"If you ask what percentage of your genes is reflected in your external appearance, the basis by which we talk about race, the answer seems to be in the range of .01 percent," said Dr. Harold P. Freeman, the chief executive, president and director of surgery at North General Hospital in Manhattan, who has studied the issue of biology and race. "This is a very, very minimal reflection of your genetic makeup."

According to Angier, a very small number of genes determine skin color, nose and eye shape, and the other visible features used to identify the races. On the other hand "traits like intelligence, artistic talent and social skills are likely to be shaped by thousands, if not tens of thousands, of the 80,000 or so genes in the human genome, all working in complex combinatorial fashion."

Dr. Aravinda Chakravarti, a geneticist at Case Western University in Cleveland, claims that "race" is "a bogus idea" because "the differences that we see in skin color do not translate into widespread biological differences that are unique to groups."

Dr. Jurgen K. Naggert, a geneticist at the Jackson Laboratory in Bar Harbor, Me., said: "These big groups that we characterize as races are too heterogeneous to lump together in a scientific way."

Of course, not all scientists agree. Dr. Alan Rogers, a population geneticist and professor of anthropology at the University of Utah in Salt Lake City, for example, thinks that racial classifications are useful. "We may believe that most differences between races are superficial, but the differences are there, and they are informative about the origins and migrations of our species. To do my work, I have to get genetic data from different parts of the world, and look at differences within groups and between groups, so it helps to have labels for groups."

[Dr. J. Philippe Rushton](#) is not likely to be persuaded by the latest research to change his mind about race and IQ. He has maintained for years that east Asians have the largest average brain size and intelligence scores, African descendents have the smallest average brains and I.Q.'s, and Europeans are in the middle. He also believes he has evidence of a link between race, IQ and propensity towards criminal behavior.

Angier notes that many scientists have objected to Rushton's methods and interpretations. The "link between total brain size and intelligence is far from clear. Women, for example, have smaller brains than men do, even when adjusted for their comparatively smaller body mass, yet average male and female I.Q. scores are the same."

The current scientific theory about human migrations and evolution must stick in the craw of anyone who wants to convince himself that his race is the master race or superior to any other. Homo sapiens originated in Africa some 100,000 to 200,000 years ago. Thus, we all are descendents of Africans; even neo-Nazi's and white supremacists have Africa running through their veins. The migrations out of Africa began about 7,000 generations ago and seems to have involved a relatively small number of people.

"As a result of that combination -- a limited founder population and a short time since dispersal -- humans are strikingly homogeneous, differing from one another only once in a thousand subunits of the genome," says Angier.

August 14, 2000. In Mexico, [seven people are dead](#) because of a botched exorcism and police are looking for a priest who burnt someone with candle wax in another botched exorcism. So says [Yahoo.News](#).

August 9, 2000. More bad news for religious people: they live longer and will not get to see their Creator or Great Spirit as soon as they would if they were atheists. The title of an article by Denise Mann of [WebMD](#) Medical News tells it all: "Religious People Live Longer Than Nonbelievers" - Healthy Beliefs, Support Network May Be Part of the Reason Why." According to the article, more than 90% of American adults are affiliated with some type of formal religion, and nearly 96% believe in God or a "Universal Spirit". Unfortunately, that means that to get, say, 1000 atheists in a random sample you'd have to have a sample of about 25,000. Since most studies have considerably smaller samples, it would be difficult to do a meaningful study comparing the longevity of believers with non-believers that had an adequate number of non-believers in it. No problem. Do a meta-study, a study of studies, which is exactly what Michael E. McCullough of the National Institute for Healthcare Research et al. did. According to the abstract of their article published in [Health Psychology](#) (May 2000 Vol. 19, No. 3, 211-222) they did a

meta-analysis of data from 42 independent samples [representing

125,826 participants] examining the association of a measure of religious involvement and all-cause mortality.... Religious involvement was significantly associated with lower mortality (odds ratio = 1.29; 95% confidence interval: 1.20—1.39), indicating that people high in religious involvement were more likely to be alive at follow-up than people lower in religious involvement. Although the strength of the religious involvement/mortality association varied as a function of several moderator variables, the association of religious involvement and mortality was robust and on the order of magnitude that has come to be expected for psychosocial factors. Conclusions did not appear to be due to publication bias.

The article is not for non-statisticians. *Publication bias* refers to the fact that published studies tend to be biased towards positive results. Four separate checks were done to measure for publication bias; all tended to indicate that this was not a problem.

I have a couple of comments. The WebMD article claims that the study shows that

people who were most involved in their religions were 29% more likely to be alive when the various studies were completed than were their nonreligious counterparts.

This makes it sound like religious people live 29% longer than nonreligious people. However, the *Health Psychology* article says something quite different. It says

highly religious individuals had odds of survival approximately 29% higher than those of less religious individuals.

Thus, according to the researchers, the contrast is not between religious and non-religious people, but between highly religious people and less religious people (including, presumably, non-religious people). Thus, even many religious people have greater mortality rates than other, more, religious people. However, I could not find any definition of "highly religious" in the article. The authors do mention "religious involvement" as being measured by such things as "religious attendance, membership in religious kibbutzim, finding strength and comfort from one's religious beliefs, and religious orthodoxy." They also state that

measures of public religious involvement (i.e., religious attendance) may be more strongly related to health outcomes than are measures of private religiousness (e.g., self-rated religiousness, frequency of private prayer, or use of religion as a coping resource).

This belief is based upon

a century of sociological theory and research [which] suggests that the association of religious involvement and physical health might be more closely tied to the psychosocial resources that religion

provides rather than any positive psychological states engendered specifically by more private forms of religious expression.

In short, the authors conclude that it is not just because religiously involved people tend to smoke and drink less than non-religious people (we are also ["slightly less obese"](#)--I love that expression!). According to McCullough, religious people "receive a lot of positive social support that helps them to cope with stress." Also, "religion helps people to develop a coherent set of beliefs about the world that help them to make sense of their stress and suffering." This may be true and it does seem intuitively correct to think that communal baptisms, bar mitzvahs, circumcisions, weddings and funerals would be good for the health of people going through some of life's major causes of stress. But this was not something his group studied scientifically. "All of these factors are probably at least partially responsible for the links between religious involvement and health," he says. He may be right. Thus, if you want to put off meeting your Maker as long as possible, get more religiously involved.

11 Aug 2000

Your skepticism on this particular issue is misbegotten - and I say this as one nonbeliever to another. Let me give you an example: My blood pressure rises every time I hear some evangelist politico sponsor legislation recognizing creationism as a scientific theory (or characterizing evolution as "just" a theory). So of course nonbelievers are dying young - the believers are killing us.

Mike Drake

reply: It will get worse before it gets better. Religion used to be the bailiwick of the Republicans. [Gore and Lieberman](#) are already praying together publicly and invoking God to bless their party, as if an omnipotent, omniscient being would be more interested in politics than high school football games. Anyway, this is just one more way the media and the candidates can avoid dealing with issues that matter and can entertain themselves and us with [another diversion](#).

11 Aug 2000

One source of systematic error: people who are really sick can no longer attend services. People who are healthy can still attend services. Sick people are more likely to die, etc. So being sick causes you to stop attending church or anything else. How much of the 29% does this account for?

John Farley

reply: The researchers are aware of the problem, mention it, and say it should be taken into account. They write

Healthy persons might be more likely than unhealthy persons to attend public religious activities. Thus, the association between religious involvement and mortality is likely to be stronger for measures of public as compared with private religiousness, and effect sizes for studies using public measures of religious involvement should be moderated also by statistical control of physical health.

What I found most interesting was their comment on the results of two studies of cancer patients that found that "religious involvement was not associated with mortality."

Because the health benefits of religiousness may be mediated in part by lifestyle choices and coping behaviors that have their effects over a number of years, the association of religious involvement and mortality might be stronger in basically healthy, community-dwelling samples than in samples of clinical patients.

In other words, had the cancer patients been more religious they would have made better lifestyle choices and they wouldn't be dying of cancer; they'd be playing bingo in the church hall or attending somebody else's funeral.

The authors also note that when doing this kind of study one must remember that women tend to be more religiously involved than men and samples might be skewed to include too many women, whom, we already know, live longer than men. The authors also note that a number of factors are relevant to mortality, such as age, gender, race, ethnicity, general social support, psychological well-being, exercise, smoking, and physical health. Studies which don't control for such things may be biased.

However, the only studies they systematically excluded were those that "used religious affiliation or denomination (e.g., Christian, Jewish) as the sole measure of religion."

August 9, 2000. A motivational [firewalking](#) at the American Association for Nude Recreation's 69th annual convention in San Diego backfired and seven naked disciples with scorched feet had to be hospitalized last Saturday night. Noted firewalker and peak performance coach [Tolly Burkan](#) said such mishaps are exceptions to the rule. He's only had a few dozen of his followers burn their feet, he says. No mishaps were reported by the nudists in other activities, however, including bocci ball, ping pong, skydiving, salsa-making, and line dancing.

August 4, 2000. Michael Shermer has joined forces with Holocaust scholar Alex Grobman for a new book on the Holocaust deniers. The book is reviewed by Charles Austin in [The Record Online](#). The title is [Denying History : Who Says the Holocaust](#)

[Never Happened and Why Do They Say It?](#) One review says that the "book refutes, in detail, the Holocaust deniers' claims, and it demonstrates conclusively that the Holocaust did happen. It also explores the fundamental historical issue in all debates over the truth of the Holocaust: the question of 'how we know that any past event happened.'"

July 26, 2000. [ABCNews.com](#) reports on a National Science Foundation survey which found that

Only 21 percent of those surveyed were able to explain what it means to study something scientifically, just over half understood probability, and only a third knew how an experiment is conducted.

The survey is a reminder of two factors which should never be overlooked in trying to explain why people believe weird things: ignorance and incompetence. Those who think the Internet has greatly reduced ignorance should note that only 16% of those surveyed could even define the Internet. That's an increase of 5% over the past 5 years. At that rate, we'll all know what the Internet is by the year 2084.

On the other hand, the survey is part of a larger project, and [this part only concerns public self-assessment](#), not actual knowledge or lack of it.

[thanks to Jon Henrik Gilhuus]

July 19, 2000. "Are 'functional foods' dangerous? Opponents renew call for stricter FDA regulations," is a [CNN.com](#) story about cashing in on the growing fascination with "alternative" medicine and "natural" drugs. Manufacturers of ice cream, cereal, [teas, soft drinks](#), etc. are adding herbs along with unsubstantiated claims about improving memory and enhancing immune systems. The so-called *nutraceuticals* are popular with consumers, despite the lack of evidence in support of the claims being made.

"According to the General Accounting Office, the investigative division of the U.S. Congress, American consumers spent about \$31 billion last year on dietary supplements and herbal food products."

[thanks to Jon Henrik Gilhuus]

July 14, 2000. Nelson Mandela "brought the XIII International AIDS Conference to an emotional close on Friday with a call to battle against what he called the 'terrible scourge' of AIDS," according to [YahooNews](#). He called the controversy surrounding the current President of South Africa, Thabo Mbeki's indirect support for the theory that HIV might not be the cause of AIDS a "distraction."

July 12, 2000. Last June, [Joe Firmage](#) announced that he was joining forces with Ann Druyan and the Carl Sagan Foundation (CSF) in a \$23 million venture called [Project Voyager](#). According to the Project Voyager website, they will create

a new type of visionary alliance of partners in finance, science,

learning, media, and entertainment to create an "integrated experience network." Our canvas is an Internet portal, a studio, and a press. With them, we aspire to demonstrate convergence of remarkable and responsible learning and entertainment.

Our success will be measured in three ways: commercially in return to our employees and shareholders, ideologically in our commitment to the intellectual and spiritual nourishment of humanity, and in the remarkable things the founders will do with their personal equity.

Joel Achenbach of the *Washington Post* expresses his concerns with the merger in ["Sagan and Firmage: Not So Perfect Together."](#) For her part, Druyan dismisses criticism of joining forces with a man who claims to have many weird beliefs based on some weird experiences. She and Carl worked with some *conventional religious* people, she says, and their beliefs were no weirder than Firmage's notions. Of course, unlike her religious friends, [Firmage gave Druyan a million dollars](#) last year for her not-for profit CSF.

According to Achenbach, [SETI](#) turned Firmage down when he offered to throw money their way and form an alliance. Frank Drake, head of the SETI Institute, thinks that to hook up with Firmage, "no matter what disclaimers you put on your site," would lead people to take it as an endorsement of his views. SETI did find other generous supporters, however. It's accepted \$12.5 million from Microsoft co-founder Paul Allen and former Microsoft Chief Technology Officer Nathan P. Myhrvold.

Firmage and Druyan will have competition, however. [Deepak Chopra](#) is starting a company later this year, to be run by his daughter, which will develop "Web, television and radio programming, services and products." [He's recently signed on Kathryn M. Downing](#), former publisher of the Los Angeles Times, as chief executive of Mypotential.com.

July 5, 2000. The *Journal of the American Medical Association* has dueling articles today regarding an issue reported on here [last November](#): death by medical error.

One argues [the numbers are greatly exaggerated](#), the other argues [they are not](#). An analysis of the disagreement is given by Rick Weiss of the *Washington Post*.

[thanks to Jon Henrik Gilhuus]

July 1, 2000. We noted [last February](#) that the Indiana House voted 92-7 in support of a law that would allow posting the [Ten Commandments](#) in schools, courthouses and on other government property, as long as they are displayed with "other documents of historical significance that have formed and influenced the U.S. legal system." Today, the Orange County courthouse became the first in the state to use the new law. Officials posted the Ten Commandments in a glass case between a copy of the Declaration of Independence and the Bill of Rights.

Renditions of "God Bless America" and scripture readings echoed from the steps of the county courthouse Saturday as nearly 300 people who began gathering just before midnight watched officials unveil a plaque with the religious tenets the moment the new law went into effect.

"You talk about being moved. Those people were really full of spirit - they were just so excited that it was happening," County Commissioner Charles W. Hall said. ([Nando Times](#))

The government officials and citizen supporters of this type of religious bullying are hypocrites, every one of them. They claim that they are not being allowed to pray, that religion is being squashed by the state, but in fact [they don't want religion to be free or openly practiced](#), because that would mean that [Jews, Catholics, Hindus, Buddhists, Sikhs, Scientologists, etc., would be equal with them](#) (i.e., the militant fundamentalist Christians). These people are also illogical because they have posted and gone wild over contradictory documents. The First Commandment says "I am the Lord thy God, which have brought thee out of the land of Egypt, out of the house of bondage. Thou shalt have no other gods before me." But the First Amendment says "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof..." The Fourteenth Amendment forbids the States from doing what the First Amendment forbids Congress from doing. Americans are free to believe in the God of the ancient Jews, but we are also free to

violate the First Commandment and have other gods we worship instead of the God of the Jews, Christians and Muslims. In short, the First Amendment says that no American has to accept the First Commandment, while the First Commandment implies that the First Amendment is contrary to one God's will.

I could go on ranting about the other commandments and their conflict with the Bill of Rights, but what good would it do? The Supreme Court will eventually toss this Indiana ruse onto the trash heap of hypocritical documents along with the [Texas prayer law](#).

July 1, 2000. Li Hongzhi, leader of the [Falun Gong](#) cult, now claims that the persecution of his followers in China is the fulfillment of a prophecy of [Nostradamus](#), according to John Leicester of the Associated Press (*Sacramento Bee*). The same lines that other believers in Nostradamus's prophetic powers have cited as predicting the plane crash of John F. Kennedy Jr. are cited by Li as applying to his group. Maybe Nossie gave the world a twofer here. The words are

L'an mil neuf cens nonante neuf sept mois Du ciel viendra grand Roy
deffraieur Resusciter le grand Roy d'Angolmois. Avant apres Mars
regner par bon heur.

The year 1999 seven months From the sky will come the great King of
Terror. To resuscitate the great king of the Mongols. Before and after
Mars reigns by good luck. (X-72)*

[Read all about it.](#)

June 29, 2000. Sister Lucia dos Santos, who claimed the Virgin Mary appeared to her and two other kids at Fatima, Portugal, in 1917 was a person who lived in a "delirious world of infantile fantasies" and suffered "religious hallucinations". That is how a friar, Mario de Oliveira, describes her. The Vatican's top theologian, Cardinal Joseph Ratzinger, said that Lucia, now a 93-year-old cloistered Carmelite nun, [might have conjured her vision from devotional books](#). Skeptics are not so charitable. According to the [Sunday-Times \(UK\)](#), a lot of people are angry in Portugal and beyond because the recently revealed third secret of Fatima was not a doomsday prophecy, making their recent penitence and contributions unnecessary at this time. Lucia didn't write down the prophecy until 1944, and she's had a cult following ever since who have beaten their way to Fatima to pray, do penance and leave money, some hoping for a miracle, others hoping for forgiveness before the world ends. To skeptics, Lucia is just another liar for Jesus, a [pious fraud](#). Whether she was deranged or just liked the attention, who can say?

Some say she predicted the end of the world would happen before [1960](#). Some also say that the 3rd prophecy is a [forgery](#).

[thanks to Joe Littrell and Jon Henrik Gilhuus]

June 29, 2000. [The First Amendment Center](#) released the results of their latest poll of our opinions. As a nation we have had over 200 years to inculcate the values of the

Constitution in our people. Where did we go wrong? Here is an excerpt from their press release:

From 1997 to 2000, the percentage of people who agreed teachers and public school officials should lead prayers increased from 56% to 65%. In addition, a majority of respondents, 56%, said a public school teacher should be allowed to use the Bible as factual text in a history or social studies class.

More than half (51%) of the respondents said the press in America has too much freedom to do what it wants, compared to 53% in 1999.

The full report is available in [PDF format](#). The full report states that 40% (not 51%) said the press has too much freedom. Are we becoming a nation of polite hypocrites? Majorities oppose allowing speech which is racially offensive (77%) or religiously offensive (53%), and 51% would ban public displays of potentially offensive art.

Only 48% of those surveyed strongly disagreed with the statement "The First Amendment goes too far in the rights it guarantees." 65% think that giving money to a political candidate is an act of free speech that should be protected by the Constitution. Only 18% disagreed when asked whether a prayer should be said at high school graduation if the majority favors it. Only 35% disagreed that students at public schools should be allowed to lead prayers over a public address system at such events as a football game.

"The survey was based on telephone interviews conducted by The Center for Survey Research and Analysis at the University of Connecticut with 1,015 adults, ages 18 or older, conducted April 13-26, 2000. The margin of sampling error is plus or minus 3 percentage points."

I generally find opinion polls to be useless. Uninformed people are asked for their opinions, which are then reported to us. Thus, the uninformed are informed by the uninformed. I'd rather see the media provide information about a subject that might help us become informed in our opinions. However, I found this poll to be of value precisely because it gives us some sort of gauge as to what people really think about freedom, majority rule, and the Constitution. What I get out of this survey is that there are an awful lot of Americans who think the majority should be able to bully minorities in matters of religion and other values. They do not grasp the fact that the First Amendment (and the Fourteenth Amendment) are there to protect our rights from being abused by Congress, the States, and our fellow citizens. They do not seem to understand that even if everybody but one person agreed that it should be illegal to say "Pluff" or read *Little Boy Blue*, that one person is protected by the U.S. Constitution against the tyranny of any majority in such matters.
[thanks to Jon Henrik Gilhuus]

June 28, 2000. Head warden Keith Harris of the Longleat Safari Park in Wiltshire (England) had a wounded rhino. The cow's shoulder and foot had been injured by a bull trying to mount her. Traditional medicine did not help the limping rhino, so he decided to try an alternative approach. "I had heard about copper neck chains being

used to treat horses with arthritis and thought that if that works for them, there's no reason why it shouldn't also be able to help rhinos." Good thinking, Keith, *if* it really works for horses. The rhino now sports custom-made copper bracelets. "Thelma's keeper says the treatment appears to be working, as she is now walking more easily," according to [BBC News](#).

Of course, one can find many [testimonials](#) based upon personal observations like the zookeeper's that copper bracelets are effective in reducing the pain of arthritis or rheumatism. Some defenders of copper jewelry theorize that the [magnetic property of copper](#) is making "energy" and blood flow more freely to the affected areas. Others speculate that [copper permeates the skin](#) and enters the bloodstream where it is needed to combat arthritis, osteoporosis and other diseases. Some don't care about theories; they just know [it works for them](#). Neither the magnetic nor the permeation theory is supported by scientific evidence, according to [WebMD](#). (Dr. Helmar Dollwet's 1981 book, *The Copper Bracelet and Arthritis* did not take the medical world by storm though it still intrigues the "alternative" community.) The felt effectiveness of such devices may be due to [self-deception](#) and [selective thinking](#), the [regressive fallacy](#) or the [placebo effect](#).

[thanks to Joe Littrell]

June 26, 2000. Tonight [ABC's](#) Peter Jennings will narrate a program on the life of Jesus "the man." The program has upset Tom Shales of the [Washington Post](#) because Peter Jennings gets top billing over the Messiah...yes, Shales calls Jesus "the Messiah" in a secular newspaper. Actually, Shales is upset about a lot of things, but mainly he doesn't seem to like the idea of treating his Messiah as if he were a human being of interest to historians in the same way as, say, well, anybody else. However, besides noting that Jennings says there "is a wide range of opinions" on the resurrection--which, I must admit, is a pretty shallow comment--I don't find Shales' complaints very compelling. Jennings apparently shows some skepticism, not only about the resurrection but about the other alleged miracles of Jesus.

One should expect the program to be superficial. It's television, for Christ's sake. If you want to know something in depth about Jesus as an historical figure rather than as a mythical god-man, read something like [The Quest of the Historical Jesus](#) by Albert Schweitzer.

[thanks to Jon Henrik Gilhuus]

June 26, 2000. Three weeks ago, Joe Littrell sent me an e-mail with a link to an article in the *New York Times*. It was about some religious novel becoming number one on the fiction best-seller list. I brushed it off as another example of not being able to account for bad taste. My mistake. Today's *Sacramento Bee* has an article by Bill Lindelof, which notes that "a conservative Christian potboiler" has been number one on the *New York Times* best-seller fiction list for three weeks. The book is the seventh in a series where "readers will experience the horrors of God's judgment and the hope of salvation as they follow Rayford, Buck, Chloe, and the rest of the Tribulation Force in heart-stopping action."* The book is called *The Indwelling* and it has sold two million copies. The authors are Tim LaHaye, a "retired" evangelist, and writer Jerry B. Jenkins. Altogether, the series has sold 15.1 million copies (*Bee*) or 17 million copies ([NYTimes](#)). According to critics, one of the objectionable

messages that runs through the books is that the only way to salvation is to accept Jesus Christ as your personal savior. Other themes include The Anti-Christ, the Apocalypse, Prophecy, and other topics of interest mainly to conservative Christians.

Skeptics might find this disconcerting, that millions of Christians are finding spiritual succor in novels. However, outside of the fact that many people don't seem to treat fiction differently than non-fiction (witness the success of of the [Celestine Prophecy](#) and all religions), I don't know what the concern should be. If people are turning to novels for religious guidance, it is because they are not getting that guidance elsewhere, like at football games or before school starts. (The [ACLU is challenging Virginia's law](#) requiring public schools to begin each day with a minute of silence, a ruse to get them to pray together.)

Those who want to get Jesus onto the football field or into the classroom ought to consider requiring students to read the number one bestseller on the NYT's fiction list. They might have a better chance of success.

June 26, 2000. President Bill Clinton, never one to pass up an opportunity to lie to the world, announced

Today we are learning the language in which God created life. We are gaining ever more awe for the complexity, the beauty, the wonder of God's most divine and sacred gift.

He was not referring to the success of works of religious fiction, but to the completion of "a rough draft of the human genetic code" by scientists, according to the [NandoTimes](#).

Investors were not as impressed as Mr. Clinton was. Shares of Celera Genomics ([CRA](#)), a private firm involved in the mapping, were down \$16.69 (13.14%) to \$110.31 in trading today at about noon PDT.

Clinton compared the genetic mapping to the mapping of the explorers Lewis and Clark

Not to be outdone by Clinton's strange comparison, Tony Blair, the prime minister of Great Britain said

Let us be in no doubt about what we are witnessing today: A revolution in medical science whose implications far surpass even the discovery of antibiotics, the first great technological triumph of the 21st century.

Maybe they were banking on most of us not knowing what 'map' or 'technological triumph' mean. The complete genetic map will certainly open the door to possible revolutions in medical science, but the technological triumphs are mere hopes at this point. How our scientists and society will use and abuse this new information remains to be seen.

Maybe there should be some sort of science IQ test given to those who want to become leaders of major nations. At least Clinton should know that it was Al Gore who discovered jeans while mapping our Interstate highway system after George W. Bush invented the hypodermic needle.

reader comments

30 Jun 2000

In response to your June 26th article about the political side-show over the rough draft of the human genome: While there were many things to be cynical about, the two items you picked out are in fact not really humbug.

First, while a genome map does not resemble anything Rand-McNally would publish, to a geneticist it serves the same purpose. For a researcher in the biological sciences, trying to find a single gene in the human genome is akin to wandering through untracked wilderness, and the creation of the genome map is no less an aid to our early genome explorations than Lewis and Clark's effort was to early settlers.

Second, Mr. Blair was dead on when he called it a technological triumph. Twenty years ago, a PhD could be had after spending four or five years at the lab bench to sequence 400 - 500 bases worth of DNA. Today, even a modest sequencing laboratory can sequence that in less than half a day. The major sequencing centers can do thousands more than that. The reason is because of the incredible automation technology that has been applied to the problem of sequencing DNA. The Human Genome Project has been referred to as biology's Apollo program, and hyperbole aside, it is an apt analogy. And while the practical benefits are still a few years in advance, it is clear to most researchers that the HGP in and of itself is the technological triumph that Mr. Blair declared.

From a scientist's point of view there was more than a bit of stock puffery going on by Celera. We can celebrate the fact that investors actually looked at the numbers announced (80% coverage, 55% finished) and questioned the announcement. Further, as a scientist, it is more than a bit sad for me to see the political capital being grabbed by people who wouldn't know which end of the microscope to put where. But that is simply politicians being politicians, and it shouldn't detract from the importance of the science.

D. Curtis Jamison, Ph.D.

paradigm and paradigm shift

A paradigm is a model or exemplar. The paradigm case is the typical or archetypal case. A paradigm shift is the movement from one paradigm to another.

One notion of a paradigm is that used in law, where a paradigm is a model case to be distinguished from penumbral cases. A law might make it a crime to use a gun while committing a crime. A case where a robber uses a loaded .357 magnum would be a paradigm case; a case where a robber uses a squirt gun would be considered penumbral. A court would have to decide whether the law meant to include the use of squirt guns as a crime, but there would be no need for interpretation of the law to decide whether using a loaded .357 magnum was within the legislature's intent. *Paradigm* in this sense has no correlative to *paradigm shift*.

A more common use of *paradigm* as *model* would be something like the paradigm of *policing*, which would include the basic assumptions, values, goals, beliefs, expectations, theories and knowledge that a community has about policing. Many models, like that of policing, have emerged over time in response to various changes in society and are not the result of a grand design or plan. A paradigm shift in policing might occur slowly over many years or it might occur abruptly as the result of a conscious analysis and evaluation of the current paradigm. An individual or a group might list the inadequacies, dangers, etc. of the current paradigm in light of relevant changes in society and present a new model for policing. If the new model is accepted by the community, then a paradigm shift occurs. The new paradigm would replace old assumptions, values, goals, beliefs, expectations, theories, etc. with its own.

Thomas Kuhn

T.S. Kuhn, in his [*Structure of Scientific Revolutions*](#) (1962), used the term 'paradigm' to refer to the conceptual frameworks and/or worldviews of various scientific communities. For Kuhn a *scientific paradigm* includes models like the planetary model of atoms, and theories, concepts, knowledge, assumptions, and values. For Kuhn such a notion as the scientific paradigm was essential to make his argument regarding a particular aspect of the history of science, viz., when one conceptual framework gives way to another during what he called a *scientific revolution*.

Kuhn believed that during periods of "normal science" scientists work within the same paradigm. Scientific communication and work proceeds relatively smoothly until [anomalies](#) occur or a new theory or model is proposed which

requires understanding traditional scientific concepts in new ways, and which rejects old assumptions and replaces them with new ones.

A paradigm of a scientific revolution in Kuhn's sense would be the *Copernican revolution*. The old model of the earth at the center of God's creation was replaced with a model that put Earth as one of several planets orbiting our sun. Eventually, circular orbits, which represented perfection and God's design for the heavens in the old worldview, would be reluctantly replaced by *elliptical* orbits. Galileo would find other "imperfections" in the heavens, such as craters on the moon.

For Kuhn, scientific revolutions occur during those periods where at least two paradigms co-exist, one traditional and at least one new. The paradigms are incommensurable, as are the concepts used to understand and explain basic facts and beliefs. The two groups live in different worlds. The movement from the old to a new paradigm he called a *paradigm shift*.

Whether Kuhn was right or wrong about the history of science--and he has plenty of [critics](#)--his notions of a paradigm and a paradigm shift have had enormous influence *outside* of the history of science. In many ways, how Kuhn is understood and applied is analogous to [how Darwin's conception of natural selection has been misunderstood](#) and applied outside of evolutionary biology. For a paradigm of this type of misapplication, see the *Skeptic's Dictionary* entry on [neuro-linguistic programming](#).

What's Your Paradigm?

[Amazon.com](#) lists more than 500 books with the word 'paradigm' in the title, most of which seem to use *paradigm* in the standard sense of model or exemplar, e.g., *Anti-Semitic Stereotypes : A Paradigm of Otherness in English Popular Culture, 1660-1830*.

One of the more common applications of the terms *paradigm* and *paradigm shift* is to mean "traditional way of thinking" vs. "new way of thinking." Some New Age thinkers seem to think that paradigms can be created by individuals or groups who consciously set out to create them. They seem to mean by 'paradigm' nothing more than "a set of personal beliefs," e.g., [Essays on Creating Sacred Relationships: The Next Step to a New Paradigm](#) by Sondra Ray and [Handbook for the New Paradigm](#) from Benevolent Energies. Many of the New Age Self-Help promoters base their approaches on the notion that one's current paradigm is holding them back and what they need to do is create a new paradigm (set of beliefs, priorities, assumptions, values, goals, etc.) for themselves that will allow them to break through, etc., e.g., [The Paradigm Conspiracy: How Our Systems of Government, Church, School, and Culture Violate Our Human Potential](#) by Denise Breton and Christopher Largent.

Others seem to identify the term *paradigm* with *theory*, e.g., [Lamarck's Signature: How Retrogenes Are Changing Darwin's Natural Selection Paradigm](#), by Edward J. Steele et al.

retroactive clairvoyance

Some, like [Joel Barker](#) in his video "[The Business of Paradigms](#)," use *paradigm* and *paradigm shift* to explain how some people or companies fail and others succeed. The ones who succeed are those who can shift to a new paradigm; the ones who fail are those who remain hidebound and fixated on traditional ideas because they have proved successful in the past or because they can see no use for some new idea. The Swiss failed to patent or market the quartz watch, even though they invented it, because they couldn't shift paradigms. They couldn't shift paradigms because they couldn't see that there would be a market for another kind of watch besides the kind they'd been successfully making and selling for generations. The Japanese made all the money from the quartz watch because they didn't have an old paradigm that locked them into a way of thinking that precluded patenting and marketing quartz watches.

This model might be called [retroactive clairvoyance](#) because it sees *always and only after the fact* who failed to make a paradigm shift and who benefited by having foresight to take advantage of other people's creations. This model is useless for predicting what creations will prove profitable and useful. But it is excellent in hindsight. It infallibly sees that Xerox didn't do a paradigm shift and screwed up when it did not pursue ethernet or graphical user interface or the laser printer, and that IBM screwed up when it initially rejected the notion of the personal computer.

Barker has moved on and now claims to be able to recognize when paradigms will shift in the future and he will teach you to do so, too, in his new book [Paradigms: The Business of Discovering the Future](#).

relativism

Probably the most serious misapplication of Kuhn's conception is the notion that everything that makes up a paradigm is relative and subjective, and therefore purely personal with no connection or test in reality. Some of those who think that [creationism](#) and evolution are competing paradigms or theories make this mistake. It may be true that all theories and beliefs are "subjective" to some extent, but this does not mean that they are all equally useful or probable, or even of the same type. The fact that *red* and all colors are "subjective" hasn't prevented the development of interior decorating, painting, clothing design, etc. Nobody hesitates to buy a red car on the grounds that red and all colors are purely subjective. Most of us can still tell the difference between red and blue even if we know that neither really exists except in our

minds or in the subjective interaction of our senses with objects under certain conditions. And most of us know that there is no comparison and no competition between understanding red in terms of wavelength of light and understanding red as a symbol for love or passion or the belief that all things red are infused with divine love and worthy of veneration.

morphic resonance

21 Dec 2000

In your article, you imply that Rupert Sheldrake coined the term "morphic resonance" fairly recently. I would like to point out that the fantasy author [Terry Pratchett](#) has been using that term for many years now, although in a context far more appropriate - fantasy magic.

In the Discworld series of novels, the "morphic resonance" is the tendency of a mind to remember, effectively, what shape it's body is. As a result, after one's death, it is "morphic resonance" that keeps the soul looking like the original body. Furthermore, if one wishes someone into a frog, one magically alters his morphic resonance (making him think he's a frog) and poof, he becomes one. "Morphogenetic field" is also used in a very similar way.

I do not point this out as a criticism of you, but rather of Mr. Sheldrake, who from my perception is taking facetious concepts from humorous fantasy books and attempting to press them on the real world.

And by the way, thank you for providing this valuable internet resource.

You might want to check out <http://www.indiana.edu/~pietsch/home.html> & <http://www.indiana.edu/~pietsch/memory-optics.html>

It goes into details on how the brain stores memories, based on controlled studies of salamander brains. When people, who know what they are talking about, refer to memory as holographic, they are referring to the property of holograms where any fragment of the whole can recreate the original hologram, but with not as much detail as the unbroken original. Along the same lines, the brain seems to store a memory throughout itself, and not just in one place. Any given chunk of the brain can be removed and result in the weakening, but not loss of memories. additionally, transplanting chunks of brains from trained salamanders (who have amazing regenerative abilities) into untrained salamanders will imbue the untrained salamander with the trick that the trained one was taught. It doesn't matter where in the brain the chunk came from.

the Mozart Effect

"We have this common internal neural language that we're born with and so if you can exploit that with the right stimuli then you're going to help the brain develop to do the things like reason." -- [Dr. Gordon Shaw](#)

"We exposed these animals [rats] in utero and then sixty days after birth to different types of auditory stimulation and then we ran them in a spatial maze. And sure enough, the animals that were exposed to the Mozart completed the maze faster and with fewer errors. And now what we're doing is we're removing their brains so we can slice them and see neuro-anatomically precisely what has changed as a function of this exposure. So it may be that this intense exposure to the music is a type of enrichment that has similar effects on the spatial areas of the hippocampus of the brain." --[Dr. Frances Rauscher](#)

"Stories stressing that children's experiences during their early years of life will ultimately determine their scholastic ability, their future career paths, and their ability to form loving relationships have little basis in neuroscience." --[John Bruer](#)

The Mozart Effect is a term coined by [Alfred A. Tomatis](#) for the alleged increase in brain development that occurs in children under age 3 when they listen to the music of [Wolfgang Amadeus Mozart](#).

The idea for the Mozart Effect originated in 1993 at the University of California, Irvine, with physicist [Gordon Shaw](#) and [Frances Rauscher](#), a former concert cellist and an expert on cognitive development. They studied the effects on a few dozen college students of listening to the first 10 minutes of the Mozart Sonata for Two Pianos in D Major (K.448). They found a temporary enhancement of spatial-temporal reasoning, as measured by the Stanford-Binet IQ test. No one else has been able to duplicate their results. One researcher commented that the "very best thing that could be said of their [Shaw's and Rauscher's] experiment—were it completely uncontested—would be that listening to bad Mozart enhances short-term IQ" ([Linton](#)). Rauscher has moved on to study the effects of Mozart on rats. Both Shaw and Rauscher have speculated that exposure to Mozart enhances spatial-reasoning and memory in humans.

In 1997, Rauscher and Shaw announced that they had scientific proof that piano and singing instruction are superior to computer instruction in enhancing children's abstract reasoning skills.

The experiment included three groups of preschoolers: one

group received private piano/keyboard lessons and singing lessons; a second group received private computer lessons; and a third group received no training. Those children who received piano/keyboard training performed 34% higher on tests measuring spatial- temporal ability than the others. These findings indicate that music uniquely enhances higher brain functions required for mathematics, chess, science and engineering (*Neurological Research*, February 1997).

Shaw and Rauscher have stimulated an industry. They have also created their own institute: [The Music Intelligence Neural Development Institute](#) (M.I.N.D.). There is so much research going on to prove the wondrous effects of music that a web site has been created just to keep track of all the new developments: [MüSICA.](#), which has a section just on [the Mozart Effect](#).

Shaw and Rauscher claim that their work has been misrepresented. What they have shown is "that there are patterns of neurons that fire in sequences, and that there appear to be pre-existing sites in the brain that respond to specific frequencies."* This is not quite the same as showing that listening to Mozart increases intelligence in children. Nevertheless, Shaw is not going to wait for the hard evidence to pour in before he cashes in on the desire of parents to enhance their children's intelligence. He has book & CD coming out called *Keeping Mozart in Mind*. You can buy it from his institute after September 1999. He and his colleagues are convinced that since spatio-temporal reasoning is essential for many higher order cognitive tasks, stimulating the area of the brain associated with spatio-temporal reasoning and doing spatio-temporal exercises will increase a person's intelligence for math, engineering, chess, and science. They even have a software program for sale, which uses no language and aims at exercising spatio-temporal skills with the help of an [animated penguin](#).

Shaw and Rauscher may have spawned an industry, but the mass media and others have created a kind of alternative science which supports the industry. Exaggerated and false claims about music have become so commonplace that it is probably a waste of time to try to correct them. For example, Jamal Munshi, an associate professor of Business Administration at Sonoma State University, collects tidbits of misinformation and gullibility. He used to post them on the Internet as "Weird but True," including the claim that Shaw and Rauscher showed that listening to Mozart's sonata for two pianos in D major "increased SAT scores of students by 51 points." Actually, Shaw and Rauscher gave 36 UC Irvine students a paper folding and cutting test and found the Mozart group showed a temporary 8-9 point increase over their scores when they took the test after either a period of silence or listening to a relaxation tape. (Munshi also claims that science cannot explain how a fly flies. [Scientists have been working hard on this crucial problem](#), so we should give them their due.)

Don Campbell, however, has become the Carlos Castaneda and P.T. Barnum of the Mozart Effect, exaggerating and distorting the work of Shaw, Rauscher and others for his own benefit. He has trademarked the expression The Mozart Effect and peddles himself and his products at www.mozarteffect.com. Campbell claims that he made a blood clot in his brain disappear by humming, praying, and envisioning a vibrating hand on the right side of his skull. Uncritical supporters of alternative medicine don't question this claim, though it is one of those safe claims that can't be proved or disproved. He might as well claim that angels took the clot away. (One wonders why, if music is so good for you, he got a blood clot in the first place. Accidentally listening to rap music?)

The claims that Campbell makes for music are of an almost rococo flamboyance. And like the rococo, just about as substantive. [Cambell claims music can cure just about anything that ails you.] His evidence is usually anecdotal, and even this he misinterprets. Some things he gets completely wrong.

And the whole structure of his argument collapses under simple common sense. If Mozart's music were able to improve health, why was Mozart himself so frequently sick? If listening to Mozart's music increases intelligence and encourages spirituality, why aren't the world's smartest and most spiritual people Mozart specialists? (Linton)*

The lack of evidence for the Mozart Effect has not deterred Cambell from becoming a favorite on the lecture circuit with the naive and uncritical.

When McCall's wants advice on how to lose the blues with music, when PBS wants to interview an expert on how the voice can energize you, when IBM wants a consultant to use music to increase efficiency and harmony in the workplace, when the National Association of Cancer Survivors wants a speaker on the healing powers of music, they turn to Campbell (Campbell's website, www.mozarteffect.com).

The governors of Tennessee and Georgia have started programs which give a Mozart CD to every newborn. Hundreds of hospitals were given free CDs of classical music in May of 1999 by the National Academy of Recording Arts and Sciences Foundation. These are well-intentioned gestures, but are they based on solid research that classical music increases a child's intelligence or an adult's healing process?

Not according to [Kenneth Steele](#), a psychology professor at Appalachian State University, and John Bruer, head of the [James S. McDonnell Foundation](#) in

St. Louis. Contrary to all the hype, they claim that there is no real intelligence enhancing or health benefit to listening to Mozart. Steele and his colleagues Karen Bass and Melissa Crook claim that they followed the protocols set forth by Shaw and Rauscher but could not "find any kind of effect at all," even though their study tested 125 students. They concluded that "there is little evidence to support intervention programs based on the existence of the Mozart effect." Their research appears in the July 1999 issue of *Psychological Science*.

In his book [*The Myth of the First Three Years*](#), Bruer attacks not only the Mozart Effect but several other related myths based on the misinterpretation of recent brain research.

The Mozart Effect is an example of how science and the media mix in our world. A suggestion in a few paragraphs in a scientific journal becomes a universal truth in a matter of months, eventually believed even by the scientists who initially recognized how their work had been distorted and exaggerated by the media. Others, smelling the money, jump on the bandwagon and play to the crowd, adding their own myths, questionable claims, and distortions to the mix. In this case, many uncritical supporters line up to defend the faith because at stake here is the future of our children. We then have books, tapes, CDs, institutes, government programs, etc. Soon the myth is believed by millions as a scientific fact. In this case, the process met with little critical resistance because we already know that music can affect feelings and moods, so why shouldn't it affect intelligence and health? It's just commonsense, right? Yes, and all the more reason to be skeptical.

[multi-frequency detectors](#)

[SkepDic.com](#)

Search the Skeptic's Dictionary

MFD (Multi-frequency discrimination or Molecular Frequency Discrimination)

The term refers to devices known as **Long Range Locators** used to find buried treasures, water, archaeological sites, etc. We are told that [Noah's Ark](#) was discovered in Turkey using one of these things! Others deny this, claiming that the alleged Ark has been exposed for years, is easily visible from the air, and is known to the locals.

One reason the world does not know more about these wonderful devices is because many of their users are engaged in illegal activities. Of course, the treasure hunters don't think of it that way. According to them it is because of "State and Federal bureaucracy" which "has made permitting so restrictive and the penalties so severe that there is a fear of announcing the smallest of finds."

As far as I can tell, an MFD is some sort of electronic device which can detect metal, infrared frequencies, temperature, magnetic fields or some other known property of physical objects. The likelihood that an MFD can distinguish Noah's Ark from a trash heap or buried treasure from buried garbage is about the same as a metal detector telling the difference between a gold watch and a pop top from a beer can.

Noah's Ark

Noah's Ark is the boat built by the Biblical character Noah. At the command of God, according to the story, Noah was to build a boat that could accommodate his extended family, about 50,000 species of animals, and about one million species of insects. The craft had to be constructed to endure a divinely planned universal flood aimed at destroying every other person and animal on earth (except, I suppose, those animals whose habitat is liquid). This was no problem, according to [Dr. Max D. Younce](#), who says by his calculations from *Genesis* 6:15 that the ark was 450 feet long, 75 feet wide and 45 feet deep. He says this is equivalent to "522 standard stock cars or 8 freight trains of 65 cars each." By some divine calculation he figures that all the insect species and the worms could fit in 21 box cars. He could be right, though Dr. Younce does not address the issue of how the big boxcar filled with its cargo rose with the rainwater level instead of staying put beneath the floodwaters.

Those not familiar with the story might wonder why God would destroy nearly all the descendants of all of the creatures he had created. The story is that God was displeased with all of his human creations, except for Noah and his family. Annihilating those one is displeased with has become a familiar tactic of the followers of this and many other gods.

Despite the bad example God set for Noah's descendants--imagine a human parent drowning his or her children because they were "not righteous"--the story remains a favorite among children. God likes good people. He lets them ride on a boat with a bunch of friendly animals. He shows them a great rainbow after the storm. And they all live happily ever after. Even adults like the story, though they might see it as an allegory with some sort of spiritual message, such as *God is all-powerful and we owe everything, even our very existence to the Creator*. Furthermore, *the Creator expects us to behave ourselves*. But there are many who take the story literally.

According to the story told in chapter 7 of *Genesis*, Noah, his crew, and the animals lived together for more than 6 months before the floodwaters receded. There are a few minor logistical problems with this arrangement, but before getting to them, there is one other thing that needs commenting on. It is obvious that floods are no laughing matter. The destruction of life and property caused by floods has plagued many animals, not just humans, from time immemorial. To watch one's family or home swept away in floodwaters must be a terrible spectacle. To see one's children drown, one's life and dreams washed away in an instant, must be a devastating experience. But if one were to discover that the flood was not a whimsical effect of chance natural events, not unplanned and purposeless, but rather the malicious and willful act of a conscious being, one might add rage to the feelings of devastation. I suppose one could argue that it is God's world; he created it, so he can destroy it if he feels like it. But such an attitude seems inappropriate for an All-Good, Loving God.

the "finding" of the Ark

Yet, as preposterous as this story seems, there are people in the twentieth century who claim they have found Noah's ark. They call themselves "arkeologists." Yes, they say that when the flood receded, Noah and his zoo were perched upon the top of Mt. Ararat in Turkey. Presumably, at that time, all the animals dispersed to the far recesses of the earth. How the animals got to the different continents, we are not told. Perhaps they floated there on debris. More problematic is how so many species survived when they had been reduced to just one pair or seven pairs of creatures. Also, you would think that the successful species that had the furthest to travel, would have left a trail of offspring along the way. What evidence is there that all species originated in Turkey? That's what the record should look like if the ark landed on Mt. Ararat.

Still, none of this deters the true believer from maintaining that the story of Noah's ark is the God's truth. Nor does it deter those who think the ark has been found. For example, in 1977 a pseudo-documentary called "In Search of Noah's Ark" was played on numerous television stations. CBS showed a special in 1993 entitled "The Incredible Discovery of Noah's Ark." The first is a work of fiction claiming to be a documentary. The second was masterminded by George Jammal, who has admitted that the story was a hoax. Jammal said he wanted to expose religious frauds. His hoax was seen by about 20 million people, most of whom probably still do not know that Jammal did not want them to take it seriously.

During his show, Jammal produced what he called "sacred wood" from the ark, which he later admitted was

wood taken from railroad tracks in Long Beach, California, which he had hardened by cooking in an oven. He also prepared other fake wood by frying a piece of California pine on his kitchen stove in a mix of wine, iodine, sweet-and-sour and teriyaki sauces. He also admitted that he had never been to Turkey. The program was produced by Sun International Pictures, based in Salt Lake City, and responsible for several pseudo-documentaries on Nostradamus, the Bermuda Triangle, the Shroud of Turin, and UFOs.

the evidence for a universal flood

Stories of floods are not unique to the ancient Jews.* What geological or archaeological evidence is there of such a universal destruction of all human societies, all plants and all animals except for the ones on Noah's boat (or Ziusudra's [Sumeria], or Utnapishtim's [Babylon])? There should be a layer of sediment dating from the same time which contains all the bones of these poor creatures. There should be evidence that all human societies were wiped out simultaneously. No such evidence exists of a universal flood. Evidence of a great flood, perhaps caused by melting glaciers bursting through the Bosphorus strait some 7,000 years ago, has been discovered off the coast of Turkey by Robert Ballard (who found the remains of the Titanic) and [some \(like Ryan and Pitman\)](#) have claimed this is evidence of Noah's flood, but this is pure and inane speculation.* The Biblical flood is due to rain, not a bursting dam. As archeological anthropologist John Alden notes

...the story in the Bible is clear -- it rained for weeks before Noah's flood, and after it stopped raining the floodwaters receded. The Black Sea flood wasn't caused by rain, and after the water rose it never went away. And neither [the Sumerian nor the Biblical] story mentions the most dramatic consequence of the Black Sea flood, which turned fresh water into salt. Noah's flood, in short, doesn't sound anything like the inundation of the Black Sea.

However, for the sake of argument, let's agree that there was a universal flood, but that somehow the evidence got twisted around so that geologically and archaeologically it doesn't appear that the flood occurred. There are still a few questions we should ask before accepting this theory. First, how big was this boat? The answer: *really, really big!* Would it float? Noah might have been given divine guidance here, so maybe this boat could float. Remember that this is all done before the discovery of metallurgy, so the boat is made of wood and other natural materials. How many forests would it take to provide the lumber for such a boat? How many people working how many years would be required? Building a pyramid would be peanuts compared to building the ark. But remember, people lived a lot longer in those days. Noah was 600 years old when he built his giant boat in the desert.

But let's say that, however implausible, such a boat could have been built using the technology of wooden-boat building known to the earliest peoples. After all, Noah allegedly had God's help in building his boat. There is still the problem of gathering the animals together from the various parts of the world that, as far as we know, Noah had no idea even existed. How did he get to the remote regions of the earth to collect exotic butterflies and Komodo dragons? How did he get all those species of dinosaurs to follow him home? (Fundamentalists believe dinosaurs and humans lived at the same time.) By the time he collected all his species, in twos and sevens, his boat would probably have rotted in the desert sun.

But let's grant that Noah was able to collect all the birds and mammals, reptiles, and amphibians, and a couple of million insects that he is said to have gathered together on his boat. There is still the problem of keeping the animals from eating one another. Or, are we to believe that the lion was lying down with the lamb on the ark? Did the carnivores become vegetarians for the duration of the flood? How did he keep the birds from eating the insects? Perhaps, the ark was stocked with foods for all the animals. After all, if Noah could engineer the building of a boat which could hold all those animals, it would have been a small feat to add room to store enough food to last for more than six months. Of course, Noah would have to store enough food for himself and his family, too. But these would have been minor details to such a man with such a plan guided by God.

Still, it seems difficult to imagine how such a small crew could feed all these animals in a single day. There is just Noah, his wife, their three sons and three daughters-in-law. The "daily" rounds would take years, it seems. Delicacy forbids me from mentioning the problems of the "clean-up" detail, but I would have to say that if the noise of all those animals didn't drive Noah insane (not to mention the insect bites), the smell should have killed him. At least they didn't have to worry about water to drink. God provided water in abundance.

Finally, belief in the universal flood or even belief in the building of the ark are not nearly as strange as the belief that this event of mass destruction was the direct work of the Creator to show anger at people who would dare to enjoy this life and have a good time rather than spend all their free time worshipping the

Almighty.

multi-level marketing

24 Mar 1999

Thank you for allowing me to comment on your MLM section. I am a student and advocate of professional MLM. I have a few factual corrections to add.

Your first paragraph: Network marketing (NM), which includes both MLM and Direct Selling, is a distribution and sales method that adds the power of networking (the sharing of information and resources, or leverage and delegation) to the marketing process. It often emphasizes recruiting because that is how more product (merchandise) is sold. The greater the sales force, the more merchandise marketed. As such, it is intrinsically unblemished.

reply: There is a big difference in recruiting sellers of a product and recruiting recruiters to recruit more recruits of recruiters ad infinitum. All markets are finite. MLMs might work in an ever-expanding market of unlimited dimension.

In addition to marketing merchandise (product category one), NM also markets hope to people (product category two). I call this the "idea behind the business." Here we are looking for people to do something more important than merchandise marketing or business building. Here we are looking for people who want a feeling of control in their lives along with a feeling of self-esteem, self-fulfillment and accomplishment. Here we are offering people an opportunity to practice being the best they can be. The idea behind the business has great attraction for many people because of the frustrations and stress they feel in their lives and work. People often feel hopeless. Some find hope in NM. They believe-a feeling of certainty--certain of the possibilities.

reply: Yes, you are selling hope to the hopeless but any relief you give is only temporary.

It is true most people quit their NM business. I think this is do more to unrealistic expectations than any serious flaw with NM.

reply: Obviously, I think otherwise.

Your second paragraph: The reason MLM plans cannot succeed has nothing to do with pyramids. Pyramid selling is a system of selling goods and services to consumers by settings up a structure consisting of layers and layers (multilevel)

of sales agents whose ultimate objective is to sell goods and services to consumers. At the heart of every successful sales force is the recruitment and selection of effective sales representatives. This is very advantageous to the company owner(s), suppliers, distributors and consumers. Its a win-win situation. It's what relationship marketing is all about. The ultimate outcome of relationship marketing is the building of a unique company asset called a "marketing network." This network consists of the NM company and all supporting stakeholders: customers, employees, suppliers, distributors, retailers and others with whom it has built mutually profitable business relationships.

reply: Again, any market is finite. Eventually, the recruited become the only buyers. Do the math. In any town, of any size, you eventually run out of people to recruit. The only thing you never run out of are people who might buy your products, and most of those people will be involved in the program because they think they're saving money by buying the products direct.

Your third paragraph: Direct sellers (face-to-face selling away from a fixed retail location) market merchandise to consumers. NM plans do not 'require' direct sellers to recruit people. It's optional. Many do recruit a sales force because more merchandise is marketed and more profits are made.

reply: I'm glad you are here to set the record straight. Every MLM I've read about is based on the notion that it is different from direct selling because you recruit recruiters. Of course, no one is "required" to do this, but that is the main selling point of MLMs, so this seems to be little more than quibbling over a word.

The people you recruit are not in direct competition with you. I believe you're referring to the concept of "market saturation." This theory just does not hold up in the real world. After at least three decades of recruiting, NM companies have barely scratched the distributor and consumer markets (less and 1%). The MLM "saturation theory" has been tested in many court cases (Go-Re- Mar, Amway & Avon) and is unfounded. Walk onto the first floor of any department store and note it is almost entirely filled with cosmetic counters. Likewise note the health and nutritional section of every major supermarket chain. As long as you see these departments, you will know there is plenty of markets for network marketers.

reply: The distributors are the ones buying most of the products. The only one who will get rich in this scheme is the one who started the thing, like the founders of AMWAY.

Illegal pyramid schemes are doomed to fail due to the intrinsic nature of their operation--there is no consumer market to purchase any item of value. Many people confuse the two. They are kissing cousins in design but not in operation.

The difference is a difference that makes a difference.

reply: Really?

Your fourth paragraph: There is no need to alienate anyone least of all family or friends. Practicing Professional Integrity Selling will keep you out of trouble. This type of selling is fulfilling needs and wants. There is no trickery involved. People, in general, practice deception all the time whether in traditional or nontraditional business. NM does not have a corner on deceit. How often I would go into stores and ask, "How you doing?" They would reply, "Fine!" The following week the store is closed. Positive thinking? Lying? Doing great? Business wonderful? You call it. It happens all the time. People are strange.

reply: Finally, we agree on something!

Your final paragraph: You still don't seem to understand the overall concept. The idea of selling goods to people and encouraging them to sell the goods to others is merely Direct Selling on multiple levels. The distributor is selling the goods themselves. They are merely offering a value-added business opportunity to others who want to take advantage of it. The ultimate goal is to market more merchandise. It's managing, selecting, training, supervising, motivating and evaluating sales representatives. It's entrepreneurship. There is nothing inherently evil with the concept. What people do with the concept is another question.

reply: If MLMing is "direct selling on multiple levels" then Mickey Rooney is a serial polygamist. It is what it is, whatever you call it.

I hope these factual comments help you understand this misunderstood industry.

All the best.

Steven Brownstein

reply: I'll let the readers decide if this help understand the misunderstood.

21 Sep 1998

Thank you for your write up and links on multi-level marketing. While I was doing my laundry at a public laundry mat, several individuals tried to get me to sign up with Excel -- long distance carriers. They never once stressed why I should have Excel as my carrier, and they never asked whether I used long distance. (I don't.) I was told how much money I would make by 'helping people'. Unfortunately, they kept coming back to the laundry mat. I finally informed the local authorities who put a stop to their activities since door-to-door sales are prohibited in our county. Your article helped me greatly. I was able to say "NO". Thank you.

Virginia Carper

23 Nov 1997

I would like to obtain your permission to use, adapt and/or to translate the content of your web pages in a publication to make South Africans aware of the issues not told by the Multi-Level marketing companies. This publication will be published for profit with or without endorsements from The Minister of Trade and Industry, the Business Practice Committee and the Consumer Council.

Recently I was one of many South Africans who lost a great deal of money to a West Indies based company. I believe the total loss was \$29,000,000. The industry is booming in South Africa and there is no way to educate South Africans quick enough to protect them. If only I saw these pages before my meeting, I would have spotted the warnings before I have joined.

South African Minister of Trade and Industry are looking for input from the public to put legislation in place to stop the Multi-level marketing Industry. I would like to send him a copy of your pages with your permission.

Lourens Human

You have my sympathies and my permission to use my materials.

29 Mar 1997

Yes. I'm in MLM. But, then, so are you with your WebPage on Critical(?) thinking.

You're a hoot!

Look, friend, no matter how it's done, no matter the format, every business enterprise is MLM. You simply have to set up your own criteria, ascertain your goals, recognize that it's not going to be easy, and get to work.

reply: If every business enterprise is MLM, then MLM is not unique, not special, and not worth our interest.

There have always been those that are looking for the easy dollar from some gullible soul. This can be said of any enterprise on the market

reply: First we learn that all business enterprises are MLM, and then we learn that all enterprises are looking for the easy dollar from gullible souls. You really do understand economics better than anyone I've met so far.

-most especially your offer to instruct people on how to be as skeptical as you purport to be by shelling out \$2-.95 for your coffers.

reply: I assume you are referring to my book *Becoming a Critical Thinker* (\$15 plus postage & handling). If I wanted to make easy money by writing a book, I think I would have chosen another topic, such as *Six Easy Steps to Finding the True You and Your Path to Success*.

Do yourself a favor? Take a good look at the way that big business is downsizing. This is affecting everyone. and if people adopt your "skepticism", they'll be so paralyzed with "skepticism" (proper definition: fear) that they'll be even more susceptible to the "blame-everyone-for-my-joblessness" bunkum that the lazy promote when they find that self-pity has landed them without the income to insure against homelessness.

reply: You're not only an expert on economics, but on social problems as well. I must admit that you make connections I have trouble following. I understand downsizing, but don't see how I'm doing myself a favor by taking a good look at it. I don't think those who are downsized or outsourced will be paralyzed by skepticism, though I can understand why they would fear the future, especially if they are older. Being skeptical about occult, paranormal, supernatural or pseudoscientific matters isn't likely to play a role in the decisions of those unfortunate enough to be victims of downsizing. But if it does play a role, I think it will be a positive one, helping people avoid making bad decisions out of desperation.

No need to reply, for I know this message will be too hard for you to accept in your fearful little world of "skepticism".

P.S.: Were you one of those people - like me - who thought that the chance to buy into a little-known company (named Xerox) in the mid-seventies was too risky because it seemed "too good to be true"? I'll bet you were.

Sheila Middlebrook

reply: Unfortunately, when Xerox stock came on the market I was too young and too poor to have known or cared about it. It is frightening, though, to find that you and I have so much in common.

30 Nov 1996

Harassment of this kind need not restrict itself to the sale of MLM "opportunities". Recently, several of our middle-managers were forced to submit to [Meyers-Briggs](#) typing, which can be seen as a pseudoscience. Other managers might become enamored of various "motivational" gurus and try to impose their cult techniques on unwilling subordinates. What this boils down to

is an equal-opportunity employment issue, where the forced belief is analogous to a religion. Anyone in a supervisory stance therefore runs considerable risk when attempting to impose unproven or fringe methodologies within their organization. Some enterprises, of course, permit much more latitude than others in this regard. Your example from the U.S. Navy is one where rogue supervisors will have much less success than in small businesses with only a handful of employees.

reader comments:

multiple personality disorder

15 Oct 2000

If you are serious about being open minded and examining evidence that may refute your position, you may find my experience a counter example to the social construction theory of DID. I was raped by my brothers and their friends when I was nine, and my brother repeated it numerous times. My memory of the first experience has been continuous, those for the subsequent ones more vague (but confirmed by my brother). This happened in 1960. In college I became aware that I was nearly totally amnesiac for the years from 9 to 14, and had extensive amnesia for many parts of the high school years; this became obvious to me when I realized how impoverished my personal memories were compared to those of friends.

Between then and now I became a scientist (currently a full professor at a big 10 university), had numerous episodes of depression (which went undiagnosed for a long time), married, divorced, remarried in 1982 and now have a family of two children and a wonderful husband. My depressive episodes always had a quality of "happening to someone else" about them; this is recorded in various journal entries I have made at different times. In 1997 during my last episode of depression I became aware of voices in my head arguing about things I was trying to do; the sensation was that an "observer I" was listening to a child's voice of whining helpless hopelessness, and a adult woman's voice trying to urge her to action and scold her.

In 1999 with the support of a family physician I began to learn more about the effects of incest and to come to terms with my brothers. In the course of reading I learned a great deal more about depression and with my physician's support designed a prevention program. I also for the first time came across the psychiatric definitions of dissociation and the various dissociative disorders. Among them I had the symptoms of dissociative amnesia (as I described above), dissociative fugues (short ones lasting one to two hours that have occurred at times of very intense stress; perhaps a total of eight to ten such episodes over the thirty years, the most recent in 1987), depersonalized experiences, mostly of intense natural beauty, and small time gaps (1-3 hours at a time where I could not remember what I had been doing). When I read the criteria for DID my reaction was, "That's odd! That could fit me - but I'm not messed up like the people who have that." I did not give serious thought to my having DID again.

This spring my physician asked me to undergo an evaluation by someone experienced in treating people with abuse so that if I have another episode of

depression he would have recommendations on how to treat it, given my history. In the course of the initial meetings with the therapist, as I heard my self telling her these things and others, like not remembering writing my own articles (!), the possibility of DID re-emerged. With her support my therapy since then has used this model as an important component, namely my focussing on self-awareness, self-acceptance and self-regulation. Another part of it was consciously using the first person pronoun when I thought about myself, as I had become aware that I thought of myself as "you" or even "they" at particularly distressing times. Early on, I experienced what seemed to me like the integration of several child parts. After this, several things changed at once; a long standing knot of anxiety dissipated, a buzzing noise in the back of my thoughts stopped (I had not been aware of it until it stopped), difficulty orienting to the day of the week on waking stopped, my memory for daily life events improved, and the short time gaps diminished and now are gone. Daily activities became simpler and easier to do. There were no more episodes of "voices in my head." Several subsequent "integrations" or whatever you choose to think of them have also been followed by less distress and better function.

Please note several things: I have never been hypnotized. I have had continuous memory for the abuse. I had never read nor seen Sybil, the Three Faces of Eve, or any other MPD stories. I had no interest in the "recovered memory" movement of the eighties because my memory was continuous; I would rather have forgotten than remembered. I cannot see in my past any secondary gain whatsoever from what I interpret as DID. Several previous rounds with therapists did not relieve the symptoms or the distress, although they helped in most cases with other presenting problems. My therapist did not suggest the diagnosis; it was a matter of my recognizing in my own experiences the criteria of the DSM diagnosis. Nor was there ever any attempt to elicit from me any of the symptoms.

It is clear that there has been an overuse of DID and that it has been casually applied by people who have very little training or critical capacity. I don't know exactly what to make of the satanic ritual abuse stuff; it could be paranoid schizophrenia, BPD (as you suggest for DID) or some sort of folie a deux between the patient and the therapists, a mass hysteria like the Dutch tulip craze of the seventeenth century. There is in any case no objective evidence for any of it, as far as I am aware.

However, severe childhood sexual abuse (severe meaning involving intercourse or other penetration) is common; 5-8% of women have experienced it, based on several reputable, population based studies, most recently one in the current issue of Archives of General Psychiatry. Given its prevalence, I find wholly believable the population studies in several countries that suggest a prevalence of DID in the range of 0.5 - 1%, with the understanding that many of these people would be like myself: functional in many ways but in great interior distress. Just as for every person with depression that needs hospitalization there are five to ten in the community, more functional but still in significant distress, I believe that there are a similar proportion of people like myself who

have struggled with this problem and managed to cope in the community.

It is good that bad therapeutic practices, ones likely to lead to confabulated or false memories, are brought to light and seen as unwise or damaging. It is tragic that blanket statements are leading to a second season of silence, one in which actual deep human suffering is being denied and forced into silence again. As a child I was told by my brother that no one would believe me; it took nearly forty years to find the interior strength to break fully free from that. Black and white treatments of this troubled question, ones that deny even the possibility of DID as a spontaneous, interior reaction to horrific childhood experiences, threaten to silence millions of others. Please reconsider your page and revise it; I would be happy to provide citations from mainstream psychiatrists such as Richard Kluft, whose work with DID predates the fad and involves none of the marginal ideology of the people you cite.

Name Withheld

reply with responses in italics from the letter writer:

You don't say specifically what it is about my position that you think I should reconsider, so I will have to guess here at what you are objecting to.

You seem to think that I think that the self is *nothing but* a social construct. That is not my position. I believe the self is in large part a social construct, but has a biological basis as well. Oliver Sacks and other neurologists have written about some interesting cases of brain damaged people who lose their sense of self. Part of the self is obviously connected to memory and if memories are lost, so is an essential element of one's self. Part of the self connects consciousness with one's body. That sense of connection has a neurological basis. Part of the self is obviously a developmental response to one's personal experiences. And part of the self is a matter of role-playing and social expectations.

What Spanos argued for, and the position I agree with, is the notion that multiple personality disorder as classically described is unlikely to be correct. That most cases of MPD are therapist induced.

This is exactly what I am disagreeing with; that there is no...socially constructed MPD.

reply: I'm afraid the evidence is against you here. Even [Dr. Bennett Braun](#), the founder of the International Society for the Study of Multiple Personality Disorder, now known as The International Society for the Study of Dissociation, has been found guilty of inducing MPD in a patient. There are other cases as well; to find them just look through the lists of further readings in my entries on [MPD](#), [false memory](#), and [repressed memory therapy](#).

Your case history does not seem to be a counter-example at all, but rather

a supporting example. The classical model assume that MPD begins with sexual abuse of a child which is repressed. You note that the memory of your abuse has been continuous, not repressed. The classical model of MPD claims that the child creates alters to aid in the repression.

I'm not sure what you call "classic," but DSM IV does not require amnesia for the abuse as one of the diagnostic criteria. Follow-up studies of documented abuse found that over a third of those abused did not remember it; another third had had intermittent memories for it. Many of those treated for DID have continuous memories for the abuse in at least some aspects.

reply: The DSM-IV has removed "multiple personality disorder" altogether, but [some influential therapists](#) are still adhering to the description in DSM-III and do not agree with the American Psychiatric Association's that "dissociative identity disorder" covers all the bases. I believe you are correct about the DSM-IV diagnostic criteria, but therapists are not required to use those criteria and many do not.

What I did not elaborate on in my first note (as I had no idea whether you would read it seriously) is that key elements of the abuse memory were inaccessible until this spring; the part of the memory that I was finally able to recover was that I had enjoyed the experience (no physical violence had been used) and that that was the part of me that remained hidden or inaccessible, a child-like part that felt deep shame and guilt because of willingly participating. My "rational" self has known since fourteen that I was not guilty of anything; this hidden self still felt responsible, until I had access to this and could address it.

Here is an analogy, or a small example, of how I believe these things work. I am certain you have had this experience - you are trying to remember a name or a word and it escapes you for the moment. Hours, even days later, the sought for word forces itself into your awareness. It is as if we have small mental file clerks that can accept an assignment and circulate in our brains until that assignment is complete. I believe that this is an analogy, or even an example of, how dissociated parts operate, encapsulating a limited range of thought, feeling and action that are only expressed in limited contexts and that operate outside the domain of active awareness.

The kind of amnesia you refer to is common to many of us who have never been abused. I, too, have amnesia for most of my childhood, adolescence and a great part of adulthood. Compared to my wife of 32 years, who remembers vast amounts of details about our children and ourselves, I might as well not have experience 90% of those years, for I can't recall most of what happened during that time. I can't remember writing some of the entries in the *Skeptic's Dictionary*. Sometimes I can remember having written the entry but reading it after a few years is like seeing something for the first time. The kind of amnesia of the classical MPD patient is

amnesia regarding the abuse or behavior engaged in which is abusive itself, such as raping women by night while practicing dentistry and attending PTA meetings by day, or murdering women while "Steve" and being a nice guy while "Ken."

Again, "classical" by what standards? I am not trying to defend every form of therapy for DID; I know that people like Braun or Allison have some strange ideas. But you don't seem to have read anything by Kluft, a thoughtful mainstream psychiatrist with none of their baggage. And I didn't tell you everything about my amnesia, either - would you, to a complete stranger? Do you routinely have several hours pass where as soon as they are gone, you have no idea of what happened? I did for a long time; that is quite different than a bad memory for children's birthday parties.

reply: Yes, the kind of amnesia you describe is not common and is symptomatic of a disorder of some kind. At the risk of sounding insensitive, however, I must ask how anyone could know that these fugue states are causally connected to the abuse you suffered?

Classical MPD posits alters that are mostly impenetrable and isolated. Feeling detached from oneself while depressed is quite different and, I suspect, quite common.

Actually, no; I learned a great deal about depression when I was designing a prevention plan with the help of my physician. The significant aspects of depression are affective (feeling sad, hopeless, helpless, bad), behavioral (inactive or agitated) and physiological (changes in sleep, eating, weight). "Feeling detached from oneself" or anything like that has never been listed as a common aspect of it, and believe me I have read a lot of it.

I have never been diagnosed with clinical depression but like many people I go through periods where I am pretty much indifferent to almost everything. I, too, feel detached from myself and feel like the "real" me will return soon. I don't doubt that seriously depressed people experience a much deeper dissociation that I do, but positing "alters" to explain these feelings is a bit much.

No, "hearing voices in the head" has a fairly short differential diagnosis. Besides DID, the list includes schizophrenia (doubtful that I would have become a full professor if I had that), psychotic depression (a form so severe that it usually requires hospitalization or ECT) and schizoaffective disorder (which mixes both). Frankly, I find it hopeful to have DID by comparison; people don't get better from schizophrenia.

reply: There is a professor at UC Davis who has schizophrenia. It is true that the disease does not go away but it is treatable and some people are able to function at very high levels despite the disorder. Because of the

stigma associated with mental severe mental illness, those who are "survivors" and functioning at a high level usually do not choose to come out of the closet.

There is, by the way, a school of psychotherapy that posits that all people have parts, and that difficulties come from not having full and ready access to those parts or conflict between them - two schools, actually. The more recent American one is called internal family systems therapy and an older Italian one is called psychosynthesis. On these two models, DID is just an extreme form of a kind of self-unawareness that can be a problem for many people.

It sounds like you have a reputable therapist who did not assume before you walked through the door that he or she knew the cause of your disorder. I agree that the charges against so many therapists putting false memories in their patients can have a deleterious effect on those who truly were abused and who truly do suffer some degree of dissociation. But I believe the fault is not with those of us who expose bad therapies, but with those who practice those therapies, regardless of their intentions.

It sounds like you have a reputable therapist who did not assume before you walked through the door that he or she knew either that you had a disorder or the cause of your disorder. I agree that the charges against so many therapists putting false memories in their patients can have a deleterious effect on those who truly were abused and who truly do suffer some depression and some degree of dissociation. But I believe the fault is not with those of us who expose bad therapies and therapists, but with those who practice those therapies, regardless of their intentions.

I hope that my writing will steer people away from the charlatans and towards responsible therapists.

But then I wish you would also call attention to responsible therapists who treat DID! People with recurrent depression and DID classically have the depression recur until the DID is treated. I worked with several good therapists on various problems over the years; they helped (some) with the specific problems, but NOTHING like the relief and improvement in function that I have experienced with therapy specifically directed toward DID by someone experienced with it. I find quite believable the population surveys that suggest an incidence of DID in the range of 0.5 - 1%, if that is taken to mean people like myself, and they will not get relief from drugs or from non-specific therapies. The excessive scepticism, that claims that there is no spontaneous DID and that the iatrogenic form can be "cured" by ignoring people, will only make it that much harder for these people to find true and last help. You may well damage more people than you help if you solely focus on the bad therapists and deny the existence of responsible ones.

reply: I don't deny the existence of responsible therapists. If my writing

steers just one budding therapist away from doing bad therapy and harming who knows how many patients, I will consider it worthwhile.

16 Sep 2000

I happened upon your website by accident and I can't bear to leave without telling you that MPD (now called DID) does exist. I know, I have lived it and, to some degree, I will continue to live with it for the rest of my life. No therapist prompted me, no one "suggested" anything to me.

You speak of something you know nothing about and with such arrogance. What do YOU think happens to children who are horribly abused? To be sure, some die of the trauma, others become mentally ill, others become sociopaths and SOME, under the right conditions, learn to "go to sleep" by burying the horror deep within the psyche. A substitute for the "sleeping" part is invented, and so the house of cards is built, part by part. The concept is at once simple and extremely complex.

reply: Are you claiming that you have discovered this on your own, without having read any of the literature on this subject, or having seen any of the films depicting people with multiple personalities?

With the eerie connotation of MPD, I can understand that some minds cannot grasp what they cannot see - cannot get past the "Sybilization" of it. If man's landing on the moon had not appeared on television, I'm certain those with the inability for abstract thought would categorize the achievement as a hoax. DID (I like this term because it is less scary to childlike minds) is primarily a terribly painful healing process. Reliving catastrophic stress at the child level is the heart of it. It is a coping mechanism that will allow the child to appear to be normal.

reply: Again I ask: are you claiming nobody suggested any of these notions to you? You came up with them all on your own?

I graduated from college, trained customers for IBM, sold [Premarin](#) to doctors, taught at the community college level (after attaining a M.A.) and sold packaging products very successfully before the "house of cards" fell to pieces. I had no therapist who counted personalities. I was always co-conscious. No part appeared terribly different from another. There were no monsters or Mr. Hydes. Mostly, it has been just PAIN. Walk a mile in my shoes.

Mary Lu

reply: I think you have misunderstood what I have written. Suggestion can be subtle. It can occur without our even being aware of it. From your description of the causes and mechanism of your illness, it appears very obvious that the diagnosis and explanation of your illness have been

suggested to you. This in no way implies a denial of your pain and suffering.

Mary Lu replies

17 Sep 2000

Making assumptions based on insufficient knowledge indicates, to me, poor reasoning ability. For the sake of brevity, I left out several hundred pages of evidence that would demonstrate that I realized there was more than one of me long before any therapist. I did not even know that it had a name, I just knew something had gone terribly wrong with me. I hope for the sake of mankind that you are not a researcher. I don't need to debate with you what I know I have suffered through for so many years -- no one can "suggest" the kind of psychological pain that is the major part of healing. You know naught of what you speak.

reply: You seem to think that I have diagnosed you incorrectly or have denied the existence of dissociation, neither of which is true. I've never diagnosed you, but I have presented a case for the position that the self, however it is construed, is a *social* construct. This is not to deny that biology or personal experience do not affect the self in profound ways. It is, however, my opinion that the arrogant ones are those therapists who *assume before even meeting their patients* that their patients have been sexually abused as children, have repressed all memories of the abuse, and that the job of therapy is to help the patient recover those memories before there is any hope of recovery.

There is ample evidence that therapists can and have suggested things to their patients which have caused the patients great psychological harm. See my entries on [false memory](#), [repressed memory therapy](#) and [satanic ritual abuse](#) for examples. Read the news story on the MPD page about what Dr. Bennett Braun did to Patricia Burgus.

*To the argument that some therapists never see MPD, I must tell you this brief story: Believing that if I could just find another antidepressant that would work safely with Parnate my world would return to normal, I consulted Dr. Uran, on the faculty at Oregon Health Sciences University. He did come up with the sought after antidepressant (although it made no difference). I saw him twice. The second time he said, "I didn't recognize you. You don't seem like the same person; in fact, you don't even look like the same person." My mind was saying "He thinks I'm the same one!" Later I learned that Dr. Uran and his colleagues on the hill deny the existence of MPD. If asked, I'm sure he would deny ever having seen a case of MPD and, he's right, he **COULD NOT SEE IT**.*

I suspect that further communication is pointless. My experience has been that people who carve their beliefs in granite have a severe deficit in analytical ability.

reply: I agree. Of course it is impossible for someone to give a diagnosis of a disorder he or she does not believe exists. In itself, however, that fact is irrelevant to who is right about MPD.

Your comments have made me realize that my writing was not clear enough. I don't think Spanos' arguments imply that MPD does not exist, but that the explanation of its origin, and by consequence the appropriate treatment for it, are not justified. I have rewritten large parts of the MPD entry to try to clarify my position and what I think is Spanos' position.

I have also introduced some new views. Dr. Hughes thinks MPD does not exist. Dr. Allison thinks it does and that spirits and angels are involved in the process. Dr. Coons buys into the standard MPD paradigm (Sybil) hook line and sinker, adding that demonic possession was a forerunner of MPD.

The fact that the Sybil case is the paradigm and forerunner of modern MPD cases, and that the Sybil case seems most likely to have been contrived, strongly suggests that Dr. Coons is not on the right side of this argument. The fact that there are no cases to speak of involving adults who suffer tremendous torture, trauma, abuse, etc., who defend themselves by creating "alters" strongly suggests that this explanation is bogus. Adults who are kidnapped and made into sex slaves, prisoners of war, etc., have as much desire to survive as children do. If the dissociation tactic is open to children it ought to be open to adults, yet it does not seem to be one they take. Furthermore, all the research that has been done on trauma demonstrates that the more traumatic an experience the more likely one is to remember it, which contradicts the repression theory. This does not mean that no child has ever been abused or repressed the memory of it or that DID is not sometimes brought about by sexual abuse. But the evidence does strongly suggest that as a model of DID, the Sybil model is a profile likely to cause more harm than good.

Mary Lu replies and bids us adios!

23 Sep 2000

In college the dept. chair was also my advisor. I took many classes from him. He was probably one of the worst teachers I've ever had, yet he was supposedly teaching us how to teach. He spent most of our valuable class time talking about the different points of view presented by his peers in the various business journals. Their "research" was so far removed from the real world that his ravings or rebuttals meant nothing to us and contributed nothing to our ability to leave that institution of higher learning and know what on earth to do in a classroom. Frankly, mostly I learned from my cooperating teacher and from good old OJT.

If you wonder why I told you that "parable", then just let it pass you by.

I could not find the first article you mentioned in your reply regarding false memories. I can only guess at what you said. If in it you suggested that some memories are false, you are partially right. Our subconscious (at least mine) doesn't seem to speak English especially well. However, I've noticed that it speaks symbolically. Any therapist who takes every detail of a memory literally is either inexperienced or not really up to the task of working with whatever name you want to put on it (MPD, Repressed Memory, DID, etc.) I get from you that everything must have an "either-or" to it. Be good or bad, black or white - that everything must be clearly defined. Frankly, I think most behavior, traced back to its roots, is a mish-mash and mostly in gray tones. Actually, I think any therapist who actually believes he/she can determine the total truth of a reported memory is a fool. The human mind is far too complicated. Furthermore, a "memory" might be a "feeling" which has worked its way into consciousness only after exhausting the conscious mind and the body through lack of sleep and extreme stress. The best word for this process is "AGONY." This kind of "memory" cannot be "planted" by a therapist. And this kind of "memory" is very real. There is no mistaking terror. The word should be in huge letters with every horrifying adjective imaginable preceding it.

Have you considered the possibility that one person might fall into all categories. In the very beginning of my nightmare, there were several very different whole personalities. No, they did not have names. I finally put names on them simply for reference sake. Mostly I named them for their most outstanding characteristic. There was teacher, mother, little girl, center and the severely handicapped Mary Lu (the core and the most debilitated). Eventually, they merged and when it happened. I had to hold on to the kitchen counter because my body shook. It was, in fact, a huge internal earthquake. That was a major turning point. There were a few others, one who only came out in sexual situations, one for rage, etc.

Oddly enough, the most painful part of the process is when the "feeling" memories finally make their way out. In every instance, so far, the feelings match up with actual memories I've always had of my childhood - I simply buried the feelings because, I suppose they were too painful to feel at the time. So far, you can say that I had MPD, DID and repressed memories. The main exception to this is the neglect as a baby and as a toddler. Those "event" memories came from "pictures" that kept popping into my mind, but it was my body's actions that finally made me understand what the pictures meant.. Too long and involved to explain here.

I did read the Coons article and I don't remember any statements about demonic possession being a forerunner of MPD. If I had the time and energy, I would explain to you how I believe people will often talk of Satan and God and battles between the two, but frankly, I think you would misinterpret what I was saying. Besides, it is too complex and I am not inclined to put forth the effort.

I agree that MPD has been "Sybilized" - but it was the mental health community

that stuck the name on it. A doctor whom I trust and is well experienced told me that the vast majority of MPD cases are actually co-conscious (as was I). Maybe now by calling cases like mine DID, they can get around to the business of actually helping instead of worrying endlessly over labels. Actually, none of my therapists have ever labeled my condition. They didn't need to.

Finally, I want to ask. Who are you? What kind of training did you have in mental health? I ask this because I find it hard to believe that anyone, even a lay person who has read at least a few "self-help" books would know that children are not simply little adults. You said:

The fact that there are no cases to speak of involving adults who suffer tremendous torture, trauma, abuse, etc., who defend themselves by creating "alters" strongly suggests that this explanation is bogus. Adults who are kidnapped and made into sex slaves, prisoners of war, etc., have as much desire to survive as children do. If the dissociation tactic is open to children it ought to be open to adults, yet it does not seem to be one they take. Furthermore, all the research that has been done on trauma demonstrates that the more traumatic an experience the more likely one is to remember it, which contradicts the repression theory.

I would hope that any training in psychology would include some amount of information on child development. Very small children have capabilities they lose as they grow older. Surely there is ample evidence of the remarkable ability of small children to become bilingual very quickly. Conversely, small children would not have the coping ability of adults, or the sense of time or place. To a very small child, mother is the world. To an adult, the world is the world. To an adult, solitary confinement might be survivable by any number of coping mechanisms. How does, for example, a toddler survive day after day of solitary confinement? Maybe, just maybe, they simply escape the horror of it by simply "going to sleep" - in other words, burying the pain (and part of themselves) very deeply in their subconscious. When mother does retrieve the child, the original baby is deeply buried in "sleep". Mother doesn't notice because a "new" baby, nearly identical in personality is there to greet her. Using this method, the child can survive and appear to be perfectly normal. My understanding is that no one really knows why some children are capable of doing this "splitting off" and others are not. Some say intelligence and creativity are the critical factors. Also, it seems the child loses this ability after the approximate age of seven.

When those feelings, apparently secreted in one area of my psyche, finally merged into what is "me", I screamed and begged for mercy. I called my doctors repeatedly screaming for help. Eventually, I came to realize no one could help because it was inside my head. The choice for me was to develop a coping mechanism or commit suicide. I don't remember making a conscious choice or deciding on what to do. I just did what my mind and body led me to

do. I drove to a mall parking lot (seeing people even at a distance) at least kept reminding my thinking brain that this was reality. I held tightly to the steering wheel to feel grounded, and let the unimaginable fear consume me again and again and again until, after truly torturous hours, my mind began to build an immunity from the onslaught. Even now, four years later, any slight sense of abandonment will jangle that fear again although the pain is far less intense and is short-lived.

I don't know why I am bothering to tell this to you, some faceless person whose credentials may be questionable and whose mind appears to be set on fine lines rather than the broad picture. Why do you write what you do? What motivates you? Have you any training in the mental health field or are you a "wannabe". Maybe your heart went out to some controlling bastard who managed to convince you that his daughter's insistence of incest was "planted" by some stupid psychologist. I won't disagree there are good and bad in every profession. I am sure there are some therapists who began to see sexual abuse in every client. I am just as sure there are parents who will go to any extreme to cover the horror of their actions. By the way, who invented the term "false memories?"

Adios Amigo

reply: Adios. No mas, no mas!

24 Dec 1999

I just finished reading your entry on MPD, and I couldn't agree more. I am a master's level social worker, and my graduate training took place on an inpatient psychiatric unit. During my internship, I was fortunate enough to actually see a case of dissociative identity disorder.

The patient was a young woman who claimed to have about five different personalities. At first, the staff at the hospital took her claim at face value. Then we began to notice a pattern in her behavior: whenever she wasn't the center of attention, she suddenly switched personalities. During one of her supposed personality changes, she threw herself on the floor and began to have a temper tantrum like a five year old child. My supervisor instructed the staff to ignore her instead of fawning over her, and the result was quite interesting. She suddenly stood up and screamed, "You people don't know a damn thing about multiples!!!" She then stormed out of the room. She didn't switch personalities again for the remainder of her stay in the hospital.

It is my opinion that most patients who present with "MPD" should really receive a DSM-IV Axis II diagnosis of borderline personality disorder. People with BPD are notorious for trying to hook their therapists into a long, drawn out "therapeutic" relationship for the sole purpose of gaining attention. They

will give the therapist exactly what s/he wants if they think it will prolong the therapeutic relationship.

Thanks for your informative web site. I would like to discuss other pseudoscientific "diagnoses" that abound in the mental health field. If you are interested, please feel to e-mail me. Also, please do not include my name if you choose to post this letter under the "readers' comments" section. I don't want to inadvertently violate patient confidentiality.

25 May 1999

I have a very close friend who has a multiple personality disorder. Through her I have started to see this disorder a lot more frequently.

I have seen quite a bit of evidence that counters your (admittedly on the surface convincing) argument that multiple personalities are always constructed by psychotherapists.

reply: I don't claim that all cases of dissociation are caused by therapists. I claim that "multiple personality disorder" has been largely created by therapists, books, movies, etc.

For one, after knowing her for about ten months, one of my friends revealed other personalities to her lover. She has never been in psychotherapy and now, two years later, she has got to the point where her alters are somewhat spontaneously re-merging into a whole. Still without ever seeing a psychiatrist.

She did not remember the abuse but the other personalities told her lover about the abuse. There was no hypnosis, no coercion, she merely finally trusted someone enough to tell them of this. Now that I am friends with the two of them they are sharing with me the process as she reintegrates. It is very touching.

People with multiple personalities aren't insane. They are quite functional and often never go to a psychologist at all. They hide their switches as best they can. I have another friend who has multiple personalities and still denies it. I have spoken to two of them and they deny they are her but I know they are her from other evidence.

reply: You spoke to two of your friend's personalities, each of whom denied identity with your friend, but you know these personalities are her "from other evidence"? Why would you need other evidence? Can't you tell by looking at the person who it is?

Also, 'insane' is not a useful word. Being "functional" is not a sufficient condition for not being "mentally ill," i.e., having a brain or biochemical disorder that affects thoughts, feelings, and behavior.

There is a circular illogic in your theory and it is this: you don't accept evidence except from scientific sources such as a psychiatric diagnosis; yet you then say that all cases are caused by psychiatric "iatrogenic" type function.

reply: I will accept evidence from any source. I've already clarified my position on the role of therapists in the diagnosis of MPD.

*There is a reason some therapists see tons of MPD and others see none: the ones who see none don't believe in it. How many cases of a disease you don't believe exists will you see? *grin**

reply: Yes, that much is obvious.

I do believe that it is possible to induce MPD through hypnosis. Also to insert memories artificially. For this reason you are right about the cases you cite more than likely. That doesn't preclude the existence of real cases however. In fact, the fact it can be induced means it probably occurs naturally as well.

reply: What is the evidence that hypnosis alone has ever induced a single case of MPD? The process of suggesting memories is altogether different. As for the relationship between being induced and occurring naturally, I would say that at least something like MPD occurs naturally, and that it is not a mental disorder requiring psychiatric treatment. Some day we will learn to think of psychiatric disorders as matters of degree.

Your friend's developing symptoms of MPD without seeing a therapist is not unusual. After the movie *Sybil* was aired there was a dramatic increase in MPD cases. This wasn't because therapists saw the movie, read the book, etc., and then started seeing MPD in every patient. No, the patients assimilated the symptoms. I wonder if your friend took a psychology class where MPD was discussed, read a book or saw a film on MPD, and then started to show her symptoms. Maybe she has been playing a role. No doubt it got her lots of attention, and perhaps that is what she craved. Maybe she is tiring of the role she's been playing. Who knows? But you misread the entry on MPD if you think I claim that every case of MPD has been induced by therapists.

