Ohio driving through eastern Ohio sees a bigfoot...They've never seen one at home, but they see one now...???? open up your mind..it's a wonderful thing.

reply: You must be from the southeastern part of Ohio?

18 Sep 2000

I almost fell off my chair when I read the bigfoot believer's comment:

"... there are never any bear corpses or bones found either, but we know they exist. Nothing goes to waste in the wild...it's all eaten."

Apparently this person has never been to a museum of natural history or even for a walk in the woods. There are two bear skulls in a very small museum in my area, along with skeletons of a mastodon and several dinosaurs that obviously did go to waste.

Karl Black Belleville, MI

10 Jan 1999

You wrote that a Hollywood director [John Landis] claimed that the Patterson film was of an actor wearing a costume designed by John Chambers. Just recently I read an interview with Mr. Chambers where he was incredulous that anyone would believe this claim. He said that the technology that would be needed to even attempt this kind of "suit" certainly was not available in 1967, and that the Planet of the Apes costumes look pathetic if compared to what is on the Patterson film. That is certainly true.

reply: From what I understand, Chambers is not well and is living in a nursing home. I don't know what interview you are referring to, but he is being unnecessarily modest or disingenuous if he claimed that the costumes for *Planet of the Apes* "look pathetic if compared to what is on the Patterson film." Those costumes are fantastic and very realistic, even when viewed in close, as is often the case in the movie.

I'm always surprised [though I shouldn't be by this time] that people still continue to doubt what their eyes clearly see. That is not a costume. And, since thousands of people have already seen this creature and continue to see it, and have seen it for many years past, how can anyone claim this to be a hoax? That's some hoax . . .

reply: There is an old saying: *She who thinks the camera doesn't lie, doesn't think.* I don't doubt that the people who make sightings of Bigfoot, Nessie, Elvis, etc., are, for the most part, genuinely convinced they saw the real thing. However, if one understands the nature of perception, one should realize that what these viewers are absolutely certain of is a subjective construction built up out of the interpretation of their observations. Many sightings are due to [pareidolia](#).

The fact that many people share the same delusion does not make the delusion any less of a delusion (witness the millions of children who see [Santa Claus](#) each year). Also, no one claims that every sighting is due to a hoax. Some are misinterpretations of visible perceptions, such as large animals or footprints enlarged due to snow melting, etc.

Another thing that makes me laugh is the question about why there are never any Bigfoot bones or dead bodies found. The response to this is always the same, and that is to point out that there are never any bear corpses or bones found either, but we know they exist. Nothing goes to waste in the wild...it's all eaten.

reply: I don't frequent the habitats of bears, so I'll have to take your word for it that no one has ever found a bear corpse or bear bones (though I must admit that I doubt that this is true). I have seen grizzly bear scat, however. It was pointed out to me by a Yellowstone ranger. Why is there no Bigfoot scat? And why has no one ever spotted a baby or adolescent

Bigfoot, or a female with infant Bigfoot?

I just wanted to pass this info on to you. I believe that if you print something, you should make sure that it's the truth. I find it odd that you would not have taken the logical [and obvious] next step and searched for Mr. Chambers' reply to this statement. Or, perhaps you already knew about Mr. Chambers' response but didn't want to add it to your article for obvious reasons.

Elizabeth Pitts

reply: Given your deep desire to help others such as myself find the truth, I am surprised that you did not mention who did this interview and where our readers can find it. The truth is often elusive, but my guess is that Patterson hoaxed us or was hoaxed by someone himself.

bio-ching

Bio-ching is the union of the modern [pseudoscience](#) of [biorhythms](#) and the ancient superstitious mysticism of the *I Ching*. Bio-ching was created by [Roderic Sorrell, D.D.](#) and [Amy Max Sorrell, D.D.](#), who describe themselves as "therapists" on their twin websites. The Sorrells use a computer program that spits out something from the *I Ching* for each of the 512 biorhythmic combos of their system. In short, they've added an electronic fortune cookie (with equivalent wisdom) to the biorhythm chart.

They prepared for their great innovation by living on a houseboat in San Francisco Bay for several years, "sampling the New Age Emporium that is California." There they learned of "the meridian energy of [acupuncture](#), the power of the deep massage of [Rolfing](#)" and "the esoteric practices of Taoist meditation." They studied "herbal healing" and "were introduced to the newly emerging electronic approaches to the mind: sound and light stimulation of the mind's beta, [alpha](#), theta and delta waves, and biofeedback." On the side, they became [reiki](#) masters.

The Sorrells describe themselves as deliriously happy and at peace with the world in their new home of Truth or Consequences, New Mexico. They want to make you happy, too, and help you achieve inner tranquility or fix whatever physical or spiritual inadequacy you might have. So, they are offering private retreats (minimum of 3 days) for couples, partners and friends for \$250 per day per person. In addition to spiritual counseling, you get room and board for this price. For \$500 more you can do a 3-day retreat on their houseboat at a nearby lake. While there ask them about their union of water and reiki to form the new therapy of [aqua-reiki](#). Ask about their "sound and light machine," their "bio-feedback machine," and their "[subliminal](#) tapes."

Bio-ching might well be called a *folie à deux deux*.*

*A *folie à deux* is the presence of the same delusion in two persons closely associated with one another. When two deluded persons bring together *two* follies to form a new delusion we have the classic *folie à deux deux*.

Search the Skeptic's Dictionary

I Ching

 The *I Ching* or *Book of Changes* is an ancient Chinese text used as an [oracle](#) to find out the answers to troubling questions such as "what does the future hold for me?" The book consists of 64 "hexagrams," each consisting of six broken or unbroken lines. (Sixty-four equals 2^6 and is the number of possible combinations of six broken or unbroken lines.) The lines represent the two primal cosmic principles in the universe, [yin and yang](#). Why the I Ching has six lines, however, is a mystery, since the ancient Chinese believed there were *five* elements (wood, fire, earth, metal, and water), *five* planets, *five* seasons, *five* senses, as well as *five* basic colors, sounds and tastes.

The hidden cosmic meanings of the hexagrams were divined many years ago by Chinese philosopher-priests in tune with the *tao* (Chinese for *path* or *way*). They consist of such bits of fortune cookie wisdom as: "Treading upon the tail of the tiger. It does not bite the man." Or, "the superior man discriminates between high and low."

The *I Ching* is consulted in several ways. One way is by flipping coins. Each coin is assigned a number. The coins are tossed and the numbers added up to determine the hexagram. Another method involves a complex divination based on dividing up bundles of yarrow stalks. One can also consult the oracle either on the [Internet](#) or on a [CD](#).

It is not too difficult to understand why ancient peoples would look to random coin tosses, plant stalks, bird's entrails, the stars, lines on burnt bones, etc., to help them decide what to do next with their lives. They had no science, little knowledge of the nature of things, and not much more to guide them in this life than their own limited experiences and the teachings of superstitious mythmakers and storytellers. It is not too difficult to imagine why the mythmakers would come up with such methods of divination: you can make money from it and, if you are clever and vague enough, you can gain a reputation for wisdom and it can be difficult to prove you wrong.

Also, such beliefs lend themselves to confirmatory experiences and are bound to have many satisfied customers. Anything that vaguely resembles an accurate prediction will be significant. What would count as counter-evidence is not clear and is certainly not actively sought out or attended to. Some prophecies, too, become self-fulfilling.

Furthermore, the oracle satisfies a need which many people seem to have: the need to be told what to do with their lives. The same is true today, though it may be disappointing to some graduates of Princeton University to see their

alma mater's name associated with the [CD-ROM version of the I Ching](#).
Business is business. And today there is hardly any business as booming as
the business of metaphysical and mystical codswallop.

[Sex, Crackers and
Subliminal Ads](#)
[March 31, 2003 By
Eleftheria Parpis](#)

subliminal

The subliminal is below the liminal (the smallest detectable sensation).

Anything truly below the level of detectable sensation could not, by definition, be perceived. However, the subliminal is generally said to be below the threshold of *conscious* perception. There is a widespread belief, not strongly supported by empirical research, that without being aware of its presence or content, a person's behavior can be significantly affected by subliminal messages. Thus, it is believed that one can influence behavior by surreptitiously appealing to the [subconscious mind](#) with words and images. If this were true, then advertisers could manipulate consumer behavior by hiding subliminal messages in their ads. The government, or Aunt Hilda for that matter, could control our minds and bodies by secretly communicating to us subliminally. Learners could learn while listening to music embedded with subliminal messages. Unfortunately, "...years of research has resulted in the demonstration of some very limited effects of subliminal stimulation" and no support for its efficaciousness in behavior modification (Hines, 312).

The fact that there is almost no empirical support for the usefulness of subliminal messaging has not prevented numerous industries from producing and marketing tapes which allegedly communicate directly with the unconscious mind, encouraging the "listener" not to steal, or coaching the "listener" to have courage or believe in his or her power to accomplish great things. Consumers spend more than \$50 million each year on subliminal self-help products (*Journal of Advertising Research*, reported by Dennis Love, *Sacramento Bee*, 9-14-2000). A place called [Hynotictapes.com](#) offers a wide array of such tapes developed by James H. Schmelter, a hypnotherapist with an MBA and self-proclaimed expertise in synergistic science. If Schmelter's stuff is not to your liking, try [Mindwriter Subliminals... A Breakthrough In Human Reprogramming.](#)

It is true that we can perceive things even though we are not conscious of perceiving them. However, for those who put messages in tapes and then record music over the messages so that the messages are drowned out by the music or other sounds, it might be useful to remember that if the messages are drowned out by other sounds, the only perceptions one can have are of the sounds drowning out the messages. There is no evidence of anyone hearing a message which is buried beneath layers of other sounds to the point where the message does not distinctly stand out. Of course, if the message distinctly stood out, it would not be subliminal.

The belief in the power of subliminal messaging to manipulate behavior seems to have originated in 1957 with James Vicary, an advertising promoter

who claimed to increase popcorn sales by some 58% and Coke sales by some 18% in a New Jersey movie theater simply by flashing very briefly the messages "Drink Coca-Cola" and "Hungry - Eat Popcorn." Even though the claim has been shown to be a hoax, and even though no one has been able to duplicate the event, belief in the legend lingers. This story and several others were retold by Vance Packard in *The Hidden Persuaders* (1957), a book that became required reading for a generation of college students.

Belief in subliminal messaging reached a surreal apex in 1980 with the publication of *The Clam-Plate Orgy and Other Subliminals the Media Use to Manipulate Your Behavior* by Wilson Bryan Key. The book has been reissued under the sexier title: *Subliminal Adventures in Erotic Art*. Key claims that advertisers use subliminal messaging of a very serious sexual nature in order to manipulate behavior, including imbedding sexy figures and the word 'sex' in images of such things as ice cubes and food. While carefully examining a Howard Johnson's menu, Key saw that the plate of clams pictured on the menu was actually the portrayal of a sexual orgy which included various people and a donkey. Among Key's many unfounded claims is that the unconscious mind processes subliminal messages at the speed of light. Actually, the fastest brain process chugs along at some 40 m.p.h. (Hines).

Despite the fact that there is no body of empirical support for the notion that subliminal advertising is effective, in 1974 the Federal Communications Commission (FCC) issued an order saying that broadcast outlets that knowingly carry subliminal ads are operating "contrary to the public interest." In September 2000, Senators Ron Wyden of Oregon and John Breaux of Louisiana complained to the FCC about a Republican ad that flashed the word "RATS" (or "BUREAUCRATS") across the screen for 1/30 of a second. "We have reason to believe that broadcasters are airing television advertisements that contain subliminal messages in violation of the public interest," they said, apparently oblivious to the fact that something which can't be registered by the brain is unlikely to have any effect on viewers and is unlikely to violate anything except the reasonable bounds of credulity.

orgone energy & Wilhelm Reich (1897-1957)

...unlike Sir Isaac Newton, Reich was not willing to stand upon the shoulders of giants. He stood only as high as his own experiences would allow, and from this low perch imagined himself to be a lone eagle soaring higher than any other man had ever reached. --[Roger M. Wilcox](#)

Orgone energy is an alleged type of "Primordial Cosmic Energy" discovered by Freudian psychoanalyst Wilhelm Reich in the late 1930s. Reich claimed that orgone energy is omnipresent and accounts for such things as the color of the sky, gravity, galaxies, the failure of most political revolutions, and a good orgasm. In living beings, orgone is called bio-energy or Life Energy. Reich believed that orgone energy is "demonstrable visually, thermically, electroscopically and by means of Geiger-Mueller counters."* However, only true believers in orgone energy (i.e., *orgonomists* practicing the science of *orgonomy*) have been able to find success with the demonstrations.