I sincerely hope my friend was not a case of induced. However I don't know any way to tell. She is who she is now and I deal with that as best I can. No matter who inflicted the trauma though, it is just as real.

Dana Anthony

reply: You are right, even if the trauma is self-inflicted and delusional.

reader comments:

Myers-Briggs Type Indicator®

note: I'm not accepting any more comments on the MBTI®. The comments below and on the other two pages linked to this page were made before major revisions of the entry in January 2001. Nevertheless, I'm still not accepting any more comments on this or any other kind of personality typology instrument.

07 Nov 2000

(The program described below seems worthy of MBTI®)

The lack of any critical examination of the program is interesting.

The Wall Street Journal Workers Wear Feelings On Their Hard Hats And Show True Colors --- On Oil Rigs and Assembly Lines, Sensitivity Training Pays Off; Blue-Yellow Meets Red-Green By Chip Cummins

11/07/2000 The Wall Street Journal Page A1 (Copyright (c) 2000, Dow Jones & Company, Inc.) NEW ORLEANS -- Jimmy Nobles has worked on offshore oil rigs for 25 years and still vividly remembers how cramped living conditions and tyrannical bosses used to fray nerves. The result: shouting matches and even the occasional fight.

Not anymore, at least on Transocean Sedco Forex rigs, says Mr. Nobles, a burly 50-year-old dressed in blue company coveralls at a Transocean training session here. "It's a different deal," he says, spitting tobacco juice into an empty Coke can. "We care about other people's feelings."

Indeed, roustabouts, never known for wearing their emotions on their sleeves, are being asked to wear them on stickers on their hard hats. The stickers have the words, "START TO UNDERSTAND ME," and next to that, two colored dots, which are supposed to tell co-workers about the personality under the hat.

For instance, "yellows and blues are touchy. They like to touch and hug, no problem. Greens don't like that," explains Mr. Nobles, who now teaches "well-control" classes at a company technical school. He's a combination red-yellow and says it fits. "Reds are driven," but his yellow side shows up in his fondness for people, he explains, slapping a visitor on the back.

Businesses have long used sensitivity training and popular psychology to help employees and managers work together. With the help of a Minneapolis

company called Inscape Publishing, some are taking the effort to a new level, labeling workers with colors or letters in the name of team-building and getting along.

Assembly-line workers in Kentucky, police officers in Kansas, electricians in Texas and construction crews in Florida have all been assigned letters as a way to assess their styles and their colleagues' behavior. Carpenters and plumbers in New York City use the same system. Inscape, a closely held company, sells the training as \$15 "personal profile" tests through about 5,000 distributors. The program draws on work published by Harvard-trained psychologist William Moulton Marston. His 1928 tome, "Emotions of Normal People," begins: "Are you a `normal person?' Probably, for the most part, you are. Doubtless, however, you have occasional misgivings." Dr. Marston is better known in psychology circles, however, for his unscrupulous promotion of an early lie detector during the Lindbergh kidnapping trial. He and his machine appeared in magazine ads for razors, and he advocated the use of lie detectors in marriage counseling. Later in life, he created the comic-book heroine Wonder Woman.

Based on 28 multiple-choice questions, a person going through Inscape's "DISC" training is assigned a letter -- D for dominance, I for influence, S for steadiness or C for conscientiousness -- that best describes his personality.

Tommy Curtiss, a project manager at S&J Electric in Fort Worth, Texas, says he is a hard-charging D, something akin to a Transocean red. After going through training with his workers, he says, he now understands that a co-worker who is a C (the green sticker on Transocean rigs) needs clear organization. "I can see how his little world is set up," says Mr. Curtiss, amid a tangle of electric cable and cement molds. S&J workers don't wear their letters after their training, but groups are small, and everybody seems to remember who's what.

Gordon Culley, a carpenter-on-call for Installinc, a New York City online service that sends tradesmen out on jobs, is a C. He says the most useful part of the training wasn't understanding himself, but figuring out how to treat everyone else. If he comes across a customer who's a talkative I, for instance, "I will explain the world."

Transocean, the offshore driller, has taken the training a step further, using colors instead of letters. It says it started the training a few years ago to help middle managers communicate better. Now it's standard for the company's 8,300 workers world-wide. The company says it helps people get along better, especially in the stressful and sometimes-dangerous environment of an offshore oil rig. It's also providing a little glue to a company still figuring out how to integrate corporate cultures after a string of acquisitions, says Lewis Senior, Transocean's manager for health, safety and the environment. "We're trying to get into people's minds and hearts," he says. Mr. Senior's booming voice still

carries the lilt of his native Yorkshire, England, despite 27 years on offshore rigs. He helped design Transocean's colors training, borrowing liberally from DISC, popular psychology and business self-help books. In the no-frills conference room of a New Orleans Best Western hotel, he addresses a class of 45: "Every single thing you do is a reflection of your colors."

To start off the day's session, he asks the group to draw a few pictures, including the sun, a snake and a house. "The more windows you have, the more open you are," Mr. Senior tells the group after they've put down their pencils. Then, another test. Presented with 28 sets of four words, each worker picks a word that describes him best and a word that describes him least. A typical set: fussy, obedient, firm, playful. The test takers are told how to score themselves and come up with their two colors. Rig workers wear their dots on their hats, while landlubbers post theirs outside their office doors.

While no one is forced to display his colors, Mr. Senior contends that "people who don't buy into it" walk away. Some question whether the program is an intrusion. Says Tim Callais, a Transocean adviser for operational safety: "They're probably blue people." "Behavioral Styles" charts are posted on the gray bulkheads of many of Transocean's rigs, explaining that people with blue in them dislike change and can be a little wishy-washy. Yellows are emotional and talkative. Greens are cautious and serious, while reds tend to be strong-willed and decisive. Thom Keeton, a red-green rig manager, keeps a color chart under the glass covering his desk for quick reference. If a crew member was "a blue-yellow, he wouldn't come to the point," the 46-year-old Alabama native says. "He'd say, 'Hey, have you been fishing? Oh, by the way, No. 6 engine has just slung a rod.'"

Tom Watkins, a tool pusher and a senior hand on the Discoverer Spirit, Transocean's latest drill ship, is also a red-green. Blunt and to the point, he doesn't like to talk much. "No granola here," he says, hurrying back to finish supervising a job. On the Spirit's mess decks, 27-year-old David Gray, a blue-yellow, chats more freely. He's a little more laid-back, he says, but he can deal with those high-strung red-greens now that he has figured out that he just has to get to the point more quickly. J. Michael Talbert, the company's chief executive officer, declines to divulge his own colors, saying that as CEO he has to be a bit of a chameleon. "I can be whatever color I want to be," he says. Not so, says Mr. Senior, the Transocean instructor, who confides, "He's actually a green-blue." That might describe a guy who is organized and reserved, according to Transocean's color charts.

After announcing Transocean's latest merger a few months ago, Mr. Talbert has been acting more like one of those competitive reds, Mr. Senior explains. But, he adds, "Once the merger stuff settles down, he'll go back to green and blue."

Gerald Trigo

22 Feb 2000

Skipping the typical compliments on your great site and getting right to the point, I have a few things to say regarding your entry on Myers-Briggs™.

Suppose I designed a simple, single-question test in which I asked people whether they preferred apples or oranges, then categorized people according to their answer as "apple-preferring" types or "orange-preferring" types. You could argue that these categorizations are worthless, and that they could be used to unfairly discriminate against those whose type differed from that of (say) their manager, and that they might discourage people from expanding their gastronomic repertoire, and that they don't account for people who dislike, are allergic to, or have not tried both fruits, and that they don't account for the fact that some people's preference changes with their mood, and that some people might like both fruits equally well. But to say that the categorizations are universally false because many apple-preferring types also enjoy oranges (and vice-versa) would be to so misconstrue the categorizations that it looks like bias. If your purpose is to discredit the test in an effort to reduce discrimination and encourage greater dietary variety, insisting that the types as defined by the test do not exist at all detracts, however slightly, from your otherwise substantial credibility.

In the same vein as my simple fruit test, Myers-Briggs™ simply asks about preferences and then tells people what their preferences are. Whatever its merits, worthlessness, or dangers, accusing the Myer's-Briggs™ categories of being as random as (say) your comparison to astrology is absurd.

My experience with Myers-Briggs™ is limited to a book I read many years ago called "Please Understand Me", and so I may have an incorrect understanding of it in many ways, and as that book had no particular emphasis that I recall on career choices or job performance I may have been naive about its Orwellian implications. But constrained as I am by my relative ignorance (insert one of your snide remarks here), I have some points to make:

>> MBTI™ assumes that each of us is fundamentally and profoundly oriented towards the inner world or the outer world. <<

No it doesn't. It places each of us on a continuum. Some of us at one extreme end are profoundly oriented toward the inner world; others at the other extreme end are profoundly oriented toward the outer world. Others fall at various points in-between; some right in the middle. Perhaps it's a bell curve, so the number of people at the extreme ends would be few compared to the number of people toward the middle. The number of possible in-between points depends only on the number of questions asked; with a sufficient number of questions, we might find as many in-between points as there are people who take the test. Those who fall approximately in the middle cannot be said to be "fundamentally and profoundly" oriented toward either the inner world or the outer world. That

said, I have no doubt that there are individuals who oversimplify in this way, but to the extent that they do so, they misrepresent Myers-Briggs™.

*>> it assumes that only those who are not sticklers for following the evidence of the senses are imaginative enough to see beyond what is to what could be.
<<*

Nonsense, for two reasons:

1) It's a test of preferences, not abilities. A preference for the senses does not require an inability to use the imagination. And vice-versa. That said, a strong preference for one is likely to lead to more frequent and enthusiastic use of it, and that in turn is likely to lead to greater skill in that area.

2) Again, it places everyone on a continuum. Some people are at the extreme ends of the continuum, but others are at various places in-between.

>> there are those who go against the evidence of their senses not because they are imaginative or creative, but because they are stupid or demented. <<

The absence of stupidity/intelligence and demented/sane axes is not in itself evidence against the validity of the axes for which it does test -- only a reminder of their limitation.

*>> However, MBTI does not mean by "feeling" what the rest of us mean by it.
<<*

This gem comes after a long-winded diatribe about the inadequacy of the thinking/feeling axis, which is as much as to admit you merely set up a straw man to tear down. It seems your only real point here is that they should have used a different word than "feeling".

>> Reading these profiles is like reading something from Omar the astrologer Psychological tests such as the Myers-Briggs Type Indicator are little more than parlor games. They will be validated by their seemingly good fit with the data, in the same way that astrologers and biorhythmists find predictive patterns fitting their readings and charts, i.e., by confirmation bias and the ambiguity of basic terms. <<

Hardly anyone would fit one profile exactly; that would require being at one extreme end or the other of each of the four axes. Most people fall somewhere in-between on all of or most of the axes, thus will not be a perfect fit with any one profile. A person who was heavily weighted one way or the other on all four axes would likely fit one profile more than any of the others -- not because of any voodoo, but simply because the profile was a reflection of their answers on the test. Rather than pay a lot of attention to the 16 prefabricated profiles, what would be more useful for most people is to read about the 4 axes and

derive a custom profile based on how far from the middle they were on each axis.

>> even if it is true that there are 16 basic personality types, what good is this information? <<

Gaining insight into the range of how others think and what motivates them, which can lead to more harmonious interaction with others.

None of which is to say that Myers-Briggs™ is scientific or worthwhile. I thought it lent some useful insight into understanding how other people think, but I was a teenager at the time and perhaps I would have gained similar insight since then without the help of Myers-Briggs™. Also, though I have found it enjoyable and worthwhile to discuss with friends, that of course is just another testimonial, thus meaningless in this context.

I think one way that Myers-Briggs™ is often misused is that people who are not very far toward the extremes read themselves in the profiles as if they were at the extremes, cubby-holing themselves into one of the 16 types when in fact they are only an approximate fit for that type.

Oh -- almost forgot: I'm an INXJ. Now you have one more piece of useless information.

Greg Lovern

reply: I think you've provided us with more than one bit of useless information. I will only say that I have not denied nor do I intend to deny now that many people find the MB typology useful for understanding others. I have not denied nor do I intend to deny now that many people find the MB typology useful for understanding themselves. I also do not intend to alter anything I have written about Myers-Briggs™.

18 Feb 2000

I took the Myers-Briggs™ test several years ago, and my INTP type is something I'll always remember. It's been very useful in self-understanding. I often recall my perceiving nature because I take many things into account, but I have trouble making decisions. Much more so than most people.

The other letters were accurate, as well. It is nice to look at certain personal behavior and then look back and say, "Well, that's because I'm introverted," or "That's because I'm a strong thinker." Actually, I'm quite proud of my type; I'd rather be thinking than feeling, and I think that a perceiver (as I understand the word) makes a better freethinker than a judger.

The personality profiles are not like astrological readings because the former

are based on your actual personality data that you provide. I can see how you could think they are similar; after all, my personality profile isn't 100% accurate, and I see bits of myself in other profiles. But that's because nobody fits completely into one of the 16 boxes. But overall, it's accurate. One of your readers reproduced part of an INTP profile, and it was so me, especially the part about INTPs being dateless and not knowing how to flirt. I do enjoy parties, which INTPs are not supposed to do; however, I enjoy them for two reasons: 1)I've become more extroverted over the years, and 2)Most parties I go to are sponsored by my campus freethought group, so I'm with people like myself who enjoy intelligent talk and philosophical discussions.

I agree that using Myers-Briggs™ in hiring practices is a bad idea. However, it's useful for most people on a personal level. By just remembering my four letters, I always have a simple guide for understand aspects of my personality.

John Franson

30 Jul 1999

I believe your article on the Myers-Briggs™ theory was written in 1996, however I just read it today. I think it helped me more than all the reading I've done trying to identify my "type."

I realize you are busy, but I just wanted to say how frustrated I was trying to fit myself into one of the 16 boxes. I seem to fit well into three of them! This is about the third time I have gone through the rounds of taking the tests and reading all the material I could find. I suppose it has to do with the desire to find the "perfect" job that will make me happy forever.

I agree with you especially, that the factors are not mutually exclusive. I feel, for example, that I am very intuitive and "sensitive." However, I am also a great thinker and love to analyze things. (Hence obsessing about the test). I laughed when one person giving feedback to your article assumed you were "a picky eater who missed appointments..." etc.

Anyway, thanks for your article. I am a skeptic who can't accept my own skepticism.

Ronnie Ellen Levine

07 Jan 1999

I greatly appreciate your Skeptic's Dictionary site. Regarding MBTI®, I have to agree with your assessment and criticisms. I have taken the test in the past and tested out as an ISTJ. At the time, the description given to me seemed to hit the nail on the head - I read every line and said "That's me."

Of course now looking at that I see certain things that do not fit. For example, an ISTJ is supposed to be orderly and an organizer. One look at my apartment or my desk at work will exclude me. Although my car is immaculate. Maybe I'm an ISTJ only in my car? After reading the various comments from other readers, it sounds like I must be an INTP. To quote from the letters, "INTP people are often uncomfortable around large groups of people, don't understand or know how to flirt, and are often "dateless". They tend to have only a couple good friends. INTP's are not "party goers"." Of course, some INFP things fit as well, but I suppose one would argue they would be similar.

However, it is also stated by another proponent, "Introverts speak before they think while Extroverts need to speak their ideas and bounce them off others. In a class discussion setting, the Extrovert always has the advantage while the Introverts are unable to speak "quickly enough"." Well, by that definition, I'm the most Extroverted person you've ever met. Kinda throws a monkey wrench into that diagnosis, huh?

One comment did strike a chord. "[P]ersonally I found it a bit relieving to know that I am not quite as peculiar as I sometimes think (And trust me, if you are a very introverted NF (or NT), you will probably have spent a fair amount of your life as the weird one who doesn't quite fit in)." I can certainly agree that as one who always felt weird, there is comfort in being categorized, because it makes you feel more normal to think that you have a category. The fact that someone can explain you and group you with others means you are not so strange - and most people are comforted to find out they are "normal".

I appreciate the distinction that is made on the terms used for classification not corresponding to their common lay meanings. Reminds me of the definition of the word theory. But overall the positive influences of MBTI® seem to be outweighed by the negative outcomes. I agree with your comments about how using the types gets in the way of really learning what a person is like.

Keith Irish

22 Sep 1998

I was interested in your comments on the Myers-Briggs Type Indicator® analysis. The team in which I work recently went through a MBTI® session presumably as a team-building exercise. It was actually a lot of fun and confirmed some previously held beliefs about the way some team members think (though we were all pretty well acquainted beforehand).

Judging by the general hilarity of the participants, I don't think any of us took it too seriously. But it was presented by a "qualified" facilitator as a serious psychological tool, with many years of verification and recognition by the professional psychological fraternity (though no specific references to the verification were provided).

I had actually done the test (and other similar tests) many years before, and it yielded exactly the same result. I guess this is not surprising, since my prejudices and preferences would not have changed significantly. It was this consistency that was claimed as evidence of the test's validity.

While I have no vested interest or desire to defend or debunk the MBTI® process, I would like to look a little deeper into your comment "The Myers-Briggs Type Indicator begins with the assumption that there are four basic categories by which people should be classified."

My interpretation of the four by four matrix is not that it is an assumption about the basic construction of the population, but simply a reflection of the structure of the test. The process can only resolve the population into 16 categories because that's all it attempts to do. If it attempted any deeper analysis, it would get very complicated indeed.

It's a bit like those images on TV where the identity of a person is disguised by overlaying a coarse pixel image of their face. It's not an assumption of how a human face is constructed, it's just a bunch of coloured squares which represents the original image as best it can. For a recognisable image you need a finer grained picture, but that doesn't mean the coarse picture is "wrong", it simply doesn't provide enough data. I agree that as an employment selection tool, a Myers-Briggs Type® Classification is at best useless, and at worst open to prejudicial assessment.

I did however find it useful in gaining some insight into the preferences and practices of my workmates. We talked amicably about such things as what people find annoying, or what pleases them. This all helped us get to know each other a little better, and become a little more tolerant of each other's idiosyncrasies. As a structured forum for discussion, it was probably as good as any other device.

It seems that most people feel more comfortable when they can put themselves and other people into little labeled boxes. If the MBTI® process provides a relatively independent and non-threatening method of doing so, then perhaps it is better than leaving us all to our own haphazard judgements, prejudices and jealousies.

natural

10 Jan 1998

*I am really enjoying the **Skeptic's Refuge** and plan to spend a lot of time at this site. Cheers to you! I wonder if you are a scientific pantheist, as I am?*

reply: *From what I can tell about scientific naturalism from [Paul Harrison's](#) site, I would have to say that I do not have the emotional constitution to be a scientific pantheist.*

I just read the new entry entitled "natural," which I enjoyed. Just because something is natural doesn't mean it's good. Since you have given some thought to nature and what is natural, I wonder if you could help me get my mind out of this hamster wheel.

Beaver's are natural. Dams which beavers build are natural. Man is natural. Strip malls which men build are what? Natural or unnatural?

I don't believe strip malls are "natural" but I can't seem to clarify my admittedly muddy thinking on this. I thought maybe you could help.

Laura

reply: What you ask is the kind of question certain philosophers have been asking for eons. Remember Bishop Berkeley and the question as to whether a tree falling the forest makes a sound when no one is around? Or William James and the question as to whether people walking around a tree several times on which a squirrel was walking, passed the squirrel even though the squirrel always moved around the tree ahead of them? The answer to yours and these questions has the same form, namely: "It all depends on what you mean by *x*". If by 'natural' you mean *an object not designed but occurring as a result of instinct*, then the beaver dam is natural but the strip mall is not. If you mean by 'natural' you mean *present in nature*, then everything is natural, including the strip mall.

09 Jan 1998

Just a quick note about St. John's Wort. While hypericin is a MAOI, it is relatively mild and reversible, which means that the side effects (hypertensive crisis) possible from tyramine in older, irreversible MAOIs is not present. Also, as with other "herbal remedies", the action is supposed to come from

more than one active principle. Sometimes it works, sometimes it's placebo. In any case, St. John's Wort appears to be effective in mild depressions. Of course, placebos help 1/3 of severely depressed individuals too.

Kevin Smith

I don't know where you are getting your information about placebos and the severely depressed, but it does not jibe with any scientific study I am aware of. You may be thinking of studies which have shown that for certain kinds of physical complaints, placebos are effective more than 30% of the time. Severe depression is a *physical* illness, but it is not one of those for which placebos show any effectiveness at all. You might want to read some of the following:

- **["Erasing the Line Between Mental and Physical Ills,"](#) by Julie Marquis . *Los Angeles Times*, October 15, 1996**
- **[An Unquiet Mind, A Memoir of Moods and Madness.](#) Kay Redfield Jamison, PhD.**
- **[Questions & Answers About Depression and Its Treatment, A Consultation with a Leading Psychiatrist.](#) Ivan K. Goldberg, MD. Dr. Goldberg has his own WWW site called [Depression Central](#).**
- **[Overcoming Depression.](#) Demitri Papolos, MD, and Janice Papolos.**
- **[The Good News About Depression : Cures and Treatments in the New Age of Psychiatry](#) by Mark S. Gold.**

and

- **"Anatomy of Melancholy," by Andrew Solomon, *The New Yorker*, Jan. 12, 1998.**

Now, regarding St. John's Wort and its potency and side-effects: The point I wanted to make is that if St. John's Wort or any other "natural" product is good medicine, it is not because it is natural but because of its chemical constitution. St. John's Wort, like any medication, comes in different strengths which can be indefinitely increased simply by taking more of the substance. To assume that because something is natural, it will have only mild or no adverse side-effects, is wrong. Each particular substance and the quantity taken must be evaluated. Furthermore, there are some known [side-effects of hypericin](#) which you do not mention, for example, "photosensitivity characterized by dermatitis of the skin and inflammation of the mucous membranes on exposure to direct sunlight." This may not be a problem for most humans, if they do not take an

excessive dose. Right now, we do not know what amount of hypericin that would be.

St. John's Wort seems to have strong empirical support for its use to treat mild depression, but so does cognitive therapy, which may not be natural, but it is often done without the patient needing to take *any* medications, natural or synthetic. People who say they take St. John's Wort because they don't want to take any medications are confused. St. John's Wort is a medication, even if it is sold as a food supplement in your local grocery store.

11 Jan 1998

To me, the word "unnatural" is meaningless. If something exists, then it is a part of nature, and therefore natural. Often, people contrast "natural" with "artificial" or "manmade." These things could only be "unnatural" if we concluded that human beings somehow exist outside of nature, which is ludicrous. Are bird nests unnatural? Ant hills? Beaver dams? Why are we so special that everything we do is "unnatural?" I agree that humans do a lot of stupid things, and can be a danger to ecology. But we need actual ethical reasons for doing or not doing something, not claims that it is "unnatural," which is simply untrue.

Greg Jensen

reply: The words 'natural' and 'unnatural' have several cognitive meanings. The context will usually make it clear which meaning is intended, but occasional ambiguity is inevitable. On the other hand, the emotive meanings of these terms is rarely unclear. 'Natural' usually has a positive emotive meaning and is usually intended to express and evoke approval. 'Unnatural' usually has a negative emotive meaning and is usually intended to express and evoke disapproval. Lazy thinkers will simply dub something 'unnatural' and erroneously think they have shown it is morally wrong. Or, they will dub something 'natural' and erroneously think they have shown it is morally good.

near-death experiences

4 Oct 2001

Hi, I'm a television series producer in Australia who had an NDE 3 years ago. Just wanted to say thank you for your intelligent explanations - I'm really trying to understand my experience and why it's had such a profound effect on my entire life - I'll continue my enquiries for many years, no doubt, but your info has been a refreshing, factual insight. Thanks and best wishes,

Helen Parker

3 Feb 2001

Just read an account of a woman who had been electrocuted and had a NDE. She left her body and observed her physical body on the floor after the incident. While out of the body she felt no pain, emotional or physical, but viewed the incident dispassionately. The part that left her body had two parts that she explains as follows:

- 1. Spirit consciousness, which she felt was herself.*
- 2. A transparent body which she felt was the casing for the spirit consciousness. When out of the physical body the casing for the consciousness was a transparent body much like the physical body in appearance, except it had no defects; did not breathe, and communicated by telepathy with other Light Beings.*

While out of the physical body she observed that all things vibrate with consciousness, even rocks, cloth... all things.

She also left her transparent body at that time. She explains that she felt her pure consciousness merge with the Cosmic Consciousness. She became One with that larger consciousness. During that time she explains that she retained her sense of consciousness, was still herself, but was also One with all things. She experienced unconditional love, peace, bliss, joy ... during that merging.

This is from the book; You Can See the Light by Dianne Morrissey Ph.D.

I had a similar experience but it was an OBE after years of practicing Yoga. I

did not die or have an NDE but had the same experience as an NDE. It was the most important and truthful experience of my entire life. It changed my entire life perspective. Had I not had this experience, I too would remain a skeptic.

Respectfully,

Carol C.

reply: If a picture is worth a thousand words, a transcendental experience is worth a library. Unfortunately, both pictures and experiences can be deceptive. While there are some unscrupulous people who are faking communication with the dead, many have had experiences such as yours. Such experiences can be life-transforming, as in your case, and they can easily become the foundation of an unshakeable faith in all kinds of supernatural and occult phenomena.

Yet, some people will be able to recognize that what they experience may be no more than a subjective experience caused by oxygen deprivation, chemical imbalance, neurological disorder, or some other kind of brain process. That doesn't make the experience less real, but it does explain how one can have experiences that have *content* based on past experiences and desires, but which have no immediate basis outside of the brain.

Ultimately, a person of faith such as yourself might well choose not to apply [Occam's razor](#), yet be willing to admit that it is a brain process that is causing their immediate perceptions. However, rather than leave it at that, the person of faith assumes that there is a real (external to the brain) cause of the brain processes that are causing the perceptions. Such an external cause is metaphysically possible, of course, but unnecessary and, I believe, unlikely. People of faith find books like *You Can See the Light* and [Hello from Heaven!](#) to be supportive of their view. I find books by [Oliver Sacks](#), [Michael Persinger](#), [Stanislav Grof](#) and [Susan Blackmore](#) more interesting and more convincing. Neurological research seems to keep finding evidence to support the brain-based hypothesis for both the origin of God and the self, e.g., [Why God Won't Go Away: Brain Science and the Biology of Belief](#), [Altered Egos: How the Brain Creates the Self](#) and the recent work of [Dr. Donald Stuss](#) on the [frontal lobes and our sense of self](#). It is, of course, possible that there is another realm of reality beyond the brain which is somehow causing these perceptions of self, spirits and God. However, the likelihood of such a realm actually existing seems to me about as probable as [James van Praagh](#) or [John Edward](#) really being contacted by dead dogs and dead strangers.

28 May 2000

I've never been one to draw within the lines, so I'm going to forego the neatly arranged form letter arrangement you've included and instead write freely.

I would, however, like to commend you for an interesting and well-organized site; so hard it is these days to find intelligent discussions of contemporary philosophy and scientific ideas.

I have read through your section on NDE's and some of the reader comments. The most glaring problem inherent in understanding the true nature of these phenomena is the fact that, as we progress down to a certain level of understanding, we get to an area where there really is no way to empirically prove what we are claiming. Scientists rely (necessarily) on facts and data, and will accept nothing else in their search for truth. Interestingly enough, the very roots of science stem from phenomena so minute and mysterious that they themselves cannot be understood or proven empirically. For this reason, we must always entertain alternative ideas, no matter how bizarre, until we can completely explain them.

A very simple dualist approach can explain NDE's and even incorporate the scientific research of ketamine and oxygen deprivation and the whole nine yards.

If we grant that consciousness may have a role in actually creating our reality (as the field of quantum physics is currently finding) then it is easy to see that the consciousness lies somewhere outside of the physical body. It would, however, have to maintain a very intimate relationship with the body, and do so using "material" principles, such as those of biology, chemistry and physics.

It is possible that, on the border of material reality and immaterial reality, there lie chemical reactions, biological responses and the changing of energy into particles. Obviously we do not understand what happens in the small scale of particle generation, but we do understand how chemistry works. When we experience something as the result of ketamine overdose, haven't we just added a chemical to an environment which responds to and works with - chemicals?

It seems obvious that any kind of spiritual experience a human has will be associated to some degree with his or her body and that will entail some kind of chemical reaction. The fact that certain aspects of a spiritual experience can be reproduced chemically proves absolutely nothing about the nature of these phenomena.

-Sean P Hulsman (I wish I had some credentials to put here. It would make me look so much smarter.)

reply: Even though we can't prove--at least not in the way mathematicians can prove--any metaphysical claims, and even though it is true that reproducing spiritual experiences chemically does not prove that spiritual experiences are nothing but chemical reactions, we should not shrink from making judgments based on reasonable probabilities.

14 Mar 2000

Dear Mr. Carroll,

Thank God for your site!

(That's a joke.)

I've been using excerpts from your site (and accompanying links) on an NDE Mail List to clear the air of everything from the Shroud, to Atlantis, to Edgar Cayce and Astrology! (Unfortunately, air pollution is a stubborn affliction.) What the heck am I doing on an NDE mail list?

I had a Near Death-like Experience when I was eleven years old. I won't bore you with the details, but the most intriguing aspect was that I willed myself to "die" during a dream. A full blown NDE followed, in which I would assert that I was no longer dreaming, but fully conscious and OBE. I think this is intriguing from a scientific and psychological standpoint, because, as you know, some avenues of exploration have tried to pinpoint the NDE on a dying brain (to put it simply). My own case argues that possibly just the "perception" of dying can produce an NDE! So, if we are to find a neurological cause for the NDE (to which I am open) then I would argue that "brain-death" is not a reliable trigger.

*I am often asked what makes me think I wasn't still dreaming. Of course, I have no proof that I wasn't. I usually offer up an analogy. Imagine you wake in the middle of the night. You do nothing that would indicate to anyone else that you were awake. Perhaps you look out the window, perhaps you stare at the ceiling or maybe check the time. Then you go back to sleep. The next day you tell someone that you woke during the night. If someone were then to ask: But how do you **know** you weren't still dreaming, how would you prove that you were awake? This analogy gets to the heart of defining consciousness. How did we know we were awake and not dreaming? At any rate, I can't prove that I wasn't dreaming, but I **can** assert that I **felt** fully conscious (and out of my body). Having had lucid dreams, I would also assert that the NDE **felt** qualitatively different. But this is all subjective.*

One fascinating aspect of the NDE, was my ability (perceived?) to see 380 [?] degrees at once.

So, when Jansen writes: One of the many contradictions which 'after-lifers' can not resolve is that "the spirit rises out of the body leaving the brain behind, but somehow still incorporating neuronal functions such as sight, hearing, and proprioception"

*I can only agree. Whatever means I was using to see was *not* eyesight. This can firstly be seen as proof (by present scientific criterion) that I was dreaming (the reasonable assumption being that the only way to "see" is with eyes, therefore, if I was seeing it was because I was dreaming) or secondly, as confirmation that our consciousness is not dependent on neuronal activity (I was seeing without my eyes and since eyes cannot possibly see in all directions at once, the only explanation (if we preclude the first) is that I was using a perceptual ability that was *not* neuronal--therefore it follows that consciousness may not be neuronal). This all begins to sound sophisticated, but I think we can't, as yet, eliminate either possibility.*

Jansen also writes: There is overwhelming evidence that 'mind' results from neuronal activity. The dramatic effects on the mind of adding hallucinogenic drugs to the brain, and the religious experiences which sometimes result, provide further evidence for this (Grinspoon and Bakalar, 1981).

*If we exclude the possibility of a "soul", then this is the obvious conclusion. After all, if we remove the brain, we remove consciousness. Period. We conclude therefore that consciousness *is* the brain. However, my favorite hobby is flying radio controlled planes. This leads to an analogy I'm sure you're familiar with. If one thinks of the brain as being a servo (the mechanism that controls the plane) then we end up with exactly the same indicators. The plane appears conscious and aware of its environment. It avoids trees (most of the time), the ground and generally behaves like a thinking object interested in preserving itself. It seems to see and be aware of its environment. Military radio controlled planes even extend this analogy, because they have on-board cameras that guide the controller. These could be thought of as eyes. If the servo were susceptible to mental illness, then, depending on the illness, ones ability to control the plane would suffer accordingly. If the battery dies (which has happened) then the servo dies and the plane plummets, having the appearance of "death". Not to sound too metaphysical, but we can safely say that the plane's appearance of consciousness and apparent "death" are illusions. The plane's consciousness, if you will, exists externally to it. If one postulates the existence of the soul, then this analogy extends to the body. Of course, such a hypothesis (if it can be called that) can in *no way* be validated. I only mention it to show that what can appear purely neuronal, need not necessarily lead us to conclude that consciousness is neuronal.*

*The objection is fairly raised that science cannot disprove a negative. However, science *can* disprove that the earth is flat, that the sun revolves around the earth... so on and so forth. So... I'm not sure we can use this reasoning as a refuge. If it's possible to prove that consciousness does *not**

*and can *not* exist beyond the confines of the body, then I think it will, at some point, be proven. Until then, I remain open.*

*I experienced my NDE at age eleven and I told no one of the experience until eighteen (so profound was the effect it had on me). If we grant the NDE a neurological explanation (which is the only explanation we can allow given the current scientific paradigm) then the reasons for its *often* (though not always) beneficial after effects becomes doubly intriguing. After all, the NDE may be drug induced. However, I don't get the sense from my readings that a drug induced NDE produces the same beneficial after effects. (Maybe I haven't read enough?) Carl Jansen's web site (Ketamine induced NDEs) lists some of these beneficial after effects and gives examples; although, unfortunately, he doesn't state whether his own experiments produce the same after effects as the non-induced variety. This has nothing to do with the nature of consciousness. I only point out that there may be qualitative differences between an induced NDE and a non-induced NDE which need to be explored.*

Anyway, after my NDE I naturally wanted to understand its "meaning". Of course, there were plenty pseudo-scientists more than ready and willing to explain the phenomena: astrologers, channelers, psychics, gurus, you name it. When I finally read James Randi's flim flam, it was a breath of fresh air. (Fortunately, Carl Sagan was one of my childhood heroes, so I was open to reading Randi.) This was several years ago. Now that I'm earning some money, you'll be happy to know that I'll be joining the James Randi Educational Foundation. I can't say enough about the process and methodology of science. I am a subscriber to the Skeptic and I finally managed to buy a used copy of "Asimov's Guide to Science" (now out of print) like the one I loved as a child.

*Where does all this leave me? The NDE (because of my own experience I suppose) is the *only* phenomena which continues to intrigue me as possibly indicative of the "paranormal". The nub of the matter is this: Can consciousness survive outside the confines of the physical body? Is consciousness physiological? While there is *no* reproducible evidence to suggest it can, there is nevertheless strong circumstantial evidence and what Kenneth Ring would describe as veridical evidence. It is admittedly anecdotal and testimonial; but then, as per my example of waking in the middle of the night, so is consciousness! If the soul exists, then it is pure consciousness. It is a creature of perceptions and nothing more. How on earth, using non-perceptual tools, do we come to grips with that? *If* there is a soul, I think this is a fascinating question! For now, however, it remains for the legions of pseudo scientists who are more than ready to tell us. The work of Dr. Ian Stevenson also provides strong circumstantial (though untestable) evidence. Of course, until science arrives at some means of testing such a hypothesis (that the consciousness can exist separately from the body) science cannot and should not act on the basis that it does.*

Nevertheless, I'm not sure that this alone is a reason to out and out eliminate

*the possibility. After all, microscopic life was postulated before the invention of the microscope. Mind you, I'm not trying to convince you that the soul exists but I *do* think, to be fair, that we can't yet say that it *doesn't* exist, only that we currently have no means to either prove or disprove the assertion. As I said before, there does seem to be compelling circumstantial evidence that it does, and on this reason *alone* I remain open minded on the subject. What's the difference between this assertion and a belief in Santa Claus? Mainly, I suppose, that thousands, if not millions, of individuals haven't derived life changing benefits from "meeting" Santa Claus at the end of a "tunnel"! Consider Robert Baker's article. Consider Louis Farrakahn's recent conversion after his NDE!! I, for one, remain open to the possibility that consciousness can persist outside of the physical body. This seems to be the overriding "message" (if you will) of the NDE. Wish fulfillment is an obvious explanation for the common content (who wants to die, after all) but why don't we have hallucinations (if we're to call them that) of fabulous wealth or prestige? Maybe we do. If so, it would be interesting to discover whether such experiences also produce the beneficial after-effects of the NDE.*

*Of course, allowing for the possibility that consciousness survives the physical body opens a *real* can of worms! What then about reincarnation, heaven or hell? I don't know. I personally don't believe *anybody* who claims any knowledge as to what comes after death (if there *is* such a thing as "after death").*

*By the way, I think you ought to update your NDE page to take into account Kenneth Ring's latest book: "[Mindsight: Near Death and Out-of-Body Experiences in the Blind](#)". This is a new study apparently having nothing to do with Blackmore's(?), which was (as Ring himself states) a model of poor research and fabrication. I've ordered the book via Amazon.com and haven't read it yet. If you're interested, I can send you my impressions. I would like to read some reviews--pro and con. I would appreciate your criticism of the book. The most important criticism, however, must come from those who have the means to thoroughly examine Ring's methods. Naturally, I don't expect the book to prove the existence of a "soul", but it may offer some *very* compelling "indications" in support of such an assertion. Given the subjective and anecdotal nature of the NDE, I think Ring does the best he can trying to work within a scientific paradigm. I feel the same for Stevenson. I honestly don't believe he should be ranked as just another pseudo-scientists. Even if we ultimately find plausible explanations for his findings (not paranormal), we shouldn't fault him for the sincerity of his effort.*

I have also read "Dying to Live". Frankly (and as of yet) I find neurological explanations for the NDE phenomena to be insufficient (riddled with exceptions-my own experience being an example). Nevertheless, I remain open to physiological explanations. Jansen's work with Ketamine seems promising, and yet even this doesn't nearly account for the wide variety and

causes of NDE, as he himself states, or NDE-like experiences.

Anyway, I appreciate your having written the following as to Ketamine:

That does not prove that there is no life after death, but it does prove that an NDE is not proof of an afterlife.

*I heartily agree and I also *mostly* agree when you write:*

In any case, the so-called "typical" NDE is not typical of anything, except the tendency of parapsychologists to selectively isolate features of a wide array of experiences and fit them to a paranormal or supernatural hypothesis.

*I disagree in that I think it *is* typical of *something*. We just don't yet know *what*.*

Ultimately, I agree with Robert Baker:

All of the beings of light are in firm agreement, and they tell the dying: Stay on Earth and resist the transcendental temptation; focus on life not death; use your human powers of love and compassion in work to make this material world-the world of the here and now and the world we all inhabit-a better world, the best world it can possibly be. This is the one thing on which all of us-the believer and the skeptic-can unanimously agree. This is the true light we all should see.

I hope you've found my thoughts somewhat enjoyable.

My best to you & admiration,

Patrick Gillespie

3 Apr 2000

Thank you for the down-to-earth skeptic site. It is a joy to read.

I saw a couple of years ago an American TV program which might have explained the near death experience.

The discovery was made while training fighter pilots to cope with black-out and red-out in a centrifuge. When the blood escaped from the brain due to the centrifugal force the pilots slowly lost consciousness. Before passing out they saw a light which got closer and closer (or a light at the end of a black

tunnel).

It seems that the phenomenon is caused by the brain not getting enough oxygen.

The people noticed the similarity to NDE.

I once passed out because of physical exhaustion. After a hard work out I stood up. First I lost my hearing, then a blackness came from my peripheral vision and slowly covered the whole view, just like an old TV which is turned off, ending in a blip in the centre. The last thing I remember was touching a solid object with my fingers as a reference to keep the balance. I came back after several seconds, surprisingly still standing (I know the time because of what had happened in the gym while I was unconscious). An amazing experience. Should I call it a near faint experience?

Sasu Mattila

Melbourne, Australia (just working in Australia, I am Finnish)

16 Feb 2000

My compliments on an intriguing, well-designed site. I would like to challenge you on your NDE position, however. Several accounts of NDEs report that the person travels to another place, whether that be the next room, or another building. The person, upon being revived from a clinically dead state, can accurately describe what was transpiring at that location they traveled to, during the time they were clinically dead. If this can be verified, then it seems plausible that at least an Out of Body experience occurred, if not an NDE. I will guess that your first refutation will deal with the issue of anecdotes, and how anyone can report anything to have happened can be lying or stretching the truth. But what if we have credible witnesses to this? Comments?

Patrick H. Ashley

reply: You're right about [testimonial anecdotes](#). They are worthless as scientific evidence, but they can point us in the right direction. Experiments have been set up by parapsychologists such as [Charles Tart](#) to test whether such [remote viewing](#) can be duplicated. So far as I know they have all been unsuccessful.

Your articles are very informative. Yet I have to disagree with you on one important note. Near Death Experience. I had a heart attack in January 1990, near San Francisco. Over the years, I have not only found that millions worldwide have had an NDE, but that there were blind NDEers who were

able to describe layouts of the room they were in, the people, and the equipment, as well as colors, and verified by their doctors.

Reply: Are you saying that you believe stories which assert that persons who have been blind from birth had "visions" while near death? I could believe that a person who once had sight and was blind at the time of a near death experience was conscious of "seeing," as in a daydream or dream, things like rooms, doctors, equipment, etc., and I would have no problem believing that a person who appears unconscious or dead to others can have auditory sensations and hear what is going on around him. Nothing seems extraordinary about that.

Maybe you are thinking of Dr. Emil Mueller's advertisement in *Revitalized Signs* (Autumn 1989). He asked for accounts of NDEs from the deaf and blind. Anyway, he says he didn't receive a single report from a blind person. [Blackmore, p. 130] Or you may be thinking of Larry Dossey's *Recovering the Soul* where he reports on a patient named Sarah who had a vivid visual NDE even though she was blind from birth. Dossey has admitted that Sarah was not a real person. She was a "composite," made up to "dramatically illustrate the key features of non-local ways of knowing." Dossey admitted to Susan Blackmore that he made Sarah's story up so he could illustrate his belief "that non-local ways of gaining information bypass the senses and are ultimately independent of the brain." [Blackmore, p. 132] Other than this made-up case to support a hypothesis, you won't find any documentation of blind NDErs reporting vivid visual experiences.

I know Susan Blackmore and her views on the subject, but she can't explain to my satisfaction, how those who were blind, described what I have just mentioned. I remembered skeptics who said, "There was no such thing as ESP." Now many know from a declassified document showing that the CIA was using ESP with a 66% success rate for over 20 years. Far above the rate for 'chance.'

Reply: Maybe you should re-read *Dying to Live*. She describes fully her correspondence with Mueller and Dossey. If their own admission that they don't have a single real case of a blind person NDEr doesn't satisfy you, I don't know what would. And where did you get your information on the CIA? The CIA is about as reliable a source on this stuff as the man in the moon. In any case, there have been other widely reported stories about the CIA and how it has abandoned its program of hiring psychics, not because it had a great success rate, but because it was recognized to have been a waste of money. Sure, there were a few psychics and some CIA officers who believe in esp and who think the money was well spent. I, for one, am glad they are not wasting our tax dollars on this non-sense anymore.

I don't believe in people who can claim to leave their body at will or those who claim to be psychics. But I can believe in my own experience and that of the blind.

Aubrey

Reply: You mean you believe in your *interpretation* of your experience. You seem to be blind to alternative interpretations and seem to have a blind spot when it comes to reading Blackmore on blind NDErs.

8 Aug 1996

I wanted to relate an experience that happened to me October 30, 1994. A friend and I went for a bicycle ride. I had stopped by his house to see him off and refill my water bottle before heading home. On my way back home I was hit by a car. The woman didn't see me and turned right into me. I hit the brakes, but there was nothing I could do. I told myself to drop and roll. The next thing I know I am standing on the sidewalk with two presence's next to me, telling me to relax, that things will be okay. I looked at the car and saw a black form rolling over the car. Then I am back in my body sitting on the ground.

I missed hitting a stop sign by twelve inches and a telephone pole by twenty-four inches. The only thing that happened to me was a cut on my leg (requiring stitches) and a few bruises. I thought I must have imagined it....but the pictures are too clear. Do OBE usually feel so real? Or would this be classified as a different experience?

Betsey Kamel

reply: Glad to hear you were not seriously injured. Our student assistant was hit by a car last year and nearly died from it.

Anyway, I can't comment on the nature of OBE's from experience, since I have never had one. I can only comment on your specific experience in a general way and speculate as to what caused your perceptions..

As you know, chemicals in our brain affect perception. How they do this is still a large mystery, but we know that electrical stimulation of certain parts of the brain, which can be brought about directly or by chemicals, can cause hallucinations, i.e., vivid perceptions not caused by an external object.

A trauma, or fear of trauma, to the body stimulates the production of chemicals in the body. Among the most well known examples of this is the production of adrenaline when frightened.

I cannot say for sure what you experienced but perhaps your perceptions were based on real people trying to comfort you who were gone by the time you recovered to full consciousness. Likewise for the black form: there may have been an ocular occlusion which affected your perception of an external object. On the other hand, it is possible that what you perceived were hallucinations, brought about by the trauma of your experience.

You clearly went from a state of conscious awareness to semi- or unconsciousness and then back to a state of conscious awareness. What you perceived was probably due to your body's reaction to being hit by a car, not due to any beings from another realm who appeared just at the moment of your unfortunate crash.

09 Oct 1996

I noticed not many comments were added to a topic I thought lots of people would be talking about (astral flight etc). Here is a scientific account from a logical and non-religious thinker. I hope it puts new light on the topic or at least makes someone laugh.

After borrowing a bottle of ether from a fruit fly experiment in Biology, a friend and I decided a human should take the place of a poor defenseless fly. I inhaled a fair amount until my lower limbs became anaesthetised and perception started to lag. What happened next seemed like an out of body experience but is what I later decided was serious lag effect in the visual perception. I stood up, changed the CD then sat down again, then as I sat down I experienced all the sensations of carrying out these tasks, giving me the feeling that my body was doing them though leaving my body behind. I attribute this feeling to the the anaesthetic characteristic of the drug.

Maybe while sleeping people experience out of body hallicinations due to lag in the cortex and other parts of the brain.

Benjamin Moir
Sydney, Australia

reply: I wouldn't generalize too greatly from your experiment, but there are scientists now researching the possibility that obe's (and other "transcendental" states) are manifestations of particular brain states.

31 Jul 1998

While I respect your right to have your own beliefs I must say I find your

responses rather arrogant, especially for someone who has never had an nde. I question your qualifications to try to convince people that these experiences do not come from God. Have you ever died? Do You know what follows death...actually you cannot say what happened to these people because YOU DO NOT KNOW.

Beverly Scott

reply: I've never been manic either, yet I do not think it arrogant to offer my observations on manic behavior. The manic person perceives reality in the only way she knows how, but that does not make her evaluations of her experiences valid or correct.

neurolinguistic programming (NLP)

15 Nov 2000

I've talked to many people who dislike your site merely because it isn't "right" on hypnosis and NLP. I think they want you to point out how great hypnosis can be (I have seen it do some exciting things - if not magical or mystical or unexplainable things - very easily and quickly). I'm sure that anyone who tries hypnosis and maintains a skeptical, scientific mindset about it from the start will know this - why should you bother to mention it? The point of your article is that many "hypnotherapists" believe in rubbish, and that hypnosis is nothing special or exciting in itself. I have been using self-hypnosis for years, and have hypnotised some friends and family - it is a rather boring thing. I am quite taken aback by the amount and loudness of these people who wish to attribute magical qualities to it.

And NLP. Poor, stupid NLP. I can't see how people could take offence at this article. No - it does not mention how NLP can be useful, which it can be, very mildly. But it hits the point home - hard - that NLP teaches little, that it's basically new-age pseudo-scientific self-motivational Anything-2-Everyone standard cretin fare.

Yes. I may be able to use NLP techniques to improve my self-confidence. I may be able to use it to impress people socially more. But then, the techniques are useful (and only a few of them), not NLP, not Bandler, not the "practitioners" - the evidence that some techniques are useful does not validate the seminars or the whole "science" itself. In the end though, the techniques are more interesting than useful.

A friend of mine recently asked about NLP. I hope my reply may be useful to some other people.

I started really looking into NLP a while ago - and I started off thinking it must be something REALLY COOL! But, unfortunately...

NLP IS totally bogus - it was s built by 2 men - one who has run away from NLP as it is now, and one who says things like - "I think the more you want to become more and more creative you have to not only elicit other peoples' (plural) strategies and replicate them yourself, but also modify others' strategies and have a strategy that creates new creativity strategies based on as many wonderful states as you can design for yourself."

Yes - it has useful, or interesting but impractical, "tools", or "techniques". These were taken from elsewhere - and claims were set up that NLP could :- a) Cure severe mental illness b) Cure anything mental, in fact c) Make ANYONE successful d) Find out when someone is lying 100% e) Influence people easily f) etc. etc. etc.

If it's that good - why is it not used everywhere by everyone? Why is the knowledge of NLP held by the boring, the unfamous, the unrich. Why do NLP practitioners not change the world?

Do you know what I can do with "NLP"? I can "pace and lead" - match your verbal "intensity" (swearwords, volume, speed), body language etc. to build rapport, and then slow down my speech, become more articulate etc. to "lead" you to a more calm state. Does matching these things build rapport? About as much as listening to someone and pretending to care.

I can look at someone's eyes, and depending where they move, I can tell if they're having an internal dialogue, remembering a sound or sight, creating a new sound or sight etc. It's not 100% and it's not that useful.

I can't tell if someone's lying by where their eyes move. However - some NLP practitioners can.

Can I use it to become a social force to be reckoned with, using clever tricks to subconsciously create a bond of friendship? No more than being nice to people and listening and pretending to care.

Some NLP techniques may have a small place in social interactions, in therapy, in self-motivation.

But as a stand-alone "discipline", there is little to it, except the standard new-age lies.

I thought you might be interested in the following link: <http://www.idea-seminars.com>

This guy is a magician here in Milwaukee and along with many other magicians, he has latched onto NLP as the be all and end all of magic patter and scripting. Just adding to the long list of BS and bogus claims that NLP has generated, I suppose.

Finally, thank you for the effort and maintenance you put into your site. It has been a great help to me in many areas.

Tim Catlett

reply: see the next letter.

15 May 2000

Hello, By way of a very brief introduction, I am a professional magician in Calgary, Alberta, Canada, and a member of a private magicians' Internet forum (called the Electronic Grymoire, or EG for short, hosted by Bruce Barnett). There are 700-800 serious magicians and magic hobbyists from around the world on this forum, which produces email dialogue at least 5 days a week; pending holidays or days off by the moderator (who operates it for a tiny yearly membership fee to offset expenses, from his home). I should add that this forum is a very serious effort on the part of the moderator (requires a "knowledge-based" magicians' questionnaire for entrance) - as a response to the abominable 'free public' magicians chat-lines (alt. magic. etc.) -- that are constantly being 'tainted' by non-magician outsiders and general rabble-rousers. The founder of the EG didn't think magicians should be 'talking shop' out there on a public-accessible forum, under such dismal conditions.

I hope you've survived the above introduction. Now to my reason for writing:

Recently a few magicians got into a spirited conversation on the EG over the alleged marvelous attributes of Neuro-Linguistic Programming (NLP). What brought the subject up and sustained it, was Kenton's book (for magicians) called "Wonder Words", which taught NLP "techniques of persuasion" in the performance of conjuring shows. Several enthusiastic testimonials for both NLP techniques and said book were then give over the course of a couple of weeks, by people who purchased the book and applied its principles, and by people directly involved with selling seminars [\$\$] and tapes on NLP. And a few magicians had dished out the big bucks for courses on NLP (some of them medical practitioners of one sort or another).

Prior to this discussion, I had never heard of NLP (I'm an extensive 'hard science' reader and in sympathy with Randi and the skeptic's cause). The 'damn broke' for me, when a lady with a Ph.D. in linguistics and psychology and 20 years in the field (by her admission), said that she'd never heard of NLP either, and wanted to know more about it. As an armchair skeptic myself, the very word "programming" (of the brain) raised a warning flag in my mind. So...I decided to do a little research of my own, starting (and ending) with the Internet.

I was immediately appalled by the number of web sites on NLP that literally screamed "NEW AGE" and had all manner of paranormal, metaphysical, hypnotic, and psychic-type links attached. Then I found a page that had a long anti-religious dissertation, containing the theme of how NLP was the revolution

that would replace organized religion, blah blah. I'm not in the least religious myself, but by now I had pretty-much nailed NLP as a non-scientific piece of claptrap.

The above web sites then prompted me to examine what skepticism had to say about NLP -- and that's when I discovered your essay.

Trying to be brief as possible here (it's hard, forgive me): I took the liberty of downloading your NLP essay and, since it was copyright, I didn't send it to the forum (a form of cyberspace 'publishing'), but instead, re-formatted it for simple email (editing out NOTHING). I then went on the EG and offered the essay (complete with your URL address at the end so anyone could access the original), just by having them say to me, "SEND IT." (I did this so that I could learn how many magicians would actually be interested in getting and READING the essay; just listing your web address alone on the EG would have told me nothing.).

Some 84 out of 700 magicians asked for the essay over a one-week period, and in a nutshell, this caused a small uproar of consternation among the few more vocal NLP converts on the magicians forum. One of the chaps most upset was an NLP lecturer with a set of tapes on neuro-linguistic programming; and so his vested financial interest in NLP was considerable. Others took me to task principally because the Wonder Words book worked well for them, making them better magic entertainers. A strangely myopic statement came from one requester of your essay: "I've tried the NLP techniques and since they work well for ME, nothing will change my mind!" - makes me almost wonder why they asked to see your essay in the first place!

The final 'straw' in all of this, was that the NLP lecturer with the tapes (filled with frustration over the skeptical point of view, I suppose) referred to skeptics carte blanche, as those "EVANGELICAL FUNDAMENTALIST SKEPTICS", and "fanatical zealots out to destroy"...and so on. Rather than make an intelligent and reasoned attempt to address the facts, all the fellow could do was engage in an emotionalized character assassination of the skeptical cause....

IN SUMMARY: I am writing you simply to say that even in a field where you'd think there'd be mostly (if not entirely) reasonably intelligent, free-thinking, scientifically literate people (as exemplified by James Randi, Martin Gardner, et al)...there are instead, a lot of people as gullible, self-serving, and scientifically-illiterate as any typical sampling of people among the general public.

By contrast, it seems to me, the skeptics' magazine/organizations would have the general public thinking that magicians are, in the main, pretty much aligned to the sensibilities and aims of skepticism. This is something of a misconception. Curiously, though, in defense of my profession, there WERE at least a half-

dozen of the magicians (who asked for, and read your article) fully in support of your position on NLP. They KNEW it was bunk, from their own scientific training. But alas, though they were professional psychologists and/or medical practitioners of one sort or another, none would speak up on the forum. I became more-or-less a 'lone wolf' bellowing in the wilderness...

Thank you for reading this letter, and I especially thank you for writing such a great article critiquing "neuro-linguistic programming".

Larry Thornton

14 May 2000

A few months ago, I bought a book called, "Instant Rapport", which introduced me to the concept of NLP. What interested me in NLP was how people typically view the world through three of their senses, how you could tell which sense they often use through language and eye movements, and how this improves communication with others. Then I decided to search the 'Net for more info on NLP, and noticed that many sites talked about seminars and programs, but didn't go into detail unless you attended for some fee; also there were some claims of NLP that seemed too "New Agey". This immediately sent up a red flag, so I went here to find out more about the darker side of NLP. I'm glad I found out more about the whole picture of NLP before going in too far. Now my opinion on NLP is like my opinion on [Myers-Briggs](#): sure, it helps in understanding yourself and others, and communicating with other people (especially when you bring up the method as a topic), but its more grandiose claims are bunk.

Wyatt Parkinson

15 Dec 1999

I studied English Language and literature at college. I then enrolled on a correspondence course in neuroanatomy. I now work as a computer programmer and am currently implementing a neural network. I can assert that NLP has nothing to do with neuroanatomy, nothing to do with linguistics, and nothing to do with programming. I also suffer from manic depression with schizoid tendencies. The idea that NLP could treat schizophrenia is absurd. We do not understand schizophrenia (for what it's worth my pet theory is that it is not a mental disorder) but one of the effects is to inhibit the patient's sense of perspective when making logical deductions. "I am God. I know I am in a mental hospital. Therefore God must be insane ... " is a typical chain of reasoning. What we do know is that blockading dopamine receptors with specially designed drugs will inhibit the symptoms. It is a psychiatric condition not a psychological one, and it doesn't seem at all likely that a non-pharmacological therapy could possibly work.

Keep up the good work.

Malcolm Mclean

9 Dec 1999

I read your comments about NLP. There is much that you have written that is 100% on. There is a lot that you have written that is off. Way off. We tend to say that people all have different experiences. If that is so, and I believe that it is, then how can you expect one thing to be the correct thing for all. Everyone cannot say that their home address is 3285 Kinard Ave in Pensacola as I can. I could not say that was my address 50 years ago, 30 years ago, 10 years ago, and it might not be so in another 15 years. Fritz Pearls might have said that what you have written therefore is a bunch of Elephant S... because it only comes from the brain. If I want to say that I will get wet, which of the following will work? Stand in the shower-not if my shower is not connected. Go out in the rain-not if we are in the middle of a draught. Go to the beach-not if I am in the middle of a desert. Go to a restaurant and pour the water they give me over my head-not if I am in the lost in a forest. Yet all of the above answers could be correct. Which one is scientifically correct if you do not know your location?

reply: If you are lost you should be asking a different question.

NLP understands that we are different, and therefore we have to do different things to help people to meet their needs "where they are." "The scientific theory" that you insist on says we are all at the same place. NLP goes to where the person is and then helps the person to get from there to where they want to go. NLP insists that nothing is as crazy as continuing on doing the same thing over and over again that has not worked before as most of the "proven therapies," by your standard, insist on doing. If you need surgery do you want a surgeon who says 90% have the part we operate at this spot, so we will cut you there, or would you want them to be flexible enough to use what will work for you, it is not scientific, but it is what you need. NLP meets the needs of those who need help not the PSEUDO SCIENTISTIFIC PHILOSOPHY that you insist on.

PERRYFF@aol.com

reply: Sounds like it's working for you! Hey, if it gets your elevator to the top floor, who am I to point out that I don't see the building.

12 Sep 1999

Thank you very much for the enlightening articles on [Landmark Forum](#), [LGAT](#), and NLP. I just met a woman over the phone tonight via a singles ad who claimed to have had her life turned around through an LEC experience. She continues to recruit for them two years after the encounter, has moved back in

with her 82 year old father (I will now ask her if that was a result of her experience), and essentially resembled the rest of the ideological physiognomy outlined in your articles and links. Her vagueness about Landmark led me to seek enlightenment on the Web, which led me to your site.

After reading up on NLP, it occurs to me that the Suzuki Method of teaching violin and other musical instruments to masses of very young children who are not necessarily prodigies is an example of this kind of thinking. I understand now what it is about the Suzuki Method that disturbed me during the four years that my son was taking lessons. It was evident to me, at least, the Suzuki had a motivation to teach millions of children to play tiny violins: his father left him a violin factory after WWII and he needed to come up with some way to stimulate demand! The most common brand of violin played by these students is a Nagoya, which comes from Suzuki's factory.

Chomsky's theories of deep language structures in the brain are evoked by some Suzuki theorists as the reasoning behind the urgings that any child can learn the language of music as easily as a spoken and written language. While there is probably something to the belief that all children should be exposed to music in whatever form as early as possible, it is also probably a cruel joke to imply to gullible parents that their child possesses the talent to play the violin as well as the next kid. A high degree of skeleto-muscular- optical coordination is required, as well as the ability to discern small changes in pitch. In my experience -- I studied the piano for ten years as a child and teenager -- not every child can possess all these traits.

In addition, Suzuki enthuses that anything can be accomplished with enough love, including teaching a child to play like Fritz Kreisler. When my child wanted to stop playing or refused to practice -- he eventually quit the violin -- I felt like a total failure as a loving parent. Fortunately, he continues his musical training in other ways and has announced his intention to retry a stringed instrument, in this case the mandolin and the viola. But he really is talented musically, unlike other very unhappy looking children I have seen in Suzuki workshops and group lessons.

Thank you again for an enlightening website, which I shall refer to often and recommend to my friends who are misled by all sorts of New Age nonsense from killer asteroid attacks to Wiccans. The article about LGAT made some things clearer for me about the joint motivational projects we are subjected to in the auto industry. And thanks for pointing me to Dave Barry's article about Tony Roberts(TM). The business about motivating large groups of people by spinning a prize wheel was totally on point from my experience at the quarterly Individual Quality Partnership meetings that the UAW and Daimler Chrysler Corporation subject us to. (I stopped going after the second one!) I laughed until I cried!

Robert Glassman
Ypsilanti, MI

7 Sep 1999

Mr Carroll do you know that a good many of the so called facts on NLP are not true and if they decided to Bandler and Grinder could easily sue you for slander.

reply: Be specific, please.

You might consider changing the page or withdrawing it. My guess is that they do not know about your page.

reply: I'm always ready to change my mind.

First of all , Tony Robbins only got through practitioner training and is not a therapist in any state.

reply: Good. I never wrote otherwise.

He also denies any allegiance with NLP.

reply: Good. I stated that he does not claim to be doing NLP anymore.

Tsvi Kilstein who I know personally knows next to nothing about NLP. He took a modeling course from David Gordon with me at an NLP center. He must be part of that therapy mill that he refers to because. He is a Rabbi who works on middle eastern negotiations. He is a college professor. As far as I know he has no formal training in NLP.

reply: I assume you are referring to the quote from the Rabbi, featured at the top of the entry on NLP: *If medical schools turned out doctors the way NLP mills turn out "therapists", people would die like flies.* No other mention of the rabbi is made in the article, and since the Internet site from which this quote was taken has vanished, I'm removing the quote from the entry.

Richard Bandler and John Grinder founded NLP in an attempt to help psychology students who were unable to model Fritz Perls effectively. Bandler is a mathematician and John Grinder is a professor of Linguistics. They went on to model dozens of other people with respect to the excellent work they did . NLP is about modeling not therapy , therapists just happened to be the first group they modeled. Oh by the way Tsvi Kilstein showed up only for a couple of modeling sessions where David Gordon introduced him and he gave a report on his negotiations which were successful using the NLP modeling techniques.

reply: As I did not rely on Kilstein for anything more than a blurb, I cannot say that this information is of much interest to me.

One Thing I can say that I do not know of a single NLP center that has a program that says if you take one of their courses that you are a therapist.

reply: And I can say that I never said otherwise.

Some have state certification for hypnosis; however, therapy and who can be a therapist is controlled by the individual states in the United States. You claim your page is about critical thinking. I for one can not see any thing in your page that approaches thinking much less critical thinking. Get your facts correct before you print something. Your NLP page is a major fabrication of someone's imagination, not critical thinking

Tim Keating

Master Practitioner of NLP

I am not a therapist, nor do I claim to be.

reply: I can truthfully say that makes me very happy. (p.s. I'll bet you're not a lawyer, either.)

Rabbi Kilstein has seen this exchange. His comments are posted here.

Hi Bob. I am the infamous Rabbi Tsvi Kilstein whose comment about NLP you pulled from the site. I have a few thoughts on that.

1. I believe my original quote on that was pulled from a discussion on alt.psychology.nlp.
2. I stand by that quote.
3. I was trained by Richard Bandler, John Grinder, Robert Dilts, David Gordon, and many other stars of NLP. I served as a co-trainer for NLP-International and led NLP trainings.
4. I am not a university professor but if there are any openings please let me know.
5. I have never been involved in Middle East negotiations but if there were any openings, again, I would be interested.
6. NLP is divided into groups of trainers who think that knowledge of a technique makes someone a therapist. Only training as a therapist makes one a therapist.
7. I have watched your site grow and it is very impressive. Keep up the good work.

I love being the recipient of ad hominem arguments. I guess I must have really hit home with that NLP quote.

Rabbi Tsvi Kilstein

17 Mar 1999

You have helped me enormously with your great site. Although already a critical thinker, the skeptic dictionary really left me astonished with its breadth of articles, and I have become a regular visitor to your site.

At the moment, I'm taking a course in ADR (Alternate Dispute Resolution) at a respectable college in Ontario. Last week, we had a guest speaker talking about the use of NLP as a negotiation and mediation tool. Never having heard of NLP and since the whole presentation left a rather bitter taste in my mouth, I decided to find out whether you had any relevant information.

Needless to say, your article on NLP expressed all the misgivings I had. I downloaded the article and will share it with the other students in my class. Hopefully, the NLP article will persuade some of them to visit your site.

Thank you for a great site.

Gratefully yours,
Louis Van Hout
Ontario, Canada

11 Dec 1997

I enjoyed the Skeptic's Dictionary very much. I'm putting together my own site on doublespeak and propaganda, and I'd like to point to your site, if you don't mind.

Re: NLP. Back when NLP was just Bandler and Grinder (the latter, a legit linguist, having since distanced himself from all things NLP), I believe it was just a combination of mainstream therapeutic theories and practices recognizable to any practitioner. Eclecticism was the rage then, and NLP was, I think, just a run-of-the-mill (if pretentious and overstated) eclectic psychotherapy framework. It seemed to draw an awful lot from rational-emotive therapy and other cognitive-behavioral techniques.

The basic idea was to induce changes in behavior by changing the client's language in various ways, supposedly freeing him from restrictive or ritualized thought patterns and therefore from inappropriate behaviors. This is an

uncontroversial and even bland idea, but I think Bandler deliberately obscured that fact with pseudoscientific and New Agey gibberish designed to give NLP its own special, trademarkable, profitable mystique.

Later, NLP began pulling in ideas from all over the theoretical map, perhaps trying to become all things to all people and only succeeding in becoming, as you've seen, anything to anybody. Whatever-- for a time, Bandler and associates could charge top dollar for seminars and workshops, which was the whole point.

Thanks again for a great website.

Scott Burright

05 Jan 1998

I have taken the Persuasion Engineering 3-day seminar in New York (I think in March, 1997). It was part of the NLP practitioners program (which I did not take), and it was coached by Richard Bandler (one of the co-developers of NLP, and the developer of DHE) and John LaVale.

The style of teaching included nested storytelling by Bandler (which is supposed to convey messages to the unconscious mind), and more "formal" teaching by LaVale with exercises.

The material focused on applying NLP skills to the sales environment. What I remember was the strong focus on creating rapport with the customer, either by mirroring his movements and his tone of voice and language, or creating it instantly, by going there before him

I also remember the idea of well posed questions about what the client values, needs; wants; should have etc, and then replying with the information arranged in a specific order from most important to least important, while repeating the words which the client stressed. Also the idea of inoculating about buyers remorse in advance by repeating to him the critics he might hear from others, or asking him to commit to send other clients.

There is also a book called Persuasion Engineering by the same people, which I bought and did not read yet, but it contains the content of the seminar.

All in all, I enjoyed the course, because of its almost "standup comedy" style, but since I am not in the sales business, I cannot really testify about the effectiveness of the sales methods, or compare it to other sales methods. I used the "rapport building" methods in social environments, and they do seem to be mostly effective.

Armin Shmilovici

07 Jan 1998

I have attended both the DHE and the NPE seminars and I can honestly say that I enjoyed just being in the environment with R.Bandler. He's brilliant. However if you are after personal improvement then I would recommend Tony Robbins who originally learned NLP from Bandler.

Have you read the books *Unlimited Power* by Tony Robbins or *Frogs into Princes* by Bandler & Grinder?

Pål W. Jota

reply: No, but they come highly recommended.

11 Dec 1997

I do not find your description [of NLP] as either fair, or informative in any way, especially the irrelevant association with firewalking.

reply: Thank you for sharing. I mention firewalking because in one of his many incarnations as a self-help guru, Tony Robbins (who used to promote firewalking) promoted NLP. Robbins is still promoting self-improvement. From what I can tell from his infomercials and interviews, he is teaching "communication skills".

"The map is not the territory" - one of the cornerstones of NLP, basically says that the model of the world should not be confused with the real world. Isn't that a philosophy any scientist would adapt?

reply: Not confusing the world and models of the world is not a philosophy, but a bit of caution that anyone doing philosophy must heed. It is hardly profound and it certainly is not a cornerstone of anything significant in philosophy.

NLP originated by trying to model the behavior of various peoples which are successful in their fields, beginning with the language patterns of the Hypnotist-Therapist Milton Erickson, and that is the source of the name.

reply: Is this the source of that writing correspondence course I took years ago which advised me to copy out word for word *War and Peace*? By mimicking the style of the great writers, I was promised I, too, could become a great writer. But don't tell me that you believe that if someone learned to parrot the speech of Bill Gates that person would become a billionaire?

There are many things to admire in Dr. Milton Erickson's life: determination, self-will, confidence, hard work, seeing physical disabilities as challenges rather than handicaps. But his language patterns are not where I would advise anyone to begin if they wanted to model their life after Dr. Erickson's. But then I am not a believer in hypnotherapy as a way to find deep truths hidden in the unconscious mind.

It originated in the middle seventies, and over the past 20 years, several of the "models of human perception" were modified, or replaced. Like scientific theories, they evolve. .Currently, NLP contains many working models (in the sense that they can be used to teach other people) to perform various mystical things on your list, like therapy, hypnosis, induced memories, psychic reading, etc. For each one of those activities, the explanation given is quite reasonable regarding why it should work.

reply: I don't know of anyone who considers therapy, hypnosis, and induced memories to be in the same class as psychic readings. What kind of modeling leads to treating these items together?

*What makes NLP hard to validate in a scientific way is its recognition of the difference between different people, which in essence means that according to the person's behavior, he would be treated in a slightly different approach. It can be judged by the results, rather than by the theory. They claim very high success rates in helping people lose weight, or stop smoking. Unfortunately, even those claims are hard to validate scientifically (unless you can do it in a prison population). NLP relies *explicitly* on the placebo effect - if a person believes that a personal change is possible, then he will obtain it more easily than if he does not believe. So, the first step in a treatment, is usually to change the person's belief - i.e. to prepare a specially made placebo for him!*

reply: I must be missing something here.

The most comforting aspects about NLP practitioners is the belief that things should change fast - if a client did not get the change he was asking for within 1-3 sessions, than he should be left alone. Over the course of the years, because of legal and marketing considerations, many of the leading NLP practitioners decided to develop their private copyright brand name, e.g. DHE [Design Human Engineering™].

Armin Shmilovici

reply: I am sure our readers now have a much clearer understanding of NLP. Thank you.

reader comments:

Noah's ark

19 Sep 2002

I have spent a few happy evenings exploring your site, and find it quite entertaining, albeit somewhat distressing in the depths of human gullibility which lay therein revealed.

I noticed quite a bit of dialogue under the heading of Noah's Ark, mostly in favor of its existence, and I wanted to toss one more bit of fuel [gopher wood maybe?] on to the fire -- you may make such hay of this as you can; I have not seen this point raised elsewhere.

Specifically, some creationists and other literalists like to point out that the proportions of the Ark closely resemble that of a modern cruise ship.

Problem is, regardless of size, that shape--what we would think of as a basic boat or ship shape--is about the worst shape you could have for an unpowered, unsteerable vessel at sea, in any weather condition, let alone the tempestuous weather presumably prevailing during the purported Flood episode.

'Broaching' it is called--the tendency of any vessel to be turned by wind and waves until it is broadside to the seas, where it is rolled violently and helplessly, frequently to the point of capsizing, swamping,

or breaking up, and certainly to the point of severe structural stresses and extreme discomfort to the crew! The effect on hundreds of wild animals may be imagined....Loss of propulsion or steering during heavy weather is one of the greatest fears of the mariner [yes, I am one, a merchant marine officer], and is the reason that lifeboats are equipped with a simple device called a sea anchor, a drogue device of fabric shaped like a parachute, or in emergency, a simple bucket on a line, to keep the bow of the boat turned into the waves; and why modern inflatable liferafts are usually round [aside from ease of design of course]. I don't recall that the Ark specifications called for a sea anchor just in case the weather got rough, although I'm sure the diehards will adopt that possibility. I understand the word "Ark" itself signifies simply 'box'--verily, verily, I say unto you, a simple foursquare box design would have been much more seaworthy under the circumstances. Interestingly, the Greek flood myth--Deucalion taking the place of Noah, I believe--refers to him setting off in a simple wooden box, with his wife.

In conclusion then, the Ark was an extremely poor design for the job it was intended, which raises serious doubts about the wisdom of an Almighty God/Yahweh/Elohim who either is ignorant of, or completely disregards, some of the most fundamental principals of naval architecture. And you can't even work that up into a 'test of Noah's faith' dodge, as he wouldn't have known any better himself--at least not until about two hours into the voyage....

I hope you find this useful, informative, and amusing, and I extend in advance all permissions you may require to use the information herein for any educational, non-commercial, and hopefully inflammatory purpose as you see fit.

Sincerely,

Robert Minor

24 Jan 2001

I stumbled across your sight on Noah's Ark while researching another topic.

Well, I figured since so many well-meaning and intelligent people have spoken, I should throw in my two cents.

You make very good, logical points. However, your logic should lead you to understand that matters of faith cannot be explained logically. Likewise, those who have embraced an anti-religious bent will not accept any measure of proof (or a universe of circumstantial evidence) without attempting to disprove it. God works in circumstantial evidence (small things that SUGGEST his reality without coming right out and proving it). He doesn't work in absolute proofs. "Why?" Because it boils down to this. God wants something from us that He can't get by creating it OR showing himself to the general populace.

reply: If matters of faith cannot be explained logically, then why are you trying to explain it logically?

What could God want that He can't create for himself. Worship. Love. True and honest "I Love You" worship. If he created a group of people who did nothing but worship Him because they were created that way, it would be like you building a robot to worship you. There's no genuine love or worship. It's what he's programmed to do. For God to get the genuine worship He desires, He has to give us the most wonderful and dangerous gift of all, FREE WILL; the power to say, "I worship you," or "I don't worship you." Then, if we choose of our own FREE WILL to worship God, the praise is precious, truly worth something. God sent the flood because He saw that nearly everyone chose not to love Him. Likewise, the few who did choose to worship Him would certainly be persecuted and killed rather than changing anyone's mind. The Bible says that He flooded

the Earth because He saw the hardness of their hearts. With a world full of Godless creatures, God's creation would turn into a nightmare.

reply: I don't think your view of God does him much praise. Why would an omnipotent, omniscient being need to be worshipped? Your notion that God lacks something only we can give him makes God look weak and as if he were suffering from low self-esteem. I don't know about other readers, but your explanation sounds like the explanation some bad father might give as to why he had so many children even though he couldn't provide for them properly.

Imagine yourself in a world full of people who didn't believe in God. It wouldn't be some atheistic paradise. No one would feel any compunction about killing you. They have no God or punishment to worry about (believe it or not, most of the laws we follow today were created from natural laws spelled out in the Bible...a.k.a. given to us by God). No one would feel any compunction about stealing everything you own. What do they have to worry about?

reply: As I have said to other writers, if the only thing that keeps you from killing others and committing other atrocities is your belief in God, please please never abandon that belief! I agree that a world of only atheists would not be a paradise. But something like 90% of the world's population believe in God and the world isn't quite as blissful as you seem to think it should be if people fear God. We have laws against killing and stealing because we want to live and live well, without fear of being killed or robbed. If God changed the commandments tomorrow to allow killing and stealing, we'd still make them illegal.

I'm about as logical as anyone you'll ever meet. However, I am a Christian (I didn't say Methodist, Baptist, Catholic, etc. I said Christian.) because I was simply overwhelmed by the circumstantial evidence.

Understand: As much as you deeply wish NOT to believe, others WISH to believe. So, it stands on both sides of God.

While I'm sure you will have some serious flaming to do because of this letter, I felt compelled to write it to try to clear up some of the misconception about God (misconceptions often held by Christians themselves, oddly enough). It is my hope that you will attempt to read this with some measure of openness. And, despite your before-stated atheism,

God Bless You, David A. Smith

reply: I have a feeling I'm a bit more open about these matters than you are, David.

9 Dec 98

I just discovered your site and the discussion re Noah's ark. I enjoyed it immensely! I hope you'll enjoy the following story that happened to me. I lived in Turkey during 94, 95, 96 and part of 97. I once wandered into a conversation between two other Americans I knew there. They were both engineers, one a structural engineer, one mechanical. Both young, bright and capable in their disciplines. They were talking about Noah's ark. The mechanical engineer was talking about how Noah's ark had been found near Mt. Ararat, several hundred miles from where we were working. He was talking about how big the ark was, dimensions, etc. I was listening, the other engineer was listening. I kept waiting for the other shoe to fall and finally realized he was serious. Before I could catch myself, I laughed.

I said, "you can't be serious; you really believe that story literally, that he (Noah) gathered up all those animals and put them on an ark?" I looked to the structural engineer, he was not smiling. "You too," I said. Both of them believed the literal truth of the story. I had discovered many times before that people capable of believing stories like the one about Noah's ark are not necessarily stupid, but, nevertheless, it always surprises me when I see it happen. They seem to have the ability to shut down part of their normal reasoning ability when considering the Bible.

I told them that I too considered myself a Christian, but there was no way I could force myself to believe in a literal translation of the Bible. This was the first time religion had come up and my reactions that day put a coolness on my relationship with these two men. They were not the same around me after that. I could see them kind of pulling together, closing ranks. It was sad to me to have this happen. Sad for myself and sad because of the larger meaning of this incident. I believe Elaine Pagels talks about this "us" and "them" kind of religious phenomena in her book The Origin Of Satan.

Jim Russell

reply: Selective skepticism is quite common. I find many of my readers praise me for my critiques of New Age ideas, paranormal and psychic frauds, etc., but draw the line at religion. Many skeptics even defend drawing the line at religion as long as one bases one's belief completely on faith. The coolness of the response you received, however, is not necessarily a sign of drawing the line between us (who have faith) and them (who don't). It could be a sign that these men did not think their belief was a matter of faith, but one that had been established by suitable evidence and argument.

31 Jul 1996

Great work, but...

[re] Noah's Ark:

You really took the hard way to refute this claim. What you describe as "bigger than any supertanker we've ever seen" is actually smaller than you would expect - the bible specifies its dimensions which are in order of magnitude of 1,000,000 cubic feet - start from the bigger animals - and see how many of the 50,000 pairs may be squeezed in (+food for 6 months).

Avnimelech Rani

reply: I often take the hard way and am well known around these parts for swatting flies with sledgehammers.

21 Nov 1996

Did you look in the December 1996 issue of Popular Mechanics? Apparently it shows that scientists have spotted the remains of a huge ship 7,546 feet above sea level on a mountain 20 miles from Mount Ararat and along with the discovery, the remains of large drogue stones used to stabilize a large ship. That shows your article on Noah's Ark is flawed.

James Gonzales

reply: How do you "spot" a huge ship? Either you have found it or you haven't. Do these "scientists" you mention have names? You're sure you're not passing on another one of those stories from pilots or airplane passengers who "see" huge ships 20,000 feet below them? Anyway, do you really think a wooden ship could survive from the time of Noah? If a ship is found at an elevation of over 7,500 feet, which I doubt will be the case, how will these "scientists" know it's Noah's Ark? Do you think they'll find a brass plate with Noah's name?

30 Jan 1997

Your entry on Noah's Ark was interesting and brought up several points which I had never considered. I'm always interested in separating fact from fiction. However, I am troubled by some of your comments on religion at the beginning of the article. I think that considering the purpose of this forum (to expose the myths behind "truths" not supported by evidence), your comments on the rightness or wrongness of a god who wipes out all life (except for the ark) to be out of place since they are opinion drawn from "common sense".

reply: I don't know where you got the idea that I was conducting a "forum" or that my purpose is "to expose the myths behind truths not supported by evidence"....whatever that means. In any case, my comments

about a Perfect Being wiping out most of creation were meant to indicate that such behavior is inconsistent with the concept of perfection and infinite goodness, two attributes commonly attributed to the God of the Bible. As you must know, despite the fact that God is said to be ineffable, that has never stopped believers from talking about God. If a missionary is murdered by the very people he has devoted his life to helping, those who believe in God have no compunction against claiming that "God called him to heaven." The true believer would not say "I haven't a clue why God let this good man be killed." I have no problem with theodicy: if believers think they can explain the ways of God to humans, let them. But we atheists reserve the right to use logic, demand consistency in thinking and to offer alternative explanations for evil events. Also, if fundamentalists demand that the Bible be read literally, we have the right to point out absurdities and contradictions which a literal reading renders.

Answers to questions like "would a loving god do this" or "would a righteous god set an example like this" are not answerable because they are absolutely untestable. They are opinion based on belief.

reply: Being opinions does not protect them from critical analysis. Some opinions make sense; some don't. Some are well-founded; some are not. Some opinions are self-contradictory. Being untestable does not mean they do not have to maintain internal logical consistency in order to be plausible.

Your comments (in this forum) serve only to humiliate people of faith and color yourself as an anti-religion bigot who resorts to ad hominem (not sure if an attack on God is ad hominem!) attacks. Those attacks lessen your credibility, which is substantial from what I've read.

Kenneth Thomas

reply: I doubt that any of my comments cause humiliation to people of faith. On the other hand, I own up to being anti-religious, though I deny being a bigot but if it makes you feel good to call me a bigot, by all means, go ahead. And if you consider my demand to be coherent, logical and free from self-contradiction to be an ad hominem attack on God, then God help you and all your followers. You may wish to worship an irrational Being, but don't expect to be praised by other believers for your efforts.

19 Mar 1997

You have a fascinating website. In regards to your belief that it would be impossible for a flood to destroy all of civilization without leaving a trace you are mistaken.

reply: I wasn't aware I made such a claim. Thanks for letting me know.

Orson Scott Card published a book titled "Pastwatch." He puts forth the theory that the land bridge between Africa and the Arabian Peninsula also acted as an immense natural dam separating the ocean and what is now the red sea. When the ocean finally eroded away the top of the barrier, any people living on the other side would have experienced a flood of epic proportions. As for it destroying all of civilization, if the flood occurred early enough in history the potential tribes in that area might have been the only civilized people at that point of history.

Although, most of Card's book is science fiction and hippie drivel, there are quite a few interesting ideas in it. It is definitely worth reading

Kevin Butts

reply: I see. Well, I'm sure Mr. Card was playing with a full deck, so I won't question his hippie drivel or science fiction.

23 Jun 1997

Here is another interpretation of "Noah's Ark"

One issue that is often raised against Christianity is Noah's Ark and the Flood. Did it really happen? Did the flood really cover the whole world? Is there enough water on earth to cover all the land? Could the ark really hold two of every kind of animal in the world? Though these might be intimidating questions, the answer to each is a resounding, "Yes."

God said to Noah in Genesis 6:14-16, "So make yourself an ark of cypress wood; make rooms in it and coat it with pitch inside and out. This is how you are to build it: The ark is to be 450 feet long, 75 feet wide and 45 feet high. Make a roof for it and finish the ark to within 18 inches of the top. Put a door in the side of the ark and make lower, middle and upper decks" (NIV). According to God's Word, Noah built the ark. Eight people entered it and all humanity died in the ensuing flood.

Did the flood really happen? Yes. Jesus said in Matt. 24:37-39 that the flood happened. If you can't trust Jesus, you can't trust anyone. As far as physical evidence goes there are numerous sedimentary deposits world wide which suggest a universal flood. There are countless fossil deposits world wide (For fossilization to occur organisms must be buried rapidly with sediment.). Every major culture has a flood legend. Of over 200 flood legends, 95% say the flood was universal; 70% say survival depended upon a boat; 66% say the wickedness of man was the cause; 88% say there was a favored family; 66% say the remnant was warned; 67% say animals were also saved; 57% say the survivors ended up on a mountain; 35% say birds were sent out; 9% say eight people were saved; and 7% mention a rainbow.

Is there enough water to flood the entire earth? Absolutely! If the earth were perfectly spherical the oceans would cover all the land by more than a mile in depth. The biblical account is that it rained for 40 days and nights in which the floodgates of the heavens were opened up as well as the fountains from the earth (Gen. 7:11;8:2). There is a theory known as the canopy theory that states it had never rained on the earth up to the time of Noah and that a mist watered the plants (Gen. 2:6-6). The theory goes on to state that there may have been a heavy cloud or water vapor layer over the entire earth and that it was this canopy of water that became torrential rains during the flood period.

Did the flood cover all the earth? Yes it did. The depth of the flood waters is described in Gen. 7:19 as covering "all the high mountains under the entire heavens." Also, there are many references in the Bible to it being global: Gen. 6:1,4-5,12,13,17,19;7:4,6,10,19;8:3;9:15. There were 40 days of rain (Gen. 7:12), 110 days of flooding (Gen. 7:24) and 221 more days of draining (Gen. 8:1-5,13-14). That is a total of 371 days of flooding that covered the mountains. That could not be a local flood.

Could the ark really contain all the animals of the world? Again the answer is "Yes." But let's look at the last question in more detail. The ark took about 120 years to build. Noah was 480 years old when he began the work and he had the help of his wife, three sons, and his son's wives. He probably hired local people to help in the construction.

The dimensions of the ark have a ratio of six to one. The Ark was six times longer than it was wide. This is the best ratio for modern ship building. Model stability tests have shown that the design is stable for waves up to 200 feet high and that the ark could have rotated 900 and still righted itself.

The volume of the ark would be 450 feet long by 75 feet wide by 45 feet high. This equals 1,518,750 cubic feet and is comparable to 569 modern railroad boxcars. Therefore each boxcar, by comparison, would be $1,518,750 \div 569$, or 2,669 cubic feet of space. The average size of an animal on the earth is smaller than a cat. But, just to keep it safe let's consider the average size of an animal to be a sheep. The average double deck stock car holds 240 sheep. The Ark capacity would be about 569×240 equaling 136,560 animals of that size. However, that still is not accurate for our needs. Since most birds, reptiles, and amphibians are much smaller, let's double the boxcar capacity for them. Therefore, the boxcars could each hold 480 different kinds of birds, reptiles, amphibians.

Noah had to take two or seven of every kind of animal on the earth. Though it is not really known exactly what is meant by a biblical kind, it is generally considered to be animals that are fertile within their own groups. Any dog can breed with any dog, therefore, dogs are one kind. It would only be necessary to bring representatives of each kind since the parents could produce offspring that would carry the genetic information for all variations within their kind.

- *The total number of mammals would be 3,700 times two pair which equals 7,400 animals. 7,400 divided by 240 = 31 boxcars used.*
- *Since Gen. 7:3 says to take seven pairs of every bird then the total for birds would be 8,600 times two pair times 7 or 120,400 animals. $120,400 \div 480 = 250$ boxcars.*
- *The reptiles and amphibians would be 6,300 plus 2,500 or 8,800. 8,800 times two pair equals 17,600 animals. 17,600 divided by 480 = 37 boxcars.*

The total number of boxcars used would be 318 with a total number of animals at 145,400. There would be 251 boxcars left over. That means that only 44% of the ark would be used for storing the animals. Obviously, then, the rest of the space would be used for food for the people and animals and sleeping quarters. In addition, considering that insects are extremely small, it is easily conceivable that they could be housed in part of the remaining space.

It should also be considered that many animals can hibernate. Additionally, predators and prey have been known to habitat peacefully together during situations of stress like fire, flood, or earthquake. In the Ark, normal animal behavior would probably have been different from normal. Specialists in animal behavior have noted that animals can sense danger and have often migrated to escape it. Perhaps God used their migratory instincts to get them to the Ark.

Though this is only a brief analysis, it should present enough evidence that the Ark account is certainly within the realm of possibility.

no signature

reply: Dear anonymous: are you a reincarnation of a medieval casuist? In any case, you didn't need to argue to establish that the Ark account is within the realm of possibility. We concede that point. Now, where is your argument to establish that the account is within the realm of reasonable probability? (p.s. Why no signature? A reader notified me that the above can be found on the [Web Page of one Matthew J. Slick.](#))

7 Aug 1997

I must say that I am somewhat disappointed by your response to the anonymous "arkeologist" who stated that a global flood was in the realm of possibility. Therefore, I feel the need to write this response. In this, I will respond to his three major points.

Did the flood really happen?-He starts by quoting Jesus. However, Jesus also said that the mustard plant had the smallest seed and that the second coming would occur during the lifetimes of his disciples. I guess you can't trust

anybody. He then says that there is a great deal of physical evidence to support a global flood. However, he presents none of this evidence, apparently expecting us to take his word as gospel. He then mentions that "every major culture" has a flood myth. First of all, a thousand myths do not add up to a single fact. Second, if a flood really happened, why do they all differ on details? They don't even agree on the flood's universality.

Is there enough water to cover the earth?-The vapor canopy is remarkably flawed. It would take about 9 kilometers of water to cover Mount Everest. The air pressure at sea level is one atmosphere, or about 14.5 pounds per square inch. There would have to be enough vapor to produce 9 km of water. This vapor would add air pressure to the atmosphere; in fact, it would be the majority of the antediluvian atmosphere. This would be the equivalent of living 9 km underwater. Since the pressure increases by one atmosphere about every ten meters you go underwater, the vapor would add 900 atmospheres, or 13050 pounds per square inch, to the air pressure. And the only way to keep all this water from condensing would be to raise the temperature. The pressure and heat would surely be enough to kill life as we know it.

Could all the animals fit on the ark?-He first starts by saying that Noah could have hired locals to help him build the ark. However, this begs the question: Why? The locals knew why he was building the ark, so why would they expedite their own destruction? He then goes into storage issues. First of all, he says that 480 animals could have fit into an area equivalent to a modern-day boxcar. To a non-creationist mind, that seems a little crowded. In addition, his calculations are inaccurate.

I will start with the mammals. Since Genesis 7:2 states that Noah was to bring seven pairs of "clean" animals and only two "unclean" animals on the ark, and since Leviticus states that the only unclean animals are the camel, the coney(rabbit), the hare, and the swine, 3696 of the "kinds" would have been in seven pairs.

*3696 times 14 equals 51744.
51744 plus 8 equals 51752.
51752 divided by 480 equals 108 boxcars.*

I will concede that the birds would occupy 251 boxcars.

As for the reptiles and amphibians, since they were not unclean, they would have traveled in sevens.

*8800 times 14 equals 123200.
123200 divided by 480 equals 257 boxcars.*

108 plus 251 plus 257 equals 616 boxcars, or 8% more than the capacity of the ark. And this is without the marine life, which the anonymous casuist has

omitted from the ark without explaining how they could have survived the silt-choked, turbulent waters of the flood. He must have done this because he knew it would destroy his calculations, since the "other" marine life by itself would have occupied 803 boxcars.

I hope that I have shown that a global flood and Noah's ark are definitely within the realm of impossibility.

Chris Durrance

reply: I'm not sure exactly what you have shown. Boxcar math is not my speciality. I am sure, however, that the number of boxcars needed to hold the true believers who will find fault with your math and logic is incalculable.

nocebo and nocebo effect

Research has...shown that the nocebo effect can reverse the body's response to true medical treatment from positive to negative. (Root-Bernstein 1998)

A nocebo (Latin for "I will harm") is something that should be ineffective but which causes symptoms of ill health. A nocebo effect is an ill effect caused by the *suggestion* or *belief* that something is harmful. The term 'nocebo' became popular in the 1990s. Prior to that, both pleasant and harmful effects thought to be due to the power of suggestion were usually referred to as being due to [the placebo effect](#).

Because of ethical concerns, nocebos are not commonly used in medical practice or research. Thus, it is not unexpected that the nocebo effect is not well-established in the scientific literature. However, there are some anecdotes and some studies that are commonly appealed to in the literature to support its validity.

- More than two-thirds of 34 college students developed headaches when told that a non-existent electrical current passing through their heads could produce a headache.
- "Japanese researchers tested 57 high school boys for their sensitivity to allergens. The boys filled out questionnaires about past experiences with plants, including lacquer trees, which can cause itchy rashes much as poison oak and poison ivy do. Boys who reported having severe reactions to the poisonous trees were blindfolded. Researchers brushed one arm with leaves from a lacquer tree but told the boys they were chestnut tree leaves. The scientists stroked the other arm with chestnut tree leaves but said the foliage came from a lacquer tree. Within minutes the arm the boys believed to have been exposed to the poisonous tree began to react, turning red and developing a bumpy, itchy rash. In most cases the arm that had contact with the actual poison did not react."^{*}
- In the [Framingham Heart Study](#), women who believed they are prone to heart disease were nearly four times as likely to die as women with similar risk factors who didn't believe.^{*} (Voelker, Rebecca. "Nocebos Contribute to a Host of Ills." *Journal of the American Medical Association* 275 no. 5 (1996): 345-47.) [Of course, one might argue that the women in both groups had good intuitions. The objective risk factors may have been the same, but subjectively the women knew their bodies better than the objective tests could reveal.]
- C.K. Meador claimed that people who believe in voodoo may actually get sick and die because of their belief ("Hex Death: Voodoo Magic or

Persuasion?" *Southern Medical Journal* 85, no. 3 (1992): 244-47).

- "In one experiment, asthmatic patients breathed in a vapor that researchers told them was a chemical irritant or allergen. Nearly half of the patients experienced breathing problems, with a dozen developing full-blown attacks. They were "treated" with a substance they believed to be a bronchodilating medicine, and recovered immediately. In actuality, both the "irritant" and the "medicine" were a nebulized saltwater solution."^{*}

Arthur Barsky, a psychiatrist at Boston's Brigham and Women's Hospital, found in a recent review of the nocebo literature that *patient expectation* of adverse effects of treatment or of possible harmful side-effects of a drug, played a significant role in the outcome of treatment (Barsky et al. 2002).

Since patients' beliefs and fears may be generated by just about anything they come in contact with, it may well be that many things that are unattended to by many if not most physicians, such as the color of the pills they give, the type of uniform they wear, the words they use to give the patient information, the kind of room they place a patient in for recovery, etc., may be imbued with rich meaning for the patient and have profound effects for good or for ill on their response to treatment.

See related entry on [the placebo effect](#).

Mass Media Bunk

17

September 13, 2001. Many are claiming they see the face of Satan in an associated press photograph by Mark Phillips of the billowing smoke at the World Trade Center.

If you look closely, at the bottom you can also see Jerry Garcia playing the guitar.

Above Jerry is either an ancient Assyrian or Mycenaean warrior.

On the warrior's shoulder is a replica of the [face on mars](#).

On top of the head of the face on mars is Cartman of Southpark, tipped on his side or possibly it is a ring in the nose of a figure that resembles an earless George Bush or Robert Bork.

copyright [Mark D. Phillips](#)

Then again, this could be Satan. Or it may just be another case of [pareidolia](#) brought on by *daemonophilia* (excessive obsession with spirits).

In any case, this was all prophesized by Bob Dylan in 1981 in a song called "Angelina" where he wrote not only of "the tree of smoke" but: "His eyes were two slits would make any snake proud with a face that any painter would paint as he walked through the crowd." Some would say that this interpretation could be an example of [shoehorning](#), but they would be wrong. They obviously did not heed the warning in such lines as "There's a black Mercedes rolling through the combat zone, Your servants are half-dead, you're down to the bone," "I see pieces of men marching, trying to take heaven by force," "In the valley of the giants where the stars and stripes explode," and "Begging God for mercy and weeping in unholy places." How much more proof could anyone ask for?

note: Mark Phillips, who took the "devil in the smoke" photo, has photos of the

World Trade Center in all its glory for sale at his [website](#). He is donating much of the proceeds from the sale of these photographs to the Twin Towers Fund.

September 4, 2001. It used to be that the front page of the daily newspaper in a major metropolitan area would be devoted to newsworthy stories. Even today, when the tabloids have taken over both print and video journalism, the front page junk news is usually about something new. Not today. At least, not in today's *Sacramento Bee*. Today there are five stories on the front page of the Bee. Hewlett-Packard plans to merge with Compaq and become almost as big as IBM. A shark kills another swimmer on the East Coast. Enrollments at the local campus of California State University are swelling as a new school year begins. Our governor sponsors a charity that benefits children but is open to abuse by both the governor and contributors. Most people would agree that those are newsworthy stories. The fifth story on page one is tucked in the lower right hand corner and has the headline: **Web site gives scientists outlet for explaining the unexplainable**. The byline is Edie Lau, Bee science writer.

The story isn't about science but about a few people who are being catered to by [Charles Tart](#), "a leading expert on parapsychology." Tart started a web site over a year ago called [TASTE, The Archives of Scientists' Transcendent Experiences](#). We didn't think much of Taste [last year](#) and why the Bee considers this front page news this year is beyond me. Gary Condit must have given another bad interview and surely that should have been on the front page.

We have written about [Tart's so-called expertise as a scientist and parapsychologist](#), so we won't beat that dead horse again. Consider the headline and the byline of today's story. You would think the story has something to do with science. But science isn't in the business of cataloguing or explaining transcendent experiences (except by [neurologists](#))* nor is it in the business of "explaining the unexplainable." If it is purely subjective or non-empirical it is not a matter for [science](#). Yet, Tart continues to complain and whine about the fact that some scientists are afraid of being laughed at or fired should they reveal to their colleagues that God talks to them in a secret language or that they frequent alien spaceships or that the Virgin Mary appears to them every Friday the 13th. So he created a haven for these persecuted scientists, a place where they can anonymously and safely tell the world about their transcendent experiences. What he complains about is that scientists are not allowed to bring into their scientific work the stuff of their extra-scientific lives: their religious beliefs, their paranormal experiences, their transcendent ecstasies. Really? Do religious people complain that they are not allowed to bring in their scientific beliefs and practices to their churches, chapels, synagogues, mosques, etc.? If they did, who would listen to them? So why is anyone interested in Tart's complaint?

On the front page of his "online Journal," Tart claims that there is a stereotype that "real" scientists don't have spiritual, mystical or psychic experiences. Is this a stereotype or a personal delusion? Real scientists who write books about such things are can't-miss authors and guests on Oprah, Larry King and the other tabloid talk shows. Where has Tart been the past few years? He should read the latest issue of the [Skeptical Inquirer](#) (vol. 25, no. 5, September/October 2001), a special issue on Science and Religion. He should read it not for the main articles, since they all maintain that science and religion should be separate endeavors, but for the

references they make to recent popular books on religion by scientists. Hasn't he heard of [John Mack](#), the Harvard professor and [author](#) who believes in [alien abductions](#)? [Courtney Brown](#) is still at [Emory University](#), despite his constant [dabbling in the transcendent and paranormal](#). Hasn't Tart followed the success of scientist-authors like [Michael Behe](#), [William Dembski](#), [Robert Jastrow](#), [Leon Lederman](#), [Frank Tipler](#), [Paul Davies](#), et al.? Does he know nothing of the "real" [Templeton Fund](#)? or the [PewForum](#)? He certainly knows about the [Fetzer Institute](#) and the [Institute of Noetic Sciences](#), since he gets money from them. Whether he is feigning ignorance or not, Tart himself is trying to get on the bandwagon of Scientists Promoting Occult or Kooky Stories (SPOOKS) with his latest book called [*MIND SCIENCE: Meditation Training for Practical People*](#).

The so-called Journal that Tart has created is typical of his sloppy scientific work. The web site is simply a chat room where anyone can post a story. Tart has no way of knowing whether the people who write the stories are who they say they are or whether the stories are accounts of personal experiences, confabulations or pure fiction. I suspect he doesn't care. His real purpose seems to be propaganda for his personal delusion that he and others like him are persecuted for their weird beliefs. Anyone who has followed the pages of the Skeptic's [Refuge](#) and [Dictionary](#) for the past seven years knows that weird beliefs are honored in our society and that, if anything, scientists who espouse weird beliefs are likely to find their status elevated rather than find themselves needing an outlet like Charles Tart's unscientific journal.

The good, though old, news is that Tart is retired and is no longer feeding at the public trough (UC Davis, where he was a member of the psychology department for some 25 years). He now wastes the money of private donors who sponsor his [Institute for the Scientific Study of Consciousness](#) as he continues his quixotic quest for an altered state of being and a life without bureaucracy.

August 22, 2001. [The Utah State Bureau of Criminal Identification](#) (BCI) "thought it would be interesting" to look at the statistics they gather and check them against a few "urban legends." They may have had some fun, but in the process they have just muddied the waters regarding evidence for belief in the [full moon](#) being a causal factor in criminal behavior and domestic violence increasing significantly on [SuperBowl Sunday](#) (SBS). Not content to confuse the issue on these two topics, BCI added a third: according to their data, Mother's Day is almost as bad as SBS for violence against women by men. According to BCI, a mother is three times as likely to be assaulted by a man on Mother's Day as on any other day of the year. To their credit, BCI notes that their data can't even justifiably be applied to the entire state of Utah because more than half of the law enforcement agencies in the state don't supply the kind of reports that their "study" is based on. Fifty-seven of 111 reporting agencies did not participate in their Incident Based Reporting (IBR) program (see page 8 of [their report](#) for an explanation of IBR). This fact is not mentioned by Pat Reavy, who wrote an article for [Deseret New.com](#) entitled "Moon shines on crime- Full moon tied to hike in most types of crime."

Reavy does note that one of the eight categories studied by the BCI, homicide and manslaughter, had reports of only a small number of cases in the past five and one-half years. By defining 'day of a full moon' as "the day before, the day of and the day

after a full moon", the BCI was able to conclude that since 19 homicides or manslaughters occurred during a full moon and an average of about 5 on other days, there was a "startling" difference. Not quite. This means that over about 214 days (13 full moons * 3 days * 5.5 years) there were only 19 such crimes or an average of 0.09 crimes on full moon days versus 0.05 on other days. With such small absolute numbers, these relatively large percentage differences don't seem to be very significant. For example, if they had counted only the day of a full moon as a day of a full moon (instead of the day before, the day of and the day after) there would have been no manslaughters on the day of the full moon and they would not have gotten the "startling" result of a 220% difference. If nothing else, this kind of study makes it obvious why national rather than local surveys of crime data are essential to truly understanding whether there is anything significant about the full moon and its relationship to crime. In their [report \[pdf file, pp. 11-12\]](#), however, BCI baldly states: "There is more crime during a full moon." The difference between full moon days and non-days is 1.5 (or 2.86%) more crimes on full-moon days.

A couple of other interesting tidbits: robbery decreases 17.19% during a full moon and the graph and the data in the BCI report don't jibe. The graph says that the homicide rate on non-fullmoon days was 0.05 while the chart says it was 0.06. The graph says that on full moon days the homicide rate was the average of 0.01, 0.12 and 0.09, which is 0.07, but the chart says the rate was 0.09. Should we be comparing .05 to .07? or .06 to .09? How does either of these pair add up to a 53.16% difference? Finally, only 16 cases of homicide/manslaughter have been reported by the 54 reporting agencies during the first 6 months of 2001. We had six murders by one person in one day this week in Sacramento (August 20). The full moon was a couple of weeks ago (August 5), in case you're wondering. (**update:** We had another mass murder in Sacramento on September 8 by a security guard who shot and killed at least five people. The last full moon was on September 2.)

The claims regarding the SuperBowl ("There are more domestic assaults on Superbowl Sundays") and Mother's Day ("There are more domestic assaults on Mother's Day") are even more confusing because the report does not give the absolute numbers of assaults. The report is in average assaults per day. The average of 5 is given for assault on a wife on SBS; the average for other days is 4.4. I would think that SBS should be compared to all other Sundays, or Saturdays and Sundays, rather than to all other days of the week. Weekends may be significantly different than weekdays for domestic assaults. The BCI itself speculates--no, they call it a "no brainer" according to Reavy--that men drink excessively on SBS and that's why they are more violent on that day. If that were true, by the way, then New Year's Eve should be the most dangerous eve of the year for women, and a close second would be St. Patrick's Day. Yet, I've never heard anyone claim either of those days are particularly dangerous for women. Anyway, if there is any truth to the more alcohol means more domestic violence, I suggest that it's likely men drink more on the weekends than on weekdays--though I have no proof of this, except a few anecdotes, which seems to pass muster often enough in this arena.

Mother's Day is on a Sunday, too, of course, and I think it also should be compared to other Sundays or holidays rather than to all days. It is hard to use the BCI data to compare Mother's Day with SBS because they use different categories. Both use common-law wife and wife, but the SBS data uses 'girlfriend' and the Mother's Day data uses 'mother' as a category.

On SBS there are an average of 5 assaults on the wife; on Mother's day there is an average of 5.8 assaults on the wife. The average day sees 4.4 such assaults. Again, without knowing the absolute numbers of these assaults, which I suspect are fairly low, these differences may be very insignificant. I would not want to conclude from this data that a wife has a 16% greater chance of being assaulted by her husband on Mother's Day than on SBS.

On SBS there is an average of 1.6 assaults on common-law wives; on Mother's Day there is an average of 0.04 assaults on common-law wives. The average day sees 0.06 common-law wives assaulted. Without knowing the absolute numbers, I don't know what to make of this data. I certainly don't think they justify concluding that a common-law wife is 40 times more likely to be assaulted on SBS than on Mother's Day.

According to BCI, 6.8 girlfriends are assaulted on SBS, compared to 3.8 assaults on other days. Again, I'd like to see the SBS stat compared to all other Sundays, or Saturdays and Sundays. I'd also like to know what the absolute numbers were so I could better judge whether this difference is significant.

BCI tells us that a mother is three times more likely to be assaulted on Mother's Day as on any other day of the year. Of course, men may be three times more likely to be with their mother on mother's day than on any other given day. On the average day, a mother is no more likely to be assaulted than a common-law wife (0.06 per day). But on Mother's day men must leave their common-law wives to go assault their mothers; for, the assault rate goes down for common-law wives on Mother's Day.

By the way, BCI doesn't blame alcohol for the violence on Mother's Day. It is "tension" and "stress" due to "dealing with split families or divorce situations," according to Rob Hall, a police detective.* I wonder if he knows this "intuitively." He may also be the one who said, "It's a good thing Superbowl Sunday isn't on Mother's Day." I wonder if this study was done during a 3-day full moon.

August 13, 2001. Last night, while channel surfing the wasteland of cable television, I was rewarded by Black Entertainment Television (BET) and MSNBC. The former featured Peter Popoff and his wife giving away holy water from Russia in exchange for personal information on how to contact you. They were doing the faith healing shtick exposed by James Randi years ago.

In 1986 [Randi] exposed Peter Popoff, a TV evangelist with self-proclaimed divine powers. With help from volunteers, a video camera, and a radio scanner, he showed the world that Popoff's "power" was actually nothing more than a miniature receiver hidden in his ear, through which he received instructions from his wife Elizabeth backstage, who had previously pumped chosen members of the audience for information.*

Popoff calls [Randi a false prophet](#) and a deceiver and justifies his continued fakery by claiming that "Thousands upon thousands of people around the world have found Jesus Christ through this ministry." Despite Popoff's obvious fraud, no charges have

ever been brought against him, which is rather typical in this country. So-called "faith healers" have been given a free ticket by law enforcement to bilk anybody in the name of Jesus. The only other group that enjoys such special treatment in this country are the telepsychics like [Miss Cleo](#). Ordinary "psychics" who practice the fine art of grifting are often arrested for conning gullible people out of their jewelry or life savings.

The other reward I got last night was a re-run (4th or 5th time) by MSNBC of their program on [exorcists](#), featuring [Tom Brown](#) and [Bob Larson](#). Their game is to bring troubled people together and look for demons that are causing the trouble so they can exorcize them. MSNBC, in an effort to discourage people from trying this at home, slipped in a couple of clips of people being arrested for botched exorcisms in which they have done such things as smothered children and beaten women to death--in Jesus' name, of course. Brown and Larson have never killed anyone, as far as we know, but whether they help or harm people was not possible to discern from the program, since the "reporters" did no background checks or follow-ups on the people exorcised. They could have been mentally ill, actors, mentally ill actors, drug addicts, mentally ill drug addicts, or they may have been possessed, as the exorcists claimed. All the participants shown being exorcized seem to have seen the movie [The Exorcist](#) or one of the sequels. They all fell into the role of husky voiced Satan speaking from the depths featured in the film. But wouldn't a real journalist get a second opinion? Why should we take the word of interested parties like Brown and Larson that their subjects really were possessed and that they really released [Satan](#) from all these bodies? They might tend to be [self-deceived](#) and be guilty of [confirmation bias](#).

Those attending the exorcism sessions of Brown and Larson seemed a very sorry lot, indeed. Even sorer than those teary-eyed hand-clappers encouraging Peter and Elizabeth Popoff. These are desperate people and one can only wonder what stormy seas set them adrift and brought them to port at the feet of these snarling, drooling faith healers and exorcists. Such pitiful creatures nevertheless always seem to find [a receptive audience who believe they are witnessing miracles](#). I'm shocked that anyone would find the MSNBC program to be an "in-depth documentary" as one viewer thought. The program was superficial, shallow, and apparently produced by cynical people who think viewers can't handle the truth. No effort was made to find out what the truth might be. Instead of investigating those allegedly exorcized, MSNB just re-runs the original program.

reader comments:

Nostradamus

18 Jan 2000

To the esteemed professor of Sacramento City College, Mr. Robert Todd Carroll

Dear Sir!

I'm a swedish surfer who's just visited the Nostradamus page of your "sceptical" website, but I can't say I was rather impressed.

reply: You're not trying to butter me up, are you, so I won't try to squash you like a worm for disagreeing with me?

The sample quatrain (X,72) has "angelmois" [sic] (actually it's Angolmois) translated as "mongol" when it's obvious that what is meant in modern French is "angoumois" i.e. "from Angoulême" (look it up in a dictionary if you like!).

reply: That is what makes it so difficult to translate Nostradamus: you never know what version of French he is anticipating...until, of course a Swedish surfer comes along and sets you straight.

Consequently there's no "king of the mongols" who will rise from the dead. The concept of an undead Djingis Khan is also very unlike Nostradamus, whose 'visions' as rule carries a very ordinary type of content, so I simply don't understand where you got this hideous interpretation from.

reply: Actually, I haven't found any other versions, except for one that translated "le grand Roy d'Angolmois" as [Ghengis Khan](#), which I thought was a bit liberal.

Do you really think it is good debunking to make a poor mock of this fellow? Also, I'm not sure about the date presented. In my Swedish translation of Nostradamus (ed. Åke Ohlmarks, Stockholm, 1961) which claims to be based on the Rigaud edition of 1566, July 1990 and not 1999 is referred to. Anyhow, what ever is the correct one, the obvious interpretation I think would be that someone bound for greatness is meant to be born this year, ("from heaven will come [a] terrible king") re-evoking the spirit of "the great king of Angoulême" ("résurrection" of course also has a figurative meaning).

reply: Thanks for straightening that out. Someone bound for greatness was born in either 1990 or 1999. I think most of us equate falling from the sky with being born, too.

Interestingly enough, there has actually existed a certain Louis Antoine de Bourbon, duke of Angoulême (1775-1844) who was the eldest son of Charles X and though childless, the true heir to the French throne (which was instead taken over by Louis Philippe). He was also great hero of the counter-revolution, at times referring to himself as "Louis XIX". Not in the least trying to prove Nostradamus to 'be right', I find it nevertheless lamentable, if not to say embarrassing, to see a homepage dedicated to enlightenment, revert to such a simplistic explanation as of something literally 'falling out of the sky'. It makes for a prejudicial understanding of Nostradamus and the learning of his milieu.

reply: Yes, it is true. I do tend to take things too literally, especially when I am learning a milieu. But do you really think it is less prejudicial to give free reign to the imagination to interpret words any way we wish? In any case, I think you missed your calling; you've stumbled upon Nostradamus' prediction of the invention of bourbon.

Finally on the question of "Mars", Nostradamus is known more or less to use planetary constellations solely as a shrouded way of telling the time. The story goes he might not even have believed in astrology.

reply: Excellent.

I'm not certain of the significance of 'the reign of Mars' in this particular quatrain, but surely it has nothing to do with either warfare, Armageddon or anything likewise.

**Respectfully,
Apostata**

reply: Truer words n'er were spoke by prophet nor profiteer.

04 Dec 1999

One thing the Nostradamus cultists seem to have forgotten is that Nostradamus also made his "predictions" under the Julian calendar rather than the Gregorian calendar and that also would put a few massive holes into the veracity of the predictions as well.

Robert Hart

reply: You are correct. Nostradamus died in 1566 and the Gregorian calendar didn't come into use until 1582. Unfortunately, you cannot win

this one, Robert. The cultists will claim that Nostradamus had so much foresight that he foresaw that a new calendar would be put to use, so he made his predictions accordingly.

06 Dec 1999

Further to Mr. Robert Hart's comment of 4/12/99, and your subsequent reply, the Gregorian calendar only makes a change of two weeks. The famous prediction

"L'an mil neuf cens nonante neuf sept mois
Du ciel viendra grand Roy deffraieur
Resusciter le grand Roy d'Angolmois.
Avant apres Mars regner par bon heur.

The year 1999 seven months
From the sky will come the great King of Terror.
To resuscitate the great king of the Mongols.
Before and after Mars reigns by good luck."

is thus still nonsense, since July, the seventh month, is still well passed by the reckonings of both calendars.

And while on this subject, "deffraieur" is not the same as "d'effraieur" meaning "of terror" but rather means "defrayer" as in a payer of debts. I have no idea why this is supposed to bring about the end of the world. The apostrophe is usually added by believers in Nosty.

Keep up the good work,
Daniel Ucko

Zener cards

Zener cards are used by some [parapsychologists](#) to test [psychic](#) ability. There are five kinds of card: a star, three vertical wavy lines, a plus sign, a circle and a square. A deck of Zener cards consists of five of each symbol. The cards might be shuffled and the subject then tries to guess the order of the cards. Or a sender might look at a card and then try to [telepathically](#) communicate the perception to a receiver.

Since there are twenty-five cards in the deck and five kinds of card, there is a one in five chance (or 20% chance) that any given card is on top of the deck or being viewed by a sender. A correct "guess" is called a "hit". Anything significantly higher than 20% hits in the long run would indicate that something other than chance is at work. In the short run, higher percentages are expected by chance. Thus, if you get nine out of twenty-five correct (36%), that would NOT be statistically significant. If you got 36% correct over 100 trials through the deck, that *would be* statistically significant and would indicate that something else besides chance is going on. Maybe you're psychic, maybe you are unconsciously picking up cues, or maybe you're cheating!

[Try it.](#)

See related entries on [parapsychology](#), [psi psychics](#) and [telepathy](#).

- [How NOT to test your psychic ability](#) (it is essential that a large number of trials be done to get statistically significant results)

rods

Rods are insects caught in the act of flying by a video camera. Some [hoaxers or very imaginative people](#) have been maintaining that rods are actually some sort of [unknown life form of alien origin](#). But, according to Doug Yanega of the Entomology Department at the University of California at Riverside and a member of the Straight Dope Science Advisory Board, rods are

a videographic artifact based on the frame capture rate of the videocam versus the wingbeat frequency of the insects. Essentially what you see is several wingbeat cycles of the insect on each frame of the video, creating the illusion of a "rod" with bulges along its length. The blurred body of the insect as it moves forward forms the "rod," and the oscillation of the wings up and down form the bulges. Anyone with a video camera can duplicate the effect, if you shoot enough footage of flying insects from the right distance.*

Rods seem to be a favorite topic of [UFO and cryptozoology buffs](#). One of the more outspoken defenders of rods as aliens is [Jose Escamilla](#), host of the RoswellRods.com web site. Jose has even brought his story and films to The Learning Channel. Some hilarious photographs of "rods" have been posted on the Internet at the Escamilla site. My favorite is "[the swallow chases a rod](#)" which looks just like a bird going after an insect.

Wilhelm Reich & orgone energy

13 Apr 2000

I stumbled onto your site accidentally, looking for web pages concerning Orgone energy. I have done research into the truth of Orgone energy for 3 years now, and I must say it has a definite scientific basis. Although I was a bit perturbed at the tone your entry on Orgonomy took, being that it was overwhelmingly bitter and sarcastic, I assumed that it was well founded. Honestly, when someone first tried to talk to me about Orgone, I believed he was an idiot. Not so now. I can say, with 100% certainty, that, while much of Reich's work was incomplete and shoddy, it had more to do with lack of funding and equipment than any maliciousness or unsound thinking on his part. The concept of Orgone is a viable one, as I have seen it at work. One thing I would suggest you look into: A book called "Right Where You Are Sitting Now" by Robert Anton Wilson. One chapter is devoted to the vehemence with which "pseudoscience" is attacked by established beliefs, often on no other grounds than it doesn't fit in with accepted belief. I truly recommend reading that chapter, as it was the only truly interesting thing in the book.

John Gregory

reply: 100% certainty? How can I quarrel with that or [Robert Anton Wilson](#)?

9 Jun 1999

Dear bogus skeptic:

You have expressed your skepticism on the "orgone shooter" based on the following statement "The Food and Drug Administration not only declared that there is no such thing as orgone energy... "

Oh, I'm sure you're not referring to the same FDA that said that Cannabis Sativa, an herb used for healing for 5000 years, had no healing properties...and recently had to swallow its words...

For a skeptic, you sure are a sucker for anything that has the government-approval label on it.

Best regards,

A real skeptic (loosely translated as "whatever works, not what I think it's politically correct and MUST work...)

reply: I gave a few other reasons for being skeptical of the orgone shooter, but I suspect your affection for cannabis may have affected your ability to pay attention to them.

It may surprise you, but not all government officials are morons. I realize that some people assume that if the government says it is bad or useless, then it must be really good, especially if it relates to one's favorite recreational drug. However, this is not a very wise rule to live by, even for "real skeptics."

Aug 26 1998

Although James DeMeo's organization is the most vocal proponent of Reich's ideas, it's not the only one.

The medical and psycho-therapeutic side of Wilhelm Reich's alleged discoveries are promulgated most strongly by a much more conservative group called ["The American College of Orgonomy."](#) They primarily train psychiatrists in the use of Reich's character-analysis and in his more, ahem, esoteric techniques (some of which bear a strong resemblance to [Rolfing](#), although Reich developed his trick of "attacking the muscular armor" in the 1940s). In order to get the American College of Orgonomy's seal of approval, a therapist must first go through the therapy himself at least until he reaches the stage where he experiences "orgonotic streamings".

The American College of Orgonomy is nowhere nearly as evangelical as DeMeo's Orgone Biophysical Lab, and in fact goes out of its way to distance itself from DeMeo.

ouija board

23 Mar 2000

You say "the Ouija board is used in divination and spiritualism". In junior high school I found another use for the board: seduction. There you are in a dimly lit room with her hand on the planchette and your hand over hers. Why it's almost like holding hands! Then the final questions always seemed to be "should we neck?" And the answer was always "YES". I guarantee that it was not me moving the planchette at least some of the time.

Tim Boettcher

24 Mar 2000

Many years ago, I remember an "article" in MAD Magazine entitled "Things you never hear people say" or something like that.

The only one I remember was, "If there really is an afterlife, I'll bet the best way to contact it is through a plastic, mass-produced board game from Milton Bradley!"

An Unquiet Mind

A Memoir of Moods and Madness

by **Kay Redfield Jamison**
(New York: **Vintage Books**, 1997)
first published by Knopf in 1995

"Manic depression distorts moods and thoughts, incites dreadful behaviors, destroys the basis of rational thought, and too often erodes the desire and will to live."

It must have come as quite a shock to her patients to be told by their therapist that she had been suffering from manic depression herself for over thirty years. Perhaps an even greater shock was felt by many of her colleagues, since Dr. Jamison is one of the leading scholars and authorities on manic depression. The general public, being generally ignorant of mental illness and kept that way by mass media emphasis on sex and violence, probably won't read the book, but if they did there would be the danger that it would feed the stereotype of the therapist as loon. As it is, the book will probably be read mostly by those in the mental health professions, mentally ill patients and their loved ones. If a film is ever made which is true to Jamison's life, it would be one of those rare films which does not depict a mentally ill person as a troubled artist, mass murderer, brilliant criminal, amusing rebel, blathering idiot, drug addict or alcoholic. Even so, such a film would still be misleading, as is Jamison's book and her emphasis on the relationship of madness and creative genius. This is a favorite topic of hers. (See her [*Touched With Fire: Manic Depressive Illness and the Artistic Temperament.*](#))

The book begins brilliantly with a metaphor for her illness taken from an actual experience: a child witness to an Air Force plane leaving its defiant flight against the gravity of earth and diving from the beautiful sky past a schoolyard full of playful innocents into the woods, leaving behind nothing but vapors in the sky and ashes on the ground. The book then moves rapidly, somewhat clinically if poetically and literately, through the stages of the author's life, her lifelong battle with her illness and her emergence as a mentally ill person with a Ph.D. in psychology, co-author of a standard text book on manic depression, recognized scholar in the academic world, and tenured professor at Johns Hopkins University. Jamison emerges from her struggles with manic depression as a woman with a love of the arts and poetry, with more than a fair share of romantic liaisons, and a marriage now

going into its second decade. In short, the book should give hope to those who suffer from a similar neurochemical dysfunction; for, she has shown that it is possible to live a good life despite being mentally ill. She makes it clear that this is possible only because she takes her medicine (lithium) and goes to therapy. Unfortunately and disappointingly, she does not describe what kind of therapy she has undergone. Perhaps she will write another popular book whose focus is on the various therapies which have been scientifically examined and which have been proven effective, along with pharmacological treatment, for various forms of mental illness.

Manic depression is a horrible disease. The horrors of years spent wishing you were dead, incapable of getting out of bed or reading a newspaper, of withdrawal from friends and family, of fear of meeting anyone, and of trying to kill yourself, are documented, as are the years of euphoric sexual energy, creativity, productivity, wild spending sprees, of friends and family withdrawing from you, of inexpressible joy at feeling high and mighty, consumed by incomprehensible thoughts and doomed to absurd behavior. The disease controls your thoughts and actions: you are not a person who is free to think and do as you wish and in accord with your talents. But with medication and therapy, a good deal of control over your life is possible. Yet, one of the great fears of many manic-depressives is that drugs will control them (or others will use drugs to control them) and therapy will brainwash them (forcing them to fit some mold of the "normal" person). With treatment from the right kind of physician and therapist, these fears are unwarranted. Good medicine and good therapy can give a person control over his or her life, not take it away. Of all Jamison's messages, I think this is the most important one.

The internal horror of mental illness experienced by the ill person cannot be equaled by the external horror experienced by family, friends, lovers and any unfortunate strangers who happen to be in the wrong place at the wrong time. Still, the harm done to those close to the mentally ill is measurable and is very large. Jamison describes the suicide watches put on her. Several lives must have been consumed by the fear that she would kill herself. She mentions their love and concern with affection, but I wonder if she can know the Hell she put them through any more than they could know her kind of Hell.

With mania there are other problems, such as feelings of persecution, indiscreet sexual behavior, spending sprees and risky investments, racing thoughts and rapid speech, sleeplessness but still maintaining boundless energy, inflated and unrealistic feelings of power or capacity for achievement, feelings of special communications from God or the dead, and, in some cases, psychotic symptoms such as hallucinations and delusions. (Delusion is defined by mental health people as being a false belief which can't be changed by argument or evidence.) Jamison describes in general terms the euphoria she feels while manic, a euphoria comparable to a cocaine high and apparently just as addictive. She describes in general terms that her behavior caused others a great deal of trouble, but she does not begin to give the reader a sense of what it must be like to love as a sister, friend or lover someone who

is very bright but has lost any semblance of good sense or judgment. Jamison's spending sprees did not make her homeless. She has a brother who mopped up after her manic episodes, loaned her money and enabled her to maintain her wealth. A manic spending spree by a less educated and poorer manic-depressive can wipe out a lifetime of accumulated wealth in a few weeks. The mental health system seems to be designed to make sure nobody interferes with the patient's right to go bankrupt and become homeless.

Because of the tireless work of the American Civil Liberties Union and individual messiahs such as Thomas Szasz, the legal system in California (where Jamison had her first major breakdown) makes sure that the patient is protected from meddling and greedy family members, friends and loved ones. The mental health system seems to have been designed by lawyers for lawyers. The social context of mental illness is ignored in favor of protecting individual rights. The patient determines whether she wants treatment, even though she may be incapable of making a good judgment about mundane matters. The patient determines whether the doctor can talk to any family member or friend about the patient, even though she may be incapable of telling the truth to the doctor as to what exactly has been going on in her life. A family member who gets a call from a merchant saying he is going to the district attorney with felony charges against a relative for passing a \$10,000 bad check during a spending spree cannot even talk to the patient's doctor about it, unless the patient gives permission. Often, the paranoid delusions that accompany extreme mania preclude the patient from trusting her most trustworthy friends and family members. The patient determines whether she talks to anyone. The patient decides whether anyone is notified about her condition or when she will be discharged from the hospital. If you want to know about a loved one who is being treated for mental illness, you will have to read about it in the papers. As one psychiatrist I know put it: *the patient has the right to die with her rights on*. The patient's right to be protected from evil relatives has been the paradigm for creating mental health law. The one right which has been ignored by the lawmakers and defenders of patient rights is *the right to proper treatment*. Proper treatment requires knowledge of the patient's past behavior and good judgment on the part of mental health professionals regarding how much to involve family and friends in getting information helpful in making the diagnosis. Confidentiality laws, however well-intentioned, are often a major hindrance to proper treatment.

Jamison touches on these issues but she does not give the reader the sense that she fully appreciates the Hell she has put others through. Intellectually, she clearly understands how she has harmed others, and she expresses concern for them, but it is apparent that she is her own main concern. Her egocentrism and vanity may be survival defense mechanisms or they may be manifestations of her illness. In any case, these traits are not very charming or endearing, but they do not interfere with her ability to describe manic depression from the inside and give hope for a good life to those who suffer the same *rotten luck*, as one of her paramours put it..

Jamison does not pretend that manic depression can be cured or that the manic-depressive can become relieved of all symptoms once and for all by some sort of magic cocktail of drugs and therapy. There is no magic to be worked here. It is all hard work, constant struggle, battling the demons within and the ignorant and unsympathetic without. Feelings of guilt for thinking and acting as you do, even though your thoughts and actions are mainly determined by your brain chemistry, are hard to overcome. Dealing with the blame others put on you for the thoughts and actions you cannot control is very hard. When a friend and colleague, a psychiatrist, tells you that he is "*deeply disappointed*" in you for having attempted to kill yourself, you realize how deep the ignorance runs in our society. It is not just those whose highest cultural endeavor is listening to talk radio or TV who are without knowledge; it is often the professionals themselves who demonstrate the most ignorance, the ones who are supposed to know and understand better than the rest of us just what mental illness is and how to treat persons with brain diseases. Books such as Jamison's are essential to overcoming this almost total ignorance regarding mental illness. Only those who have been to Hell know what Hell is like. If you needed a road map to escape from Hell, who would you buy it from? From one who lives there or from one who has read about it in his study in north Paradise?

Manic depression is a disease which is biological in its origins. There is also strong evidence that there is a genetic basis for the illness. There is also evidence that lithium, the most common drug used in treatment for the disease, can cause birth defects. Think of the complications this means for a woman who wants to have children. If I go off the drug and get pregnant, what will happen if I have a manic episode during the pregnancy? If I stay on the drug while pregnant, what will happen if my fetus is adversely affected? If I have a child, will the child be manic depressive? What kind of mother can I be if I am ill? Eventually, perhaps another question will be askable: if a genetic test indicates my fetus has the gene for manic depression, should I abort? Add to these dilemmas, the comment of a psychiatrist who tells you that you should not even *think* about having children and you have a blueprint for a condo in Hell.

Hell is fueled not only by the fire in the brain. Jamison herself was the child of a mentally ill father, one who functioned quite well for many years before becoming hopelessly mad. Not only would Jamison not exist if her father had taken the advice of this psychiatrist, but the world would be a much duller place, less creative and diverse, certainly the worse for it if the mentally ill did not reproduce. The desire for a "pure" race of balanced brains is a vision of Lilliputian proportions, worthy of a small mind living in small, tidy, dull world. It does not take long to whip up [a list of great artists, poets, writers, athletes, etc.](#) who have suffered from neurochemical dysfunction. It is obvious that the species and human culture have benefited from the mentally ill and their progeny. To suggest that anyone with a neurochemical dysfunction should not even *think* of having children is an idea so preposterous as to deserve laughter rather than the rage it is likely to evoke from a mentally ill

woman of Jamison's character and disposition. Who knows what great achievements would not have been conceived much less attempted but for mania? And who knows what foolish endeavors have been avoided because of the depression of world leaders? What would our libraries and museums look like if we removed everything created by a mentally ill person or the descendent of a mentally ill person? But while laughing at the suggestion that we should practice eugenics with the mentally ill, we should not get so carried away as to think that somehow having a neurochemical problem is a ticket to creativity or genius. Even if it were, the pain and suffering that accompany the diseases of the brain would not justify a policy of breeding creative geniuses.

The reason it is easy to come up with a list of great insane people is probably not because the genes which are major causal factors in neurochemical problems are also the genes which are the major causal factors in creativity or intelligence. The reason is much more mundane. There are lots of famous people and there are lots of people with neurochemical problems; that the two lists should overlap a great number of times is to be expected. The vast majority of the mentally ill are probably of ordinary intelligence and creativity. We never hear of them because they are not eloquent, do not create great works of art, etc. We only hear about mental illness from eloquent people: either the highly educated professionals who care for them or the highly articulate and creative ones among them, or, as in Dr. Jamison's case, both. Studies which claim there are a disproportionate number of poets, artists, composers, etc., who suffered from depression or manic depression may be accurate, though it is difficult to establish just what percentage of any population is "mentally ill." Also, I don't know how many poets would appreciate being told that their affinity for alliterative allusions may be due to a neurotransmitter malfunction.

Many of the "ordinary" mentally ill persons roam our streets and sleep in ditches. They scavenge the trash bins in our cities and towns. Some of them have children and it is monstrous to suggest that none of these people should have been born or given birth. The shame on humanity is not from its mentally ill, but from the rest of us because of the way we treat them...or rather because of the way we *mistreat* or *fail to treat* the less fortunate among us. But the lack of proper treatment for a large percentage of the mentally ill is a social problem and is not Jamison's area of specialization. Clinical problems, however, are her specialty.

The main clinical problem with manic depression is not that it can't be treated effectively with drugs and therapy, but that many patients don't take their medications and many others don't seek treatment. The latter is due to ignorance, "poor medical advice, stigma, or fear of personal and professional reprisals." The former is due to a combination of several factors. Often there is knowledge that drugs are used to make people docile and easy to handle in institutions. Drugs have sometimes aggravated mental illness and done irreparable damage. There is knowledge that drugs might take an edge off

one's intelligence and memory, as well as diminish physical coordination. Medicine often has painful and annoying physical side effects. When medicine works and one is feeling good, one often quits the medicine because one comes to believe medicine is no longer necessary. Medicine prevents the euphoria and burst of creative energy of manic episodes, which are extremely pleasant and addictive. There is a cultural taboo against using drugs, as well as a cultural stereotyping of people as weak and lacking character if they cannot solve their own problems by determination and guts. Anyone should be able to control their thoughts and actions by an act of will. In short, there are numerous personal, social and cultural hindrances to proper treatment of manic depression. These hindrances often outweigh the knowledge that there is hope for the manic depressive through proper medication and therapy. Jamison should know. Even though she is an expert in the field, it took a near death experience (not the mystical kind, but the kind caused by intentionally taking an overdose of lithium), to awaken her to the fact that though she hated taking lithium, the alternative was worse.

Jamison is a survivor, literally. If we are to believe her, she is much more. She had several love affairs of romantic novel proportions and all of them with brilliant psychiatrists. She has a Ph.D. in psychology yet is a "professor of psychiatry." She is not medically trained, but she has been so extraordinary that she has been put in charge of medical facilities. And when she has been wronged, it was never trivial but monumental. She loves poetry and is fond of sprinkling literary quotes throughout her book. She obviously likes to drop names and present herself as a very important person. There isn't a murmur of humility which comes through as one reads her unquiet memoir. In short, her account comes across as a very honest description of a manic depressive.

In conclusion, the reader might wonder why I have not used the American Psychiatric Association's preferred moniker of "bipolar disorder." Dr. Jamison's book is not a *memoir of moods and bipolar disorder*. Jamison prefers the term "madness" to bipolar and I don't blame her. 'Bipolar' is very clean and impersonal. It is useful mainly for diagnostic classification. (Jamison describes herself in DSMV-IV terms as having ***bipolar I disorder; recurrent, severe with psychotic features, full interepisode recovery***. DSMV-IV is the 4th edition of the American Psychiatric Association's *Diagnostic and Statistical Manual*.) Imagine your physician telling you that you have "oncology disorder B-6" rather than breast cancer. I don't like 'madness' or 'manic depression' very much either. I prefer 'neurochemical dysfunction', 'neurochemical imbalance' or 'neurophysical damage', or even 'brain disorder'. Such terms are not very descriptive and they are very vague, but they do not imply that there is a single cause which gives rise to all forms of the disease. 'Manic depression' or 'melancholia' call attention to the behavior of the ill person and may encourage the belief that the ill person is not ill but needs a good laugh, a good kick in the butt or some serious jail time. Such responses to the mentally ill are too typical and indicate a profound and pathological type of ignorance. Being ignorant is a condition a person can remedy by an act of will to study the issue. Being controlled by a dysfunctioning brain is

not.

reader comments:

out-of-body experiences

30 Nov 2000

Hello, First of all you have an awesome website, it's amazing how much people allow themselves to be diluted [deluded?] by things they wish were true.

There is something I heard that is pretty interesting about how people who have near death or "life after death" experiences that think they see a "white tunnel of light to heaven." A professor at USC told me that people see that when there is a lack of oxygen to the visual cortex (V1). The fovea, or center of our vision corresponds to the neurons in the visual cortex closest to the spinal cord. As you move out towards the peripheral of our visual fields, so move the corresponding neurons out towards the edges of the visual cortex. So when the brain is deprived of oxygen, the outside neurons "turn off" or go black first. The "dying" patient experiences a blackness encroaching upon his visual field that starts at the edges and contracts towards the center of the vision. It's not so much a white tunnel, but a black surrounding area. There is also weird stuff going on with perceived contrast, and the dilation of the pupils, so instead of seeing the ceiling of the operating room, you might just see bright, white light, surrounded by darkness. Essentially you get tunnel vision, in high contrast. My professor suggested this as an explanation for why people report that they flew into a tunnel of white light. This is only his theory, but he is a professor of neurobiology at USC.

I think the scientific explanations for things are almost always much cooler than the mystical and magical ones.

Chris Sowick

6 Apr 2000

I read the reader comments about OBE, and I wanted to add something...

When I was rather young (about 5 years old, I'm guessing), I had the same physical experiences that another reader mentioned: physical paralysis, electrical tingling, loud, high-pitched rushing/humming sound, sensation of weightlessness... I had no idea that they were supposedly related to out-of-body experiences until 10 to 15 years later when I read a book on the subject that mentioned when you have those sensations, you're very close to dissociating.

The only other time I've had those sensations again was just a few years ago when I dreamed I had an out-of-body experience. As soon as it started occurring in the dream, I became completely conscious and had those strange sensations again. When I was young, it scared me quite badly and it happened fairly frequently. I never "left my body" or had an experience of another entity being present. (I completely understand, though, why people who don't know better might think aliens or demons are involved.) As far as I know, those sensations merely result from a slight glitch in the mechanism that disconnects your brain from the rest of your body when you fall asleep. If you are not unconscious when it happens, you have some really odd sensory information (or a lack thereof) to deal with. This neural disconnection is what results in those strange sensations.

Something I would like to see mentioned is the supposed gathering of information by people during an OBE that they could not have otherwise known.

*Thank you for maintaining such a fantastic sceptical resource! It's too bad healthy scepticism doesn't spread like scientific ignorance does (check out <http://www.alexchiu.com/> for complete details on how to live forever! *ha*).*

Donald Wilson

reply: Mr. Chiu sells magnetic finger and toe rings that allegedly make one immortal. He claims "the fingers and toes are the negative (-) and positive (+) terminals of your body. When placing the magnetic devices, the magnetic pole on the right side of the human body is opposite to the left side. With a opposite pole on each side of the human body, blood circulation and electric current of the body are enhanced. The enhanced blood circulation and electric current increase metabolism in order to fight the aging process." Last August, I wrote him and asked: "If I go to Brazil or New Zealand in the southern hemisphere, will I need to repolarize my rings to account for the different pull on my cells in other side of the world? Or do I just put the left hand ring on the right hand and vice versa?"

Someone named Richard wrote back for Alex and told me "You wear the rings the same way everywhere in the world." I figure that this answer got me as close as I'll ever get to an out-of-body experience.

05 Nov 1998

Being a skeptic myself, I loved reading through your no-nonsense articles. But when I got to the section on OBEs, I noticed that you left quite a bit of really interesting info out. Perhaps you haven't fully researched the subject.

A lot of people commonly regard OBEs as purely mental experiences.

"Hmmm... the book told me to sit in lotus position, forget about my body, and visualize flight... yeah, this is sort of nice."

Any real research into OBEs would have dug up a whole list of violent PHYSICAL symptoms that occur before going "out of body". They include:

- The sensation of weightlessness*
- Feeling like your body is shaking uncontrollably, as if with a seizure or extreme hunger*
- Hearing loud, insistent noises such as the rumbling of freight trains, or gunshots, directly between your ears*
- Feeling a painless, undeniable shocking sensation, as if your entire body has just completed a huge, powerful electric circuit, that lasts for minutes at a time*

Can I give you any sources? No, since I did all my research at least a year ago. But these symptoms were reported by almost everyone who claimed to have had an OBE, so it wouldn't be too hard to find now.

Being a skeptic, I assumed that these sensations were all grossly exaggerated feelings (a lightheaded feeling instead of weightlessness, tingling skin instead of electric shock) until I experienced it firsthand. Then again the next day, the next, and the next.

*I'm still having these sensations on a regular basis. And guess what? I'm still a skeptic. But I'm willing to admit that there must be *something* causing this phenomenon, even if it's only medical. You owe it to your readers to offer more info than you have; otherwise skeptics will continue to regard OBEs as optimistic daydreams; while the people who actually experience them will continue to turn into religious fanatics, having no other explanation.*

Please consider adding more info.

Eris Portiarti

reply: I understand your concern. I picked up a book on OBEs that promised anyone could have one and discovered that daydreaming counts as an out-of-body experience. This is not a well-defined subject area, to say the least. Some of the characteristics you listed have been used to identify alien abductions. Some are clearly related to medical problems. So much that has been written on this subject has been written by New Age dreamers that I think I will leave it up to others to do more research on the subject.

23 Jun 1996

Dear Mr. Carroll,

I have read your material on OBEs with interest. While I make no claims to be a scientist, I have had an unique experience, which I still can not explain. Perhaps it was a dream, a shared dream.

While asleep one evening in 1981, I thought I left my body and traveled to the foot of my mother's bed (110 miles away). My mother was very ill at the time. As I stood at the end of the bed she asked me if I would let her die. I told her, "No. Not unless you let me help you get better." She agreed to those conditions. Then it felt as if I was speeding back to my own bed. I woke up with the feeling that something inexplicable had happened. I woke my wife and told her of my experience. We said nothing more about it.

Six months later my mother came to live with my wife and me. After she had been with us for about a week she told us the strangest story while we were having our morning coffee. It was the same experience that I had had. However, she said that in her -- dream -- I appeared like an angel at the foot of her bed.

She clarified that she had had her experience the same day that I had had mine.

There is no physical proof that I can provide. Unlike some of the authors you have cited I have no reason to make a profit from having had the experience. To my mother, who is now deceased, my wife and me the experience seemed real. I am curious if there is another explanation.

Falko Schilling

reply: It could have been an OBE or a [lucid dream](#), but I doubt it.

For a son to dream about visiting his very ill mother, or a very ill mother to dream about her son visiting her, is not surprising or unusual. That two such dreams occurred on the same night under such circumstances does not seem to require an extraordinary explanation. Your mother was very ill but lived too far away for you to be with her as much as you wanted to. She desired her son to be with her during her time of extreme need. Dreams fulfilling such basic needs and desires are common, not uncommon.

On the other hand, when you say that six months after your dreams she told you that she had "the same experience" on "the same day" that you had your dream, I have to wonder. You guys must keep pretty good diaries to be so precise on the dates. How many people can look back six months and remember what they did on a particular day, much less what they

dreamed? Even so, it would be very unusual if neither you nor your wife had mentioned your dream to your mother between the time you had it and six months later when she came to live with you. You considered it to be a very unusual type of dream and woke your wife to tell her about it. Even if you did not mention the dream to your mother, it is possible that your wife did. Or, maybe you don't even remember mentioning the dream to your mother. We often fill in our memories of events and dreams after the fact and what we remember as having happened or having been in our dream often happened *after* the event or dream occurred.

When you say your mother's experience was the "same" do you mean that her dream was identical to your dream except for the angel bit? (By the way, I'd be honored if my mother dreamed of me as an angel! She must have thought you were a pretty good son.) If her dream had the same dialogue in it as yours, my best guess would be that you or your wife had told her of the dialogue and that what she remembered as her dream was actually what you or your wife had told her of your dream. Wives don't always tell husbands everything. We don't always remember what we said to whom and when we said it. Verification later may be erroneous, yet we take it to be certain. Our subjective certainty in these matters is often so strong as to make us prefer an explanation in terms of OBEs or dream telepathy rather than assume that it is more likely that we have cued each other but don't remember doing so. So-called psychic performers, or mentalists, often amaze people with what they "know" about them, when much of what they "know" was revealed by their subjects. The subjects don't remember revealing information about themselves, even though the time lapse between their revelations and the psychic's "reading their mind" is only a few minutes. (See the entry on [cold reading](#).)

Finally, as to the motivation of those who have strange and seemingly inexplicable experiences, I would note that most similar stories are not told by people who are trying to profit by it. They are truly baffled by what seems to them something beyond co-incidence and they seriously seek an explanation. Even though having a profit motive would be good grounds for being skeptical of such claims, not having a profit motive is not a very significant fact in evaluating the nature of such claims.

tachyons and takionics

A tachyon is a [theoretical particle](#) or wave which travels faster than the speed of light. [Tachyons](#) exist in a theoretical world where objects have negative mass and time goes backwards. Tachyon energy is used to scan "subspace", among other things, on the sci-fi fantasy program, Star Trek Voyager. So far, there is no empirical evidence for the existence of tachyons. "If they do exist, tachyons would be extremely difficult to utilize under our current understanding of physics," says NASA scientist Tom Bridgman. Despite being theoretical and, if real, difficult to utilize, and if utilized, of unknown value, tachyons are the main ingredient in a feature line of New Age products that range from beads, belts and shoe inserts, to sweatbands, power pillows, massage oils and vials of tachyon water. And, of course, there are books, such as *Tachyon Energy: A New [Paradigm](#) in [Holistic](#) Healing* by Gabriel Cousens and David Wagner (2000).

A few enterprising New Agers claim that they know tachyons exist and they have harnessed its power. For example, [Fred Pulver](#) who runs the [Carbondale Center for Macrobiotic Studies](#) (formerly known as Biotech Industries of Carbondale Colorado) claims to know that "The Tachyon Field supplies the [energy](#) needs of all living organisms until balance is achieved, then it eases until called upon again. As it is needed, and a depletion occurs, it rushes in until balance is achieved once again."¹ But just in case Nature fails to keep you in tachyon balance, you can get all the tachyon power you need from one of Biotech's swell takionic products. (The reason for the spelling difference has to do with the fact that common words such as 'tachyon' cannot be trademarked and 'tachyonized' was [taken](#). 'Takion' and 'takionic' can be trademarked and thereby used to identify one's products.)

Pulver makes some incredible claims. For example,

Motors have been built which draw upon the Tachyon Field for energy. They exhibit strange behavior, such as increasing in speed the longer they run, even though they are connected to no visible power source.²

Where are these motors? No one has seen them but we are to take it on faith that they exist. Perhaps they are in the vehicles bringing all those [UFOs](#) to earth for the [cattle mutilations](#) and [reproductive experiments](#).

Here's another claim:

Takionic products, with their aligned atomic polarities,

enhance the body's natural ability to draw from the Tachyon Field for its energy needs. Athletes have discovered that Takionic products allow them to perform faster and longer, and shorten recovery time. As conduits for input from the Tachyon Field, Takionic products are proving themselves in the sports performance arena.

Who are these athletes? The same ones who wear magnetic shoes and wear crystals to ward off bad energy?

What is this "Tachyon Field"?

The Tachyon Field is extremely dense. This density cannot be measured because it is a negative state, mirroring the universe of positive density which we inhabit. The theory of negative density is supported by an observable phenomenon: a perpetually expanding physical universe which is brought into being through pressure exerted by expansion of the invisible one. Pressure exerted by the Tachyon Field upon our physical universe indicates the existence of an invisible, highly dense universe, the Tachyon Field.³

The tachyon field may be dense but it would have to go a long way to match the density of an "alternative physicist who finds this stuff compelling. There seems to be something missing here--such as a fundamental grasp of reality. We are asked to believe in an invisible universe causing pressure on ours, thereby forming energy which "cannot be proven by instrumentation currently available" but which we can use to explain just about anything we want.

But wait, there's more!

Tachyon theory is holistic because it accepts the notion of two interdependent universes which are actually indivisible: the visible, sub-light speed universe and an invisible, faster-than-light one. Tachyon theory also substantiates omnipresence, a purely metaphysical concept. God is omnipresent (simultaneously existing everywhere). Omnipresent existence can only occur at faster-than-light speeds, since slower-than-light travel takes time to cross space. Therefore, omnipresence can only be an attribute of a Tachyon Universe where time and space are uniform.⁴

Pulver is also an "alternative" metaphysician! The speculation seems infinite. "The nervous system and brain are nothing but an extremely sophisticated antenna and receiver to absorb, process and transform the resources of the Tachyon Field." "Healers have learned to access the Tachyon Field's

resources for its healing powers more successfully than the average person has."

All the above claims are by way of introduction by their author to the line of [takionic products](#) he has for sale. New Age Energy is especially marketable in alternative health care, where the products to make us healthy and happy are as boundless as the imagination, as endless as New Age Energy itself. (Note: the following are 2002 prices and may not be accurate any more.) There are takionic beads, 10 for \$118.95, which are said to have antennae which "focus the beneficial tachyon energy". There is a takionic belt for \$268.95 which is said to help improve circulation and increase strength.. Takionic water comes in a small vial for \$27.95 and is "pure and cluster-free".

Another New Age business, [Advanced Tachyon Technologies \(ATT\)](#) of Santa Rosa, California, offers a much broader array of products, including some for cats and dogs. ATT has products which can enhance your love-life (including one called panther juice) and your athletic skills, not that the two are mutually exclusive. They have products to ease your pain and improve your brain. They have chakra balancing kits for those who would like a little takionic boost to their meditation. You can purchase a personal tachionized cocoon for \$396 or a Tachyonized Silk Meditation Wrap for \$298 to use while meditating "with your lover before making love."

reader comments:

past life regression

28 Mar 1999

Although not a particularly spiritual or religious person myself, I pride myself on being open-minded. I found your dismissal of many ideas to be too simplistic and fairly inaccurate.

reply: Thanks for noticing.

Several friends of mine have gone through past life regressions, a couple of them only having done it out of curiosity, and not one of them reported having been a King, Queen or famous poet. In fact, nearly every one of them reported having had pretty mundane "past lives" such as librarian, housewife, banker, etc. Also, the most notable aspect of the regressions was that each person I knew who had done it came away from the experience in an improved condition. One friend felt he had gained deeper insight into relationship issues with his father, another with his wife. One female friend who had undergone years of psychological care with little result came away a changed woman and discontinued her treatment. Five years later she still appears to be psychologically sound (it's no wonder psychologists want to shut these people down!)

reply: I'm not sure whom you think the psychologists are trying to shut down, but as far as I know many psychologists use past life regression in their therapy. Most of them are probably as impressed as you are with the apparent success of their treatments. There is a danger of [self-deception](#) when one uses [personal validation](#), anecdotes and [testimonials](#) in lieu of [controlled studies](#).

Also, my limited understanding of metaphysics as explained to me by this female friend (now a devout believer) is that [reincarnation](#) is not viewed as a bad thing, or a good thing, just a necessary thing and similar to attaining Nirvana, the evolutionary goal is to reach a point where one no longer has to reincarnate. Personally, I have no particular belief on the subject, no direct personal experience with such phenomena, and my one and only attempt at meditation left me with a headache of epic proportions. However, it bears consideration that ancient worshippers once regarded the sun as a god. Today, no one considers the sun particularly sacred, but that makes it no less real, and no less vital to our existence.

reply: I'm not sure why the sun's importance despite not being regarded as divine bears consideration, but I think it is interesting that [some past life regression therapists](#) do not believe in reincarnation and do not think that their patients need to believe in it either.

Forty-two percent of the world's current population claims to have had some sort of paranormal experience. That kind of eyewitness accounting would put a suspect behind bars in any courtroom, regardless of the absence of physical evidence.

reply: Yes, and therefore fifty-eight percent don't claim to have had a paranormal experience. If more eyewitnesses see nothing, whom should we believe?

You might also consider that science changes its mind far [more] often than spiritual experience does. One can find amazingly similar accounts of near-death experiences, past life remembrances and ghostly sightings throughout history and across cultural lines. Science is constantly disproving itself.

reply: The similarity in accounts can be explained by shared expectations created by shared experiences with books, movies, stories, etc. Changing one's mind when the evidence warrants it is a sign of maturity and intelligence. "A foolish consistency is the hobgoblin of small minds." Ralph Waldo Emerson

If you are questioning such phenomena for the sake of expanding your mental horizons then more power to you. I believe nothing should be taken at face value, even skepticism itself. If you are simply enjoying the role of raining on someone else's mystical parade, it begs the question "Why?" The existence of a spiritual world is the unanswerable question, but if believing in one helps people to live their lives in this world, what possible difference could that make to you? You claim that such "mediums" between this world and the next are simply preying on the credulity of people for profit. Well, I assume all the proceeds from your books are not going directly to the Home for Little Wandering Skeptics. Does that mean you're preying on people's fears for the same reason?

reply: What does it mean to say that "nothing should be taken at face value"? That nothing is as it appears to be? That everything is a matter of taste? That there is no essential difference between truth and falsity? That we should stand by and let frauds work their deceptions because after all one of them might be a true miracle worker?

Why stoop to the ad hominem? I don't begrudge anyone making money, if they do so honestly. And I do not claim that everyone I write about is a fraud preying on the innocent. Many of those I write about truly believe in what they are doing. Many truly believe they have "gifts", ranging from

the "gift" of healing to the "gift" of seeing the future. Should I stand by and say nothing about anything simply because somebody might be benefiting from a delusionary belief?

On the other side, I get many letters thanking me for helping them see things in a different light and for making their lives better.

Another tactic I find interesting is the fact that you consistently use put-downs and condescension when referring to anyone who holds a spiritual belief, a trait I find commonplace among skeptical friends of mine. Yet I almost never encounter that attitude when talking with more spiritual friends. They couldn't care less whether or not I see things their way, and accept my laissez-faire attitude without reproach.

reply: I suppose you mean 'constantly', not 'consistently'. I hope you don't consider my correcting you a put-down or condescension. Since you have not presented any specific examples, I can't defend myself except to say that many people consider criticism of their ideas and beliefs to be personal attacks and put-downs. I certainly do not intend to refrain from criticizing ideas and beliefs for fear of hurting someone's feelings. I try to mock only the arrogant and the dogmatic.

My intent is not to criticize your tone, so much as it is to wonder at the source of it. I know many highly intelligent, educated and well-reasoning folks who believe in their own spirituality. Certainly skeptics have not cornered the market on that, and referring to spiritualist and religious believers as though they were a pack of ignorant children led easily around by the nose in order to make your case is simply a misrepresentation of the situation (something I believe you find distasteful in the average spiritualist).

reply: I think you are the one doing the misrepresenting.

You give a number of alternate explanations as to why such events take place, but no empirical evidence to back it up. You sound as if you are supposing that people experience deja vu as a result of present day remembrances, yet offer no reason for it except, I assume, that you believe it to be so. You claim that a soul is unnecessary. Well, so are humans (the universe got on quite nicely without us for billions of years) but here we are. I do not advocate the acceptance or rejection of any particular belief system, but I do think a little more respectfulness would not be out of order. You could do one of two things Admit that although you are entitled to your beliefs and may be absolutely correct, it is possible that our limited human faculties really do inhibit a true understanding of the scope of our world. Or you could just concentrate on selling more books.

Paula Coviello

reply: It is always nice to hear from someone who doesn't like put-downs

and is respectful of other people's opinions, especially when they differ from her own.

the penile plethysmograph (PPG)

The penile plethysmograph (PPG) is a machine for measuring changes in the circumference of the penis. A stretchable band with mercury in it is fitted around the subject's penis. The band is connected to a machine with a video screen and data recorder. Any changes in penis size, even those not felt by the subject, are recorded while the subject views sexually suggestive or pornographic pictures, slides, or movies, or listens to audio tapes with descriptions of such things as children being molested. Computer software is used to develop graphs showing "the degree of arousal to each stimulus." The machine costs about \$8,000 and was first developed in Czechoslovakia to prevent draft dodgers from claiming they were gay just to avoid military duty. Farrall Instruments Inc., of Grand Island, Nebraska, manufactures the device and in 1993 had sold most of the 400 units then in use in sex-offender treatment centers in some 40 states. Medical Monitoring Systems of New Jersey is also one of the leading PPG manufacturers. Another vendor of the PPG is Behavioral Technology Inc. in Salt Lake City. In addition to the United States, the device is being used in China, Hong Kong, Norway, Britain, Brazil and Spain.

The theory behind the device is described by Dr. Eugenia Gullick

The plethysmograph . . . directly measures the outside evidence of sexual arousal. We know-- it's established throughout the literature that when a man becomes sexually aroused--there is engorgement of the penis. It's a one-to-one relationship.

In a polygraph, galvanic skin responses are measured, and we have to make a leap of logic to think that galvanic skin response is related to anxiety, and therefore truthfulness. And it is that jump in logic that leads to a lack of reliability at times with that instrument

We know when the penis becomes engorged, we are measuring sexual arousal. So it's much more akin to ... blood pressure measurement. ([State of North Carolina v. Robert Earl Spence](#))

This much everyone seems to agree on: the device measures penile engorgement. Any male who has awakened with an erection knows, however, that penile engorgement is not always a measure of sexual arousal. On the other hand, most males would probably acknowledge that penile engorgement occurring while watching pornographic movies is due to sexual arousal.

What utility could such a device possibly have? Two uses have already been mentioned: to weed out false gays and to treat of sex-offenders. The latter is sometimes done in conjunction with aversion therapy, which involves subjecting patients to electric shocks or foul odors while being shown sexually suggestive pictures. The hope is that the treatment will dull the patient's interest in sexy materials. Psychologists use the PPG to measure the success of the therapy.

Submission to a PPG has been made a condition of parole for certain sex offenders. The PPG has been used in child-custody cases to determine that a father is or is not likely to abuse his child, and in sentencing decisions for sex offenders. It has even been given to children as young as 10 who had abused other children. The latter was done in Phoenix, Arizona, with no evidence either that the test was useful or that it would not be harmful when given to children. Not everyone submits quietly to the PPG requirements, however. Officials in Old Town, Maine, had to pay nearly a million dollars to a policeman who was threatened with firing for refusing to submit to a PPG.

Researchers at the University of Georgia have used the PPG to test the claim that homophobic men are latent homosexuals. In their study of 64 exclusively heterosexual men (self-identified), 66 percent of the non-homophobic group showed no significant arousal while watching a male homosexual video, while only 20 percent of the homophobic men showed little or no evidence of arousal. This University study has not aroused much interest elsewhere, however.

Finally,

there is an area where this device makes a valuable contribution: that of sorting out organic from psychogenic impotence. This is done by measuring changes in penile circumference during sleep, with increases expected during REM sleep. Men with psychogenic impotence still show erections, while those with an organic problem don't. It works. I once set up a lab in a psychiatry dept. at U. of Penn. to do this (Dave Bunnell, personal correspondence).

where's the science?

Scientifically, what are we to make of such a device? Well, the machine can measure response time to a stimulus and it can measure change in penile girth over time. Apparently, it is assumed that the more quickly aroused and the greater the engorgement the higher the "arousal level." Apparently, it is also assumed by many practitioners that any "arousal level" when viewing or listening to descriptions of naked children or adults having sex with children is "deviant." Yet, according to studies done by the inventor of the PPG, Dr.

Kurt Freund, "many so called *normal* men who have not committed illegal sex acts show considerable arousal to stimuli depicting naked children or children involved in sexual activity."* And, in one [court case](#), Dr. Michael Tyson, a clinical and forensic psychologist specializing in the field of sexual criminal behavior, testified that "the vast majority of individuals who commit sexual offenses against children are not sexually aroused by stimulus material involving children." His expert adversary in that case, Dr. Gullick, claimed that "the plethysmograph has been extensively studied and recently shown to be ninety-five percent accurate in discriminating between individuals who had committed sexual offenses against children and a control group that was randomly drawn from the population." Yet, other experts have claimed that there are "studies in which the devices have failed to detect nearly one out of three known sex offenders tested."

It seems to be the case that the device has been the subject of many scientific studies and the results have been mixed, to put it kindly. The reliability and utility of the device have been argued in court and penile plethysmographic evidence has been declared inadmissible because of its "questionable reliability." The case in which Dr. Tyson testified was heard by the North Carolina Court of Appeals. That Appeals Court upheld a lower court's exclusion of testimony by Dr. Gullick because her testimony was based upon the use of the penile plethysmograph. The defendant in the case was accused of sexually molesting his 5-year old stepdaughter. He called Dr. Gullick to testify that his "arousal pattern" when tested on the plethysmograph indicated that he was not aroused by children. Presumably, the defense believed that this was strong evidence that he didn't molest the child. The trial court ruled that "Dr. Gullick would be permitted to testify as to any opinions which were not based on the plethysmograph." The Appeals Court agreed with the trial court that "the instrument was of questionable reliability; that the testimony was not relevant; and that even if relevant, its probative value was outweighed by its prejudicial effect."

We agree with the trial court that the evidence before it by no means established the reliability of the plethysmograph; there is a substantial difference of opinion within the scientific community regarding the plethysmograph's reliability to measure sexual deviancy....

In the present case, plethysmograph testing formed the basis for Dr. Gullick's opinion that defendant was not sexually aroused by children, thereby making it less likely that he committed the acts charged. In view of the lack of general acceptance of the plethysmograph's validity and utility and therefore, its reliability for forensic purposes in the scientific community in which it is employed, we hold that the trial court did not abuse its discretion in finding defendant's plethysmograph testing data insufficiently reliable to provide a basis for the opinion testimony which

defendant sought to elicit from Dr. Gullick. ([State of North Carolina v. Robert Earl Spencer](#))

Dr. Tyson testified in the Spencer case that it was "generally accepted in the mental health community by both proponents and opponents of the plethysmograph *that the plethysmograph data does not give any evidence that is useful in determining whether an individual did or did not commit a specific act.* He also noted that "there is substantial disagreement as to the extent to which the penile response is subject to voluntary control and as to whether the penile response as measured by the plethysmograph can then be generalized to anything else pertaining to sexual behavior." Putting it mildly, Dr. Tyson claims that the plethysmograph has very limited forensic utility. It seems clear that evidence based on the PPG has no business in the courtroom, either to exculpate or incriminate.

Nevertheless, there is a whole industry of therapists who treat sex offenders and think the PPG will assist them "in determining whether someone who has committed a sex crime has a pattern of deviant sexual interests." Therapists use the PPG to help them devise treatment programs and to measure the success of their treatment. All this is done without any concern, apparently, that there is no compelling evidence that *sexual arousal or non-arousal from pictures or sounds* significantly correlates with *criminal deviant behavior.* There is no compelling evidence that a person who gets aroused by pictures or sounds is significantly more likely to commit sex crimes than one who does not get aroused. On the other hand, there is no compelling evidence that a person who does *not* get aroused by pictures or sounds is significantly *less* likely to commit sex crimes than one who does get aroused.

Still, the PPG can provide some information which might prove useful to a sex-offender therapist. The computer software used with the PPG enables the tester to develop graphs that indicate whether the subject is more aroused by males than by females, by children than by adults, by coerced than by consensual sex, etc. The therapeutic controversy begins, however, as soon as the therapist tries to convert "arousal levels" to anything meaningful, such as claims that a sex-offender is "cured" or is "responding positively to treatment." This is in addition to the controversy already mentioned over using the PPG in conjunction with aversion therapy.

One glaring problem with the use of the PPG is the lack of standardized materials to use as stimuli for subjects, a factor which clearly biases the data. Therapists vary greatly in the kind of materials they use to arouse subjects. Some materials are rather tame, e.g., nude adults, children in underwear or bathing suits. Others use hardcore pornography, including depictions of rape and pedophilia. Furthermore, there is no standard of "deviancy" for arousal. Worse, if therapists can define certain arousal as deviant, they can then suggest treatments for the deviancy as well as having the power to declare when the "deviant" is "cured." Convicted sex-offenders are in no position to

protest either declarations that they have "deviant arousals" or treatments forced upon them in the name of curing them of the "disease" of "deviant arousal."

More objectionable than the questionable scientific validity of the device, however, are the moral and legal questions its use raises. Some of the materials would probably be illegal on the open market because they constitute child pornography. Much of the material is morally objectionable. Some of the uses of the device raise constitutional issues. For example, submission to the PPG test as a condition for employment, for enlistment into the armed forces, or for granting custody of children. Some penal institutions have made submission to the PPG a condition of parole, even though the device's usefulness as a predictor of behavior is unproven. The practice has been upheld by the [Seventh Circuit Court of Appeals](#). Parole Boards have great latitude in establishing conditions for parole. These conditions do not have to meet the same rigorous standards as are required before something allegedly scientific can be admitted as evidence in a trial. Nor do the normal liberties and constitutional protections of citizenship automatically apply to one being paroled.

From a scientific, moral and legal point of view, what should matter is whether a person *gives in* to perverse desires and *commits* sex crimes. It is neither immoral nor a crime to get aroused. Furthermore, being aroused is not identical to having a desire. A man or woman may be aroused by the sight of animals copulating or be aroused by a film of a woman eating a banana and a man eating a fig in particularly provocative ways. Still, they may have no desire to engage in bestiality or have sex with a bowl of fruit. A heterosexual man or woman may be aroused by the sight of lesbians engaging in oral sex, but have no desire to have sex with lesbians or in the presence of lesbians. And, if Dr. Tyson is correct, apparently there are many "normal" men who are aroused by photos of naked children but have no desire to have sex with children. And there are many pedophiles who are not aroused by photos of naked children. The PPG measures *arousal*, not *desire*, though many sex-offender therapists seem to identify arousal with desire. These therapists, therefore, may be engaging in little more than wishful thinking when they think that because they witness a decrease in arousal they have evidence for a decrease in desire, which they correctly correlate with a decreased likelihood of acting on that desire. Decreased arousal may not be strong evidence for decreased tendency to engage in criminal sex acts. Strong arousal need not imply strong desire for what causes the arousal; and weak arousal need not imply weak desire. Furthermore, no test can determine whether a person will act on his feelings and desires. Nevertheless, many of those who treat sex offenders swear by the PPG even though there is no compelling evidence that PPG readings validly indicate a tendency to commit or not commit sex crimes.

penile plethysmograph

30 May 2000

Hello, I'm the member of the committee of the organization of the Czech transgendered people Transforum. We've found your article about using PPG in diagnostic. I'd like to let you know that this machine is used in diagnostics of transsexuals (both Females to Males and Males to Females) here in the Czech republic.

Some of the doctors ask the clients to undergo the test with PPG as the obligatory test for making a diagnosis of transsexuality! They show erotic photos to transsexuals. Of course, we transsexuals consider this to be total nonsense. They think it is science They don't even consider the possibility of homosexual transsexuals oh, well.

We consider this test to be very humiliating and at the same time absolutely useless in these cases. What's your opinion? Will you tell us, please.

Thanks.

O.R.

<http://move.to/transforum/>

reply: I think your doctors are very confused about sex and transgendering if they are measuring arousal to help them make a decision as to whether to proceed with the treatments.

10 Mar 2000

I have a skeptical reference for the subject penile plethysmograph and related matters. It is "Sexual Instrumentation", IEEE Transactions on Biomedical Engineering Vol. BME-30, No.6, June 1983. pp 309-319.

This article is an applied review of sexual instrumentation, including the PPG. The paper is quite illuminating.

Steve Lutes

I am a psychologist in NY. Graduate of SUNY Buffalo. I've become more skeptical over the years.

I've received some heavy handed treatment of a certain powerful bureaucrats who insist that retarded individuals should be hooked up to penile plethysmographs to see if they're pedophiles. . . It's unbelievable! When you question their assumptions about this, they come back with veiled threats and ad hominem arguments.

The power of these people is scary.

Keep up the good work. . .

6 Nov 1996

Your argument holds true for the unauthorized use of the device in a prison or child custody situations, but in other cases it is a revolutionary and standardized method of determining the etiology of one's criminal persuasion.

reply: Revolutionary, perhaps, but in no way a standardized method of determining the etiology of anything, except perhaps the gullibility of soldiers, cops, prosecutors, parole boards, psychologists and social workers.

I think your "skeptical" cry to ban the device is little more than a witch hunt to eradicate its use.

reply: Thank you for noticing my "cry." Most people miss it. In any case, I haven't called for a "ban" on anything. You are partly right, though; I would like to eradicate the abuse of the PPG and see less wishful thinking and self-delusion in the world.

Perhaps addressing the inappropriate reasons for using the test should be focused on rather than the actual nuts-and-bolts of the setup.

Jim Roche, Seattle, WA

reply: I don't see why one can't do both.

Mr. Roche's follow up:

11 Nov 1996

You missed my whole point, charlie. Let me break it down to you. You popped up after an Infoseek search for the word "plethysmograph." I work in a residential care unit for witnessed sex offenders who for one reason or another stand incompetent to stand trial. They each received this test (albeit perhaps by an overzealous practitioner) to assess their compatibility with a community living environment. To make it simple, if they proved stimulated by a snapshot of a naked infant, their placement would be as far from infants as

was possible. This expands to protect the public from any pursuits, because their conduct shows that they have low impulse control, and respond vigorously to stimuli that they see as appealing. ok? ok. I'm sure you're glad that there is a way, despite all of the financial, psychological, and bureaucratic hangups, to keep the predators away from your family and friends. Right? Thanks, jimr.

reply: "Residential care unit?" Is that the euphemism we now use for psychiatric facilities for sex-offenders? What kind of facility would consider placing "witnessed sex offenders who are incompetent to stand trial" anywhere in any community, except the community of other "witnessed sex offenders" and their caretakers? If your facility does, then I think the community needs to be protected from your facility as well.

31 Dec 1997

From 1982-1988, I was the Director of the Psychophysiological lab at the Sexual Behavior Clinic in New York City. I personally (not through a technician) assessed and treated over 700 adolescent and adult sex offenders. After reading your piece on the plethysmograph, I have a few comments:

- 1. Plethysmograph data is totally useless for determining guilt or innocence regarding deviant sexual acts. It would be like using a personality test to convict someone of burglary.*
- 2. Plethysmographic data have no diagnostic value of any kind.*
- 3. About one-third of offenders show no arousal in the lab.*
- 4. The proper stimuli to use are not pictures, but taped fantasies. Ideally taped fantasies spoken by the offender themselves, describing the offenders' own fantasies as well as contrived ones.*
- 5. The value in plethysmographic assessment is to aid the offender in learning how to control erection responses during deviant fantasy. that is it. It has no value in "seeing if the treatment worked." Treatment should not be court-ordered. The best outcomes I've seen were post-adjudication, when there was no coercion involving treatment. I had the occasion to do some treatment with post-adjudication offenders at a detention facility in Bucks County, PA.*
- 6. The plethymograph most definitely has value in diagnosing organic versus psychogenic impotence. A study by Dr. Charles Fisher in 1965 determined that 1,000 out of 1,000 healthy men tested had penile erection responses during REM sleep. When there is lack of response, that indicates further evaluation by a urologist. So it is useful as a screening device.*

In summary, I agree with many of your concerns regarding the plethysmograph. I may have more direct, hands-on experience with this device than anyone in this country, and I've spoken against its abuses for some time now. But don't throw it away completely. It still has some limited, though functional use.

personology

10 Aug 1999

Your article was very interesting, however, you didn't seem to have gotten the information that we connect our work to biology, physiology, genetics, and a number of other true sciences. Our work is more tangible than is psychology or even the medical profession.

My husband, William F. Burtis, trained Naomi Tickle in a "Crash course" type of classroom, at her request. She stated she wanted to use personology as an adjunct to her "color consulting business". She tried to teach personology classes, but because she did not study long enough to understand the intricacies of our work she did not succeed. George Roman is currently a student of Bill Burtis' and so not fully trained as yet. Bill Whiteside, as far as I am aware, has used his knowledge of personology in Sales Training seminars, and been quite successful. However, he has not been involved in the research as of late, and I don't believe I know of any personologists that he has trained.

Teaching a subject causes any instructor to have to learn more and dig deeper into their subject, constantly. That is true if they want to be a truly knowledgeable teacher on any subject. You apparently interviewed people who are very familiar with the subject but not aware of all the connections and research that has been done in the area. Mr. Burtis has been working in personology for almost 45 years. He studied with Jones, and with Robert and Elizabeth Whiteside. He helped Robert Whiteside validate the 68 traits and was in the group who categorized the traits into groups. He and I are currently teaching several personologist, have graduated many, and are continuing the research as best we can with no funding to assist us. Other personologists are doing their own individual studies and findings.

We would welcome the chance to test our work with any of the other "accepted" personality tests out there. Most of our clients (who have had other tests) tell us their personology analysis was much more helpful because it was so specific. Our profiles fit ONLY the person for whom they were designed. They are not biased by the person's feelings about themselves, or by us for the most part, because we put the profile together from cell proportions compared to cell proportions. It's all in the head, face, hands, and body. I am sure there is still an enormous amount of information to be discovered about our work. I welcome all the help we can get. I also welcome anyone who would like to do further "scientific tests and research" on our work. I know it would prove itself

true!!

The reason you don't find it in any of your "scientific" studies books is because it is so unique there are really no "peer groups" with which to compare it. And it was and is used by the "everyday" people and not by the hard scientists. I'd love to an in depth scientific study happen. We have little money and even less time, but someday you will see structure-function "Personology" worldwide. And it is NOT like astrology or phrenology. It is like physiognomy and psychology and genetics and physics and biology and anatomy! Its real, it works. Ask any sports coach, ballet coach, or tennis coach, etc, if structure doesn't play a HUGE role in champions. Ask a race horse trainer. Structure equals function! That is a fact. Humans have the ability to CHOOSE how to use their structure but when under pressure we revert to our innate patterns.

If you'd like more information on this subject call my husband William F. Burtis, M.S. (831-476-1632) He is probably the world's most knowledgeable person on the subject of personology. Both its history and what is going on currently, as he is still involved in it.

Sincerely, Janelle M. Heyes-Burtis

reply: Personology doesn't seem that unique to me that it couldn't be tested. In fact, as mentioned in the entry, these ideas have already had their day in the past under different names.

The Philadelphia Experiment

If we are to believe [Carl] Allen, our naval hierarchy abandoned sanity and historical precedent by conducting an experiment of enormous importance in broad daylight using a badly needed destroyer escort vessel . . . If someone were to write a book telling the real story, its title might be *The Philadelphia Hoax: Project Gullibility* (Robert A. Goerman)

The Philadelphia Experiment is an alleged United States Navy experiment (Project Rainbow) done on October 28, 1943. According to legend, the destroyer [USS Eldridge](#) was made invisible, dematerialized, and [teleported](#) from Philadelphia, Pennsylvania, to Norfolk, Virginia, and back again to the Philadelphia Naval Yard. The experiment allegedly had such terrible side effects, such as making sailors invisible and causing them to go mad, that the Navy quit exploring this exciting new technology.

The experiment was allegedly done by Dr. Franklin Reno as an application of Einstein's unified field theory. The experiment supposedly demonstrated a successful connection between gravity and electromagnetism: *electromagnetic space-time warping*.

[The Navy denies that it ever did such a test.](#) The denial is taken as proof by the conspiratorially minded that the experiment must have really occurred. The less gullible ask, *Where did this story come from?*

The story is a mixture of fact, fiction, speculation, and madness.

The facts are that the Navy does all kinds of experiments, many of them secret. Many of these experiments attempt to find military applications for the latest discoveries or theories in physics, such as Einstein's unified field theory. It seems to be a fact that the Navy was experimenting with "invisibility" in 1943, but not with making ships disappear. Edward Dudgeon, who says he was there on the *U.S.S. Engstrom*, claims that they hoped to make our ships "invisible to magnetic torpedoes by de-Gaussing them." Dudgeon described the procedure: to UFO investigator [Jaques Vallee](#):

They sent the crew ashore and they wrapped the vessel in big cables, then they sent high voltages through these cables to scramble the ship's magnetic signature. This operation involved contract workers, and of course there were also merchant ships around, so civilian sailors could well have heard Navy personnel saying something like, "they're going

to make us invisible," meaning undetectable by magnetic torpedoes....([Vallee](#))

The *Engstrom* and the *Eldridge* were harbored together and, according to Dudgeon, crew members from both ships had parties together on shore and "there was never any mention of anything unusual." Though they did witness some spectacular electric storms, he says. ([St. Elmo's fire](#) is common in the area.)

[Marshall Barnes](#), who identifies himself as a "Special Civilian Investigator," claims Dudgeon's story is disinformation and that Vallee is a hoaxer out to cover up the government's real activities. Maybe so, but in March of 1999, sailors who'd served on the *Eldridge* reunited and told a *Philadelphia Inquirer* reporter that they "find the story amusing — especially because the ship never docked in Philadelphia."* Barnes also claims that he can prove that "optical invisibility" is possible through "the use of an intense electromagnetic field that would create a mirage effect of invisibility by refracting light."* He claims he proved this to the cable network A&E for an *Unexplained* episode, but that they reneged on the deal. One would think they would have jumped at the chance to demonstrate something so wondrous.

Morris Jessup's book

Another fact is that in 1955 an auto parts salesman and amateur astronomer named Morris K. Jessup published a book called *The Case for the UFO*. In his book, Jessup speculated--among other things--that anti-gravity and electromagnetism would be better than rocket fuel for propelling space vehicles. The following year, Carl Allen (a.k.a. Carlos Miguel Allende), a somewhat brilliant but very disturbed human being, started the hoax by writing letters to Jessup telling him of The Philadelphia Experiment. Allende claims that he witnessed the disappearance of a ship while on board the SS *Andrew Furuseth*, a merchant ship. He also claims he saw some *Eldridge* crew members disappear into thin air during a fight. Allen sent an annotated copy of Jessup's book to the Office of Naval Research in Washington, D.C. Jessup was summoned to Washington and turned over the Allen letters. Later, the Varo Corporation, a firm which did research for the military, published the annotated version along with Allen's letters to Jessup. Jessup committed suicide in 1959. Allen continued sending strange annotations to relatives for many more years, as he drifted from place to place.

The speculations regarding the origin of Allen's story have run rampant. Some say that he was there and saw it all. Some say that Allen is an alien and [channels](#) information. Some claim that the Navy is covering up the experiment and their complicity with aliens. The simple truth is that Allen made it all up.

Allen's hoax has grown into a legend which has been spurred on by a number of books, some of them fictional, some non-fictional, and others fictional but claiming to be non-fictional. In 1965, Vincent H. Gaddis's *Invisible Horizons: True Mysteries of the Sea* was published. In addition to stories about various disappearing islands, aircraft, and ships, Gaddis presents the basics of the legend as created by Allen in his letters and published in the Varo edition of Jessup's work. In 1977, Charles Berlitz published *Without a Trace: New Information from the Triangle*, which included a chapter on the Philadelphia Experiment. Berlitz is a frequent source for stories on strange phenomena, such as [Atlantis](#), the [Bermuda Triangle](#), and [Noah's Ark](#).