Reich claimed to have created a new science (orgonomy) and to have discovered other entities, such as *bions*, which to this day only orgonomists can detect. Bions are alleged vesicles of orgone energy which are neither living nor non-living, but transitional beings.

Reich died on November 3, 1957, in the Federal Penitentiary at Lewisburg, Pennsylvania, where he was sent for criminal contempt. The criminal charge was levied because Reich refused to obey an injunction against selling quack medical devices such as the [Orgone Accumulator and orgone "shooters,"](#) devices which allegedly could collect and distribute orgone energy, thereby making possible the cure for just about any medical disorder except, perhaps, megalomania and self-delusion.

The Food and Drug Administration not only declared that there is no such thing as orgone energy, they had some of Reich's books burned--a sure-fire way to ignite interest in somebody. If the government burned his books, Reich must have been on to something BIG!!! Or so one theory goes. There is another theory which says that some government decisions look stupid because they are made by incompetent people.

Despite having no status in the scientific community, Reich's ideas have been passed on by a number of devoted followers led by Elsworth F. Baker, M.D., founder of [The American College of Orgonomy](#), and Dr. James DeMeo of [The Orgone Biophysical Research Laboratory, Inc.](#), located in Ashland,

Oregon. Baker's successors (he died in 1985) and DeMeo continue to defend both Reich the scientist and orgonomy. Reich saw himself as a persecuted genius and considered the critics who ridiculed him to be ignorant fools.

magnet therapy

"I know of no scientist who takes this claim seriously...It's another fad. They come and go like copper bracelets and crystals and all of these things, and this one will pass too." --Robert Park of the American Physical Society.

"Iron atoms in a magnet are crammed together in a solid state about one atom apart from one another. In your blood only four iron atoms are allocated to each hemoglobin molecule, and they are separated by distances too great to form a magnet. This is easily tested by pricking your finger and placing a drop of your blood next to a magnet. " -- Michael Shermer*

Magnet therapy is a type of ["alternative" medicine](#) which claims that magnetic fields have healing powers. Some claim that magnets can help broken bones heal faster, but most of the advocacy comes from those who claim that magnets relieve pain. Most of the support for these notions is in the form of [testimonials](#) and anecdotes, and can be attributed to "placebo effects and other effects accompanying their use" (Livingston 1998). There is almost no scientific evidence supporting magnet therapy. One highly publicized exception is a double-blind study done at [Baylor College of Medicine](#) which compared the effects of magnets and sham magnets on the knee pain of 50 post-polio patients. The experimental group reported a significantly greater reduction in pain than the control group. No replication of the study has yet been done.

A less publicized [study at the New York College of Podiatric Medicine](#) found that magnets did not have any effect on healing heel pain. Over a 4-week period, 19 patients wore a molded insole containing a magnetic foil, while 15 patients wore the same type of insole with no magnetic foil. In both groups, 60% reported improvement.

Despite the fact that there has been virtually no scientific testing of magnet therapy, a growing industry is producing magnetic bracelets, bands, insoles, back braces, mattresses, etc., and claiming miraculous powers for their products. The magnet market may be approaching \$150 million annually (Collie). (Lerner claims that U.S. sales are near the half billion mark and that world-wide magnetic therapy is bringing in nearly twice as much.) Magnets are becoming the gimmick of choice of chiropractors and other ["pain specialists"](#). Former potter, Marlynn Chetkof sells Russell Biomagnetic products, and advises that magnets are better than painkillers or living with pain (Collie). Even a bankrupt building contractor, Rick Jones, is trying to cash in on the current magnet craze. He has formed a company called Optimum Health Technologies, Inc. to market his ["Magnassager,"](#) a hand-

held vibrator with magnets retailing for \$489. Jones claims his invention "isn't just another massage device." He says it uses an electromagnetic field to help circulate blood while it's massaging the muscles. Jones raised \$300,000 from investors and spent it all on "product development and marketing." Not a cent was spent on scientific testing of the device before bringing it to market, though he did give \$20,000 to a physiologist to evaluate his device "to make sure that it was not gimmicky" (Kasler).

The claim that magnets help "circulate blood" is a common one among supporters of magnet therapy, but there is no scientific evidence that magnets do anything to the blood. Even though the evidence is lacking that magnets have anything other than a placebo effect, theories abound as to how they work. Some say magnets are like a [shiatsu](#) massage; some claim magnets affect the iron in red blood cells; still others claim that magnets create an alkaline reaction in the body (Collie). Bill Roper, head of Magnetherapy claims that "Magnets don't cure or heal anything. All they do is set your body back to normal so the healing process can begin" (Collie). How he knows this is not clear.

Some supporters of magnetic therapy seem to base their belief on a metaphysical assumption that all illness is due to some sort of imbalance or disharmony in energy. The balance or flow of electromagnetic energy must be restored to restore health, and magnets are thought to be able to do this.*

The most rabid advocates of magnet therapy are athletes such as Jim Colbert and John Huston (golfers), Dan Marino (football) and Lindsay Davenport (tennis). Their beliefs are based on little more than [post hoc](#) reasoning. It is possible that the relief a magnetic belt gives to a golfer with a back problem, however, is not simply a function of the [placebo effect](#) or [the regressive fallacy](#). It may well be due to the support or added heat the belt provides. The product might work just as well without the magnets. However, athletes are not given to scientific testing any more than are the manufacturers of magnetic gimmickry.

Athletes aren't the only ones enamored of the power of magnets to heal. Dr. Richard Rogachefsky, an orthopedic surgeon at the University of Miami, claims to have used magnets on about 600 patients, including [people who have been shot](#). He says that the magnets "accelerate the healing process." His evidence? He can tell by looking at X-rays. [Dr. William Jarvis](#) is skeptical. He says that "Any doctor who relies on clinical impressions, on what they think they see, is a fool" (Collie). There is a good reason scientists do [controlled double-blind studies](#) to test causal efficacy: to prevent [self-deception](#).

[Dr. Mark S. George](#), an associate professor of psychiatry, neurology and radiology at the Medical University of South Carolina in Charleston, did a controlled experiment on the use of magnets to treat depression. He only

studied twelve patients for two weeks, however, so his results are of little significance.

While sales of magnetic products keep rising, there are a few scientific studies going on. The University of Virginia is testing magnets on sufferers of fibromyalgia. The Universities of Miami and Kentucky are testing magnets on people with carpal tunnel syndrome (Collie). At present, however, we have no good reason to believe that magnets have any more healing power than [crystals](#) or copper bracelets.

See **related entries** on [alternative medicine](#), [the post hoc fallacy](#), and [the regressive fallacy](#).

 bioharmonics

reader comments:

bioharmonics

3 Jan 2000

Dear Mr. Carroll,

Although we encourage free speech and the right to opinions voiced in well researched articles on the internet, we feel that the link to BioHarmonics on your website is highly inappropriate. You have had a link to bioharmonics.com on a page entitled "Suggestions for future entries in the Skeptic's Dictionary" for over two years now. After pursuing the articles posted in the Skeptic's Dictionary, we have found that they tend to be biased against energy healing research of various types. Our link placement on your site suggests to visitors that we are being investigated for some kind of quackery or other fraudulent behavior which is not the case. Since we have not once been contacted by you, we feel that you are intentionally misleading the public and that your actions should at the very least create skepticism about your intentions. You have had plenty of time to research BioHarmonics and write your article. Yet, you have not initiated contact with us to date, nor have you ever given any indication that you are actually planning to do anything other than sully our reputation by placing the link on your page. Therefore, we ask that you remove the link from your site. Thank you.

Wishing you wellness,

Linda Townsend

BioHarmonics Researcher and Consultant

Cornerstone Enterprises International, SA

reply: Your wish is my command. Bioharmonics and the BioHarmonizer have been removed from the "future entries" page and now have a place in the SD itself along with other pseudoscientific New Age quack theories and devices.

By the way, the page listing "Suggestions for future entries" is just that: a page of suggestions. Readers suggest the sites and I post them on this page if they seem like the kind of thing I might some day write an entry for. The list keeps getting longer instead of shorter. Periodically, I thin the list, as when I actually write an entry on a suggested topic or remove items I deem inappropriate. Because the material to write about is infinite and my time finite I often will let a suggestion sit for years until someone, such as yourself, motivates me to investigate it at a time when I have a few hours to spare.

4 Jan 2000

Thank you for taking the time to write your article. Criticisms of scientific reports are considered part of the refining process and actually improve the final results. When the website was reconstructed recently, the case studies were not uploaded. We are working on updating them and adding new case studies as well. I am also in the process of preparing a book on BioHarmonics as well.

In your message you stated ". . . motivates me to investigate it at a time when I have a few hours to spare." I am most interested in being interviewed by you when you find the time. A respected investigative reporter usually spends time and effort in deriving at the truth. I personally had to devote several years of research and documentation for my articles.

Bottom line is anyone can go the BioHarmonics website and make their own decision regarding the information presented there. Any hack can pick apart a few published articles but responsible writers have higher ethics. What investment beyond a few hours writing time have you really made in preparing your article with its recommendations? Have all the articles in "The Skeptics Dictionary" been based on this lack of commitment?

Wishing you wellness,

Linda Townsend

BioHarmonics Researcher and Consultant

reply: My investment includes a few decades of studying, observing, reading, investigating, discussing, etc., numerous claims regarding paranormal, supernatural, occult and quasi-metaphysical New Age claims. I've also researched many pseudoscientific theories over the past thirty years. Your work bears all the marks of pseudoscience on its sleeve. Any critical thinker with a good grasp of scientific methodologies and theories would notice almost immediately that your work is not scientific and offers little hope of being based on anything other than metaphysical claptrap garbed in jargon to make it appear reasonably informed.

In case you are wondering what I am referring to, I mean:

- 1. You are unclear regarding basic concepts. You give no clear definition of 'bioenergy'.**
- 2. You show you do not understand biochemistry by your writing, viz., "if bioenergy and biochemistry have a mutual influence on each other, correcting bioenergy irregularities may also effect balancing the biochemistry." Bioenergy (as understood by biochemists) can't *influence* biochemistry any more than nuclear power plants can influence nuclear physics.**
- 3. You show you do not understand that empirical and metaphysical**

concepts are different types. Your claims about layers of bioenergy and the connection with chi have no empirical basis.

- 4. Your thinking is metaphorical, not scientific. Your comparisons of the body to a piano regarding harmony and the body to a magnet regarding "bipolarity" have no basis in fact.**
- 5. The machine you are selling, which allegedly harmonizes bioenergy, has many analogues in the history of pseudoscience. You posit an undetectable energy, declare it is defective, claim you have what can set it aright, then offer a device that is impossible to monitor except by subjective validation. (Are your case studies going to be reports of people who say they used the machine and boy do they feel better now?)**

Finally, I am having difficulty in understanding why you keep baiting me. I could go on for a few more hours as to why I don't feel a need to spend any extensive time studying your work to be reasonably assured that it is worthless.

Why would you want to be interviewed by a hack who you know will rip you to shreds?

8 Jan 2000

Just a quick note to tell you that I have been enjoying your site for the last few years and I applaud your informative and well-crafted dissections of various pseudoscience claims.

I was prompted to write after reading your article on Linda Townsend's BioHarmonics. Visiting her site I not only found the annoying, buttonless pop-up window (a feature usually reserved for seedy adult web sites) but looking at the source I noticed that she has included META keyword tags listing nearly every type of cancer known to man, and maybe some that aren't. She even includes the terms 'dog cancer' and 'canine cancer' along with the names of some well-known cancer research centers. All in an obvious attempt to get her site listed on search engines to snare unsuspecting individuals seeking help or information.

All in all, it's a truly shameless attempt to take advantage of people's misfortunes and ignorance. At least I did find her email address so now I can share with her all the wonderful, unsolicited email I receive regarding miracle cures or sure-fire profit making opportunities that will help her continue her noble efforts.

Keep up the excellent work,
Mike Hall

reply: You're right. Ms. Townsend replies:
10 Jan 2000

Dear Mr. Carroll,

Thank you for your observation [that 'bioenergy' is not clearly defined]. I will need to give a clear definition on my website. In brief, "bio" means means "of living things" and "energy" has many meanings "inherent power", "power in action", "expression of force", etc. Basically my term "bioenergy" is energy

that is inherent to living things. The term is accurate, even if it has been also used as scientific term to describe something completely different.

reply: Your definition may be accurate, but it still is not clear. What do you mean by 'inherent'? What are the essential characteristics of this energy that distinguish it from other forms of energy? How is this energy detected and measured? How does 'bioenergy', in your sense, differ from [élan vital](#), [chi](#) or [prana](#)?