In the fictional category, *Thin Air* (1978) by George E. Burger and Neil R. Simpson stands out. It is about a Navy investigation of a cover-up of an experiment involving the USS Eldridge in 1943.

In 1979, *The Philadelphia Experiment: Project Invisibility* by William L. Moore and Charles Berlitz was published. This book is fiction but claims to be fact, and [plagiarizes](#) parts of *Thin Air*. In the Moore and Berlitz book, not only the ship but several crew members disappear into a new dimension, never to be seen again (unless, of course, you sail to Atlantis on Noah's Ark through the Bermuda Triangle where you will no doubt find these sailors holding a [séance](#)).

In 1984, a movie called "[The Philadelphia Experiment](#)" was produced. It was directed by Stewart Raffill and was based on a screenplay by William Gray and Michael Janover.

There have been other attempts to exploit the gullible with stories about this so-called experiment, but two stand out as more insane than the rest: *The Philadelphia Experiment, and Other UFO Conspiracies*, by Brad Steiger, with Alfred Bielek and Sherry-Hanson Steiger (1990); and *The Philadelphia Experiment Part 1- Crossroads of History*, presented by [Alfred Bielek](#). The former is a book which rehashes the usual stories of CIA plots, government conspiracies, secret meetings with aliens, trips to Mars, visits from the [Men in Black](#), etc. The latter is a video featuring a man who claims he was a physicist on the USS Eldridge in 1943 and was part of the team that conducted the experiment. Bielek claims he time-traveled in 1943 to 1983 during the experiment and lived to tell the story, only to be harassed by the U.S. government for his troubles.

The central claim of the Philadelphia Experiment may have a basis in fact, however. Edward Dudgeon describes the event.

I was in [a] bar that evening, we had two or three beers, and I was one of the two sailors who are said to have disappeared mysteriously...The fight started when some of

the sailors bragged about the secret equipment [radar, sonar, special screws, a new compass, etc.] and were told to keep their mouths shut. Two of us were minors....The waitresses scooted us out the back door as soon as trouble began and later denied knowing anything about us. We were leaving at two in the morning. The Eldridge had already left at 11 p.m. Someone looking at the harbor that night might have noticed that the Eldridge wasn't there any more and it did appear in Norfolk. It was back in Philadelphia harbor the next morning, which seems like an impossible feat: if you look at the map you'll see that merchant ships would have taken two days to make the trip. They would have required pilots to go around the submarine nets, the mines and so on at the harbor entrances to the Atlantic. But the Navy used a special inland channel, the Chesapeake-Delaware Canal, that bypassed all that. We made the trip in about six hours" ([Vallee](#)).

Such is the mundane stuff that urban legends are made of.

Piltdown hoax

I thought you might be interested to know who created Piltdown man. In my article on the subject in the spring issue of Pacific Discovery the magazine published by the California Academy of Sciences in San Francisco I present new evidence that the man behind it was Sir Arthur Conan Doyle. Sounds to good to be true? Perhaps, but he did do it. And knowing that it was him, Piltdown man can be seen as a hoax--a huge practical joke--and not a case of scientific fraud committed by a scientist to advance his career.

In the article, I solve a puzzle left by Doyle in his novel The Lost World (published in 1912 right before Piltdown man's jaw turned up). The solution leaves little doubt that Doyle was behind it, a suggestion that was made in Science 83 by an anthropologist named John Winslow. Although he compiled a lot of circumstantial evidence against Doyle, he failed to notice the puzzle.

To appreciate the solution to the Piltdown mystery you have to be open to the possibility that the hoaxer could have hidden the clues in a young person's adventure novel, if you're not you won't get it. Also, I might mention that Doyle began The Lost World with these four lines that haven't made much sense until now:

I have wrought my simple plan
If I give one hour of joy
To the boy who's half a man
Or the man who's half a boy

Robert Anderson

American Museum of Natural History, NYC

response: I would have thought Arthur Conan Doyle would be more likely to fall for such a hoax than to perpetrate it, given his credulity with respect to the fairy tales of little girls.

07 Jun 1996

The little poem that this reader offers up as proof [that Arthur Conan Doyle perpetuated the Piltdown Man hoax] is fine evidence that the human mind will see what it wants to see in almost anything.

In my opinion, that little poem is saying nothing more than this:

I have done my job as an author
If I can give but an hour's joy
To those children that dream of being adult
And to those adults with a child's heart

Or something to that effect. I'm sure you get the idea. Great Dictionary by the way! Keep up the good work!

Catalina (Katya or Catia) Rivas (a.k.a. de Arze, a.k.a. Arce)

Catalina Rivas is almost certainly a [pious fraud](#). The [thrice-married woman](#) hails from Cochabamba, Bolivia, though she now dwells in Mexico (Merida, Yucatan). Her piety is expressed by her alleged [stigmata](#) and her alleged "messages" from Jesus, Mary and angels who, for some unexplained reason, dictate their messages to Rivas not only in Spanish, but in Greek, Latin and Polish. (For some unknown reason, Jesus and Mary don't dictate to Rivas in English, so her "messages" have to be translated into that language. Many are posted on the [Internet](#).) She does not sign her name to her "messages," preferring to refer to herself as "la sierva de Dios" (the servant of God) or "la secretaria de Dios" (the secretary of God). She doesn't claim to be the author of her books; rather they are said to be [channeled](#) ("dictada a la sierva de Dios"). Nor does she have a publishing house. Her books are sold as photocopies.

Because of her alleged stigmata and "messages," Rivas is considered the spiritual mother of international religious movements known as the [Apostolate of the New Evangelization](#) (ANE) (in Spanish, [Apostolado de la Nueva Evangelización](#) and [The Great Crusade of Love and Mercy](#) (in Spanish, [La Gran Cruzada del Amor y Misericordia](#)) and has followers [all over the world](#).

If asked how it is possible for her to have the stigmata and be a pious fraud, the answer is that she does not truly suffer inexplicable wounds. They are most likely self-inflicted wounds, as evidenced by her performance on the Fox Network special ["Signs from God: Science Tests Faith."](#) If asked how it is possible for her to write books in languages she does not understand, the answer is simple: [she copies them](#).

She has already been [caught plagiarizing](#) the work of José Prado Flores and Salvador Gómez of Guadalajara, Mexico. Her messages from God published in 1996 as "Renovacion Evangelica" (Evangelical Revival) bear a remarkable resemblance to *Formacion de Predicadores* (*Training Preachers*) published several years before she got them from "God." The work of Prado Flores and Gómez was actually written many years before Rivas claimed to have gotten remarkably similar and often identical messages from God. According to Prado Flores, he and Gómez prepared the first version of their work in 1980, gave it as a workshop in 1982 and published it in 1988 [ISBN 83-7224-026-4]. Their work has been translated into Portuguese (1990), Italian (1992) and Polish (1999). *Formacion de Predicadores* has been published in later

editions with different ISBNs: 03-2001-0612 and 10-4933-00-01. I have the 1992 edition published by [Kerygma](#).

José Prado Flores is a respected Mexican author of Catholic books. He has [numerous publications](#) to his credit. Salvador Gómez is the author of [Para Un Matrimonio Feliz](#) (*For a Happy Marriage*). Prado Flores has written to me that Rivas has even kept his Mexican examples in her work, which, he says, would only be understood by Mexican readers. Also, in one of her books Rivas claims that Jesus warns us against listening to the authors of books!

Rivas has not always been such a holy person. She was a "fallen-away Catholic" in 1993 when she saw and heard [Nancy Fowler](#) in Bolivia. She even went to Conyers, Georgia, in the U.S. to see Fowler, a woman who claims the Virgin Mary appeared to her on the 13th of each month (à la [Fatima](#)) for several years. (For some reason, the visions have stopped and for [various reasons](#) Fowler has dissociated herself from the [Conyers people](#).) It was in Conyers that Rivas claims to have had her first stigmatic experience. For a while Rivas was a Fowler follower, but she broke away and, as mentioned above, is now considered the spiritual mother of another religious movement. (Fowler has distanced herself from Rivas and a group who tried to publish some of Rivas's "messages," noting that Rivas claims to have been in Conyers when she received one of her messages but she could not have been there because of an airline strike.)*

Rivas has credibility in part because she has the approval of her bishop, René Fernández Apaza, who has given his [imprimatur](#) to her "messages." He has also given his blessing to a bleeding, weeping statue, claiming it is worthy of veneration. He has even asked the Vatican to declare it a Signum Dei, a Sign of God. The Bishop is joined in his support of Rivas by Miguel Manzanera, a Jesuit theologian and member of the commission of Faith and Doctrine in Bolivia.

Some [Catholics](#) even think that the approval of Michael [Willasee](#), who produced the Fox program mentioned above, is significant evidence in her favor. Willasee, however, has proved himself to be [highly untrustworthy](#). He is either a [dupe](#) or a [dope](#) or [both](#). He is not without his fans, however. [Mr. Alastair Thompson](#) thinks Willasee and Fox walk on water. The able Mr. Thompson is joined in support of Fox with Mr. [Michael Cain of Catholic PewPoint](#) who writes

...this time FOX truly has leapt [sic] over the wall of division and immorality by bringing us programming that produced excellence in depth and devotion.

Whatever the opposite of skeptic is, Willasee, Thompson and Cain are the reigning triumvirate.

Rivas also has the support of Dr. Ricardo Castañón Gómez of La Paz, Bolivia, who is known as a former atheist and one with a keen eye for pious frauds. He also has been involved with the establishment of the [Apostolate of the New Evangelization](#) (ANE), which has centers in [Bolivia](#) and [Mexico](#), among other places. He is the author of *Father of All Mankind*. Chapter 13 of this book is published on the [Internet](#). He quotes Rivas and says of her "Catalina is a stigmatist from Cochabamba, Bolivia whom Dr. Castañón has studied extensively. The Archbishop of Cochabamba has given his Imprimatur to eight books of Catalina's writing which she attributes to receiving from Jesus and the Blessed Mother." Both she and Dr. Castañón might also attribute some of these "messages" to José Prado Flores and Salvador Gómez, for the English words of Ch. 13 translate beautifully into the Spanish of *Formacion de Predicadores*. [[See Document 1](#)]

Rivas' [spiritual advisor](#) is Fr. Renzo Sessolo Chies, S.D.B., of Bolivia, founder and president of ANE* and an active supporter of the [La Gran Cruzada](#). Prado Flores claims that Sessolo was kicked out of his religious order.

Not everyone has been taken in by Catalina Rivas. Besides those she has plagiarized, she has apparently lost favor with Juan Cardenal Sandoval Iñiguez, the Bishop of Guadalajara, who cancelled a scheduled appearance in Guadalajara by Rivas last summer (2001) after Prado Flores showed the bishop copies of his book and her "messages." Prado Flores wrote to me:

Catia was scheduled to appear in Guadalajara, Mexico where I now live. You can understand my total amazement when I put 2 and 2 together and figured out the famous "visionary and stigmatist" was the same lady that had "stolen" my book. A friend showed me a set books which were to be sold during the convention. We then went to the bishop of Guadalajara, Juan Cardenal Sandoval Iñiguez, who after seeing our study on her material immediately cancelled her participation. This of course made her write a letter accusing me of "stealing" her visions to write my book.

According to Prado Flores, Rivas sent a letter to Fr. Argulo, who had invited her to Guadalajara, in which she made the accusation that they "stole her visions." How this was possible, since her visions and "messages" occurred many years after their book, is left to the reader to discern.

[The shroud on display in Rome: get your tickets now!](#)

shroud of Turin

"All empirical evidence and logical reasoning concerning the Shroud of Turin will lead any objective, rational person to the firm conclusion that the Shroud is an artifact created by an artist in the fourteenth-century." --[Steven D. Schafersman](#)

The shroud of Turin is a woven cloth about 14 feet long and 3.5 feet wide with an image of a man on it.

Actually, it has two images, one frontal and one rear, with the heads meeting in the middle. One [anonymous critic](#) notes that if the shroud were really wrapped over

a body there should be a space where the two heads meet. This critic also thinks the head is 5% too large for

its body, the nose is disproportionate and the arms are too long. Nevertheless, the image is believed by many to be a negative image of the crucified Christ and the shroud is believed to be his burial shroud. Most skeptics think the image is a painting and a pious hoax. The shroud is kept in the cathedral of St. John the Baptist in Turin, Italy.

Apparently, the first historical mention of the shroud as the "shroud of Turin" is in the late 16th century when the shroud was brought to the cathedral in that city, though it allegedly was discovered in Turkey during one of the so-called "Holy" Crusades in the so-called "Middle" Ages. In 1988, the Vatican allowed the shroud to be dated by three independent sources--Oxford University, the University of Arizona, and the Swiss Federal Institute of Technology--and each of them dated the cloth as originating in medieval times, around 1350. The shroud allegedly was in a fire during the early part of the 16th century and, according to believers in the shroud's authenticity, that is what accounts for the carbon dating of the shroud as being no more than 650 years old. To non-believers, this sounds like an [ad hoc hypothesis](#).

According to Dr. Walter McCrone,

The suggestion that the 1532 Chambery fire changed the date of the cloth is ludicrous. Samples for C-dating are routinely and completely burned to CO² as part of a well-tested purification procedure. The suggestions that modern biological contaminants were sufficient to modernize the date are also ridiculous. A weight of 20th century carbon equaling nearly two times the weight of the Shroud carbon itself would be required to change a 1st century date to the 14th century (see [Carbon 14 graph](#)). Besides this, the linen cloth samples were very carefully cleaned before analysis at each of the C-dating laboratories.*

It may interest skeptics to know that many people of faith believe that there is *scientific* evidence which supports their belief in the shroud's authenticity. Of course, the evidence is limited almost exclusively to pointing out facts that would be true *if* the shroud were authentic. For example, it is claimed to be the negative image of a crucifixion victim. It is claimed to be the image of a man brutally beaten in a way which corresponds to the way Jesus is thought to have been treated. It is also claimed that the image is not a painting but a [miraculously](#) transposed image. Skeptics disagree and argue that the shroud is a painting and a forgery.

the relic trade

Skeptics believe that the shroud of Turin is just another religious relic invented to beef up the pilgrimage business or impress infidels. (Another equally famous painting, also claimed to have miraculously appeared on a cloth, cropped up in Mexico in the 16th century, ["Our Lady of Guadalupe."](#)) The case for the forged shroud is made most forcefully by Joe Nickell in his *Inquest On The Shroud Of Turin*, which was written in collaboration with a panel of scientific and technical experts. The author claims that historical, iconographic, pathological, physical, and chemical evidence points to inauthenticity. The shroud is a 14th century painting, not a two-thousand year-old cloth with Christ's image.

Another scholar to declare the shroud a fake is [Walter McCrone](#), a microchemist. He presents his case in [Judgment Day for the Shroud of Turin](#) (March 1999). His thesis is that "a male model was daubed with paint and wrapped in the sheet to create the shadowy figure of Christ." The model was covered in red ochre, "a pigment found in earth and widely used in Italy during the Middle Ages, and pressed his forehead, cheekbones and other parts of his head and body on to the linen to create the image that exists today. Vermilion paint, made from mercuric sulphide, was then splashed onto the image's wrists, feet and body to represent blood." For his work, McCrone was awarded the American Chemical Society's [Award in Analytical Chemistry](#).

the evidence for authenticity

The shroud, however, has many defenders who believe they have demonstrated that the cloth is not a forgery, dates from the time of Christ, is of miraculous origin, etc. It is claimed that there is type AB blood on the shroud. Skeptics deny it. Blood has not been identified on the shroud directly, but it has been identified on sticky tape that was used to lift fibrils from the shroud. Dried, aged blood is black. The stains on the shroud are red. Forensic tests on the red stuff have identified it as red ocher and vermilion tempera paint. Other tests by Adler and Heller have identified it as blood.* If it is blood, it could be the blood of some 14th century person. It could be the blood of someone wrapped in the shroud, or the blood of the creator of the

shroud, or of anyone who has ever handled the shroud, or of anyone who handled the sticky tape. But even if there were blood on the shroud, that would have no bearing on the age of the shroud or on its authenticity.

It is claimed that the cloth has some [pollen](#) [pdf format] and images on it that are of plants found only in the Dead Sea region of Israel. [Avinoam Danin](#), a botanist from Hebrew University of Jerusalem claims he has identified pollen from the tumbleweed *Gundelia tournefortii* and a bean caper on the shroud. He claims this combination is found only around Jerusalem. Some believers think the crown of thorns was made of this type of tumbleweed. However, Danin did not examine the shroud itself. His sample of pollens originated with [Max Frei](#) who tape-lifted pollen samples from the shroud. Frei's pollens have been [controversial](#) from the beginning. Frei, who once pronounced the forged "[Hitler Diaries](#)" to be genuine, probably introduced the pollens himself or was duped and innocently picked up pollens another [pious fraud](#) had introduced ([Nickell](#), [Shafersman](#)).

[Danin](#) and his colleague Uri Baruch also claim that they found impressions of flowers on the shroud and that those flowers could only come from Israel. However, the floral images they see are hidden in mottled stains much the way [the image of Jesus is hidden in a tortilla](#) or the [image of Mary is hidden in the bark of a tree](#). The first to see flowers in the stains was a psychiatrist, who was probably an expert at seeing personality traits in [inkblots](#) (Nickell, 1994)

Danin notes that another relic believed to be the burial face cloth of Jesus (the [Sudarium of Oviedo](#) in Spain) contains the same two types of pollen grains as the Shroud and also is stained with type AB blood. Since the Sudarium is believed to have existed before the 8th century, according to Danin, there is "clear evidence that the shroud originated before the eighth century." The cloth is believed to have been in a chest of relics from at least the time of the Moorish invasion of Spain. It is said to have been in the chest when it was opened in 1075. But, since there is no blood on the shroud of Turin and there is no good reason to accept Danin's assumption that the pollens were on the Shroud from its origin, this argument is spurious.

In any case, the fact that pollens found near the Dead Sea or Jerusalem were on the shroud means little. Even if the pollens weren't introduced by some pious fraud, they could have been carried to the shroud by anyone who handled it. In short, the pollens could have originated in Jerusalem at any time before or after the appearance of the shroud in Italy. This is not a very strong piece of evidence.

Moreover, that there are two cloths believed to have been wrapped around the dead body of Jesus does not strengthen the claim that the shroud is authentic, but weakens it. How many more cloths are there that we don't know about? Were they mass produced like pieces of the true cross, straw from Christ's manger, chunks of Noah's ark? That cloths in Spain and Italy have identical pollens and blood stains is a bit less than "clear evidence" that they originated at the same time, especially since there is clear evidence that the claim that they have identical pollens and blood stains is not true. But, even if it were true, it would be of little value in establishing that either of these cloths touched the body of Jesus.

unraveling the weave

The weave of the cloth is said to be typical of the weave wealthy Jews would have had in the time of Jesus. The weave of the wealthy Jew doesn't seem consistent with the kind of people Jesus supposedly hung out with. However, as one reader, Hal Nelson, pointed out, "The linen cloth was supplied by Joseph of Arimathea, described in Matthew 27 as a "rich man" as well as a disciple. (The weave of Turin is herring bone; the weave of Oviedo is taffeta, proving, I suppose, that Jesus had disciples of all types, even AB.)

The image is of a man about six feet tall. The size and weave of the cloth have convinced one researcher/believer that the cloth may have been used as a tablecloth for the Last Supper. It could have been used for a lot of other things as well, I suppose.

To the believer, however, it is not the *scientific* proof of the shroud's authenticity that gives the shroud its special significance. It is the *faith* in the *miraculous origin* of the image that defines their belief. The miracle is taken as a sign that the resurrection really happened and that Jesus was divine.

Just another relic?

Perhaps the most fascinating aspect of the shroud of Turin controversy is the way true believers keep bringing up red herrings and the way skeptics keep taking the bait. Danin made his plant image/pollen grain argument in 1998, a follow-up on another plant image argument he made in 1997. He said in the 1998 article that his evidence showed that "the Shroud could have come only from the Near East." An AP article by [Traci Angel](#) (8/3/99) quotes Danin as saying that the evidence "clearly point to a floral grouping from the area surrounding Jerusalem." No doubt, [a raging debate will follow](#) (once again!) as to the origin of the plants and pollens. As if it matters. Even if it is established beyond any reasonable doubt that the shroud originated in Jerusalem and was used to wrap up the body of Jesus, so what? Would that prove Jesus rose from the dead? I don't think so. To believe anyone rose from the dead can't be based on physical evidence, because resurrection is a

physical impossibility. Only [religious faith](#) can sustain such a belief. To believe that someone floated up to the sky and disappeared (i.e., rose into heaven) is also not going to be proved one way or the other by these shroud arguments. Finally, no amount of physical evidence could ever demonstrate that a man was God, was also his own Father and conceived without his mother ever having had sex. Thus, no matter how many brilliant scientists marshal forth their brilliant papers with evidence for images of Biblical ropes, sponges, thorns, spears, flowers, tumbleweeds, blood, etc., none of it has the slightest relevance for proving these matters of faith.

Mass Media Funk

21

June 22, 2001. Two years ago, in a [review of a Fox network pseudo-documentary](#), I suggested that the alleged [stigmatic](#) Catalina ("Catia" or "Katya") [Rivas](#) was either deranged or a pious fraud or both. Now she is accused of being a plagiarist. Catia claims she gets messages from God and these have been published, causing amazement among her followers that such an illiterate woman could write such literate prose. Guadalajaran writer José H. Prado Flores claims Katya's messages are photocopies of his book *Formacion de predicadores (Training preachers)*, published six years before Catia's "messages." She was scheduled to speak in Guadalajara a couple of weeks ago, but the show was cancelled by Juan Cardenal Sandoval Iñiguez, the bishop of Guadalajara, after Prado Flores and a friend showed the bishop his work and the book Catia was claiming to have written from divine inspiration.

Unrepentant, Catia has accused Prado Flores of stealing her visions. (Perhaps he dipped into the [Akashic record!](#))

Well, at least that is the story of Prado Flores, a Catholic writer who described himself in an e-mail to me as "a writer of books oriented to forming leaders in the Catholic Church."

June 20, 2001. [USA Today](#) features an article on [psychics](#) that doesn't pander to the gullible and even presents some criticisms of [James Randi](#) and [Paul Kurtz](#) of those claiming to get messages from the dead, such as [John Edward](#).

The article by Greg Barrett of Gannett News Service is entitled "Can the living talk to the dead? Psychics say they connect with the spirit world, but skeptics respond: 'Prove it'." ([The Seattle Times](#) also picked up the article.)

This is old ground and I've covered it so much I think I may be getting close to the people living in the center of the earth, so I won't comment extensively. I agree with Randi that many people have an emotional need to believe in life after death and communication with dead parents, children, friends, etc. Perhaps that explains why they are not ashamed to present evidence for their belief that is weaker than what the same people would probably require before spending \$20 on a new garden hose.

For example, "in 1981 psychic Noreen Renier was lecturing on ESP at the FBI Academy in Quantico, Va., when she warned that President Reagan would soon receive an injury to the upper chest. Two months later, the name John Hinckley was

June 8, 2001. I have been looking for the silver lining in the cloud of the latest [Gallup poll](#) on Americans' Beliefs in Psychic and Paranormal Phenomena. While about half of Americans believe in [ESP](#), 62% percent do not believe in [channeling](#). And, while 42% believe in haunted houses, 46% do not believe that people like [James Van Praagh or John Edward](#) can get messages from the dead. Furthermore, 38% don't believe extraterrestrials have visited the earth, more than half of us don't believe in astrology and 59% reject belief in witches. Unfortunately, belief in haunted houses, ghosts, witches and getting messages from the dead are all up more than 10% from a decade ago.

May 24, 2001. [The New England Journal of Medicine](#) (Vol. 344, No. 21) published an article today which calls into question the validity of [the placebo effect](#). "Is the Placebo Powerless? An Analysis of Clinical Trials Comparing Placebo with No Treatment" by Danish researchers Asbjorn Hrobjartsson and Peter C. Gotzsche "found little evidence in general that placebos had powerful clinical effects." Their [meta-study of 114 studies](#) found that "compared with no treatment, placebo had no significant effect on binary outcomes, regardless of whether these outcomes were subjective or objective. For the trials with continuous outcomes, placebo had a beneficial effect, but the effect decreased with increasing sample size, indicating a possible bias related to the effects of small trials."

"The high levels of placebo effect which have been repeatedly reported in many articles, in our mind are the result of flawed research methodology," said Dr. Hrobjartsson, professor of medical philosophy and research methodology at University of Copenhagen.*

Typical of the kind of flawed research methodology Hrobjartsson is referring to would be that of surgeon J. Bruce Moseley who performed [fake knee surgery](#) on eight of ten patients. Six months after the surgery all the patients were satisfied customers. Rather than conclude that the patients didn't need surgery or that the surgery was useless because in time the patients would have healed on their own, he and others concluded that the healing of the eight who did not have surgery was due to the placebo effect, while the two who had real surgery were better because of having had the operation. [Irving Kirsch and Guy Sapirstein](#) made the same kind of methodological error in their controversial meta-study which found that anti-depressants work by the placebo effect, rather than that anti-depressants are unnecessary and useless. Hrobjartsson would probably claim that the observed results of controlled studies on anti-depressants were actually due to [regression](#).

Many researchers have avoided this kind of flaw by having a third group, who receive no treatment at all, to compare to the other two. If the placebo group shows better results than the group getting nothing, then surely the placebo is effective. Hrobjartsson and Gotzsche think most of these studies, too, are flawed, mainly due to having samples that were too small or due to patients who make reports aimed at pleasing the researcher. Thus, to those researchers who have found that depressed patients on a waiting list did not do as well as those on a placebo,* Hrobjartsson and Gotzsche might claim that the studies were too small or that the improvement was due to subjective and biased evaluations of either the would-be patients or the researchers.

The placebo effect is commonly asserted to be very strong: one-third of placebo patients getting better is a typical claim in textbooks and studies.* It is unlikely that the textbooks will be immediately revised to reflect the claims of Hrobjartsson and Gotzsche, but as [Dr. John C. Bailar III said](#): "The shoe is on the other foot now. The people who claim there are placebo effects are going to have to show it." (Bailar wrote the [editorial](#) accompanying the new study.) The need is for large, rigorously designed studies which clearly define and measure effects of drugs and therapies versus placebos versus no intervention at all. These studies will have to clearly distinguish objective measurements (such as blood pressure, cholesterol levels, etc.) and subjective measurements (such as reports of pain or evaluative sensory observations by researchers, e.g., "I can see your tumor is smaller" or "I can see you are not as depressed as before"). The new studies must avoid [confirmation bias](#), selective perception, and subjective validation.

Most of the studies evaluated by Hrobjartsson and Gotzsche were small (for 82 of the studies the median size was 27, and for the other 32 studies the median was 51). Thus, even the seemingly positive effect of placebos for pain, may be illusionary. ("In 27 trials involving the treatment of pain, placebo had a beneficial effect, as indicated by a reduction in the intensity of pain of 6.5 mm on a 100-mm visual-analogue scale.")

One of the more disturbing aspects of this research is that it reminds us that placebos are widely prescribed. The authors of the article recommend that this practice be stopped. Dr. Bailar, on the other hand, thinks that "there should be a sharp reduction in the prescription of placebos," but he is opposed to the wholesale condemnation of placebo prescription. "The evidence that placebos might contribute to pain relief may merit their continued therapeutic use when there is reason to think that a patient may benefit." He may or may not be right about that.

May 11, 2001. [ABCNews.com](#) has a story today about the Disclosure Project (see [below](#)), complete with photo from an "alien" on display in [Roswell](#). James Oberg, an ABCNEWS space consultant and retired NASA engineer, is quoted as saying that Stephen Greer, who is orchestrating the Disclosure Project, has long argued "there's this bizarre theory that there is a worldwide real X-file cabal that is using UFO technology....People see strange things they can't understand, and that can't be explained either then or in hindsight, and it's good to keep documenting these, because often the mysterious sightings are things of interest, to military intelligence or even to science....Often, I've seen people jump to conclusions about what they saw, because, after all, to have been scared by a distant fireball can be embarrassing but to have encountered an alien space ship is more exciting."

The [WashingtonPost.com](#) also covered the event. The article, authored by Joel

Achenbach, begins

A group of people who believe in UFOs held a news conference yesterday morning that established beyond the shadow of a doubt -- that reached levels of credibility so high as to constitute actual proof -- that there really do exist people who believe in UFOs.

Achenbach says of Greer that

He arranged an impressive venue, the main ballroom of the National Press Club. Upward of a hundred people were there, along with more than a dozen TV cameras. At a long table up front sat 20 witnesses, most of them gray-haired men who'd served in the military.

The event was "old-fashioned," according to Achenbach, since it involved mostly a discussion of aerial anomalies and nothing about abductions or reproductive experimentation.

Achenbach noted a couple of items that are likely to hinder this project from being very successful: (1) Greer's insistence that the U.S. government possesses alien technology that could provide unlimited energy and has helped them build vehicles that travel faster than the speed of light, and (2) testimony from people like Clifford Stone, a retired Army sergeant, who claims that there are 57 alien species and he's seen them all, dead and alive.

May 9, 2001. Today was supposed to be the big day for UFOlogists but so far the great [Disclosure Project](#) hasn't ruffled any feathers. A group of UFOers, led by Dr. Stephen Greer, a founder of [CSETI](#) who gave up his position in medicine to pursue aliens full-time, has lined up several hundred motley "witnesses" to pour forth their heartfelt testimonies regarding various experiences with [UFOs](#), [aliens](#) and government agencies. For those who missed the earthshaking press conference, videos of the event are for sale and a couple of clips viewable on Real Audio are [available online](#).

As far as I can tell, the only thing new about this project is that Greer has brought disparate elements together, no doubt thinking that the sheer quantity of the testimony and quality of the witnesses should convince even the most hardened skeptic. The alleged hope is to get enough popular support to force Congress to hold hearings on the issue. Each of the those who testified asserted that he or she is ready to testify before Congress that what they say is the truth. I say that this is an *alleged* hope because it seems unlikely that Greer really thinks Congress is going to let several hundred people testify before Congress that the United States Government has conspired to keep the truth about aliens and UFOs from the American public for over fifty years. Now, if ex-President Clinton is accused of having had sex with an alien, Congress might agree to the hearings, but barring anything of that nature, these testimonies are likely to remain right where they are.

None of the testimony is new, nor is anyone holding a smoking gun. These are just hundreds of people who have had various experiences they believe are suspicious

and have interpreted as evidence of an alien presence. (They are not, however, the stereotypical country bumpkins walking the dog near swamp gas on the bayou.) The group claims that one of its goals is to stop the building of weapons systems to be used in space. I applaud them for that, but in a world where the daily news brings reports of the army's new lead-free bullets for a cleaner environment and executions that are carried out with dignity and professionalism, I have to be a bit skeptical of the chances of their success.

I looked for news reports on the Disclosure Project's big press conference, but found nothing on the websites for ABC, CBS, or NandoTimes. Even Fox News seems to have passed on this one. Maybe the networks were too busy following up on Tina Wesson and Survivor stories to be bothered with a mere UFO/alien press conference.

May 1, 2001. Harvard Medical school ([John Mack](#), [Andrew Weil](#), [Deepak Chopra](#), etc.) announced it has received [a \\$10 million gift](#) from the [Bernard Osher Foundation](#) to study non-traditional medicine. The money should help sustain the medical school's fledgling Division for Research and Education in Complementary and Integrative Medicine. The head of the "alternative" program at Harvard is Dr. David M. Eisenberg, who became hooked on the stuff while visiting China. (I wonder if he noticed that only about 10% of China's population is over age 60, while about 17% of the U.S. population is over 60. On the other hand, Sweden, Norway, Belgium, Italy, the United Kingdom, Germany, Austria, Greece and Denmark all have more people living longer than the U.S. does.* Maybe they have some secret "alternative" medicine our government is conspiring to conceal. I also wonder if he thinks that [China's doubling its lifespan since 1949](#) is due to the increase in traditional Chinese medicine. How effective does Dr. Eisenberg think acupuncture or mugwort was in treating malaria or tuberculosis? Maybe he wants to close the gap between China's and the U.S.'s longevity rates: Americans now live an average of about 5 years longer than the Chinese.)

There would be merit if the money were used for basic scientific research into the effectiveness and dangers of herbal therapies. The first of the money spent, however, is going to establish the Bernard Osher Chair in Complementary and Integrative Medical Therapies, a tenured professorship.

[thanks to Joe Littrell]

April 24, 2001. The [Journal of the American Medical Association](#) has published the results of a six-week study of medication errors at Children's Hospital Boston and Massachusetts General Hospital for Children. The researchers found an error rate of 5.7 percent: 616 medication errors out of 10,778 orders written for 1,120 patients.

The researchers found 115 potential adverse drug effects (ADEs), i.e., 1.1%. and 26 ADEs (0.24%). "Of the 26 ADEs, 5 (19%) were preventable. While the preventable ADE rate was similar to that of a previous adult hospital study, the potential ADE rate was 3 times higher. The rate of potential ADEs was significantly higher in neonates in the neonatal intensive care unit. Most potential ADEs occurred at the stage of drug ordering (79%) and involved incorrect dosing (34%), anti-infective drugs (28%), and intravenous medications (54%)."

The researchers believe that computerized physician order entry could have

prevented most of the potential adverse drug effects.*

- [Mass Media Bunk 10](#)
- [Mass Media Bunk 9](#)

April 22, 2001. [Citylinkonline](#) features James Randi in an article by Art Levine. The article details Randi's pursuit of [John Edward](#) and describes the 72-year old magician and debunker as "basking in the limelight while going on the warpath against psychics." Randi's challenge--a million dollars to anyone who can prove they possess psychic or paranormal abilities--is described as a publicity stunt and not offered in good faith by people like [Ray Hyman](#) and [Marcello Truzzi](#). The latter describes Randi as someone "who shoots from the lip." Randi denies the charges and calls Truzzi a "fence-sitter." (Truzzi seems to think that true skeptics should suspend judgment on just about everything.)

Randi also criticizes the work of [Gary Schwartz](#), a Harvard-trained professor of psychology and director of the Human Energy Systems Laboratory in Tucson. Schwartz claims to have proof of Edward's and others psychic abilities. "Harvard-trained" seems to impress some people, but we should remember a few others who are either Harvard-trained or who train others at Harvard: [Deepak Chopra](#), [Andrew Weil](#) and [John Mack](#).

[The Skeptic's Refuge](#)

[More Mass Media Funk](#)

Silva Mind Control (Silva Method)

The Silva Method (formerly Silva Mind Control) is a self-help program which claims to teach one how to increase one's IQ, develop clairvoyance and use the mind to heal the body and find God, among other things. The program promises to teach you to "use the untapped power of your mind to accomplish whatever you desire."* The program is a hodgepodge put together by trial and error by José Silva (1914-1999), an electronic repairman who had a voracious appetite for literature in psychology, [parapsychology](#) and religion. He studied [hypnosis](#), hoping to use it to increase the IQ of his children, but became interested in developing [psychic](#) abilities after he became convinced that one of his daughters was [clairvoyant](#).

According to [Silva](#), he began using his method in 1944 on family and friends, but the program that now goes by his name started in the 1960s. He called his program "subjective education" and *psychorientology*, which he defined as "Educating the mind to function consciously within its own psychic dimension....becoming aware of the enormity of human potential and learning how to actualize this potential for the better of humanity."

The instruction emphasizes positive thinking, visualization, meditation, and self-hypnosis. One key element of the course "consists of 'visiting' absent persons imagined by students and performing diagnoses on them" (Randi, 218). Silva became convinced that most personal and world problems are due to "using only logical, intellectual, objective means to correct problems."* He claimed that "only 10 percent of humanity think with the right brain hemisphere" and these 10 percent are geniuses. The other 90 percent "use only the left brain hemisphere to think with. They do both their thinking and acting with only the left brain hemisphere."

Silva seems to have based his notions about the split-brain on the work of [Roger Sperry](#) and his colleagues. Silva, like many others who latched onto this split-brain model, seems to have modified it to his own purposes and beliefs. Much work has been done on the brain since Sperry. Without putting too fine a point on it, nearly everything Silva said about the brain is wrong. For a more accurate picture of what scientists think about this split-brain distinction see "[Left Brain Right Brain](#)" by John McCrone (*New Scientist*, July 3, 1999). The truth is that nobody thinks or acts only with their left hemisphere unless the right one is damaged or gone. In any case, it seems that Silva latched onto the split-brain theory *after* he had developed his subjective education program. I have no idea where he got the notion that geniuses don't use their left hemisphere.

So, Silva not only had found the method to make people smarter, healthier and happier, he also found out why his method works. It is because he is training his subjects to think with their right brain.

Those who think and act with only the left brain hemisphere get sick more often with psychosomatic health problems. They are more accident prone. They make more mistakes. They are less successful in life. When people think with the right brain hemisphere and act with the left, the results are just the opposite: They are healthier, less accident prone, make fewer mistakes, and are more successful in life.*

How he knows these things is not clear. He claims that leftbrainers are functioning at the beta wave level, while rightbrainers are at the [alpha wave](#) level. Silva believed that alpha waves are significantly better than beta waves. Actually, alpha waves increase in meditation and under hypnosis, indicating lack of focus or visual stimulation, not some higher brain activity. They are also produced by both sides of the brain. And the evidence is very speculative and tenuous that geniuses and creative artists are primarily functioning at the alpha wave level. Beta waves are evidence of concentration and heightened mental activity. If they are too extreme, they can be indicative of stress. But no one in his or her right mind should want to eliminate beta waves, unless you are trying to relax or go to sleep, in which case you would want fewer beta waves and more alpha waves if you want to relax and more delta waves if you want to sleep.*

Silva claimed that right brain thinking

- **changes the sub-conscious into an inner-conscious level. This allows people to also use the information stored in the subconscious, consciously.**
- **Right brain thinking — through intuition (ESP) — connects us mentally with all information on this planet, so that we can use this information to correct problems.**
- **It also connects us with higher intelligence, so that we can get the guidance and help that we need.**

It is his claim that he found a gateway to the subconscious, the psychic and to a "higher intelligence" (which he also refers to as "[Christ consciousness](#)") that sets the Silva Method apart from other self-help programs such as [Landmark Forum](#) or [Neuro-linguistic Programming](#). The claim to be teaching a way to get connected to that "higher intelligence" is what led some critics to think that the method is actually [a religious movement](#).

Despite the fact that the Silva Method is promoted with hyperbole worthy of

Fox news promoting the notion that aliens built the pyramids, it has many satisfied customers. Some claim their backhand in tennis has improved, others claim they were able to quit smoking or lose weight because of the Silva method. Still other say that they are happier and healthier than they've ever been, thanks to the Silva Method. It's been around for over forty years and claims to have instructors in 107 countries. Weekend seminars run about [\\$350 dollars](#).

For those who would like a cheaper method of improving your mind, especially your problem solving, and who would like to become more creative and effective as a thinker, I recommend [Conceptual Blockbusting](#) by James L. Adams. It's a lot cheaper and it will show you that there is a time for visualization and there is a time for logic and language. Knowing when to use which is the key to solving problems quickly and effectively. And it won't waste your time chasing after supposed truths in your subconscious. Nor will it mislead you with exercises for unleashing your psychic powers or for developing your Christ consciousness, which are more likely to lead your mind to delusion than to truth. Unfortunately, it is not likely to raise your IQ significantly or help you quit smoking or lose weight. But it will offer you some practical advice on how to use your mind more effectively.

In Mass Media Funk, you will find articles about news stories, magazine articles or TV programs of interest to skeptics, which do not pander to the public's appetite for the occult and supernatural.

Note: because many of the sites linked to here are newspapers or magazines, it is impossible to maintain the links.

Mass Media Funk

8

December 10, 1999. That anguished howl heard round the world was none other than the "Church" of [Scientology](#) in Britain responding to the bad news that, according to the British government, Scientology is neither a charity nor of public benefit. So says the [Independent News](#), which uncharitably notes that "One of the group's main teachings is that the human race's problems are due to disembodied souls brought to the planet millions of years ago." [L. Ron Hubbard](#) must be turning over in his grave.

December 8, 1999. [The Dalai Lama says](#) that religious leaders should stop relying on prayer and meditation to bring about world peace. They should *do* something instead. "Change," he says, "only takes place through action, not through meditation and prayer." I wonder how they took the news in Damascus, where President Hafez al-Assad has all of Muslim Syria [praying for rain](#) even though [he knows words are not enough for some things](#).

The Dalai Lama also says that the new millennium is "nothing special."

His remarks were made before some 7,000 delegates from 70 countries at the Parliament of the World's Religions held in Capetown, South Africa. "We need to ask, 'How can I make a contribution (to world peace)?', not 'How can I further my own religion?'" he said.

While on a tour promoting [his new book](#) in the U.S. recently, he was asked what Buddhists would do if science discovered that something they'd been teaching were proved false. He said that if the scientists were right, the Buddhists would change their teaching.

Bravo.

[thanks to Jon Henrik Gilhuus]

December 6, 1999. "I am so scared that sometimes I stay awake on purpose so the day won't end," says 6 foot 4/220 pound, Jeffrey Modahl, recently released after fifteen years in prison for being wrongly accused of sexually abusing his stepdaughter during the witch hunt for [satanic baby killers](#) in the mid-1980s.

According to *Sacramento Bee* reporter Laura Mecoy, Modahl had gone to Kern County welfare workers in Bakersfield, California, because he learned that a pair of male baby sitters might have molested his daughter. (Modahl's wife died three years after marrying her in 1976 and he was raising her two daughters.) In a familiar story (there are about 50 other similar cases in Bakersfield alone, with about half resulting in prison sentences), his 10-year-old daughter was interrogated by officials and the girl claimed her father and six others had molested her. Carla Jo Owen, now married

with children of her own, says she lied under pressure from investigators and that only the babysitters abused her. She said so within three months of her father's conviction. Last May, a judge overturned Modahl's conviction.

Craig Phillips, the prosecutor in Modahl's case, says that investigators could have done a better job, but he has not changed his mind about Modahl's guilt. "If the claims were false," he says, "that is attributable to Carla." However, a 1986 report by the attorney general's office in Bakersfield criticized "poorly trained county investigators for taking children from their homes, interviewing them repeatedly, using leading questions and verbally rewarding those who made accusations."

"We were lied to so much and we were abused so much by the system that we don't know who to believe anymore," said Modahl.

Carla Jo has had a drug and alcohol problem most of her life since she was put in foster care (in 23 homes by the time she was sixteen). She says she's tried to kill herself eight times. Her sister, who still blames her for ruining her father's life, has also had drug and alcohol problems, has never married but has four children by two abusive boyfriends.

Modahl's family has been given a life sentence, as have many others who were caught up in the hysteria fueled by the likes of Geraldo Rivera who played up the satanic cult myth on his talk show years ago.

November 28, 1999. Avoid shopping at [Gurnee Mills](#) unless you want to support belief in psychics. According to [ABCNews.com](#), they've hired a "psychic" to help shoppers pick out the perfect gift. (I wish I was kidding.)
[thanks to Jon Henrik Gilhuus]

November 27, 1999. Donna Bryson of the Associated Press in Cairo provides a reminder that this year is not only not the end of the millennium for those of us on the Gregorian calendar, but that the Gregorian is not even the calendar of choice for billions of people on the planet. In fact, some people still prefer lunar years to solar years. For example, it is 1420 according the Egyptian Muslim (lunar) calendar, which marks the beginning of historical time from the day the Prophet Mohammed fled Mecca. The few Jews still living in Egypt consider this 5760. They use a Hebrew calendar.

According to one group of Hindus in India, it is 2056. According to another group, it is 1921. And, in Iran, Shiite Muslims are in the year 1378.

Others accept the Gregorian calendar but don't celebrate New Years Eve on December 31. The Copts (Egyptian Christians), for example, consider September 11 to be New Years Day.

So when does the new [millennium](#) begin? (This is important for those predicting the end of the world as we know it.)

November 24, 1999. Italy may be a Catholic country, but the Italians have some

strange superstitions regarding priests and nuns, according to [CNN.com](#). Passing either on the street is considered bad luck.

[thanks to Jon Henrik Gilhuus]

November 23, 1999. Erica Good of the [New York Times](#) (reprinted in the *Sacramento Bee* today, p. A9) reports that a coalition made of of the National Education Association, the American Academy of Pediatrics and the American Psychological Association have taken aim at the anti-homosexual religious movement, particularly the [Love Won Out](#) campaign to introduce reparative therapy (also called [conversion therapy](#)) into the schools. Reparative therapy is therapy directed specifically at changing sexual orientation. [Most psychologists disapprove](#) of such therapy.

The coalition's concern is with the growing anti-gay movement by people such as [Pat Robertson and the Christian Coalition](#), [Bridges Across the Divide](#), and [Focus on the Family](#), a Colorado Christian group which sponsors Love Won Out conferences where participants are taught how to recognize and combat "pro-gay" messages and encouraged to endorse reparative therapy in public schools. The movement is seen as furthering the [hostile environment](#) gays find themselves in.

The coalition, in an effort to promote a safe environment for gays, has announced that it will be sending a 12-page booklet to the nation's 14,700 school superintendents entitled "Just the Facts About Sexual Orientation & Youth." The booklet states that "there is no support among health and mental health professional organizations" that being gay is abnormal or unhealthy.

Janet Parshall of the [Family Research Council](#) condemned the pamphlet. "If they're going to talk about 'the facts,' then here's a fact: All the major religions of the world consider homosexuality wrong," said Parshall.

Here's another 'fact': all the major religions of the world are wrong about this and about almost everything else they talk about.

November 17, 1999. The November issue of [Charisma](#) magazine has a skeptical article about a weird phenomenon that apparently began in Toronto several years ago and has spread to revival meetings in several countries. Some revivalists believe that God is doing dentistry and transforming amalgam fillings into gold. In Brazil, gold dust is said to fall from the head of [Sylvania Machado](#) when she prays. In *When the Glory Comes Down* Elizabeth Moll Stalcup examines the claim of certain pastors in North and South America and Europe who say that gold dust is falling in revival services. She questions whether what is appearing is really gold and wonders if it really comes from God.

When the charismatics are skeptical of miraculous signs, I suppose the hardened skeptics should take note.

In "[Gold Dust Phenomenon Stirs Up Questions Among Charismatics](#)," Andy Butcher notes that John Arnott of the Toronto Airport Christian Fellowship (TACF) canceled

a scheduled four-day appearance by Machado after a geochemist at the University of Toronto, who examined some "gold" flecks that fell from her head during a revival meeting, concluded the specks did not contain any gold but were some type of plastic film.

In "[From base metal to gold: theological reflections on the gold teeth filling phenomenon](#)," Andrew Walker traces the history of the God the Dentist movement from the Toronto Blessing in 1994 and casts doubt upon the veracity of the claim that God is replacing base metal fillings and crowns with gold at revival meetings. "Doing divine dentistry, like doing a turn at a party, seems to be a form of showing off, the self-indulgence of a mischievous sprite," according to Walker.

"I do not know who or what is behind the gold tooth phenomenon," says Walker, "but I do know that if God is behind it, then this is not a God I want to follow."

Amen.

[thanks to Bob Liichow and Jez Smith]

November 10, 1999. [The Associated Press](#) reports that Oklahoma has joined Illinois, Kansas, and Kentucky in the effort to have evolution demoted from the foundation of modern biology to 'just another theory.' (Kanawha County, West Virginia, is considering joining the pack.) The Oklahoma State Textbook Committee voted to require that all new biology textbooks carry a disclaimer saying evolution is a "controversial theory."

"Some of us on the committee wanted to send a strong statement to the publishers that we are fed up with textbooks that only present one side of the story," said John Dickmann, a middle school teacher who introduced the disclaimer. According to Mr. Dickmann, biology texts do not give enough attention to alternate explanations of the development of life (such as the *Genesis* myth?).

November 8, 1999. *Time* magazine devotes this issue to articles predicting what will happen in the year 2000. While waiting in the dentist's office I read an article by Leon Jaroff who predicts that the next century will see the end of the "alternative" medicine fad. He notes that the term 'alternative medicine' is just a politically correct term for quackery and claims that once people realize that homeopathic remedies are nothing but water and that those nurses waving their hands over your body are moving air not "energy," they will revolt. The Office of Alternative Medicine at the National Institutes of Health will be abandoned, says Jaroff. I wish I saw the same things when I look into my crystal ball.

While reading the article I started to envision a new movement devoted to alternative dentistry.

November 5, 1999. The [Electronic Telegraph \(UK\)](#) reports that a Kansas teacher has been sacked for telling a student that her parents have been teaching her "crap" about the creation of the universe. I can understand how exasperating it must be for a teacher to have to deal with hordes of infallible children who have been encouraged to believe that science is a bunch of crap, especially when school boards, government agencies, presidents and would-be presidents of the United States encourage the

students in their notion. Still...a teacher must show respect for even for the least of his or her minions and their guardians.

11 Nov 1999

Greetings,

I regularly visit your Skeptic's Refuge, but this is the first time I actually feel the need to respond to something I found there. This concerns one of your most recent entries in the Mass Media Funk column, dated Nov 5, about a Kansas teacher who got sacked. You write, "a teacher must show respect for even for the least of his or her minions and their guardians."

Well, you see, I agree with you 100%, except on one point: I think said teacher's anger over what his young student was being taught at home proves that he showed a great deal more respect towards this child's developing mind than the student's parents did...

Thanks for a great Web site!

Viktor T. Toth

November 2, 1999. Will the Eastern Seaboard replace the Bermuda Triangle as the place where mysterious crashes occur in exceptional numbers? Not if John Allen Poulos has his way. In "Fear, Logic and Tragedy - Looking for Meaning in Coincidences," on [ABCNews.com](#), Poulos tries to ward off the tabloids with some mathematical logic. He explores the human "tendency to attribute significance to anomalies and coincidences" and encourages a rational look at statistics and events in light of several recent air crashes. He reminds us that "a passenger who daily and randomly takes a jet flight between American cities would, on average, go 19,000 years before dying in a crash."

[thanks to Jon Henrik Gilhuus]

November 1, 1999. On [ABCNews.com](#), John Allen Poulos revisits the [Bible Code](#) and summarizes its uselessness while reviewing the latest critique by Brendan McKay, published in the same journal as the original article that started all the fuss. [thanks to Jon Henrik Gilhuus]

November 1, 1999. "There was no exodus from Egypt, Joshua didn't bring down the walls of Jericho, and Solomon's kingdom was a small, tribal dynasty, an Israeli archaeologist says in a new article," according to [ABCNews.com](#). Zeev Herzog's archaeological evidence brings into question the accuracy of "the national myths that are the basis of Jewish claims to the land of Israel. "

October 29, 1999. James Redfield is joining other New Age healers in asking that "In the last moments of 1999, just as everybody focuses on the clock no matter where they are...join with everyone else and pray in their own way for a better world in the next century and millennium, for an increase in peace and freedom, and a general uplifting in the human race." That should do the trick. And if it doesn't usher in a new paradigm at least it might increase sales of his latest book, *The Secret of Shambhala*. Not that he needs the publicity. His latest is already a ["runaway bestseller."](#) [Jon Henrik Gilhuus, who alerted us to this nonsense, says it reminds him of Ambrose Beirce's definition of *pray*: "To ask that the laws of the universe be annulled in behalf of a single petitioner confessedly unworthy."]

October 29, 1999. Reuters reports that today [Erich von Däniken](#) called upon investors to buy shares in a [Mystery Park](#) he hopes to open in Interlaken, Switzerland, on a site that used to be a military airfield. The park, he told Reuters, "will let visitors explore unexplained phenomena such as how the great [Egyptian pyramids](#) in Giza were made or what caused the strange, miles-long [Nazca drawings](#) in Peru's desert." It is to be expected that von Däniken will emphasize the mystery part of his park. He says the park will provide more questions than answers to its visitors. People don't have "the time or money to visit the mysteries of this world themselves," he said, so he is bringing the mysteries of the world to them....if they live in Switzerland.

In his spiel to entice investors, von Däniken says that his park will present "the wonders and mysteries related to such questions as where our civilization came from and where it is going." Historians please do not bother to offer your assistance. This group has no interest in traditional explanations of the origins of civilization. They are not mysterious enough because they don't involve stories of aliens and spaceships. And who better to tell us about the future than a group of visionaries who think history should be created out of the imagination.

Von Däniken's group is selling shares in the Park to raise some \$3.5 million (5.5 million Swiss Francs). I don't know why he doesn't just give [Joe Firmage](#) a call. [thanks to Neil Winder]

October 29, 1999. A [Gallup poll](#) found that only about 12% of American adults object to Halloween on religious grounds. However, the poll also found that belief in [ghosts](#) and [witches](#) is going strong. Belief in ghosts is up 200% over twenty years ago and belief in witches is up 100%. What is most scary is that "belief in ghosts is much higher among younger Americans than among older Americans. In fact, over half -- 54% -- of those 18-29 say they believe in ghosts, compared to only 8% of senior citizens 65 and older." We're going the wrong way, baby! [thanks to Jon Henrik Gilhuus]

October 25, 1999. [The Chicago Tribune reported](#) that the Illinois Board of Education beat Kansas by two years in eliminating evolution from the state school standards. In July 1997, Illinois replaced references to evolution with "change over time."

A Christian conservative group affiliated with Republican presidential candidate Gary Bauer is taking credit for influencing the state's decision to exclude the

language, otherwise the quietly made decision might have continued to go unnoticed.

The bowdlerized Illinois Standards Achievement Test, to be administered for the first time next February, will not use the term 'evolution'.

The National Center for Science Education issued a report, ["Evolution Too 'Controversial' for Illinois Schools"](#) by Molleen Matsumura, on the proposed changes two years ago, but the media has not paid much attention either to the report or to the Illinois Board's decision.

[Thanks to Roy W. Mumaw]

October 21, 1999. Blair Anthony Robertson's "Speed-reading between the lines," (Sacramento Bee, October 21, front page) exposes one of the many scam artists in the speed-reading trade, [Howard Berg](#), who claims to be able to read 25,000 words a minute by reading "15 lines at a time backwards and forwards." That's about 80-90 pages a minute. Tolstoy's *War and Peace* should take Berg about 15 minutes to read, Robertson calculated. If Berg's claims were true, he would be, as he boldly asserts, the fastest reader in the world. Robertson, however, read Berg like a book, and was not fooled by the peppy personality or the hype. The first clue came at lunch when the reporter noticed that the world's fastest reader took twice as much time as he did to read the menu.

Robertson contacted Anne Cunningham, a University of California at Berkeley education professor and an expert on reading. She told him that tests measuring saccades (small rapid jerky movement of the eye as it jumps from fixation on one point to another) while reading have determined that the maximum number of words a person can accurately read is about 300 a minute. "People who purport to read 10,000 words a minute are doing what we call skimming," she said. Speed in reading is mainly determined by how fast a reader can understand the words and expressions one is reading. The fastest readers are those with excellent "recognition vocabularies." Faster readers can see words and understand them faster than slower readers. To improve one's speed at reading, she says, one should work on comprehension and study strategies.

Robertson did not skim over Berg's exaggerated claims or his credentials. He checked with Berg's alma mater and discovered that Berg was not telling the truth about his academic degrees. He noted that Berg had simply repackaged the Evelyn Woods Reading Dynamics course, one popular several decades ago with people like John F. Kennedy. Robertson noted that in his five-hour course, Berg hadn't said much about comprehension, except to suggest that it would come with practice. This did not deter several of the 35 students, who had paid \$51 each for the class from the Learning Exchange in Sacramento, from purchasing audio tapes for \$65.

The students would have done better to have enrolled in a community college course devoted to building study skills, vocabulary, and reading comprehension. It would have cost them less, and they would not end up wasting their time trying to read 10 lines at a time, backward and forward. They would also avoid the frustration that will be inevitable when they find that while they can skim through material at a greater rate than they can read it, the utility of such a skill is limited (good for most of what's likely to be in the daily newspaper, for example). Skimming makes both

comprehension and taking pleasure in words or ideas next to impossible. Why read fiction at all if you don't want to enjoy the language and the ideas? Who would want to hire a physician or lawyer who skimmed rather than studied? Does anyone really need someone like Berg to teach them to skim the sports pages?

07 Mar 2002

Hello, I'm a recent visitor to your skepdic.com web site, and the following statement from the page about prayer really caught my interest: "Some religions require parents to ignore medical treatment for their children, even if to do so is likely to prove fatal, in favor of prayer, e.g., Congregants of Church of Christ, Scientist, the Followers of Christ Church, and the General Assembly and Church of the First Born." A link to a "Time" magazine article on the subject is also provided. I'm writing to share a few thoughts with you about this subject.

I don't believe that your statement is a correct characterization of the teachings of Christian Science. For instance, in another article from "Time" called "Faith or Healing? Why the law can't do a thing about the infant-mortality rate of an Oregon sect" (August 31, 1998), a Christian Science Church spokesman has stated: "If one form of treatment is not working, parents have an obligation to investigate other alternatives, 'including doctors or hospitals'." This is not a new policy for the church. Mary Baker Eddy (1821-1910), the founder of Christian Science, has written in her book: "If patients fail to experience the healing power of Christian Science, and think they can be benefited by certain ordinary physical methods of medical treatment, then the Mind-physician should give up such cases, and leave invalids free to resort to whatever other systems they fancy will afford relief." ("Science and Health with Key to the Scriptures," p. 443). The church respects the right of individuals to make their own choices regarding health care treatment.

I'm certainly in favor of healthy skepticism, providing that it serves to uncover truth. I know that there are plenty of books and articles containing various opinions about Christian Science, but I find that the best way to know what it actually teaches about a given subject is to consult with the primary source, "Science and Health." I'd appreciate it if you would consider amending your statement about this subject, and please don't hesitate to contact me if I can be of further assistance.

Rick Sawdon

reply: Thank you for taking the time to write and inform me of your views on Christian Science regarding seeking medical treatment. I can see where some readers might interpret what I write as meaning that 'Christian Scientists are forbidden to ever seek medical help' or that 'Christian Scientists never seek medical help'. However, that was not my point. My point is that prayer is preferred and chosen by parents as a means of healing their child, even though at times this approach proves

fatal to the child. I do not believe the parents in such cases want their children to die or are malicious, but I believe there have been sufficient court cases dealing with this type of child abuse to warrant saying what I say. Whether it is the Church's policy to allow members to seek medical help when prayer isn't working is not my concern. Sometimes the child dies too quickly and the parents don't have time to seek proper medical care.

If I am wrong about this, I would like to be corrected. In any case, I have added a parenthetical comment to the entry on prayer and I hope this clarifies my claim so that the views and practices of these religions are not misrepresented.

pseudoscience

2 Feb 1997

Congratulations and thank you for posting such a fine document on the web. I am 7-12 math/science teacher in a very small town in the very far north of Manitoba [Canada] In the 3 years that I have been employed here, I have seen scores of students who accept mass media pseudoscience as fact.

Even sadder, many of my aboriginal students (and their families) still seek medical advice and treatment from traditional "healers". These Shaman (or should I say Sharletans?) travel from remote community to remote community preaching their traditional healing methods. They encourage their patients to stop seeing local doctors and hospitals ("white" medicine) and they command a high level of respect the leaders of the aboriginal community. As you can imagine, their services aren't free. These snake-oil hucksters annoy me because:

-they prey on the mistrust and disdain that many in the aboriginal community already have for "white". They are widening the gulf between our cultures.

-they perpetuate superstition and misinformed attitudes towards science and medicine (like Christian Scientists, they deny that diseases are caused by germs!)

-they take money from families on social assistance, many of whom send their kids to school hungry.

The "white" community aren't always helpful either, when it comes to doing my job (teaching science). I am constantly pressured by fundamentalists from the local Protestant church to include "creationism" in my senior high biology program. The first couple of times this happened, my responses were somewhat glib, "only if I can come to your church next Sunday and give a lecture on Darwin." But now, I respond with a simple no - creationism is not science, and remind them that this is a public (not private) school. I am very glad that none of these people have succeeded in being elected to our school board.

Your website is a great service to teachers who, like me, are fighting against the tides of irrationality.

Madness on the Couch: Blaming the Victim in the Heyday of Psychoanalysis

by Edward Dolnick
(Simon & Schuster, 1998)

**I can't help being convinced that my dear fellow men,
with few exceptions, are worthless.
--Freud, in a letter to Lou Andreas-Salomé**

Edward Dolnick, former chief science writer for the *Boston Globe*, traces the popularity of psychoanalysis in America during the 1950s and 1960s. His focus is on the [pseudoscientific](#) theories and dangerous practices that emerged and flourished in the wake of World War II as American psychotherapists battled to understand and treat schizophrenia, autism, and obsessive-compulsive disorder. The analysts fought under the banner of [Freud](#), a self-declared conquistador, and ventured into territory their general had declared unconquerable. For two decades, history was written by these conquistadors, but when Dolnick retells the story one is reminded not of conquering heroes and brave explorers, but of the Nazis from whom many of them had been forced to flee.

Though Dolnick does not mention Freud in the title, his book is another in a growing list of attacks on the father of psychoanalysis. Freud is attacked not only for his ideas and methods, but for his arrogance and contempt for his patients and colleagues. For example, Dolnick points out that the couch, which has become the symbol of Freudian psychoanalysis, was not used by the master to help the patient relax. Freud explained it this way: "I cannot put up with being stared at by other people for eight hours a day (or more)" (20). It is tempting to apply the same kind of wild speculative interpretation of Freud's methods that he applied to everyone else's behavior. For Freud, nothing is as it seems. Everything is a symbol waiting to be interpreted. Thus, one might say that Freud laid his patients down so he could be above them, could dominate them, lord it over them. He himself sat erect while his patients lay limp. It was subtle, but he was raping them, taking from them their innocence, using them for his own pleasure. It was his shame, his fear of losing face, that kept him from facing his patients.

Speculation was and is at the heart of psychoanalytic theory and practice. However, unlike scientific speculation, which leads to testable hypotheses and controlled experiments, psychoanalysis was developed mainly by unscientific, if not anti-scientific, minds. One searches in vain among the analysts for any semblance of the typical concerns and attitudes of scientists. There is no

concern for testing their claims, which are put forth dogmatically rather than tentatively. Skepticism about their work is rare; bravado and bold assertions are common. Debate and argument with critics is acrimonious and fruitless. Yet, their influence was widespread. Art, literature, philosophy, religion, history; what discipline was not influenced by Freudian notions? Who did not emerge from college in the sixties and seventies "knowing" that [repression](#) explained everything and that the [unconscious](#) is the gateway to the secrets of the universe?

What can explain the popularity of Freud in America, if his theories and practices were so wrong? Like so many other things in life, it boils down to timing. The world had gone mad in the forties, culminating with the development and use of nuclear bombs. The beauty and genius represented in the development of flying machines was replaced by the horror of rockets and airplanes used to drop bombs on cities. The irrational ruled. Civilization is a thin veneer behind which lurks a raging animal ready to tear it down. How could one possibly make sense out such a world? Freud had an answer and it was better than anything the competition could come up with. Religion and philosophy, the traditional guides for the perplexed, were so vacuous and devoid of answers, they too looked to Freud for help. Furthermore, Freud's ideas had great utility for nearly every discipline. Marxists could gleefully explain capitalism in terms of anal fixations and hoarding feces (i.e., money). Writers could explore dreams, stream of consciousness, sexual symbolism, and feel they were plumbing the depths of hidden profundities. Everybody could explain their weird friends and relatives with these notions. It was creative; it was fun. Best of all, nobody could prove you wrong.

The main bit of good timing, however, did not come from the fact that Freudianism could explain such horrors as the Holocaust (as well as just about everything else), but from the fact that the analysts were primarily European Jews who ended up in America.

Dolnick's book, however, is not an attempt to explain why psychoanalysis became so popular, but how it destroyed many lives in the name of helping people. It is the story of good intentions and promises of hope, of treating patients with respect, treating them as persons who possess free will and who deserve love and patience. In fact, *Madness on the Couch* should be read by all the New Age medical gurus, such as [Andrew Weil](#) and [Deepak Chopra](#), who think that the problem with medicine today is that it lacks a mind/body approach. Treating the mind, rather than the body, was tried by psychoanalysts, psychiatrists, and psychologists during the 1950s and 1960s, and still enjoys a good deal of popularity in [some circles](#). A generation or more of some of our brightest minds seem to have gone mad, however, in their pursuit of understanding madness. What distinguishes them most, however, is not their errors, but their arrogance. They developed theory after theory, treatment after treatment, based almost exclusively on intuition and insight. Nothing resembling a scientific concern for [self-deception](#) appears in

the methods of the main figures, who are depicted by Dolnick stripped of their power, their unchecked ideas exposed for all to see. Their concern with persons and minds, rather than with bodies and their mechanisms, did not make them either humane or correct.

Freudian pseudoscience

The story starts, of course, with [Freud and psychoanalysis](#). Though Freud and his followers thought of themselves as scientists, and did a very good job of fooling a good part of the rest of the world on this matter, their main methods of inquiry were untestable. Such methods as free association, interpretation of dreams, and treating thoughts and actions as symbols, gave them a virtual blank check to claim they knew both the cause and cure of madness. They never used [control groups](#) because they saw no need for them. Their brilliance alone would show them whether their intuitions and insights were correct. All they needed for evidence was a plausible story affirmed by their colleagues. They had no trouble coming up with either.

That some of the best minds working in this field would ignore fundamental truths about human frailty--such as the ease with which we can [deceive ourselves](#) and the natural tendency toward [confirmation bias](#) and [self-validation](#)--is a puzzle in itself. The field seems to attract a particular type of personality: arrogant, authoritarian, and convinced of his or her own brilliance and special ability to see through the way things appear to what they "really" are. They lacked the essential skepticism that marks true scientists. They showed no tendency to propose *tentative* hypotheses or to test those hypotheses in ways that might exclude or minimize bias or error. Their behavior was more analogous to interpreters of *literature* than to interpreters of *nature*. These giants were [pseudoscientists](#) in every sense of the term.

Who were these giants and what did they do? First there was Freud, who taught them that the [unconscious](#) mind is a storehouse of [repressed memories](#) and that behavior, like dreams, must be treated as being symbolic. Furthermore, he taught that everything has meaning and the job of the analyst of the mind is to decipher the patient's thoughts, speech, dreams, and actions. Early on he imagined that mental disorders were due to childhood sexual abuse. Later he imagined that they were due to repressed memories of seeing or hearing adults engaging in various forms of sexual activity. He would not treat the severely mentally ill because he thought they were resistant to psychoanalysis, but he would not hesitate to explain severe mental illness. Schizophrenia, for example, was caused by unresolved feelings of homosexuality. His evidence for his theories and practices came from the insights he gained by seeing his patients, who, for the most part, consisted of middle class Viennese women suffering from "hysteria." His imagination was his only check in reality. Nothing resembling a sense of the need for a scientific methodology issues from his pen. All is speculation and interpretation put forth as dogmatic fact. He was so brilliant that he could

examine a single case, even at a distance (as with [Daniel Paul Schreber](#)) and declare that to understand one male paranoid is to understand them all. No generalization was too sweeping or too grand for the master. Freud was a guru, not a model scientist.

psychoanalysis in America

Had the [Holocaust](#) not occurred, psychoanalysis may never have flourished in America. Three-fourths of all analysts ended up here after the war with Germany. Those who sided with Nature in the Nature/Nurture debate were seen as aligning themselves with Nazi race theorists, as well as with [materialism](#) and [determinism](#). Worse, they were saying that the Holocaust was not an aberration and it could not have been avoided. (Freud, by the way, did not think that human nature is neutral and that a person can be made into anything by one's culture. The Holocaust and much more from human history made it indisputable that man is by nature a "savage beast" who desires to die and who has little empathy towards his fellow creatures.)

In America, theories of personality and mental illness based on upbringing, education, training, etc., were favored, not only because they distanced themselves from the [Mengele's](#) of the world, but because they seemed to be reconcilable with a belief in [free will](#). Biological explanations, on the other hand, seemed to imply a hopeless determinism. Any discipline or theory which threatens a belief in the [soul](#) or in free will faces centuries of cultural resistance. Thus, while there were some scientists after the war who were working on the theory that personality and mental illnesses were biologically determined, it would take decades before their voices could be heard above the din of the Nurture-over-Nature enthusiasts. Even now such voices are still being attacked for being "reductionist" and not "[holistic](#)." Psychoanalysis should be proof enough that being holistic does not mean one is any closer to the truth. Likewise, the discoveries of genetic causes of certain diseases should be proof enough that sometimes the material explanation, though reductionist, neither dehumanizes us nor takes us away from the truth. Finally, it should be obvious to even the amateur philosopher, that siding with nurture is as deterministic as siding with nature in the nature/nurture debate. There is a greater illusion of freedom in siding with nurture, since the environment can be changed, while one's genes can't. However, the deterministic power of one's genes might be overestimated, since a genetic defect might cause a problem only when one is exposed to something particular in one's environment, something which might easily be avoided, such as [fava beans](#).

the schizophrenogenic mother

In America, psychoanalysts soon started claiming that they not only understood the *cause* of such illnesses as schizophrenia, but that they could *cure* it. The new breed of analysts remained true to the spirit of their master: freewheeling theories and practices unchecked by meaningful empirical tests.

But they came up with new explanations for madness. *Mothers* caused it by their bad mothering. Or, *mothers* and *fathers* both caused it by their own mad behavior. Later, it would be claimed that the parents were victims, too, ad infinitum, I suppose all the way back to Adam and Eve.

Of course, if the parents caused the disease, then the cure would have to involve getting rid of the parents. The best way to do this was to devise treatments that isolate the patient, get him to reject his family, and encourage him to accept the therapist as a surrogate parent. It would not be long, however, before attachment to the therapist, encouraged by the very methodologies used, would itself be seen as another problem that belonged to the *patient*.

The paradigm therapist became someone like Frieda Fromm-Reichmann, who acted as a mother surrogate to her patients at Chestnut Lodge, a private mental hospital near Washington, D.C., for some twenty-two years. She invented the term "schizophrenogenic mother" to describe the kind of mother who caused schizophrenia in her child. She was heroized as "Clara Fried" by Joanne Greenberg in *I Never Promised You a Rose Garden*, a bestseller in the mid-1960s. According to Greenberg, Fromm-Reichman used *empathy* to cure her of schizophrenia (84). However, the diagnosis may have been an error. It is as likely that empathy can cure schizophrenia as it is that it can cure diabetes.

Fromm-Reichmann declared that schizophrenia was "a secondary result of very early serious warping of [the schizophrenic's] relationships with the people significant in their environment in infancy and childhood" (90). "Serious warping"--now, there is a truly scientific term! One might say that the serious warping continued with the therapist who now offered hope to the patient by claiming that she could undo the wrong that had been done to the child, the wrong that had caused schizophrenia. She would cure all their wounds and frustrations, like a good doctor and good mommy. How would she do this? By listening to her patients, by showing them that they had a true friend in Frieda, that there was someone who cared and would not run away from them no matter how strangely they behaved or spoke.

Soon there would be analysts claiming that just about every illness, physical as well as mental, was caused by bad parenting. Two analysts in particular were important to this development: Helen Flanders Dunbar and Franz Alexander. In 1947, Dunbar published *Mind and Body*, in which she declared that people get sick because subconsciously they want to get sick to receive "compensation for the neglect or severity they may have suffered in childhood" (68). In 1950, Alexander published *Psychosomatic Medicine* in which he claimed that asthma is caused by "a repressed desire for the mother" and other such nonsense.

the holistic Karl Menninger

In the 1950s and 1960s, Karl Menninger, with his father and brother, ran the Menninger clinic in Topeka, Kansas. He proclaimed that love would remove the evil in man's heart, that he was more "Freudian than Freud," that criminals are mentally ill, and that all mental illness was temporary, basically the same, and could be cured by psychoanalysis, i.e., talk therapy. Anxiety was the root of all illness; therapy would relieve anxiety. Since we are all anxious to some degree, the mentally ill do not differ from us in kind but in degree of anxiety. Such a view rendered diagnosis superfluous. One could begin the treatment right away, since the analyst knew before seeing the patient that he or she suffered from excessive anxiety. (This approach is popular today with [repressed memory therapists](#). They know before the patient reaches the door that her problems are caused by repressed memories of childhood sexual abuse.) The fact that Menninger had no scientific evidence to support his notions was deemed of no importance to those who saw him as a messenger of hope who respected the criminal and the insane as fellow human beings with fixable problems. He was holistic and treated the *person* not the disease. It seems to have mattered little to his supporters that he didn't know what he was talking about.

Searles and Rosen, therapists from Hell

Two other very influential analysts in the 1950s and 1960s were psychiatrists Harold Searles and John Rosen. Both treated their patients as an angry parent who lacks self-control might treat a naughty child. Searles and Rosen not only assumed that their patients were ill because of bad parenting or grandparenting, they believed that the cure would be *reparenting* with the therapist as the surrogate parent. If the way they treated their patients was their idea of *good* parenting, however, one would need Dante as a guide through Hell to describe their idea of *bad* parenting. Like Freud, they treated everything as a symbol and gave themselves absolute power to interpret these "symbols" in any way they saw fit. They abused their patients psychologically and physically. This is a chilling chapter (chapter six) in Dolnick's book as well as in the history of psychoanalysis. These men are described as if they were deranged themselves. Yet, they held positions of respect and authority within the therapeutic community.

Searles contribution to theory was that the mother causes schizophrenia in the child because of unconscious, repressed feelings of love for the child which the mother is unable to express because *her* mother was a bad parent. Thus, grandmothers are really the cause of schizophrenia. Rosen, on the other hand, was best known for what he called "direct analysis," in which, he claimed, he spoke directly to the patient's unconscious and could cure anybody of anything, including schizophrenia. In 1971, Rosen was named Man of the Year by the American Academy of Psychotherapy. In 1983, he gave up his license to practice medicine when he was faced with sixty-seven violations of the Pennsylvania Medical Practices Act (116). He and his associates beat and tortured a number of patients, at least one of whom died from their reparenting.

help from the wings

As if the doctors themselves could not come up with enough untested and untestable theories and practices, analysts sought allies from any quarter. One of the most notable was Gregory Bateson, one of Margaret Mead's husbands. Bateson had no training in medicine--he was a zoologist by training and an anthropologist by profession-- and had no experience with schizophrenia, yet he claimed to understand the cause of schizophrenia. What's more, he got a large segment of the analytic community to agree with his theory of the "double bind." Schizophrenia is a parenting problem and understanding it involved understanding how to interpret symbols. Parents, by their conflicting speech and behavior, confused the child so badly that the child could not decipher messages. The child would become so confused that as an adult he or she wouldn't even be able to know what anyone meant by "What would you like to do today?" According to Bateson, to the victim of perpetual double binds such a question might mean you were being condemned for what you did yesterday or it might be taken as a sexual invitation. Such a person would "be unable to judge accurately...just what was meant" (120).

Bateson claimed that there were three possible responses for someone caught in perpetual double binds. Not coincidentally, the three responses corresponded to what every text book described as the three main forms of schizophrenia (120).

1. The paranoid response. Every message has a concealed secret meaning.
2. The hebephrenic response. Every message is unimportant and laughable. ["Hebephrenia is marked by giggling dismissal of the world" (120).]
3. The catatonic response. Every message is to be ignored.

Schizophrenia, according to Bateson, is caused by a family's communication style, which, in turn, was due to the hostile, anxious, unloving nature of the parents. The schizophrenic's strange speech and behavior, the voices in the head, etc., are all due to linguistic confusion brought about by a childhood of mixed messages. It is indicative of the pseudoscientific nature of psychoanalysis that such a theory could become a centerpiece, though it was proposed by someone who had not done a single observation of a schizophrenic patient.

a psychiatrist for the sixties: R.D. Laing

There are many others in this litany of abuse that Dolnick describes, such as Harry Stack Sullivan and Theodore Lidz. However, one who deserves special mention is R.D. Laing, who was very popular during the sixties. Laing was a psychiatrist who claimed that schizophrenics did not have "breakdowns;" they

had "breakthroughs." Like many others during that period, Laing enjoyed his psychotropic drugs and his booze, and found a large audience ready to hear that being mad and getting stoned were akin to experiencing God. To many people, especially those who thought of themselves as being *oppressed* by society, Laing was a liberator. To hear him declare that the *world* is mad was to hear the voice of reason in an irrational world governed by racism, sexism, and tribal hatreds. However, when it came to specific patients with their specific problems, Laing was a true Freudian: everything is a symbol to be interpreted by the therapist. Furthermore, the "word salad" commonly identified with schizophrenic speech, was playacting "to throw dangerous people off the scent" (134). Their incomprehensibility is intentional. Schizophrenia is a strategy some people use to deal with an intolerable situation. His proof? He said he "cured" all twelve of his patients in just eighteen months. However, within a year all of them were readmitted to the mental hospital where he had treated them.

ice picks and lightning bolts

Why was psychoanalysis so popular among so many bright people for so long? One reason was its appeal to the creative mind. Freud's ability to create worlds out of dreams, twitches, figures of speech, etc., was unparalleled. There is something in the human psyche that desires to make sense out of things and there is something attractive and exciting about stories that make sense out things in surprising and intelligent ways. For the intellectual, creating myths is fun. So, on one side there is the sheer pleasure derived from coming up with these fantastic explanations of the most irrational or seeming meaningless or mundane thoughts and actions. On the other side, was the fact that the main opposition consisted of doctors who were sticking ice picks into their patient's orbital sockets in order to cause destruction in the prefrontal lobes or who were administering drugs or electricity in an effort to shock the brain into submission.

Chapter eight covers this period in medical history when it was considered a scientific advancement to move from drilling holes through the skull to jabbing an ice pick directly into the brain by entering through the eye socket. Better lobotomies through advancing technologies! Walter Freeman and James Watts' *Psychosurgery* was a hit in 1942 and Egas Moniz won the Nobel Prize for medicine in 1949 for his pioneering work in prefrontal lobotomies! The operation was so simple that even a non-surgeon like Freeman could do it. Killing a couple of patients by severing their cerebral arteries was considered a minor setback (146).

It was also considered a great step forward when electroconvulsive therapy (ECT), aka *electroshock*, replaced both intentional overdoses of insulin to induce coma and Metrazol injections intended to induce "epilepticlike convulsions in the schizophrenic" (144). [ECT continues to be used](#) for patients with severe and otherwise untreatable depression, although a new

therapy using magnets instead of electricity is now being tested: [transcranial magnetic stimulation \(TMS\)](#).

The main defense of these seemingly barbaric procedures was and is that "they work!" In this case, however, that did not mean that the doctors had many satisfied customers. It meant that the doctors themselves were satisfied with the results. It certainly did not mean that anyone with schizophrenia had been cured. It did mean that some patients with severe depression improved significantly, even if only temporarily and even if no one had a clue as to why it worked.

In short, patients had little choice in terms of what treatment was available. Psychoanalysis must have appeared to be the more *humane* of the available alternatives. But it was like asking the mentally ill whether they would prefer a lethal injection or the electric chair.

biology not quite to the rescue

So, where were the "biopsychiatrists" during this period? Where were the brain researchers, the neuroscientists, and the geneticists? They were there and they were mostly discovering that the brain was much more complex than anyone had ever imagined. Dolnick describes their struggles in chapter nine. The most interesting part of the debate between the Nature and Nurture advocates was that the data could be made to fit either hypothesis. In fact, I suppose, the data could have fit the astrologer's theory as well. The earliest data were gathered, in part, from studies of families and twins. It was known that about one percent of the population in America suffers from schizophrenia. It was discovered that the chances of being schizophrenic double if you have a cousin who is schizophrenic. The chances quadruple if you have an aunt or uncle who is schizophrenic. If a sibling is schizophrenic, the chances increase ninefold. If a parent is schizophrenic, there is a 13 percent chance that his or her child will have the disease. And if one identical twin is schizophrenic, there is a 50 percent chance that the other one is too. Does the data support bad parenting or bad genes as the most significant causal factor here?

Both sides saw the data as supporting their views. These poor schizophrenic creatures not only shared genes, they shared family histories as well. For example, it is no wonder that an identical twin of a schizophrenic is fifty times more likely to have schizophrenia than those in the general population. Their parents treat them alike. They dress them the same, talk to them the same, etc. Those who had blamed parenting already knew that schizophrenia ran in families, and they knew why, too. So, the geneticists' data were unconvincing that this was exclusively, or even primarily, a genetic disorder. In any event, the astrologer knows why twins tend to be alike even in their mental illnesses: they were born at the same time!

enter Leonard Heston, psychiatrist and scientist

A different kind of data was needed, if this issue of bad parenting causing schizophrenia was to be resolved. It would be provided by Leonard Heston, a psychiatrist working in a mental hospital in Oregon in the early 1960s (155). Heston gathered data on children born to schizophrenic mothers and given up for adoption. He compared them to a control group of adoptees born of non-schizophrenic mothers. If schizophrenia was due to bad parenting, there should be no difference in the incidence of schizophrenia in the two groups. Each should have about one percent schizophrenic children. On the other hand, if schizophrenia is caused primarily by a genetic predisposition to the disease, then the adoptees whose mothers were schizophrenic should have a significantly higher incidence of the disease than the control group. Heston gathered the data and another psychiatrist evaluated it without knowledge of whether the adoptee was in the control group or the schizophrenic mother group.

It was difficult, but Heston managed to track down 92 of 97 adoptees of schizophrenic mothers on his list. Five had schizophrenia; whereas none of the control group did. The chance that this was a coincidence was one in forty (157). Some analysts stuck to their guns and said the only surprise was that a bad mother could have such a tremendous impact in the few hours or days she had with her infant before giving it up for adoption (157). A larger study, done on Danish adoptees by David Rosenthal and Seymour Kety, confirmed Heston's work. Kety and Rosenthal studied "more than two decades' worth of adoption records from Copenhagen and its environs, an area that included roughly one-quarter of the population of Denmark" (158). Kety did a later study on the entire country. Elaborate controls were set up to avoid researcher bias. In comparing biological to adoptive relatives of schizophrenic adoptees, they "put in place an elaborate system of safeguards" to isolate "nature" and "nurture" factors (158). The evidence showed that "schizophrenia was concentrated in the biological relatives, although they had never spent time with the child they had given up for adoption" (158).

It was becoming clear that some people have a genetic predisposition to schizophrenia. About the only thing the analysts had been right about was that many of the parents of their patients were weird. They were weird because they suffered from a disorder similar to that of their children. However, their weird behavior did not cause their child's disease.

the cause of schizophrenia: unknown

Even with this data, however, researchers were no closer to understanding what causes schizophrenia. It might not be bad mothering, but something in the environment might serve as a catalyst, triggering the disease in some family members but not in others. To this day, no one knows what causes schizophrenia. All we know is that most children of schizophrenic parents,

and most parents of schizophrenic children, are healthy. We don't know why. There is no happy ending here...not yet, anyway. We know that there is an extremely complex biochemical system that affects our cognitive and emotive abilities. The fact that certain drugs which affect neurotransmitters, such as dopamine, significantly affect this system in schizophrenics, but not in healthy people, *indicates* that the disease is related to a neurochemical "imbalance." However, the drugs used to treat this and other severe brain disorders have been discovered serendipitously. We really do not understand why or how they work. The psychoanalyst, of course, can say that bad parenting is what causes the neurochemical imbalances. The astrologer can say that neurochemical imbalances are due to astrological imbalances. They can say these things, but their words seem hollow and without force. Where is their proof? What was it about all those adoptive parents that triggered schizophrenia in their adopted children with a genetic predisposition to the disease? Until the psychoanalysts can answer this question, their belief that bad parenting is a significant factor in the development of the disease remains little more than an article of faith. And where is the data showing that schizophrenic adoptees share some significant astrological connection? If it existed, I am sure the astrologers would have informed the world by now. The number of environmental factors that can significantly affect neurochemistry is quite large. Schizophrenia may not be one disorder, but a family of disorders with multiple causes. It is quite possible that very distinct triggering events could result in similar symptomologies. A viral infection might have the same effect on one person that a series of vicious assaults might have on another.

psychoanalysis not the cure for schizophrenia

It remained to be shown that psychoanalysis is ineffective as a *cure* for schizophrenia. This was done in the mid-1960s by psychiatrist Philip May. He randomly assigned 228 schizophrenia patients at Camarillo State Hospital in California to one of five treatment groups. Some got psychotherapy; some got drugs; some got both; and some got electroshock. The fifth group received "standard patient care" and served as a control group (161). The treatment lasted for six months to a year. May did follow-up studies on his patients three, four, and five years after the initial study. He published a series of papers over the years, detailing his findings. The control group and those who received only psychotherapy did about the same; they did the worst of the five groups. There was some improvement in the electroshock group. The two groups that fared the best were those treated with drugs, and there was almost no difference between those given therapy with their drugs and those who were only given drugs. May didn't know any more than anyone else as to why drugs worked, but it seemed pretty obvious that therapy, at best, was "nonsignificant" (161), i.e., useless. Other studies would conclude that psychoanalysis was not just ineffective; it was often harmful to schizophrenics (162). Karl Menninger responded by calling drugs such as Thorazine (chlorpromazine) "chemical straightjackets" (162). Menninger declared that drugs can't heal persons. Only persons can heal persons. It was a

lament one now hears from the likes of "alternative" medicine advocates, such as Dr. Weil, who claim that conventional medicine treats diseases not people.

Of course there is a danger that some psychiatrists will jump to the conclusion that the mentally ill need no therapy at all as long as they get their drugs. Nothing could be further from the truth, especially when many diagnoses are based on the patient's response to different medicines. The worst thing that could happen to psychiatry would be for it to think that everybody with a problem needs a pill, and the challenge is to find the right pill. Just because it has been shown that bad parenting is not the cause of schizophrenia does not mean that bad parenting doesn't cause many psychological problems in children for which there is no magic pill that will make the problems go away. Furthermore, the fact that a good percentage of the "mentally" ill do not respond to drug therapy may indicate that some "mental" illness is not primarily biological.

dangerous kindness

What makes people like Menninger and Weil dangerous is their kindness. How can one disagree with their idealized speech about proper doctor/patient relationships? A human being is suffering. A human being must understand the other's suffering and give hope to the sufferer. To reduce a human being to the level of cells, organs, neurochemicals, etc., is dehumanizing. We must treat persons as persons, and that requires that we not engage in reductionism or materialism. We must give proper respect to the patient's spirit and treat the whole person. The rhetoric is appealing, but it misguided and misleading. If you have a collapsed artery, you need a doctor who will open it up for you. This does not reduce you to a thing and it does not require medicine that reduces everything to the material level. You no more need a holistic or spiritualistic doctor to perform an angioplasty than you need a geomancer to repair a leaky pipe in your bathroom. Your doctor may pray with you and may treat you with the utmost respect, but if he or she does not repair your artery properly, you will die. The holistic baggage is superfluous metaphysics.

Psychoanalysts and many "alternative," holistic practitioners are fond of pointing out that nobody knows how or why these drugs work. All we know is that in a good number (some 75 percent) of schizophrenics, drugs such as Thorazine and Clozapine can stop the voices inside the head and eliminate the delusions. As a result of these and other drugs, many schizophrenics and others with severe brain disorders (such as manic-depression or obsessive compulsive disorder) are now able to lead productive lives in a broad range of professions, including psychiatry. However, when we say that drug therapy works, we do not mean that it produces many satisfied customers or pleased therapists. We mean that it allows a significant number of patients to live meaningful and productive lives. That is along way from saying that we know what causes schizophrenia and we have a cure for it. Nevertheless, research into biological explanations of thought and behavioral disorders seems to be the most promising now.

Is there no role for psychotherapy, then, in the treatment of schizophrenia? Dolnick does not address this question. He leaves little doubt that there is no role for psychoanalysis here, however, at least not as it was practiced in its heyday. The [National Alliance for the Mentally Ill](#) thinks that there is a significant role for therapists in the treatment of mental illness. It would be a mistake for psychiatrists to become little more than dispensers of drugs. But the nature of therapy must be radically different from that offered by traditional psychoanalysis. Some of the key problems that now occur are patients who don't take their medication, monitoring for side-effects of medications, helping with coping skills, dealing with radically diminished capacities and hopes, surviving in a world where one is stigmatized, jobless, etc. These require a different role from trying to come up with a plausible story to explain why your patient fantasizes about being pregnant with her deceased father.

autism¹ and the holistic Bettelheim

The history of the treatment of [autism](#) parallels that of schizophrenia. The analysts blamed bad parenting for this disorder, as well. The leader of the pack was Bruno Bettelheim (1944-73), whose survival of Dachau and Buchenwald, gave authenticity and sympathy to his opinions. Bettelheim's comparison of the autistic child to the survivor of the concentration camps was at the heart of his analysis. The child withdraws into himself as a defense mechanism against his tormentors, i.e., his parents. But equally attractive to his colleagues was Bettelheim's notion that he was treating the whole person. Those who claimed autism and other mental diseases were actually *physical* diseases with *biological* rather than environmental origins, were reductionists. His psychological approach, on the other hand, was holistic and humane. Not that errors can't occur in the other direction as well: one current myth is that autism is caused by the MMR vaccine.*

Bettelheim was director of the Orthogenic School for the rehabilitation of emotionally disturbed children, many of them autistic, at the University of Chicago. He wrote a number of articles and books on child psychology and child rearing, including *Love Is Not Enough* (1950) and *The Empty Fortress* (1967). Dr. Bettelheim had a Ph.D. in mythology and was not a trained psychologist or psychiatrist, though, like Bateson, he had tremendous influence on those fields. It was not until a parent of an autistic child entered the fray that the bad parenting therapists were pushed from center stage. Bernard Rimland, a research psychologist for the U.S. Navy, made the case that autism is biological and not caused by bad parenting in his *Infantile Autism* (1964). He got Leo Kanner, a leader of the bad parenting school who had invented the label "refrigerator mothers," to write the preface. Times were clearly changing. Rimland provided no original research, but he compiled an impressive argument from work already done by others. He may not have known what caused autism, but he knew that it was not bad parenting and that

it was biological. His own child, and many others, had it from the moment of birth. The data also showed that parents who fit the pathogenic profile "almost invariably had normal, non-autistic children" (222). Parents who don't fit the pathogenic profile give birth to most autistic children. Siblings of autistic children are almost always normal. He also noted that autism strikes boys much more frequently than girls, an odd fact in a culture that does not prize girls more than boys (to put it mildly). It has since been discovered that the vast majority (some 75%) of autistic children are also retarded,* and even the most vehement of parent bashers had not blamed mental retardation on bad parenting.

Bettleheim had allies, however. Harry Harlow's famous experiment with monkeys "raised" by surrogate mothers, one soft and cuddly, the other made of unwrapped wire-mesh, was touted as showing how bad mothering caused infants to go mad. The metal mother might provide milk, but it didn't provide sustenance. The infant monkeys much preferred a wooden mother wrapped in soft cloth to a cold and metallic mother. Harlow was famous for tormenting monkeys to gain insight into mental illness in humans. When he introduced "monsters" to frighten infant monkeys, they ran to the cloth momma, even though the metal momma provided milk. Ergo, a human child's first need is love, not food. Ergo, some families are "characterized by coldness, ambivalence, double binding messages and lack of physical contact" (200). He wrote that in 1971 for the *Journal of Autism and Childhood Schizophrenia*. In his article, he compared his tormented monkey infants to human infants. Both exhibited "marked social withdrawal" and they retreat to a corner to "avoid social contact." The autistic child, he declared, is a mirror of his isolated monkeys. They try "to shut out all outside stimulation." It seemed to be of little concern that observations of "refrigerator" or "metal" mothers were based on little more than self-fulfilling prophecies. They saw what they were looking for. Their common sense and insight told them what was true. They had no need for studies designed to eliminate [confirmation bias](#) as the source of their beliefs.

obsessive-compulsive disorder²

The one disorder that Freud claimed to know the most about was obsessive-compulsive disorder (OCD). He claimed to have found not only the cause but the cure for OCD. Bad toilet-training caused it: a child forced to control his bowels will grow up afraid of losing control over everything and will be driven to obsessive-compulsive behavior. Psychoanalysis cured it. He had no scientific evidence for either claim, however. Insight and the cleverness of his interpretations of "symbols" were the basis for the diagnosis. Self-delusion or fraud was the basis for his claims of cure; for, there is no evidence he cured anyone of this disorder, despite his repeated claims to have cured many, including two notable failures in patients he dubbed the Rat Man and the Wolf Man.

The obsessive-compulsive (OC) is characterized by being obsessed with certain ideas (such as "germs must be avoided") and being compelled to perform certain behaviors in response to the obsession (such as repeatedly washing one's hands). The OC's behavior bears a superficial resemblance to ritualistic behavior. For this reason, it is generally thought that the OC's compulsions are engaged in for the purpose of exorcising the obsession. After all, the OC admits that he does not want to have these thoughts. However, the OC also admits that he does not want to engage in rituals, which he recognizes are absurd and harmful. Nevertheless, the obsessive thoughts cause anxiety and the compulsive behavior seems to relieve it temporarily.

Freud at one time saw connections between OCs and both Lady Macbeth's attempt to wash away her guilt and religious rituals aimed at the same sort of thing. The OC feels guilty about masturbating, or about resenting her children or her husband. The obsessions and compulsions allowed the patient to replace unacceptable ideas with acceptable ones (248). Freud finally landed on the notion that the OC was repressing his or her excessively rigorous toilet-training. He eventually abandoned some of his wilder "symbolic" interpretations of behavior, but stuck to his guns that [repression](#) was the ultimate mechanism behind OCD.

It is worth noting that Freud was rather blind to a basic problem that plagues everyone seeking causal explanations. He did not just see his patients' behaviors as confirming his hypotheses, even when his explanations conflicted with one another. *He encouraged his patients to see things his way.* For example, one of his patients performed a nightly ritual before going to bed, which consisted of removing all clocks and watches from her bedroom, among other things. Freud noted (252) that

I was obliged to give the girl hints and propose interpretations....Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night....The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement....Wild thoughts, you will say, to be running through an unmarried girl's head. I admit that is so. But you must not forget that I did not make these things but only interpreted them.

But he *was* making these things. The above is only part of the "wild thoughts" in this case. There was more about fluffed comforters representing pregnancy; pillows and the headboard representing intercourse; and, flowers being arranged to represent fear of losing virginity. Not only was he making it all up, he was encouraging his patients to accept his explanations. He was undaunted by their repeated rejection of his notions. Like many [repressed memory therapists](#) today, Freud pushed on until his patients agreed with his notions of what was *really* behind their problems.

Freud declared that, as infants, obsessive-compulsives "refused to empty their bowels when put on the pot because they derive a subsidiary pleasure from defecating; for they tell us that even in somewhat later years they enjoyed holding back their stool, and they remember...doing all sorts of unseemly things with the feces that had been passed" (255). Did he do any controlled studies? No. Does he provide any data to back up these claims? No. Does he give any indication that he realizes he ought to be more scientific? No. This was junk science at its worst, but that did not deter its success.

Freud's notion that OCD is an attempt to exercise control, caused by harsh toilet-training leading to fear of losing control, was seen as a blank check for speculation by followers such as Karl Abraham. "Compulsive orderliness is at the same time an expression of the patient's desire for domination. He exerts power over things. He forces them into a rigid and pedantic system." Such ideas dominated psychiatry for some fifty years (254).

What is essentially different today is that most therapists, such as [Judith Rapoport](#), M.D., of the National Institute of Mental Health, see OCD and other "mental" illnesses as biologically based. The Freudian model of human behavior, for all its deterministic and mechanistic sounding explanations, is ultimately a model with free will at its heart. Patients are either too strong-willed to be argued out of their illness, such as schizophrenics, or they are amenable to change by persuasive arguments. Ultimately, talk therapy is an attempt to persuade the patient to agree with the therapist's interpretations in order to get better. Failure to heal is due to patient obstinacy.

The evidence keeps piling up that disorders such as OCD have biological causes and can be effectively controlled in most cases with medications and cognitive behavioral therapy. (What could be more holistic than providing both medicines for the body and therapy for the person?) Nevertheless, those favoring psychological explanations will probably always have a strong contingent. The main reasons for this seem to be (1) a desire to believe in the mind or soul as a separate reality from the body, (2) a belief that all behavior is ultimately a matter of choice, or (3) the well-founded belief that many troubled people are troubled because of "life-problems," not brain disorders. There will always be those who fear that to advocate biological explanations of behavior is to abandon psychological explanations and free will. The fear is that going down the biology path will lead to determinism, materialism, and the denial of responsibility for our actions. It is to abandon hope. It is to say you are doomed to be ill and you will always be ill. As a result, there will always be [therapists](#) who will defend their pseudoscientific and unscientific notions primarily by claiming that they are holistic, that they treat the mind *and* the body, that they are not reductionists and are therefore more humane and respectful of human dignity, hope, etc. They will point to their own satisfaction or to their satisfied customers as proof that their therapies "work." Their failures will be written off as due to either their patients' unwillingness to trust them and work with them, to interference from concerned family

members, to incompetent earlier treatment by other therapists, or to delaying too long before seeking treatment, etc. Finally, there will always be [journalists](#) like [Ariana Huffington](#) who will recommend discipline, and decry treating children with drugs for thought disorders or behavioral disorders. Anyone who gets out of line should be punished. It's as simple as that for some simpleminded people.

Freud's biggest mistake?

Freud's biggest mistake may have been his focus on the irrelevant, on red herrings. The weird thoughts and actions of the "mentally" ill may not be not clues to anything except the personal history of the patient. If "mental" illnesses are physical illnesses, then the *content* of delusions will be of no value in understanding the nature of the illness. Focusing on bizarre beliefs or weird behavior is a diversion, however interesting and compelling. All the knowledge in the world about a patient's delusions regarding the C.I.A. or gender metamorphosis will be of absolutely no value in curing the patient. Such knowledge would be as useless as knowledge of the dreams of someone suffering from viral meningitis. Moreover, if the weird thoughts and actions are caused by a brain disorder or neurochemical imbalance, then talk therapy will be ineffective. The therapist and patient might as well talk about the weather. Actually, talking about the weather might be better, for then there would be some check in reality for the therapist's interpretations. Traditional psychoanalysis, however, is like being thrown into the world of *Alice in Wonderland*. What do the patient's thoughts and actions *really* mean? They mean whatever the therapist says they mean. In the final analysis, however, the therapist's interpretations may be meaningless to anyone seeking to discover the cause or proper treatment of "mental" illness.

Will history repeat itself?

In conclusion, one can't help but wonder whether the excesses of psychoanalysis will be matched by equally disastrous excesses from those who think that there is a drug for every problem. (Depressed? Here take some Prozac. No need to talk to you. No matter that your brother was recently murdered by your mother's boyfriend. You need a serotonin adjustment.) Will there be Personality Doctors in the future, prescribing designer drug cocktails in an attempt to satisfy the customer's desire to change herself? (Cosmetic surgery to your left, Personality Adjustment to the right.) About the only thing that is certain is that whatever happens will mean full-employment for ethicists and critics such as Dolnick, as well as for those in the "helping" professions.

¹ Many people got their first look at autism by seeing the movie *Rain Man*. Experts seem to agree that Dustin Hoffman's

portrayal of Raymond, the autistic *idiot savant*, was essentially correct. Many autistics have strange abilities--at least they appear strange to the rest of us. Some can remember almost any date, or identify the day of the week of a particular date from the past. Some seem like human calculators. In addition, autistics are commonly devoid of affect and of have little sense of what others might be feeling. However, the likelihood that a traumatic experience in childhood is what triggers autism (suggested in the film) is not supported by the scientific literature. For an interesting account of what it is like to be autistic, one might read the work of [Temple Grandin](#) or Oliver Sack's account of her in the title essay of [An Anthropologist on Mars](#). Despite her disorder, Grandin earned a Ph.D. and a university professorship at Colorado State. She has become a renowned expert in the handling of livestock bred for slaughter.

Another interesting person with autism is [Kim Peek](#) who was partly the model for Raymond, the *idiot savant* in the movie *Rain Man*. Kim has the ability to read two pages simultaneously, one with each eye, with 98% retention. Nobody knows how he does it but he was born without a corpus callosum, the bundle of nerves that connects the right and left hemispheres of the brain. However, others have also been born with no corpus callosum, or had it surgically disconnected, without resulting in an increase in reading or retention abilities. Kim can recall most of the contents of some 7,600 books, yet he can't brush his own teeth. But, since nobody knows how Kim Peek does it, nobody can teach this skill to others.

² Many people got their first look at obsessive-compulsive disorder by seeing the movie *As Good As It Gets*. Jack Nicholson's portrayal of an OC has also been hailed as being essentially accurate, including his non-compliance with taking prescribed drugs and the improvement of his condition when he does take his meds.

[The Skeptic's Refuge](#)

[About Too Good to Be True](#)

Too Good to Be True

DielectroKinetic Laboratories LifeGuard

A reader of the *Skeptic's Dictionary*, recently wrote:

It seems that the [Quadro Tracker](#), which you have included in your Dictionary, has reincarnated (if not, then we have proof here that great minds think alike). A company named [DielectroKinetic Laboratories](#) has manufactured 3 versions of a remote heartbeat detector, the DKL Lifeguard, and is trying to sell them to various government agencies for the purpose of detecting the presence of humans up to 500 yards away. The cheapest model, at \$6000, doesn't even require batteries or any power source! [Note: the most expensive model costs \$14,000.]

I saw and tested their products first hand at a government-sponsored exhibition last September, where hundreds of vendors came to demonstrate equipment that the government could buy for force protection. I immediately recognized their equipment as the "high-tech" version of the dowsing stick. Each has a box which swivels on a pistol grip and has an antenna pointing out the front. You swing the antenna back and forth, and the device is supposed to generate a tug on your hand whenever the antenna is pointing toward a person. The answers they supplied to our questions were typical of scam artists' talk, and would have been very entertaining if not for the fact that a lot of people there actually believed them.

My supervisor, who is a world-rekknowned expert on sensor technologies, pointed out to them that the antenna was an omni-directional antenna, and they are pointing the null (its weakest direction) at the target. And their answer was: "Well, yeah, the antenna IS omni-directional, but the ELECTRONICS are directional." Total nonsense to an electronics engineer.

The scientific gobbledegook used by DKL is overwhelming and could easily dupe the untrained with their talk of electrostatics, electrodynamics, electromagnetics, dielectrokinetics, and dielectrophoresis. But the focus here will be on what they claim their product can do, not how it does it. According to DKL,

DKL's new line of LifeGuard instruments can locate and track any living human being more than 500 yards away in the open and at shorter distances through concrete walls, steel bulkheads, heavy foliage, earthworks, or up to 10 feet of water. All three LifeGuard models can detect and lock onto a person in three to five seconds, and they can distinguish a human from any other animal, even a gorilla or an orangutan.

One wonders, however, how this amazing device tells the difference between the person who is operating it and any other person. If this thing really works as specified it should be useless because the person using it would always set it off. After all, DKL claims that

DKL's detectors locate and point toward a small irregular electric field generated by a human heart. And because the heart generates its electric signals at ultra-low frequencies, less than 30 cycles per second, they travel right through barriers that absorb or reflect higher frequency energy.

Why would anyone want such a device? It could be used to find lost children in the forest or who wander into the gorilla or orangutan area of a zoo. It could be used to locate criminals who are trying to hide from you (assuming no one else is around and you can somehow turn off your own heartbeat while you use the LifeGuard). It should be a big seller with the same crowd who bought the Quadro Tracker: local, state and federal police agencies with lots of taxpayer money and little accountability.

note: the DKL LifeGuard was tested by [Sandia Labs](#) in April 1998. The device failed to perform any better than expected by chance. In October 1998 Sandia took a DKL LifeGuard apart and found that the [electronic components could not possibly function as advertised.](#)

Whether in response to the Sandia tests or in response to increased criticism of their claims, I don't know, but DKL has changed its claims on its Internet site. It no longer features a collapsed building with the message that a DKL product would save the lives of those trapped inside. The featured come-on now is that the LifeGuard can detect stowaways on a truck. Also, the ads now say that the products can detect *people*, rather than *heartbeats*. It has removed some of its so-called scientific tests and replaced them with others, including one regarding the detection of stowaways on trucks.

Is this a major problem in your neighborhood?

psychic

7 Dec 2000

Hello, I have recently learned that my 50 year old sister has been taken in by Sylvia Browne, hook line and sinker. Isn't there some way that, under current consumer protection laws, that Sylvia can be charged with false advertising? There must be a way that we can stop her kind from taking advantage of people's gullibility. If there isn't, there should be. Just because her victims don't complain, doesn't make it any less a travesty. What can I do to help expose the people for what they are?

Bill

reply: According to an online article at <http://www.post-gazette.com/magazine/19990119psychic1.asp> 17 states have laws against fortune telling. Maybe yours is one of them. Another [article](#) reveals that psychics are sometimes charged with crimes. But, most so-called psychics seem to be able to get away with their capers unless their clients complain to the police. Many who have been ripped off by a pseudo-psychic, i.e., a psychic, feel too stupid to file a formal complaint. But there are so many satisfied customers, one is likely to find the citizen brigade storming the skeptic's camp rather than rallying around the fighter of fraud.

03 Dec 1999

In studying the strange behaviour of subatomic particles like photons in quantum experiments Einstein coined "spooky action at a distance" to describe the apparent ability of photons, etc. to know what's going on elsewhere and behave accordingly. The Copenhagen interpretation of these bizarre results posits that photons, electrons and even entire atoms in their 2 slits experiments have no concrete existence but exist as probability waves until an observation of the experimental result collapses the probability function and causes a determinate result. Nobody has ever said how this mental causation is transmitted or how it works, but the Copenhagen interpretation is taught in all the physics departments.

In his book, Schrodinger's Kittens and the Search for Reality, John Gribben presents John Cramer's alternate explanation for the 2 slits experiments, the "transactional interpretation". Cramer thinks that energetic entities (electrons, photons) constantly emit "information waves", and that before the entity can actually DO anything there has to be an "offer wave", a

"confirmation wave", and an information "handshake" with whatever the entity will interact with. The information waves and transactions occur in an "atemporal" space (and Einstein, again, showed that the subjective perception--the frame of reference--of something approaching the speed of light is that time slows, and time stops at light speed, so if the information travels at lightspeed it would happen in 'no time' as Cramer requires). This is how the entities in 2 slits experiments seems to know beforehand how they should behave in the experiments.

Cramer apparently claims there are mechanisms in place that prevent "leakage" of the atemporal information into our temporal space, but his interpretation requires that the information waves travel backwards and forward in time without taking any time to do so. A logical consequence of this is that, ultimately, all of the "information" about everything that has ever happened or ever will happen coexists simultaneously in this atemporal space. Gribben doesn't say what kind of waves the information travels on, but all waves are vibrations at whatever frequency, so if people somehow become attuned to a frequency on which some of Cramer's advanced waves (traveling backwards in time, if viewed, from our frame of spacetime reference; as contrasted with "retarded waves" traveling forward to our 'now' from our past) exist then they'll be receiving information about some future event (precognition), and if somebody happens to latch onto the frequency of some dead or distant person's experiences (assuming that consciousness is electromagnetic and thus works like other e/m entities like photons and electrons so that the overall e/m structure of an experience behaves like an e/m unit--sending and receiving information waves) they will experience "past lives" or "distant viewing".

reply: I knew there was a point to this somewhere.

The anecdotal evidence that people actually experience such things is quite compelling, and Cramer's lucid interpretation of quantum strangenesses [?] offers the means of explaining these "paranormal" phenomena quantum mechanically. Considering that practically the entire subject matter of science is "phenomenal"--our awareness of reality begins with visual and other sensory experiences of "phenomena"--I don't think paranormal phenomena reported by people should be off-handedly skeptically dismissed merely because science does not yet possess the intellectual tools to explain them. With William James I say experience should be held as prior to conceptual systems in our ranking the credibility of "realities", so if even a very good conceptual system like modern science cannot explain widely experienced phenomena then that shows a shortcoming in the conception, NOT in the perception (I'm familiar with Willard Quine's "core/periphery" view of our neural net, so I'm not simplistically assuming that conception does not affect perception and vice versa). But I think Cramer has given science the tools to begin understanding temporal oddities like precognition, etc., so that this area, at least, of "paranormal" perceptions can be 'normalized'.

Quantum physics has shown us that the reality underlying our everyday perceptions of a clockwork Newtonian universe is far stranger than appearances would lead us to believe, though philosophy and intellectual culture in general have failed to embrace this decades old development and are still stuck in the 19th century scientific paradigm where everything is ultimately predictable--in principle if 'not yet' in practice. The probability equations of modern physics do not preclude the possibility that the improbable might occur, and I think the improbable in fact does occur with surprising frequency. No "laws" are broken when the improbable occurs because the laws of classical physics are merely laws of 'averages', and the very term "average" presumes a whole range of actual cases occurring away from the center. So to presume that human experiences that fall outside the range of "normal human experience" are suspect simply because of their relative rarity constitutes a material fallacy: the "conceptualist fallacy" of an entrenched Newtonian.

Derryl Hermanutz

reply: Obviously, we disagree. I think explanations for psychic phenomena are to be found in the brain (by neuroscientists), in misinterpretation of perception, and in fraud rather than in some bizarre application of quantum physics. I recommend Victor Stenger's *Physics and Psychics: the Search for a World Beyond the Senses* (Buffalo, N.Y.: Prometheus Books, 1990).

vinyl vision

Vinyl vision is the ability to see groove patterns in vinyl recordings and correctly identify musical recordings without the benefit of identifying labels. Only one person is on record as having this amusing ability: [Dr. Arthur B. Lintgen](#), who demonstrated his talent in the 1980s to none other than [James Randi](#). Even though Randi promised to pay \$10,000 to anyone who could demonstrate a [paranormal](#) ability, Lintgen's ability is merely *abnormal*, i.e., rare. Hence, his award was little more than a few moments of fame.

Once it was disclosed that he used ordinary sense perception, his vast knowledge of orchestral music from Beethoven onward and of recordings of such music, and deductive inference from general rules about such music, the mass media and the public lost interest. Though Lintgen continues to have a core following of true believers in his psychic powers, based on such astounding feats as identifying Beethoven's "Fifth Symphony" from across a room without even looking at the record, most consider Lintgen a decent fellow for not abusing his power over the gullible. He admitted, for example, that Beethoven's "Fifth" was the most common recording he was asked to identify (Seckel). He was simply making an educated guess, not using psychic powers, when he identified the recording without looking at it.

Lintgen did not claim to read individual notes in the record grooves. "The trick is to examine the physical construction of the recording and look at the relative playing time of each one of the movements or separations on the recording" (Seckel).

All phonograph grooves vary minutely in their spacing and contour, depending on the dynamics and frequency of the music on them. Lintgen says that grooves containing soft passages look black or dark gray. As the music gets louder or more complicated, the grooves turn silvery. Percussive accents are marked by tiny "jagged tooth marks." The doctor correlates what he sees with what he knows about music, matching the patterns of the grooves with compositional forms (*Time*, January 4, 1982).

According to Lintgen, a Beethoven symphony will have a slightly longer first movement relative to its second movement, while Mozart and Schubert would compose in such a fashion that each movement in many cases would have the same number of bars. Beethoven, however, had set out in a new direction and that changed the dynamics of the recording. In addition, if there was a sonorous slow

beginning, one could look at the recording at that point and see a long undulating groove that would not contain the sharp spikes that would identify sharp percussion (Seckel).

Lintgen was featured on the ABC-TV program "That's Incredible" in 1981. Before a live audience in the auditorium of Abington Hospital, near Philadelphia, he was tested by Stimson Carrow, professor of music theory at Temple University. Dr. Lintgen correctly identified 20 out of 20 recordings just by studying the record grooves (Holland).

He admitted that he used only his knowledge, experience, and reasoning power to accomplish this amazing feat. "I have a knowledge of musical structure and of the literature," he said. "And I can correlate this structure with what I see. Loud passages reflect light differently....Record companies spread the grooves in forte passages; they have a more jagged, saw-tooth look. I also know how the pressings of different labels look, so I can often figure out who is conducting" (Holland). He can also occasionally figure out the nationality of the orchestra, an ability that amazed even James "The Amazing" Randi. In Randi's test of Lintgen, the doctor not only identified a recording correctly but announced that the orchestra was German. The recording, he said, had an upturned edge, a feature that was unique to the Deutsche Grammophon label. He also saw that there was a "lack of junk in between the grooves," from which he inferred that the recording was digital. He also knew that "Deutsche Grammophon, up to that time, had only recorded German orchestras for their digital recordings" (Seckel).

Lintgen discovered his unusual ability at a party in the mid-1970s. Some friends said that he knows so much about music he could probably read the grooves of records. He tried it and found that as long as the recordings are of music that he knows--orchestral music from Beethoven to the present--he has a high rate of success.

The rest, as they say, is on the record.

psychic detectives

29 Jun 1996

Mr. Carroll

You didn't mention one of the few certifiable facts about "criminal psychics." In some well-documented cases, they themselves are the killer, and simply looking for a way to confess.

Source: *Mind Hunter* by John Douglas and Mark Olshaker

Joe

According to the sci.skeptic FAQ, On one occasion Randi did agree that the claimant had passed the test. Arthur G. Lintgen claimed an ability to identify LP records without labels. Randi tested him, and found that he could in fact do this by reading the patterns of loud and quiet in the groove. Lintgen did not get Randi's reward because he had not demonstrated (or claimed) any paranormal ability.

While a Usenet FAQ is obviously no guarantee of truth, I think you should at least check the details.

--Gareth Rees

reply: The idea of "patterns of loud and quiet in the grooves" of vinyl records strikes me as very odd. I own a good number of such items and until CD's came into my life played them quite regularly. I have looked very closely at the grooves of a few records and I defy anyone to identify anything that looks like a pattern of anything, much less of "loud and quiet" in those grooves.

In any case, musical tones have four distinct qualities: pitch (frequency of vibrations), duration (length of tone), intensity ("loud and quiet", more or less) and timbre (due to the production of different overtones, different instruments playing the same note will sound different). Unless you are a record needle, you are not likely to perceive any of these qualities with the naked eye. Just examine a few records and you'll see what I mean.

The man with "vinyl vision" can only read record grooves with classical music in them. Such music in general has quite complex "patterns of loud and quiet." However, I doubt that even an audiophile with a great record collection could identify very many classical compositions if presented the sheet music for the piece without musical notation but with complete references to *pianissimo*, etc. A trained conductor or performer might be able to do this, however, but not because knowing the "pattern of loud and quiet" indicates what the music sounds like, but because of knowledge and familiarity with the sheet music. I suggest that if someone can tell you what a classical record is without seeing the label, he is using knowledge and experience, not "vinyl vision" or any extraordinary power.

There was a time when I could have told you whether you were holding my Ray Charles or my Bob Dylan album. I only owned two albums at the time and they were physically quite distinct. I still remember one of them (I think it was the Ray Charles record) as being significantly thicker than the other. In addition, I got to know the scratches on each and could have told you which was which just from the extraneous markings I'd managed to create on each. But the main piece of information which distinguished the records was the number of bands and the size of the selections between bands. An audiophile might well be able to tell you what recording you have in your hand simply by looking at the bands and bandwidths on the record.

Also, the man with "vinyl vision" claimed he could sometimes identify the conductor of the recording. I doubt if "pattern of loud and quiet" would be of much help in identifying the conductor on more than a very occasional basis (e.g., one might be able to do it for the over-recorded Pachelbel's *Canon*, but even there the main difference in treatment seems to be tempo rather than intensity). However, due to physical differences in records put out by different record companies, the same composition by different orchestras and with different conductors might be identifiable by physical differences in the vinyl record.

A comment on your piece: You seem to think the case of the guy reading the record grooves is nonsense and was not worthy of serious investigation. I get the impression that eventhough you note that I cited Discover magazine on this, you may not be aware that the positive outcome for him was on a doubleblind test done by Randi for Leon Jaroff (then at that magazine). There really is no question that the guy could identify the music, etc. Luckily for Randi, the guy never claimed his ability was paranormal (as Jaroff pointed out in a CSICOP speech), for Randi might otherwise have had to forfeit his challenge money.
--Marcello Truzzi

reply: I have had other responses to this vinyl vision claim that are similar to yours. Each cites Randi and his test as evidence of believability. The question is: what are we being asked to believe in? That a man looked at the grooves of records and identified the recording? If so, I admit that I have done that myself. Or, are we to believe that there is something unique about his vision (the only one out of 5.5 billion people) who can "read" record grooves? That's the claim I can't fathom and it's the one I compare to claiming that Chinese children can read newspapers by sitting on them through some unique anal ability.

9 Dec 1996

I've read some entries from your dictionary, and as a skeptic I found it very interesting and informative. One thing puzzled me however - your statements about the inability to see patterns of loud and quiet sounds on vinyl records.

I remember from my childhood that I was often able to recognize where the music is loud and where it is not - my mother was surprised when I told her about this, but when I explained how it was done, she was able to repeat it herself. There is nothing unusual about it - the surface of a record does look differently in places where volume differs greatly. Of course, I do not claim to be able to spot [changes in] one or two seconds of volume change - it takes at least several revolutions of the record (30 seconds at least) for the effect to be visible.

Your observation that "vinyl reader" was able to "see" only the classical music converges with my experience - pop music is mostly the same over a song's duration, which makes it impossible (at least for me) to "read" it.

Considering what I've written above, I do not see anything unusual in fact that someone was able to remember how these patterns of loud and quiet are positioned on many records and distinguish among them with this technique. More surprising is the fact Randi didn't know about this.

Miloslaw Smyk

reply: Take a look at ["The Man Who Could Read the Grooves"](#) by Al Seckel. Dr. Lintgen's technique was pretty simple.

psychic surgery

06 May 2000

Stephen Turoff, the so-called psychic surgeon, is well known to me. I went to see him about 2 years ago.

You wait in his surgery while endless films of Sai Baba play. Sai Baba has been exposed as a sham and a charlatan in several books and also the [Skeptic's Dictionary](#). There are [books on the www](#) exposing him too.

Stephen Turoff is a follower of Sai Baba.

In the Turoff surgery are many people - all foreign - and most with no command of English. This 'free' healer takes £200 in under ten minutes.

I saw him for spasmodic torticollis.

He had never heard of dystonia but nevertheless performed an 'operation', i.e. his 'guide' did.

He then pronounced me as being completely cured.

I felt nothing - especially no benefit.

Stephen Turoff was then investigated by the tax authorities.

That's all I know.

pyramidiocy

16 May 2000

I work in an office building at L'Enfant Plaza in Washington DC. Recently, the quadrangle in front of my building was renovated to modernize and waterproof it. One of the highlights of the new design is a massive skylight in the shape of a right rectangular pyramid.

The pyramid is over a sitting area on the shopping mall, one level down.

I've been keeping my eyes on the sitting area to observe any significant pyramid-generated effects. I felt I had to report the first of them.

Overnight, actually over a weekend, what was originally a bleak area with a few benches and some empty planters has become a jungle! Plants are everywhere! They are not seedlings or sprouts, but full-grown, mature plants. Obviously, the pyramid focusing the solar energy into this previously-unlighted area caused a previously unknown rate of photosynthesis. Plants which are obviously several years old sprang up as if drawn there by some cosmic force. I'm convinced the pyramid caused this, there can't be any other reason.

I'll keep watching the pyramid area and report any more unusual or unexplainable events.

I have to stop at this point. My tongue hurts too much for keeping it firmly in my cheek for so long.

Andrew Kapust

3 Jan 2000

Thank you for your overview of pyramidiotical pseudoscience. I was hoping that you might one day pay attention to all the BS going around surrounding Ancient Egypt. My only complaint is that the isn't extensive enough, but then the subject deserves a debunking site of its own.

If you can tolerate lots of nonsensical mail on top of what you're already getting, I could mention the page on www.guardians.net, a major Ancient Egypt site. While the main thrust of the site and its bulletin board is scientific

Internet Bunk

Pharaoh's Pump Foundation

Steven Myers has created this Internet site in honor of his hero Edward J. Kunkel and his book *Pharaoh's Pump*. Kunkel argued that the great pyramid in the desert at Giza was a [water pump](#).

Myers has created The Pharaoh's Pump Foundation, which, he claims, is going to build a pump using ancient Egyptian technology. He is accepting donations. Even if it were true that Giza was a water pump in the desert, why bother to build a copy of a pump that's been broken for thousands of years? Because the "ancient pumping technology is nonpolluting and does not require fossil fuels or electricity to operate." Just like windmills! Not quite. According to Myers, the pyramid pump was fueled by fire. I am just guessing here, but I think if it was fueled by fire, something had to burn. I guess they burned all those forests that used to be in the desert, or maybe they burned some magic non-polluting fuel brought in by aliens.

Apparently, Myers envisions a countryside dotted with pyramids, pumping our polluted rivers and streams into our polluted cities and out to our poisoned and mineral-depleted farmlands.

Myers' visions seem to have been stimulated by his reading of *5/5/2000: Ice: The Ultimate Disaster* by [Richard W. Noone](#), a cult classic which, among other things, predicts doomsday on May 5, 2000, when Mercury, Venus, Mars, Jupiter, and Saturn will be aligned with Earth. This alignment, he says, will cause the polar ice caps to melt. Since Noah won't be around to build an ark for us, we'll need pyramids to pump all that water away from our cities. Otherwise, we drown. It seems of little interest to Myers that [astronomers are well aware of the upcoming alignment](#) and do not see why there is concern. [It's happened before and it will happen again.](#)

The notion that Giza was a water pump is bunk, according to the most recent issue of *Skeptic* magazine (Vol. 7 No. 2, 1999). In the "Skeptic's Forum" there is a letter from Norman Cohan, Director of the [Karpeles Manuscript Museum](#) (Santa Barbara branch), in which he exhorts readers of *Skeptic* to "reexamine the latest evidence with respect to the bewildering construction techniques utilized in the Great Pyramid of Giza, as presented in Christopher Dunn's new book [The Giza Power Plant](#). Giza was not a water pump but a power plant! Dunn [claims](#) that the Giza power plant worked "by responding harmonically with the seismic energy contained within the Earth." He claims that "the Great

Pyramid became a coupled oscillator and drew energy through it and converted it to electromagnetic energy through the sophisticated use of acoustics and quartz-bearing rock." What did the ancient Egyptians use this great power plant for? Among other things, they used it for [levitation](#), according to Mr. Cohan.

Dunn is said to be "[an engineer with intimate knowledge of machine tools.](#)" He went to Egypt and became convinced that many of the artifacts created by the ancient Egyptians had to be done using precisely machined tools. Once he believed this, it was not difficult for him to see evidence everywhere ([confirmation bias](#)) and see everything from the smallest artifact to wall carvings and papyrus paintings to the pyramids themselves as requiring advanced technology. [Margaret Morris](#) (*The Egyptian Pyramid Mystery is Solved*) thinks Dunn is all wet because he didn't realize that the stones the Egyptians used to build the pyramids weren't natural and didn't need to be cut from quarries. The stones are synthetic and were made by adding water to "earthen materials" and shaped while soft.

Myers and those who see Giza as a water pump have also deluded themselves. How easy it is to find supportive evidence for our hypotheses! And how powerfully strong our arguments seem when we selectively present our facts and make no effort to find contrary evidence. It is especially easy when our audience isn't knowledgeable enough to know what's been left out or how plausible one's claims are.

What next? That mummies were repositories of vibratory chi? That all those centuries of hieroglyphics that give no indication of a high-tech society, were done that way so that future generations wouldn't know how advanced the Egyptians were? That those ancient historians, such as Herodotus, who are brought in to support the view that the pyramid was a water pump because he says he saw water around it, omitted mentioning that the Egyptians had created a huge water pump in the desert? Maybe Herodotus, not being from [Atlantis](#), couldn't tell the difference between a water pump and a power plant. Fortunately, our modern day alternative "scientists" can. They just don't realize how easy it is to deceive ourselves into believing something simply because we can find confirmation for our belief in the form of data that is consistent with the belief, or is easily molded to be consistent with the belief.

05 Jan 2001

I have just been reading your debunking of the pharaohs pump. Firstly - I am a skeptic. I found this stuff on the internet and thought it was very strange. In addition the site does not help itself by linking within one click to perpetual motion 'vortex' machines.

Despite the theory being strange and I myself would need a lot more evidence to be convinced there was a working pump in the pyramid, it is not a truly outlandish idea. About 100 years ago pumps were built along the Murray (Australia's largest river) which consisted of large cylinders bored into the ground alongside the river. Fuel (oil) and air entered the chamber, were ignited and the pressure forced the water out for irrigation. The volume of the pump was about the size of a large room. Nothing weird here - simply a large internal combustion engine with water acting as the piston. The engine ran for about 50 years.

One of the problems that would have faced the ancients is they lacked metals - specifically steel. It is very difficult to build engines that can handle any sort of pressure without metals. One solution of course is to dig out a hole in the ground. Large pressures can then be accommodated.

The pharaohs pump page describes a simple ram pump. Again nothing strange about ram pumps. One does of course need a high supply of water, and this small point is glossed over. If there were a high source of water there would be no need to have the pump...

The idea of using a fire to pump a column of water is not strange. Looking at the pharaohs pump page I think they have quite a bit of the physics wrong. If one has a chamber with a fire in it, the simplest solution is to use pressure to force water up higher. One would not need negative pressure sucking water then running the water through a ram pump - seems a bit complex. Also one can't suck water up more than 10 metres before one reaches the vapour pressure of water. The positive pressures from a fire could be quite large - at least 5 atmospheres positive if the fire were burning greater than 400C.

The one fatal flaw I can see in the whole pharaohs pump concept is how one sucks water up from the level of the Nile. One would need another pump on the banks of the Nile which is situated lower than the level of the Nile (as the pumps along the Murray are). Perhaps the source was groundwater - I don't know what the water table level is in that area, but even if it was there probably wouldn't be a great deal of flow.

The pharaohs pump foundation is probably off course (clue - they keep asking for money), but the concept of an ancient underground pump is interesting. I am going to get a hydraulics engineer to critically appraise the concept.

Raëlians

01 Nov 2000

One can express his opinion freely, but information should be accurate, here are a few rectifications to be made to the following text by Taras Grescoe found on your website.

The Raëlians are UFO-cult (*Cult having a negative connotation, as recommended by the UN, religious minority would be more appropriate*).

His followers consider him to be "the prophet of the third millennium." **Like all good religious leaders, Raël expects his followers to support him. A 10% tithe is the norm.** (*No one in the Raelian religion is paid, Rael does not get any money collected by the different national movements. As a non profit corporation the money and subscription fees are to be spent for the goals of the movement: spreading the Message worldwide and building the Embassy. The 10 % does not go to Rael but to the movement. Rael gets his money from the sale of his books translated in 27 languages and sold at over a million copies. Rael also gets donations.*

According to Grescoe, "Raël's success seems to derive from providing a structured environment for decadent behavior: (*Have you personally witnessed so called decadent behavior? If not then you are spreading false rumors. Sexual freedom is not an obligation*).

reader comments:

James Randi

November 08, 2002

I am wondering why the Skeptics Dictionary is not skeptical of the Randi million dollar offer. He gets the interest from the million and if he gives the award away he will lose that interest income, isn't that situation an obvious conflict of interest situation, and one that any intelligent person should be skeptical of ?

Respectfully, William Perron

reply: Randi doesn't have the million in the bank. As you probably know, the prize is in the form of negotiable bonds held in a special investment account.

Also, as you probably know,

The JREF does not involve itself in the testing procedure, other than helping to design the protocol and approving the conditions under which a test will take place. All tests are designed with the participation and approval of the applicant.*

What would be a real conflict of interest would be if Randi got a percentage of the prize should anyone win it. You claim the JREF is getting the interest on these bonds and that these funds would be lost should anyone win the prize. Thus, should the prize be won, the JREF would lose substantial funds. The JREF would also lose face and have to eat crow. It would lose a lot more than this funding should anyone win the prize. My guess is, the JREF would be out of business should anyone win the prize. So would I and every other skeptic who maintains that the likelihood of miracles and paranormal powers is near zero.

You might as well argue that it was a conflict of interest for the University of Nevada (Las Vegas), Charles Tart, and Raymond Moody to take money from [Robert T. Bigelow](#) to set up the so-called Consciousness Studies program at UNLV. If they had failed to come up with some scientific proof of life after death, they would lose their funding. Well, [they did fail and they did lose their funding](#). You are assuming that Randi will never allow anyone to win the prize. But that is what you claim to be proving by claiming he will lose money if anyone wins the prize. In logic, we call this kind of fallacious reasoning *begging the question*.

I think you would have a better chance of a winning argument if you could show that it is logically impossible to prove any paranormal power; therefore, Randi's money is safe and the \$1,000,000 offer is just a gimmick to gain publicity for the skeptical cause.

The "conflict of interest" argument is interesting, but very weak. You might as well claim that anyone who offers a prize has a conflict of interest because they will lose the prize when it is given away.

Mr Perron replies:

Dennis Rawlins, a co-founder of CSICOP in his article titled sTARBABY quotes Randi, when he is asked about his then ten thousand dollar offer that he said " I always have a way out." He is the final word on the give-away of the money, it will never be given away, but certainly not for the reasons that you suggest at your site. To say that there is no "paranormal" events is ridiculous, I myself have had at least on one mystical experience so I know that they are possible. The jackals bark and the caravan moves on.

**Not so respectfully,
William Perron**

reply: I don't deny that people have mystical and paranormal experiences. What I deny is that anyone knows that the origin or cause of those experiences is supernatural or paranormal, rather than natural. I reject your *interpretation* of your experience, not the reality of it to you.

29 Sep 1999

I was browsing the net the other day when I came across a web page for [Riley G](#). Your hero, James Randi was allegedly tied in with a Sex Tape and teenage boys. If this is true, I think you should select another idol, Mr. Carroll. I'm sure your colleagues would be disappointed with your choice of leaders to fight for. I have added the section from Riley G's site on this e-mail.

Awaiting my e-mail on your website,

Prof. Marco Beriolle

reply: Professor Beriolle seems to believe Riley G has some credibility. I wonder on what basis. I would be a bit more careful about what I admitted I do with my spare time, if I were the Professor. But if participating in the spreading of vicious innuendo is what you want to be known for, so be it.

P.S. I think he's talking about you in the next to last sentence.

[from Riley G's page]

And just how can you claim I screwed up on something when you can't even get the persons name correct. Sure, someone claiming to be from the Miami PD sent me a photo of a death scene that looked like Andrew Cunanan. I had this photo on my web site for about 1 week before I debunked it myself when the evidence proved is was not Andrew Cunanan.

As to your remarks about me never backing up my claims that I was NYPD, I suggest that you do better research. Hell, even the Septic Cult leader James Randi ate crow on that one. And speaking of the gutless wonder (Randi). He has always hated the fact that I have a copy of the court transcript and cassette tape of the infamous Sex Tape and other assorted items with what appears to be underage teen-age boys!

For the record, Randi refused me twice to take his psychic challenge. All I requested was direct access to the SAME DATA AFTER the tests, and for it to be done LIVE in front of an TV audience. This is something that would keep RANDI and his CULT honest, but he refused. Geez, I wonder why?

Prof. Marco Beriolle

reply: I suggest that if you want to quote from the gutter, Professor Beriolle, you have your reasons. Allying yourself with Riley G is not something I would let my colleagues know about, however. For those who have never heard of Riley G, you are lucky. He is a self-declared psychic detective, claims he used to be a police officer (but was retired due to injury after three years), is an actor, entertainer and remote viewer. He also refers to himself, for reasons known only to Mr. G, as The Minister of Propaganda. He says he rides a Harley and is a friend of [Uri Geller](#)'s, too. On his website, he has the following notice: "All graphics and text contained within these web sites remain the property of Riley G & Squatting Dog Productions and can not be reproduced or altered without the permission or consent of Riley G"

You like this Squatting Dog fellow, Professor?

Riley G once sent me an e-mail and asked why there was no page on Riley G in the Skeptic's Dictionary. I looked at his website and determined that he was perhaps not the most stable person on the planet and that it would be best to leave him alone.

I suspected Mr. G or one of his friends was behind the recent smear

campaign that I wrote about in [Mass Media Funk](#). Riley G denies it and says he does not condone such stuff. (See his comments below.) He sounds like a swell fellow to associate with, Professor. Perhaps *you* are the anonymous author of both the e-mail and the slanderous website on Freeyellow.com that was removed after I complained about it. If so, please come forward and identify yourself. It seems shameful that such eloquence should hide in the darkness of anonymity.

01 Oct 1999

(Sender psicop@pop.pipeline.com)

I suggest that you get your facts straight. I have nothing to do with the Randi Site, and I don't condone it!

BTW, there is no period (.) after the last name of G (Riley G).

Riley G

Blood Brothers MC Founder & International President

<http://www.BloodBrothersMC.org>

reply: I'm glad to hear it, but I'm surprised that I heard from you before the Professor responded. I have a feeling you are not a daily reader of the Skeptic's Dictionary, so I assume the Professor informed you of these comments. Where are you, Professor?

reflexology

7 Jun 1999

A true skeptic reviews the facts before making a judgement. There are studies on reflexology including Medline. Your biased piece shows that you haven't reviewed the facts. Shame on you.

Kevin Kunz

Reflexology Research Project

reply: I took the bait and checked out Kevin's page on "[controlled studies in reflexology](#) ." He lists 34 studies, most of them done in China for the Chinese Society of Reflexology or the China Reflexology Association. A couple were done for the Danish Reflexology Association. None of the studies were published in a reputable refereed scientific journal. The reader is invited to check out the list. You will probably be as impressed as I was.

Kevin Kunz replies, heaping more shame on me:

You said there was no research on reflexology. There is. You didn't retract your statement. You may take issue with the studies done but you can't say there hasn't been studies on reflexology. There are studies on Medline. Shame on you for not telling it straight.

Kevin Kunz

Reflexology Research Project

reply: I can't find where I claim that there has been no research on reflexology. I do say that there is no scientific evidence for the claim that each part of the body has a corresponding double in the feet. I do say that there is no evidence that chi, yin, yang, separate bioelectrical charges or energies are key factors in health. I'm especially puzzled by Mr. Kunz's reply, since I posted his first comment and even linked to the studies he is so proud of.

A search of [Medline](#) for "reflexology" yields some interesting results, e.g., "Physiotherapy as manual therapy," "Effective techniques for massage in labour," "Using massage in the care of children," and from the *Journal of Nurse Midwifery*, "Acupuncture and acupressure. Applications to women's

reproductive health care." Apparently, Medline equates reflexology with massage.

19 Nov 1999

You wanted scientific. Here is a controlled, randomized study from Medline. Will you be putting this up on your site. Or do you strictly stick to polemics devoid of science? [Reflexology Forsch Komplementarmed 1999 Jun;6(3):129-34[Anderung der nierendurchblutung durch organassoziierte reflexzonen-therapie am fuss gemessen mit farbkodierter doppler-sonographie] by Sudmeier I, Bodner G, Egger I, Mur E, Ulmer H, Herold M Universitatsklinik fur Innere Medizin, Innsbruck, Austria. [Medline record in process]]

Using colour Doppler sonography blood flow changes of the right kidney during foot reflexology were determined in a placebo-controlled, double blind, randomised study. 32 healthy young adults (17 women, 15 men) were randomly assigned to the verum or placebo group. The verum group received foot reflexology at zones corresponding to the right kidney, the placebo group was treated on other foot zones. Before, during and after foot reflexology the blood flow of three vessels of the right kidney was measured using colour Doppler sonography. Systolic peak velocity and end diastolic peak velocity were measured in cm/s, and the resistive index, a parameter of the vascular resistance, was calculated. The resistive index in the verum group showed a highly significant decrease ($p \leq 0.001$) during and an increase ($p = 0.001$) after foot reflexology. There was no difference between men and women and no difference between smokers and non-smokers. Verum and placebo group significantly differed concerning alterations of the resistive index both between the measuring points before versus during foot reflexology ($p = 0.002$) and those during versus after foot reflexology ($p = 0.031$). The significant decrease of the resistive index during foot reflexology in the verum group indicates a decrease of flow resistance in renal vessels and an increase of renal blood flow. These findings support the hypothesis that organ-associated foot reflexology is effective in changing renal blood flow during therapy.

PMID: 10460981, UI: 99392031

Kevin Kunz

reply: I have to admire Kevin's tenacity. Perhaps others will duplicate this study and soon we will have hundreds of such studies showing that there is a correlation between parts of the foot and all of the organs of the body. This is a most interesting approach to science. First we invent the theory and then we go looking for confirmatory evidence. Who knows? Maybe this approach will work for reflexology, but it seems they have a long way to go and are taking the long way home. (Scientists do not first give an explanation and then seek for something to explain.) The risk of [confirmation bias](#) is exceeding high with such a methodology.

I hope Kevin realizes that such a small study should not be taken as final. I hope he also realizes how much faith I am putting in him by publishing these claims.

22 Nov 1999

It is fortunate the nonplussed Kevin mentioned MEDLINE, in his harangue.

This site - MEDLINE - among others, most notably WebMB, are loaded with alternative remedies, conjectural essays and authoritative-sounding discourses with no references or citations.

Some of the 'strategic partnerships' for these sites between, say, Cnn's WebMD and those listed on the home page are very questionable - with a decided lack of scientists and scientific institutions.

Most of the partners I have checked that WebMD claims are vitamin stores or shadowy organizations within a few miles of CNN center. The online chat 'experts' are usually vitamin charlatans who sell their wares on the WEB.

Try typing in "Gingko Biloba" in the search window of one of these sites sometime. You will find many, many glowing articles. I have personally done this and found enlightening pieces purporting to be full of scientific data. Alas, the article that sounded the best was signed "ANON" and the next best one was signed "D. Jones", or something like that... Surprising some of these sites haven't been sued by folks experiencing bad results or no results.

Indeed, a search on MEDLINE for many quack cures turns up articles suspiciously non-critical, seeming to imply good results for substances the FDA has banned.

I would NOT do any research nor attempt to retrieve data held to be valid on these sites !

reiki

26 Jul 1999

I'm not sure what your information source is, but I wish to comment on part of the entry for Reiki at your site.

Reiki healers differ from acupuncturists in that they do not try to unblock > a person's ki but to channel the ki of the universe so that the person heals.

Actually, by channeling the Reiki energy, a practitioner does unblock the [chakras](#) and natural flow of energy in the patient.

The reiki master claims to be able to draw upon the energy of the universe and actually increase his or her own energy while performing a healing.

NO! Reiki practitioners never claim to be channeling anything but Reiki. Personal energy is NEVER used. Anyone who claims to be using personal energy to heal is NOT using Reiki.

reply: I didn't mean to imply that the reiki healer uses personal energy to heal, but that the healer's energy increases during the healing....or so some healers say.

Reiki healers claim to channel reiki into "diseased" individuals for "rebalancing." If the healing fails it is because the patient is resisting the healing energy.

Reiki practitioners channel Reiki into anyone desiring it. Most importantly, any ethical practitioner will tell the client/patient that Reiki is NEVER a substitute for medical treatment, but only a way of assisting healing. Reiki DOES NOT guarantee a cure, and the ethical practitioner WILL NEVER tell the patient that they are to blame if they are not healed. They will, however, explain that Reiki energy always works toward what is the highest good for the patient. That is not always a cure... sometimes it is just an acceptance of dealing with an incurable disease.

reply: I'm glad to hear this, but some of your colleagues apparently do not

agree with you.

I humbly suggest that you do a bit more research into Reiki and update your misleading and erroneous entry.

Lisa Rodrigues Reiki Master/Teacher, Usui Shiki Ryoho

reply: Take a browse of some of the sites I link to on the reiki page. You may be surprised at what your colleagues are claiming.

reincarnation

03 Jan 1998

I was on the net trying to learn more about reincarnation when I stumbled upon your wonderful Skeptic's Dictionary. I'm a fourteen year old agnostic/existentialist and I found your pages incredibly fascinating and educational. I think the best part about being skeptical is how one's beliefs don't sway the facts. I mentioned my interest in reincarnation, and I saw a lot of pages, but they were so opaque and dogmatic I couldn't attempt to learn anything about it. In conclusion thank you for putting up the wonderful, informative sites and know there are probably many people like myself who are just as grateful.

Emily

Dec 1996

You missed an interesting problem in your essay on reincarnation. You mention Buddhism as a major religion that includes reincarnation, and go on to argue that it must be the soul that is reincarnated, if anything is. One of the most basic doctrines of Buddhism is anatman (anatta), translatable as "no-soul", "no-self", "no-ego", etc. Buddhism specifically regards the existence of the soul (self, ego) as illusory. It would therefore be this illusion, if anything, which is "reincarnated"--or rather, simply continued.

Dan Clore

reply: The reincarnation of an illusion....hmmmm....now there is a concept for the New Age.

31 Dec 1996

I am an Engineer and not prone to illogical things, but I have had a number of things occur in my life to make me curious...maybe you could tell me where to look. About 2 years past I had a dream that still bothers me. I was an officer in the Navy and was in a plane crash in which I died. From this dream I remember the day, and a part of my service number. Could I check this somehow? The day in my dream that I died is troubling for 2 reasons.....in is almost 9 mos to before I was born, and my father in law, whom was very close to me, died on this same

day (only the year is different). Let me know what you think.

Doug

reply: I don't know what you think is so strange or special about your dream, or why it bothers you or puzzles you. I'm not in the dream interpretation business, but if a guy dreams he dies nine months before his birth date, I'd say that is not too pleasant a thought either taken literally or figuratively. Of course, I would take it figuratively. The chance that your dream is a representation of an actual experience is about zero, but I have no doubt believers in reincarnation would take it as evidence for their belief. Figuratively, your dream expresses the notion that you were dead from the moment of conception...not a pleasant thought and one I wouldn't dwell on.

As for the part about the father-in-law...his death date appearing in your dream doesn't seem surprising since you were close to him. Also, I don't know how often dates appear in dreams, but it is often difficult to know for sure whether the source of a date [or for other dream-details] is really the dream. It is often the case that the source is something else, i.e., a waking experience which took place either before or after the dream.

27 Jun 1997

I have come across your Skeptic's Dictionary while surfing the net and was interested in your entry under reincarnation. I would like to remark on this entry in your dictionary.

You state: 'In those ancient eastern religions, reincarnation was not considered a good thing, but a bad thing. To achieve the state of ultimate bliss (nirvana) is to escape from the wheel of rebirth'. This is not true. Reincarnation itself is not a bad thing, it is uncontrolled rebirth that is a problem as one never knows if he/she will have a fortunate rebirth or an unfortunate one. Attaining nirvana does not break the cycle of rebirth but ceases uncontrolled rebirth. Once nirvana is reached one has control over his reincarnation.

reply: Strictly speaking, I suppose, you are partly correct. Good and bad are relative terms and in the strictest terms, there are no "bad" things according to these ancient religions. What is, is. On the other hand, like the western religions, the eastern ones have disdained human existence and created an ideal which is the negation of human existence with all its pains, woes and suffering. However, your notion of nirvana does not match what I have read about Buddhism. Nirvana is the final emancipation, the end of the line, the time for the annihilation of individuality and absorption into the One. Maybe you are thinking of the *bodhisatva*, who delays his or her own final exit to help others reach the promised land. Though, I have no doubt, that somewhere there is a doctrine of reincarnation which not only

allows reincarnation as an inanimate object but also allows one who has reached nirvana to come back as a swan or nuclear bomb if they so desire.

Reading your passage about the soul, I feel that you are making a distinction between the mind and the soul. This is not so, the soul is the mind, not a separate entity. So what is carried on when the physical body dies is just the mind of the being. I would like you to explain the following: 'More promising is the work of those who see consciousness in terms of brain functioning and who try to treat 'mental' illness as a physical problem.'

reply: If I have been confusing, I apologize. Let me clarify my views. The soul is a fictional entity which is claimed to be a substance which can exist independently of the body. The mind is a fictional entity which is claimed to be a substance which can exist independently of the brain. Many, but not all, philosophers equate mind and soul. Philosophers who focus on these fictional entities, rather than on the brain, when trying to understand consciousness and behavior are unlikely to discover much more than a few phenomenological truths. For example, they may discover that a psychotic "mind" creates delusions of being abducted by aliens rather than being visited by the Holy Ghost because the dominant cultural motif is no longer religion but science fiction. Or they may discover that the paranoid "mind" believes it is being followed by the FBI or the CIA rather than the Devil because the dominant cultural motif for power to harm is no longer religion but the government. To me, this does not represent progress in understanding anything interesting about human consciousness or behavior. Those who will provide us with useful information in this area will be those who study the brain and discover the neurochemical and physiological processes which cause psychoses. I believe that neuroscientists are also the ones who will lead to valuable knowledge about the workings of the "normal" brain, e.g., how memory works. A work like [Daniel Schacter's](#) or those of [Oliver Sacks](#) will help us learn more about memory and other functions of consciousness than a dozen books on the "mind" by Plato's or Aristotle's intellectual descendants. Phenomenology may describe hallucinations, but neuroscientists are likely to discover the endorphins and other chemicals which give rise to feelings of levitation, leaving the body, unity with all things, etc.

Also in your writing, you try to argue whether reincarnation is useful or useless. Surely just because a person finds a phenomenon useless does not equate with it not existing. If, say, I found PCs useless, it would not then mean that computers don't exist. If one feels that there is no benefit in believing in reincarnation then why should there be a problem in thinking that way.

reply: My point is that there is no way to tell the difference between a person with a soul which will be reincarnated and a person with a soul which will not be reincarnated and a person with no soul at all. The utility of this idea is all it has going for it, since it is not based on facts or

observations. Its utility has to be found in its ability to explain things or to satisfy some personal desire. I think anything the doctrines of reincarnation or of eternal life can explain can be explained better without reference to a soul. Of course, I exaggerate when I say the doctrine is meaningless and useless: it is so to me. Obviously, the belief is satisfying to billions of people who hate this life but still want to live forever.

My opinion is that reincarnation does explain a host of issues that puzzle scientists and psychologists. One does however need to find authentic teachings on the subject to understand the subject in full.

Neil Williams

Farnborough, Hampshire, England

reply: I guess I'll just have to keep searching for those authentic teachings.

15 Dec 1997

I have some suggestions that may counter some of your arguments against reincarnation.

You said:

"...if we pretend for a moment that the idea of a soul is possible, we can pretend that this soul has either suddenly started existing out of nothing, or it evolved out of something else, or it has existed forever. I don't think any self-respecting believer in reincarnation has claimed that the soul evolved out of something else. So, for the purposes of argument let's assume that each soul either suddenly came into being or they've existed forever."

These are not the only possibilities. You assume the relevance of time to souls. Most sources would agree that souls have no form in the three normal spatial dimensions, so it seems inconsistent that they should have any form in the time dimension either. Note the similarity with the question "what happened five seconds before time began" - questions of beginnings and ends are only relevant where there is a time axis to measure against.

reply: You're assuming that it is the "soul" which persists. In any case, if what persists is outside of time, how does it manage to move in and out of time?

"If they've existed forever and reincarnation is correct, then the world population should remain constant. The world population does not remain constant. Therefore, either souls have not existed forever or reincarnation is not correct."

That is only a valid disproof to a reincarnation theory which requires that:

- 1. all souls available must be incarnated*
- 2. all souls reincarnate instantly, sequentially forward in time*
- 3. all incarnated souls reside on planet earth*
- 4. all souls incarnate only in humans*
- 5. all souls incarnate in only one body at a time*

Here's an alternative model (this one was suggested by the Seth books):

Souls exist external to the normal space-time frame. They can have nil, one, or many incarnations dipping into the timeline at any point (including more than one in the same time), and can incarnate into any lifeform. Incarnations may have complete, partial, or no access to the total soul's facilities, including its "memories" of its other incarnations.

Note that I am not necessarily advocating reincarnation, merely proposing a way in which it could occur which would not be subject to the problems you pointed out.

Julian Morrison

reply: Your model also assumes that it is the soul which reincarnated. I'm willing to grant that it is not the soul that is reincarnated and that whatever it is that persists can move in and out of any living or dead entity in the universe. For all I know, every particle in the universe has a "blah blah" which persists eternally and moves from particle to particle. I have no idea what value such an assumption has, except to make reincarnation of "blah blahs" impossible to disprove.

13 Jan 1998

I really enjoyed your essay on reincarnation, but I have something to add. You and others have mentioned that reincarnation is a ridiculous idea, and not useful, but it is also something else: a complete and total non idea: absolutely meaningless when we look at ourselves as individuals and ask "what are the necessary components that make up me?"

Descartes' idea that "I think therefore I am" is some pretty powerful stuff. I myself am incapable of imagining the concept of "me" if I have no thoughts, memories, sensations - all the things that make up me. Without these, I am no more than an inanimate lump of rock.

This is where the whole criticism of reincarnation comes in. If the "soul" is passed on to another body (and that soul is the true "me"), then I would expect

that next body to remember my former life, what I liked to eat for breakfast as well as personality traits and such. There should be no change at all, if reincarnation is simply the passing of "me" from one container to another. But how many of us remember a damn thing about former lives? And how many that do "remember" these former lives are making money from these memories?

reply: You're assuming it is the "self" which persists, but what if it is the "blah blah" which has no memory, no personality?

Let's just humor these reincarnationists - yes, matter is neither created nor destroyed, so perhaps when I die one or two of my former atoms will help to make up the armor on the back of a beetle, or a lump of earwax in a gerbil. So what?! In conclusion, a soul without memories, personality and continuity is nothing at all. And the concept of reincarnation is a delusion built upon an even bigger delusion.

Oh yes, and another thing: if reincarnation were true, and the "soul" (memories thoughts and all) are passed from body to body, then why don't we see insect labor unions, poetry writing sloths and historian fruit flies? do some slugs dream about their former human lives?

Tony Jensen

reply: We don't need to humor anyone. Those who believe in reincarnation don't necessarily believe that it is the soul which persists. They don't necessarily believe there would be any memory of past lives. They don't necessarily believe that the "self" or "personality" of any individual persists. What they believe is very mysterious.

repressed memory therapy

24 Dec 1999

Let me begin by saying how much I enjoy your web site. I try to check it out at least once per week.

I know you are busy, so I'll keep this brief. I have an idea for a new entry in the dictionary: anatomically correct dolls. I am a master's level social worker who practices in San Francisco, CA. While in grad school, I had the pleasure (and good fortune) to study under Dr. Bruce Thyer at the University of Georgia. Dr. Thyer is renowned (and somewhat notorious) in the fields of social work and psychology for being a radical behaviorist whose research focuses on outcome studies of various psychological and psychosocial interventions. It is Dr. Thyer's belief that social workers and other psychotherapists should only utilize treatments that are supported by empirical research. He spent a great deal of time in class debunking "therapies" like NLP, psychodynamic psychotherapy, hypnosis, etc. During one class, he began ranting and raving about the use of anatomically correct dolls (ACDs) in the assessment of child sexual abuse.

Assessments by social workers and psychologists using ACDs are frequently used in court as evidence against alleged perpetrators of sexual abuse. Dr. Thyer challenged our class to find even one journal article that scientifically demonstrated that this form of assessment was useful. He offered extra credit for the first person who could find such an article. No one was able to do so.

This was the first of several disillusioning lectures delivered by Dr. Thyer. At first, I was quite upset at being disillusioned, because I had envisioned myself becoming a psychotherapist. In hindsight, however, I am quite grateful to Dr. Thyer for dispelling so many of the myths that infest my field. You would not believe some of the nonsense that is presented in graduate level social work classes as "therapy".

Anyway, if you would be interested in exploring this topic, I can provide you with additional information. You can also contact Dr. Thyer at the University of Georgia School of Social Work. I'm sure he would LOVE to contribute to your site. Dr. Thyer is one of the most ardent skeptics I have ever encountered.

*Once again, thanks for such an informative site.
(name withheld at author's request)*

reply: The author is correct in noting that anatomically correct dolls are commonly used by those who search for evidence of sexual abuse in children. It is not the dolls, however, that are a problem. It is how they are used to lead and badger children until they come up with a story that satisfies their inquisitors.

2

May 13, 1997. Roger Katz, 50 years old, was caught with a naked 14-year old girl and charged with being a bad boy in Santa Fe, New Mexico. He used to be her social studies teacher, so he was especially naughty, abusing not only the girl but his profession. He told judge Steve Herrera that his relationship with the girl dated back to 640 A.D. Katz claims that in their previous lives the girl took an arrow to the chest on his behalf and saved his life. His current love was just an expression of his thousand-year-old gratitude. As he was being led out of the courtroom to begin serving his 1 1/2 year sentence, Katz told a deputy "This is the price you pay for love." He should have quoted Frank Zappa: "the only thing universal is stupidity."

January 12, 1997. An article in today's newspaper reports that the state of Washington has announced that as of January 1, 1997, it will no longer pay for repressed memory therapy out of a state fund for victims of violent crimes. Over \$2.5 million has been on 325 patients over the past five years to help (mostly) women recover memories of childhood sexual abuse. The decision to halt the funding of repressed memory therapy was based on a critique of the program which studied 30 cases, presumably selected at random, from the 325. Of the 30, 25 were employed at the beginning of treatment; only 5 were employed three years later. Twenty-eight were married when treatment began; 10 were still married after three years of treatment. All 30 were still in therapy three years after treatment began. The report stated that "it appears that the longer the patient is [in] treatment, the more disabled s(he) becomes."

The critique of the Washington program noted that there was no effort made by therapists to verify the accuracy of the repressed memories, some of which were monstrously bizarre, such as eating penises and infants in satanic rituals. The program was defended by Laura Brown, a Seattle psychologist in the forefront of Recovered Memory Therapy. Fantastic memories, she says, are "perhaps coded or symbolic versions of what really happened." What really happened, she's sure, was sexual abuse in childhood. "Who knows what pedophiles have done that gets reported out later as satanic rituals and cannibalistic orgies?" asks Dr. Brown.

On the other hand, who knows what therapists have done that gets reported out later as recovery of memories of horrors suffered at the hands of loving parents?

January 9, 1997. "Junk Science", an ABC special hosted by John Stossel of the news magazine *20/20* was exceptional television journalism. Not only were skeptical viewpoints allowed; they were featured. There was no catering to paranormal prurience. There wasn't much distinction made between pseudoscience and inept, faulty, incompetent or fraudulent science, but on the whole the program was a

refreshing alternative to the junk journalism we usually get with features on Virgin Mary apparitions, UFO sightings, and tearful testimonies taken as proof of causal connections.

The show began with a listen-in on various cosmetologists (i.e., "beauticians" or "esthetic technicians") babbling on as if they were nuclear physicists, while extolling the wondrous virtues of their products to prospective or actual clients. But the cosmetic industry was not analyzed or evaluated. A cynic might think that to do so would risk losing advertising dollars. Better to go after those who don't advertise, like the government. The government took two big hits from Stossel: for its program on salt and for the EPA's destruction of an entire community because of dioxin contamination.

I did not know before watching "Junk Science" that my government has a bureaucracy devoted to informing the public of the dangers of salt. Dr. Jeffrey Cutler heads the government's salt propaganda campaign. The idea is to persuade us that we should not take in more than 2,400 milligrams of salt a day. Stossel lined up about a dozen experts from places like Harvard and Stanford, including Dr. Michael Alderman of the American Society of Hypertension, to argue that there is no evidence that reducing salt intake is good advice for the general public. There are some individuals who should limit their salt intake, but the evidence is lacking which would suggest that all of us should do so. In fact, one study of heart attack victims found that those with the lowest salt intake suffered a significantly greater number of attacks (about 4 times as many) than the rest of the group.

Our government came in for another attack when Stossel took us to a town in Italy that had had a major dioxin catastrophe twenty years ago: a plant blew up or something like that and there was major contamination of the town and the people. There is evidence that dioxin does all kinds of bad things to rats and mice and other animals. There is not much evidence that it does the same kinds of things to humans. For example, no studies have shown that workers who were in contact with dioxin for years run any greater risks for disease or death than comparable groups not working with dioxin. The Italians buried the debris, including the remains of the plant, and built a park over the buried contaminated debris. They don't seem to be any the worse for their action. On the contrary, when dioxin contamination entered the town of Times Beach, Missouri, the EPA destroyed and buried the whole town and displaced the 2,000 residents, forbidding them to re-enter their homes. The cost has run to over \$100 million for the exercise in environmental destruction by the EPA. The Italian contamination was 10,000 times greater than the one in Missouri, yet William Farland, Ph.D., of the EPA defends the operation and appeals to scientific studies which indicate the dangers of dioxin to humans. There is no doubt he could line up "experts" to back up his claim. [update: May 17, 2000. [Dioxin danger may be greater than originally thought.](#)]

Stossel spent a good part of "Junk Science" dealing with "scientific experts" who testify before the government and in court. Some of these experts and the lawyers who hire them are of dubious integrity. Some of them seem to be on a crusade. All of them are making money. The most egregious case Stossel uncovered was that of Dr. Michael West, a Mississippi dentist who claims to be an expert in "bite marks." His testimony has sent a dozen people to jail, two of whom are on death row. Because of

his incompetence and fraudulent practice, Dr. West has been kicked out of and condemned by the professional organizations he had belonged to. One of his convictions involved exhuming a murder victim's body which had been in the ground for over a year, using some sort of special light as he examined the remains, and claiming to identify bite marks on her shoulder which were "invisible to the naked eye." He also claimed that the bite marks were put there by her husband, who was arrested, convicted and spent two years in jail before being freed after Dr. West's dubious credentials were uncovered. (Tony Kekko, the accused, may be completely innocent, or he may well have killed his wife or hired someone to do it. The point is that the only evidence used to arrest and convict him was the junk science testimony of a quack. I wonder how jurors would respond to such testimony if they realized that the same thing could happen to them!)

The problem of junk science in the courtroom is a significant social problem and needs to be addressed. Stossel has made a major contribution to making the public aware of the problem. One aspect of the problem involves people like Dr. West who claim to be experts in something for which there are no established social criteria. That is, some so-called experts are not really experts because what they claim to be experts in is controversial or dubious. Stossel showed the hire-an-expert advertisements which appeared in a magazine which caters to lawyers. Very few, if any of them, could honestly claim to be scientists. On the other hand, many of the experts called to testify in court have very good scientific credentials. The two experts who testified for the lawyers who sued Dow Corning over breast implants were seemingly reputable scientists. They testified to the causal connection between breast implants and such things as connective tissue disease, Dow paid off millions and filed for bankruptcy. Jenny Jones and Oprah had programs featuring women who'd had breast implants and were suffering from painful disorders. The general public would reasonably conclude from such behavior that there must be strong evidence that breast implants caused these disorders. Yet, the rest of the medical scientific community maintains that given the more than one million women who have had breast implants, it would be expected by chance, if there were no causal connection between the implants and disease, that about 1% or 10,000 women would be ill, because that is the percent of women in the general population who suffer from these problems. That is what the studies have found. If there were a causal connection, the percentage of women who'd had breast implants suffering from diseases such as connective tissue disease should be significantly higher than that for women who do not have breast implants. It isn't.

It is hard not to be moved by anyone's suffering, but lawyers, scientists and jurors have a responsibility to get at the truth. Unfortunately, all too often interest in the whole truth, necessary to achieve justice, is suppressed in favor of finding a perpetrator, guilty or not, who can be blamed for causing such pain and suffering. The only suggestion Stoffel had to remedy the situation is that scientific consensus should carry more weight than the opinion of a few experts, no matter what their credentials. He also clearly implied that some judicial criteria are needed to prevent quack disciplines from being able to provide "scientific experts" in the courtroom.

Journalists and the mass media were criticized for their role in promoting junk science, but not nearly as severely as they should have been. About 15 or 20 years ago there was a major media flurry on "crack babies". Cocaine was said to doom a baby to a lifetime of moronic existence. Experts made strong claims about the

inability of crack babies to ever lead normal lives. Such babies can't respond to a human voice, one expert claimed. The media jumped on the bandwagon and so did the government (it fit the government's war on drugs scorched earth policy). *Rolling Stone* magazine came in for special criticism. The studies on crack babies, it turns out, were done on samples as few as 23, and no controls were made for the effects of alcohol or other potential causal factors. In short, crack babies are not necessarily doomed. Cocaine in a baby's body at birth has not been established as causing brain damage. Where were the media and the government when better studies undermined the claims of the doomsayers? As usual, they were nowhere to be found.

Stossel also reported on Pons and Fleishman whose fame was as ephemeral as the cold fusion they claimed to have harnessed. The lesson here may be that this is what happens when scientists skip peer review and go right to the media and the court of public opinion before begging for dollars before Congress. By the way, it was reported that Toyota has built these guys a research plant in the south of France. Not bad for a couple of bumlbers whose best data was most likely due to either fraud or faulty equipment.

Other scientists were called to task by Stossel, including Linus Pauling and his campaign on behalf of vitamin C. At least a dozen studies have shown that there is no demonstrable cold-preventative effect in vitamin C. Stossel had nothing to say about the fad to take zinc supplements to prevent colds. But he did bring up the fact that spinach is overrated as a source of iron because of a decimal placement error by a scientist years ago.

"Junk Science" was a rare program and I would like to see much more similar programming. ABC is to be commended for the program and for 20/20.

reader comments

20 Dec 1999

I've learned to take Stossel's claims with a huge grain of salt, especially when he's attacking government programs, and this was certainly no exception. I presume that he's talking about the Seveso accident of 1976-- it's the one item that kept turning up when I did a MEDLINE search on "dioxin" and "Italy." If Stossel claimed that the Seveso-area residents are doing just fine, he didn't do his research: I found several papers which noted higher rates of cardiovascular disease and CVD-related deaths (Pesatori 1998), higher rates of mortality for several kinds of digestive canal cancers (Bertazzi 1997), and increases in Hodgkin's lymphoma and thyroid cancer (Pesatori 1993). A 1989 review noted that "An increased mortality, from chronic ischemic heart disease (males) and hypertensive disease (females), which could not be explained in terms of chance, confounding, or bias, was noted in the exposed population. The stressful experience of the population in the aftermath of the disaster was deemed relevant to the interpretation of these findings. Overall, cancer mortality was not increased. Suggestive increases, however, were seen for melanoma, brain cancer, soft tissue sarcomas and certain hematologic neoplasms, whereas mortality from breast cancer and cancer of the liver was

noticeably decreased." (Bertazzi 1989)

No, no one study can really be the final word on a medical controversy, and no paper is immune to criticism. But it sounds as though Stossel's dismissal of the Seveso incident was far from accurate.

--Brian Siano

December 26, 1996. An editorial in today's *Sacramento Bee* praised the recent decision by U.S. District Court Judge Robert E. Jones which barred scientifically unsubstantiated testimony that silicone breast implants cause disease. Despite the fact that scientists have been unable to find reliable evidence that silicone breast implants cause disease, manufacturers have paid out more than 4 billion dollars in lawsuits. Numerous epidemiological studies by reputable researchers have found that women with breast implants are no more likely than other women to come down with the disorders about which plaintiffs complain. Why, then have companies like Dow Corning paid up? According to the Bee

Many of the plaintiffs in breast implant cases are seriously ill, and sympathetic jurors are often reluctant to send them home empty-handed. Judges have allowed those emotions to have greater play by permitting plaintiffs to put on the stand a handful of paid experts and physicians who give their opinion that implants are responsible for causing disease. Although that testimony is scientifically ungrounded, it has given jurors license to follow their hearts.

The Bee goes on to say that

Jones' order, barring plaintiffs' junk science arguments in 70 Oregon implant cases, begins to change that. Following the U.S. Supreme Court's 1993 instruction that judges serve as gatekeepers to determine that scientific evidence introduced in trials be reliable and relevant, Jones hired four disinterested scientists to advise him, then conducted an intensive hearing on the merits of the evidence offered for trial. Drawing on the experts' advice and the results of the hearing, Jones decided that none of the plaintiffs' scientific claims met the federal standard for scientific evidence, dismissing some of it as "no more than educated guesses dressed up in evening clothes."

Junk science has been allowed in our courtrooms for too long. Jones' decision goes a long way toward eliminating some of the injustice which our courts and juries have allowed to flourish in the past, mainly out of ignorance, pity and a contemptible attitude toward reason and real science.

Nov 24-26, 1966. [NOVA - Odyssey of Life](#) tells the story of evolution in the stunning color photography of Lennart Nilsson. Excellent.

November 22, 1996. The *Sacramento Bee* reports that Thomas Molina, a 12-year old boy is diagnosed with Hodgkin's disease. His mother, Katherine Quartz, a Paiute Indian, wants him to be treated by a holistic homeopath recommended by a tribal medicine man. The boy had started chemotherapy but a tribal judge, Ron Johnny, ordered the chemo stopped until a "traditional medicine man" examined the boy. A pediatric oncologist says that the chances of survival are 90 percent or higher with chemotherapy and radiation. The traditional tribal healers say that the chemotherapy will interfere with the homeopathic remedies. The mother is arrested on a felony warrant of child endangerment. The boy is being treated by a homeopathic doctor, somewhere unknown to the court which wants to force the boy to have chemotherapy. Who's right?

Stay tuned. We'll follow the progress of this case of parental vs. state rights and traditional medicine vs. alternative therapies.

January 15, 1997. Charges against the mother have been dropped. She apparently put the boy back in chemotherapy. The boy's oncologist, Dr. Arun Ragasawami, reports that Molina is responding well to chemotherapy and that "tumors are getting smaller." However, an American Indian appellate court, the Inter-Tribal Court of Appeals for Nevada, has ordered the UC Davis Medical Center to stop the chemotherapy while Molina undergoes a 120-day "holistic Indian cure" for cancer. The article by Stephen Magagnini in the *Sacramento Bee*, which gives an account of the Indian court's decision, does not mention what authority the Indian court has or whether the Sacramento District Attorney is likely to file charges against the mother again should you abide by the Indian court's ruling.

February 26, 1997. Today Katherine Quartz spoke at Sacramento City College and I was able to attend and get some more information on the case. She was part of a panel which included her lawyer, a Native American who is also a psychologist and a woman who heads an Indian Services Agency. Her son, Thomas, was also in

attendance.

Apparently, an Indian who lives on a reservation is not a citizen of the United States and is under the jurisdiction of Indian tribal laws and courts. Had Ms. Quartz never left her reservation, she would have been free to seek any kind of treatment she wished for her son. But she had gone to Portland, Oregon, to go to college. This fact was used by authorities in Oregon and California to impose their laws on her. She did seek out a pediatrician for her son when he first got ill. She did not seek out an Indian healer at that time, she said, because the only healer in her area was gravely ill himself. The diagnosis of Hodgkins was not immediate, but was not made until four months after the first visit with a physician. When chemotherapy was offered as the only reasonable therapy for her son, she says she told the doctors she wanted to do some research first. She did and concluded that chemotherapy was not a reasonable modality of treatment. She then took her son to a practitioner of traditional Chinese medicine, who treated her son with acupuncture and herbs. (She asserted a belief that "herbs can go in and break up tumors," though she gave no source for this notion.) She then took her son to a naturopath who treated him with herbs.

She says that her troubles began when she tried to get a CAT scan of her son, which she says she wanted in case any questions came up later about the efficacy of the treatments she'd chosen for her son. X-rays had shown significant reduction in tumor size and growth, she says. But a CAT scan would provide better evidence, she believed. Her treatment by the medical doctors in Oregon she went to for the CAT scan was less than respectful of Indian ways. She was told that chemotherapy was the only correct medical treatment for her son and that she was endangering his life by seeking alternative treatments. One pediatrician even wrote to authorities investigating the case that Ms. Quartz's thought processes were impaired. His evidence seemed to be limited to the fact that she disagreed with him on the proper medical treatment for her son.

Given the unique status of Indians--they are basically members of a foreign nation, but have unique status granted in the U.S. Constitution--the Tribal appellate court's ruling is binding and California cannot order the boy back into chemotherapy. According to Ms. Quartz, her son received five chemotherapy treatments against her will. He looked fine today, but she said that after the treatments he look awful. His hair fell out and he developed mouth sores and other signs of physical debilitation (which are common side effects of chemotherapy). She says that her research discovered that her son might be made sterile by chemo and that the statistics were not exactly as promising as they might seem. According to her lawyer, the survival rate was 90% if the patients were followed for ten years. But if they were followed for fifteen years, the survival rate was less than 10%. Both claim that there is evidence that while chemo might stop a cancer, it so debilitates the immune system that the effects after ten years are devastating.

In her quest to seek the best course of treatment for her son, Ms. Quartz was charged with child endangerment and had her son taken away from her. She was charged with kidnapping for taking him from a hospital. She claims a police officer held a gun to her head and told her she was killing her son by not getting him into chemotherapy. A medical doctor abused his authority to try to get her declared mentally incompetent because she dared to favor alternative medicine to traditional medical treatment. Her behavior as a mother was exemplary and her seeking out an Indian healer is

consistent with her life on a reservation for the past sixteen years. I don't know if I would have made the same decision as she did about the chemotherapy, but I know that I would have done research, too. And if I came to the conclusion that the therapy recommended by my physician was not the best for my child, I would not put my child into the therapy. Furthermore, I would not expect to be labeled mentally incompetent or a child abuser simply because I came to a different conclusion than my physician.

As readers of my pages know, I hold no sympathy for alternative medical treatments. But I have even less stomach for authoritarian bullies whether they carry guns or a stethoscope.

reverse speech

13 Jan 1998

I was going to offer a refutation of Oates' theory of reverse speech until I read the study by Mark Newbrook and Jane Curtain, which appears under your "further reading". Their study and its results are devastating, and I have a hard time seeing how anyone could read it and continue to believe in this incredible theory.

I have an undergraduate degree in theoretical linguistics, and I wanted to offer my analysis of one of the examples that Oates uses.

Allegedly, a toddler who asked "A diaper?" was really saying "Help me out". This makes a very good case study in the phenomenon of reverse speech:

The following sounds appear in "A diaper": uh dye uh pur

Here are those sounds reversed: rup uh I'd uh

Compare these to the sounds in "help me out": help mee owt

Not all that similar, are they?

But add to this the question intonation of "A diaper?", which starts low and ends high. In "help me out", the toddler starts high and ends low. What an incredible coincidence! That high to low voice intonation conveniently masks the marked differences in the sounds. For example, there is no "m" in "a diaper", nor is there a "t", nor is there an "h", nor is there an "l". If I'm missing something here, help me out!

The crucial point in Newbrook and Curtain's report is the role of the power of suggestion. Without being told in advance what you're supposed to hear, it is difficult, even impossible, to hear the "subconscious message". That speaks volumes.

Bret Palm

reply: I agree that the only reason Oates is able to convince others that there is something to his theory is by telling them what some garbled message says before they hear it. The same is true of the so-called satanic messages in rock music. Until someone points it out, nobody hears anything. Suddenly, everybody hears it. Something similar happened

with Disney and homosexual porn. Somebody played an animated film at slow speed and claimed to see erections under the Sorcerer's robes, etc. So-called Christian groups organized and started calling the trash talk shows. Pretty soon the talk show hosts were looking at all the Disney animations and finding evidence of obscene cartoons everywhere. Callers were more than happy to look for and discover even more examples of homosexual promiscuity placed in cartoons by a cadre of evil-minded graphic artists hellbent on corrupting the morals of the nation's youth.

Yes, it's the power of suggestion, but it is more as well. In the case of Disney, there was also homophobia which was a driving force behind the pareidolia. In the case of reverse speech, it's driven in part by the same wishful thinking that drives people to believe in truth serums and lie detectors because of a profound distrust in our judicial system to catch, convict and punish people like O.J. Simpson or the Ramseys. It is also driven by our fascination with anything bizarre.

Document 2 - The Plagiarism of Catalina Rivas

Comparison of two typical pages from *Renovacion Evangelica (Evangelical Revival)* allegedly dictated to the alleged stigmatic Catalina Rivas by Jesus Himself in 1996 to *Formacion de Predicadores (Training Preachers)* by José Prado Flores and Salvador Gómez of Guadalajara, Mexico, taken from the 1992 edition.

Nearly every page of *Renovacion Evangelica* can be found to correspond to nearly identical pages of *Formacion de Predicadores*.

from *Renovacion Evangelica*, "dictada a la sierva de Dios," [Catalina Rivas] Cochabamba - Bolivia, 1996, pages 34-35

salvación de Dios. Tienen que encarnarse tanto para denunciar la ausencia de Dios, como para anunciar también su presencia divina.... Tomen ejemplo de Pablo que supo descubrir Mi presencia en un lugar atestado de dioses paganos: *"Pablo... estaba interiormente indignado al ver la ciudad llena de ídolos. Discutía en la sinagoga con los judíos y con los que adoraban a Dios y diariamente en el ágora con los que por allí se encontraban. Le tomaron y le llevaron al Areópago. Pablo, de pie en medio del Areópago, dijo: Atenienses, veo que ustedes son, por todos los conceptos, los más respetuosos de la divinidad...."*

(Hech 17, 16-21.)

Fue tan hábil que, interiormente indignado, puesto que en cada esquina había ídolos, supo aprovecharse de la ocasión para anunciar Mi Evangelio. El estaba preparado, sabía de memoria versos de poetas griegos. Hablaba perfectamente la lengua de los atenienses, y de cualquier tema que le hablaran, sabía responder. Estaba al día en cuanto a los conocimientos de su época. Luego añadió: *"Cuando pasé por la ciudad me encontré que ustedes tienen un pedestal vacío, adorando a una divinidad desconocida. Pues bien, de este Dios desconocido es de quien yo quiero hablarles el día de hoy"*.

(Hech 17,23.)

- Las canciones de moda son un buen medio para predicar en el lenguaje de todos los días. Te daré algunos ejemplos que puedes usar para anunciar o para denunciar.

- La amante canta: Que me perdone tu señora (el

34

descaro ante el pecado).

- Qué bonita es la venganza, cuando Dios nos la concede (Atribuírme a Mí lo que hacen).

- Esta flor ya no retoña, tiene muerto el corazón (la desesperanza).

- Con dinero y sin dinero, hago siempre lo que quiero y mi palabra es la Ley (La arrogancia).

- Si amarte es pecado, quiero ser pecador (No importa que sea pecado).

■ Denunciar los criterios del mundo es una parte de la evangelización. Renunciar a estas oportunidades es bajarse del tren donde viaja el mundo.

■ - Es indispensable también, para predicar, el estudio de biografías.

■ Por Ej: Tomás A. Edison dedicó 3 años a investigar la fibra incandescente que pudiera iluminar en un foco. Experimentando con todo tipo de materiales, efectuó más de dos mil pruebas, aunque sus amigos le aconsejaban desistir. Gracias a su perseverancia, logró su objetivo.

from *Formacion de Predicadores (Training Preachers)* by José Prado Flores and Salvador Gómez of Guadalajara, Mexico, taken from the 1992 edition. Compare everything from the 4th sentence on to the above.

Jesucristo no nos quiso salvar por correspondencia. Por ello, la Palabra se hizo carne y habitó entre nosotros. Si el predicador no está encarnado en la vida de los hombres, nunca podrá estar cerca de ellos para manifestarles la salvación de Dios. Tenemos que encamarnos tanto para denunciar la ausencia de Dios, como para anunciar también su presencia divina.

Pablo supo descubrir la presencia del Dios verdadero en un lugar atestado de dioses paganos:

*Pablo... estaba interiormente indignado
al ver la ciudad llena de ídolos.
Discutía en la sinagoga con los judíos,
y con los que adoraban a Dios;
y diariamente en el ágora
con los que por allí se encontraba.
Le tomaron y le llevaron al Areópago.
Pablo, de pie en medio del Areópago,
dijo: "Atenienses, veo que ustedes son, por todos los
conceptos, los más respetuosos de la divinidad...":
Hech 17, 16-21.*

¡Qué hábil Pablo, Interiormente estaba indignado, puesto que en cada esquina había ídolos, pero supo aprovecharse de la ocasión para anunciar el Evangelio.