[You write]

You show you do not understand biochemistry by your writing, viz., "if bioenergy and biochemistry have a mutual influence on each other, correcting bioenergy irregularities may also effect balancing the biochemistry." Bioenergy (as understood by biochemists) can't influence biochemistry any more than nuclear power plants can influence nuclear physics.

Put a plant in total darkness, it cannot thrive by the nutrients in the soil alone. God forbid that a child try to grow in total darkness, but I imagine it would be the same result. Why? Every scientist recognizes that certain biochemical reactions only can occur with the energy called light -- and not all "light" is in our visual spectrum. Dogs hear sounds we cannot. I have met people who can also hear beyond the typical range for humans. Existence of something does become unreal just cause we cannot detect it, just deniable.

reply: I think you mean, in your last sentence, that the existence of something does not depend upon our ability to detect it. I agree. However, that is a philosophical issue. We are here discussing an empirical matter. The fact is that we *can* detect areas of the electromagnetic spectrum that are not detectable by the senses without help from sonar, radar, the spectrometer, etc. If this energy you posit exists outside the range of our most sophisticated equipment, how do you know it exists? You are making claims for a very powerful effect from this energy, yet the energy itself is undetectable. This sounds like faith, not science.

Bioenergy is expressed in frequencies and harmonics of magnetic, electricity and light energies working together just at the outer boundaries of our ranges for physical detection. If the body/bioenergy field lacks these energies, illness will result.

reply: How do you know these things? What evidence is there for either of these claims? If these harmonics are at the outer boundary of our range of physical detection (by which I assume you mean detection using sophisticated scientific equipment), then they are detectable. If so, why are you the only one who has detected them? I don't imagine you even

have access to the kind of equipment necessary to detect energy at the boundaries of detection.

Furthermore, what is the basis for your claim that there is a causal relationship between these boundary energies and illness? And if there is a causal relationship, you have no way of knowing which is the cause, which the effect. How do you know that it is not illness which causes disharmony (assuming for the moment that these boundary energies and their harmonics exist)?

You like musical analogies, so here is one for you. If I hit the G string on my guitar and send out sound with various harmonics, you will have no effect on my G string by altering the harmonics with another instrument.

Every chemical reaction has an "electromagnetic" basis and every atom has movement, at least that was what I understood from my basic chemistry. Sunlight contains light in spectrums beyond technology's detection less than a century ago but technology is always behind human imagination. Someone had to see something that made him search beyond what he accepted to be absolute. That is "the stuff" that makes discoveries.

reply: It is also the stuff of quackery and nonsense. You seem to think that you have carte blanche to furnish the universe with whatever entities you wish on the ground that scientific knowledge has increased over time.

[You write]

Your claims about layers of bioenergy and the connection with chi have no empirical basis.

That is true at this time but as technology advances, I am positive that someday soon devices will be produced that will give the empirical evidence you are seeking.

reply: On what do you ground this hope? And, until then, shouldn't you be a bit more cautious of making grandiose claims regarding the health benefits of your Harmonizer? By the way, how could you invent the Harmonizer if you don't have the technology to detect these energies? If you can create them or affect them, you must be able to detect them. You should be writing a scientific paper and getting ready to receive your Nobel Prize.

[You write]

Are your case studies going to be reports of people who say they used the machine and boy do they feel better now?

Not exactly. For instance, one Florida man has interstitial fibrosis of the lungs. This is caused by breathing in mineral dusts even though he wore a mask, when he worked in a steel mill in Pennsylvania. One year before we met, he was told he had three years left and was put on the lung transplant list. After doing some research on his own he found that a lung transplant would not improve his quality of life and most likely only give him additional 3 to 5 years of suffering. He approached me when the specialists told him in August that he would not have two more years but barely 6 months because the disease was progressing much faster than anticipated. He began the self administered harmonization process in September. In November, his doctor can not hear any cracking in his lungs and asked him to come back for tests in January. In January, his doctor told him he would no longer qualify for a lung transplant. All this occurred in 1996-97 and he is still alive today. This disease rarely goes into remission, let alone improves. He is off medication most of the time except for occasional illnesses that seems to target his weaken lungs. Although he still harmonizes daily, at times he still has bouts of coughing and difficulty breathing but overall he is still improving. This was not the only case with documentation (x-rays and medical reports) but one of the toughest cases I have observed so far. He tells me that how he is now still is better that he would have been with a lung transplant. Most of the people he interviewed who had transplants are dead or dying. (I featured the progress of his case on the old website for over two years along with some others and this case is also featured in the book I am writing.)

reply: Not exactly? If you don't call this a case study, what do you call it? This is a [testimonial](#), not a [scientific study](#).

[You write

It is true that alternative practitioners can help some people by the [placebo effect](#) and by providing attention, love and care.]

Placebo? I really doubt it but let's say for a moment that it is. (Isn't it too bad that the learned, scientifically based, medical profession could not give him the elements needed for the placebo effect -- hope, faith and love.) Placebo effects rarely, if ever, actually make the person well rather than just "feel good". It is doubtful that this was placebo especially when you consider the time factors of this one case but there are several others.

reply: According to the Methodist Health Care System [webpage](#) on respiratory disorders, there are over 180 kinds of interstitial lung diseases. It is possible your machine helped the man, but we'll never know because so many other factors could account for his condition.

I would not place too much emphasis on the erroneous predictions of medical divinities (MDs).

Actually, I am pretty skeptical of many of the metaphysical ideas that you have categorized with my research. The thing I find so fascinating is that you assumed it was the same as the others and did not really investigate BioHarmonics itself. I have been able to do something no healing energy philosophy has ever done to date. With a bioenergy test, I have been able to accurately (less than 5% error) determine blood types from bioenergy patterns with hundreds of people who knew I could not possibly know that information about themselves. This is something that can be empirically verified with a blood test. As a skeptic, don't you find that the least bit interesting?

reply: I not only find it interesting, I find it appalling. So you *can* detect bioenergy. Do you do this with a machine or is it intuitive, some gift that only you possess? What journal have you published your study in? I would like to read how you detect the patterns and what algorithm you use to correlate the patterns to blood type. This alone would win you the Nobel Prize. Think of the lives that might be saved by not having to do a blood test before a transfusion in emergency cases!

[You write

Finally, I am having difficulty in understanding why you keep baiting me. Why would you want to be interviewed by a hack who you know will rip you to shreds?]

I view this conversation as exchange between two people of unlike minds. I honestly respect the views of someone who is true to skepticism. At this point I could quote your definition of a skeptic but you already know what you have written. I believe to be skeptical is to doubt and question. Skepticism is not about prejudging but in seeking truth that can be proven. I merely ask the question why are you convinced before you seek all the evidence? Are you not a contradiction of your beliefs? And if you are convinced what you believe is the truth and do not need further proof, why did you respond?

**Wishing you wellness,
Linda Townsend**

reply: A good critical thinker must not only have a healthy skepticism, but also be able to recognize a likely fraud or deluded person when he or she comes upon one. It would be wasteful of time and intellectual energy to dig deeply into every crackpot idea that is put forth by people such as yourself.

I respond for three reasons. One, I'm open-minded enough to allow that maybe you have some evidence for your claims and that maybe I was wrong in my initial evaluation of what you present as your work.

Two, the public exposition of my reasons and reasoning in your case can serve as an example of what I am doing in many other cases that are similar. Hopefully, by reading my comments some readers will see more clearly the importance of doing controlled tests rather than collecting testimonials. They may recognize how easy it is to delude ourselves if we do not clarify our terms and set out precise methods of evaluating our claims.

Three, in case you are a fraud, rather than a sincere person who is deluded or mistaken, I hope that by exposing you and others like you some people with serious illnesses will not seek your services. Your kind of medicine gives false hope to desperate people. Your attempt to lure in cancer patients with a meta tag and keywords in your html code is especially disgusting.

Ms. Townsend replies to my replies again (to avoid confusion I will reply to these replies to my replies at the end of her letter rather than respond to each reply to the reply). My earlier replies and questions are in bold, Ms. Townsend's responses are italicized:

10 Jan 2000

Dear Mr. Carroll,

**Your definition may be accurate, but it still is not clear.
What do you mean by 'inherent'?**

I believe the definition of inherent is "existing in someone or something as a natural inseparable quality".

What are the essential characteristics of this energy that distinguish it from other forms of energy?

The only essential characteristic is that is of living systems. Even plants have it although in a different formation than animals.

How is this energy detected and measured?

You cannot measure the power of a magnet with a piece of wood but you can with a piece of iron. The iron, unlike wood, has the potential of becoming magnetic. You cannot measure bioenergy without a sensitive source of bioenergy.

How does 'bioenergy', in your sense, differ from elan vital, chi or prana?

They don't reveal patterns relating to physical variation of one's blood type.

If this energy you posit exists outside the range of our most sophisticated equipment, how do you know it exists? You are making claims for a very powerful effect from this energy, yet the energy itself is undetectable. This sounds like faith, not science.

Perhaps. Science is also a belief system with several sects. What one scientist believes is a logical conclusion of the evidence can often be doubted and even concluded as wrong by another. Interpretations of evidence is still ruled by imperfect humans. In effect, yes, I believe all things of science have an element of faith.

How do you know these things? What evidence is there for either of these claims? If these harmonics are at the outer boundary of our range of physical detection (by which I assume you mean detection using sophisticated scientific equipment), then they are detectable. If so, why are you the only one who has detected them? I don't imagine you even have access to the kind of equipment necessary to detect energy at the boundaries of detection.

About 250 B.C. Greek scientists determined the Earth was round. Yet, the discoverers did not act on that belief. It does not amaze me that it was over 1700 years later before a "civilized" explorer acted on that information. What amazes me is how one can claim to prove with theory alone that something exists and then sit back discussing it without venturing on. Acting on a belief is what makes it believable.

The answers I would give you may be no more proof to you that bioenergy exists than the sophisticated mathematical equations was [sic] proof to common people that the world was spherical. I have no mathematical equations except for simple harmonics, no quantum science theories and no empirical evidence that would satisfy you and still I say it does exist because I can detect it. If it does not exist, how can I detect it and determine a person's blood type by it?

Furthermore, what is the basis for your claim that there is a causal relationship between these boundary energies and illness? And if there is a causal relationship, you have no way of knowing which is the cause, which the effect. How do you know that it is not illness which causes disharmony (assuming for the moment that these boundary energies and their harmonics exist)?

It can be either or both. Often the bioenergy reveals an anomaly prior to

physical symptoms of temporary conditions such as colds, flues and infections but whether the bioenergy anomaly causes or allows the cause of the illness is something I cannot say with absolute certainty at this time. I only say that the bioenergy anomaly is found in relationship to the effected areas.

You like musical analogies, so here is one for you. If I hit the G string on my guitar and send out sound with various harmonics, you will have no effect on my G string by altering the harmonics with another instrument.

I am not sure what you meant here, but I believe you are saying that I cannot make the G string change. If I had a guitar with an out of tune G string and we played together, it would eventually effect [sic] your G string. I used to play guitar with others and have noticed this happens. If you are saying I could not do this with harmonics alone, I would have to say that it would be an interesting experiment.

It is also the stuff of quackery and nonsense. You seem to think that you have carte blanche to furnish the universe with whatever entities you wish on the ground that scientific knowledge has increased over time.

I apologize for misleading you about how I think.

On what do you ground this hope? And, until then, shouldn't you be a bit more cautious of making grandiose claims regarding the health benefits of your Harmonizer? By the way, how could you invent the Harmonizer if you don't have the technology to detect these energies? If you can create them or affect them, you must be able to detect them. You should be writing a scientific paper and getting ready to receive your Nobel Prize.

I have not made any claims other than the Harmonizer can be used [to] energize bioenergy and correct bioenergy imbalances. The rest has been extracted from personal experience and reports of others. You know, a doctor gave me this same Nobel Prize speech once. It was done publicly and, unknown to him, in front of researchers, doctors, and scientists who had just witnessed me determining blood types by bioenergy testing. I was terribly embarrassed for him.

Not exactly? If you don't call this a case study, what do you call it. This is a testimonial, not a scientific study.

The "not exactly" was answering your question: "Are your case studies going to be reports of people who say they used the machine and boy do they feel better now?"

What I gave you is a synopsis from dated notes, reports, etc. as well as his testimony. His case reports are several pages long.

According to the Methodist Health Care System webpage on respiratory disorders, there are over 180 kinds of interstitial lung diseases. It is possible your machine helped the man, but we'll never know because so many other factors could account for his condition.