Pablo estaba capacitado para discutir con los epicúreos y los estoicos. Hasta sabía de memoria versos de poetas griegos. Hablaba perfectamente la lengua de los atenienses, y de cualquier tema que le hablaran sabía responder. Era un hombre que estaba al día en cuanto a los conocimientos de su época.

Luego añadió:

*"Cuando pasé por la ciudad me encontré
que ustedes tiene un pedestal vacío.*

*que ustedes tiene un pedestal vacío,
adorando a una divinidad desconocida.*

38

*Pues bien, de este Dios desconocido
es de quien yo quiero hablarles el día de hoy":
Hech 17, 23.*

c.- La música

Las canciones de moda son un trampolín maravilloso para predicar en el lenguaje de todos los días.

Daremos ejemplos de algunas canciones, que obviamente tienen algo que el predicador puede usar para anunciar o denunciar:

- La amante canta: Que me perdone tu señora (El descaro ante el pecado).
- Qué bonita es la venganza, cuando Dios nos la concede (Atribuirle a Dios lo que hacemos).
- Esta flor ya no retoña, tiene muerto el corazón (La desesperanza).
- Con dinero y sin dinero, hago siempre lo que quiero y mi palabra es la ley (La arrogancia).
- Si amarte es pecado, quiero ser pecador (No importa que sea pecado).

Sería lamentable desaprovechar esos ejemplos que todo mundo usa en la vida diaria. Denunciar los criterios del mundo es una parte de la evangelización. Renunciar a estas oportunidades es bajarse del tren donde viaja el mundo.

d.- Biografías

Es indispensable también para un predicador, el estudio de biografías.

- *Tomás Alva Edison* durante 3 años se dedicó a investigar la fibra incandescente que pudiera iluminar en un foco. Experimentando con todo tipo de material, efectuó más de

Experimentando con todo tipo de material, efectuó más de dos mil pruebas, aunque sus amigos le aconsejaban desistir. Gracias a su perseverancia, logró su objetivo.

Document 1 - The Plagiarism of Catalina Rivas

From the book FATHER OF ALL MANKIND by Dr. Ricardo Castañón Gómez (The International Group for Peace, La Paz, Bolivia 1999) taken from Renovacion Evangelica 1996, p. 9).

From the book *Formacion de Predicadores* by Salvador Gómez and José Prado Flores (Kerygma, 1992, p.11)

Jesus says to Catalina:
“Observe My daughter every morning, even when it is still dark, the farmer walks down the path that takes him to his land. His path is well-worn from so much coming and going on the same place. Even his animals come and go alone to the field. His schedule is routine...The case of the fisherman is very different. In the

sea there are no roads or paths, new ways will always be taken. Waves are never the same. Every day the wind blows in a different way and a new way has to be invented. Every morning the fisherman stands in front of the sea and wonders: "God, and now, where should I go? Where are the fish today? Therefore the fisherman repeats daily with psalmist: "Show me thy ways, O Lord. Teach me thy paths" (Psalms 25, 4)

D.- Pescadores sí, agricultores no

Si Jesús comparó ordinariamente el Reino de los Cielos con elementos de la agricultura, lo más lógico era que hubiera llamado a hombres del campo para este ministerio. Sin embargo, llamó a pescadores y a éstos les dijo que serían pescadores de hombres. ¿Por qué no les dijo que serían labradores?

La razón puede ser que cada uno realiza su trabajo de manera muy distinta, y Jesús necesita personas con el carácter de pescador y no con la forma de ser de un labrador.

El agricultor, todas las mañanas, aún oscuro, se encamina por el sendero que lo lleva a su terreno. Incluso, su vereda está trillada por tanto ir y venir por el mismo lugar. Hasta sus animales van y regresan solos al campo. Su itinerario es rutinario. Recorre siempre el mismo camino de sus antepasados. Sus hijos y nietos usarán la misma senda.

El caso del pescador es muy distinto. En el mar no hay caminos, ni veredas. Siempre se va por nuevos derroteros. Nunca las olas son las mismas. Cada día el viento sopla distinto y hay que inventar un camino nuevo.

Todas las mañanas el pescador se para frente al mar y pregunta: "Dios, y ahora, ¿por dónde?, ¿dónde están los peces hoy?". El pescador repite cada día con el salmista:

"Muéstrame, Señor, tus caminos.

Haz que tu senda pueda encontrar": Sal. 25, 4.

reader comments:

rolfing

03 May 2002

Please update your section on Rolfing® to correct the following errors. You will notice that these errors could have been avoided had you obtained your information about Rolfing directly from the Rolf Institute, the organization founded by Dr. Rolf which is the sole certifying body for Rolfers worldwide, and the sole owner of the service mark "Rolfing®". The definition of Rolfing® is legally owned by the Rolf Institute. To base your article about Rolfing® on a handful of illegitimate sources -- or worse yet, on the diluted hearsay and popular misconception that sadly passes for authoritative information on the Internet these days -- is irresponsible, misleading and weakens the noble cause of skepticism. The address of the Rolf Institute web site is www.Rolf.org, not <http://guide.boulder.net/Rolf/as> you indicate in your article.

And now, the errors:

"Rolfing is a kind of deep massage developed by Ida P. Rolf (1896-1979), a biochemist and physical therapist."

-- Rolfing® is not "a kind of deep massage". The methods and goals of massage are inconsistent with those of Rolfing®. The only thing massage and Rolfing® have in common is that both involve a practitioner touching the body. If this condition were sufficient to define massage, then dentists and hairdressers could be considered massage therapists (and boxers could be said to perform "a kind of deep massage.") See www.rolf.org/about/index.html and also <http://www.rolf.org/about/facets.html> for an authoritative description of Rolfing®.

reply: According to the [FAQ](#) on the official Rolf Institute site

When most people think of Rolfing, one of the first words that come to their mind is pain. Often, this perception is based on anecdotal accounts of sessions performed during Rolfing's infancy, when it tended to be often a less subtle and more intense discipline, frequently linked to popular emotionally intense types of therapies in the late 1960's and early 70's. Part of this reputation can be attributed to an often-quoted complaint of Dr. Rolf during her training classes that her students failed to work deep enough. Apparently, many

assumed that what she meant was that they needed to work harder and deeper. However, we now realize that deep work is not necessarily synonymous with physical intensity.

I note in the entry that this early approach has been replaced by an emphasis on *gentler* methods. On their homepage, the Rolf Institute describes Rolfing as "a holistic system of soft tissue manipulation and movement education." While I don't go into detail, I do indicate that Rolfing is more than massage when I note that the goal is "integration" and "alignment" and quote the local Rolfer's focus on Rolfing's "gentle deep muscle balancing process that structurally aligns your body."

-- Ida Rolf was not a physical therapist. See <http://www.rolf.org/about/history.html> for an accurate history of Dr. Ida P. Rolf.

reply: You're right. Physical therapists receive extensive training in physiology and anatomy and science-based therapy. They don't use intuition about gravity, nor make magical connections between physical alignment and emotional stability. Hence, I've removed the adjective 'physical' in describing her type of therapy.

"Rolfing is the name given to Dr. Rolf's method of massage ..."

-- Rolfing® is the name given to Dr. Rolf's principles and methods of structural integration of the human body.

"Rolfing ... transcends chiropractic in that it is based on the notion that emotional as well as physical health depends upon being properly aligned."

-- this statement betrays an unfamiliarity with both Rolfing® and chiropractic. While there is some area of overlap between these two disciplines in so far as their subjective effects can be appraised by the untutored masses, their aims and methods are different, rendering any comparison about as profitable as comparing apples to oranges. Furthermore, any statement asserting that "apples transcend oranges" is so weakly conceived as to yield no meaningful information.

reply: What has Rolfing done to your sense of humor?

-- Rolfing® is not based on a notion that emotional as well as physical health "depends" upon being properly aligned. This statement commits the logistic fallacy of asserting that proper alignment is prerequisite to emotional and physical health. This is nowhere stated in the Rolfing® literature, nor is this idea taught in the Rolfing® training curriculum. What has borne out conclusively in published research is that both emotional and physical health can improve as a consequence of Rolfing® structural integration. (See cited

references below).

reply: There certainly is an effort on the Rolf Institute [FAQ](#) page to dissociate Rolfing from emotional release. However, Ida Rolf seems to have had other ideas, according to [The Toronto Rolf Structural Integration Center](#):

She determined that the human structure is a "plastic medium", and that by applying pressure, energy and intention, the muscular structure can be altered and freed from long-held aberration, the result of physical and/or emotional traumas. By working to free the myofascial network which encases and relates each muscle and each group of muscles, the body returns to its natural organization, and accordingly functions in a more efficient, graceful and comfortable way. She observed that when human structure becomes more vertical, more balanced, more upright, a whole series of other significant changes occur in the person. Further, she noticed that a body which becomes more structurally upright, *provides greater emotional, psychological and spiritual uprightness.* [emphasis added]

"To be healthy, according to rolfers, you must align your head, ankles, hips, thorax, pelvis, knees, shoulders, ears, etc., in just the right way or else the evils of gravity will be felt."

-- similar to the last error, this statement claims that Rolfers believe that alignment is a necessary ("must") prerequisite to be "healthy." Furthermore, the word "healthy" here is a weak and meaningless generalization. The published research proves only that certain specific factors contributing to health can, in fact, improve as a result of Rolfing®.

reply: ?

"... according to rolfers ... the evils of gravity will be felt."

-- perhaps you can explain exactly how the concept of "evil" can be attributed to gravity. Your use of this term is flippant poetic license - no doubt conceived with a self-satisfied smirk - designed to characterize Rolfers in an absurd light. Such thinly veiled Ad hominem arguments do not serve the cause of skepticism. You would do better to remain objective and refrain from dramatic bias.

reply: I think you need to have your humor fascia adjusted.

"Has this claim of the muscular/emotional connection been demonstrated by

any scientific studies? No..."

-- it is a popular misconception that the goal of Rolfing® is to induce emotional well-being. This probably stems from the fact that a great many people who have experienced Rolfing® report improvement in their emotional state. The goal of Rolfing® is simply to take advantage of the greater mechanical efficiency afforded a structure that is balanced in the field of gravity. This is simple engineering physics. However, such balance occurring in a living structure has been shown to have beneficial consequences for many systems of the body (See cited references below). While there is no arguing the perceived value or validity of one's subjective emotional experience, it must be noted that such effects constitute a class of unpredictable epiphenomena which MAY manifest as a byproduct of achieving a more stable, resilient and efficient structure.

reply: You may be right that Rolfing is now simply about "engineering physics" and aims only at "mechanical efficiency," but until the Rolf Institute stops claiming to be "[holistic](#)" I will assume that its practitioners think Rolfing is not just about the body, but about the mind and soul as well.

-- even a cursory scan of the scientific literature yields an enormous body of conclusive research demonstrating the role of the neuromuscular system in mediating the functional connection between the activity of the brain and its emotional expression in the rest of the body.

reply: Well, either you are proud of the fact that Rolfing enhances the emotional well-being of people or you deny that emotional well-being is even a goal (didn't you say it was an 'epiphenomenon'?). I would be the last person to deny that a well-tuned body is very important to a healthy emotional life. I would not even deny that Rolfing is effective in teaching people to use their muscles in a more efficient way. What I object to are the metaphysical overlays and the seeming contradictions such as these from the Rolfing Institute's [FAQ](#).

What the Rolfing method does is create a higher level of integration in the body, balancing and educating the body and the psyche. As the body approaches balance, it is more comfortable in the gravitational field. As the body becomes more comfortable, physical and emotional stress diminish.

What most potential clients fail to understand is that Rolfing is not a method which focuses on stress reduction....All clients experience benefits from Rolfing, an important one for most is that they are less stressed and more at ease in their bodies.

Sincerely,

Scott Cantrell, Certified Rolfer

10 May 1998

I understand where you are coming from with "The Skeptic's Dictionary." There are undoubtedly many quacks out there, although I suspect many you would define as such are quite sincere - which of course doesn't legitimize their methods.

I do take some umbrage with your snide - to me - comments re Rolfing. From a biomechanical standpoint, I would think it quite obvious that structure has an impact on function. I speak from personal experience, as I was born with a clubfoot. I have experiential evidence (which of course cannot be scientific as there is no possibility of replicability or control) of the changes Rolfing has wrought on my body. I suspect you would concur if you saw the photographs. At the same time, my eyesight has improved from diopters of -10 in both eyes to -4, with continuing improvement. (This has occurred contemporaneously with use of The Bates Method, which I am somewhat surprised is not in your work as it has generated much scorn from the medical community over the last 70+ years.) These are real structural changes which have taken place.

reply: I don't know of too many people, medical doctors or not, who would disagree with the notion that structure has an impact on function. The [Bates Method](#) has generated scorn in the medical and optometric communities, but I, too, am fallible and incomplete.

Again, my greater ease and efficiency of movement, which also have emotional correlates, are not the type of thing scientists look for in validating a "system" of healing. To be quite frank, I really don't care a whit! The important thing from my standpoint is that I know Rolfing has been of benefit to me. I realize that you undoubtedly haven't had this personal experience, and can therefore easily be skeptical, and perhaps that's appropriate.

However, I think you should perhaps be a little more selective in what you include in your work. Does lack of scientific evidence alone merit inclusion, or should, perhaps, only affirmative evidence of lack of scientific merit be the

benchmark for inclusion? Admittedly, as a practical matter, no mainstream scientist would be caught dead studying alternative therapies; therefore, affirmative evidence is unlikely to appear. Remember there are orthodoxies and heresies and fashions in the scientific world, just as in any form of human endeavor. To ignore this is to most assuredly engage in self-deception. The human ego is a frail thing.

John Hicks

reply: Customer satisfaction is obviously a good thing, but it cannot substitute for scientific testing. For every happy customer of a quack remedy, there are many who are not helped and some who are harmed because they did not seek a traditional therapy known to work for their ailment. Contrary to your claim, there are often good reasons to examine alternative therapies and mainstream scientists are usually the ones to do the examination, e.g., magnetic therapy and therapeutic touch.

Rorschach ink blot test

20 Jan 2001

I strongly disagree that the interpretation of the Rorschach (if using Exner) is highly intuitive on the Psychologist's part. Exner has done an amazing job of standardizing the scoring of responses. Secondly, I completely agree that, despite this scoring system, the test is completely useless. Most of psychological testing is. It is the test report (conclusions from the entire test battery) that is so highly subjective that without any exaggeration, in my opinion, is similar to astrology. I do not state this to merely make a point. That is what it is like. Exner's scoring system has impressed scientific types into believing that because the scoring is so tedious and standardized, that it must therefore be valid and useful. Neither is true. Study after study has demonstrated that personality tests are invalid and perhaps more importantly, not useful tools.

Scott Shimabukuro, Ph.D.
Clinical Psychologist

8 Nov 2000

As a tremendous fan of skepticism in general and your site in specific, I feel that I must take issue with the explanation of the Rorschach Inkblot Protocol contained therein. I practiced in the field of psychology for eleven years and spent many hours administering and interpreting a variety of psychological measures. In order to better understand the inner mental workings and defense postures of clients, I developed a fondness for the Rorschach. My interest in and experience with the Rorschach led me to develop my own scoring system, which I taught to many other clinicians. Part of this instruction dealt with the proper understanding and use of the instrument.

First, the Rorschach is not, and has never been properly used as, even an inferential measure of "personality". It is a structured, non-verbal interview methodology that demonstrates the mental and emotional workings of an individual. It is almost impossible to "fake", since the act of attempting to do so tends to accentuate defenses rather than hide them. The only methods by which one can deny the test access to one's defense structure is to refuse to take it, or to respond with irrelevant or similar responses to all items. Even these responses are telling, however.

Much of the information that is gathered by a competent examiner using a

Rorschach protocol could be gathered similarly with interview techniques. I favored the Rorschach because it always presented the person against the same backdrop. It was easier for me to see them clearly this way. Interviews are loaded with bias, transference, diversion, etc. The Rorschach is always the same ten cards, presented (at least the first time through) with only the simplest of instruction: "I'm going to give you a series of ten cards to look at, one at a time. All you have to do is to look at each card and tell me what you see." The first card is presented to the client and they are instructed, "Tell me what you see." The first time through, their responses are recorded with no, or almost no additional prompting or explanation. They must organize the experience. After the initial run-through the cards are re-presented (again, one at a time) and "inquiry" is performed. The examiner is somewhat free to ask about how the client came to see certain things and why. If expected responses are not demonstrated, the subject can be prodded to see if these can be elicited.

I always enjoyed using this instrument, because there is an art to it, rather than the cold mechanism of paper-and-pencil tests. I gave up the field because it became obvious to me that, while developing a good understanding of a person was possible, helping them effectively and permanently improve themselves was not. I now design rubber gaskets for sewer pipes and find it a challenge equally as intellectually interesting as psychotherapy.

Michael R. Miller

reply: I think you made a wise career change.

18 Jun 1999

*I am aware of 2 errors of fact in your **Skeptic's Dictionary**.*

The first concerns your skeptical criticism of the Rorschach Inkblot. You criticize the putative scientific status of the Rorschach because the scientific evidence for its validity is based as it must be on correlation alone. You compare this to the efficacy of interpreting dreams. In point of fact the Rorschach has a more immediate source of validity: clinical usefulness. It is in fact a powerful tool in properly trained hands, and your skeptical criticisms amount to nothing more than "character assassination", that is, you have neither proven it to be useless or invalid, nor have you proved to be invalid the claims of those who find it useful and valid. Therefore, I consider your propositions regarding the inkblot to be errors of fact, in that they are speculation posing as proof.

reply: I don't criticize the ink blot test because the evidence for its validity rests on correlation alone. I criticize it because it is too subjective and its application and validation rests completely with the therapist's "insight" and intuition. As such, it is no different from making a diagnosis based on

conversations with someone.

The attempt to standardize a projective test is akin to what Freud did in his *Interpretation of Dreams*. There is no objective set of rules for what either the ink blots or dreams mean.

I never claimed the ink blot test to be useless. A good therapist ought to be able to use *any* interaction with the patient to some purposeful and useful end.

I think, however, that you, like many therapists, don't know the difference between a statement of fact and an opinion.

The second error of fact is more egregious. You claim that the images seen on Kirlian photographs are due to "moisture" emanating from the object. Again you have not studied your subject in enough depth to offer better than speculative criticism. The moisture effect is your theory, nothing more, and it is disproved by two observations: first, that aura's have been captured from objects that were bone dry, such as stone or metal, and second, that if the photographic emulsion is separated from the object by a thin layer of glass, the aura can still be detected even when it is impossible for moisture to have penetrated the glass. Finally, you are guilty of bad faith, because you essentially imply that persons reporting such things as phantom half leaves are either so foolish as to conduct the experiment sloppily so as to confound the results with the effects on which you speculate, or else that they are liars who misrepresent their technique. From what I have seen the people conducting both Kirlian photography research and those doing research on the Rorschach are working harder and more intelligently, and certainly with more good faith, than what you have done.

reply: Apparently, you have a difficult time reading. I claim that the "auras" in Kirlian photographs can be due to several things: pressure, electrical grounding, humidity, temperature, changes in moisture, barometric pressure, and voltage.

Moisture left behind by a section of a leaf that has been sliced accounts for the appearance of "phantom" sections of the leaf in Kirlian photographs. Moisture is not what is photographed. Electrical discharge is what is photographed.

I haven't heard anyone being accused of "bad faith" since my college days when existentialism was the rage. I don't doubt that your researchers work hard, nor do I challenge their intelligence. Whether they have good faith or bad faith, I can't say. However, I think your critical comments demonstrate the uselessness of such expressions.

17 Jul 1996

I hope you will take the time to talk to a psychologist or psychiatrist before debunking a sometimes useful tool. The Rorschach ink blot can be over-interpreted to be sure, yet, there are certain characteristics of response which very accurately predict mental illness and conflict. If I were to explain these, it would render the test useless to anyone who read this. The reliability of the test is, in part, due to the fact that the patient does not know what kind of information in his responses, is pertinent.

I have seen a profile of a patient from a Rorschach. This was a patient of whom I had privileged and intimate knowledge, (of which the testing psychologist had none) and found the test VERY accurately described many aspects of the patient's personality and relationships. Maybe you should read about this, rather than theorize from the hip.

-- S Durrenberger MD

reply: theorizing from the hip is a problem of mine, but being a physician you must understand how hard it is to break ingrained habits. Anyway, how long can this test remain useful when the info you won't reveal has been published and is available to anyone who cares to dig for it. Don't forget that the one who administered the Rorschach also met with, conversed with and interacted with the patient. The evaluation of the patient's personality wasn't based solely on the interpretation of the patient's interpretation of ink blots.

1 Nov 96

You might be surprised at the usefulness of the Rorschach. As you mentioned, it is not really a projective test. One looks at the structure of the person's responses. The people who are researching this test are not soft scientists--the data is pretty meticulous, in order to avoid lapsing into the kind of pseudo-science that characterized interpretation in the past. There's much more subtlety in the interpretation than is conveyed by your passage. Anyway, I'm a psychologist, and find that many people are skeptical of it. But it is one of the stranger discoveries of my life that such an odd technique really does seem to have merit. The same types of people really do produce the same types of responses to the blots. I never would have believed it when I first began reading about it years ago. Of course, to make sense of the responses, one has to first have a coherent understanding of personality. The cards alone don't provide that. Its impossible to interpret the cards, or any test, well, if there is no cohesive understanding of personality with which to inform the results.

reply: You are correct. I would be surprised at the usefulness of the Rorschach.

9 Nov 1997

Since I happen to be a "believer" in the inkblot test (a belief which is founded on my own research on neuropsychological patients, and on extensive, critical literature studies) I object to the publishing of the data (i.e., "the contours of the blots") about the Rorschach cards. As you do not fail to emphasize, everybody must always consider the possibility that he is wrong even in his favourite beliefs. And if you are wrong about the validity of the Rorschach test, you may do serious harm to a valuable clinical praxis by this publishing.

In the matter of who is right and who is wrong about validity, excuse me if I put the matter somewhat rudely, but if you are so ignorant that you believe that Rorschach did not use his cards for personality analysis (quote from your page!), you should be very careful in your judgements about the test until you have checked out some more facts.

**Helge Malmgren PhD, MD, associate professor
Dept. of Philosophy, Göteborg University**

reply: I haven't published any "data" about the Rorschach cards or the shapes of the blots. I hope you are not suggesting that because something may be useful in clinical practice, it would be wrong to criticize it.

30 Nov 1997

I loved your page on the Rorschach. At the moment (and much to my regret), this course is required for our Ph.D. degree in clinical psychology. I have taught courses on personality, and have several publications on the biological underpinnings of personality traits. Your readers' comments show that these professionals have a distinct lack of appreciation for the "Barnum Effect," as related to assessment of individual differences. Rorschach never conceptualized his little test as a "projective" assessment tool (thus, saving himself from purgatory). He would turn over in his grave if he knew how his test was used over the years. Sure, there are some data to support the validity of the inferences drawn from scores on the test using the Exner system. However, the Rorschach, in general, provides little bang for your buck (e.g., questionable incremental validity; time required for administration, scoring, and interpretation is excessive). One argument I hear for continued training of psychologists in the use of this instrument is that our friends in psychiatry love it. That is, us poor psychologists can make a dollar on consults from our M.D. associates. Let them stick to prescribing meds!

Roswell

01 Aug 1996

I've just begun reading your dictionary. I must say I'm not an avid believer of paranormal phenomena. I think some people would believe just about anything to give life more meaning and to plug some of their soul's loopholes about their purpose on this earth. Nonetheless, I do find your rebuttal of UFOs not only symptomatic of cynical skepticism, but also very obstinate.

reply: First of all, what I have written is not a "rebuttal" or any other kind of butt. Secondly, I take it that "cynical skepticism" is skepticism applied to something you believe in. Fair enough. Anyway, you might have gotten more bite by saying that my argument is obstinately skeptical and also very cynical. Still, you'd be wrong. To be cynical is to be scornful of the motives or virtue of others, or to bitterly mock or sneer at them. 'Cynical' is too strong a word. I'm a skeptic and I'm obstinate and proud of it, but I wouldn't say I'm cynical nor is my argument against the belief that aliens landed on earth in 1947 at Roswell. Anyway, let's get to the meat of this debate. I'm sure the world can't wait to hear what we have to say on this earth shattering subject.

As you said, it is probable we are not the only intelligent beings in existence. Out of the billions of stars out there, maybe only a couple million would harbor planets where life could develop. Maybe only a small percent of that number would have more intelligent life forms than earth. We cannot as terrans make predictions as to how these life forms would think, much less extrapolate on their motives for visiting other worlds. How can we explain other worldly life forms when we can't even explain our own? How do you explain the fact that there is a species of insect that incubates 17 years in the ground and lives only one day subsequent to hatching?

reply: I think we're losing our audience here. Let's get to the point.

I don't believe in abductions, but I believe there is just too much evidence supporting the fact that we are visited by more advanced life forms to simply say that witnesses are deluded, and though most don't have ulterior motives, they didn't really see what they claimed to have seen.

reply: Now we're talking! Let's get to this evidence.

Let's talk about Roswell. Why doesn't the U.S. government release the files pertaining to the 1947 incident to the public if nothing really did happen.

They quote national security as a reason for not disclosing information. National security? What does national security have to do with it if nothing really happened.

reply: The government has released information on Roswell, but if the government released every file in the universe relating to aliens, what do you think the response would be from those camping out near Area 51 or those going to the UFO museums in Roswell? You can't trust the government! Those files are fake files, meant to deceive us! Only a fool would believe the government is releasing real files. And the reason they aren't releasing those fake files is because they have so much to hide! If they didn't, why don't they release the fake files? Huh? You see, people, it's as simple as ABC. You know it. I know it, but the buttpickers in Washington just don't get it.

I believe extremism of any kind is the nemesis of the truly open mind. Unfortunately, your obstinate skepticism is a form of extremism.

reply: Good, because I don't mind being called an extremist. It's better than being called a cynic. Or a nemesis.

You seem to have a very analytical mind. The type that warrants scientific explanation in order to validate an existence, an event, a process. Sometimes life holds mysteries that just cannot be explained in this manner. You should open up your mind, and although you shouldn't believe everything you hear, you should try to accept certain things as unexplained but plausible.

Regards
Joey Koon

reply: Joey, far be it from me to claim that life is not full of mysteries. Life itself is a great mystery. I'm a mystery to myself. Some things can't be explained. We don't have enough data in some cases. In other cases, we'll never have enough data. Why mysteries are so intriguing is a mystery. Still, it is a quantum leap of faith to jump from "mystery" to "plausible" in the case Roswell and the ten little aliens.

8 Aug 1996

Hmm... I start wondering who are the real true believers out there when I read your statement on the Roswell crash. All it says is: Something crashed in the desert near Roswell and everybody who believes that the crash was of alien origin is crazy.

reply: Are you crazy? If you read what I said and think I said that everyone who believes the crash was of alien origin is crazy then you are

crazy. I never said that, and only a crazy person would say that I did. It would be crazy to believe that everyone is crazy who believes aliens landed at Roswell and signed a treaty with the U.S. Government.

This is despite the fact that over 100 witnesses plus highly ranked military personnel support that theory. One of the military (Jesse Marcel I think) even said on his deathbed that the craft was not of this earth (would you lie on your deathbed??).

reply: My mother taught me never to lie, especially on my deathbed. However, she also taught me how to make reasonable inferences. Just because a person is dying and believes something is true, doesn't make his or her belief true and it doesn't make the person a liar if he or she is wrong.

Second, do you REALLY think that the only airfield in the world that holds nuclear weapons would mistake a crashed disc for a weather balloon? (In case you didn't know, General Ramey issued a press release stating that the debris was from a "crashed disc" from space.) I wouldn't trust them with nuclear weapons in my life.

reply: Good for General Ramey, but I thought you wouldn't trust these military types. Why do you trust this particular general and the other 100 you mentioned but not the ones who were there and can't confirm these allegations?

I seriously doubt that you even bothered to find out anything about the crash before you wrote the article. Just because the scenario doesn't fit in your narrow-minded view of the world you dismiss it as fantasy. And don't try to throw the autopsy film in my face 'cause I think that is a fake. I would be glad for a reply.

Christian Lundkvist

reply: My mother also taught me not to throw films at faces, especially alien autopsy films. But I am encouraged by your expression "serious doubts." You may make a good skeptic someday after all.

17 Jul 1997

*I just finished reading your entry in the **Skeptic's Dictionary** on Roswell.... If it was a military test gone awry, then why have they changed their explanation before? What they should have said in that event is that it was a secret military test! That would've satisfied most of the curiosity around it. Isn't it strange that these intelligent people of the military let that by? The military has admitted to testing in the past, and refused to divulge details. But on this notable occasion, they didn't. They chose to attempt a cover-up with*

an idiotic explanation. Very interesting...

reply: The military is in a no-win situation. Had they told the truth and a consistent story, they would still have been accused of a cover-up and lying. What I find amazing is that anyone can say with a straight face that the military has been able to keep anything a secret for 50 years.

.... An alien craft could certainly be pieced together with some guess work, and examined in the same fashion. It's very possible that we do have technology copied from aliens.... technology has suddenly jumped at the start of the 1900s. Remember that the first modern UFO sighting was in 1902 (I'm a bit unsure on this because I'm without my reference material on this) by a businessman in his private airplane. Statisticians have found that if we keep on at this rate, we will double our knowledge every 6 years. Some have speculated that we will hit a major slump at some point in the future because mankind won't know what else to try, what else to invent. Could it be that we did piece together an alien craft?

reply: Sure. Then again, could be that we didn't.

I welcome a response from whoever else should happen to read this!
Phil White swhite@laedu.lalc.k12.ca.us

21 Jul 1997

*I was just reading the section on Roswell in **The Skeptic's Dictionary**, and decided to contribute. A person I met at work was in the Air Force Intelligence in the 50's and was actually at Roswell at the time of the commotion. He said that it was just a pile of junk and a reflector, and definitely man-made. Oh, well, that's probably not inherently more reliable than the other testimony, but infinitely more realistic. BTW, nice piece of work on getting all that info.*

Alex Veytsel

reply: Your source's testimony may seem more believable to you and me, but the true believers will denounce him as an imposter!

runes

26 Aug 1998

Many thanks for creating what I believe to be the most useful reference source on the internet. On the topic of "runes" though, I think it would be remiss of me not to point something out. You wrote that "There is no ancient document indicating any magical use of runes."

While I do not want to disagree, I would like to remind you of [The Poetic Edda](#) which is a compilation of poems collected during the 12th or 13th centuries and rediscovered in Iceland by Danish scholars. The runes are referred to in "the Sayings of Har" ("Harvamal"). Go to the fourth part, the so-called "rune-poem", which are stanzas 138 - 148. The question is not whether or not the Norse used runes for magic, but whether or not they worked (no prizes for working out that they don't).

*Despite the stereotype, the Norse were an extremely superstitious people. Remember too that this is from a period of great social change for them which undoubtedly contributed to their reliance on personal magic, as opposed to choosing which god to put their faith in. For more information on this, you can read *Myth and Religion of the North* (Weidenfeld and Nicolson, 1964) by Professor E.O.G Turville-Petre. For another broader picture of the Vikings, I can recommend any book by H.R. Ellis Davidson, in particular [Myths and Symbols in Pagan Europe](#) (Syracuse University press, 1988), as well as the very skeptical work by Ronald Hutton, [The Pagan Religions of the Ancient British Isles: Their nature and legacy](#) (Blackwell, 1991). For a skeptical view of history, Ronald Hutton's book is a must. He is as far as I know still Reader in British History at the University of Bristol.*

Thank you again for your efforts producing the Skeptics Dictionary. I am often referring to it as ammunition against irrational "new agers".

Philip Peters (member of the Australian Skeptics)

reply: Thank you for sharing this information.

saint

A saint is a former human being, now dead, whose [spirit](#) is said to dwell in heaven with God. Such spirits are identified by their having belonged to [heroically virtuous](#) or holy people when [attached to their bodies](#) on earth. (The word 'saint' derives from 'sanctus', the Latin word for *holy*.)

Some spirits are officially recognized as saints by Christian ecclesiastical authority in a process known as [canonization](#). Different ecclesiastical authorities used different criteria and hence have different canons (catalogues) of saints.

Keeping a canon of saints assists in recruitment of new church members, mythologizes the faith, and allows for currying favor from subordinates close to the boss. Saints are *venerated* not worshipped, that is, they are admired and sought as intercessors because of their special place in the hierarchy. Saints are in the inner circle, so to speak, and because of their status a word from them to the boss might be sufficient to get a wish granted.

Why saints would intercede for the living seems inexplicable to the logical mind. One, they have nothing to gain by acting as anybody's intercessor. They are already in glory and their glory does not depend on others reaching glory and there is no reason they should prefer the glory of one person over another. Earthly beings might grant favors only to those who ask, but supernatural beings would have no reason for favoring only those who curry favor from them. Two, there is no reason why God would be more accessible to the prayers of a saint than to those of a holy person on earth. Why use a middleman when you can go directly to the source? Three, if God would not listen to an unholy and unworthy person who wants a favor, why would God listen to a saint's plea for such a person? The unworthy shouldn't get a hearing from the boss or his underlings. Were it not for their supposed utility here on earth, saints would be superfluous to humans.

That sainthood is valued for its intercessory value is clearly indicated by the fact that the primary method of identifying who will be canonized is by the performing of miracles. To even be considered for canonization you must not only have led an exemplary holy life, you must perform a [miracle](#) that shows you are answering the prayers of those who pray exclusively to you. Such miracles are identified by a theological board and require some sort of connection to an allegedly miraculous cure. For example, [Katherine Drexel](#), an heiress from Philadelphia who became a nun, was canonized because several cures have been attributed to her intercession. Drexel's spirit is being credited with being instrumental in the "cure" of the temporary deafness of

young girl. [Edith Stein](#), who was recently [canonized](#), allegedly interceded to save the life of a young girl who had swallowed an obviously [non-lethal dose of Tylenol](#). "[Padre Pio](#)" was a controversial cult figure and alleged [stigmatic](#).

In his effort to provide role models for the faithful, Pope John Paul II has added more than 450 names to the canon of saints since he took over the head of the Roman Catholic Church in 1978. That's about 150 more than have been sainted in the past *four hundred years*.

saint

31 Jan 2000

I think that your article saints is oriented to Catholicism and while accurate for Catholics (and I believe, Greek Orthodoxy) it does not reflect the different usage by Protestants. The term saint is commonly used in Protestant churches to refer to any one who has accepted Jesus Christ as Savior, usually referring directly to the people seated in the meeting. The correct name of the Mormon Church is "The Church of Jesus Christ of Latter-day Saints" again referring to people who are alive.

Easton's Bible Dictionary defines a saint as: One separated from the world and consecrated to God; one holy by profession and by covenant; a believer in Christ (Ps. 16:3; Rom. 1:7; 8:27; Phil. 1:1; Heb. 6:10).

The "saints" spoken of in Jude 14 are probably not the disciples of Christ, but the "innumerable company of angels" (Heb. 12:22; Ps. 68:17), with reference to Deut. 33:2.

This word is also used of the holy dead (Matt. 27:52; Rev. 18:24). It was not used as a distinctive title of the apostles and evangelists and of a "spiritual nobility" till the fourth century. In that sense it is not a scriptural title.

Tim Boettcher

reply: You're right about which sense of 'saint' I am defining and commenting on. I know there are many other uses of the term. For example, my mother used to call her mother a saint, and everyone I knew who knew my mother called her a saint. I agree; they were both saints.

reader comments:

Santa Claus

03 Oct 1996

From: **Neil Kitchen**

Love the site. I was wondering whether you had seen this article entitled "Does Santa Exist?"

IS THERE A SANTA CLAUS?

As a result of an overwhelming lack of requests, and with research help from that renowned scientific journal SPY magazine (January, 1990), I am pleased to present the annual scientific inquiry into Santa Claus.

- 1) No known species of reindeer can fly. BUT there are 300,000 species of living organisms yet to be classified, and while most of these are insects and germs, this does not COMPLETELY rule out flying reindeer which only Santa has ever seen.
- 2) There are 2 billion children (persons under 18) in the world. BUT since Santa doesn't (appear) to handle the Muslim, Hindu, Jewish and Buddhist children, that reduces the workload to 15% of the total - 378 million according to Population Reference Bureau. At an average census rate of 3.5 children per household, that's 91.8 million homes. One presumes there's at least one good child in each.
- 3) Santa has 31 hours of Christmas to work with, thanks to the different time zones and the rotation of the earth, assuming he travels east to west (which seems logical). This works out to 822.6 visits per second. This is to say that for each Christian household with good children, Santa has 1/1000th of a second to park, hop out of the sleigh, jump down the chimney, fill the stockings, distribute the remaining presents under the tree, eat whatever snacks have been left, get back up the chimney, get back into the sleigh and move on to the next house. Assuming that each of these 91.8 million stops are evenly distributed around the earth (which, of course, we know to be false but for the purposes of our calculations we will accept), we are now talking about .78 miles per household, a total trip of 75 and 1/2 million miles not counting stops to do what most of us do at least once every 31 hours, plus feeding and etc.

This means that Santa's sleigh is moving at 650 miles per second, 3,000 times the speed of sound. For purposes of comparison, the fastest man-made vehicle on earth, the Ulysses space probe, moves at a poky 27.4 miles per second - a conventional reindeer can run, tops, 15 miles per hour.

4) The payload of the sleigh adds another interesting element. Assuming that each child gets nothing more than a medium-sized Lego set (2 pounds), the sleigh is carrying 321,300 tons, not counting Santa who is invariably described as overweight. On land, conventional reindeer can pull no more than 300 pounds. Even granting that "flying reindeer" (see point #1) could pull TEN TIMES the normal amount, we cannot do the job with eight or even nine. We need 214,200 reindeer. This increases the payload - not even counting the weight of the sleigh - to 353,430 tons. Again, for comparison - this is four times the weight of the Queen Elizabeth.

5) 353,000 tons travelling at 650 miles per second creates enormous air resistance - this will heat the reindeer up in the same fashion as a spacecraft re-entering the earth's atmosphere. The lead pair of reindeer will absorb 14.3 QUINTILLION joules of energy. Per second. Each. In short, they will burst into flame almost instantaneously, exposing the reindeer behind them, and create deafening sonic booms in their wake. The entire reindeer team will be vaporized within 4.26 thousandths of a second. Santa, meanwhile, will be subjected to centrifugal forces 17,500.06 times greater than gravity. A 250-pound Santa (which seems ludicrously slim) would be pinned to the back of his sleigh by 4.315,015 pounds of force.

In conclusion, if Santa ever DID deliver presents on Christmas Eve, he's dead now.

Rebuttal: Several key points are overlooked by this callous, amateurish "study."

1) Flying reindeer: As is widely known (due to the excellent historical documentary "Santa Claus is Coming to Town," the flying reindeer are not a previously unknown species of reindeer, but were in fact given the power of flight due to eating magic acorns. As is conclusively proven in "Rudolph the Red-Nosed Reindeer" (a no punches pulled look at life in Santa's village), this ability has bred true in subsequent generations of reindeer - obviously the magic acorns imprinted their power on a dominant gene sequence within the reindeer DNA strand.

2) Number of households: This figure overlooks two key facts. First of all, the first major schism in the Church split the Eastern Churches, centered in

Byzantium, from the Western, which remained centered in Rome. This occurred prior to the Gregorian correction to the Julian calendar. The Eastern churches (currently called Orthodox Churches) do not recognize the Gregorian correction for liturgical events, and their Christmas is as a result several days after the Western Churches'. Santa gets two shots at delivering toys.

Secondly, the figure of 3.5 children per household is based on the gross demographic average, which includes households with no children at all. The number of children per household, when figured as an average for households with children, would therefore have to be adjusted upward. Also, the largest single Christian denomination is Roman Catholic, who, as we all know, breed like rabbits. If you don't believe me, ask my four brothers and two sisters - they'll back me up. Due to the predominance of Catholics within Christian households, the total number of households containing Christian children would have to be adjusted downward to reflect the overloading of Catholics beyond a standard deviation from the median.

Also, the assertion that each home would contain at least one good child would be reasonable enough if there were in fact an even 3.5 children per household. However, since the number of children per household is distributed integrally, there are a significant number (on the order of several million) of one child Christian households. Even though only children are notoriously spoiled and therefore disproportionately inclined towards being naughty, since it's the holidays we'll be generous and give them a fifty-fifty chance of being nice. This removes one half of the single child households from Santa's delivery schedule, which has already been reduced by the removal of the Orthodox households from the first delivery run.

3) Santa's delivery run (speed, payload, etc.) These all suffer from the dubious supposition that there is only one Santa Claus. The name "Santa" is obviously either Spanish or Italian, two ethnic groups which are both overwhelmingly Catholic. The last name Claus suggests a joint German/Italian background. His beginnings, battling the Burgermeister Meisterburger, suggest he grew up in Bavaria (also predominantly Catholic). The Kaiser style helmets of the Burgermeister's guards, coupled with the relative isolation of the village, suggest that his youth was at the very beginning of Prussian influence in Germany. Thus, Santa and Mrs. Claus have been together for well over one hundred years. If you think that after a hundred years of living at the North Pole with nights six months long that they remain childless, you either don't know Catholics or are unaware of the failure rate of the rhythm method. There have therefore been over five generations of Clauses, breeding like Catholics for over one hundred years. Since they are Catholic, their exponential population increase would obviously have a gain higher than the world population as a whole. There have therefore been more than enough new Santas to overcome the population increase of the world. So in fact, Santa has an easier time of it now than he did when he first started out.

Santa dead, indeed - some people will twist any statistic to "prove" their cynical

theory.

[Author Unknown]

10 Nov 1997

*I just read a bit of your **Skeptic's Dictionary** and the entry on God and Atheism. I liked it so much so that I'm sending it to a few friends that will also appreciate it. My personal opinion about God and Atheism is that neither can be proved, so both seem to be a kind of faith, however, Atheism is, by far, the more thoughtful choice. In the past few months I have caught my limit of religious people, not spiritual people, mind you, but religious ones, especially those of the Christian variety (having been a home-grown Catholic myself, I'm able to spot them at quite a distance), and I have come to calling that particular brand of God - the one you define - as Santa God since Santa and God share so many nearly identical characteristics.*

Somehow, when we grow up it is considered wildly unreasonable (nutty, in fact) to believe in Santa (a kindly old - ageless, in fact -white-bearded man (with no beginning and no end) that has an ambiguous relationship with a woman (Mrs. Claus/Mary), surrounds himself with flying creatures (reindeer/angels), has many helpers (Santa's helpers/saints), a man who can be all places at the same time(omnipotent) - at least on December 24th, reads our minds (omniscient),reads the letters we send him but never responds to them (prayers)unless the responses are really from kindly people at the Post Office(clergy), knows if we are bad (sinners) or good (saints) and rewards us accordingly (heaven and hell, but not in that order). And yet, at the same time, it is also considered wildly unreasonable to disbelieve in God even though they are nearly the same childish wish for a kindly, but fair, protector. Hence the name Santa God since they are two versions of the same fairy tale. And as with most fairy tales, the version for children is much sweeter than that darker, original version that was written for adults.

These singular, uppercase, Only-One-Possible Gods usually show their faces in the mostly western world which tends to be much younger and less sophisticated in its outlook and needs than the eastern world that believes in multiple gods. But my God (no pun intended), when are we in the west going to grow up? I admit, it's nice to think that there are guardian angels and that all I have to do is pray to God and I'll get that new car I've been wanting or even get rid of war, but doesn't it say in the Bible that when we grow up we must put away our childish things? and isn't Santa one of the most childish - albeit sweetest -things we have? So doesn't it stand to reason (literally and figuratively) that we should also put away his older brother while we're at it? At least that's what the Bible says. And I always do what's in the Good Book.)

Well, gee, didn't expect to go on like that. When I get a little more time, I'll peruse your site some more and read about the other jewels with which you have salted your mine.

satan

13 Jul 1996

When water gathers from the rain, it is directed to the LOWEST places and DUMPED (in the lowest places) at the end of the river it follows Do you see your life in 20 or 30 years ?

So whenever GOOD people who are NOT involved with DEMONIC activity make GOOD, demonic activity strives to use any MEDIA available to make GOOD PEOPLE look bad.

It is obvious, even to the most casual observer what has taken place here.

Unfortunately, you have NO LIFE, no POSITIVE goals, or no POSITIVE directions.

RODERICK MCAFEE

reply. What is obvious is not always obvious. And remember: you cannot lock a broken door. Nor is it chivalrous to engage in a battle of wits with an unarmed man.

In your "Satan" entry, you write: "As the power of the Christian Church has waned, so too has the power of Satan It is no accident that Satan reached the peak of his career at the same time the Church did, during the thirteenth century." This is not true!

The peak of the satanic scare and of the witch trials happened in the early part of the seventeenth century. Heresy trials did happen during the middle ages, but the large scale inquisition trials happened in the modern era, mostly in Spain.

The thirteenth century was the peak of the church influence (it was the era of the great cathedrals.) But it was not the era of the inquisition or of the witch trials. And the inquisition (catholic) and the witch trials (mostly Protestant) were two basically distinct phenomena.

Get your facts right!!!!!!!!!!!!!!!

Filippo Neri

Los Alamos National Laboratory

reply: Good idea. The era of the great gothic cathedrals was not the 13th century, but the 11th and 12th. And the witch trials were not mostly Protestant, although the Protestants were every bit as prolific and sadistic as the Catholics when it came to witches.

Europeans started building massive stone cathedrals after the earliest crusades. The crusaders brought back from the east more than blood and gold. They must have taken some time to admire the mosaics and icons of "Notre Dame," Our Lady, that are dominant features of many Byzantine churches. Before the crusades the Blessed Mother was not a dominant Christian motif in the west. After the crusades, she was elevated nearly to the status of goddess.

The title "inquisitor" (judge in matters of faith) was first granted by Pope Alexander III in 1163 at the Council of Tours. The main "devils" at that time were the Albigensians. But the Inquisition really got started by Innocent III, who became pope in 1198. Jones claims that he initiated the Fourth Crusade (which took Constantinople) to channel the divisive crusading energy of nearly all of Europe which had led to "an open war between Satan and the church." [Jones, p. 255] Maybe. But Innocent certainly used the power he gained for the church to extend his political domain. And in 1209 he called for a crusade against the Albigensians to drive the devil out of France. "He gathered an army which in its hatred of satan and its zeal for god's service established new precedents." [Jones, 256] And he is reported to have said, when asked what to do with the heretics, something to the effect of *kill them all; God will sort them out*. It is estimated that by the end of the century (the 13th century) a million people were slaughtered in God's name. [Jones, 257] Also, it was in 1232 that Gregory IX empowered the Dominicans (the *Domini canes*, hounds of God) to be inquisitors as well as itinerant preachers. Gregory's major crusade was against a fishing community accused of worshipping the devil, who was, according to the inquisitors, appearing to these people under the guise of a duck, a goose or a youth. And "when they kissed him and danced around him, [he] enveloped them in total darkness wherupon they all, males and females, gave themselves up to debauchery." [Jones, 258] Gregory's chief inquisitor was Conrad of Marburg, a man in no way inferior to Torquemada in understanding the wiles of the devil and the need to be merciless in fighting Satan.

The thirteenth century saw the edges between heresy and witchcraft blur so that the distinction between the two is often unrecognizable. Satan was behind heresy and he was behind witchcraft. He was everywhere, gaining more and more in power and influence. The methods of fighting Satan had to become more and more brutal and savage; fire had to be fought with

fire, evil with evil. This is why Paul Carus writes: "In the thirteenth century the Devil reached the acme of his influence...." [Carus, 282] Of course, this was before the invention of the printing press, so the written accounts from this period are scarce compared to the seventeenth century when anyone with a pen and a clerical education could publish a book in God's honor. But we do have some writings from this period besides those of Thomas Aquinas.

Yet, we should probably start with Aquinas. His theory of incubi and succubi reflects a widely held view of the time. The devil is everywhere and he has a potent sex drive. Any person or animal you meet could be the devil in disguise. Other writings give testimony to the pervasiveness of satanic superstition which emerged in full force during the thirteenth century. It had been growing for centuries, but it peaked in the thirteenth century. In 1211, Tilberiensis explains nightmares as caused by the devil [Carus, 283] Caesarius von Heisterach (died about 1245) writes of Satan as the cause of thunder-storms, hail-storms, inundations, diseases, unexpected noises, the rustling of leaves. Satan appears "as a bear, a monkey, a toad, a raven, a vulture, a gentleman, a soldier, a hunter, a peasant, a dragon, and a negro." [Carus, 284] Caesarius's work is called *Dialogus Miraculorum*; it was written mainly for instructing young monks. It presents in detail the many superstitious beliefs about Satan pervasive in the thirteenth century.

In my view, Satan was at his peak when his influence was felt by nearly everyone; when his presence in the world was an acknowledged fact; when he became a major player in the daily lives of everyman. That happened in the thirteenth century. The persecution of heretics and witches continued for over four hundred years. The Protestant Reformation did not protest either, nor did it reform these practices. The Protestants did not initiate them but, when they had their chance, they equalled or surpassed the Catholics in ferocity and zeal.

My opinion is that the ferocious persecutions of heretics and witches from the thirteenth through the seventeenth centuries is symbolic of the waning power of the Church. It was losing its magic, literally. Satan's magic had to be fought with diabolical weapons. In my view, it was not the last witch trial or heretic burning that signalled the end of the Christian era of power. A more symbolic event might be picked, such as, putting lightning rods on the tops of church steeples. Churches resisted for years because, as everyone knows, lightning is caused by the magic of God or Satan. If God zaps the church or let's the devil do it, there must be a divine reason for it. Prayers and incantations should be enough to fight off Satan. I'll finish with a quote from Jones:

It was long before the churches consented to be protected by the heretical tool [known as the lightning rod]. The tower of St. Mark's in Venice had at the time of Franklin's invention been struck again and again by lightning, sometimes with

such disastrous effects that it had been almost destroyed. The Almighty, or alternatively the Powers of Darkness, seemed to have singled it out for special punishment, in spite of the angel that adorned its summit, the consecrated bells which were repeatedly rung to drive away the thunder, the holy relics in the cathedral nearby and the processions of the Virgin and the patron saint. The tower was struck again in two successive summers after the lightning rod was introduced in Italy, whereupon the authorities succumbed and a rod erected. The edifice has never been struck since, but God alone has received the thanks of a grateful people.[Jones, 295]

I guess we can say that, for some people, faith is stronger than the lightning rod.

p.s. My *opinions* may differ from yours, but I think I have most of the facts right.

scapulimancy

09 Sep 1996

In reading through your section on scapulomancy, I noted that you have omitted reference to evidence that this practice has ancient origins. If memory serves me correctly, I believe that it was practiced in China's earliest pre-historical and earliest historical periods (Shang dynasty-approx 2200 B.C.). Words were written on the bones and the cracks through the writings were then interpreted. It was imperative to guard the new writing skills from being disseminated in order to maintain a monopoly on this method of divining the gods' wills. This is my recollection from my studies of ancient Chinese history and religion. Though somewhat rusty from lack of use and vague, I hope you find this information interesting.

selective thinking

16 Jun 1999

Just wondering if you could point me in the right direction. For the last 10 years or more, at least twice a month, my eyes pop open and I look at the clock (digital) and it's 3:15 am.

It's happened more and more recently. I've spoken to my astrologist (and my therapist) about this occurrence. She doesn't really have an explanation. In the last two years, I've noticed it more (or became more aware of it) and when I'm driving my car in the daytime I happen to look down and my clock radio will say 3:15.

What is this and how can I find more information on this issue?

Thanks for your help, Debra

reply: Many people experience the same thing, but with different numbers. In our family, the number is 338, which was the number of the street address of a family member. We "see" more occurrences of 338 because we pay more attention to that number than to any other number. We never remember waking up at other times, because we don't give those other times any special significance, but if we wake up at 3:38 (or close to it) we pay attention. Same with license plates, prices, numbers in articles, etc.

It's a simple matter of [selective attending](#). The phenomenon is related to numerous errors based on [confirmation bias](#).

shroud of Turin

21 May 2002

The reason why a fire can't change the apparent date of the Turin Shroud is that to do so, the fire should change the amount of C-14 atoms compared to C-12; to make the date 2/3 younger (e.g. 700 years old in stead of 2000 years old) one should add so much modern C-14, that 2/3 of the carbon weight should be modern. If a fire would have added soot, then 2/3 of the weight by carbon, about 6/7 by total weight, should have been soot. So it's not so much the fact that the pieces were cleaned and burnt, but the fact that they weren't a large mass of black soot hiding the original cloth as a minor component.

The same goes for pollution with molds and bacteria. Only when photosynthesizing organism (e.g. algae or moss) had added about twice the original mass in dry weight they could have caused the decrease in age from 2000 to 700 years.

Alternatively, the fire or algae could have taken out C-12 preferentially, but then this preference would have to be so strong that (in the best case) 2/3 of the C-12 was taken out, and none of the C-14. However, none of the known processes that cause isotope separation can be so effective, so that possibility is also about as probable as a flying elephant. Moreover, you can't remove at least 2/3 of the carbon atoms from cellulose fibers without utterly disintegrating them.

JW Nienhuys

29 Apr 2002

I followed the link from your site to the ABC story about Turin Shroud, which includes the following:

“In 1977, American scientists Eric Jumper and John Jackson processed electronically a negative photographic image of the shroud and discovered that it produces a three-dimensional image, a feature that is not possessed by normal paintings or photographs.”

I remember reading about this years ago in a spectacularly credulous Reader's Digest article. It vaguely intrigued me then as it seemed to suggest that even photos of the shroud have some kind of magical property. If I remember correctly, the peculiar feature was not that a three-dimensional image was produced by the processing – they expected that – but that unlike “normal paintings or photographs” it was undistorted and actually resembled a human face.

However, there isn't anything really remarkable about this. The type of image processing Jumper and Jackson did basically produced a 3D image which “raised” the light parts and “sunk” the dark parts of a black and white image – similar to the “embossing” option on many Photoshop-type software programs.

The image on the shroud is symmetrical, with uniform lighting of the features, hence a symmetrical, undistorted image after processing. Most photos and especially paintings show a person's face from an angle with light shadowing one side of the face, which would produce a warped image. So if you photographed someone from directly in front, with a soft light source from the same point, you could produce your own “magic shroud” 3D image.

It's a shame ABC simply parroted this actually-not-very-interesting-at- all factoid from the 70s without following it up – but I guess “Turin Shroud shares same property as other symmetrical images” doesn't make much of a story. Keep up the good work on the site.

Regards, Michael Geissler

14 Apr 1997

Query,...why is it that people who choose to believe are labeled sadly misguided?

reply: I don't know about the "sadly," but we non-believers think anyone who believes in the occult, supernatural, paranormal or pseudoscientific are *misguided* because if they were properly guided they would agree with us!!

One must consider the aspects of faith.

reply: we have considered faith, and we have rejected it as a reasonable choice.

In fact, faith seems to be the predominant aspect in your views,...faith that what you perceive is true. You choose to perceive the shroud as a fake or a hoax when in fact to be quite honest the evidence to support either side is quite strong. You have made a choice based simply on faith contrary to all the argumentative data and you find evidence to support it just as the believers do.

reply: you seem to know me better than I know myself! If I thought the evidence was as strong for the shroud being genuine as it is for its being a fake, I would not take the position that it is a fake. If I did, you would be right; but I don't, so you aren't. As I see it, there is overwhelming evidence that the shroud is a fake, and very little evidence to support the notion that it is the death shroud of Jesus.

For example, evolution cannot be proven as fact and is a theory but mainstream science chooses that alternative out of faith just as a Christian believes in the Creation.

reply: ??? How did we get into the topic of evolution? Are you insinuating that if a person believes the shroud is genuine, they are thereby committed to reject evolution in favor of creationism? For your information, many Christians believe in both the shroud *and* evolution.

Your real war is not to prove or disprove the shroud but to validate your own faith or you wouldn't even waste your time on such subjects.

reply: You should switch from critical theology to psychology. You seem to have a deep grasp of ulterior motives.

Even if you consider your aspirations as noble and are to save the poor pitiful believers such as myself who are sadly misguided, spare me, would you, and be honest with yourself.

reply: Believers such as yourself are probably beyond redemption. My hope is that some of the younger generation will be stimulated to think about some of the things they have been asked to take on faith by their elders and that they will reject the crooked aspirations of their parents and take to the straight and narrow byway of skeptical righteousness.

It is true [that] whether the shroud is real or not doesn't validate Jesus as God,...but I choose to believe He is. And that is what it is really all about.

David Downs

reply: I respect that choice; please respect mine.

14 Apr 1997

It does not matter if the Shroud of Turin turns out to be a real burial cloth. I definitely agree with you on this. Even if the image is produced from a dead man, who is to say that man was Jesus? There were many crucifixions, and I suppose, many people wrapped in shrouds afterwards. Who's to say that it isn't all a hoax? A sick individual may have performed his own crucifixion of an individual similarly to the accounts of the Bible. Don't be surprised at what people will do for a little bit of money. After all, these are how many so-called miracle artifacts came about.

Like you said, it isn't the death of Jesus, but the Resurrection. I believe that abstract and creative thinking separates man from animals. This is how faith comes about. It's unexplainable how an individual can put their beliefs in something so out of touch with 'reality.' If an individual puts his trust in God, or any gods for that matter, then the individual must realize that science will not prove the existence of such deities because science is explainable and faith is not. So instead of individuals basing their faith on scientific evidence and/or debating with others about it, I suggest to them to keep their faith and look for no other explanations. If not, they may find their faith not enough and may find confusion intermingled with disappointment...like myself.

Highley

*Great dictionary! I recently read the Feder book you mention in the section on the Cardiff Giant. In his chapter on the Shroud of Turin, he mentions that a 13th Century Pope (I'm sorry, I'm at work right now and the text is at home, so I'm paraphrasing here) issued an edict stating that the Shroud was a fake and could *not* be displayed as the actual shroud of Christ. Yes, written proof (sort of) that the Shroud's a phony.*

*Skeptically Yours,
--Cory Herndon*

In regards to your information on the web about the Shroud of Turin - What about the claim that because of the supposed ability of the shroud to impress its image on other cloth that is next to it, during the middle ages, several "copies" (I believe six) were supposedly made of the shroud by placing clean pieces of cloth next to it. The original was hidden away or lost afterwards. What we know to be the shroud would actually be a copy of the original and, therefore, should date to be much younger than the actual shroud. I try to be very skeptical but have never seen any refutation of this claim. In fact, for some reason, whenever I see a show or read some material on the Shroud, this information is never discussed, even though all other material, no matter how insignificant, is discussed in full.

--RG Downey

reply: The reason this material is not discussed is probably because someone just made it up. No Church authority has ever claimed that the Shroud could magically transfer its imprint to cloth next to it. You can bet that if the Shroud had this magic power, the "miracle" would have been documented long ago and there would have been no need to do any carbon dating. In fact, I've never heard this claim until you brought it up. Where did you get it? It sounds like an [ad hoc hypothesis](#) to me. It's very clever, actually.

I read with interest the discourse on the Shroud of Turin. A friend asked me what I thought about its authenticity. I shared with him that, based on my reading of Scripture, it could NOT be genuine. I read from St. John Chapter 20, verses 6 & 7. Jesus had risen, the disciples came into the tomb and found the

CLOTHS (plural) lying folded, and the NAPKIN THAT HAD BEEN WRAPPED AROUND HIS HEAD lying separate from the CLOTHS (plural). I checked the original Greek and found the translation to be accurate. If the Bible is to be believed, Jesus was wrapped in at least THREE cloths, one of which was wrapped about his head. The Shroud of Turin is supposed to be ONE cloth which wrapped the body from feet to head and back to feet. There is no evidence on the Shroud that would indicate that his head was bound with a napkin or that there were any other cloths used in the burial process. I would be interested in others thoughts on this subject.

--Joe Mallinson

24 Jun 96

Your item on the Shroud of Turin is rather sparse in information and the tone of the article is biased against the shroud. Let me offer the following items:

- the shroud image is limited to the first two or three fibrils of the surface, just a few microns and is composed of desiccated linen fibrils ... no pigments are present except for microscopic quantities of pigment presumably transferred to the shroud when it was brought into contact with paintings (this image transfer referred to in your listing is a misunderstanding of that process)*
- the image is not only anatomically correct, but its distortions are those which would be present if the image were directly transferred in some way to a cloth wrapped around a body.*
- the blood is real human blood and saturates the cloth (or did when the image was fresh) (this is determined by transmission tests)*
- there is no known way to duplicate the image on the shroud even with modern technology, making claims that it is a "fake" sort of silly -- a fake what anyway.*
- the shroud image on the evidence can only have come from a cloth wrapped body of a man showing all the signs of a brutal crucifixion.*
- several aspects of the carbon dating are highly questionable -- certainly the fact that no comparable samples of known provenance were used so the dating is highly suspect since there are no "benchmarks"-- tree samples don't count. There has been quite a lot of information coming out on the problems with the dating (1) linen selectively takes up Carbon 14 in its fibrils rather than its husk so this produces an artificially enriched sample vis a vis the whole plant, (2) the shroud was exposed to a severe fire in 1532 to reached temperatures high enough to melt the silver reliquary in which it was stored -- it was barely saved. Studies of this have shown that the resulting high temperature steam would have further enriched the carbon 14 contents, finally (3) recent work by the Health Science Center show that the linen does not remain passive but has taken up bacteria and fungi through the centuries -- this is also a source of carbon 14 enrichment. In view of the contamination it is hard to know what the dating of the shroud should be -- but certainly the subject is still open.*

I just thought I'd drop you this jot -- as I've been a close student of the shroud for many years -- at least since 1960.

Regards, Ray Schneider

reply: Well, Ray, I don't know what to say. Seems like you've got this shroud covered!

04 Aug 1996

I just skimmed your Shroud of Turin information quickly, and thought you'd like to know that Ray Schneider's information on the Shroud is utterly incorrect. For example, he claims that the Shroud contains real blood, but, in fact, the bloodstains are actually red paint (not that it would prove anything if they were blood, of course- it would still be much more reasonable to assume it to be a fake.)

The real howlers come in his rather bizarre arguments about C14 enrichment by hot steam. The simple

fact of the matter is that C14 isn't enriched by steam, linen doesn't magically absorb C14 better than C12, etc. etc. Since C14 and C12 are chemically virtually identical, there is no natural physical process which can significantly separate the two. Interestingly, creation "scientists" also make up strange arguments about isotopic enrichment to explain away the results of radioisotope dating of rocks.

Anyway, you probably know all this already; I just wanted to drop you a line just in case you hadn't, since I thought you'd be interested.

Ben Sandler

07 Jul 1996

Dear Bob,

I enjoy your column, which is what it amounts to thanks to your thoughtful inclusion of a Recent Additions page. I wish the people over at the Urban Legends page would follow your lead.

I would like to know how many scientists who have studied and supported the authenticity of the shroud were not Christians before they investigated it. I would guess that the number is small. Allowing a Christian to do the job is something like asking a Scientologist to examine Hubbard's claims or a Mormon to examine Smith's.

Anyway, enough of my blather; here's an article from today's [Sunday Times \(London\)](#).

Malcolm Davidson

Gdansk, Poland

28 Aug 1996

Your dictionary entry on the Shroud of Turin is biased towards inauthenticity for it does not describe numerous findings that point toward authenticity.

For example, it mentions the C14 dating but does not discuss many observations that support some other dates. It looks like one C14 dating is an absolute certainty. A critical mind should ask for more than this.

reply: There have been several datings of the shroud, not one, and all point toward a medieval origin. Absolute certainty? Now there is an expression which can muddy the waters, which I am sure you would not want to do..

Just to mention one fact: a reproduction of the Shroud has been found in the Hungarian codex Pray, dated 1192. But the C14 dating declare a 1260-1390 range. The Shroud is obviously before 1192, even before that if we study the iconography evidences. What does happen to the probability of the C14 dating if we change the range with 1192 as its mean? No one knows for the 3 laboratories never disclosed the raw data of the C14 dating!

Many irregularities occurred during the C14 dating. Just to mention one bad fact: the raw data of the dating were never disclosed and so far after many requests they were kept secret. Only the statistical results are known. But what is the problem about making them available? Of course the problem is that it is not possible to evaluate other range of dates by other scientists. After taking so much precaution to choose a method of dating that use a small amount of the Shroud it would be the least to publish all data.

reply: What "raw data" are you talking about? Do you think there was an academic conspiracy to hide the truth from scholars such as yourself?

Your observation that "the authenticity of the Shroud is of no interest to the skeptic" is strange. Is "authenticity of the Shroud" of any interest? If not, why discuss it? It sounds like "whatever the result" it does not change the skeptic point of view. Then the skeptic point of view would not be changed by whatever the truth is, which is a vacuum point of view.

reply: I would think a careful scholar such as yourself would have figured out that what I meant was that even if the Shroud is the one Jesus was wrapped in that would not be of evidentiary value towards supporting the claim that Jesus is God.

Taking Joe Nickell's book as a reference to support inauthenticity is a very weak handle. Joe Nickell displays a lack of understanding on many relevant fields too numerous to list. I'll mention only his handling of the 3D information of the Shroud. He argues based on some picture taken by some computer program that 3D information does not exist, not knowing how it was done. It is utterly nonsense simply because the naked eye can perceive the 3D information looking at the Shroud. No need of a computer here! 3D information can be carried in many ways and Nickell is simply using the wrong instrument. It is true that some studies were done using a computer but it was to study its 3D information objectively without an observer.

reply: Joe Nickel's work stands on its own and is not in need of any defense from me. The main instrument he seems to use is his brain, which seems to me to be the right instrument.

Another important fact: the Greek text of John 20:6-7 is often badly translated to suggest that the soudarion was apart from the othonia. It is not what the Greek text says, and this has been recognised by many koine greek scholars. It says that the soudarion (a piece of cloth to hold the jaw closed) was distinctly enrolled in its only and unique place. In other words no piece of cloth moved and everything looks like the body disappeared without any human external intervention. Moreover, the word soudarion is a diminutive and should not be taken as the cloth covering the whole body it is rather one of the othonia that should covered the whole body. The greek text has to be read to realise the beauty of the concise method used by the evangelist to describe this crucial and turning point of his finding.

reply: The diminutive soudarion was apart from the othonia, eh. Well, that wraps it up for me. This is definitely the work of divine inspiration and meddling.

The Shroud of Turin has to be studied with great care to realise its true source.

**Mario Latendresse
University of Montreal
Parallelism Laboratory
CANADA**

reply: No doubt about it. But wait, Mr Latendresse of the Parallelism Laboratory is not finished with me yet.

5 Sep 1996

In reading your entry on the Shroud of Turin I was surprised to see the following sentence. (at least coming from a philosopher)

"Of course, the evidence is limited almost exclusively to pointing out facts that would be true if the shroud were authentic."

And the most troublesome for someone who believes in the scientific method

"Not only is consistency with the authenticity claim merely a necessary and not a sufficient condition for the claim to authenticity being true. ..."

But all natural science theories have necessary conditions and never sufficient ones! Can you name one theory of physics that have sufficient conditions? They all match the known data, but that does not prove

that it describes reality. The Newtonian theory matches some data but that never proved its validity. And that is the same for all physical theories.

reply: I fail to see the significance of the conditions for establishing the reasonableness of a scientific theory and the conditions for establishing a factual claim. However, I will say that there seem to be many people who think that it is sufficient support for both facts and theories to find evidence consistent with them. These people are misguided, I believe. Scientific theories are explanations and while consistency with the facts is a necessary condition for a scientific theory to be considered worthy of acceptance, it is not a sufficient condition. Establishing that something is a fact, such as that it is a fact that the shroud dates from the time of Jesus, has very little in common with establishing a physical theory.

Moreover, the theory of a medieval forgery has been shown to be highly improbable. You have to address this question in your column: if it is a medieval forgery how was it done and what type of person could have done it. You'll soon discover that such a forger is beyond technical capability of the time.

Mario Latendresse

reply: I take it you think you are the one who has shown that it is highly improbably that the shroud is a medieval forgery, because that view is one that not even the Church holds. I think it has been adequately demonstrated that it is highly probable that the Shroud of Turin is of medieval origin, is painted with paint and not the blood of Christ or anyone else, that defenders have made false claims about pollens and other things to make it seem consistent with an origin in ancient Palestine, etc. Finally, the "forgery" is no more beyond the technical capability of the time than was the moving and carving of megaliths by ancient humans.

29 Sep 1996

As a "rebuttal" to your article on the Shroud of Turin, Mario Latendresse of the U. of Montreal writes:

"Just to mention one fact: a reproduction of the Shroud has been found in the Hungarian codex Pray, dated 1192. But the C14 dating declare a 1260-1390 range. The Shroud is obviously before 1192, even before that if we study the iconography evidences. What does happen to the probability of the C14 dating if we change the range with 1192 as its mean? No one knows for the 3 laboratories never disclosed the raw data of the C14 dating!"

If, in 12xx AD I were to create a "fake" of the burial shroud of Jesus, what would prevent me from using the Hungarian codex Pray as my reference, especially if I thought that the codex was regarded as authoritative of what the shroud was supposed to look like? I wish you had asked that question in your response to Mr. Latendresse's remark.

reply: I wish I had, too!

*By the way, I admire your work in putting together the **Skeptic's Dictionary**. I'm about halfway through reading all of the articles. It amazes me how so many true believer's comments are to the effect that you "fail to disprove" so-and-so, when you make it abundantly clear that that is not your intent. There seems to be some fundamental inability on the part of many to see the difference between an "attempt to prove a negative" and a "skeptical view of 'proof' of a positive". I imagine that can be very frustrating.*

Karl Jennings

reply: you imagine right, Karl. But there is a bright side, too, such as the missives from Mr. Latendresse, who has something to say to you, too.

7 May 1997

I was surprised to see my email message posted on your site. I believe the following answers should be posted as well !

Karl Jennings comments my remark about the codex Pray:

"If, in 12xx AD I were to create a "fake" of the burial shroud of Jesus, what would prevent me from using the Hungarian codex Pray as my reference, especially if I thought that the codex was regarded as authoritative of what the shroud was supposed to look like? I wish you had asked that question in your response to Mr. Latendresse's remark."

Of course this has to be addressed, and it has been addressed by the persons who first brought the subject about the codex Pray and the depiction of the Shroud in it. I thought that a skeptical mind would look at those arguments and address them head on. But nothing such appears in that comment.

And I am a skeptic ! I verify everything.

Now the codex Pray and why the evidence shows that the depiction of the Shroud in it is a copy of the Shroud of Turin and not the opposite.

But first a little explanation as this is necessary for any skeptical mind, including myself.

On the codex Pray not all details of the Shroud are depicted. It is clearly a depiction of the Shroud but a good simplification of what can be seen on it. One detail that the artist reproduced: tiny holes of the Shroud. They are indeed the small holes that can be found on the Shroud. That can be perceived simply by looking at both of them. We don't know how and when they were done.

Now you could still think that the forger of the Shroud reproduced the holes on the Shroud according to the codex Pray. But this does not explain why the artist of the depiction found in the codex would have done these random holes. There is simply no artistic value to them. They are just there without reason.

In this context it is much more likely that the copy was performed in the direction Shroud -> codex Pray. That would bring the Shroud before 1195.

I think this is common sense.

(I would add that among the publishers of dictionaries this is a common way to detect unlawful duplication: they purposely introduce mistakes here and there (like a misspelled word in a entry of a word) in their work. They could prove that duplication occurred base on these. Common sense again.)

You'll say that the codex Pray does not prove that the Shroud is still authentic. Granted, that is obvious ! But it makes one more fact against the range 1260-1390 of the C14 dating. You'll think one hundred years won't change the argument that much, but it probably brings the statistical base of the range out of wack !

To accept a date as early as 1260 for the Shroud we have to resort, once again, to the strange explanation that the artist simply put random holes on his depiction without purpose.

Another comment by Mr. Jennings:

"It amazes me how so many true believer's comments are to the effect that you "fail to disprove" so-and-so, when you make it abundantly clear that that is not your intent. There seems to be some fundamental inability on the part of many to see the difference between an "attempt to prove a negative" and a "skeptical view of 'proof' of a positive". I imagine that can be very frustrating."

On the contrary a positive is stated about the Shroud. The dictionary states that it is very likely a fake or if you like a forgery of medieval epoch. This is a positive statement. It is now the duty of the person that states a positive fact to sustain it with some evidences. And can many known facts be forgotten and still be taken seriously ? I think not, because otherwise Mr. X could sustain that my home town does not exist, which I would regard as not serious. Yes Mr. X could sustain that more than one hundred different maps found around the world do not show the town of Joliette of the province of Quebec(Canada). He would then have a case? But to many I think it is not serious, because I simply offer to show to Mr. X some other evidences to the contrary. These have to be looked at and discuss to realize that even one hundred maps still does not sustain well (not to say seriously) his argument.

This is a skeptical endeavor. Known facts has to be explained.

I address the comments made by the owner of the skeptical dictionary:

"I take it you think you are the one who has shown that it is highly improbable that the shroud is a medieval forgery, because that view is one that not even the Church holds."

I think this shows that you have been misinformed. It is customary to hear this comment that the Roman Catholic Church either declared the Shroud a fake or that it declared it unlikely to be authentic. Neither statement is true. And that is a fact that can be verified from the RCC itself.

Where did you get this information from ? Some argue that the RCC declare it a fake since the official authorities presented the 1988 C14 dating of medieval epoch. But they simply presented the final result and never declare it a fake. As a matter of fact, Pope John-Paul II made the clear statement that for the Church the OFFICIAL (his own words) scientific data were the 1978 scientific inquiry.

Whatever I think or any body think about such statement, the fact is that the RCC did not declare it a fake nor declare it to be authentic. It has never been officially done.

And to rebuke more this point, I'd like to point out that since the 16th century, may 4th is the official RCC day, celebrating the Shroud of Turin. So it is not declared authentic, but every member of the RCC has to make their own mind about it, and it is clear that the Pope John-Paul II believes it to be authentic. And John-Paul IIe is not alone among the Popes to have believed in its authenticity.

"I think it has been adequately demonstrated that it is highly probable that the Shroud of Turin is of medieval origin, is painted with paint and not the blood of Christ or anyone else."

It is quite obvious that you have not looked at the subject of the Shroud being a painting. Even Joe Nickell, who you believe to have shown the Shroud to be a fake, does not believe this possible. That is why they have now these strange methods to try to reproduce it. Painting simply does not work. Look with your own eyes ! Hundreds of artists copied it, and it never has the quality that the original has. Even, present artists cannot copy it and keep the anatomical details correct.

Blood has been shown to be on the Shroud. Do I have to bring up all studies that were done ?

"....that defenders have made false claims about pollens and other things to make it seem consistent with an origin in ancient Palestine, etc. "

No false claims were done about the pollens. To my opinion the pollens is simply too weak an argument. That's all. But false claims ? WHICH ONES ?

"Finally, the "forgery" is no more beyond the technical capability of the time than was the moving and carving of megaliths by ancient humans."

But can you show me ONE reproduction of the Shroud that has the same quality in anatomical details, the 3D information, the superficial image on the linen fibers ?

You claim that it is a technical capability of the time, but we cannot even reproduce one like it today. A major factual problem.

I guess you'll claim that Picknett & Prince and Nickell reproduced one. Once again, just look at their work, they do not reproduce the three elements stated earlier: 3D, anatomic details, superficial image. I am not asking for the same image or all identical details but similar physical property.

It all sounds as if you were saying that we can easily reproduce gold with iron. Just paint it gold and Voila ! It looks the same as gold therefore it is gold ! This is what Nickell and Picknett did: look we have something that resembles the Shroud. But is there some microscopic analyses done ? None whatsoever. And Picknett's method does not reproduce the 3D that we can easily perceived on the Shroud. They are really far off similarities.

"There have been several datings of the shroud, not one, and all point toward a medieval origin. Absolute certainty? Now there is an expression which can muddy the waters, which I am sure you would not want to do.."

You mean that there was one dating done by three laboratories. May I remind that one person saw all data and perform some statistical computation to publish one paper in a non peer-review magazine.

"What "raw data" are you talking about? Do you think there was an academic conspiracy to hide the truth from scholars such as yourself?"

The raw data is the data that were sent for final computation of the range 1260-1390, the data produced by the three laboratories. We don't have the raw data. What so difficult about publishing them ?

And may I remind what is a scientific experiment. It must at least have one quality: reproducibility. If from a scientific paper I cannot reproduce the experiment I cannot conclude it to be scientific. It is at the center of science: experiment must be reproducible for everyone to be able to verify what is stated by peer-review. This is a very basic quality of science and experiment that does not conform to that is no longer scientific.

Would you believe some scientists that proved in their laboratories that gravity is made of proton (!) but that nobody could repeat this experiment to see for themselves ? Is this science ? Of course not. Who ever makes the experiment, reproducibility is at the heart of science (natural science that is).

Why is this so hard to see in this case (1988 dating), that it is not a scientific experiment ? Whoever performed it.

Mario Latendresse

reply: I'm sure you have convinced Mr. Jennings and the rest of the world as well. Then again, maybe not.

28 May 1997

*While your entry on the Shroud of Turin referenced Joe Nickell's excellent book, **Inquest on the Shroud of Turin**, it failed to cite the one central fact in that book that changed this Christian's mind about the shroud; namely, that "negative 3D" images abounded in medieval times, and are commonly know as rubbings.*

In fact, I like to amuse my friends by taking a quarter out of my pocket and, with the aid of a pencil and a

piece of paper, I magically recreate "the Shroud of George Washington."

Spencer W. Hunter

reply: I hope Mr. Latendresse does not see your reply. We may have to rent more space for his rebuttal and the ensuing discourse on *Paintings and Rubbings: which side are you on?*

Zecharia Sitchin and *The Earth Chronicles*

2 Jul 2001

Since you rely on Rob Hafernik's essay on Zecharia Sitchin's book, THE 12TH PLANET, what is your opinion now that Hafernik has been thoroughly discredited by C.A. Honey in his publications? Hafernik criticized Sitchin by basing conclusions on conventional books written as far back as 1929. Modern discoveries are backing Sitchin right and left and none to date have discredited any thing he said. Do you ever admit you might be wrong on anything. By the way, if you want the criticism of Hafernik's article, I'll be happy to forward you a copy so you can judge for yourself.

VITVAN

reply: C.A. Honey? OK, I'll admit I never heard of him. According to a really reliable source on the [Internet](#) (perhaps VITVAN himself),

C.A. HONEY's present endeavor is to expose the 95% to 98% misinformation and outright hoaxes being fed to the public by both official and unofficial sources. UFO's are physical ships, with humanoid occupants, and have no connection to "other dimensions" or psychic sources. The pseudo-religious wacko cults who claim that "flying saucers" are piloted by "demons" and led by Satan are also exposed. Mediums claiming to be in mental contact are either knowingly or unknowingly spreading falsehood. No exceptions exist. The "greys" are manufactured androids who do most of the manual labor involved in the scientific journey's of those coming to the vicinity of Earth. Just as humans were created to do the manual labor of the Nefilim (as recorded in the book of Genesis in the Bible), so were the greys created to serve the same function during this time period.

Even though I am no longer accepting feedback, letters like VITVAN's still arrive all too often. What is the point in responding? I am half-heartedly considering that maybe there is some truth to these alien stories. I can't believe I am a member of the same species as fellahs like VITVAN and C.A. Honey. Can we all really be brothers? Maybe aliens really did do some reproductive engineering with apes or reptiles. Maybe VITVAN,

Honey, Sitchen, etc. are the spokesmen they've left behind.

Well, as Bob Dylan has said: "I used to care, but things have changed."

11 Dec 2000

I read the article and the follow-up comments. [Gary Gorton](#) made some comments that were factually in error, and I wish to address them.

Mr. Gorton said: New evidence that man was around some 80,000 years longer than women confirms the story of the Anunnaki creating and using us as slaves until Enki came and gave us both knowledge and the ability to procreate.

This is a gross misunderstanding of the "new evidence". This appears to be a great distortion of recent biological findings about the "Mitochondrial Eve" vs earliest human male common ancestor. Mitochondrial Eve premise uses the DNA of the mitochondria in our cells to trace back to the earliest ancestor for all of humanity. This is done by comparing the DNA in mitochondria from a diverse sample of people and looking for the common ancestor. This traces "Eve", the female ancestor, because Mitochondrial DNA is not like the nucleic DNA - it does not recombine during reproduction, and does not take on half the father's genes. Thus it is a direct maternal line. The earliest father ancestor traces the genes in the Y chromosome - the male contributed feature of our genetic identity. It is thus only a feature in men, not women, and therefore cannot apply to women. It looks for the earliest male ancestor that we all share, using some sampling technique. Obviously in both cases it would be impractical to check.

By these techniques, the "Adam" and "Eve" found do not share a common era, but are separated by the 80,000 years mentioned above. However, it is a gross misrepresentation to assume that this "Adam" and this "Eve" were somehow concurrent with each other (via Genesis), and it is also a gross misrepresentation to assume that there were not other women around with the man and other men around with the woman, or that either was the only member of their gender alive at their times.

Mr. Gorton said: The article is also a little dated now as it fails to mention that NASA is now actively seeking Planet X, thought to be beyond Pluto and the cause for Pluto's irregular behaviour.

No. NASA is not looking for a planet X. Pluto is not exhibiting any orbital irregularities indicating the need for another planet. The oddities of Pluto's orbit can be explained by Pluto being a captured cometary body. See <http://www.seds.org/nineplanets/nineplanets/hypo.html#planetx>, the Nine Planets web page discussion of Planet X, and "Nemesis".

Keith Irish

28 Nov 2000

I read with great interest the critique posted on your site about Mr. Sitchin's work. I also read the comments from others who have read it.

The style is pretty stereotypical of a person who will critique anything just for the hell of it. The points made against Mr. Sitchin are wishy-washy and to attack the idea that superior alien visitors did not genetically modify man flies in the face of modern enlightenment. If we can do it now then they sure as hell could have done it then and they did.

New evidence that man was around some 80,000 years longer than women confirms the story of the Anunnaki creating and using us as slaves until Enki came and gave us both knowledge and the ability to procreate.

Even without the Sumerian tablets the OT and other ancient writings are full of symbolisms which looked at in light of modern science and understanding make very possible that Sitchin is right on the money.

As a former believer and long time student of the Old Testament and Antiquities when I read Sitchin's ideas it was as if all I had suspected for many years finally fell into place. I am not for one minute preaching the new way here but will state that I find Sitchin's offering the most plausible explanation to how we came to be here.

The article is also a little dated now as it fails to mention that Nasa is now actively seeking Planet X, thought to be beyond Pluto and the cause for Pluto's irregular behaviour.

I guess the world will always have and need skeptics until Enki himself returns to shove a lightning bolt up their asses.

Oh yes, I forgot the most obvious question. Did Rob Hafernik actually read any of Sitchin's books? My impression is that he did not or at least not recently.

The first step to freedom from religion is accepting that it's OK to die.

Gary Gorton

reply: Gary, your arguments are so elegant and your evidence so overwhelming, I don't know how I have not been persuaded by the commonsensicalness of them.

22 Jul 1999

I read some of your essays. It is easy to attack the person, but where is your contradictory evidence to the ideas? What happened to the scientific method that you espouse? For example, you criticize Zechariah Sitchin as being basically scientifically illiterate, thus ALL his ideas must be absurd. Have you read his work? He is simply trying to correlate ideas from different cultures and he offers a potential explanation. If someone wants to challenge the explanation, let them take it point by point and show that the explanation is in error. Then, let that same person offer a more reasonable explanation.

reply: I never said Sitchin is scientifically illiterate. I said he was a pseudoscientific mythmaker.

By now you have figured out that I have some biases. So do you. It is called perception and perspective. I could claim that NASA science is no better than the science of the Roman Catholic Church of Galileo. And, I might even be able to provide some real evidence or produce people with contradictory evidence. But, nobody would listen to the contradictory evidence, because NASA is always right, and Galileo is wrong. Do you see my point?

reply: No.

Perhaps Sitchin is right?

Are comets really dirty snowballs as NASA claims? Why won't NASA show us the Hubble images of Hale-Bopp? Moon? Where are all the SOHO/LASCO images taken during that same period of time?

reply: If you want images take a look at the [Comet Hale-Bopp Home Page](#) from JPL. Or try <http://oposite.stsci.edu/pubinfo/PR/97/08.html> and <http://oposite.stsci.edu/pubinfo/PR/95/41.html>

I worked for 5 1/2 years at JPL.

I also saw with my own eyes in the JPL image library two of the Face on Mars images. Not long after I saw them, they became unavailable. Go talk to an Intel analyst sometime.

Neal

reply: I'll do that, Neal. Thanks for the tip.

09 Feb 1999

Being a sceptic myself, I am interested in finding contradictions in the Zecharia Sitchin explanations of our past, which would have put to an end the discussions originated by Sitchin. Unfortunately, if anything can be called pseudo-science, that's your writings. I tried to find in them a single provable fact, and failed. Your rudeness reminds me of V.I.Lenin's pseudo-philosophical musings, where his only style of discussion was calling his opponents names, instead of confronting them with logic. I would not have replied to your writings, if you kept them for yourself, but you perform a great disservice to people who are really interested in finding the truth.

Yury Girshovich, Ph.D.

reply: Thank you for the kind words of encouragement, Yury. I've never been compared to Lenin before. It could be worse: you could have called me Stalin's son. Anyway, if you really are interested in writings which "contradict" Sitchin's claims, I suggest you take a look at the items I list under "further reading." As I say in my introduction to the *Skeptic's Dictionary*, I am not going to repeat all the arguments against non-sense that others have made, but I will provide references to the best skeptical literature I know of. Such notions as that beings from another planet (Niburu, which orbits our Sun every 3,600 years) arrived on Earth some 450,000 years ago and created humans by genetically engineering female apes have been adequately handled by others.

Still, there are two things that should be cleared up. When you go to an auto parts store, don't complain when they don't serve ice cream. If my purpose was to provide full arguments for and against each of the topics I took up, then your criticisms might carry some weight. But it isn't, so they don't. Secondly, when someone claims that human evolution did not occur naturally over several millions of years (as the current evidence now suggests) but rather in a burst some 450,000 years ago as a result of genetic engineering on apes (yet these space engineers left no other evidence of their presence), the burden of proof is not on those who reject such notions, but on the one who proposes them. There is no intellectual duty to attempt to disprove ideas which contradict current scientific knowledge. If a revolutionary idea is backed with evidence and arguments, rather than speculations and assumptions, then there is a duty to examine the evidence and the arguments. Thus, however interesting Sitchin is, to take him seriously one would have to reject everything we know about evolutionary biology, as well as what we know about the formation of our solar system. Scientists will do that only if given adequate reason to do so. Telling a compelling story which assumes ancient myths are scientific truths does not count as an adequate reason.

sixth sense

5 Dec 2000

I always find it amusing when someone uses the term "Sixth Sense" to refer to some sort of paranormal ability.

Because although it's standard practice to refer to the "five human senses", the truth is that we have more than five senses. In addition to sight, smell, taste, touch, and hearing, we also have the sense of Stasis (balance) and Kinesthesia (the deep sense of muscle/joint movement-- the sense that allows us to coordinate our muscles when we walk, talk, and use our hands).

So I guess that when people talk about the "Sixth Sense", they really mean the Eighth Sense?

Tony Fabris

reply: It's too bad we don't have a natural sense for detecting non-sense.

philosophical skepticism

12 Aug 2000

Using your arguments challenging many of the subjects covered by your website, I believe it is possible to cast doubt on the possibility of the existence of humans.

I mean, how could any thinking entity believe that a planet just the right distance from the sun, spinning at just the right speed, tilted at just the right angle could support life. It's preposterous I tell you! Furthermore, the idea that plankton floating in salty brine could end up reading e-mail is really bizarre. And what is a "thought" anyway? You can't see it. You can't measure it or take its' temperature. I don't believe "thoughts" exist. What do you think?

dboothe

reply: I think you have lost your senses and are out of your mind.

9 Aug 2000

In doing research on various skeptic martyrs on the net and elsewhere, I have noticed that their personal education is often nowhere near what would be required to make a reliable, let alone educated, opinion on a subject. For example, your site covers everything from Bigfoot to Egypt to Abductions. A hefty load, requiring a hefty knowledge base to back it up. But quite frankly, philosophy just doesn't cut it. After all, my brother also has gone the philosophy route because he found he could not pass anything else.

It should be perfectly obvious, the pro-bigfoot people are usually anthropologists while the pro-alien/Egypt people are geologists/Egyptologists and so on. No Egyptologist seems to think it's appropriate to wager an opinion on Bigfoot, and by the same obvious deduction, no anthropologist ever wagers an opinion on Egypt. Nor should they, for it's not in their area, and THEY at least know enough to not spout off about what they know nothing about. I already know this falls on deaf ears, enough naked anger leaks through your comments to let anyone realize you can't be bothered with those who prove you wrong. Not posting any of the letters I've sent where I've very effectively nailed you to the wall for your factual errors is a dead give-away. But if you have ANY respect at all for an informed analysis, here's one::: Your site suggests that you DO know enough about a 100 different fields of discipline to comment on all of

them, despite the fact that such knowledge would amount to several if not dozens of PhDs.

There's your delusion, if you are really looking for one. Learn well.

Bern Finnigan

reply: Tell me, Bern, what kind of Ph.D. does one need to write such a letter? What field is it that justifies the claim that the "personal education" required for "reliable...educated" opinion on a subject is professional degreed education? Did you learn this from your brother?

I don't doubt that to you it is "perfectly obvious, the pro-bigfoot people are usually anthropologists while the pro-alien/Egypt people are geologists/Egyptologists and so on." It is also false. Real anthropologists won't bother themselves with distractions like Bigfoot, and real Egyptologists find [pyramidiocy](#) ludicrously irrelevant.

I don't question your powers of deduction, Bern. But your assumptions are asinine as well as false. I shudder to think that you might have learned such things at school. "No Egyptologist seems to think it's appropriate to wager an opinion on Bigfoot," you say. That may be true, but not for the reason you assume. They don't wager opinions on Bigfoot because they probably have no interest in Bigfoot. Egyptologists don't make claims in nuclear physics because it is not their field, but if they don't make claims about Bigfoot or God, it is not because only appropriate experts should make such claims.

Another assumption you seem to make is that a person can't gain knowledge or reasoning ability by reading or studying a subject outside of an academic or professional environment. Bern, let me tell you something: you don't need to have a Ph.D. in philosophy to make intelligent claims about what is ethical or not. You don't need to be a Ph.D. in Egyptology to make intelligent claims about aliens breeding with ancient peoples and teaching them to build pyramids as radio towers or water pumps.

People like you don't make me angry, Bern. You irritate me with your pompous attitude and you remind me that what I do often falls on deaf ears for reasons beyond my control. I don't recall any of your previous letters, but I usually ignore long, rambling letters that have no specific criticism and I ignore letters I don't think would benefit anyone either by their content or by my response. Now, perhaps you have "nailed me to the wall" as you say, but I am sure there was some good reason why I was unable to appreciate the brilliance and insight you must have shown. It was probably because I only have one Ph.D. and it isn't in the appropriate field.

In conclusion, I wonder if you could help me and my readers out by informing us what kind of expert would be appropriate to comment

intelligently on the following claims by [Michael Menkin](#)?

This request references reports of alien abductions as reported by Bud Hopkins, David Jacobs and Raymond Fowler. I made a device which may help people abducted by aliens as reported by the above investigators. The device works by blocking alien telepathy and mind control, I call my device a "thought screen helmet." My device consists of a leather helmet lined with layers of special conductive plastic, the same material used to prevent static electricity damage to printed circuit boards. When worn over the head, I believe the device may insulate an abductee from alien telepathic control. Its function is not proven, I realize, but a shield for blocking alien telepathic control is worth trying.

To date I have one abductee trying my device. He has not had any memorable alien contact for three months so the device may work. I am still working with this person and hope to confirm its operation. I am trying to get other abductees to try the device to confirm its operation. My "thought screen helmet" cannot be tested in a laboratory. The only way to test it is for an abductee to wear it for a period of time and determine if the telepathic control of aliens is blocked or neutralized. If the "thought screen helmet" works it will minimize alien activity with a person and allow that person to resist aliens.

If I cannot verify the function of my current "thought screen helmet" configuration, I plan to test different materials to find one that does work. If your organization can put me in contact with the kind of abductee described by Jacobs and Hopkins who is interested in trying the device, I will mail it to them for free, worldwide. There are no catches. It's available to any serious abductee who wants to test if for free, anywhere in the world. Several size "thought screen helmets" are available.*

My guess is that the appropriate expert would be your local hardware store manager, but I could be wrong.

reader comments

10 Aug 2000

Your local hardware store manager is unlikely to be a highly degreed person, so I have to disagree that he/she would be an appropriate expert to comment on the hat. Having seen picture of the hat at Michael Menkin's site, I think that a comment by a

fashion designer would be more appropriate.

Or since the idea for the hat originated from a Science Fiction novel, perhaps the "Aids is a Conspiracy" Science Fiction author James Hogan would be appropriate.

Tim B

13 Aug 2000

Actually, you do not need to go the high-tech (and no doubt expensive) route that Mr. Menkin has in order to shield your mind from alien influences.

Minor league baseball caps serve the same purpose. I have a small collection of them, and I wear them often. I am able to state that I have never been under any sort of alien mind control while wearing such a cap.

I don't know if major league caps perform the same function. Next time I go to a game I'll buy one and see if I notice any alien influences.

Alex Bensky

13 Aug 2000

Regarding Bern F's quip of 9 Aug 2000, in which he states:

"In doing research on various skeptic martyrs on the net and elsewhere, I have noticed that their personal education is often nowhere near what would be required to make a reliable, let alone educated, opinion on a subject."

When - if ever - have institutions of "higher education" held a monopoly on knowledge? As someone who considers myself self-educated and generally quite knowledgeable on many subjects, I must respond; how arrogant! Look, you either agree or disagree. There's no need to insult, or attempt to belittle . . . or to bore for that matter. Make your point and get on [over] with it.

Dennis G

Bern Finnigan replies:

14 Aug 2000

Another commonality between all skeptic messiahs I have researched is their LACK of research towards contrary views. Such skeptical talking heads on any number of paranormal television shows can have their entire thought process summed up with: "My opponent has expert testimony, but I have a quippy one-liner, therefore I'm right. Oh, I have a life too."

The sole exception would be Carl Sagan, who in his book "Broca's Brain" dedicated no less than 56 pages to a dissection of the "aliens and Moses" hypothesis of Dr. Velikosky, wherein Dr. Sagan used natural laws of physics, chemistry and mathematics to demonstrate the impossibility of the unusual ideas. Such a qualified disproof, is of course, the exception in your chosen hobby.

*Sticking with the example of [Bigfoot](#) (as we both live in his alleged stomping ground, pun intended), you said the utterly misinformed statement: "Real anthropologists won't bother themselves with distractions like Bigfoot." The conceit and lack of objectivity here is obvious. I can't help but wonder the criteria that a philosophy PhD sees fit to impose on a field that has nothing to do with philosophy. Heaven forbid letting anthropologists be autonomous in their own field. I suppose by "Real" you mean "agrees with me", and I'll let the ridiculousness of that speak for itself. Regardless, you're wrong. Anthropologist Dr. [Grover Krantz](#) PhD. of Washington State University has been studying the phenomenon since the sixties, and I do believe he qualifies as "real": tenured position, teaches graduate level courses, publishes papers including a few books. Sound good? Except he has the audacity to actually explore the situation before making a irrational proclamation based on the statue quo. He publishes articles on his findings based on the known rules of anatomy and primate locomotion and other silly new-age fantasies. His finest achievement: a book where he discusses all known evidence and subjects it all to scientific rules, AND I might add, without a single one of those pesky unreliable testimonials. (Big Footprints, look for it on Amazon). **[The title has been changed to [Bigfoot Sasquatch : Evidence](#)]** He makes a case for the creature using the available physical evidence (footprints) and the best film of the alleged creature, the 1967 Patterson footage. He puts them all to the test of known rules of vertebrates that supposedly all earthly creatures must obey no matter how hairy they are: skeletal anatomy, weight distribution, muscular formation, etc. He should be quite qualified, after all that's his job to know those things, and that's what he has been teaching for 30 years. He concluded that the 1967 creature could not have possibly been a man in a suit. His book is full of all of his mathematical calculations and rational deductions that anybody can double-check to their hearts content. He concealed nothing. So, if Dr. Krantz says its a real monster by using mathematics, if anyone has a complaint with him the logical recourse would be to counter him by using mathematics.*

Unfortunately, just saying "It looks fake to me" comes in a distant second in the reliability department, and is an insult to the accepted procedure of the scientific method. If you do not accept the findings of a professional merely because he supports the creature, and then you deserve to be irritated, and even a PhD. in basket weaving should recognize the validity of the scientific method over a layman knee-jerk reaction.

Now for completeness sake, I will tell you where you can find monster-maker

John Chambers directly quoted denial that he had nothing to do with the Patterson monster: The Fortean Times, issue of February 1998, pg 48.

That will make it the 3rd time I've sent you that information. If you want to believe the movie was a fake SO badly, give me your address and I'll send you a copy of the whole article. My pleasure.

Bern Finnigan

reply: Well, Bern, I guess this is where you think you have "nailed me to the wall" with your evidence and arguments. I'm afraid you're not very convincing, however. I can't deny that Krantz has a Ph.D. and teaches anthropology at Washington State any more than I could deny that alien abduction advocate John Mack is an M.D. and a psychiatrist who teaches at Harvard. I don't think you should deny, however, that both are considered quite odd by their colleagues. Be that as it may. Krantz is considered heroic by some because he did what many would have thought was professional suicide when he devoted his scholarly talents to investigating Bigfoot. He is still the odd man out, regardless of his credentials. You will not find mainstream anthropology textbooks or classes that take seriously the study of Bigfoot, just as you will not find standard texts in psychiatry giving advice on how to treat patients who have been abducted by aliens. (I don't doubt that you can find a book or a teacher that takes seriously just about every topic I've debunked.) I've never met Krantz, but he has some odd ideas. For example, according to the [Fortean Times](#), Dr. Krantz advocates a hunt-and-kill-a-Bigfoot mission. Now, I'll say that's true scientific devotion, a willingness to kill in the name of finding the truth. I only bring this up because I have a hunch that if Bigfoot exists, the creature would qualify for listing as an endangered species.

What would you do, Bern, if someone pointed out to you another Ph.D. in anthropology who thinks Krantz, while building a strong but selective case, has failed to prove his point? Krantz, by the way, is not an expert on films as far as I know. I thought you required that nobody speak outside of their own field of expertise? By the way, how do you know this? Is it common sense? Do you have a Ph.D. in common sense, Bern? (You know, the only reason common sense is so common is because it often doesn't make much sense.)

Do you really accept Krantz's response that Bigfoot is "shy and nocturnal" to typical criticisms, such as those below from my entry on Bigfoot?

There are no bones, no scat, no artifacts, no dead bodies, no mothers with babies, no adolescents, no explanation for how a species likely to be communal has never been seen in family or group activity, no evidence that any individual, much less a

community of such creatures, dwells anywhere near all the "sightings," etc.

This shy and nocturnal animal has been spotted in broad daylight hundreds of times, if the testimonials are to be believed. Are the creatures so shy that they pick up their scat and hide it? Does the community live underground or in caves no human has ever found? Maybe they live in the [Hollow Earth](#)? (Oops, sorry. I forgot that you don't like one-liners or quips. They help me keep my sanity when dealing with humorless doubledigits.) Not one baby or adolescent spotted in all these years? No evidence of habitation? What are the mathematical probabilities of such a species surviving for hundreds of thousands of years without a single shred of direct physical evidence?

Finally, the issue regarding costume-maker Chambers is a side issue I've [addressed before](#).

You might be interested in my site [The Anti-Skeptic Site]

www.mysite.com/don/antiskeptic.htm

Gordon Cohen

reply: I have looked at your site and read some of the entries. However, I don't see what any of it has to do with skepticism or Skepticism (see my entry on the topic for the distinction <[philosophical Skepticism](#)>.

The members of your first group of "skeptics" (people who made bad military decisions) seem to share in common only two things: they were close-minded and their preconceptions turned out to be wrong. If one defines a skeptic as one who is closedminded and turns out to be wrong, then examples of skeptics and non-skeptics will fill up a very long list, indeed. Neville Chamberlain, for example, is one I would characterize as gullible and guided by wishful thinking. To call Chamberlain a skeptic seems silly.

Your medical mistakes list seems also to be a list of people who share these same two characteristics of being hidebound and wrong. Again, one could find both skeptics and non-skeptics to add to this list.

You head your page with the following "The web has plentiful sites by skeptics - people who try and critically analyze the mass of nonsense loose in our society. Skeptics usually find themselves in the position of saying something is not true - that there is not enough evidence for something."

By defining skeptics in this way, you make everyone a skeptic who has

analyzed an issue, taken a position against that issue on the grounds that there is not enough evidence to support it, and then turned out to be wrong. Such a broad definition would include many strange bedfellows in its denotation. You are, of course, free to use words any way you see fit, but I wonder about the utility of defining 'skeptic' in a way that would include Richard Nixon and George Patton and Joan of Arc.

Mr. Cohen replies:

I will change the title of my website, perhaps to "The anti-Closed Mind" Website.

Gordon

09 Nov 1998

Thanks for providing the Skeptic's Dictionary, which is almost unique on the Web in being interesting, well-judged, well written and well researched...I just wanted to raise a couple of issues concerning your account of Philosophical skepticism and your alignment of yourself within that movement I'll be as concise as I can.

You say (I think!) that modern skeptics, by and large, accept that certain knowledge is impossible (at least outside the fields of logic and mathematics) but accept that empirical or sensory evidence can confer some degree of probability, or confirmation, on theoretical claims; and that the distinguishing quality of a contemporary skeptic is a sort of healthy refusal to believe theoretical claims unless supported in this way by properly conducted empirical tests, coupled with an unwillingness ever to regard such claims as finally decided for once and for all.

reply: No, I say that one tradition of philosophical skepticism has defended probabilism and the tentative nature of empirical knowledge. This distinction is a very old one. Accepting probabilism does not make one "modern" in any sense of the word.

It seems to me that this, while probably a position which is extremely and justifiably common among 20th century philosophers and scientists, is not a skeptical one, since it is actually called into question by some of the most important skeptical arguments. The point of Hume's skepticism about induction, for instance, is not merely that it demolishes claims to dogmatic certainty, but that it calls into question our right to claim that any amount of empirical data makes any theoretical claim any more probable than its contrary. Similarly, Descartes' "evil demon" argument, if it works, shows that sense data (appearances) is consistent both with our ordinary scientific world-view and with a completely different set of theoretical claims about the way the world is, and cannot therefore provide any evidence, even of a probabilistic nature,

either way.

reply: Hume's skepticism is very complex, but generally he is sympathetic to probabilism. He rejects metaphysics as a waste of time, but not math and science. He certainly does not advocate the notion that one scientific theory is always as good as any other. Descartes, on the other hand, had no interest in probabilism. Philosophical rationalists demand absolute certainty. I take it you do not think Descartes disposed of the Evil Demon hypothesis adequately. Metaphysical possibilities, such as that we are all dreaming or that we are all atoms in a universal being or that we are all being constantly deceived about fundamental matters of perception and mathematics by an Evil Demon are not denied by skeptics. Descartes was not a skeptic, so I don't know what your point in noting that he believed that if the Evil Demon hypothesis were not disposed of then any empirical theory would be as good as any other.

The view that the scientific or empirical method is the only trustworthy one, and that while it cannot yield certainty it can confer probability on theoretical claims, seems to me not to be a skeptical one, but closer to what has traditionally been called "pragmatism" or "fallibilism" (in which I would include, for instance, the views of philosophers such as Dewey, most Bayesians, and many modern philosophers of science). Unless accompanied by a satisfactory refutation of Humean and Cartesian skepticism, it remains a dogmatic view. To me at least, the most valuable 20th century work in the philosophy of science has been done by those philosophers (such as Popper and, in particular, Quine) who accept the correctness of Hume's argument but try nonetheless to come up with an account of why it is rational to pursue scientific, empirical inquiry. In the absence of a plausible refutation of Hume, the idea of constructing a philosophy of science which makes no appeal to any positive concept of confirmation or justification seems like the natural way to develop, since Hume's argument appears to undermine these concepts fatally. It might, therefore, be appropriate to call Quine and Popper skeptics, since both deny that empirical evidence can ever confirm a theoretical claim. The view that empirical data can confer any non-zero degree of probability on a hypothesis, by contrast, strikes me as quite anti-skeptical, since most skeptical arguments are just as effective against claims to have even weak confirmation of a hypothesis as they are against claims to certainty. skeptical doubts apply equally to scientific claims and to the claims of New Age therapists, proponents of the paranormal etc. The difference is that there are, as your site ably demonstrates, additional reasons to doubt the latter - you don't have to be a skeptic, in any traditional philosophical sense.

Hope that all sounded coherent.

Sam Inglis

U.K.

reply: It's coherent, but wrong. Popper does not say that no empirical evidence can ever confirm a theoretical claim. He says that no amount of

confirmation of an empirical theory can prove the theory is true. He also used 'probability' in a mathematical sense when he claims that all scientific theories have zero probability (because no matter how many tests have been done, there are an infinite number left to do and any number divided by infinity equals zero). The ancient (and modern) skeptics who defend probabilism are not talking about mathematical probability. They are using the term in much the same way I would use it when I say "I probably left my notebook in the office." They are not using it in the sense of "the probability of a heads coming up on any given coin flip is 1 in 2."

Thank you for your entry on sleep paralysis - the description of this phenomenon exactly parallels an experience I had as a youth, in which I seemed to be unable to move in my bed, yet was "aware" somehow of an evil, buzzing entity in the corner of the room. I've been an agnostic for most of my life, and have never taken this memory at face value, but it's nice to know that other people have had the same experience. I can easily see how someone who already believed in demons, ghosts or aliens could assume he'd been visited. Could you add more to your entry regarding the experiments I saw on a science program ([Nova?](#)) in which it was claimed that this state could be induced?

By the way, your website shows an interest in Celtic music. You should point this out when asked how a skeptic can possibly enjoy life. How can one NOT enjoy a life in which one can listen to beauty?

Bryan Haught

Slick 50 and other engine oil additives

Slick 50 and other engine oil additives supposedly reduce engine wear and increase fuel efficiency.

You may have heard the commercial or seen the ad:

Multiple tests by independent laboratories have shown that when properly applied to an automotive engine, *Slick 50 Engine Formula* reduces wear on engine parts. Test results have shown that Slick 50 treated engines sustained 50 percent less wear than test engines run with premium motor oil alone.

There are about 50 other products on the market which make similar claims, many of them being just duplicate products under different names from the same company. The price for a pint or quart of these engine oil additives runs from a few dollars to more than \$20. Do these products do any good? Not much. Do they do any harm. Sometimes.

What's in these miracle lubricants, anyway? If they're so wonderful, why don't car manufacturers recommend their usage? Why don't oil companies get into the additive business? Where are these studies mentioned by Petrolon (Slick 50)? Probably in the same file cabinet as the tobacco company studies proving the health benefits of smoking.

The basic ingredient is the same in most of these additives: 50 weight engine oil with standard additives. The magic ingredient in Slick 50, Liquid Ring, Microlon, Matrix, QM1 and T-Plus from K-Mart is Polytetrafluoroethylene. Don't try to pronounce it: call it PTFE. But don't call it *Teflon*, which is what it is, because that is a registered trademark. Dupont, who invented Teflon, claims that "Teflon is not useful as an ingredient in oil additives or oils used for internal combustion engines." But what do they know? They haven't seen the secret studies done by Petrolon (Slick 50).

PTFE is a solid which is added to engine oil and coats the moving parts of the engine.

However, such solids seem even more inclined to coat non-moving parts, like oil passages and filters. After all, if it can build up under the pressures and friction exerted on a cylinder wall, then it stands to reason it should build up even better in places with low pressures and virtually no friction.

This conclusion seems to be borne out by tests on oil

additives containing PTFE conducted by the NASA Lewis Research Center, which said in their report, "In the types of bearing surface contact we have looked at, we have seen no benefit. In some cases we have seen detrimental effect. The solids in the oil tend to accumulate at inlets and act as a dam, which simply blocks the oil from entering. Instead of helping, it is actually depriving parts of lubricant" (Rau).

In defense of Slick 50, tests done on a Chevy 6 cylinder engine by the University of Utah Engineering Experiment Station found that after treatment with the PTFE additive the test engine's friction was reduced by 13.1 percent, the output horsepower increased from 5.3 percent to 8.1 percent, and fuel economy improved as well. Unfortunately, the same tests concluded that "There was a pressure drop across the oil filter resulting from possible clogging of small passageways." Oil analysis showed that iron contamination doubled after the treatment, indicating that engine wear increased (Rau).

the FTC and Slick 50

In 1997, three subsidiaries of Quaker State Corp. (the makers of Slick 50) settled Federal Trade Commission charges that ads for Quaker State's Slick 50 Engine Treatment were false and unsubstantiated. According to the FTC complaint, claims such as the following made in Slick 50 ads falsely represented that without Slick 50, auto engines generally have little or no protection from wear at start-up and commonly experience premature failure caused by wear:

"Every time you cold start your car without Slick 50 protection, metal grinds against metal in your engine."

"With each turn of the ignition you do unseen damage, because at cold start-up most of the oil is down in the pan. But Slick 50's unique chemistry bonds to engine parts. It reduces wear up to 50% for 50,000 miles."

"What makes Slick 50 Automotive Engine Formula different is an advanced chemical support package designed to bond a specially activated PTFE to the metal in your engine."

In fact, the FTC said, "most automobile engines are adequately protected from wear at start-up when they use motor oil as recommended in the owner's manual. Moreover, it is uncommon for engines to experience premature failure caused by wear, whether they have been treated with Slick 50 or not."

zinc: good for the common cold & your car's engine

Another type of additive is **zinc dialkyldithiophosphate**. Zinc-d is found in Mechanics Brand Engine Tune Up, K Mart Super Oil Treatment, and STP Engine Treatment With XEP2, among others. The touting of zinc-d as a special ingredient in engine oil additives is a little like the Shell ads which touted "Platformate." (Most gasoline has similar additives but under different names.) Zinc-d is an additive in most, if not all, major oil brands. The wonder oils just put more of the stuff in a 50 weight engine oil. It would be useful if your engine were ever operated under extremely abnormal conditions where metal contacts metal: "the zinc compounds react with the metal to prevent scuffing, particularly between cylinder bores and piston rings....unless you plan on spending a couple of hours dragging your knee at Laguna Seca, adding extra zinc compounds to your oil is usually a waste.... Also, keep in mind that high zinc content can lead to deposit formation on your valves, and spark plug fouling" (Rau).

If zinc-d is so good for your engine, why haven't oil manufacturers been putting more of it in their standard mix of oil and additives? Actually, oil companies have been *decreasing* the amount of zinc-d because the evidence indicates that zinc-d causes deterioration of catalytic converters.

The bottom line is that outside of the [testimonials](#) of happy and satisfied customers and the guarantees of company executives about the wonderful effects that studies have shown will follow the use of their products, there isn't much support for using oil additives. Of course, there are those millions of customers who buy the stuff: aren't they proof that these things really work? Not really. They're proof that this stuff really sells!

cleansed, not coated

On the other side of the engine block are those additives which will cleanse your engine, not coat it. Stuff like Bardahl, Rislone and Marvel Mystery Oil claim they can make your engine run quieter and smoother, and reduce oil burning. These are products which contain solvents or detergents such as kerosene, naphthalene, xylene, acetone or isopropanol. If used properly, I suppose these products will strip off your Teflon and zinc protective coatings! But unless you have a really old and abused car, you probably have no need of stripping away sludge and deposits from your engine. Thus, you probably have no need for these wonder cleaners. If you overuse such products you can damage your engine by promoting metal to metal contact.

If you use a synthetic oil, such as Mobil 1, you are advised not to use any engine treatments or additives. [Mobil claims](#) that

The use of an engine oil additive is not recommended, either by Mobil or by virtually any vehicle manufacturer. In fact, it may void your new-car warranty.

Finally, you may have seen the commercial where two engines are allowed to run without any oil in them and the one which had the special oil additive keeps on ticking after the other engine has conked out. This may be appealing to the car owner who never changes his or her oil or who runs his or her car without oil, but it should be of little interest to the person who knows how to take care of their automobile.

Should you invest in something like [Tufoil](#)? It is touted as being "a super-suspension of micro-miniature PTFE particles and soluble Molybdenum, permanently suspended in oil." And, it will not clog filters or oil openings, according to the manufacturer. Or, how about Lubrilon, which contain a nylon polymer that will coat your metal parts? Or Bishop's Original Permafused Lubrication™, which also coats your metal parts with an anti-wear lubricant film? It's your money, but I think you'd be better off if you just changed your oil and oil filter regularly. And don't forget to change the fuel and air filters at the recommended intervals. We can't say for sure that these new products do no good, but what good they might do is probably not necessary or of much value for the average vehicle owner who takes proper care of the vehicle.

slick 50 and other engine oil additives

25 Dec 2002

Many years ago Slick-50 changed formulations without telling their customers (they fell out with their suppliers). Yet they continued using tests of the original formulation in their advertising until relatively recently. It is the cut-off between the original and the new Slick-50 that defines the good and the indifferent tests. The original formulation stood up to testing. Magazines including the Consumers Digest recognised that it worked. In recent testing Consumers Digest gave Slick-50 the thumbs down. However they were not testing the same product they had in the past. I hope they redo the tests with the original formulation.

The original Slick-50 formulation is now being sold as [Xcelplus](#). It is this original formulation that had all the impressive testing done to it. Xcelplus have quite extensive and interesting documentation on their site verifying this. Some of the material includes Supreme Court findings and legal documents. Slick-50 have now taken all the tests referring to the original formula out of their advertising material. Unfortunately most people still don't know the tale of the two formulations. This is creating a lot of confusion as they're not comparing apples and apples. Now we know why original testing showed up different results to more recent testing.

Links to your site were instrumental in sorting this out. BTW: The original formulation contains no Teflon.

Michael Czajka

PS. It's me you're quoting extensively on your web site so it would be nice to put up this clarification.

15 Sep 2000

Wow, I didn't expect so many defenders of these additives to appear. I do have some insight to the testing, if you don't already have it.

I am a Society of Tribologists and Lubricatin Engineers Certified Lubrication Specialist. I worked until February 1998 at a well respected independent petroleum analysis laboratory in Vallejo, CA.

The 3 published test papers related to Slick 50 are available from the Society of Automotive Engineers, and, as part of a project evaluating Slick 50, DuraLube,

and other additives, I ordered copies of the three (I would give you the six digit numbers, but I do not recall them. They were referenced in an article by Petrolon in "Lubrication Engineering", the STLE magazine). What it boils down to- they are very turgid- is the four ball test results (ASTM D2272, IIRC) performed by (IIRC, again) Southwest Research in San Antonio, TX.

The test results did not seem to be that different to me. But what really makes me laugh is that the four ball test bears little relation to what happens in an engine.

Three steel balls are fixed in a triangle in a cup. The fourth ball is placed in a chuck at the end of a vertical shaft, set against the three fixed balls to a set loading, and spun. The resulting wear scars are measured for area. The cup is generally filled with the candidate lubricant.

The major difference? The relative sliding motion is in a constant direction, temperature, and force. This simplifies the hydrodynamics greatly. In an engine, this is not the case. The PTFE particles can not be counted on to lay flat against a surface (don't get me started on the "coating"). In fact, if they are caught more perpendicular to a surface, they can cause damage just like any hard contaminant.

Most of the non-PTFE additives were either just higher viscosity or contained high amounts of chlorinated anti-wear additives. These additives do work- but so do the ones already in motor oil- but they should not be used here because of chemical reactions which form corrosives. Nitric, carbonic and sulfuric (in diesel) acids are problem enough, why add hydrochloric?

John H.

reply: Maybe the users want to make sure their cars gets all the food groups for a well-balanced diet?

28 Nov 1999

Consumer Reports did an oil test on 60(?) New York taxi cabs. What they did was strip the engines down every 6000 miles and measured wear, etc. Anyway, all oils are basically the same with synthetic showing slightly less wear. AND, two oil additives, similar to Slick 50 if not the same, showed a propensity to cause more wear.

Well, I would not normally bother someone with this fact, but, you seem to have a bunch of flakes out there who believe in snake oil. Now, you can have a reference done through an independent study.

George

reply: I haven't seen that issue, but [Consumer Reports](#) said in 1996 that

"anyone using one of today's high-quality motor oils shouldn't need an additional engine or oil treatment. We reached that conclusion in our July 1996 report on motor oils after we tested Slick 50 Engine Formula and STP Oil Treatment in New York City taxis." [Consumer Reports](#) also once tried to duplicate the Prolong commercial but burned up the engine.

4 Nov 1999

Slick 50 is not like synthetic motor oil as some of the recent letters may lead one to believe.

There are no proven studies on the efficacy of adding TEFLON - which Slick 50 is - to the oil.

Synthetic oils have been proven to such a degree and are considered so superior in resisting heat breakdown that federal law allows only synthetic lubricants in jet engines - ask any Airframe and Powerplant (FAA certification) mechanic...

AND there are studies showing the reduced wear on engine components when synthetic lubricants are used - the FAA has that, too...

Comments also alluded to "...increasing oil change frequency..." when using synthetic oil. Wrong again. Even the manufacturers recommend filtering and re-using of synthetic oils in automotive applications. In fact, synthetic oil used in cars can be filtered/re-used many times.

Chris Long

31 Oct 1999

Having used slick 50 for about 15 years and through over 20 vehicles I feel well qualified to say "It works".

reply: My mother went through 20 rosaries over 70 years and she was sure her prayers worked, too, but I have my doubts.

However when starting out I wasn't so sure so I did oil analysis (yes metal wear decreased significantly). I also continue to use magnetic sump plugs so that I can see how much visible ferrous metal comes out of my engines each time I change my oil.

reply: Doesn't everybody?

Over the years I have also noted mileage improvements (usually around 10%): I keep log books.

reply: You keep log books, but do you do [controlled studies](#)? What is the 10% compared to? Do you run half your vehicles with Slick and half without? What do you use for comparison? My mother thought she had a high success rate with her prayers but she never kept track of the unanswered ones, or she just figured God decided they weren't worthy of being granted. Either way, she was satisfied.

Other improvements include decreased temperature: very noticeable on air cooled motorbikes or by noting the position of your temperature gauge before and after.

Decreased noise (sometimes the difference is huge).

reply: Are these validations based on subjective experience? If so, there is the danger of [self-deception](#).

I agree that Slick-50 sometimes exaggerate the perils of not using their product.

reply: So did the [FTC](#) when they when they got Quaker State Corporation (which makes Slick 50) to pay \$10 million and agree to quit making false and unsubstantiated claims.

However I figure that if my engine gets up to 50% less wear I get up to 100% more life out of it. This is particularly relevant to the air cooled 4 stroke motorbikes I favour. I have accumulated over 500,000 Kms (300,000 miles) with slick and motorbikes and more in cars. I have also had a few engines lose all their oil with no damage (often after running many miles dry).

reply: That's good figuring but that's a big "if". By the way, for a guy who is so meticulous about keeping records on his oil, you don't show much care for your vehicles if you let them run dry.

I accept that sometimes slick-50 may not be at its optimal level after 50,000Kms but in my experience even if it has slightly worn away it is still working. As my air cooled motorbikes run so hot and the gears run in the engine oil whipping it to premature failure I'm not surprised Slick wears out quickly. I just add about 10ml of slick with my oil changes to keep the coating 100% all the time. However in cars this is not necessary and one treatment does genuinely appear to last well past 50,000 Kms.

And the cost...? Well if I get a 10% improvement in economy it takes me about \$500 of fuel to pay for the treatment. I do this in about 1/2 a year. This totally discounts the savings in repairs that I might otherwise have to make. Say I only get 5%... then it would take a year. What about 0%? Well I still get the power and decreased repair bills. How can I lose?

reply: Even if your "if" isn't actual, everything's still satisfactual.

I've seen the booklets Slick put out. They contain either full reports or excerpts. I know they're correct because I have sourced a few direct from the testing organisations concerned. One of the best ones is the Consumers Association report, quite a few years back, which stated it was the only product they could find that did work (I sourced that one direct too).

Enough proof? No? Well try it... I did and that's what really sold me.

Michael Czajka <slick@rabbit.com.au>

reply: I don't usually print e-mail addresses, but I couldn't help but notice the name you go by. You are one devoted person.

1 Nov 1999

Michael Czajka says in support of Slick 50:

Other improvements include decreased temperature: very noticeable on air cooled motorbikes or by noting the position of your temperature gauge before and after.

This is not possible on a typical car engine, whose coolant temperature is controlled by a thermostat. Assuming the cooling system can keep up with the rate of heat production of the engine (i.e., assuming there isn't something grossly wrong like no coolant), the temperature gauge will remain fixed whether or not Slick 50 has been added.

Czajka's stated improvement of 10% in fuel economy on average cannot be considered statistically significant. Such a change could be caused by increasing tire pressure, reducing engine or transmission oil viscosity, fixing dragging brakes, performing routine maintenance, or changing one's driving habits, among other things.

Tom Kite

21 Sep 1998

Thanks for taking up these wonder additives.

But I would not recommend single viscosity oil, even for old cars. If your old car does not consume too much oil, use synthetic oil and maybe increase the drain interval by 50 % if you think the oil is too expensive. Oil consumption will be smaller with synthetics. If it does consume lots of oil, you should fix the engine, not try to run it on cheaper single viscosity stuff.

So here is a skeptic comment: Your reasoning in terms of science is very good, but what is your expertise in the fields of internal combustion engines? You do not refer to any source in your last paragraph, so I assume that it is you speaking in the last paragraph. How do you justify the sentence "That multi-viscosity stuff is for the younger set." What do you mean? I personally use Mobil 1 in both my cars (Rabbit -86 and Jetta -91).

reply: I've noted my source.

According to my (professional) sources, it is the best oil on the market. I think Porsche even supported extended drain intervals, but maybe that was changed again (too complicated, I guess). This is no evidence, but the Jetta's engine still does not need any oil fill-up between the 10,000 intervals after 130,000 Miles. Moreover, the oil level is almost constant.

Since the oil consumption is reduced with synthetics due to their higher boiling points, catalyst poisoning is reduced which might save you trouble (at least here in Europe) because you may need a new catalytic converter later. Alright, this is theory, I do not own 1000 cars which run under comparable conditions for 40,000 Miles each.

I have recently downloaded and updated my desk copy of your quite brilliant Skeptics Dictionary. Over the last year or two it has seen much use, fighting of MLM people, I used it to chase a tarot reading maniacs back to where she belonged, and your piece on Ancient Astronauts has come in handy, when members in my book club had the weird idea that the pyramids were built by aliens.

Your article on Slick 50 oil additive got a real chuckle out of me, I have become a part time mechanic, looking after my VW Beetle. If you have the time, take a look at "The Sermons of Bob Hoover." This guy is in Southern California someplace and he has written a companion manual for looking after a VW Beetle (or any darned car). His style is unique, urges a common sense approach and spends lots of energy trying to keep his readers away from things like Slick 50 and other 'Go Fast' ideas that are really stupid. His site is not as cool as yours, it has a rugged functionality about it. I have downloaded his entire manual and keep it in the same directory as the Skeptics Dictionary. Take a look at <http://www.type2.com/sermons/>

Keep up the good work.

Adrian Jessop

Durban, South Africa

reply: I was sorry to see that Bob Hoover was hounded off the Internet by flamers with dim bulbs. It took me awhile to get used to the uncivil and vicious criticism that comes my way on occasion, but using filters on the mail program helps. So does that little trash can icon.

12 May 1998

Enjoyed your site, will keep coming back to read more. Would like to tell you about using Teflon additives in a two-stroke motor. I used to race go-karts and a Teflon additive for the lubricating oil would drop engine temp a good 15 degrees and add about 400 rpm on the top end to the engine. When the engine would be occasionally torn down to service it, the piston would look like it was polished, almost no scuff marks were visible.

Experience in my auto was another story. Teflon engine oil additives would plug up oil filters and cause a loss of oil pressure. Using a Teflon additive in my manual transmission was helpful and added noticeably to the ease and smoothness of shifting gears. I think there is a use for Teflon in auto's but not in the motor, use it in grease for the ball joints and bearings, and use it in manual transmissions and it will make a positive difference.

James Bare

08 Aug 1996

I found your site by accident. It is great!

I do not know much about most of your topics in the Skeptic's Dictionary, but I know a thing or two about lubricants and you are 100% right on the money about the scams in this arena. In fact, I have some very entertaining discussions with my neighbor about this subject. He is a lube specialist with Texaco here in Houston. He really does know his stuff and he supports everything you say. They spend a lot of time tweaking the mixture of their additive packages to balance all of the desired effects. If you just pick a good oil, stick with it and change it often, there is nothing else you really need. Over time, with wear on the engine, you do need to change the oil viscosity you use, but that is about all.

Keep up the good work!

Jim Cannon

17 Sep 96

In addition to the oil additive scam, you might include the "you have to change your oil every 4000 miles or your engine will spontaneously explode" scam. All of the speedy lube joints are now making every effort to scare the heck out of motorists, insisting that horrible things will happen if you don't rush in every 90 days or 4000 miles for that dump-and-pump.

Automobile manufacturers have pulled back their requirements for service, based on lawsuits filed against firms which provided false representations of adequate intervals for service. I have had an extensive career in the automotive and heavy equipment service industry. Oil analysis performed on both automotive and diesel engines indicated that the average vehicle has the oil changed about 10 times more frequently than required. Not only is this a massive waste of petroleum products, it also initiates a massive amount of petroleum wastes which require disposal in some form.

In the early 80's we extensively tested synthetic motor oils through an independent laboratory. When the results, indicating exceptionally high metal content were brought to the attention of the oil manufacturer, they immediately stopped all communication with our firm, in spite of the fact that we were (at the time) a major distributor. In one specific test, we operated a 6-cylinder GM engine under moderate to severe conditions for over 250,000 miles without changing oil. There was no indication of any engine damage or reduction of the lubricating quality of the oil below minimum requirements. There was a reduction in the additive functions, such as anti-foaming and contaminant suspension. Because the average engine uses a quart of oil every 900 to 1500 miles, the quality of the oil was sustained through the addition of that oil.

I recently watched a TV report on the possible side-effects of not changing oil at close intervals, where a "mechanic" reported that "a head gasket could just blow or anything." Anyone who can associate extended oil change intervals with the failure of a head gasket must have certified through correspondence courses.

Irv Boichuk

reply: I think Irv's right about oil changes. My absolute favorite Public Radio celebs, Tom and Ray Magliozzi (Click & Clack), say that changing your oil more frequently than at 5,000 mile intervals is unnecessary given today's oils and engines. Even this, they say, may be overdoing it. They also say, by the way, that you can mix and match any oils, even different brands, as long as you stick with the same viscosity and don't use olive or cod liver oil. [Sacramento Bee, "Click & Clack Talk Cars," Sept 20, 1996, C. 1. If you haven't heard Tom & Ray on Saturday mornings, you are missing out on one of life's great treasures and pleasures. They even have good advice once in a while. And they are on the [WWW](#).]

20 Jun 1997

I think it's unfortunate that Marvel Mystery Oil has been tarred with the same brush as Slick50 and similar "miracle engine cure-all-inna-can."

I ignored this product for years because of the name alone. But upon the suggestion of a trusted mechanic, I recently used it the way it was intended to be used: as a solvent/cleaner and top end lube. I read the skeptical follow-up in the Dictionary, where somebody implies that it's rare for well cared for engines to require harsh cleaning. IMHO, what's rare is people who take good care of their cars.

A bit further down the page, another person mentions the Car Talk radio show (which I also enjoy). Well, Car Talk has a web site, <http://www.cartalk.com> and they've been developing a database of car facts from their visitors. The study's nowhere near done, of course, but already, it's turning out that owners of Japanese cars seem to be pretty sloppy about maintenance procedures. Those kinds of owners can either flush their engines with some really harsh cleaners, after mucking their engines up by not changing oil in 25,000 miles, or use a product like Marvel Mystery Oil, which leaves behind an oil coating as it cleans. If they've gotten to the point of needing to take off a valve cover, and find a real nasty mess in there, try putting an inch of Marvel in the cover, along with a few nuts and bolts for agitation - and just shake it a bit. This stuff cleans quite well, without entirely destroying all the oil film the way many ordinary flushes do.

I feel obliged to point out I am a home mechanic, I don't sell any of this stuff. Adding a few ounces of MMO to the crankcase in a really dirty, neglected engine and driving it around for about forty miles made a real difference in one car I experimented on (a 1987 Nissan truck with 100,000 miles). There's a hill near my house I use as a sort of diagnostic test. It had been chugging up that hill at 35 mph, with hesitations, pedal to the floor. After running with MMO in the crankcase for a bit, it went up that hill at 50 mph, with less hesitation. I can view a section of timing chain from the oil filler hole. It was WAY cleaner after running MMO.

I looked into why this legitimate product had such a hokey name. It turns out the inventor's name was Marvel and he got his start back in the early days of aviation. People were less reactive to lurid product names in those days, I suppose. Tradition and name recognition have their own momentum. Whatever, it's unfortunate, but there it is. It is a legitimate product anyway. The major ingredients, naphtha and wintergreen, have been around for decades as solvents and cleaners. If you've heard anything disparaging about them, I'd sure appreciate hearing it.

Regards,

Chita Jing

reply: Actually, Chita, I've never hear from anyone paraging or disparaging Marvel Mystery Oil until you wrote. I hope those readers who only change their oil every 25,000 miles take your advice. Though I think such people have more than car problems.

15 Aug 1997

I read your discussion about Slick 50 and other oil additives. However, I would like to set the record straight as you are erroneously lumping Slick 50 in with all the other charlatans in this industry.

Slick 50 does have the test results to back up their claims with respect to wear reduction. These test results are from the ASTM Sequence III-D Wear Screener conducted at a nationally recognized testing facility in San Antonio, TX, which I won't name at this time. These tests were conducted a number of ways, using the reference oils as specified in the test parameters and utilizing well known commercially available oils for reference. In each instance, the test with the Slick 50, resulted in wear reductions of approximately 50% when compared to the reference oil. The III-D Sequence test is, or was at the time, the industry standard for wear evaluation, oil oxidation, and viscosity results with respect to engine oils. The test has since been upgraded to the III-E Sequence test. The difference being the D used an Oldsmobile V-8 and the E uses a Buick V-6 engine, making it more closely reflect the engines on the road today. Since most of the wear occurs during the first of the test, the Wear Screener portion can be run without going through the entire test where viscosity and oxidation are concerned. I was the consultant charged with seeing that this work was accomplished under strict industry standards, and I have copies and results of all this work. I would be happy to talk with you about these tests and the results if you are interested in the facts where Slick 50 is concerned.

reply: Send me the reports and maybe I'll publish them on the WWW.

Additionally, the carrier oil utilized by Slick 50 is not an SAE 50 viscosity, but a crossgraded, multiviscosity, fully formulated API SH/SJ. To my knowledge, they have never used a single grade SAE 50 viscosity, although they did use an SAE 30 viscosity before switching to the multigrade product. The oil carrier manufacturer is a national oil company that I won't name either.

Early in the 80's, Slick 50 was a dubious player and their entire emphasis was on multilevel marketing, not product development or technical verification of the claims made about the product. The company back then was called Scientia and Petrolon. However, when Ron Fash took over the operation, he undertook to prove or disprove the capabilities of the product and develop the product from a technical standpoint to allow its introduction into the mainstream market. Fash has since moved on, but the product has been improved from his

time and does have the accepted industry tests to back up its claims.

A couple of other points. DuPont and Slick 50 entered into a joint agreement some time ago to further develop the aspect of PTFE to lubricants. I don't know if that partnership still exists, but the statement that you mention in your discussion from DuPont is close to 15 years old and meaningless today. As further credibility for Slick 50, the company was recently bought by none other than Quaker State, indicating that the snake oil mantle is ill placed on Slick 50.

reply: I assume Quaker State would buy Slick 50 because they believe they can make money from the deal, not because of the integrity of the product. Rather than see the credibility of Slick 50 go up by this deal, some might see the credibility of Quaker State going down. The FTC wasn't too impressed with Quaker State's [advertising campaign for Slick 50](#). I assume you did your tests after July 1996, or did the FTC lambaste you as well as Quaker State?

I too am a skeptic when it comes to products like these since I have been in the lubrication industry for some 30 years. All the others are just "me tooers" and none have spent the money and effort to verify the credibility of their "products" like Slick 50. Testimonials, racer endorsements, engines running without oil, squealing bearings, and other such gimmicks don't impress me. Yes, Slick 50 did use these dubious methods at one time, but not since the early 90's.

I would trust that you will examine the facts that I have mentioned and correct your misconceptions about Slick 50 and inform your readers of these facts also. I will be happy to talk with you about my comments and anything else pertaining to Slick 50 that you may want to know. Thanks for your time.

Jerry T. Shelby

reply: Whatever the test results, the questions will still remain: does the average person driving the average car really need to put any of these additives into their oil pan? Are there cheaper alternatives? Are the cars that benefit significantly from such additives going to last that much longer or perform that much better than they would from either no intervention or intervention with a cheaper product?

*26 Aug 1997 **reply to the reply:***

Your response to my letter was not unexpected and typical for a pseudo expert such as yourself...don't confuse me with the facts, ignorance is bliss.

The report results have already been published in several Slick 50 marketing brochures, but since you don't seem to believe them, why should I think you would believe the source reports.

You are right, the mere purchase by Quaker State does not necessarily lend credibility to the company or the product, but you conveniently failed to address

the DuPont matter and partnership. Would DuPont get involved with snake oil people?

I never said Slick 50's use was necessary, only that the benefits of its use can and have been documented in industry recognized tests and evaluations.

Your lack of resourceful research and objectivity in this matter leads me to question all the information on your web site, and as such I will delete it from my favorite places....who cares, right!!!???

reply: It never occurred to me to use a Slick 50 marketing brochure for objective evidence on the accuracy of the claims made in their advertising. I must have swallowed too much sea water as a child and it's affected my critical sense. As far as Dupont goes, maybe they saw the light. Since Slick 50 and others were just putting their product, Teflon, into their additives, why not join forces? Anyway, I did check out another source, Ray and Tom Magliozzi, who write:

Slick 50 has actually conducted some bonafide research. And the research was legitimate enough to be published by the SAE, the Society of Automotive Engineers. And that research showed--to our satisfaction--that Slick 50 does make a difference during those first few seconds of operation (although there is still no evidence that it does anything to improve mileage). ...

According to the report published in SAE, Slick 50 adheres to the moving parts of the engine, and serves as a lubricant before the engine oil gets distributed. And those first few seconds ARE when a lot of wear and tear take place. ...

So, if you think it is important to protect those moving parts during those first few moments, by all means, use Slick 50. Just remember that while you are coating the moving parts you are also coating the non-moving parts, like oil passages and filters. While you're at it, write to all the car manufacturers and ask them why they don't recommend using Slick 50. Are they hoping our engines will wear down faster, so we'll have to buy a new car sooner than if we'd had that extra protection? [Click [here](#) to read the vice-president of Slick 50, Doug Ross, answer this and many more questions about the miracle product.]

speed-reading

Speed-reading is the purported ability to read as many as 10,000 to 25,000 words a minute. For example, [Howard Berg](#) claims to be able to read 25,000 words a minute by reading "15 lines at a time backwards and forwards." That's about 80-90 pages a minute. Tolstoy's *War and Peace* should take Berg about 15 minutes to read.

[George Stancliffe](#) claims he has taught a woman with a reading disability to read 18,000 words a minute. Such a feat, he says, is common in children, but rare in adults.*

Anne Cunningham, a University of California at Berkeley education professor and an expert on reading, reports that tests measuring saccades (small rapid jerky movement of the eye as it jumps from fixation on one point to another) while reading have determined that the maximum number of words a person can accurately read is about 300 a minute. "People who purport to read 10,000 words a minute are doing what we call skimming," she said. Speed in reading is mainly determined by how fast a reader can understand the words and expressions one is reading. The fastest readers are those with excellent "recognition vocabularies." Faster readers can see words and understand them faster than slower readers. To improve one's speed at reading, she says, one should work on comprehension and study strategies (Robertson).

Others claim that "the average college student reads between 250 and 350 words per minute on fiction and non-technical materials" and that a "good" reading speed is 500-700 words per minute.* It does seem intuitively true that one could speed up one's reading by (a) spending less time between eye movements; (b) taking in more words with each fixation; and (c) always moving forward, rather than skipping back to re-read something. Having a good recognition vocabulary would certainly speed these processes up. Conscious practice at improving one's speed should also help.

Berg has repackaged the [Evelyn Woods Reading Dynamics](#) course, one popular several decades ago with people like John F. Kennedy. A reporter who attended one of Berg's classes noted that in his five-hour course, Berg hadn't said much about *comprehension*, except to suggest that it would come with practice. This did not deter several of the 35 students, who had paid \$51 each for the class from the Learning Exchange in Sacramento, from purchasing audio tapes for \$65 (Robertson).

Those desiring to increase the speed of their reading would do better to enroll in a community college course devoted to building study skills, vocabulary,

and reading comprehension. It would cost them less, and they would not end up wasting their time trying to read 10 lines at a time, backward and forward. They would also avoid the frustration that will be inevitable when they find that while they can skim through material at a greater rate than they can read it, the utility of such a skill is limited (good for most of what's likely to be in the daily newspaper, for example, but not for studying physics or reading a good novel). Skimming makes both comprehension and taking pleasure in words or ideas next to impossible. Why read fiction at all if you don't want to enjoy the language and the ideas? Who would want to hire a physician or lawyer who skimmed rather than read his or her texts?

*** There seems to be only one person who can read at such speeds with near-perfect comprehension. His name is [Kim Peek](#) and he has the ability to read two pages simultaneously, one with each eye, with 98% retention. Nobody knows how he does it but he was born without a corpus callosum, that bundle of nerves that connects the right and left hemispheres of the brain. However, others have also been born with no corpus callosum, or have had it surgically disconnected, without resulting in an increase in reading or retention abilities. Kim can recall most of the contents of some 7,600 books. But, since nobody knows how Kim Peek does it, nobody can teach this skill to others.**

Kim Peek was partly the model for Raymond, the *idiot savant* in the movie *Rain Man*.

reader comments:

spontaneous human combustion

18 Dec 2000

I've been reading your article and the readers remarks on Spontaneous Human Combustion. While I don't believe any of this "fire from within" stuff, I do believe human bodies should burn well and quickly in an atmosphere of pure (or highly enriched) oxygen. Extra oxygen reduces the ignition point of materials, and lets them burn at a much higher temperature and speed. In a chemistry lecture, a cigarette was dropped into a glass of liquid oxygen. It burnt within about 2 seconds, brightly illuminating the room. If human fat burns in a normal atmosphere, it should be easily combustible in pure oxygen, maybe the little heat generated by friction with clothes might do to ignite it. (The Apollo 1 mission failed due to a fire in the Command Module, which contained a 100% oxygen atmosphere. The inside of the Module burnt to a crisp (and so did the astronauts), see <http://images.jsc.nasa.gov/images/pao/AS1/10074802.jpg>)

reply: There may have been one or two poor souls whose last cigarette was enjoyed while they were hooked up to an oxygen tank, but as far as I know most of the alleged cases of SHC have occurred in places with an ordinary amount of oxygen.

Now why does the fire suddenly stop and leave i.e. the feet or furniture untouched? The most likely answer is that the oxygen runs out. A room of 40 m³ (5x4x2 m) contains about 40 kg of oxygen (in a pure oxygen atmosphere, in normal atmosphere about 1/5th), which burns less than 1/2 the amount of organic material (the resultant gases are H₂O and CO₂, in both the oxygen makes up for >2/3 of the mass) so after burning about 20 kg of organic material the oxygen should be spent. 2/3 of a human body are water, I don't know how much of the rest are combustible organic material but I think about 20 kg is not too far from plausible - in which case the oxygen in our example room would do to just burn the body, if doors and windows are closed so that no extra oxygen can get inside. The question here is: are there signs of a higher than normal oxygen concentration in the rooms where supposed SHC has occurred?

Ciao, Alex

reply: Lack of oxygen is as good an explanation as any other I've heard as to why these fires don't consume everything in sight.

07 Jan 2000

I am writing in regards to your article on spontaneous human combustion (SHC). You say "While no one has ever witnessed SHC, several deaths involving fire have been attributed to SHC by investigators and storytellers." You really should investigate your stories just a bit more before you go putting this trash on here. That's what a professional would do anyways. Here are only a few quotes from other articles from a book I read written by someone who had done about 10 years of research into this matter and ALL of them include people who witnessed the whole thing.

reply: You really should be a bit more skeptical of what you read. It does sound impressive when someone says that they have been "researching" a book or topic for 10, 20 or 30 years. However, such claims should be taken with a grain of salt. It is not how long one spends doing something that matters so much as *what* one does. Eric von Däniken (just to mention one such creature) has studied alien landings in ancient times for many years but that does not mean he has done anything worthwhile.

One should be especially skeptical when reading books on the marvelous and the mysterious. Authors know what sells and know that there is little chance their work will be scrutinized because most serious scholars and investigators consider such stuff unworthy of their time and attention. The editors of such stuff don't care whether it is true or false; what matters is, will it sell. As long as there is a large section of the public who are gullible and desirous of such stuff, it will continue to be popular.

THE SUDDEN COMBUSTION- of Mrs Mary Carpenter who perished while vacationing on a cabin off Norfolk England on July 29,1938 took place in full view of her husband and children. She "was engulfed in in flames and reduced to a charred corpse" in minutes. No one else was burned and the boat was undamaged.

A FORMER ACTRESS- Mrs Olga Worth Stephens age 75 of Dalls, Texas was sitting in a parked car in October 1964 when witness saw her burst into flames. She was fatally burned before anyone could come to her rescue. Firemen said that the automobile was not damaged and contained nothing that could have started the fire.

ON AN OCTOBER EVENING- in the 1950, 19 year old Maybelle Andrew's was dancing with her boyfriend Bill Clifford, in a London discotheque suddenly she burst into flames .The fire blazed from her back and chest, enveloping her head and igniting her hair, her boyfriend and some of the bystanders tried to beat out the flames but they could not save her, she died on the way to the hospital. According to Clifford's testimony: I saw no one smoking on the dance floor, there were no candles on the tables and I did not see her dress catch fire from anything. I know it sounds incredible, but it appeared to me that the flames burst outwards, as if they originated within her body.

Really, you should be embarrassed of your ignorance.

R.Mackey

reply: Perhaps. But I think you should be more embarrassed by your gullibility.

7 Jan 2000

I read about spontaneous human combustion many years ago from a book entitled: FIRE FROM HEAVEN. I have often theorized one possible source, that is: MICROWAVES. perhaps directed on a target by a radar antenna or other method, and maybe, for the sake of government defense. That or some high voltage or high power radio waves. It's just a thought. Thanks for the time to let me add this comment.

NS

reply: The house as a microwave oven with the smoldering body as the meat is a very unlikely scenario. Many of these alleged cases of SHC go back centuries and are not likely due to government experiments or high power lines.

Maybe aliens are taking pot shots at people with new weapons.

02 Jan 2000

I read your article on spontaneous human combustion and I was just e-mailing you not to criticize you but to make a point. In the case of Beatrice Ocki of Bolingbrook Illinois the woman's feet were not burnt and it appeared to me that she was wearing nylons (it looked [like it, but] I don't know). Anyway, how come her feet were not burnt and how come the rest of the room was not burnt or the rest of the house for that matter? I just think it is pretty bizarre that something like that could happen and from the looks of things, but I will created [sic] you this that the body fat could burn and if it was a cigarette but I mean the rest of the room would have caught on fire and her legs would have burnt to a crisp. Well like I said I am not here to criticize you but I am just e-mailing you just to make a point. Thank you for your time and understanding.

Timothy O'Reilly

reply: I don't know why her feet were not burned or even if they were not burned. Maybe there was not enough oxygen left in the room to keep the fire going; maybe there was not enough combustible material in her body to keep the fire going.

I don't know why the rest of the house did not burn. Maybe the fire was not hot enough to spread, or the room was too cold.

What I do know is that the probability is greater that people whose bodies are partially burned in house fires are more likely to have been ignited by their own carelessness or by foul play than by spontaneously bursting into flames.

Why is it assumed by believers in SHC that fire would burn differently if caused by SHC than by accident or foul play? Whether fire begins inside a body or outside it, once it reaches the outside shouldn't it burn like any other fire? In other words, partially burned bodies and houses that are not burned are not signs whether a fire started inside or outside the body.

11 Jan 2000

A couple of quick answers to your "I don't know" in response to Tim Reilly 1/2/00.

1. I've seen those pictures of the unburned feet in a couple of different places. Real easy answer: Fire burns up, not out. Light a long wooden match and hold it parallel to the ground. It will burn out before it reaches your fingers almost every time.

2. The rest of the house rarely burns in "SHC" incidents. The reason is that the wick effect causes very high temperature smoldering with short flames. This was shown with a simple demonstration done on a skeptical (gasp!) documentary on, I believe, The Discovery Channel (Could've been TLC, but I doubt it). They wrapped a pig carcass in a blanket (haha) and lit it with a lighter (if I remember correctly; could've been a match or something similar). The carcass burned slowly and surely with short flames. The articles in the test room used to simulate a normal dwelling (TV, some furniture) were damaged only by the heat of the fire. That is to say that the wood furniture was unharmed but the plastic parts of the television were melted. It was such a simple test I'm (not) surprised that the proponents of SHC didn't think of it earlier.

Steve Young

4 Jan 1997

Good Day, and a Hot New Year to you. Found you thru INFOSEEK, and read your amusing citation on spon-comb.

Regrettably it needs to be updated. Significantly, we humbly suggest. Yes, "the physical possibilities of spontaneous human combustion are remote." Doesn't mean it doesn't happen tho. We've spent 22 years arriving at that conclusion,

*the results of which appear in our book, **ABLAZE! The Mysterious Fires of Spontaneous Human Combustion** (Evans, 1995). 500+ pages of truly bizarre fires, emphasizing SHC. As in reported by and attested to by fire officials, medical personnel, etc.; eyewitnesses; survivors of partial self-ignition; and good ol' common sense and best evidence.*

We'd urge you to get a copy Forgive the merciless self-plug, but if you want to know much more about SHC than your dictionary offers, this was the way to inform you.

Larry E Arnold

reply: Twenty-two years of research on spontaneous human combustion! Now that's what I call dedication. And I thought the topic was worth maybe 22 hours of devotion. Let's hope your book is ten times more interesting than either my entry on the subject or the subejct itself. In the meantime, what's your next project? [human spontaneous involuntary invisibility?](#)

27 May 1997

Your conclusions are generally quite true; however, your arguments against SHC could be a good bit stronger if you consulted with an expert on combustion. For example, to say that fire burns at a temperature above 200°F is an understatement. I guess you are thinking about the boiling point of water. The temperature of a flame depends on many variables, including the rate of combustion and the kind of fuel, and combustion temperatures often exceed 2000°F. Conditions for ignition vary considerably also. Paper in air will burst into flame at about 452°F, and some volatile fluids will flash at even lower temperatures, but you are quite right that human flesh is not readily combustible.

victim soul

But the goat, on which the lot fell to be the scapegoat, shall be presented alive before the LORD, to make an atonement with him, and to let him go for a scapegoat into the wilderness (Leviticus 16: 10).

And he shall make an atonement for the holy place, because of the uncleanness of the children of Israel, and because of their transgressions in all their sins: and so shall he do for the tabernacle of the congregation, that remaineth among them in the midst of their uncleanness (Leviticus 16: 16).

A victim soul is a person who suffers pain or sickness for another person. This notion is clearly related to the belief that Jesus of Nazareth redeemed humankind by suffering and dying for our sins. Christ as scapegoat probably goes back to the ancient Jewish custom of letting a goat loose in the wilderness on Yom Kippur after the high priest had (symbolically) laid upon the goat all the sins of the people (*Leviticus 16*).

According to the Most Rev. Daniel P. Reilly, Bishop of Worcester (Massachusetts), the concept of the victim soul was popular in the 18th and 19th centuries. He has set up a committee to investigate the claims that a young girl in his diocese, [Audrey Santo](#), is a victim soul. The girl allegedly agreed with the Virgin Mary to be a victim soul when asked while on a pilgrimage to [Medjugorje](#) in Bosnia-Herzegovina (formerly part of Yugoslavia). At the time the girl was four-years old and in a comatose state due to an accident that had destroyed a good part of her brain a year earlier. Her mother, Linda Santo, had hoped for a miracle cure. Instead, she says, the Virgin Mary appeared to her daughter and talked to her about being a victim soul. Linda Santo claims that her daughter suffers so others can live and has turned her lifeless daughter into a [living relic](#).

stigmata

21 Sep 1999

I'm sure now with the movie's prevalence [[Stigmata](#)], this topic will seem slightly trite, but the fraudulent claims of stigmata can also be demonstrated by the point of puncture wounds on the hands (a physiological impossibility) instead of just below the wrists (a fact that the movie pointed out as well, and was one of its few saving graces).

Absir Dittee
Los Angeles

reply: Mr. Dittee is referring to the historical data which suggests that when the Romans crucified a person, the nails were driven into the wrists, not the palms. There is, of course, no *physiological* impossibility of nailing the palms, but physically to do so would put so much weight on the flimsy bones and flesh of the hands that the body of an adult male would not be supported for very long. Hence, a "real" stigmatic would have wounds on the wrists, not on the palms.

reader comments:

the unconscious mind

16 Nov 2000

I enjoyed going through the Skeptic's Dictionary, but I feel there are a couple of places where you are attacking a straw man. Unfortunately my argument has turned out to be fairly lengthy in order to be complete, so I don't expect you to read it right away, but hopefully at some point you can consider these points.

In the meantime, my compliments on the rest of the site which is very well done.

One quibble is your discussion of the unconscious mind, which looks at only the question of repressed memory and whether the unconscious mind can be shown to have some physical location in the brain.

Another definition of the unconscious mind could be those things which occur in our minds, of which we are not conscious.

When I eat lunch, it is the result of a conscious decision. When I fall in love, it is not (typically) the result of a conscious decision. Falling in love, therefore, can be categorized as an example of the operation of the unconscious mind. You can say that falling in love is caused by the operation of various chemicals in the brain, but that's not really saying anything different. If it happens in my mind, and I'm not conscious of it, it's happening in my unconscious mind.

That also brings in your discussion of Jung, which I think also is an oversimplification. In this case, Jung himself should be differentiated from Jungians, who often say a lot of things that Jung himself did not.

Jung says that the unconscious mind has two components, the personal unconscious and the collective unconscious. The personal conscious is based on our own experience and the collective unconscious is wired in to the structure of our brain.

An example of the operation of the personal unconscious is the distance at which you feel comfortable conversing with someone. If somebody moves too close to you, you feel uncomfortable. This distance varies according to which culture you were brought up in. Therefore, it must be something that is learned. However, it is not something that is learned consciously like reading or how to use chopsticks; thus (by definition) it is learned unconsciously.

Even if you know consciously why you feel uncomfortable, it doesn't stop you from feeling uncomfortable. The personal unconscious has nothing to do with "repressed memories".

Jung postulated that we have some built-in unconscious functions. Again, one example of this is falling in love. In Jungian terms, we possess an archetype of a spouse which pre-exists in our minds. The operation of falling in love is the identification of this archetype with a particular person. Once we are in love with that person, our interactions make use of the archetype. Other archetypes would include mother, father, infant. It is essentially the same process that causes baby birds to imprint the first animal they see as their mother. Another example would be the torturers in Argentina who, after killing the parents for their political views, took pity on the poor orphaned baby and raised it themselves (numerous such cases). Jung would say that they exhibited an archetypal response to the infant.

(An archetypal response to an infant is typically to take care of it--but only if you identify it as your own.) Or consider childless people who treat a pet like a child rather than an animal. Archetypes are much the same as what are often called instincts.

Keep in mind that Jung started his career working in a lunatic asylum at a time when modern drug-based treatments were not available. There was little that could be done in terms of treatment, but he had ample opportunity to study the ways in which people's minds went wrong. This is what led him to the idea that the basic structures of the mind are the same, but in insane people they operate in inappropriate ways. Thus a stalker might be making use of the spousal archetype, but applying it to a person he never met.

You could study the operation of these common archetypes by studying other primates, and we find that there do appear to be built-in instincts for parenting, forming social groups, etc. For example, childless female apes will play with dolls.

Jung further speculated that humans came ready-wired with a lot of other archetypes as well. He devoted quite a lot of time to comparing religions and mythologies in an effort to identify these. This also involved him in studying such topics as astrology, Tarot cards, etc. to identify their archetypal content.

This is where I think the skeptics get nervous and turn back. A skeptic sees someone who believes in astrology and reacts by saying that astrology can not be proven scientifically. By implication, that person is stupid for believing it. Jung asks, why does that person believe in astrology and not in some other unprovable theory like a flat earth? A belief in astrology is fulfilling some need for that person. Jung was interested in identifying those needs and classifying them under the name of archetypes.

Many skeptics have difficulty understanding the difference between studying a belief and believing it. Jung was interested in astrology because people believe in it. He was also interested in UFOs because people believe in them. He wrote a whole book about UFOs which begins "I have absolutely no interest whatever in whether UFOs really exist or not". The book describes how UFO beliefs share a lot of common features with other archetypal beliefs such as elves. Yet I often see skeptics claim that Jung "believed in UFOs".

You claim that archetypes are invalid because they are not empirically testable. I think this misses the point. The concept of an archetype is merely a classification device. Certain instincts are grouped together because they commonly appear together. You might as well claim that the Dewey Decimal System is invalid because there's no empirical test that will predict the call number of a book.

Jung postulates that since archetypes are hardwired into the brain, they must exist essentially from birth in everybody. One way to deal with archetypes is to bring them into your conscious mind. For instance, you could engage your child-nurturing archetype by raising your own children. You could also engage it by other activities such as coaching a children's soccer team, volunteering at the YMCA or whatever.

Jung says that any archetypes that you keep out of your conscious mind stay in your unconscious where they can affect your actions, not always in a beneficial way.

How to tell which archetypes are most at work in your unconscious? You must examine the operation of your unconscious. One way to do this is to look at your dreams. I think the current scientific opinion is that dreams are side effects of the way that long term memories are stored during sleep. That's why the content of dreams are frequently related to the previous day's events.

Jung, though, is interested in the side effects. Of those random images that are called up by the storing of the day's events, why this one and not some other one? He thought that relating the content of dreams to the archetypes called up (out of all the potential ones in existence in your brain) could give clues to the emotional reaction to those events, particularly unconscious ones. You mention some of these concepts in your entry on dreams.

Jung did appear to have a real belief in synchronicity, which is hard to defend. However, if we consider this to be a case of [apophenia](#), then it becomes consistent with the rest of the body of thought. Apophenia is an effect of the unconscious mind, which gives us clues to its operation. Why does the beetle cause apophenia and not the sandwich?

Jungian analysis based on this theory is that in order to have a fulfilled life, you need to connect all your archetypes to your conscious life. For most

people, marriage, raising a family and having a reasonably interesting career or hobbies will more or less cover all of them. But for some people who are unhappy in their lives, it may be because some archetype (built-in instinct) has been excluded from their conscious and hence remains in the unconscious. Analysis consists of identifying the archetype by means of looking at dreams, emotional reaction to works of art, etc. When the archetype is identified, the patient then can look around for ways to incorporate it into his or her life. As noted in your entry on dreams, only the patient himself can provide any useful insight into the emotional content of his dream images.

(Note: modern psychoanalysts do not claim to be able to cure diseases such as schizophrenia. Freud thought it was possible, because the cause of schizophrenia was not known during his time. However, modern psychoanalysts try to help people find ways to cope with their problems, among which may be schizophrenia or other diseases.)

Interestingly, Jungian theory provides an answer to the question that must vex the skeptic: why do so many people persist in believing things that are easily proved to be untrue? The answer is that these beliefs provide the people with a means of bringing certain archetypes into their lives. If by this means their lives are made happier, should we care? As a society, the answer is probably yes, because otherwise we could well end up teaching creationism in science class or funding homeopathy instead of cancer research. Then, as the Jungian said to the skeptic, if you want to have people stop believing in something, you have to provide something else that involves the same archetype. Science is not necessarily the answer. There are cases, for example, of former rabid fundamentalists of the flat earth variety who found fulfillment working with the homeless or sick. Possibly people create elaborate pseudoscientific theories as a way to exercise their needs for creative activity. (There are, of course, also deliberate frauds who are motivated strictly for financial reasons.)

So, is Jungian theory science or pseudo-science?

This is not a useful question since there are plenty of other possibilities besides these two.

There is a certain amount of hard science since part of the theory is based on research on animal behavior (and human behavior).

The archetype concept is just a classification system and is more related to social science. (Calling something a "matriarchal society" has little or no predictive value.) The "collective unconscious" is not any kind of mystical concept but simply a term for the instincts and other built-in wiring of our brains, as it affects behavior.

Jung had a interest in topics such as astrology, mythology, etc. Unscientific? All these topics are products of the human mind. So are art and science. One way to study the human mind is to study its products. Of these products, some have predictive value (science), some do not. It would be inducing a bias into the research to remove from consideration all products of the human mind that do not have predictive value.

Jung appeared to have a genuine belief in synchronicity and possibly telekinesis (the exploding knife). However, if these are considered as examples of apophenia then they are not inconsistent with the rest of his theory.

I can't claim to have read all of his voluminous writings, but I have read quite a lot of it, and nowhere do I see him claim any belief in astrology, ESP, clairvoyance, spiritualism, etc. He is, however, interested in belief in these topics as examples of the workings of the human mind. Many skeptics may be deceived by the fact that he neglects to denounce these topics as unscientific. In fact, he is not interested in the question of whether such things actually exist, but rather in the question of how people think about and react to them.

There is one example of a dream Jung cites, which he says predicts the outbreak of WW I. This is not given as an example of clairvoyance, though, but as an example of how his mind was unconsciously analyzing the unstable nature of society (particularly in Germany) at the time, a matter in which many historians would agree. However, he doesn't claim any predictive value, since he says he didn't understand the meaning of the dream until after the event.

The situation is complicated by the existence of many "followers" of Jung who do in fact believe in clairvoyance, etc. Not many of these people are found within the ranks of professional Jungian therapists.

Does Jungian analysis work in terms of making people happier or better able to cope with their lives? (Excluding the problem of how this could be scientifically measured.) Sometimes it works, sometimes not.

Does methadone therapy help people get over heroin addiction? Sometimes it works, sometimes not. However, I don't hear skeptics say that methadone therapy is pseudoscience.

I think you should differentiate among

1. What Jung actually said 2. What skeptics claim Jung said 3. What amateur "Jungians" claim Jung said 4. How professional Jungian therapists have modified thinking about Jung's work based on advancing scientific thought

After all, anyone can claim that the theory of relativity proves the existence of

*ESP, but that's not quite the same as being a physicist. Or as Shakespeare said in *The Tempest* (I'm quoting from memory): I can call spirits from out of the deep! Why so can I, or so can any man, but do they come when you do call them?*

Michael Robinson

reply: I'm worn out just reading your remarks and I won't weary the reader by a lengthy reply. Suffice it to say that I have rewritten a section of the entry on the unconscious to make it clearer that I reject the *Freudian* notion of the unconscious, not the notion of an unconscious.

As for Jung...I don't think that the collective unconscious and archetypes were posited just for classification. I would prefer an explanation of irrational belief with less metaphysical baggage. To say that an intelligent person believes in something obviously false like astrology because it brings archetypes into her life isn't very enlightening.

I believe that if there is an answer to that question it might be discovered by neuroscientists. The brain seems to be on some sort of incessant quest to make sense out of everything, to find relations and connections, etc. Clearly, there is something satisfying about seeing connections. As [Jacob Bronowski](#) pointed out, this is an area where the artist and the scientist excel. I would not be surprised if it were discovered that some people believe in obviously false things like astrology because astrology is immensely satisfying and it is immensely satisfying because there are numerous complex relations and connections that can be manipulated to explain just about anything under the sun. In short, astrology fills them with a feeling of AHA Insight!

28 Oct 1999

While I agree with many of your comments regarding unconsciously repressed memories, I think it's shortsighted to refer to the unconscious mind as a memory machine rather than as a processor.

Modern psychology tends to treat the unconscious as simply the non-conscious processor of information, and suggests that the unconscious mind carries out the bulk of day to day processing. This is illustrated in the example of a person driving a car. After one becomes an experienced driver, it is no longer necessary to pay scrupulous conscious attention to every aspect of the environment. One is able to listen to the radio, have a conversation, etc. But the ability of the brain to unconsciously process is shown strikingly well in the example of a man driving while keeping his attention focused on the car to one side of the windshield. If the car in front of him slams on the brakes, the brain sends an alert that forces the man to pay conscious attention to the car in front of him... if there was no unconscious

processing, the man would have only been able to follow events that occurred within the area he was currently conscious of. This function has nothing to do with memory or repression... just the computational abilities of the brain outside of conscious awareness. Nothing mystical or occult, just good hardware design.

Brannon Smith

reply: There is little point in my exploring unconscious processing of mundane data while criticizing the Freudian view of the unconscious mind. And you may be right that modern psychology treats the unconscious mind as simply the non-conscious processor of mundane information. If so, that is too bad, because there is sufficient evidence to support the belief that implicit memories do affect conscious thoughts and actions.

18 Feb 1998

Your new entry on "the unconscious mind" is as interesting as the rest of your Skeptic's Dictionary. However, I am having trouble with your narrow definition of the unconscious as "a mythical 'part' of the mind which stores repressed memories."

Although I am not a native speaker, I would describe, for example, a nervous person constantly fiddling with his pen in a conversation without thinking or being aware of it, as doing it "unconsciously". I would also state that, if I make a decision based on a vague feeling of preference (e.g. for a certain type of car), I may be "unconsciously" influenced by certain facts about car makers that I have neither repressed nor forgotten, but that I am not explicitly thinking of at the time.

I am sure you will not deny such mechanisms exist, but it appears that you have a different word for them. Which is it?

Holger Maertens

Germany

reply: Daniel Schacter and Endel Tulving introduced the terms 'implicit memory' and 'explicit memory' in their attempt to find a common language for those who believe there are several distinct memory systems and those who maintain there is only one such system. (See chapter 6, "The Hidden World of Implicit Memory," in Schacter's *Searching for Memory*.) The kinds of memories you are referring to are *implicit memories*. Schacter writes: "The nonconscious world of implicit memory revealed by cognitive neuroscience differs markedly from the Freudian unconscious. In Freud's vision, unconscious memories are dynamic entities embroiled in a fight against the forces of repression; they result

from special experiences that relate to our deepest conflicts and desires. .
. [I]mplicit memories . . . arise as a natural consequence of such everyday
activities as perceiving, understanding, and acting." (pp. 190-191)

subliminal

16 Dec 2000

Your essay on subliminal messages has a reference to the "RATS" that was "inserted" into a republican political commercial. In my opinion this is a perfect example of how the media cannot only distort a truth but take something that was never true in the first place and "make" it "true".

I subscribe to TIME, NEWSWEEK, PEOPLE, US WEEKLY, and I read the daily newspaper. I also visit some Web news site like IWON, ABCNews, and the like. When this story "broke" not one of the daily news sources I read mentioned the fact that the RATS was part of the word BUREAUCRATS that scrolled on the screen from right to left and that the image of the word RATS that was published all over the world was done by freeze framing it at just the right split second so that only those letters were seen on the screen. Every picture I saw was then taken of the entire TV screen with the word RATS on it. This made a very innocent non story seem sinister.

It wasn't until a couple of days later when I got my weekly magazines that I read about the word bureaucrats. I don't watch TV News so I don't know how they handled it, but since news sources all seem to get their information from just a couple of news services and each other I doubt they did any better. Since you did not mention any of this in your essay I thought I would let you know just in case you had not read about it. (I don't mean to imply that you are not well read or informed. I say that because although, I don't remember exactly, I think it was PEOPLE or US Magazine that actually had the whole true story. I went on the Web to see if I could confirm this and found a video clip of the entire commercial at Salon.com).

My father always used to say "Don't believe anything you read and only half of what you see". Almost 20 years after his death I wish he could see some of things going on in the media today and see how right he was.

I know! I'll go see [John Edward](#).

Thanks for the great site. I am almost done reading the Skeptic's Dictionary. Like getting near the end of a great book, I am reluctant to turn the last page and I look forward to the updates.

Lori

reply: Thank you for the update!

substance abuse treatment

16 May 2000

As one of those professionals (social worker) who works to provide lifestyle alternatives to suffering addicts and alcoholics (however you choose to define them). I maintain a bit of skepticism myself regarding the motivations and methods of many treatment programs, and my experiences regarding mental health professionals is that a large number of them are working their own issues out on others, especially their clients. This, however, does not excuse your misdirection, disingenuousness and downright dishonesty in your diatribe regarding alcoholism. The problem with your writing is, although you present some valid points, you disqualify yourself by your either dishonesty or misunderstanding.

Here are just a few:

- 1. AA does not regard alcoholics as victims. Quite the opposite. What is said is that it's not their "fault" they have a "disease," but they are absolutely responsible for all their actions.*
- 2. There are indeed other "diseases" which are similar to alcoholism in that others need to provide the diagnosis...how about schizophrenia, or other mental illnesses where denial is an essential component. You do believe that denial as an ego defense mechanism exists, don't you?*
- 3. I'm not sure whether or not alcoholism is a disease, and don't much care. When I see someone doing something compulsively (i.e.: they can't seem to stop even if they want to), I know that help will often need to come from others. Is spontaneous remission possible...of course....just like with any other malady or "disease."*
- 4. AA says that alcoholics are powerless over alcohol, not everything. This is in terms of taking that first drink and then going off on a binge, etc. Maybe none of it is really so, but AA says that they aren't bad people getting good, but sick people getting well. They also make it clear that, despite their common belief in a God (of some kind), it's not required for membership.*
- 5. AA is not alone in believing in spiritual power...the power of God. In fact, probably most of the people in the world believe in it...what's wrong with that?*

I could go on and on. I've witnessed good treatment and bad treatment, and I think most of it is bad. I think AA works for some and not others. I have no investment in any of this crap, but it irks me when dishonest people masquerade as "skeptics." Unless you are just remarkably ignorant...which is, I'll admit, what I think is really the case.

By the way, we don't diagnose alcoholism by how much or how often one drinks. Check out your DSM IV (if you have one). The criteria are pretty much behavioral. And, by the way, your implication that interventions are in the employ of sleazy treatment programs is also a misdirection....most of them aren't, and there are other models of intervention which don't ambush the "client."

For you to maintain that you'll only consider your perspective and what supports that is so bizarrely anti-honesty that I can't believe anyone really takes you seriously. Frankly, I suspect that those who truly believe your obviously biased half-truths are really not interested in reality anyway.

I'm not even sure why I've wasted my time with this, other than I'm bored with nothing to do for a few minutes.

James Sandel, MSW

reply: You probably just felt the need to vent. Social workers need social workers to help with the stress of dealing on a daily basis with desperate people, people who won't or can't help themselves, people in trouble through no fault of their own, mentally ill people who self-medicate with alcohol, cocaine, heroin, crack, crank, etc., to the point where nobody can tell what their problem really is.

If someone I know and love called me dishonest, I'd be hurt, but when a total stranger calls me dishonest, I start thinking of my college psychology professor's lecture on projection and defense mechanisms.

Calling alcoholism a "disease" and comparing it to schizophrenia or obsessive-compulsive disorder is about as useful as calling crime a disease. Choice is the key difference here, not denial. The mentally ill don't choose to be neurochemically imbalanced. The alcoholic and the criminal choose their behaviors. (By the way, just because someone is mentally ill, does not mean one has no choice in what one thinks or does. Many mentally ill people know what they are doing, do things they know are right or wrong, and can control their behavior. I think the model used by our courts, which forces a decision 'sane or insane', is mistaken. I think there are degrees of insanity and degrees of responsibility for insane persons. I would not give a person a "do anything and never go to jail" card simply because he or she was mentally ill.) And even if it is true that alcoholics have a [genetic tendency to abuse alcohol](#), it doesn't follow that they don't choose their

behavior any more than it would follow that a genetic predisposition toward pedophilia would imply that pedophiles don't choose to act on their desires. It may be more difficult for a genetically predisposed person to overcome their desires than for someone not so predisposed, but that only implies that people who don't have a predisposition to abuse children or alcohol don't deserve any special praise for being so virtuous. A genetic predisposition to behave badly does not mean you cannot be a bad person for making the choices you make.

Just because the alcoholic or drug addict has a pathological dependence on booze or other drugs doesn't make them 'sick'. The psychologists and psychiatrists, the authors of the *DSM IV [Diagnostic and Statistical Manual of Mental Disorders]*, have co-opted the language and with each new edition have created more 'illnesses' for them to treat. Just because they call homosexuality an illness, doesn't make it one (as they did in the second edition of the DSM). On the other hand, I don't agree with those who think that alcoholism and schizophrenia are not diseases because there is no agreed upon physical test or symptom for identifying the disease, as there is with things like measles or cancer. I think it is absurd to argue, as some have, that [mental disorders are not diseases](#) because they are defined by behaviors that others disapprove of or are annoyed by and are therefore nothing but value judgments.

Despite the claim by some experts that there is no evidence for a biological or genetic cause of any mental illness, there does seem to be such evidence. For example, about one percent of the population in America suffers from schizophrenia, yet the chances of being schizophrenic double if you have a cousin who is schizophrenic. The chances quadruple if you have an aunt or uncle who is schizophrenic. If a sibling is schizophrenic, the chances increase ninefold. If a parent is schizophrenic, there is a 13 percent chance that his or her child will have the disease. And if one identical twin is schizophrenic, there is a 50 percent chance that the other one is too. Does the data support a significant genetic causal factor here? I think it does.

Even so, I don't claim that only physical disorders can be called illnesses or diseases just because traditionally physicians have treated illnesses and they define them by their physical causes or symptoms. A person is more than a body with moving parts. I see no reason why it would be intrinsically inappropriate to speak of mental, psychological or emotional illness or disease. An illness or a disease is a malfunction of an organism. We may not know exactly what consciousness is but we do know that there is a relationship to the human organism's ability to function and its physiological response to emotional trauma, for example. We don't necessarily have to treat a traumatized person with drugs or tell them to wait for two weeks and the symptoms will subside. Dealing with the emotions by a variety of psychological interventions may in fact restore the organism's vitality. To refuse to call the person ill because the cause of their dysfunction was not physical seems to be mere quibbling.

But if the cause of a person's dysfunction is a chosen behavior such as abuse of drugs or alcohol, there seems to be something screwy about calling the tendency to make such a choice an illness itself. Using alcohol is not dysfunctional. Abusing alcohol renders one dysfunctional. Helping a person change the way they use alcohol is more like helping a person break a habit than it is like curing a person of a disease.

I may be wrong about this, but that's my honest opinion.

19 Aug 1999

Hi there. Very nice entry. It reminds me of my own experiences. Nearly 20 years ago I had developed a moderately severe drinking problem, one that ultimately resulted in my being expelled from college. Not long afterward, a friend brought me to an AA meeting. For the short term, it worked. But once I was back on an even keel, I started to see AA as a monumental waste of my time. Then there was the religious angle, which as an atheist I found difficult to swallow. So I stopped going. I went back to school, and managed to go through it (and get my degree) without touching a drop of alcohol -- all without AA support.

Now, AA's chapter-and-verse will tell you "once an alcoholic, always an alcoholic", and that even if one has been sober for years, one drink will bring all of that success crashing down. I can tell you that this is, at least for my experience, a load of crap. Not long after I finished school, I had a drink. As in, one drink, after which I switched to soda.

Nearly 20 years later, I have been able to keep that same pattern: have one (two, on rare occasions) drink, then change to something non-alcoholic. The last time I got drunk was about a week before that first AA meeting. Sounds to me like I've managed to cure my problem.

-- g

17 Aug 1999

First, thanks for creating this site-it's enjoyable and informative.

One of AA's traditions: "The only requirement for membership is a desire to stop drinking."

I joined AA out of desperation-my drinking was out of control and destructive-DWIs, job loss, physical problems.

I might have sought AA's help sooner, if not for the mistaken belief that it was a Christian organization that required a belief in the Christian God. It was certainly founded by Christians, and there's a lot of "God" in the literature, but it's evolved to a much more inclusive program where all who desire to stop drinking are welcome. I think you do a disservice in suggesting that AA says it's necessary to substitute "God-addiction" for alcohol addiction in order to recover.

I'm a skeptic in the God arena, but a believer in the power of shared experience in AA meetings. This, I think, is the real power of AA-to know that you're not alone, and that others have to stop drinking and find serenity.

Thanks for listening.

Hugh Vandervoort

reply: Not all AA groups are created equal. Some are obviously less forceful than others regarding belief in God as a necessary condition to get sober. There are, however, alternatives to AA, which eliminate the need to find out whether religion is going to be an issue in seeking sobriety with a particular group.

25 May 99

Interesting book, although I sometimes think you fall into a kind of Randian Ubermensch trip here & there, but we're all allowed our little flaws.

I thought I'd share a bit about my AA/Al-Anon (more the latter) experiences, 'cos I think you're tarring them a bit too heavily with the theism brush here. Experiences vary, obviously, but my experience with Al Anon is that their idea of God isn't exactly theistic. I knew one Al Anon group that was largely atheists.

My general experience has been that Al-Anon and AA see god as a metaphor. There's a tendency for alcoholics and their families to start to see everything in a hugely imbalanced, fairly control-freaky fashion. Everything that happens is perceived as a personal fault & judgement. Mom's drinking is your fault, wars in Bosnia are your fault, messy rooms are your fault and so on. It can really wrench a person internally, and one of the things you have to learn to do is differentiate between what's your fault (and responsibility) and what you can't do anything about. I've seen a lot of satires of Al-anon where it's described largely as a blaming group. My experience has been that one of the things you have to learn to do is stop worrying about problems that aren't connected to you.

Enter God. God's more or less a convenient place to hang problems that you can't really touch, and worrying about those problems doesn't do me (or anyone else) much good. God's job is to take care of the bigger problems so I can

concern myself with my own. For example, I can't do much about an alcoholic's drinking, I can hide booze, but that isn't going to fix the problem. If the alcoholic's going to do something about it, it's going to have to be his decision. Interventions, in that context, are largely useless. In AA parlance, there's a term called 'dry', which refers to an alcoholic who is basically between drinks. Dry people aren't a pleasure to be around, since they're basically alcoholics who've gotten religion. There's a distinction between dry and sober, and it's one that most people who haven't been through it themselves have a bit of trouble grasping. If you've ever been around anyone who is on a diet and makes you change your eating habits, you've got the gist. What interventions, court ordered detox programs and the like tend to do is irritate the alcoholic, which doesn't really solve the problem. You might get 'em dry, but sobriety is a matter of personal choice. Which is a large part of the paradox - alcoholics have to make a decision to become sober, and it's not really something that comes easily. Whether it's a Saul Of Damascus experience or not, I really can't say, I've heard people talk about moments of clarity, but I also know people who just eased into it over the years.

I guess the thing that surprises me the most (and you may want to pursue the literature in and out of AA on this), is that the organization is markedly different from, say Syanon or one of those culty groups. My experience with Al-anon is one of a marked lack of ego - AA is similarly goal oriented. The major focus of both organizations is to help folks (drunks or the families of drunks) to get on their psychological feet and get on with their lives. If you can do it without AA, fine with them, most of the AA folks I've known really don't care how you get to sobriety, as long as you eventually get there. I know culty, and these organizations really aren't culty - either that or I was too cheap to buy the photocopied promotional material. (Actually, promotional material isn't the right word. I've never actually seen Al Anon boost anything. Guidebooks is probably a better term).