I thought I had given you the cause, breathing metallic dust while working in a steel mill, and if you looked it up you know that there is no medical cure. The disease progresses even when removed from the environment that caused it. His diagnosis was chronic interstitial fibrosis. His prognosis was terminal in 1995 with 3 years, possibly 5 years, of life without a lung transplant until August of 1996. At that time his prognosis was change to 6 months of life.

I would not place too much emphasis on the erroneous predictions of medical divinities (MDs).

Oh. Well, I agree. I used to work at a place that did x-ray readings. You see some things and learn some things here and there. One thing I have noticed is that when about half of the lungs look white on an x-ray one month and the next month more than half with greater density, that person is has a fast paced disease that is most liked going to inhibit his breathing to the point the lungs cannot exhale.

I not only find it interesting, I find it appalling. So you can detect bioenergy. Do you do this with a machine or is it intuitive, some gift that only you possess?

I test the motions of bioenergy using a special device that is able to swing freely and has access living bioenergy source [sic?]. Even though this is a subjective device at this time that will not always be so. Subjective or not, I still can detect blood types with high accuracy.

Everything causes a reaction in the bioenergy field. I am in the process of logging the patterns of various stimuli. For instance, the Florida man had difficulty correcting his bioenergy patterns to healthy states. I tested the bioenergy motion reactions of various metals and found the "signature" of nickel in the lungs, liver, and in the joints. He also had arthritis. Nickel is known to have an affinity for the lungs and is a known cause of lung cancer. Detoxification methods were suggested. Afterward, the bioenergy did improve and the nickel signature cannot be found. He reports he has very little to no arthritis pain now. When we first met, he could barely walk most days.

What journal have you published your study in? I would

like to read how you detect the patterns and what algorithm you use to correlate the patterns to blood type. This alone would win you the Nobel Prize. Think of the lives that might be saved by not having to do a blood test before a transfusion in emergency cases!

All things come in time.

Have you ever written a paper for a journal and had it accepted?

It is extremely difficult to get a journal to accept a paper without some peer recognition regardless of supportive findings. Still, I am continually looking for devices or someone with the technical expertise to make a device that would be considered absolutely objective, if there ever is such a thing.

I respond for three reasons. One, I'm open-minded enough to allow that maybe you have some evidence for your claims and that maybe I was wrong in my initial evaluation of what you present as your work.

I recognized that or I would not have responded.

Two, the public exposition of my reasons and reasoning in your case can serve as an example of what I am doing in many other cases that are similar. Hopefully, by reading my comments some readers will see more clearly the importance of doing controlled tests rather than collecting testimonials. They may recognize how easy it is to delude ourselves if we do not clarify our terms and set out precise methods of evaluating our claims.

I appreciate that as well.

Three, in case you are a fraud, rather than a sincere person who is deluded or mistaken, I hope that by exposing you and others like you some people with serious illnesses will not seek your services. Your kind of medicine gives false hope to desperate people. Your attempt to lure in cancer patients with a meta tag and keywords in your html code is especially disgusting.

I understand your concern. Perhaps it is inappropriate but then if someone does a search for cancer, I very much doubt he will find our site in the first 500 sites that come up on any major search engine.

Usually those with cancer who come to us are terminal with have no medical

options left. I do not give them false hope about their situation or miracle speeches although I have seen some miraculous things. I think you can tell that I am not trying to use hype and, even if I am deluded by your definition, I am sincere about my work and the research I have done.

I have really enjoyed our conversation and your questions have helped me. Perhaps when we get some case studies on-line you will be inspired to review the site again.

Wishing you wellness,

Linda Townsend

reply: I think you've answered all my questions as well as they can be answered. Your own words have exposed your intentions, methods, accomplishments and understanding of scientific procedures with exquisite clarity and appalling self-confidence.

10 Jan 2000

In her latest missive, Linda has actually made a testable claim, viz, that she can (with her magic box), type blood to a 95% accuracy by measuring the bioenergy field. You might wish to suggest that she apply for the million dollar Randi award. Or, ask for volunteers to run a controlled test, with her written pledge that if the test should prove negative, she will cease and desist from all promotion of her devices, books, and seminars. Of course, if she DOES succeed, we will do everything we can to promote her important work and get her that Nobel Prize that she apparently deserves.

Stuart Yaniger

10 Jan 2000

I have been reading the ongoing email discussion you have been having with the BioHarmonics quacks. I found the Meta tag to be very disturbing, so I took the time to email the agencies listed in the tag to alert them to the inappropriate referencing by BioHarmonics. I included a link to your letters page. I don't know if they have the time or resources to pursue things like this but I felt they should be given the opportunity. Large corporations have sued companies and website owners for doing the same thing and won.

It is an obscenity. Thanks for bringing it to the attention of the web community.

Kevin Miller

reply: It was Mike Hall (see his letter above) who brought it to my attention.

10 Jan 2000

I am following with interest the on-going discussion between you and Ms. Townsend regarding bioharmonics. Looking at a website's search keywords can probably shed some light on a company's motives; I think a company's accounting practices can, too. From the bioharmonics web page (<http://www.bioharmonics.com/cei/ie-index.htm> , under Harmonizer, then DISCOUNT PRICE!), I found this gem:

"Would you like to pay \$100 less for a Harmonizer and 10% off all other products.....

"To qualify you will need to pay in CASH. Postal Money Orders from the U.S. Post Office and U.S. Currency are the only types of payments that qualify. Wire transfers may be considered on an individual basis.

Money Orders, Cashier's Checks, personal checks or any other type of payment method through banks or other companies are exempt from this offer."

This appears to be an attempt to collect money without a paper trail. While this doesn't invalidate bioharmonics per se, it does affect my opinion of the company, and causes me to question the nature of their motives, and the veracity of their claims.

Blondlot and N-rays

One of the first things I did with every graduate student who worked with me is to convince them how difficult it was to keep oneself from unconscious bias.* --Michael

Wetherell, head of [Fermi National Accelerator Laboratory](#)

René Prosper Blondlot (1849-1930) was a French physicist who claimed to have discovered a new type of radiation, shortly after Roentgen had discovered X-rays. He called it the N-ray, after Nancy, the name of the town and the university where he lived and worked. Blondlot was trying to polarize X-rays when he claimed to have discovered his new form of radiation. Dozens of other scientists confirmed the existence of N-rays in their own laboratories. However, N-rays don't exist. How could so many scientists be wrong? They deceived themselves into thinking they were seeing something when in fact they were not. They [saw what they wanted to see](#) with their instruments, not what was actually there (or, in this case, what was *not* there).

The story of Blondlot is a story of [self-deception](#) among scientists. Because many people have the misguided notion that science should be infallible and a fount of absolutely certain truths, they look at the Blondlot episode as a vindication of their excessive skepticism towards science. They relish accounts such as the one regarding Blondlot and the phantom N-rays because it is a story of a famous scientist making a great error. However, if one properly understands science and scientists, the Blondlot episode indicates little more than the fallibility of scientists and the self-correcting nature of [science](#).

Blondlot claimed that N-rays exhibit impossible properties and yet are emitted by all substances except green wood and certain treated metals. In 1903, Blondlot claimed he had generated N-rays using a hot wire inside an iron tube. The rays were detected by a calcium sulfide thread that glowed slightly in the dark when the rays were refracted through a 60-degree angle prism of aluminum. According to Blondlot, a narrow stream of N-rays was refracted through the prism and produced a spectrum on a field. The N-rays were reported to be invisible, except when viewed as they hit the treated thread. Blondlot moved the thread across the gap where the N-rays were thought to come through and when the thread was illuminated it was said to be due to N-rays.

Nature magazine was skeptical of Blondlot's claims because laboratories in England and Germany had not been able to replicate the Frenchman's results. *Nature* sent American physicist Robert W. Wood of Johns Hopkins University to investigate Blondlot's discovery. Wood suspected that N-rays

were a delusion. To demonstrate such, he removed the prism from the N-ray detection device, unbeknownst to Blondlot or his assistant. Without the prism, the machine couldn't work. Yet, when Blondlot's assistant conducted the next experiment he found N-rays. Wood then tried to surreptitiously replace the prism but the assistant saw him and thought he was removing the prism. The next time he tried the experiment, the assistant swore he could not see any N-rays. But he should have, since the equipment was in full working order.

According to Martin Gardner, Wood's exposure of Blondlot led to the French scientist's madness and death (Gardner, 345 n.1). But were those who verified Blondlot's N-ray experiments stupid or incompetent? Not necessarily, since the issue isn't one of intelligence or competence, but of the psychology of perception. Blondlot and his followers suffered "from self-induced visual hallucinations" (*ibid.*).

What is the lesson from the Blondlot episode? James Randi writes

...science does not always learn from these mistakes. Visiting Nancy recently and speaking on the subject of [pseudoscience](#), I discussed this example and though I was in the city that gave the name to N-rays, no one in the audience had ever heard of them, or of Blondlot, not even the professors from the University of Nancy!
--[James Randi at Cal Tech](#)

The fact that Blondlot is not remembered at Nancy ought to be taken as a sign that science *does* learn from its mistakes. The fact that Blondlot is not considered a prophet in his homeland is a healthy sign that although scientists often make errors, even big ones, other scientists will uncover the errors and get science back on the right path to understanding nature. Those who think that science should be infallible do not understand the nature of science.

Recent examples of "Blondlot's Folly" are Pons and Fleischmann's discovery of [cold fusion](#) (1989) and the Lawrence Berkeley National Laboratory in California's claim to have discovered [ununoctium or element 118](#) (1999), although the latter seems to be marred by [faked data](#).

See **related entries** on [Charles Fort and the Forteans](#), [confirmation bias](#), [pathological science](#), [Piltdown Man](#) and [pseudoscience](#).

mesmerism

Mesmerism is a bit of medical quackery developed in the 18th-century by Dr. Franz Anton Mesmer. It involves some social role-playing with the mesmerizer making suggestions and his clients becoming absolutely mesmerized by him. Mesmer used his extraordinary powers of suggestion to send people into frenzied convulsions or sleeplike trances. He was so successful that to this day we use his name to describe the exercise of such powers over others.

In the early 1770s, Mesmer, a Viennese physician who got his doctorate for a plagiarized dissertation on how the planets affect health, met Maximillian Hell, a Viennese Jesuit and healer. The rest, as they say, is history. Fr. Hell cured people with a magnetic steel plate. Hell's "proof" of magnetic healing was that it worked, i.e., he had a lot of satisfied customers. Mesmer plagiarized Hell's magnetic therapy and posited that it works because there is a very subtle magnetic fluid flowing through everything but which sometimes gets disturbed and needs to be restored to its proper flow. Hell, Mesmer theorized, was unblocking the flow of this magnetic fluid with his magnets. Mesmer eventually discovered that he got the same results without the magnets. Rather than attribute this to the [placebo effect](#), he posited that "animal magnetism" accounted for his ability to correct the flow of the universal magnetic fluid. (Today, the term "animal magnetism" means mesmerism or hypnotic power, but I have heard it misused more than once by females to mean a sexy male and by members of both sexes to mean someone to whom animals are attracted.)

Mesmer also discovered that even though he didn't need magnets to get results, the dramatic effect of waving a magnetized pole over a person, or having his subjects sit in magnetized water or hold magnetized poles, etc., while he moved around in brightly colored robes playing the scientific faith healer, made for better drama and for larger audiences. He was able to evoke from a number of his clients entertaining behaviors ranging from sleeping to dancing to having convulsions. Mesmer did basically what today's [hypnotists](#) do in the showroom and the clinic, and what faith healers do in the circus tents and churches, only he did them together, making a great show out of his magnetic cures. With Louis XVI's and Marie Antoinette's help, Mesmer set up a Magnetic Institute where he had his patients do such things as sit with their feet in a fountain of magnetized water while holding cables attached to

magnetized trees. He was later denounced as a fraud by the French medical establishment and by a commission which included Benjamin Franklin.

Did Fr. Hell and Dr. Mesmer really cure anyone? No, of course not. Did any of their patients feel better after taking the cure, or did they declare that they had been healed? Yes, of course. Faith healers and quacks always have "successes." In some cases, they create the illnesses themselves through their power of suggestion and the receptiveness of their subjects. These iatrogenic diseases may or may not have painful physical manifestations. These "diseases" can be as serious as demonic possession or as trivial as excessive giggling. They can present dramatic manifestations such as convulsions or soporific manifestations such as a sleeplike stupor. According to Nicholas Spanos, such patients are not really sick until they agree to play the role of the sick patient for the heroic doctor/savior. Spanos also argues that so-called dissociation or [multiple personality disorder](#) is an iatrogenic disease and got established as a treatable illness in much the same way that [exorcism](#) for demonic possession, [psychoanalysis](#) for hysteria, and fads such as mesmerism got established. Spanos maintains that there is no such thing as multiple personalities, that the idea is a social creation accepted by certain patients who learn to play the roles expected of them as a person with multiple personality disorder (MPD). (Robert Baker makes the same argument for [hypnosis](#).)

When characters such as Mesmer "cure" people, it is his subjects who "cure" themselves. They provide the rapport with their master, and they respond to his suggestions because they agree to respond to them. In short, all such "healing" is done by faith. Sometimes the cure or behavior change might be accomplished by less troubling and less expensive alternative means.

The spirits of Fr. Hell and Dr. Mesmer might be happy to know that magnetic stimulation of the brain's left prefrontal cortex is being tested as a possible aid for depressed patients. Most depression can now be controlled with pharmaceutical treatment, but very severe cases seem to respond only to electroconvulsive therapy (ECT), the kind featured in *One Flew Over the Cuckoo's Nest* and lampooned by almost anyone in the media or public eye who brings up the topic. Researchers at the National Institute of Mental Health (NIMH) are hoping that repetitive [transcranial magnetic stimulation \(TMS\)](#) will work like ECT but without the side effects (seizures and memory loss, in some patients). This research is not based on a belief in animal magnetism or universal magnetic fluids, but upon the facts that (1) ECT works even though nobody knows how; (2) the left prefrontal cortex has been implicated as a site of abnormally low metabolism in depressed brains; (3) after ECT and TMS there are widespread increases in brain metabolism; (4) after ECT many patients experience a dramatic improvement in mood; and (5) preliminary studies have found some mood improvement in some patients who have been treated with TMS. However, do not look for another Mesmer to arise from the medical establishment and take this show on the road.

Scientists are investigating TMS, not faith healers. They may end up concluding the treatment is worthless or harmful.

Multiple Identities & False Memories: A Sociocognitive Perspective

by Nicholas P. Spanos

American Psychological Association, 1996

The mind is a strange thing. Stranger still are some of the ideas psychologists and philosophers have devised to explain the mind. Strangest of all, perhaps, is the fact that some of these ideas become dogma and are taught to unsuspecting undergraduates in textbooks, to trusting graduate students by their mentors in their labs and discussion groups, and to the general public by the mass media. Words find their way into our dictionaries and encyclopedias which give the impression that these strange ideas are not strange at all, but known to be true by the experts who have studied them. I am thinking of expressions such as 'unconscious mind', 'hypnosis', 'repression', 'subliminal advertising', 'libido', 'dissociation', 'codependency' (and numerous other 'addictions'), 'collective unconscious', 'penis envy', and all the *syndromes* and *disorders* that have multiplied over the years in psychiatric diagnostic manuals. Explanatory concepts in psychology are reified and become entities at a rate of development which would fill with envy any third world country desiring the riches of industrialized nations. Mind is a growth industry.

There have been a few notable critics of the expansive nature of psychological theorizing. Robyn Dawes, Robert Baker, Carol Tavris, Elizabeth Loftus and Margaret Singer come to mind. One voice stands out, however: that of Nicholas P. Spanos, silenced by a plane crash in 1994, but whose words remain with us in his many articles and in this remarkable book submitted for publication just prior to his death. Here Spanos presents his case against the "standard textbook" concepts of hypnosis, memory and multiple identities, as well as casting doubt on the validity of the cottage industry of therapies which use hypnosis and other procedures to ferret out false memories and false entities. In what can only be fairly described as a brilliant marshaling forth of evidence, Spanos makes his argument that *hypnosis*, *repressed memories of childhood abuse* and *multiple personality disorder* are "rule-governed social constructions established, legitimated, and maintained through social interaction" (from the preface by John Chaves and Bill Jones).

In short, Spanos argues that some of the most fundamental concepts and treatable disorders in psychology, as well as some fundamental techniques for the treatment of those disorders, have been created by psychologists with the

cooperation of their patients and the rest of society. Thus, many psychologists and therapists are little more than modern day witchhunters, creating their "witches" by questionable assumptions and procedures, misleading the rest of us into believing in "demonic possession" (i.e., repression of memories of childhood abuse and dissociation) and that only the experts know the correct procedures for ridding the world of these evils. The experts create both the disease and the cure, not unlike the creation of Listerine for 'halitosis,' except for the much more devastating consequences of creating "treatable mental disorders."

A rather common view of multiple personality disorder (MPD) is given by Daniel Dennett, who seems to accept the standard view as accurate.

...the evidence is now voluminous that there are not a handful or a hundred but thousands of cases of MPD diagnosed today, and it almost invariably owes its existence to prolonged early childhood abuse, usually sexual, and of sickening severity. Nicholas Humphrey and I investigated MPD several years ago ["Speaking for Our Selves: An Assessment of Multiple Personality Disorder," *Raritan*, 9, pp. 68-98] and found it to be a complex phenomenon that extends far beyond individual brains and the sufferers.

These children have often been kept in such extraordinary terrifying and confusing circumstances that I am more amazed that they survive psychologically at all than I am that they manage to preserve themselves by a desperate redrawing of their boundaries. What they do, when confronted with overwhelming conflict and pain, is this: They "leave." They create a boundary so that the horror doesn't happen to *them*; it either happens to no one, or to some other self, better able to sustain its organization under such an onslaught--at least that's what they *say* they did, as best they recall.

[*Consciousness Explained* (Little, Brown, and Co., 1991), ch. 13, "The Reality of Selves"]

Dennett exhibits minimal skepticism about the truth of the MPD accounts, and focuses on how they can be explained metaphysically and biologically. For all his brilliant exploration of the concept of the self, the one perspective he doesn't seem to give much weight to is the one Spanos takes: that the self and the multiple selves of the MPD patient are social constructs, not needing a metaphysical or biological explanation so much as a social-psychological one. That is not to say that our biology is not a significant determining factor in the development of our ideas about selves, including our own self. It is to say, however, that before we go off worrying about how to metaphysically explain one or a hundred selves in one body, or one self in a hundred bodies, we might want to consider that a phenomenological analysis of behavior which

takes that behavior at face value or which attributes it to nothing but brain structure and biochemistry, may be missing the most significant element in the creation of the self: the sociocognitive context in which our ideas of self, disease, personality, memory, etc., emerge.

But if thinkers of Dennett's stature accept MPD as something which needs explaining rather than explaining away, the task of convincing the psychological community to Spanos' way of thinking is Herculean. How could it be possible that MPD patients have been created in the therapist's laboratory, so to speak? How could it be possible that so many people, particularly female people, could have so many false memories of childhood sexual abuse? How could it be possible that so many people could have been fooled into thinking they were in an altered state of consciousness when they agreed to be hypnotized? How could so many people behave *as if* their bodies have been invaded by numerous entities or personalities, if they hadn't really been so invaded? How could the *defense mechanism* explanations in terms of *repression* for childhood sexual trauma and *dissociation* for MPD not be correct? How could so many people be so wrong about so much? Spanos' answer makes it sound almost too easy for such a massive amount of self-deception and delusion to develop: it's happened before and we all know about it. Remember demonic possession?

Most educated people today do not try to explain epilepsy, brain damage, genetic disorders, neurochemical imbalances, feverish hallucinations or troublesome behavior by appealing to the idea of demonic possession. Yet, at one time, all of Europe and America would have accepted such an explanation. Furthermore, we had our experts--the priests and theologians--to tell us how to identify the possessed and how to exorcise or execute the demons. An elaborate theological framework bolstered this worldview and an elaborate set of social rituals and behaviors validated it on a continuous basis. In fact, every culture, no matter how primitive and pre-scientific, had a belief in some form of demonic possession, its shamans and witch doctors who performed the rituals to rid the possessed of their demons, and its own sociocognitive context in which such beliefs and behaviors were seen as obviously correct and were constantly reinforced by traditional and accepted social behaviors and expectations.

We know now that the behaviors of witches and other possessed persons--as well as the behaviors of their tormentors, exorcists and executioners--were enactments of social roles. We do not believe that in those days there really were witches, or that demons really did invade bodies, or that priests really did exorcise those demons by their ritualistic magic. Yet, for those who lived in the time of witches and demons, these beings were as real as anything else they experienced. In Spanos' view, what is true of the world of demons and exorcists is true of the psychological world filled with phenomena such as hypnosis, repression of childhood sexual trauma and its manifestation in such disorders as bulimia and other emotional problems, dissociation of the self as one of several defense mechanisms to avoid having to face the horrors of the

past, and the unconscious mind as a cellar of horrors which seep through to disturb conscious thought and behavior the way demons used to creep into the world to haunt us.

Spanos makes a very strong case for the claim that "patients learn to construe themselves as possessing multiple selves, learn to present themselves in terms of this construal, and learn to reorganize and elaborate on their personal biography so as to make it congruent with their understanding of what it means to be a multiple." Psychotherapists, according to Spanos, "play a particularly important part in the generation and maintenance of MPD." It would be unfair to present his case in a review, but anyone should find it significant that most therapists never see a single case of MPD and that some therapists report seeing hundreds of cases each year. It should be distressing to those trying to defend the integrity of psychotherapy that a patient's diagnosis depends upon the preconceptions of the therapist. Typically, an MPD patient has no memory of sexual abuse upon entering therapy, but once the therapist begins encouraging the patient, memories of extremely bizarre sexual abuses emerge, often involving satanic rituals. But [the scientific evidence on memory](#) is inconsistent with the claim of amnesia for all these reported sexual horrors.

Multiple selves exist and have existed in other cultures without being related to the notion of a mental disorder as it is in North American culture today. "Multiple identities can develop in a wide variety of cultural contexts and serve numerous different social functions." Neither childhood sexual abuse nor mental disorder is a necessary condition for multiple personality to manifest itself. Multiple personalities are best understood as "rule-governed social constructions." They "are established, legitimated, maintained, and altered through social interaction." In a number of different historical and social contexts, people have learned to think of themselves as "possessing more than one identity or self, and can learn to behave as if they are first one identity and then a different identity." However, "people are unlikely to think of themselves in this way or to behave in this way unless their culture has provided models from whom the rules and characteristics of multiple identity enactments can be learned. Along with providing rules and models, the culture, through its socializing agents, must also provide legitimation for multiple self enactments."

Spanos presents brilliant and analogous scenarios for the development of [mesmerism](#) and [hypnosis](#), [repressed memory therapy](#), [UFO abduction therapy](#), [past-life regression therapy](#), [spirit and demonic possession and exorcism](#), [glossolalia](#) and multiple personality disorder. And some of his work is suggestive of research one wishes he had lived to fulfill. For example, he wonders aloud about the sociopolitical implications of the fact that it is mostly women who have false memories, yet studies demonstrate that women are no more prone to false memories than men. He notes, too, that the witch hunt for child abusers has focused almost exclusively on day care centers,

while it is highly unlikely that such a widespread phenomenon would be restricted to just those places that working mothers might take their children. Before the day-care operators became the focus of attention, most of the abuse stories were of recovered "memories" made in therapy by relatively well-to-do woman against their middle-class parents. Where would he have taken these ideas? One wonders. Look what he does with the false statistics created by the abuse survivor movement:

...support for the notion that childhood sexual abuse is widespread and virulent can be used to support various social and political agendas. Strong advocacy of these ideas is voiced not only by certain aspects of the feminist movement, but also by some sections of the religious right with its support for false reports of satanic ritual abuse made both by adult survivors and by children trapped in day-care sexual abuse panics. In the case of the religious right, perpetuation of the idea that child sexual abuse is prevalent is used to support rather than challenge a conservative and antifeminist political agenda.

Relatedly, the propositions that one third to one half of women have experienced severe sexual abuse during childhood, that such abuse invariably produces serious psychological symptoms, and that half of these abused women suffer psychological sequelae without even being aware that they were abused could be said to undermine a view of women as mature and responsible adults who are as capable as men of economic self-sufficiency, professional attainment, and political acumen. On the contrary, the picture painted by these statistics serves to justify rather than challenge the political and economic inequality of women. After all, from this perspective, the problems of women stem not from economic and politically based discrimination that, with organized effort, can be changed. Instead, these problems are attributed to the "fact" that an astounding one third to one half of the female population has been psychologically and emotionally crippled by childhood events that cannot be altered.