Michael Collins

18 Nov 1998

Let me start by telling you that I am a member of AA. I am the oldest child of a UCC minister, who pretty much rejected a GOD by the time I was sixteen, not uncommon for the offspring of ministers. At fifteen I started drinking alcohol and experienced my first blackout, if you have never had one they are a strange experience, it was not until I turned 18 that I was able to drink legally and thus as often as I wanted, before that it consisted of whenever we were lucky enough to get some beer.

I experienced blackouts pretty regularly at that point, with no consequences in my life, until at age 24 I got my first drunk driving, I swore that I would never do that again, but of course did, with in the next three years I would be arrested two times more before realizing that I could not drink successfully.

In your treatise you state that an alcoholic is defined by a number of factors, when , how much etc. While this may be how treatment centers define it, it is not how AA defines it. In the big book of AA an alcoholic is defined as what happens after you take the first drink.

reply: I don't see any inconsistency here.

This rang true with my experience of drinking. Once I had taken the first drink I might stop there, or I might not stop for a day, I never knew, and once having taken that first drink had no control. If you are not an alcoholic this is probably difficult to believe, but it was my experience.

The AA big book differentiates between people who may drink a lot, by whatever scale you want to use to measure that and people who lose control of their drinking after taking the first drink.

The intervention practice you wrote about also goes against AA philosophy and is one that I have many problems with in the end a lot of times it does do more harm than good. The AA traditions are explicit about the program being one of attraction rather than promotion and at no time should anyone be forced to take the program.

reply: True. And by the same token, non-theists ought to be aware that just because the 12-step plan works for some people does not mean it is the best for them.

The steps of AA work for some reason that I cannot explain, I do not feel that they are in any way demeaning and the concept that AA tells people that they are worthless and need to tell the world that has not been my experience. Human beings are emotional as well as logical people, the steps in my experience are designed to help identify those areas of emotional/spiritual pain, without that knowledge one cannot fix the problem, you would not renovate a house with out first checking out what needed to be fixed , the steps work in the same way with the human psyche. As well there is nothing new in the AA program which was pretty much borrowed from traditional organized religions. The real difference in AA is the fact that it is one alcoholic relating to another.

I thank you for your time and listening to me, also for the efforts you have taken in your work. I hope that what I have written makes some sense.

Rod Lowe

12 Mar 1997

I read your article on Substance Abuse Treatment. I can't disagree with anything in it, and your points about being skeptical about the disease

paradigm of alcoholism and the treatment process, as well as your point about "all alcoholics not being equal", are well taken. With all due respect, however, there were places where I thought the article might benefit from editing or rewriting:

reply: Somehow, I knew this was coming!

1. If you are going to include Tim's story, I did want to know about the end of the story. Did he quit drinking? Did he not even need to? Did he get a divorce? Did he live happily ever after?

reply: Tim's story is here to illustrate the dangers of good-willed interventionism, pseudoscientific therapies for substance abuse, and greed. Obviously, Tim's wife believed he needed to quit drinking. Tim says he "sometimes abuses alcohol." They're still married, thought the interventionist/clinic experience has left a bitter aftertaste which has not diminished much in three years. As for living happily ever after....well, the point of the illustration was not to show that his life had been ruined or improved by the experience, nor was it to support the claim that SAT in general ruins or helps lives, so, whether Tim lives happily ever after or not will have to remain a great mystery known only to Tim.

2. About Tim's story: do you think that it presents your point about SAT well? It seemed to veer off into a criticism of Tim's experience. I had three problems with it:

a. It was a single anecdote. I am skeptical of the inclusion of anecdotes in critical articles. I won't say that it was a waste of space but ...

b. Even as an anecdote, it didn't really make a good point. Was it the fuzziness of the "disease" definition, or was it the inappropriateness of his "treatment", or was it the expense, or the damage to Tim's ego or another part of the anecdote that was the point?

reply: The point of the illustration is described above. Sorry it's use wasn't clearer to you. It is an anecdote, but it is used to illustrate not to prove anything. It was there to vivify the material, not to validate my critical comments. I hope other readers don't find it quite as useless or fuzzy as you do.

c. We don't really know the whole story about Tim. It was told from his point of view to an unknown observer. There may (or may not!) be another point of view that presents more details that leave the reader with an entirely different impression.

reply: Exactly. That is why the article is not primarily about Tim and his drinking problem and how he worked it out and is now living happily ever after. As I indicate in the article, I have only Tim's subjective impression

that his drinking was not as serious a problem as others thought it was. So I make no claims about whether his impressions or that of his wife were more accurate. It should not require too strenuous an effort to infer from the article that there were quite a few people who had a very different view of Tim's drinking than Tim's own view. And I'm sure the interventionist does not see herself primarily as someone paid to deliver a live patient to the clinic. I think most readers will figure out these things and that the staff at the clinic would have a different point of view from either Tim's or mine.

Finally, alcoholism and substance abuse in general are pretty subtle phenomena. I think they deserve, perhaps, a bit finer brush than you were using.

reply: The article is not really about alcoholism or substance abuse, but about *treatment* for alcoholism and substance abuse. Even so, your point is well-taken. The issue could be, and deserves to be, explored in great depth by someone whose art of criticism and depiction is much greater than mine. I suggest you read some of the sources mentioned in the "further reading" section below.

Please don't take this as a reaction objecting to your inclusion of the article; it's more a reaction to coming away with an impression that the article wasn't up to the quality of the rest of the dictionary.

Mike Coldewey

reply: I appreciate the criticism and will take your final remark as a backhanded compliment meant to inspire me to greater heights.

20 Mar 1997

*I just read your article in the **Skeptics Dictionary** about Substance Abuse Treatment. I also think the emphasis on religious content in these programs is unwarranted. However, what I wanted to share with you is this - I am an astronomer, and teach part-time at Baldwin-Wallace College in Ohio. When looking with my students through the telescope, I sometimes find that the magnification is insufficient. It is only then that I get some satisfaction from appealing to a "higher power."*

Dr. Dale C. Ferguson

09 Apr 1997

I have been greatly enjoying your skeptic's dictionary, and I was particularly interested in the entry on substance abuse treatment. I agree with virtually everything you said in it, however, there was one section which may be weak. here it is:

If alcoholism is a disease, it is the strangest disease there is. What other disease is there which requires coercive teamwork to convince the sick person that he or she is ill? If I have kidney disease, for example, I expect a certain kind of evidence to be produced to verify that I have such a disease. A few bits of medical evidence ought to suffice. I sure wouldn't need a team of interventionists to coerce me into seeing that I have kidney disease.

Though some people question whether mental illnesses are diseases, many of them easily fall into the category of diseases that require coercion in order for the sick person to accept that s/he is ill. This is often due merely to the general lack of knowledge about mental illness in our society, but at other times may be caused by the illness itself. For example, very few people with paranoid schizophrenia will admit that they have a disease. Though I question the veracity of many mental illnesses as being true diseases, I have little doubt that schizophrenia is an illness, or at the very least a developmental aberration. Simply put, schizophrenics have different brains than non-schizophrenics. Exactly what causes schizophrenia is a mystery, but it has been shown that there are differences in the mass of certain brain regions in schizophrenics and "normal" people. Bipolar disorder (manic depression) is another mental illness which is organic, and which is often denied by those who suffer from it. This may be due to misunderstanding of the disease, fear of stigmatization, or any of a million other reasons. Bipolar disorder and schizophrenia are the only mental illnesses which have medications to treat them that are proven to be effective. The effectiveness of antidepressants is generally no greater than that of psychotherapy without medication. Certainly not everyone with a mental illness refuses to admit it, but some do, and there are quite valid reasons for not admitting to something like this. It's really a minor point, but it harms your argument that alcoholism is not a disease.

reply: I don't think it is a minor point. The analogy between brain disorders and alcohol abuse is a stretch. Some people do have problems metabolizing alcohol and cannot drink without having problems. Such people are not brain damaged and should be able to understand the medical evidence presented to them. Even the genetic argument--that some people inherit a genetic tendency to alcohol abuse--does not amount to more than a claim to a *tendency*. In any case, it does not involve the notion that one's *brain* can't function properly. The only medication given for alcohol or drug abuse are either more drugs which can be abused (such as methadone for heroin users) or drugs which make one physically ill if one drinks alcohol. Such treatment is trivially analogous to treating schizophrenia: both involve prescribing a drug. On the significant issue of brain or other physical dysfunction or damage, there is no strong analogy. In alcohol abuse the most noticeable physical elements are *effects* of the abuse; in schizophrenia and other diseases, the significant physical

elements are *causes*.

One would expect that a disease which significantly affects the brain, whatever that disease, could be of such a nature that the affected person would not be capable of rational evaluation of evidence, including evidence of their own disease. There are people who have drunk so much that they have caused themselves significant brain damage, but that is a far cry from identifying all people who abuse alcohol as having a diseased brain.

Additionally, I'd just like to suggest that you might include as an entry the D.A.R.E. (drug abuse resistance education) program that has become ridiculously popular in this country despite being utterly ineffective. There is a wonderful source of information about it at <http://www.dare.org> despite the name, this site is in absolutely no way affiliated with the dare program. It is a very impressive site. [note: Reader John P. Brockus alerted us to the fact that D.A.R.E. has taken over the site and it is no longer a parody of the program many have [criticized as a scam.](#)]

the sunk-cost fallacy (“throwing good money after bad”)

When one makes a hopeless investment, one sometimes reasons: *I can't stop now, otherwise what I've invested so far will be lost.* This is true, of course, but irrelevant to whether one should continue to invest in the project.

Everything one has invested is lost regardless. If there is no hope for success in the future from the investment, then the fact that one has already lost a bundle should lead one to the conclusion that the rational thing to do is to withdraw from the project.

To continue to invest in a hopeless project is irrational. Such behavior may be a pathetic attempt to delay having to face the consequences of one's poor judgment. The irrationality is a way to save face, to appear to be knowledgeable, when in fact one is acting like an idiot. For example, it is now known that Lyndon Johnson kept committing thousands and thousands of U.S. soldiers to Vietnam *after* he had determined that the cause was hopeless and that the U.S. could never defeat the Viet Cong.

This fallacy is also sometimes referred to as *the Concorde fallacy*, after the method of funding the supersonic transport jet jointly created by the governments of France and Britain. Despite the fact that the Concorde is beautiful and as safe as any other jet transport, it was very costly to produce and suffered some major marketing problems. There weren't many orders for the plane. Even though it was apparent there was no way this machine would make anybody any money, France and England kept investing deeper and deeper, much to the dismay of taxpayers in both countries.

swastika

The swastika is a symbol representing the Nazi party and all of the evil that party stood for: anti-Semitism, the Holocaust, hatred of homosexuals, desire to eliminate the handicapped and infirm, etc.

It wasn't always that way. The swastika is an ancient and frequently recurring symbol, found in many different cultures during many different times. One can find the swastika associated with Hopi Indians, Aztecs, the Celts, Buddhists, Greeks, [Hindus](#) (swastika derives from Sanskrit and means *to be well*), etc.

Whatever and however noble its ancient heritage, the symbol of the swastika has been forever tainted in the West because of its Nazi association.

Some occultists think the swastika has special value because it is found in many cultures that were unaware of each other. How can this be, they ask, unless there is some universal significance to the symbol? Easy. The symbols that are called swastikas are often [quite distinct](#). Drawing a straight line with perpendicular arms at each end going in opposite directions is one of the simplest drawings possible. Like the cross and the circle, it should be expected to be found repeatedly because of its simplicity. Swastikas are just variations on this theme. Several swastika designs cross 3-line figures. The Nazi has the arms going to the right and tilts the figure so that the tip of one of the arms is at the top. The [Jain](#) is the same, only it is not tilted. Other so-called swastikas have no arms and consist of crosses with curved lines. Some symbols look more like propellers than swastikas. The [Aztec symbol](#) looks like a stylized version of Notre Dame's fighting leprechaun. The [XFL Football League logo](#) looks like a medieval weapon. The so-called [Celtic swastika](#) hardly resembles a swastika in any significant way. The Buddhist and Hopi swastikas look like mirror images of the Nazi symbol; perhaps this is because the Hopi and Buddhist symbols are signs of peace, prosperity, good luck and love, not hate and bigotry.

reader comments:

takionics

23 Jul 1999

Just to let you know that the "tachyon" crowd were last seen operating from the Osho Commune (used to be the Rajneesh Ashram) in Pune, India. Perhaps the Osho phenomenon needs some skeptical investigation too, though it cleverly avoids making any overt pseudoscientific claims.

JS

23 June 99

How can you explain benefits experienced by users such as those described below in the actual words of the users? Forget the "New Age Pseudo-Science" as you describe it. What about results people obtain? The following are unpaid, unsolicited testimonials from real, live people, commenting on results they obtained using Takionic Products. Science can argue the validity of theory, but you can't argue about benefits people obtain.

Fred Pulver

[Mr. Pulver attached his testimonials page, which may be seen at <http://www.macrobiotic.org/health13.html>]. It includes high praise from Gary Null, the current darling of public television's New Age health gurus, and Curtis Sliwa, founder of the Guardian Angels.]

reply: Contrary to what you think, we can argue about the both the benefits people obtain from takionic products and the claims themselves. [Testimonials](#) are not a substitute for scientific studies, which are done to make sure that we are not deceiving ourselves about what appears to be true. It is especially necessary to do controlled studies of alleged pain relievers to avoid [self-deception](#) due to the [placebo effect](#), [post hoc reasoning](#) or the [regressive fallacy](#). We may not want to question too deeply the felt relief, but we must question the *cause* of that relief.

Also, while many of the testimonials for products like yours are honest and heartfelt, some are not. The promoters of products like yours do not check on the accuracy of testimonials, nor do they ever report the letters of those who claim the products did them no good.

Advertising claims are never acceptable in place of scientific studies done by independent researchers, i.e., those who do not have a financial stake in the outcome of the studies.

To claim that something is good because it works, when you don't know either that it does work or, if it does, *why* it works, is to commit the [pragmatic fallacy](#).

*Mr. Pulver replies:
26 June 1999*

I have not received any letters to date from anyone who claimed the products did them no good. I do believe in the product, because I have witnessed and have heard nothing but good reports from everyone who has used them. My father graduated from MIT, and is as sceptical as they come. The only reason he tried them is because I was his son, and he was willing to humor me. However, he claims they helped him eliminate pain he was experiencing in his toes. He was quite amazed at the results he obtained. He is in his 80's now. Can you really say it is wrong for me to be promoting something that is reported by the users to be of benefit? Is the criteria of user benefit not adequate just because of the possibility of placebo effect, post hoc reasoning or the regressive fallacy?

reply: Your reply is a refrain I'm sure many snake oil salesmen have used to comfort themselves as they traveled from town to town selling their quack remedies. What about the old man who has a pain here or there and tries out your takionic beads and then dies because he didn't seek proper treatment for his cancer? Of course, he didn't write to you to tell you the product did him no good. He's not writing to anyone from six feet under. Sure, he felt good for some time after wearing your beads. He even swore the headaches were hardly noticeable anymore. The tumor kept growing, however. Too bad; it was operable, too.

On the other hand, I see your point. What difference does it make if I lie or deceive someone, as long as I make them feel better? I can see the utility of such a principle in certain circumstances, but I don't think it's a good one to live by on a daily basis.

Many advances come about from people trying them, before they can be demonstrated or explained in a manner acceptable to mainstream science. Why should this be grounds for dismissal of their value? Do we all have to conform to the scientific method before we promote anything? Such rigidity seems counterproductive and illogical to me. There are many instances -- I am sure you can think of many -- where science comes in to try to explain things that seem to defy scientific explanation. Thanks to such phenomena we have new breakthroughs in research and theory. Why can't such an attitude be extended in your way of thinking to Takionic products? It would not be hard for you to

put some of the Takionic products through a trial to prove whether they are of any benefit or not, wouldn't it? After all, it is you who are challenging them. Would not such a methodology give your sceptical essays more weight than dismissing them from an "armchair" approach? That is totally unscientific. Scientific method as I understand it consists of conducting experiments to prove or disprove a suspected hypothesis. If I did them, you would probably consider them flawed. Therefore, why don't you conduct them?

*In the interests of truth, I remain,
Sincerely yours,
Fred Pulver*

reply: Testimonials from satisfied customers are not equivalent to demonstration. Anyone who claims curative powers for a product should be able to demonstrate by scientific tests that the product not only cures but also must note any harmful side effects. To the quack, this is counterproductive and illogical: to make them demonstrate the efficacy of their products before they market them is an insult to their genius and deep love for humanity! To the critical thinker, both logic and decency demand that an allegedly curative product be scientifically tested before it is marketed.

The burden of proof is always on the developer of the product, not on the potential consumer. It is not my duty to prove your products don't work; it is your duty to prove they do.

You are wrong to dismiss my argument that your products are not to be trusted without scientific testing as "totally unscientific". The skeptical attitude is a necessity for scientific thinking. Without it, we become prey to fundamental human weaknesses such as [wishful thinking](#) and [self-deception](#). [Controlled studies](#) are required to limit errors in causal reasoning. Also, critically thinking consumers should be skeptical of fantastic claims backed by nothing but testimonials from satisfied customers. Some promoters of fantastic products are unscrupulous, in it only for the money, and do not care that the products are untested or that the testimonials are dishonest. But even the promoters who are selling their products because they genuinely believe they are helping mankind should know that good intentions are no substitute for good science.

I would be suspicious if you did the tests yourself only if no one else could duplicate your results.

However, if you would be willing to part with about 25 sets of Takionic belts or beads, and make up a set that looks and feels just like the real thing but without the takionic treatment, I'd be glad to devise a protocol for testing your devises.

You and your supporters should read my essay: ["Dowsing for Dollars: Fighting High-Tech Scams with Low-Tech Critical Thinking Skills"](#)

In case you are not sure which claims I think you need to support, I will list them:

"Takionic products, with their aligned atomic polarities, enhance the body's natural ability to draw from the Tachyon Field for its energy needs."

takionic beads "have a unique ability to emit photon (light) energy from the far-infrared spectrum [4-16 millimicron (um) wavelength]" (even if true, so what?)

'the Takionic belt ... helps improve poor circulation....'

"Hundreds of tests conducted on students and adults revealed that this unique headband improved their mathematical test scores by as much as 20-30%. The headband delays mental fatigue and heightens focus and concentration." (Where are these studies published?)

takionic massage oil brings "Pain relief, increased flexibility and range of movement"

Some of your claims are too vague to be cognitively meaningful, though they have very positive emotive meanings, e.g., your takionc water is "revitalizing and refreshing."

Maybe you have not heard, but the [FTC is cracking down on Internet sites](#) which make dubious claims for health products. I've forwarded your claims to the FTC. If they give you their seal of approval, let me know.

Mr. Pulver replies:

30 Jun 1999

Thank you for your prompt reply. I appreciate your concern, and mission, to help alert unassuming and gullible people to scams that take their money while offering no real value, or even delaying treatment that may offer more real results. You are providing an important and valuable service.

We are aware of the concerns you express, and for that reason do not make medical claims about our products. There are ongoing studies being conducted at the university level which, unfortunately take time to complete. We will keep you informed of their outcome as they become available.

Have you read "Vibrational Medicine" by Richard Gerber, MD? Our products are more closely aligned with the traditional Oriental approach to health, which involves restoring proper energy circulation. As you may know, acupuncture is supposed to help in this regard because of the way it stimulates energy circulation. Acupuncture has been widely accepted as a legitimate modality. At first, however, it met with stiff resistance until a large number of cases that had shown improvement were well-documented. We are in a similar, preliminary phase of gathering data and documentation to support the theory.

Until such a time, however, we try to be careful not to promote Takionic products as alternatives or replacements for conventional therapy. In this regard, we wholeheartedly agree with you about the importance of making this distinction as clear as possible so that people will not be misled.

Again, your efforts in this regard are appreciated.

Fred Pulver

reply: Contrary to what Mr. Pulver claims, the data supporting acupuncture is not strong except for a very limited role in temporary relief of some types of pain.

tarot

30 May 1998

...regarding tarot cards -- I have a deck and have done readings for fun, and been astounded by the results. M.A.s, M.S.W.s, R.N.s, M.D.s, and PhDs, despite being told that the cards have no power and neither do I, still manage to make the cards fit their lives, no matter the mental contortions necessary. Or, they just refuse to have their cards read, for fear of evil spirits or some undefined connection with Satan. I suppose the joke's on me, for having thought an education necessarily created a more critical mind.

Your dictionary is a wonderful thing. Many thanks for having created it (my jaw literally dropped open while reading the firewalking entry).

Lisa

What a great job you've done on this dictionary! It has taken me several days to read through it, and I will be back.

I must agree with a recurring theme of yours - how fervently people want to believe even the lamest crap you can imagine. Years ago, I used to read tarot cards. I always told people that these were just pieces of paper and that this was just a party trick. It didn't matter. I was informed repeatedly that I did not have to be a believer myself for the spirits to channel through me. I could not convince them that I was a fake. I finally quit bringing my cards to Halloween parties because people refused to NOT believe in me.

Keep up the good work.

Leslie Steach

18 Apr 1998

*If you're interested in (an attempt at) a critical history of occult tarot for use as a reference, check out *A Wicked Pack of Cards* by Decker, Depaulis, and Dummett (New York, St. Martin's Press, 1996).*

The lords/ladies/servants titles are not seen on the more popular tarot decks

today. The agriculture/warriors/clergy/commerce attributions are also somewhat out of line with the notions popular among most tarot practitioners today.

Suits in playing cards most likely antedate tarot. It's probably not accurate to say that today's 52-card deck was derived from tarot. (See Decker/Depaulis/Dummett, preface p. ix.)

Although exact details of the origin of tarot are not available, it most likely originated in Italy around the early 1400s. Cartomancy in western Europe doesn't appear to have been popular until long after that; tarot was mainly a game for some time before it was popular for fortune-telling. (See Decker/Depaulis/Dummett, p. 47.)

Cards can be used as a projective test--as an ambiguous stimulus. Our minds often languish in iterative thought patterns, and a tool of divination can be used as a jolt to suggest other approaches to the matter at hand, as suggested by the I Ching's subtitle ("The Book of Changes"). Of course, many users of divination tools don't see it this way at all, and instead impute fantastic powers to their tools.

Tom Ace

reply: I don't doubt that cards, sticks or ink blots can be used as a projective test. Nor do I doubt that such items could be used to jolt the imagination. I just think there are better ways to go about the task of understanding and stimulating ourselves.

16 Oct 2000

i read your "analysis" of homeopathic medicine, weak my friend, you represent every close-minded narrow thinking american in this hallowed land, and we wonder why the rest of the world can't stand us, may be it is because we have attitudes like yours, homeopathy works, it is not pseudo, it is not placebo, i spent a year searching for what ailed me, i went to allopathic doctors who kept pumping me with chemicals, finally i went to a homeopath, who understood my disease, and healed my body, i am not saying traditional medicine is no good, there are wonderful medicines, and techniques available today, i am saying there is more to healing than what your pharmaceutical companies want you to know, how else are they going to get rich, learn the history sir and pull the wool from over your eyes, there is more to life than antibiotics, and antihistamines, and steroids, and decongestants, and all other toxins we put into our bodies in our lifetime,

larry montgomery

reply: Just because doctors couldn't cure you and you feel good now, after going to a homeopath, doesn't mean homeopathy works.

17 Oct 2000

This is to inform you that though you may very well be entitled to your opinion, so are all the other folks in the world. Just browsing through your pages has not interested me to finish reading everything (although I know I should and some day I might). I'd rather put my faith in God first and therapist who care about humans as a whole person, than see a doctor who only cares about kick backs from a drug company and all the riches it may bring. Riches that I might add, does not last forever and does not bring happiness. I have seen my mother die of cancer. The process took over 18 months. The hospitals poked and jabbed her with needles and probes until she couldn't take it anymore. They offered no help to heal her in the way she needed. Healing comes from within, not from a pill. I wish that she could have encountered someone who could have healed her emotionally and spiritually, even though she knew she was going to die. The healing may not have helped her physically, but it sure would have helped in other ways. I know for a fact that the conventional ways did not help her in any way what so ever. All the treatments she went through only killed her faster than if she would have only taken pain pills that was prescribed to her at the end while she was on hospices. Healing is not about taking away the surfaced problem, it is about

getting to the root of the problem. Most physical pain and it's problems comes from ourselves, we or other people put too much stress on our bodies. Which in turn breaks down the immune system. Therefore, as you already know, causes colds, flu, and disease. The doctors fear that these new (but old) ways may take their place. This is not the case. We as human beings will always need a doctor for something in our lifetime. Progress can be good, only if we use it for the good of ourselves and others. This means not to have temptation for material gains as our motive. As for the therapist who do work with their hands to help others, more power to them . We need more human connection in this world. Look on the bright side, these healers can not poison you while they touch you, unlike the drugs that enter your body. Which, may I add, comes from doctors who like to be called healers. Was that not a term used for doctors long ago????? You may keep your opinions. And may I suggest that if ever you feel out of sorts, which is a sign from your body that it needs to rebalance its self, Give one of these healers a try. What do you have to lose, besides a little money. The doctors take it from us a 100x faster then they do. Anyway you can't take gold and silver with you when you die.

Entitled to my opinion too, thanks for your time.

Kathy

reply: As badly as doctors and hospitals may have treated your mother, it doesn't follow that faith healers are trustworthy.

[therapeutic touch](#)

reader comments:

therapeutic touch

14 Jun 2000

Your article on Therapeutic Touch shows clearly your arrogant disdain for this healing system you appear to know little about. I have found closed minded skeptics rarely learn anything, how can they? their minds are closed. Case in point, a new instrument has been developed that reveals in great detail the subtle energy field that surrounds all live human beings and indeed all living things. I say live because those dead bodies that were scanned had no energy field around them. If you can squeeze open your mind a few mm and go to www.spiritnetwork.com/indexinsts.html and look at the bottom of an article entitled Human Energy Fields you will find an example of the changes in this field when two pairs of tt hand are placed on the body. This experiment has been repeated many many times in UK. If you were the tt "expert" you claim to be you would have known about this system, it is at the leading edge of energy healing research.

reply: I am aware of this "system" and [have commented on it with disdain.](#)

I don't expect an answer to this email, after all no-one else will see it and if you ignore it you have nothing to lose and your reputation and integrity, what there is of it, remain intact.

*Best regards,
Chris Lovelidge*

reply: I agree that I have disdain for TT and other forms of energy medicine, such as [Ayurvedic medicine](#). I would call my disdain contemptuous, however, rather than arrogant. I do not admire people who are so open-minded that a vacuum is created whenever they speak. Case in point, your article on Human Energy Fields.

I encourage the reader to examine Lovelidge's [article](#). In the first few sentences, we discover that Lovelidge believes that thousands of years ago in India there were special people ("sensitives") who discovered energy fields known as [chakras](#) and that a modern [homeopath](#) in England ([Harry Oldfield](#)) can measure these energies with his invention called Polycontrast Interface Photography (PIP). Mr. Oldfield is also the inventor of [electrocrystal therapy](#), which allegedly diagnoses and heals diseases by stimulating [crystals](#) with high frequency electro-magnetic waves. His theory seems to be based on some sort of [sympathetic magic](#),

e.g., low frequencies are calming and high frequencies are stimulating. He thinks cancer is a low energy state and should be treated with high frequencies, while pain is a high energy state and should be treated with low frequencies. He claims he has proof that this electrocrystal therapy works, but his evidence seems to consist of [testimonials](#).

Oldfield was also an early believer in the diagnostic utility of [Kirlian photography](#), but has now moved on to the invention which Lovelidge thinks is proof that [chi](#) or [spirits](#) can be measured and that energy medicine is truly scientific. PIP uses a digital video camera and a computer to generate colorful images of people, plants, doorknobs, whatever. People like Oldfield and Lovelidge think these images reveal chakras, diseases, healing, etc. Look at the images from [Oldfield](#) or from another [Oldfield follower Mark Lester](#) or at [Lovelidge's](#) own images and you will see that they bear an uncanny resemblance to thermographic images. The images do reveal different energies, but they are electromagnetic, not chakras.

Tim Boettcher looked at Lester's images and wrote:

I examined the the photographs of Chakras ... and I noticed that the walls of the room and the chair seem to have their own energy fields, very similar to those of humans. This raises some questions:

- o Does that mean that these inanimate objects are alive?*
- o Was the red congestion of the patient in picture one transferred to the back of the chair in picture three?*
- o Does the chair feel congested?*
- o Should we form a Society for the Prevention of Cruelty to Chairs?*
- o How come the Chakras disappear right at his underwear line?*
- o Would "The Congested Chairs" be a good name for a rock band?*

If I didn't know better I'd think they were measuring minute differences in temperature.

Apparently, Tim does not take this stuff as seriously as Mr. Lester, who, in addition to PIP, also practices "[Electro-crystal therapy](#), [Rife treatment](#), [Bowen technique](#), Nutrition [??], [Remedial Massage](#) and [Oxygen/Ozone Therapy](#)."* He is quite the multi-tasker. He, like many other "alternative" scientists, is quite fond of quoting Schopenhauer: "All truth passes through 3 stages: First, it is ridiculed. Second, it is violently opposed. Third, it is accepted as being self-evident." He's

forgotten the fourth stage, however. "Fourth, while the rest of the world recognizes that it wasn't truth at all, pseudoscientists open a clinic or write a book based upon it."

I recently visited the [Exploratorium](#) in San Francisco and went through an exhibition called [Revealing Bodies](#). There were several exhibits demonstrating the application of technology to understanding health and disease, but no mention was made of Mr. Oldfield's invention. There was, however, one exhibit which seems to be very similar to PIP. A video camera films visitors and projects large images on a screen. The images look very similar to those Oldfield and Lovelidge think are images of chakras. I suppose I was misled by the stupid scientists who put together the exhibition. They think the images depict different light and heat frequencies, not chakras! What a bunch of dummies!

According to Lovelidge, in PIP photos

....chakras are visible in various detail depending on the subject's mental and physical condition. Also visible are the meridians used by acupuncturists.

The evidence for these claims seems to be intuitive. I have juxtaposed two images below, one is a PIP image and the other is a thermographic image of termites at work in somebody's house. Use your intuition to determine which is which and who has the better chakras.

Lovelidge seems to have an unquenchable gusto for gullibility. He seems to believe everything Oldfield claims, though Oldfield has published nothing of note in any reputable journal and is only taken seriously by people ignorant of the known laws of physics and the dynamics of various types of photography and imaging. (Lovelidge even admires Brazilians for performing exorcisms on the mentally ill!) His greatest gullibility is revealed, however, in accepting at face value Oldfield's claim that he has photographed "discarnate energy forms", i.e., [ghosts](#), in graveyards and elsewhere. His article on Human Energy Fields concludes with the

following:

I am involved with a local group who will be undertaking further research into the nature of the human energy field and one of the first experiments will be to scan an animal as it is being euthanized. We expect to see the animal's energy field leave its body as it dies. In following on from that I leave readers with a question to ponder. If an energy field can be observed leaving a human body during its last moments of physical life- are we watching the human soul? Only more thorough and complete research will help us to answer. Watch this space.

I have no doubt that Chris and friends will indeed see what they are looking for. They'll even have the pictures to prove scientifically that animals have souls. And, if we watch this space long enough we may even see God looking back at us.

I'll conclude by sharing an image that seems to show two souls flying away in the upper left. Two people died within seconds of taking this photo, one in Hong Kong and the other in Dallas, Texas. Could these be their discarnate energy forms? Notice the escaping energy from the head of the fourth person from the right. Could this be the first photo of an unfelt OBE? And where's Waldo?

If the reader is truly interested in medical imaging, I suggest looking at [Medical Imaging Resources](#).

01 Dec 1997

I am sure your efforts to provide an alternative view to some ideas and topics which seem to be silly or untrue to you will provide some entertaining reading for people after many of the subjects you ridicule are proven to be true to everyone's satisfaction.

I read part of your comments on Therapeutic Touch (which I believe is a specific school of hands-on healing, not a phrase which can be applied to an entire school of thought about healing) and would like to recommend to you

that you do some further research on this topic. I particularly recommend the study of a particular art known as [Quantum Touch](#). I believe its founder, [Richard Gordon](#), can be reached at rgordon@scruznet.net.

reply: Mr. Gordon is a very interesting character. He also has a video out on [how to read Tarot cards](#). He is a true renaissance man.

I also recommend examining the art of Shinkiko, a Japanese healing art. You can reach the Ki Science Institute, which teaches Shinkiko, at harmonyki@worldnet.att.net. I believe that either of these practices could provide for you the proof you clearly need.

reply: Shinkiko is the Japanese version of Chinese healing by manipulating [ch'i](#).

"{Shinkiko (true ki) Energy Flow, true ki energy flow}: Allegedly the ultimate "healing art" from Japan. Shinkiko is an "intuitive medical science" founded by Masato Nakagawa, Ph.D. Somewhat similar to Qigong, it purportedly involves application of "Shin-ki" ("healing-energy"). Supposedly, Shinkiko "therapists" can tap a "limitless universal energy source." The Japanese word "shin" refers to an alleged soul-like "divine spirit." ("Kiko" means Qigong.)"[\[Jack Raso\]](#)

I don't think that Shinkiko will provide me with any more proof than [Qi Gong](#) does.

Or, you could wait until you get cancer, AIDS, leukemia, radiation poisoning, a broken bone, sciatica, pneumonia, etc., before you try it out. If you, yourself, are healed of a serious ailment, that should knock your intellectual socks off. Remember, the healer assists, but it is the patient who does the true healing, internally. If you can do it, anyone can!

**Mrs. Tamarleigh Lippegrenfell
Harvard-Smithsonian Center for Astrophysics**

reply: Well, I certainly agree with your last statement.

thought field therapy

21 Feb 2000

Thank you for adding TFT to the Skeptic's Dictionary and for linking to my site.

I only have a couple points of clarification:

1) I'm not sure if TFT can be exactly characterized as a cognitive therapy. Callahan doesn't say this at all. I have simply made the observation that TFT contains some techniques that are common in cognitive-behavioral therapy like imaginal exposure and rational responses. However, these techniques are utilized in an apparently incidental way and are not integrated in what would be conceptualized as a cognitive approach. As another example, newer brief psychodynamic therapies employ what looks like CBT techniques but they would never characterize it as such. I also make this assertion because TFT is very reminiscent of EMDR which some say is CBT with eye movements. (Eye movements of course being shown to be superfluous). In any event, saying it's a cognitive therapy may be giving it too much credibility. There is no empirical evidence to support that it works anywhere near as good as other cognitive behavioral approaches.

2) Even though the one web site says that Callahan is a cognitive psychologist he actually has claimed in repeated places (and to me personally) that he has a Ph.D. in clinical psychology from Syracuse.

3) Callahan claims to have told Mary to tap under her eye because is supposedly connected to the stomach energy meridian. This was prompted when Mary complained of stomach discomfort associated with water.

4) He commonly claims even higher success rates than 85%:

*"I had to make further discoveries which increased my success rate from about 3% with that one under the eye treatment to about 98% success today." -
-Callahan (recent email from SSCPnet listserv)*

These are just some minor points but I don't want Callahan to use these trivialities against you in the future.

*Thanks again,
Brandon Gaudiano*

transcendental meditation

19 Aug 2002

You speak of adherents of Maharishi Mahesh Yogi [in the entry on [levitation](#)] who say they feel lighter than air. I have done the flying sutra and I have felt lighter than air. That was when Maharishi was first introducing his TM Siddhi program. I suppose it must have been in 1977.

Let me try to explain the context. I was a young, serious man concerned about questions like what's it all about? The meaning of Life, The Universe and Everything. Stuff like that. And then there was a strange concatenation of circumstances. A friend of mine, generally level-headed, told me that he was thinking of trying TM because his University room-mate was a teacher of it. There was an article in the Guardian (a fairly well respected Brit Newspaper) to the effect that someone had shown that doing TM did something physiologically, and another friend of mine invited me to an Introductory Talk.

So I went, and since my attempts to find answers to the adolescent questions I describe above by thinking about it rationally were not doing very well, I thought I'd try something else, for it did promise enlightenment.

My initiation was a very powerful experience, with physiological results. Every muscle in my body, it seemed, started to twitch, and I felt so At Home. It was very pleasurable, and I dismissed (at the time) the possibility that it was a hypnotic experience, because I hadn't been told about the possibility of muscle twitches.

So I threw myself into it. I was young, idealistic, thought I had found something precious, and wanted to share it.

So after I graduated, I volunteered for Work Study with the TM movement in order to gain credits to become a teacher of TM. I was around the centre of the TM movement for about 2 1/2 years, though I never became a teacher of it.

I put myself in a state of suspended disbelief. At that time, the Maharishi started the TM Siddhi program, I was working in the press, where his pamphlets and posters, etc. were printed. We were getting pictures to print which purported to show people flying, moving along for perhaps 20 feet,

about six inches from the ground. We at the press got very excited by this we didn't imagine that they were taking pictures at the top of successive hops, though they were.

Shortly after that I was initiated into the flying sutra myself, and we used to go and practice it in the Flying Room. Lots of people bouncing around. I didn't take off at all. I was told that I had to help it a bit, which started to ring alarm bells. Now, I look at phenomena like what happens at Toronto Blessings, the Quaking of the Quakers, the Shaking of the Shakers, and see it as the same thing.

But I did, several times, feel Lighter than air. And it felt wonderful. I now view my experiences as being hypnotic. Suggestion can, in my view, be very powerful. I've seen a stage hypnotist make people known to me do very silly things. But adherents of Mararishi (and I am no longer one) DO feel lighter than air. The trouble is that they are not really, and the feelings are illusory.

It is easy for bright, idealistic people to get trapped in all sorts of nonsense, because the experiences they have seem so real. Those people I've seen on TV at evangelical churches falling over and twitching are having very powerful experiences, as are those who think they can fly because they use one of Patanjali's yoga sutras.

David Bleines

(who found his mystical time an interesting experience, but is glad to be out of it)

20 Jan 1997

There are many very legitimate reasons to criticize the TM organization and to question its hyperbole. As an independent 21-year practitioner of TM, I'm frequently dismayed by the movement's antics, but not anywhere near as dismayed as I am delighted by the results of TM in my life. Whatever the movement's questionable behavior, I've found practice of the techniques to be more than worthwhile.

I guess it takes more objectivity than most people can muster to separate the issue of the potential usefulness of some specific approach or practice from the issue of the reliability of those who promote it. Just as it's possible, as you suggest, for a person of apparent integrity to be cynically deceptive or deluded, it's also entirely possible for someone whose integrity you suspect to be promoting something of genuine value. It would be a shame to dismiss a potentially useful modality out of hand simply because you don't trust the promoter.

Where TM--or any group or movement that has a significant "anti" faction--is

concerned, I would suggest consulting with an informed current member of the group (preferably one who, like myself, is not a "True Believer" and at least makes an attempt to be objective) before swallowing whole what the "anti" faction provides, and then doing some independent checking of your own about points of factual disagreement. That should help weed out illegitimate or inaccurate criticism and will make your reporting much more useful.

Hard-core skeptics will uncritically accept whatever you tell them. True believers will uncritically reject whatever you tell them. It's the group in between you are most likely to be able to influence, but if you appear to be as biased negatively as the True Believers are positively, you'll have less of a chance of reaching them. That's why accuracy and fairness are so important to your effort.

Judy Stein

12 Jun 1997

I like your Skeptic's Dictionary, it's interesting and fun to read. Today I read your entry on Transcendental Meditation (which I used to practice myself for a few years), and I'd like to make two particular comments on it:

1. One thing you do not mention that is typical of sects like the TM movement: They're after people's money. They offer series of courses (as well as the health and beauty products you do mention) and a number of other things at greatly exaggerated prices. You may want to point this out more clearly.

2. I think you are in danger of disparaging meditation in general. There are a number of techniques designed for relaxation and stress relief only; they do not cost a lot of money, they have no religion attached etc. If you referred to such approaches in contrast to TM, this might help avoid misunderstandings.

Holger Maertens

reply: You are right about the benefits of non-religious meditation. Too many people in our society think that relaxation means having an alcoholic beverage, smoking a joint or snorting some cocaine while watching television or a movie. I prefer napping, but meditation is a good way to relax for some people.

[Transcendental Meditation](#)

trepanation

"A genius is one to whom the knowledge of the difference between yes and no is innate."

-- Dr. Bart Huges

Trepanation is the process of cutting a hole in the skull. According to [John Verano](#), a professor of anthropology at Tulane University, trepanation is the oldest surgical practice and is still performed ceremonially by some African tribes. A trepanned skull found in France was dated at about 5,000 BCE. About 1,000 trepanned skulls from Peru and Bolivia date from 500 B.C.E. to the 16th century.*

Bart Huges (b. 1934), a medical school graduate who has never practiced medicine except for a bit of self-surgery, believes that trepanation is the way to higher consciousness. He wanted to be a psychiatrist but failed the obstetrics exam and so never went into practice. So [he says](#). In 1965, after years of experimentation with LSD, cannabis and other drugs, Dr. Huges realized that the way to enlightenment was by boring a hole in his skull. He used an electric drill, a scalpel, and a hypodermic needle (to administer a local anesthetic). The operation took him 45 minutes. How does it feel to be enlightened? "I feel like I did when I was 14," says Huges.

What led Dr. Huges to believe that trepanation would lead to enlightenment? His first insight came when he was taught that he could get high by standing on his head. He came to believe that by permanently relieving pressure he could increase the flow of blood to the brain and achieve his goal. After he took a little mescaline he soon understood what was going on. "I recognized that the expanded consciousness was attributed to an increase in the volume of blood to the brain." How has such a simple fact eluded scientists and mystics alike for so many millennia?

In the past, trepanation was used either to relieve pressure on the brain caused by disease or trauma, or to release evil spirits. The former is still an accepted medical procedure. The latter has died out in those parts of the world where scientific understanding has replaced belief in invading demons. Huges has yet to command a large following of trepanners, but he has managed to attract a few supporters with holes in their heads. One of his most illustrious pupils was [Amanda Fielding](#) from Oxford, England, who not only lived

through the filming of her self-surgery but also became a candidate for Parliament. She received 40 votes from the people of Chelsea in 1978 where she ran on the promise of free trepanation from the National Health Service.

Feilding maintains that having a hole in her head allows more oxygen to reach her brain and helps expand her consciousness. It's safer than LSD, she says, apparently convinced those are her only two options to expand her consciousness. She claims she now has more energy and inspiration, and is on a "permanent natural 'high'." She claims the trepanned are "better prepared to fight neurosis and depression and less likely to become prone to alcoholism and drug addiction."* One could say that she is very open-minded.

Urantia

17 May 1999

I recently found your website and have enjoyed most of it. Concerning the entry on Noah's Ark, I found it to be very informative, though I disagree with the findings.

reply: I know, I'm right about everything except this one thing that you happen to know is true. I've heard this for almost every entry.

My reason for writing you concerns the Urantia entry, or more specifically, a reader response to it. I do not understand why celebrities (Elvis, Janis Joplin, Jackie Gleason) are always mentioned in causes/movements like Urantia, As if their adherence actually gives the movement more credibility. Unfortunately, there are many people in the world who do think that something must be true if a celebrity believes it as well. So what if Elvis read the Urantia? Everything I've read on Elvis points to the fact that he read LOTS of different things on all sorts of metaphysical subjects due to major insecurities in his life.

Incidentally, Kerry Livgren, of 1970's band 'Kansas' fame, was a Urantia believer for about a year, before he became an evangelical Christian. What are ordinary believers supposed to do when a celebrity renounces his or her belief in the Urantia?

Doug Hugo

reply: They should renounce Satan and buy a copy of the [Demon Haunted World!](#)

02 Mar 1999

For your information --- I had a lengthy relationship with Gardner during the preparation phase of his Urantia: The Great Cult Mystery. Exchanged more than forty letters. Visited in his home.

Perhaps you would like to know more.

Visit my web site at <http://www.world-destiny.org>

There you will find much material on the origin of the Urantia Papers never before published, and background on William Sadler.

To say that Gardner was biased would be an understatement.

Ernest (Moyers)

reply: I am pleased to refer readers to your clearly "unbiased" materials.

05 Jan 1999

You have a wonderful site, I've enjoyed browsing and agree with you about 95% of the time.

I was a born skeptic...early on in the small group who argued the implausibility of the Bible in classroom discussions. In college, I found many more free-thinkers. But 25 years ago I felt I had to prove the Urantia Book was bogus because someone close to me, who is quite bright, said it was true, and I just knew it couldn't be....all religions were actually very similar and crutches for illogically minded people.

Two years, and a ton of reading & research later....I realized it was true, and that the reason all religions had so much in common is that they have common evolutionary roots. The differences are in the dogma...and some of the dogma is pretty crappy. This book, however, is PACKED with logical science, history, and soul-satisfying inspiration. No conflict here with evolution. At least read Paper 100 and the last paper.

I've met over 500 people who are involved with this book, including Norman Lear (Jewish), Buffy St. Marie (Native American), many clergy people (typically liberal traditions, but including Baptists and Catholics), dozens of teachers (I teach math right here in Sacramento!)...Mo Segal (of Celestial Seasoning's Tea...see the connection?), and a whopping percentage of scientists and computer people. Of course, there is the wacko group in Sedona...anything like this will attract egoists. Many more of the big names in Rock & Roll than you might realize are/were dedicated readers including Elvis, Jerry Garcia, Moody Blues, Spirit, Janis Joplin, and many others. Jackie Gleason was really into this book.

Over 350,000 books have been sold since 1955. I know over a dozen people who knew Sadler; he was not a fake, nor a liar. His experiences were unimaginable, but there is no reason at all for him to make this stuff up. Financially, it was far better off not being involved. Harold Sherman, on the other hand was very unstable. He is the one passing off lies and the only reason Gardner believes his stories is that it supports his skeptical arguments. Sherman was one in favor of all kinds of traditional channeling and nonsense. Martin G. did not read the UB through, it is very clear from his sloppy analysis.

He did do some good research, but there are many web-references with good critiques of his work. I am close friends with many of the people he refers to and he has got his facts wrong at least as often as he got them right.

Do your own analysis of the Urantia Papers, I challenge you, as I did, by reading them and comparing them with scientific, historical, and other research.

You'll find a gem like no other.

I've been a reader for 25 years...half my life.

No need to respond....just FYI.

Claudia Ayers

reply: There may be no need to respond, but your mentioning of Jackie Gleason (also "a gem like no other") brought back fond memories of my childhood. Did Art Carney introduce Gleason to the UB? Perhaps they read the Croatian translation together in-between alcoholic stupors. I suppose it was good enough for Elvis and Janis Joplin, the world should take notice.

Oct 1996

*I've been reading your **Skeptic's Dictionary** and I like most of what I read. I have to ask you, though: the **Urantia Book** was "allegedly" channeled by William Kellogg??!!*

*I've been reading the **Urantia Book** for 15 years and I have NEVER heard that claim made before! Did Martin Gardner make that claim? And if so, where did he get his information? The identity of the human being who wrote down (and it was NOT channeling, according to Dr. Sadler) the papers of the Urantia Book has never been revealed. Dr. Sadler, I understand, said that he and the others who knew this person had been sworn to secrecy because it was felt that the message of the book itself was more important by far than the person wrote the words down. No human name was to be associated with the book, ever.*

reply: I would imagine that you are not the only reader of the book who has never heard that the Urantia Book was channeled by Wilfred Kellogg. The book itself claims that the Urantia papers "were authorized by high deity authorities and written by numerous supermortal personalities." [\[Origins\]](#) Sadler and his group tried to avoid associating the origin of the Urantia Book with words like *spiritualism* . The word *channeling* was not used in those days, of course. But when you claim that an individual, whom you will not name, wrote a book but the authors were really "supermortal

personalities," then you have claimed the book was channeled in today's New Age terminology. Gardner's research uncovered the author as Wilfred Kellogg. You can read about it in his book and articles, listed below. Of course, Sadler's version differs from Gardner's.

Sadler claims he and other equally brilliant men could not detect any other type of psychic phenomenon except revelation from on high when they examined the "author." Their author was not telepathic, clairvoyant, a spirit medium, nor did he go into trances or do automatic writing. Sadler also declared that his man was not insane (actually he says he did not have a split personality). One thing Sadler and his illuminati seem to have failed to consider was the possibility of fraud. Or maybe they were in on the con. Who knows? In any case, Sadler was right about one thing: focusing on who wrote the book takes attention away from the content of the book. If you are looking for spiritual teachings, apparently this book has plenty of them and many people find these teachings agreeable. For those of us who are no longer on a spiritual quest, such books are mainly of interest because of the Byzantine intrigue surrounding their authorship and the people who would invent such stuff. Gardner himself says: "Why do I waste time on such a pretentious tome? Two reasons: One, the Urantia movement is gaining new recruits. More interestingly, the book's origin is a capital mystery." According to Gardner, Iola Martin and Mrs. Harold Sherman (members of the original Urantia movement in Chicago) revealed to him that Wilfred Kellogg wrote and dictated the Urantia Book. All the sordid details are revealed by Gardner. The one I find most fascinating, though I don't know why, is that Wilfred Kellogg, his wife, Anna Kellogg and Dr. Sadler's wife, Lena Kellogg (Anna's sister), all had the same grandfather, John Preston Kellogg, who was the father of William Keith Kellogg (the Cornflakes king) and Dr. John Kellogg. The latter did battle with Ellen G. White and was excommunicated from the Adventist church.

I also am unaware that there is a separatist 7th Day Adventist cult that uses the Urantia Book's teachings. To say that the book has Adventist teachings is like saying the Bible has Adventist teachings, when actually both books contain teachings used by all manner of religions and belief systems. The religions get their teachings from the books, not vice versa.

reply: As I understand it, Adventists interpret the Bible differently from other Christians, especially in their notions of the Millennium and The New Earth and in accepting the words of Ellen G. White as revelations.

I don't belong to any cult. There are groups of Urantia Book readers who get together and some of them are pretty weird, to my way of thinking, so I don't belong to any groups espousing the Urantia Book's teachings. I find the book's value in what it says and how I can apply those sayings to my own life-not anybody else's. (I add that I was raised a Catholic, left the church at 14, became an atheist and a devotee of Ayn Rand and finally read the Urantia Book 18 years later.)

reply: I guess we could say that you are on the road to Wellville!

There is no organized religion of any kind involved in the reading of the Urantia Book. There are no "thou shalt" or "thou shalt not". There is no guilt. There is no "we've got the answers and we'll only tell you if you give us money". The only money I've spent is on the book itself, and I consider the price worth it.

reply: The fact that you and many other readers of the Urantia Book do not belong to any organized cult or religion does not mean that such a group doesn't exist. According to Gardner, such a group does exist and is growing. On the other hand, he may be using the word 'cult' loosely to refer to the some 50,000 (according to one of the Urantia Websites) who belong to Urantia groups who meet regularly.

I suspect that you have not read the book, as it's over 2000 pages long. I assume you are passing on the information that you found in Gardner's book. I find it hard to believe that Gardner, intelligent man that he is, would so lightly pass off a book by identifying it with an organized religion that really had and has nothing to do with the Urantia Book at all. It almost sounds as if he'd just recently heard about the book and asked someone and they said, "aw, it's some book some crackpot offshoot cult of the 7th Day Adventists uses."

reply: Believe me, it is not the *length* of the Urantia Book which keeps me from poring over its pages. I've probably read over 2,000 pages of Gardner over the years! In any case, you underestimate Gardner and I suspect you haven't read his book on Urantia, either.

I applaud the idea of debunking all the stuff you include in your dictionary. It's a great service. I only ask that you do a little more solid research on the Urantia Book before tossing off such a casual and inaccurate review.

Sharon Carthy

reply: ok. In the future, before tossing off an inaccurate review, I'll do more solid research.

urine therapy

14 Mar 2003

I wanted to call your attention to the quote from Proverbs on the page on urine therapy. With the quote on its own, it would seem to imply that the particular proverb is suggesting one drink one's own urine. However, while this passage is clearly a metaphor and not talking about literal cisterns, it appears in the midst of a lengthy passage elaborating on exactly why "thou shalt not commit adultery." Given the context, it seems far more likely that this passage's intent is closer to, "Don't dip your wick in your neighbor's well." There are, however, some passages in the Bible that clearly and unequivocally refer to drinking urine. This generally seems to be an act of desperation due to a shortage of water, as often happened during sieges. For example, in Isaiah 36:12, an Assyrian officer yells at the people of Jerusalem that he will force them to drink their own piss (that's really the word used in the King James Version) if they do not surrender.

Matt Cramer

06 Mar 2003

One minor little, but rather common, mistake in your presentation: human urine as produced by the kidneys and freshly voided does not contain ammonia (the urine of some other species does). However, if human urine is exposed to air for any length of time, airborne bacteria will break down some of the urea into ammonia. So it's only "stale" urine that contains ammonia.

Eric Bohlman

28 May 2002

Although this comment comes late, I feel I must point out that there are in fact scientific studies supporting the efficacy of urine therapy. I have included a link, with the conclusion of the paper excerpted (in case the link does not work). I have been in the field of immunotherapy for the past eight years, and prior to that I was pursuing a Master's degree in Molecular Biology and Immunology. The company that currently employs me manufactures a biologic for the immunotherapy of solid tumors. I manage the manufacturing department. I am also enrolled in a natural healing school, and urine therapy is one of the

*healing methods I am being taught. With my scientific background, I am reluctant to take anyone's good word as proof. I have turned up several studies supporting the use of urine therapy for autoimmune disorders, cancer, and AIDS. As disgusting as it initially appears, there is some evidence to support urine therapy. And with a whole new generation of uncharacterized biologic drugs appearing on the horizon, it seems "science" is coming to believe the same. An excerpt, if the link doesn't work: "Conclusion: Urotherapy is **suggested** as a new kind of immunotherapy for cancer patients. Unlike the clonal immunotherapy the urine of the cancer patients contain the many tumor antigens which constitute the tumor. Oral auto-urotherapy will provide the intestinal lymphatic system the tumor antigens against which they **may** produce antibodies due to non-self recognition. These antibodies **may** be transpierced through the bloodstream and attack the tumor and its cells." [emphasis added]*

Sincerely, Anna Lloyd

reply: Interesting, especially since [immunotherapy](#) treatment for cancer is [controversial](#) and hasn't been especially effective.

If the reader is wondering about the missing link, it wasn't included by Ms. Lloyd. For those who are interested, I have found the article: [UROTHERAPY FOR PATIENTS WITH CANCER](#) by Joseph Eldor, MD, of the Theoretical Medicine Institute P.O.Box 12142, Jerusalem, 91120,Israel. Eldor publishes a [journal](#) "devoted to the evaluation of the 'philosophy of medical explanation'." Eldor is apparently an anesthesiologist who runs the [CSEN](#) Web site devoted to his products, such as a spinal-epidural needle.

One should also read, for comparison, the [Office of Technology Assessment](#) article on [Immuno-Augmentative Therapy](#) (1990) or Dr. Stephen Barrett's [article on the same](#) (1999).

25 May 2000

When I read the article in the Skeptics Dictionary regarding urine therapy, I was uncomfortable when you mentioned the potential salvation by urine in extreme situations. Then I read the March 31, 1998, commenter, and agreed with what he had to say. If one is lost at sea, the LAST thing you want to do is drink seawater. Seawater is about 97% water by weight, and closer to 99% by volume. You suggested urine might not be so bad, seeing as how it's 95% water. You can see my alarm here.

Brian Magnuson

reply: I'm sure some lethal concoctions are 99.9% water. My [sources](#) tell me that seawater is 3.5% salt and that some of the other things in seawater

are animal waste, plant cells, pollutants, rust, etc. How much of urine is water is not as important as how much other stuff is in urine that might be harmful.

18 Feb 2000

I read with interest you article on urine therapy. Many of the points you made are indeed true. I would urge you however to have an open mind.

The next time you cut or burn your hand, try putting some of your own urine on it as soon as possible. Don't just put one drop on but rather soak it for about 15 min. You will find that the pain disappears almost at once, and it heals in about half the time. I don't know why this is, but I strongly suspect that the urea plays an important role. Urea is now used in many high priced skin care products.

From there you take a leap of faith and assume that what works on the outside, works on the inside as well. Is it the placebo effect? Hard to say, except that the placebo effect only works 30% of the time based on FDA studies. If you are still concerned about the placebo effect, try it on a dog or cat when they have an exterior injury, is this the placebo effect?

Bottom line, the wild claims notwithstanding, if it works and will not hurt you, use it.

Keep an open mind.

C. Berger

reply: I'll keep an open mind but consider that urine contains ammonia and ammonia reacts with the skin to cause ammoniacal dermatitis, which, when it occurs on a baby's bottom is known as diaper rash.

29 Jun 1999

I have not participated in any form of urine therapy as yet but have researched it extensively via medical reference materials and periodical articles written by doctors dating back as far as 1947.

Are you a medical doctor or trained homeopath/naturopath? As a self-proclaimed Skeptic, have you tried urine therapy in any form? If so, what were the results, if any? If not, why; since it is clear that there is little or no risk of side effects in healthy individuals? What is your healthy Skeptisim based on? Is there any medical evidence by documented research study or your personal experience that this 5000 year old Practice has little or no therapeutic value? There seems to be a tremendous amount of research on whole human urine and its constituents and their apparent medicinal value. Is your opinion based on

simple "good sense"? If so, "good sense" would seem to be more inclined to support the value of this particular therapy in some cases rather than not. It (urine) appears to be a truly spectacular healing agent whose value had been forgotten once medical technology developed more appealing and far more lucrative drug products.

reply: No I have not tried urine therapy, nor have I tried [trepanation](#). That's ancient, too, and advocated by a medical doctor. You might like it. Seriously, what is this medical evidence you speak so highly of? I hope you aren't referring to the testimonials of an Indian premier who lived to be a hundred and drank a cup of his own pee every morning or the fellow whose foot got better after two weeks of wrapping in a cloth soaked in his own urine?

You mentioned the placebo effect. If it is true that the placebo effect really exists and is the reason for some patients seemingly miraculous and "non-scientifically verifiable" recovery, would not the converse be true as well? A patient treated by conventional, scientifically tested and approved methods could very well not respond because that particular patient decided that the prescribed therapy simply would not work? How the do you explain all those patients that have been cured by unwanted medical procedures? And if that is true, would not all therapies, conventional and alternative, be effective in direct proportion to the patient's own belief as to the effectiveness of that therapy? If medical doctors have rediscovered the use of leaches in some situations, is it not possible that medical science may (and already has in some cases) rediscover the medicinal value of the long known but overlooked practice of auto urine therapy?

reply: The [placebo effect](#) is well established, but it is clearly not as simple as you have framed it. The placebo effect is not an effect that is in direct proportion to the strength of one's belief. Some suggestible people might feel tipsy when drinking a non-alcoholic beverage they believe to be alcoholic. But it would be a strange person, indeed, who could drink six glasses of vodka with no inebriating effect as long he believed his beverage was non-alcoholic or that it could not affect him. You raise some interesting questions but I don't see what they have to do with urine therapy. By the way, I don't belittle urine therapy because it is ancient. My comment is that it is very unlikely that the ancient Indians had scientific or health reasons for drinking their own golden fluid.

I say all that to say this:

The art of medicine is just that, an art based in scientific theory and procedures. It is a combination of the intrinsic value of self healing and the power of modern technology and scientific theory and I did not find much more than a hurriedly (Internet) researched opinion in the piece I read on your website. Until we know everything about the human body, any medically ethical

therapy which demonstrates an ability to heal-especially a natural one-should be pursued to see if it in fact could provide an effective and affordable, in this case-free, treatment available to anyone who needs it!

Can you tell that I am skeptical of those who claim to be "professional" Skeptics?

*Best regards,
M.P.*

reply: I can hardly criticize someone for being skeptical. However, I await this "demonstration" of the ability of urine to heal.

31 Mar 1998

Hello. I have been reading and enjoying 'The Skeptic's Dictionary' for some time now. I haven't really felt the urge to comment on anything, but I ran across this statement in your latest entry and I felt I should say something [about the following passage in "Urine Therapy."]

For most people most of the time, one's own urine is not likely to be harmful. However, it is not likely to be healthful or useful except for those rare occasions when one is buried beneath a building or lost at sea for a week or two. In such situations drinking one's own urine might be the difference between life and death. As a daily tonic, there are much tastier ways to introduce healthful products into one's blood stream.

To establish my credentials, I am a biochemistry graduate student. I am in no way an expert on metabolism or nutrition (I actually do enzyme kinetics), nor do I have a textbook handy that addresses this particular subject. However, I believe that drinking one's own urine out of desperation when no source of clean water is available is a serious mistake. Urea, as well as other salts, are diuretics as you mentioned, and cause the body to excrete more water to remove them from the bloodstream. Drinking urine (or sea water, for that matter), does not help you conserve water, it just forces your body to give up more of its water to get rid of the contaminants present in the urine, as well as any other metabolic wastes produced since that earlier urination. In other words, drinking urine only causes you to become dehydrated faster.

I just felt that I should mention this, in case any loyal readers happen to become lost at sea or trapped in a collapsed building, and decide that drinking urine might be an acceptable survival practice because they read it on your web

page.

David Rhode

reply: I used the examples of being buried beneath rubble or lost at sea because those examples are used by the advocates of urine therapy (quoting news stories) to indicate how useful drinking urine can be. My understanding is that the urine is 95% water and the average amount of urea from a healthy person would be about 25 mg a day. Such an amount of urea might be of some assistance in stimulating urination, but as a diuretic it would hardly dehydrate a person, especially if one continues to reuptake the urine. I also understand that most of us could survive for only three to five days without water. Any urologists out there with a third opinion?

James Van Praagh (George Anderson & John Edward)

15 Apr 2003

I have recently lost my 17 year old son in an automobile accident and in my grief and shock I had somehow fallen into new age spiritualism.

I bought James Van Praagh's book Talking To Heaven and have seen his show and I began to wonder if this was really possible. Then, as I got further along in his book, he mentions his beliefs about people who die in car accidents and people who die of AIDS somehow had a destiny to fulfill and only then did I realize what nonsense all this was.

Fatal Collisions: First, there are no accidents and such accidents are the direct results of the spiritual law of cause and effect, or karma.

AIDS: During sessions with spirits who have passed with this condition, many gave reasons for having to go through this experience. Many have said that they are helping to balance the negative karma on this planet about our wrong way of thinking (gay lifestyle) and behaving towards each other.

I really doubted my 17 year old son had bad karma or that this was his destiny to die in a fatal car crash. It was an accident. With a little common sense, one could read between the lines of his book to discover his own personal issues with homosexuality and AIDS and how he incorporates that into his work.

I searched his name on the internet and found your article (among others) to be what you could call the real enlightenment, especially the part that this so called phenomena only works because of cold readings and a basic belief system. I had almost bought into spiritualism because I wanted to believe it was true and your article probably saved me a lot of additional grief. I just wanted to thank you for affirming my suspicions with basic facts and principals, which is a lot easier to accept than talking to the dead.

Sincerely,
L. S.

reply: It never occurred to me that Van Praagh might be working out his own neuroses with his messages, but the idea makes a lot of sense. Van Praagh calls himself a "grief counselor" yet some of his notions seem

aimed at causing more grief to the grieving. It is hurtful enough to lose a son or daughter, but then to be told that they got what they deserved is to rub salt into the wound.

16 Jun 2002

I would like to thank you for putting this site on the web.

My son-in-law and daughter are into this psychic medium stuff hook, line and sinker. They recently lost their youngest son, an adorable 5-year-old, to a freak accident. They have buried themselves in George Anderson's books. My son-in-law was recently baptized with his 11-year-old son as a nondenominational Christian. However, since his son's death, he has completely thrown out his religious beliefs for the views of George Anderson, and the touchy, feely, nobody suffers kind of new world in which God has no role to play. Instead of reading books on how to deal with grief, of which there are many excellent ones (I know because I also lost a 23-year-old son in an auto accident), he and my daughter just reads George Anderson over and over. My daughter got in touch with James Van Praagh through his web site and Mr. Van Praagh wants to interview her and my son-in-law on some TV show. When my grandson died, there were no fewer than 15 articles in various newspapers regarding his freaky death of being asphyxiated by getting his head caught between two tree branches. There are also obituaries, so it will be easy for Mr. Van Praagh to get information on our entire family in advance and look like a hero. I feel that Mr. Van Praagh is predator, preying on those who are grieving the most.

I thank you for your web site and hope my daughter and son-in-law come across it and actually look at some of your information as they are surfing the web.

Kathi

3 Aug 1999

Just to add my 2 cents in..... well if you don't want to believe in James then just don't watch or listen.... you must be insane yourself..... this man is for real... believe it or not !! let him talk to one of your relatives [sic] and I guarantee you will believe!!!

god bless

BETONKIM@aol.com

16 Jul 1999

James Van Praagh was profiled recently on 48 HOURS, which aired again on

7/15/99.

Once again, Van Praagh proved the gullible types in this world far outnumber those given to skepticism and reason.

At one point, the talking head presenting the story stopped and asked, to no one in particular, in a incredulous voice, "How can anyone believe this..."? Indeed.

The presentation was even-handed and skeptical and (hallelujah !) resulted in a controlled "reading" wherein Van Praagh would talk to the dead again.

A woman was shipped in from out of state for the reading, which occurred in Van Praagh's 'normal' house: "See, I don't make money from any of this..." Oh, really ?

Van Praagh's usual refrain dominated the exchange, saying things like: "He is here by your side", "He wants you to know he's OK..." and such twaddle.

The Amazing Randi was allowed to review the performance and clearly showed how Van Praagh uses generalized statements (Do you know a John ?) that are true for anyone. Indeed, it is safe to say we all know at least one John in the world. Sad to say, Randi noted, that people want to believe they can settle accounts with the dead and will go to any lengths to live the illusion. Wise words.

Chris Long

13 Jun 1999

It really ticks me off that a person like James Van Praagh can go around doing the crap he does. Why on earth would my dead relatives talk to a total stranger like Mr. Van Praagh, instead of coming straight to me.? That is, if they are able to communicate in the first place.

He is as phony as they come and I really would love to believe he is the real thing, but I know with all my heart he is a phony.

Thank you for letting me speak my mind. I wish I could tell Mr. Vanpraagh myself, but his website is a joke and of course, at this moment , he is not accepting any e-mail because he is on "tour". Yeah, right.

Thank you again.

Sheila Hancks

11 Jun 1999

Van Praagh surfaced on Maury Povich during the week of 6/6/99 - 6/13/99

(Wednesday, I believe) purporting to communicate with deceased loved ones of guests appearing for "closure".

Van Praagh's performance was as silly as it was crude, displaying no ability to divine any information about a deceased relative beyond the usual "cold-reading" technique, which he doesn't even do well.

If the guests had not 'fed' information during Van Praagh's Q&A it was apparent he would have been rendered entirely helpless. After a correct guess (far fewer than incorrect guesses) Van Praagh would make non-specific, generalized statements to which the tearful relatives on Povich's stage would nod and agree.

Incorrect statements by Van Praagh were always followed by the comment "...maybe not now but watch for that - it's coming..." Yeah, right.

Van Praagh is incompetent to counsel and pry into the affairs of emotionally-wrought people with his crude, guessing style that just is not convincing. But Povich was in ascendancy leading choruses of oohs and aahs during the very few correct guesses by Van Praagh.

The show was little more than hype for a new book by Van Praagh and a staged PR exercise. It's sad that entertainment has reached this sort of low, eliciting teary, gut-wrenching personal horrors from devastated people by a clown like Van Praagh for little more than entertainment.

Chris Long

22 Jul 1998

James van Praagh appeared on "Positively Texas" not too long ago...being a big skeptic myself I watched to see how someone so obviously fake could fool so many (I've honed my skills watching people such as Peter Popoff and Robert Tilton).

Anyway, TV seems to be a bad medium for his "product"...the cameras show right up his sleeves. The episode I watched had him doing a reading with a woman who obviously was a believer in Praagh. James starts off doing what's expected...throwing out very general comments and looking for positive feedback. However, because the camera was focused on her and not him, you were able to notice the slight quirks that would spread across her face whenever he mentioned something, quirks that he used to decide which way the reading should go. She'd either crinkle her brow in confusion, or kind of release the tension in her lips as a sign of "whew...there was something I recognize." As she became more and more disgruntled that he wasn't "hitting" on anything, he all the sudden stopped and went a MORE general route:

"Ok, I'm sensing someone...a woman...who has died." James looks at the woman for feedback, which he gets. Eventually he establishes that he's talking about her dead mother and that he can see her dead mother standing right beside her. Already I'm wondering why he couldn't see the dead mother standing beside her before and why he couldn't give a better description other than "she's dead." So, keeping with the general questions, he says: "I'm sensing someone had a heart attack...I see a heart attack." She smiled real big and said "Yes, my cat had a heart attack." James is off and running. "Ok...Your mom is here, she's holding your cat. She wants you to know that your cat is going to be taken care of in the next life."

I'm now wondering why he never saw the cat before: after all, if he can see her mom standing next to her, he should be able to see the cat she's holding. That's basically all her dead mom had to say to her. Not "Time is but an essence of life and the whiskey of the damned. Drink to me tonight." Not "All is just as just is all. A profound experience of you I have dreamt; let me tell you of it..." Not, "The swirls of life coalesce and collide and bind you to the crystals of your empathetic mind. Peace be with you my daughter, I am dancing with the fates." But..."I'm taking care of your cat." If I were dead and I knew I probably had only one chance to talk to my "dearly stuck-in-the-mortal-world," I'd try and come up with something more searching, more important. Not pet arrangements.

However, I now know that when our pets die our ancestors take care of them. Whew...that's a relief. I wonder if that applies to someone with insects as pets. What if someone has a pet rock?

Also, has Van Praagh ever told someone "Your mother still hates you. She wishes you were dead so she could smack you around in the after-life." Are ALL his readings positive? Whew...apparently all our dead relatives have forgiven us for everything.

Van Praagh is so obvious, it's actually painful to see someone swept up by his obvious lack of originality. I personally prefer the woman that channels that 35,000-year-old warrior. At least there you get a floorshow. With Van Praagh you get just about as much as if you'd dialed 1-800-PSYCHIC.

Aaron Nations

25 Sep 98

I had the chance to see James van Praagh on a TV appearance not long ago, and was, quite frankly, astounded that people can believe that he is real. The clip I saw was full of him making vague statements, including some where he managed to say that something was either X or not X. I watched as he pursued several dead-ends, stopping only when the subject showed no recognition of the topics he described.

One part deserves special mention - van Praagh said "...whenever this person died, or 'was killed'..." (single quotes indicated by van Praagh with hand motions). This was the most egregious fishing - he was able to catch both natural deaths, accidental deaths, and murders in this net of a question. All in all, it was a very enlightening example of how well cold-reading can work.

[Maharishi University
demolishes negative
energy dorm](#) 5/10/02

[CAN YOU VASTU?](#)

By MICHAEL
ROVNER

vastu

*Think of vastu as yoga for the home.**

Vastu is India's version of [feng shui](#) (or is feng shui China's version of vastu?). Anyway, vastu goes by many names, including *Vedic architecture*, [Sthapatya Ved](#), [vastu vidya](#), and [vastu shastra](#). But vastu has one goal: to create buildings in harmony with Nature. This will lead to more happiness, but can only be done with the help of [numerology](#) and [astrology](#). One must understand all the planetary influences and numerological connections to the Cosmos in order to have harmony in rooms like the kitchen. If things are done properly, "the meals get cooked better, assimilation improves and frittering of energy gets checked."* Different qualities of [energy](#) are dispersed by different things at different times and if one is not attuned to these changes, one will be out of tune. If your house is not aligned properly, you could get sick. I am fortunate I live in a house whose entrance faces east. Many people in my neighborhood, whose houses face west or south, are more likely to suffer such things as poverty, negativity, lack of success, disease, and of course, anger at being so poor, sick and unsuccessful.

One cannot deny that a poorly designed workspace, kitchen, bathroom or bedroom can cause a lot of stress, but one will search in vain for the scientific evidence that one's kitchen must be in harmony with moon energies or that sickness will befall you if your entrance faces west.

Was it *vastu* or *feng shui* that inspired Danish architect Jørn Utzon's design of the Sydney opera house?

The people who gave America [transcendental meditation](#) and [Ayurvedic medicine](#) are also responsible for giving us vastu: [the people of the Maharishi](#).

They are fond of making such unsubstantiated claims as that *brain physiology is significantly different* when one faces east because neurons fire differently in the thalamus when facing east.* They claim that if we could only build one billion new houses in the proper fashion, we could all live invincibly and in peace and harmony with each other and the universe. They make many claims about the Natural Law (no relation to scientific laws of nature, as far as I can tell), Cosmic Consciousness, the [Maharishi effect](#), yogic [flying](#), [mantra chanting](#), direct links of planets to brain parts, etc. None of these claims have any scientific basis. However, simply because Vastu--this "[holistic design system](#)"--is another bogus philosophy of nature and energy, does not mean that people who claim to be Vedic designers can't produce beautiful and comfortable living quarters. They can, but you don't need a Vedic astrologer to tell you where the sun rises and sets, or what clutter looks like.

reader comments:

Velikovsky *Worlds in Collision*

23 Dec 2001

I am sure you receive many letters a year ranting about trivialities. I am no different. (I am, however, a graduate student of physics and a moderate believer in the paranormal). I found your article on Immanuel Velikovsky to be quite harsh. I don't intend to rant, so I will be short. Mr. Velikovsky put forward several other books relating to "Worlds in Collision" which did not contain the historical "evidence", namely "Earth in Upheaval" where he presented geological evidence. Furthermore some of his prediction of the atmospheric temperature and composition of Venus are amazingly accurate (especially considering the theories of the day).

As a side note about "manna", last week [scientists discovered](#) a meteor on earth that contained a "sugarlike substance".

I don't think that Mr. Velikovsky deserves to be regarded as "discredited" quite yet.

Merry Christmas!

Jim Cairn

reply: You should read David Morrison's article "Velikovsky at Fifty" in the current issue of *Skeptic* magazine [vol 9, no 1, 2001]. Morrison addresses the materials of people like Lynn Rose, Bargmann, Motz, and Velikovsky himself, who proclaimed the accuracy of some of V's claims. For example, Velikovsky was right that Venus is hot but wrong in how he came to that conclusion. He thought it was because Venus is a recent planet violently ejected from Jupiter and having traveled close to the sun. Venus is hot because of the greenhouse effect, something V. never mentioned. As to the composition of the atmosphere of Venus, V thought it was hydrogen rich with hydrocarbon clouds. NASA put out an erroneous report in 1963 that said Mariner 2 had found evidence of hydrocarbon clouds. In 1973 it was determined that the clouds are made mainly of sulfuric acid particles. V was also right about Jupiter issuing radio emissions, but wrong as to why. He thought it was because of the electrically charged atmosphere brought on by the turbulence created by the expulsion of Venus. The radio emissions, however, are not related to the atmosphere but to "Jupiter's strong magnetic field and the ions trapped within it" (Morrison 65).

There is more, but I refer you to Morrison's article for all the details that justify continuing to treat Dr. V as a pseudoscientist, even if a very interesting one.

21 Dec 2001

In the opening paragraph of "Immanuel Velikovsky's Worlds in Collision" you state that he associates his claims with the myth that Athena (whom Velikovsky identifies with the planet Venus) sprang from the head of Zeus. What troubles me is that, Venus in ancient Greece, was a planet/star that was associated with the Greek goddess Aphrodite (Goddess of love and beauty) and not Athena. In fact, her Roman counterpart was actually named Venus. That being said, I don't understand how he would make this myth supportive of his theory, as he just can't turn around and associate Greek gods/goddesses to whatever planet he pleases.

Jean-Michel Cormier

reply: Geniuses make their own rules.

Just a couple of quibbles about the Velikovsky entry:

Sagan misrepresents Velikovsky who never wrote that the comet and the Earth graze. The comet makes a close approach.

"According to Velikovsky, the comet also caused the Earth to stop rotating."

Velikovsky quotes many ancient texts recording that the movement of the Sun and Moon appeared to stop in the sky. Velikovsky himself says "..there are physical problems.. the actual results of such a slowing down of the angular momentum of rotation would depend on the manner in which it occurred." It was Peter Warlow who showed how the Earth's rotation could be apparently reversed without the Earth stopping, using a similar mechanism to a 'tippe top' (SIS Review, Vol III No 4, Spring 1979, page 100). Even Sagan himself says '..it is easy to see that a gradual deceleration of the Earth's rotation at about $10^{-2}g$ could occur in a period of less than a day.'

"Sagan refutes Velikovsky's claim that Jupiter ejected a comet which became Venus by examining the amount of kinetic energy needed."

Sagan forgets to include in his calculations the rotational speed of Jupiter. Sagan also forgets to include the difference in rotational speed of Jupiter now, and at the time of ejection, which would have caused Jupiter to slow (conservation of angular momentum). Sagan mistakenly uses an escape velocity for an object reaching an orbit extending to infinity, rather than one required to produce an elliptical orbit (71% less). All these factors substantially reduce the energy required.

--Ian Tresman

reply: Now, if we could only harness all the energy used to do these monumental calculations, maybe we could save the world!

20 Nov 1996

On Velikovsky - I support entirely your comments about Velikovsky's lack of scientific rigour. There is no possibility of Venus coming from Jupiter. But if you read Velikovsky - that is only one interpretation of what happened from the accounts he reports. He got it wrong; but don't ignore the evidence, just his interpretation.

A far more logical interpretation to my mind is that a large comet had a close encounter with Jupiter which swung it in our direction. It then came toward earth with a very bright coma. It passed earth close by, and went away (with all reported effects). 52 years later it returned, came past earth and hit Venus. Venus then went from dull to very bright, and has been slowly dimming since.

That is still an awful lot of close encounters in a very short space of time - and is a highly improbable scenario - but sometimes shit happens. It is, at least, consistent with the laws of physics as we know them, and with reported phenomena.

Worth a thought perhaps ?

Ted Howard

New Zealand

reply: Worth a thought, perhaps, but it has little to do with Velikovsky. David Morrison read my original comments and showed me the error of my ways. He writes:

Velikovsky focuses narrowly on encounters between the Earth and planets -- Mars and Venus. While he refers to Venus being accompanied by debris, the dominant agents of his catastrophes are tidal, chemical, and electrical interactions between planets, not meteoritic impacts. Remarkably, Velikovsky did not even accept (let alone

predict) that the lunar craters are the result of impacts -- rather, he ascribed them to lava "bubbles" and to electric discharges. I see nothing in his vision that relates to our current understanding of interplanetary debris and the role of impacts in geological and biological evolution. I conclude that Velikovsky was fundamentally wrong in both his vision of planetary collisions (or near collisions) and in his failure to recognize the role of smaller impacts and collisions in solar system history.

Morrison's article "Velikovsky at Fifty" is published in *Skeptic* magazine [vol 9, no 1, 2001]. Morrison argues that Velikovsky is being given way too much credit for influencing or being ahead of his time on the issue of catastrophism. He writes

In preparing my *Skeptic* article "Velikovsky at 50" I corresponded with 25 leading contemporary scientists who have played a significant role in the development of this "new catastrophism" to ask what influence, if any, Velikovsky had on their work. The statements of these scientists indicate that none of them saw any value in Velikovsky's theories, and that Velikovsky's reputation sometimes impeded acceptance of their own work, or at least was an irritant when they described their work to the public. I was also struck by how easily these scientists (by their own report) rejected Velikovsky. Note that these are not conservative, ivory-tower academics, constitutionally prejudiced against new ideas. They have been among the most creative and revolutionary researchers in their fields. Like all successful research scientists, however, they are used to making quick judgments concerning which evidence is more likely to be accurate and relevant, which research directions more promising. This quick judgment against Velikovsky by scientists separates these academics from those who wished (or still wish) to give Velikovsky the benefit of the doubt, to look for some lasting value in his work. The supporting material, with quotes from these scientists, appears in my article in *Skeptic* 9:1:62 (2001).

Morrison's article will also be published in *Skeptic: Encyclopedia of Pseudoscience*, edited by Michael Shermer, due out in August 2002. The price will be \$185, according to Amazon.com.

25 Nov 1996

Regarding Velikovsky, the slant given the article was that Velikovsky's work is

religious in nature and that Sagan sets Velikovsky's theories in order and mostly discredits them.

Sagan's forays on Velikovsky would indicate some degree of professional jealousy to anyone familiar with the works of Velikovsky. Sagan certainly was not professional with his demonstrations against Velikovsky on Educational Television and neither were you on your article in the Skeptic's Dictionary on Velikovsky.

reply: Thank you. I missed the "unprofessional" Sagan but I feel I am in good company.

Before rendering an opinion on anyone's work, including Velikovsky, it would be wise to consider all the person's work and not form an opinion on a skimmed-over reading of that person's most controversial book. Anyone reading Velikovsky to ascertain if he were or not "religious" would find the time wasted. Velikovsky was meticulous to avoid any tone of a religious nature and was constantly using literature from all corners of the world to indicate points for consideration. He was careful to avoid stating a personal view, probably realizing the resistance his works would meet and knowing there would be persistent critiques of himself and his work because he happened to be a Russian Jew.

Velikovsky never did refer to the New Testament of the Bible. He did refer to certain writings of the Old Testament wherever pertinent but never where it did not parallel other writings from outside the religious arena unless you want to consider some of his references to Indian and Chinese writings where some of those writings are religiously revered.

Velikovsky's Worlds in Collision was not critiqued on anything except for those few areas where he used the Old Testament to indicate a corroboration of other writings. Neither did you refer to his many other works. I must conclude that you are mostly careful to discredit anyone who uses any part of the Bible in their works. You appear critical of anyone who would dare use what is universally considered good history by anyone who has the credentials to evaluate ancient writings.

reply: You are correct here, Robert, and so I have revised my entry on Velikovsky to indicate that I don't have a clue what his motivations are. But you are correct. He is an equal opportunity mythologist and pseudohistorian

Anyone who would read Velikovsky Reconsidered from the University of [the State of] Washington's magazine Pensée would see the railroading job done on Velikovsky and it would appear that you are also on that train.

Instead of reviewing Velikovsky, you found someone who has been extremely

critical of Velikovsky to do your dirty work for you. However, you have brought your own expertise into question along with the Skeptic's Dictionary itself. The first premise of the Skeptic's Dictionary is "The only thing infinite is our capacity for self-deception" and you have apparently written your own epitaph. Instead of a question, it's a statement that aptly describes your situation, taking the article on Velikovsky as a gauge.

When you read Velikovsky's works, read them all and try to read the works which are referenced. Several times in Velikovsky's works, he mentions that what he's writing is not provable but is an indication from several sources. By implying in the article that Velikovsky's sole source is the Bible paints an erroneous view of his work and in turn, it paints a pretty clear picture of YOUR mindset.

reply: You should have stopped while you were ahead, Robert. Now you are getting away from good argument into the realm of ad hominem attack, not to mention being self-refuting. (If you were consistent, you would judge the *Skeptic's Dictionary* by all its entries, not just this one.) This is not befitting a scholar of your magnitude. And while I agree that one should judge a person by all his work, not just part of it, I don't claim to judge Velikovsky. My scope is limited to his *World's in Collision*. For me, that is enough of this type of "scholarship" for several lifetimes.

Velikovsky had impeccable credentials and was a close friend of Einstein at Princeton. Also being aware of intercollegiate jealousy, I cannot but come to some pretty low conclusions for professionalism for some quarters at Cornell and UC Davis.

reply: A close friend of Einstein's, you say. Well, you've got me there. I can't compete on the genius-friends level. Did you know Einstein, too? I think Sagan knows some pretty smart people, too, at Cornell and other places. By the way, I assume you meant to revile my college when you referred to UC Davis, but I have never been employed there.

Dictionaries do not editorialize. Dictionary editors mark their work for posterity if the information is incorrect or slanted toward error. These are simple and basic foundations for this kind of editor and I'm frankly surprised to find your bias and prejudice has so influenced your work. All your work must now be cautiously accepted, if at all.

reply: Are these Robert's rules of order in a chaotic universe? Anyway, I've recently changed the title of *The Skeptic's Dictionary* to

**The Skeptic's Dictionary :
wherein are defined occult, paranormal, supernatural and
pseudoscientific terms
with references whereby readers may arm themselves against the forces**

**of unreason
with occasional biased comments by the author**

I hope you like the new title, even if you don't like the book.

Instead of marking Velikovsky as one who tries to bring others to his erroneous ideology, I must come to the same conclusion with you and your school. Truth is not something to be accepted merely because it is in print. Checking the related documents brings Velikovsky clearly into the foreground of original thought which may not be totally correct, by his own admission, but his data was proposed more as "possibility" than fact, along with many other documents that seem to say the same thing or something very similar. Nothing more!

reply: Wow! I must have hit your v-spot or something. This stuff's really got you excited. My school? What are you talking about? You're not going to generalize to all skeptics on the basis of one article by one skeptic, are you? As to Velikovsky's originality, I've never denied it. As to his proposing improbable or merely possible things as tentative, I have to disagree. He frequently uses expressions of certitude, such as "must have" and "can only be explained by." Where is the tentativeness in this: "The birth of Pallas Athene on her first visit to earth was the cause of a cosmic disturbance, and the memory of that catastrophe was "a day of wrath in all the calendars of ancient Chaldea." [p. 181]

It's significant that pseudo-scientists react so violently to ideas that they feel are counter to what they consider to be common knowledge. Where you should desire credibility, you should also desire recognition from those who check out the data and know it to be true or credible, at least. The Skeptic's Dictionary is much more than what the title would lead readers to believe but the "more" is not something you cannot use to bolster your pride.

**Bob Lunsford
Sacramento**

reply: I assume you meant that as an insult. I'll interpret it that way, though I admit I could be wrong.

10 Sep 1997

Yesterday Bob Kobres e-mailed me a copy of your write up of Worlds in Collision. My first inclination was to thank you for linking to my SKEPTIC article and to tell you, on the basis of my cursory skimming, what a nice essay you put together. After reading it last night, however, I wish to bring to your attention some problems I believe exist with this discussion.

Although I agree that it is not a bad job, it could with little extra effort be a

*very good treatment. As it stands, Lynn Rose, Lew Greenberg, Irving Wolfe and Charles Ginenthal, for starters, could have a field day with your essay, similar to what was done to Sagan in "Sagan and Velikovsky". I would not go to the obsessive lengths Ginenthal et al. have done recently in the two new books you mention in your text; but I do wish to share with you my major reservations. For background, Sagan's analysis of WiC was not composed with the goal of showing supporters why Velikovsky is wrong; but, rather, with showing an uninformed reader (someone who had not read what V wrote) how crazy the book is. I say this because the AAAS session in 1974 was convened due to the popular support for Velikovsky that *Pensee* magazine had stirred up and that series of issues had developed a basis of support for Velikovsky that Sagan essentially ignored, besides the fact that in large part he criticized a straw man of his own making. For example, a close reading of the book shows that Velikovsky was not writing about grazing collisions; yet that was what Sagan examined in his Appendix 1 (see Kogan's letter in Sept. 1980 *Physics Today*, e.g., on this point).*

*Most, if not all, of Sagan's errors were exposed in 1977 in *KRONOS III:2*, sold under the title "Velikovsky and Establishment Science" (even still). You can imagine my surprise several years ago searching the stacks here at Wash. Univ. in St. Louis for a book and see this title staring back at me on level three! Anyway, for all its deficiencies, this volume pins Sagan on many errors and contains Velikovsky's own (partial) rebuttal to Sagan. You cite both *Scientists Confront Velikovsky* (containing Sagan's analysis) and the revised version in *Broca's Brain* and cite the latter in your essay. Some day, compare the texts of the two versions and you'll find many differences. For example, on the escape velocity from Jupiter, Sagan first used 70 km/sec, which was changed to 60 km/sec for *Broca's Brain*. Curiously, 70 km/sec is the value Lloyd Motz used in April 1967 Yale Scientific exchange with Velikovsky (and V corrected Motz at that time), but Carl did not pick up on this. Basically, at the time there was a rebuttal to Sagan's treatment of escape from Jupiter, using the technical literature, but