Multiple Identities and False Memories is a book every psychology major and every therapist should read, though it would probably not alter the thinking about alters of those whose livelihood depends upon providing therapy to abuse victims. It would probably be too much to expect the general public or the mass media to take to the book. It lacks the simplicity, entertainment qualia and bizarreness of a *Sybil*, *The Three Faces of Eve*, *The Five of Me* or *The Minds of Billy Milligan*. The role of such books in influencing not only the general public's beliefs about MPD, but in affecting MPD patients, is documented by Spanos, including the surge of MPD cases following the

showing on television of *Sybil*. However, the numerous social scientists who provide the data and the arguments that MPD is iatrogenic or a social construct will probably not be invited to speak on Oprah. The mass media caters to the public's desire for lurid entertainment. What could be more lurid and entertaining than a nation of women abused as children, subjected to satanic rituals, and driven mad by their abusers? Whether they are reporting the truth, doesn't matter. Their reports are accurate. For those who love the truth, Nicholas Spanos will delight more than any lurid tabloid, Hollywood production or talk-back show.

About the author: Nicholas Spanos received his Ph.D. from Boston University. From 1975 to 1994 he was Director of the Laboratory for Experimental Hypnosis at Carleton University, Ottawa, Ontario, Canada, where he was a Professor of Psychology. Prior to his appointment at Carleton, Dr. Spanos was a senior research associate at Medfield State Hospital in Medfield, Massachusetts. He was killed in 1994 when the plane he was piloting crashed shortly after takeoff. He authored some 250 articles and book chapters, and was co-author of two important book on hypnosis.

transubstantiation

Transubstantiation is the alleged process whereby the bread and wine offered up at the communion service has its substance changed to that of the body, blood, soul and divinity of Jesus Christ while its accidents appear to be that of bread and wine. What looks like, tastes like, etc., bread and wine is actually another substance altogether. How this happens is a mystery and defies logic. How it *can* happen would require a [miracle](#).

Transubstantiation is also known as the doctrine of *the real presence*.

[Good evidence makes
science we can live
with By Chet Raymo,
7/9/2002](#)

science*

Science is first and foremost a set of logical and empirical methods which provide for the systematic observation of empirical phenomena in order to understand them. We think we understand empirical phenomena when we have a satisfactory theory which explains how the phenomena work, what regular patterns they follow, or why they appear to us as they do. Scientific explanations are in terms of [natural phenomena](#) rather than supernatural phenomena, although science itself requires neither the acceptance nor the rejection of the supernatural.

Science is also the organized body of knowledge about the empirical world which issues from the application of the abovementioned set of logical and empirical methods.

Science consists of several specific sciences, such as biology, physics, chemistry, geology, and astronomy, which are defined by the type and range of empirical phenomena they investigate.

Finally, science is also the application of scientific knowledge, as in the altering of rice with daffodil and bacteria genes to boost the vitamin A content of rice.

the logical and empirical methods of science

There is no single scientific method. Some of the methods of science involve logic, e.g., drawing inferences or deductions from hypotheses, or thinking out the logical implications of causal relationships in terms of necessary or sufficient conditions. Some of the methods are empirical, such as making observations, designing [controlled experiments](#), or designing instruments to use in collecting data.

Scientific methods are impersonal. Thus, whatever one scientist is able to do *qua scientist*, any other scientist should be able to duplicate. When a person claims to measure or observe something by some purely subjective method, which others cannot duplicate, that person is not doing science. When scientists cannot duplicate the work of another scientist that is a clear sign that the scientist has erred either in design, methodology, observation, calculation, or calibration.

scientific facts and theories

Science does not assume it knows the truth about the empirical world *a priori*.

Science assumes it must discover its knowledge. Those who claim to know empirical truth *a priori* (such as so-called [scientific creationists](#)) cannot be talking about scientific knowledge. Science presupposes a regular order to nature and assumes there are underlying principles according to which natural phenomena work. It assumes that these principles or laws are relatively constant. But it does not assume that it can know *a priori* either what these principles are or what the actual order of any set of empirical phenomena is.

A scientific theory is a unified set of principles, knowledge, and methods for explaining the behavior of some specified range of empirical phenomena. Scientific theories attempt to understand the world of observation and sense experience. They attempt to explain how the natural world works.

A scientific theory must have some logical consequences we can test against empirical facts by making predictions based on the theory. The exact nature of the relationship of a scientific theory making predictions and being tested is something about which philosophers widely disagree, however (Kourany 1997).

It is true that some scientific theories, when they are first developed and proposed, are often little more than guesses based on limited information. On the other hand, mature and well-developed scientific theories systematically organize knowledge and allow us to explain and predict wide ranges of empirical events. In either case, however, one characteristic must be present for the theory to be scientific. The distinguishing feature of scientific theories is that they are "capable of being tested by experience" (Popper, 40).

To be able to test a theory by experience means to be able to predict certain observable or measurable consequences from the theory. For example, from a theory about how physical bodies move in relation to one another, one predicts that a pendulum ought to follow a certain pattern of behavior. One then sets up a pendulum and tests the hypothesis that pendulums behave in the way predicted by the theory. If they do, then the theory is *confirmed*. If pendulums do not behave in the way predicted by the theory, then the theory is *falsified*. (This assumes that the predicted behavior for the pendulum was correctly deduced from your theory and that your experiment was conducted properly.)

The fact that a theory passed an empirical test does not prove the theory, however. The greater the number of severe tests a theory has passed, the greater its degree of confirmation and the more reasonable it is to accept it. However, to confirm is not the same as to prove logically or mathematically. No scientific theory can be proved with absolute certainty.

Furthermore, the more tests which can be made of the theory, the greater its empirical content (Popper, 112, 267). A theory from which very few empirical predictions can be made will be difficult to test and generally will

not be very useful. A useful theory is rich or *fecund*, i.e., many empirical predictions can be generated from it, each one serving as another test of the theory. Useful scientific theories lead to new lines of investigation and new models of understanding phenomena that heretofore have seemed unrelated (Kitcher). This feature of fecundity is probably the main difference between the theory of natural selection and the theory of special creation. The theory of special creation has not led to new discoveries, better understanding, or increased understanding of the relatedness of areas within the field of biology or between such fields as biology and psychology. As such, the theory of special creation is nearly useless. And, since the theory is put forth as dogma, it is the antithesis of a scientific theory.

However, even if a theory is very rich and even if it passes many severe tests, it is always possible that it will fail the next test or some other theory will be proposed that explains things even better. Logically speaking, a currently accepted scientific theory could even fail the same tests it has passed many times in the past. Karl Popper calls this characteristic of scientific theories, "falsifiability."

the fallibility of science

A necessary consequence of scientific claims being falsifiable is that they are also fallible. For example, Einstein's special theory of relativity is accepted as "correct" in the sense that "its necessary inclusion in calculations leads to excellent agreement with experiments" (Friedlander 1972, 41). This does not mean the theory is infallibly certain. Scientific facts, like scientific theories, are not infallible certainties. Facts involve not only easily testable perceptual elements; they also involve interpretation.

Noted paleoanthropologist and science writer Stephen Jay Gould reminds us that in science 'fact' can only mean "confirmed to such a degree that it would be perverse to withhold provisional assent" (Gould 1983, 254). However, facts and theories are different things, notes Gould, "not rungs in a hierarchy of increasing certainty. Facts are the world's data. Theories are structures of ideas that explain and interpret facts." In Popper's words: "Theories are nets cast to catch what we call 'the world': to rationalize, to explain, and to master it. We endeavor to make the mesh ever finer and finer."

To the uninformed public, facts contrast with theories. Non-scientists commonly use the term 'theory' to refer to a speculation or guess based on limited information or knowledge. However, when we refer to a scientific theory, we are not referring to a speculation or guess, but to a systematic explanation of some range of empirical phenomena. Nevertheless, scientific theories vary in degree of certainty from the highly improbable to the highly probable. That is, there are varying degrees of evidence and support for different theories, i.e., some are more reasonable to accept than others.

There are, of course, many more facts than theories, and once something has been established as a scientific fact (e.g., that the earth goes around the sun) it is not likely to be replaced by a "better" fact in the future. Whereas, the history of science clearly shows that scientific theories do not remain forever unchanged. The history of science is, among other things, the history of theorizing, testing, arguing, refining, rejecting, replacing, more theorizing, more testing, etc. It is the history of theories working well for a while, [anomalies](#) occurring (i.e., new facts being discovered which do not fit with established theories) and new theories being proposed and eventually replacing the old ones partially or completely (Kuhn). It is the history of rare geniuses--such as a Newton, a Darwin or an Einstein--finding new and better ways of explaining natural phenomena.

We should remember that science, as Jacob Bronowski put it, "is a very human form of knowledge....Every judgment in science stands on the edge of error.... Science is a tribute to what we can know although we are fallible" (Bronowski, 374). "One aim of the physical sciences," he said, "has been to give an exact picture of the material world. One achievement of physics in the twentieth century has been to prove that aim is unattainable" (353).

scientific knowledge

Scientific knowledge is human knowledge and scientists are human beings. They are not gods, and science is not infallible. Yet, the general public often thinks of scientific claims as absolutely certain truths. They think that if something is not certain, it is not scientific and if it is not scientific, then any other non-scientific view is its equal. This misconception seems to be, at least in part, behind the general lack of understanding about the nature of scientific theories.

Another common misconception is that since scientific theories are based on human perception, they are necessarily relative and therefore do not really tell us anything about the real world. Science, according to certain "postmodernists" cannot claim to give us a true picture of what the empirical world is really like; it can only tell us how it appears to scientists. There is no such thing as scientific truth. All scientific theories are mere fictions. However, just because there is no one, true, final, godlike way to view reality, does not mean that every viewpoint is as good as every other. Just because science can only give us a human perspective, does not mean that there is no such thing as scientific truth. When the first atomic bomb went off as some scientists had predicted it would, another bit of truth about the empirical world was revealed. Bit by bit we are discovering what is true and what is false by empirically testing scientific theories. To claim that those theories which make it possible to explore space are "just relative" and "represent just one perspective" of reality, is to profoundly misunderstand the nature of science and scientific knowledge.

science as a candle in the dark

Science is, as Carl Sagan put it, a candle in the dark. It shines a light on the world around us and allows us to see beyond our superstitions and fears, beyond our ignorance and delusions, and beyond the magical thinking of our ancestors, who rightfully fought for their survival by fearing and trying to master occult and supernatural powers.

Jacob Bronowski put it all in perspective in one scene from his televised version of the *Ascent of Man*. I'm referring to the episode on "Knowledge and Certainty" where he went to Auschwitz, walked into a pond where the ashes were dumped, bent down and scooped up a handful of muck.

It is said that science will dehumanize people and turn them into numbers. That is false, tragically false. Look for yourself. This is the concentration camp and crematorium at Auschwitz. This is where people were turned into numbers. Into this pond were flushed the ashes of some four million people. And that was not done by gas. It was done by ignorance. When people believe that they have absolute knowledge, with no test in reality, this is how they behave. This is what men do when they aspire to the knowledge of gods (374).

The trick is to know how to develop tests in reality that avoid [confirmation bias](#), [wishful thinking](#), [self-deception](#), [selective thinking](#), [subjective validation](#), being seduced by [communal reinforcement](#) or persuaded by [ad hoc hypotheses](#) and [post hoc reasoning](#), as well as having a healthy [skepticism](#) and an ability to apply [Occam's razor](#) when needed.

See **related entries** on [alternative science](#), [naturalism](#), [pseudoscience](#), and those listed in the [Logic/Perception & Science/Philosophy Topical Index](#) and those listed in [Junk Science and Pseudoscience](#).

***This material is adapted from my [Becoming a Critical Thinker](#), ch. 9, "Science and Pseudoscience." I am aware that 'science' can also refer to any systematic body of knowledge about some object of study and that mathematics and even theology are sometimes referred to as sciences. This entry is obviously not an attempt to define every possible use of the term 'science.' In some quarters, the science I am concerned with here is called *natural science*. I do not intend to issue any debate as to what is and what is not a 'real' science by this entry, nor do I intend to get into any "borderline" issues as to whether some discipline or activity is or is not science.**

pathological science

"Pathological science" is a term coined by [Nobel-laureate](#) in chemistry [Irving Langmuir](#) in a presentation he made at General Electric's Knolls Atomic Power Laboratory a few years before his death in 1957. Langmuir described typical cases as involving such things as barely detectable causal agents observed near the threshold of sensation which are nevertheless asserted to have been detected with great accuracy. The supporters offer fantastic theories that are contrary to experience and meet criticisms with ad hoc excuses. And, most telling, only supporters can reproduce the results. Critics can't duplicate the experiments.

He gave several examples, including [ESP](#) experiments and [Blondlot's N-rays](#), and stated that

These are cases where there is no dishonesty involved but where people are tricked into false results by a lack of understanding about what human beings can do to themselves in the way of being led astray by subjective effects, wishful thinking or threshold interactions. These are examples of pathological science. These are things that attracted a great deal of attention. Usually hundreds of papers have been published on them. Sometimes they have lasted for 15 or 20 years and then gradually have died away.

Langmuir visited J.B. Rhine's lab at Duke University where Rhine was claiming results of ESP experiments that could not be predicted by chance and were probably due to some sort of psychic power. Langmuir found that Rhine was not counting all his data, however. He was leaving out the scores of those he believed were guessing their [Zener cards](#) wrong on purpose.

"Rhine believed that persons who disliked him guessed wrong to spite him. Therefore, he felt it would be misleading to include their scores" (Park 2000, 42). Rhine determined that some of his subjects were deliberately guessing wrong because their scores were too low to have occurred by chance. "Indeed, he was convinced that abnormally low scores were as significant as abnormally high scores in proving the existence of ESP" (ibid.).

A. Cromer, commenting on Langmuir's characteristics of pathological science, noted that scientists are often not very good judges of the scientific process. Even the best intentions can be subverted by [self-deception](#). Good science is not simply a matter of honesty or wisdom. Furthermore,

Real discoveries of phenomena contrary to all previous

scientific experience are very rare, while fraud, fakery, foolishness, and error resulting from overenthusiasm and delusion are all too common (Cromer 1993).

Do Langmuir's observations imply that scientists should shy away from controversial topics such as prions, [facilitated communication](#), cold fusion, [orgone energy](#), ESP, and zero-point energy? No. What follows is that *any* scientist doing *any* research must proceed with caution, tentativeness, a sense of the history of science and an awareness of the tendencies in human nature which can easily lead the wisest of men or women astray. What also seems to follow is that to show little or no interest in allowing oneself and others to try to prove one's fantastic theories to be wrong, while immediately meeting every objection with [ad hoc hypotheses](#), is a sign of pathological science if not [pseudoscience](#).

Blondlot

6 Aug 1998

*I recently read your article on Blondlot in your excellent **Skeptic's Dictionary**. An interesting sidelight on the case is provided by William Broad and Nicholas Wade in **Betrayers of the Truth** (Oxford University Press). I quote: "The reason why the best French physicists of their day continued to support Blondlot after Wood's critique was perhaps the same as the reason for which they uncritically accepted Blondlot's findings in the first place. It all had to do with a sentiment that is supposed to be wholly foreign to science: national pride. By 1900 the French had come to feel that their international reputation in science was on the decline, particularly with respect to the Germans. The discovery of N-rays came just at the right time to soothe the self-doubts of the rigid French scientific hierarchy."*

Nicholas Clarke

reply: National pride has also been invoked to explain why some British anthropologists accepted Piltdown man. Too bad the French couldn't wait a bit. [Antoine Becquerel](#), a French physicist who discovered natural radioactivity, and [Marie and Pierre Curie](#) were awarded the 1903 Nobel Prize in physics. That should have helped their national pride

the "blue sense"

The "blue sense" is a cop's intuition about impending danger, about whether a suspect is guilty, about whether someone's lying, about hunches regarding cases or people. The term is used by Lyons and Truzzi to refer to something akin to psychic power possessed by good cops. "It is that unknown quantity in the policeman's decision-making process that goes beyond what he can see and hear and smell." (Lyons and Truzzi, p. 11)

Studies have not validated the "blue sense," but there is good evidence that some people, including some cops, reliably infer others' emotions, intentions, and thoughts by their demeanor and facial expressions (Eckman and Friesen 1975; Eckman and Rosenberg 1979).

See related entry on [psychic detectives](#).

psychic detectives

Psychic detectives (PDs) are alleged [psychics](#) who offer to help law enforcement agencies solve crimes.

In their book, *The Blue Sense: Psychic Detectives and Crime*, Arthur Lyons and Marcello Truzzi list many reasons people without any psychic powers gain a reputation for assisting in the detection of crime. In many cases, most of the evidence in favor of the psychic detective is provided to the mass media by the psychic rather than by an independent source. The mass media is rarely critical or skeptical of the claims of psychics. For example, alleged psychic detective Sylvia Browne has declared many times that she has used her psychic powers to solve crimes, yet it is rare to see her challenged as she was by *Brill's Content*.

***Brill's Content* has examined ten recent Montel Williams programs that highlighted Browne's work as a psychic detective (as opposed to her ideas about "the afterlife," for example), spanning 35 cases. In 21, the details were too vague to be verified. Of the remaining 14, law-enforcement officials or family members involved in the investigations say that Browne had played no useful role.**

"These guys don't solve cases, and the media consistently gets it wrong," says Michael Corn, an investigative producer for "Inside Edition" who produced a story last May debunking psychic detectives. Moreover, the FBI and the National Center for Missing & Exploited Children maintain that to their knowledge, psychic detectives have never helped solve a single missing-person case.

"Zero. They go on TV and I see how things go and what they claim but no, zero," says FBI agent Chris Whitcomb. "They may be remarkable in other ways, but the FBI does not use them" ("Prophet Motive," *Brill's Content*, November 27, 2000).

Browne has made many claims on the "Larry King Show" about her great crime-solving powers, including the claim that she solved the 1993 World Trade Center bombing. James Randi challenged another of Browne's claims, made on "Larry King," to be working with Stephen Xanthos of the Rumson, New Jersey, police department. She said she was getting ready to close a case.

....no person named Xanthos ever worked with that police

department, though there was a Stephen Xanthos who was canned from another New Jersey police department. Looking a little further into this mythical claim of Sylvia's, we discovered that Xanthos had a private investigator's license at one time, but it expired in 1994. It's interesting to note that if this man really had been working with Browne, as she stated he was on the Larry King show, he would be subject to charges of a third degree felony, under New Jersey State law - that's on a par with burglary and car theft. Not that we ever believed Sylvia was telling the truth, but she should be a bit more clever with her mendacity ([Randi](#)).

There are other reasons for the undeserved reputations of psychic detectives besides blowing their own horns to an uncritical media. They do sometimes guess correctly. Everybody can have a 50% hit rate if we guess "dead" or "alive" about a missing person. The odds are good that by the time a psychic gets involved in a missing person case, the person is probably dead. The events predicted by PDs are commonplace events which are predicted by thousands of psychics every year. (A missing person will be either dead or alive; if dead probably buried; if buried probably in a remote place such as the woods. Shallow graves are likely to be pretty common, too. How many killers take the time to dig a deep grave? Yet, predicting that a body will be found in a shallow grave in a wooded area is taken by some to be truly astounding if it turns out to be the case.) In other words, some PDs' "visions" are bound to be "correct" often enough for the credulous to be duped. What seems like an accurate perception is due to its vagueness, commonness, and the latitude available as to what will count as a psychic hit. E.g., "I see water near the body;" "I see trees." Some PDs are very skilful in their use of vagueness and ambiguity, and provide "the verbal equivalent of a [Rorschach test](#)," according to Piet Hein Hoebens, one of Truzzi's collaborators in a "Psychic Sleuths" project.

Lyons and Truzzi note that, over time, reports of psychic achievements get exaggerated and distorted. Vague claims become specific. Errors become replaced with correct predictions. Events that never happened become "facts." Often, the PD herself or himself is the source of this historical reconstructionism. Sometimes a psychic's "predictions" are made after an event, but claimed to have been made before it, like Sylvia Browne's claim after the September 11th terrorist attacks that she had predicted it.

Some of the undeserved reputation of PDs comes from their clients: the police or relatives of crime victims. The clients count misses and errors as hits. For example, Browne told a woman her husband died of a "clot" and, even though he died of a hemorrhage, the client agreed that Brown was right, even though the difference between the two is like the difference between a plugged drain and a burst pipe.

Clients often take coincidences for hits. Sometimes, as Lyons and Truzzi point out, the information provided by the PD was garnered from another source, often from an unwitting law enforcement agent. The psychic just feeds back information initially provided by the client himself. Some psychic successes are merely self-fulfilling prophecies. Clients find ways to retrofit facts with the vague and ambiguous pronouncements of the psychic. Clients also often use [selective thinking](#), remembering what seems accurate and forgetting what was clearly not on the mark. Furthermore, the mass media publishes stories about alleged psychic successes, while generally ignoring stories about psychic failures and frauds. Reputations are thereby created and enhanced from trivial or paltry evidence of psychic detective powers.

According to Lyons and Truzzi, PDs often use [shotgunning](#) to providing information, i.e., they provide a large quantity of information, some of which is bound to fit the case. Shotgunning relies on [confirmation bias](#) and [cold reading](#), the [Forer effect and Barnum-type statements](#): the cop tunes in to the info that is correct and ignores what isn't and unknowingly gives cues to the psychic as he or she fires salvo after salvo.

Some PDs are simply frauds, according to Lyons and Truzzi. Some psychics even use accomplices to accomplish their frauds and deceptions. Some bribe informants, including police officers, for information they pass off as acquired by psychic means.

While it is true that some cops believe in psychics, many simply use them for their own purposes. Lyons and Truzzi tell the story of a cop who considered psychic Noreen Reiner's drawing of a circle to be a correct clue in a crime because the person arrested drove a cement mixer. Another cop considered Dorothy Allison's clues in a case to be on the money even though she predicted a missing person was dead who was not dead but was living in a religious cult community. The cop admitted he was baffled by Allison's error about the person being dead but which way was he dead? asked the cop, "Biologically? Clinically? Dead tired?" However, such [wishful thinking](#) and [self-deception](#) seem to be the exception rather than the rule among law enforcement officers. Cops are more likely to use psychics to cover up their real sources of information, to protect an informant, or to conceal the fact that information was obtained illegally. Finally, some cops use psychics, or even pretend to be psychic, to psyche out superstitious suspects.

Lyons and Truzzi also note that many PDs simply use their intelligence, reason inductively and deductively, play hunches, examine evidence, make careful observations, listen attentively, consider alternatives, follow their intuition, etc., just like "real" cops do. In some cases, the PDs have more experience with certain types of crimes than the cops they work with.

Despite the very strong evidence that most psychic detectives are deluded or

frauds, Lyons and Truzzi divide the world of psychics into psychics and pseudo-psychics. Pseudo-psychics are divided into authentic (those who are not aware that they are using tricks or ordinary means of perception, information gathering, reasoning, etc.) and unauthentic (the outright frauds). To support their notion that at least some of the PDs may truly be psychic, Lyons and Truzzi note that

Some people have an unusually acute sense of vision, hearing, or smell, what psychologists call hyperesthesia. A recent example was a New Jersey doctor [Arthur G. Lintgen] who was able to examine an unlabeled classical recording and ascertain the music and sometimes even the conductor just by looking at the grooves.

The authors take such an ability as evidence of some extraordinary power ([vinyl vision](#)), but Dr. Lintgen has a different explanation: The trick is to examine the physical construction of the recording and look at the relative playing time of each one of the movements or separations on the recording ([Seckel](#)).

Dr. Lintgen also used other quite ordinary inductive and deductive powers to identify such arcane bits of information as the nationality of the orchestra. One thing he didn't do, however, was deceive himself or others regarding his talent, a bit of honesty seemingly lost on many of today's self-proclaimed psychics.

Bridey Murphy

Bridey Murphy was a 19th century woman from Cork, Ireland, who began speaking through Virginia Tighe in Pueblo, Colorado, in 1952 when Morey Bernstein, a local businessman and amateur hypnotist, hypnotized her. Bernstein encouraged [past life regression](#) of his subject and she cooperated by speaking in an Irish brogue and claiming to be a 19th century woman in Ireland. Bernstein hypnotized Tighe many times after that. While under [hypnosis](#), she sang Irish songs and told Irish stories, always as Bridey Murphy. Bernstein's book, *The Search for Bridey Murphy*, became a best-seller. (Tighe is called Ruth Simmons in the book.) Recordings of the hypnotic sessions were made and translated into more than a dozen languages. The recordings sold well, too. The [reincarnation](#) boom in American publishing had begun.

Newspapers sent reporters to Ireland to investigate. Was there a red-headed Bridey Murphy who lived in Ireland in the nineteenth century? Who knows, but one paper--the *Chicago American*--found one in Wisconsin in the 20th century. Bridie Murphey Corkell lived in the house across the street from where Virginia Tighe grew up. What Virginia reported while hypnotized were not memories of a previous life but memories from her early childhood. Whatever else the hypnotic state is, it is a state where one's fantasies are energetically displayed. Many people were impressed with the details of Tighe's hypnotic memories, but the details were not evidence of past life regression, reincarnation, or [channeling](#). They were evidence of a vivid imagination, a confused memory, fraud, or a combination of the three.

It is indicative of the typical lowering of the standards of critical thinking when it comes to belief in the supernatural that defenders of preposterous stories such as this one find easily accessible information to be incontrovertible proof of their veracity. For example, Tighe talks about kissing the Blarney stone and knew that the act requires the assistance of someone who holds you as you lean backwards and face up to kiss the stone. This is common knowledge and photos of this are available in hundreds of sources, yet this fact has been cited as strong evidence that Tighe really kissed the stone in a previous incarnation.* Yet, these same proponents of the strange and occult are not concerned that the kind of reincarnation they are considering contradicts everything we know about how [memory](#) works, not to mention that it is impossible to explain without rejecting everything we know about human consciousness and the brain. Such beliefs are works of pure

imagination, which we tolerate in cartoons and for entertainment, but which any rational creature should rebuke in those who claim to be seeking the truth.

As Martin Gardner says, "Almost any hypnotic subject capable of going into a deep trance will babble about a previous incarnation if the hypnotist asks him to. He will babble just as freely about his future incarnations....In every case of this sort where there has been adequate checking on the subject's past, it has been found that the subject was weaving together long forgotten bits of information acquired during his early years" (Gardner 1957).

See related entries on [channeling](#), [hypnosis](#), [past life regression](#) and [reincarnation](#).

false memory

A false memory is a memory which is a distortion of an actual experience, or a [confabulation](#) of an imagined one. Many false memories involve confusing or mixing fragments of memory events, some of which may have happened at different times but which are remembered as occurring together. Many false memories involve an error in [source memory](#). Some involve treating [dreams](#) as if they were playbacks of real experiences. Still other false memories are believed to be the result of the prodding, leading, and suggestions of therapists and counselors. Finally, [Dr. Elizabeth Loftus](#) has shown not only that it is possible to implant false memories, but that it is relatively easy to do so (Loftus, 1994).

A memory of your mother throwing a glass of milk on your father when in fact it was your father who threw the milk is a false memory based upon an actual experience. You may remember the event vividly and be able to "see" the action clearly, but only corroboration by those present can determine whether your memory of the event is accurate. Distortions such as switching the roles of people in one's memory are quite common. Some distortions are quite dramatic, such as the following examples of false memories due to confusion about the source of the memory.

A woman accused memory expert Dr. Donald Thompson of having raped her. Thompson was doing a live interview for a television program just before the rape occurred. The woman had seen the program and "apparently confused her memory of him from the television screen with her memory of the rapist" (Schacter, 1996, 114).

Jean Piaget, the great child psychologist, claimed that his earliest memory was of nearly being kidnapped at the age of 2. He remembered details such as sitting in his baby carriage, watching the nurse defend herself against the kidnapper, scratches on the nurse's face, and a police officer with a short cloak and a white baton chasing the kidnapper away. The story was reinforced by the nurse and the family and others who had heard the story. Piaget was convinced that he remembered the event. However, it never happened. Thirteen years after the alleged kidnapping attempt, Piaget's former nurse wrote to his parents to confess that she had made up the entire story. Piaget later wrote: "I therefore must have heard, as a child, the account of this story...and projected it into the past in the form of a visual memory, which was a memory of a memory, but false" (Tavris).

Remembering being kidnapped when you were an infant (under the age of three) is a false memory, almost by definition. The left inferior prefrontal lobe is undeveloped in infants, but is required for long-term [memory](#). The

elaborate encoding required for classifying and remembering such an event cannot occur in the infant's brain.

The brains of infants and very young children are capable of storing *fragmented* memories, however. Fragmented memories can be disturbing in adults. Schacter notes the case of a rape victim who could not remember the rape, which took place on a brick pathway. The words *brick* and *path* kept popping into her mind, but she did not connect them to the rape. She became very upset when taken back to the scene of the rape, though she didn't remember what had happened there (Schacter 1996, 232). Whether a fragmented memory of infant abuse can cause significant psychological damage in the adult has not been scientifically established, though it seems to be widely believed by many psychotherapists.

What is also widely believed by many psychotherapists is that many psychological disorders and problems are due to the [repression](#) of memories of childhood sexual abuse. On the other hand, many psychologists maintain that their colleagues doing [repressed memory therapy](#) (RMT) are encouraging, prodding, and suggesting false memories of abuse to their patients. Many of the recovered memories are of being sexually abused by parents, grandparents, and ministers. Many of those accused claim the memories are false and have sued therapists for their alleged role in creating false memories.

It is as unlikely that all recovered memories of childhood sexual abuse are false as that they are all true. What is known about [memory](#) makes it especially difficult to sort out true from distorted or false recollections. However, some consideration should be given to the fact that certain brain processes are necessary for any memories to occur. Thus, memories of infant abuse or of abuse that took place while one was unconscious are unlikely to be accurate. Memories that have been directed by [dreams](#) or [hypnosis](#) are notoriously unreliable. Dreams are not usually direct playbacks of experience. Furthermore, the data of dreams is generally ambiguous. Hypnosis and other techniques that ply upon a person's suggestibility must be used with great caution lest one create memories by suggestion rather than pry them loose by careful questioning.

Furthermore, memories are often mixed; some parts are accurate and some are not. Separating the two can be a chore under ordinary circumstances. A woman might have consciously repressed childhood sexual abuse by a neighbor or relative. Some experience in adulthood may serve as a retrieval cue and she remembers the abuse. This disturbs her and disturbs her dreams. She has nightmares, but now it is her father or grandfather or priest who is abusing her. She enters RMT and within a few months she recalls vividly how her father, mother, grandfather, grandmother, priest, etc., not only sexually abused her but engaged in horrific [satanic rituals](#) involving human sacrifices and cannibalism. Where does the truth lie? The patient's memories are real

and horrible, even if false. The patient's suffering is real whether the memories are true or false. And families are destroyed whether the memories are true or false.

Should such memories be taken at face value and accepted as true without any attempt to prove otherwise? Obviously it would be unconscionable to ignore accusations of sexual abuse. Likewise, it is unconscionable to be willing to see lives and families destroyed without at least trying to find out if any part of the memories of sexual abuse are false. It also seems inhumane to encourage patients to recall memories of sexual abuse (or of being [abducted by aliens](#)) unless one has a very good reason for doing so. Assuming all or most emotional problems are due to repressed memories of childhood sexual abuse is not a good enough reason to risk harming a patient by encouraging delusional beliefs and damaging familial relationships. Assuming that if you can't disprove that a patient was abducted by aliens, then he probably was, is not a good enough reason. A responsible therapist has a duty to help a patient sort out delusion from reality, dreams and confabulations from truth, and real abuse from imagined abuse. If good therapy means the encouragement of delusion as standard procedure, then good therapy may not always be worth it.

Finally, those who find that it is their duty to determine whether a person has been sexually abused or whether a memory of such abuse is a false memory, should be well versed in the current scientific literature regarding memory. They should know that all of us are pliable and suggestible to some degree, but that children are especially vulnerable to suggestive and leading questioning. They should also remember that children are highly imaginative and that just because a child says he or she remembers something does not mean that he or she does. However, when children say they do *not* remember something, to keep questioning them until they do remember it, is not good interrogation.

Investigators, counselors, and therapists should also remind themselves that many charges and memories are heavily influenced by media coverage. People charged with or convicted of crimes have noticed that their chances of gaining sympathy increase if others believe they were abused as children. People with grudges have also noticed that nothing can destroy another person so quickly as being charged with sexual abuse, while at the same time providing the accuser with sympathy and comfort. Emotionally disturbed people are also influenced by what they read, see, or hear in the mass media, including stories of repressed abuse as the cause of emotional problems. An emotionally disturbed adult may accuse another adult of abusing a child, not because there is good evidence of abuse, but because the disturbed person imagines or fears abuse. In short, investigators should not rush to judgment.

free will

Free will is probably located in the pre-frontal cortex, and we may even be able to narrow it down to the ventromedial pre-frontal cortex. **Stephen Pinker**

Free will is a concept in traditional philosophy used to refer to the belief that human behavior is not absolutely determined by external causes, but is the result of choices made by an act of will by the agent. Such choices are themselves not determined by external causes, but are determined by the motives and intentions of the agent, which themselves are not absolutely determined by external causes.

Traditionally, those who deny the existence of free will look to fate, supernatural powers, or material causes as the determinants of human behavior. Free will advocates, or *libertarians*, as they are sometimes called, believe that while everything else in the universe may be the inevitable consequence of external forces, human behavior is unique and is determined by the agent, not by God or the stars or the laws of nature.

The traditional concept of free will enters the mainstream of Western Philosophy in metaphysical questions about human responsibility for moral behavior. Many modern debates about free will are often couched in terms of responsibility for moral and criminal behavior. In the Christian tradition, which has framed the issues surrounding free will, the belief hinges on a metaphysical belief in non-physical reality. The will is seen as a faculty of the soul or mind, which is understood as standing outside of the physical world and its governing laws. Hence, for many, a belief in materialism is taken to imply a denial of free will.

The modern view of [determinism](#) and free will does not see the two concepts as mutually exclusive. This view began to take shape with arguments such as those offered by Thomas Hobbes (*Leviathan*, XXI). God is the ultimate cause of every action, argued Hobbes, but as long as a person is not physically forced to do an act, the act is free. Hobbes couched the argument in terms of liberty vs. necessity, rather than free vs. externally determined will. The sequence of causes leading to a person being blown off a cliff by the wind would be said to have led to an event which was the necessary effect of a series of causes. A person jumping off the cliff would also have a series of causes which led up to it, but if the person was not chased off the cliff and jumped without any immediate material cause necessitating the jump, then the act is one of liberty.

Hobbes' view shows progress for reconciling materialism, determinism and

free will, but it is unsatisfactory. While it makes the case that materialism and determinism do not imply that humans have no metaphysical liberty, it does not address the issue of internal determining causes. It is unlikely a modern materialist would make the argument that regardless of a person's neurochemical state, if the person is not pushed or chased off the cliff, but jumps, say, while under the delusion that she can fly, the act is one of liberty.

A modern view, which sees no contradiction between believing in free will and materialism, would be couched in neurological terms. The key issue stemming from the free will/determinism debate is the issue of responsibility for one's actions. Responsibility, however, has at least two essential components: control and understanding. Even early Christian philosophers, such as St. Augustine and St. Thomas Aquinas, considered infants, young children and imbeciles, as lacking in control or understanding, not lacking in some metaphysical entity needed for free acts. It is an obvious absurdity to ascribe free will to infants, young children or the insane. Traditional libertarians held that only when a child had reached "the age of reason" did free will kick in. For those who never attained the capacity for adult rational thinking, free will never kicked in.

All our concepts of praise and blame, punishment and reward, depend upon our belief in human responsibility. A person who has an undeveloped or damaged brain or a neurochemical disorder is not responsible for her thoughts or actions *if the condition causes an inability to understand or control them*. Being able to control one's behavior is not a *sufficient* condition for holding a person responsible for her actions. A mentally ill or retarded person or a child may be incapable of understanding the nature of their actions, though capable of controlling their behavior. The incapacity to understand the nature of an act absolves one of responsibility for the act, if not for the behavior. For example, a person might intentionally jump off a cliff but not intend to kill himself. He may have been responsible for jumping off the cliff, but it would be a mistake to say he committed suicide if he thought he could fly and did not intend to kill himself.

Since brain development, damage, and disorders occur in degrees, it follows that understanding and control of thoughts and actions occur in degrees. At one extreme, a person may have little or no control over his or her thoughts and actions. Such a person would be a paradigm case of someone lacking free will. At the other extreme, a person may have an apparent superhuman ability to control his or her thoughts and actions. Someone with such self-discipline would be the paradigm of truly free person in the metaphysical sense of 'free'. To claim that to be truly free one must not be bound by laws of cause and effect is absurd and unnecessary. It is unnecessary for the reasons just given. It is absurd, for it requires free acts to be *uncaused* acts. On this notion, the only free person would be the one who had no clue as to what his or her next thought or action would be. Such a person would be as *unfree* as one could imagine.

Today, the focus of the debate over human responsibility is on the capacity to control one's thoughts and actions, rather than on the metaphysical presence or absence of a non-physical entity with will. Determinism is compatible with 'free will', though the term should be abandoned to indicate that the issue is one of capacity for controlling one's thoughts and actions. That capacity is independent of the truth of [materialism](#) or [dualism](#). Certain neurophysical and neurochemical conditions must hold before one can enjoy whatever freedom our species is capable of. A better understanding of these issues will not come from traditional philosophers debating free will vs. determinism. Neuroscientists will provide the knowledge, neurophilosophers the understanding.
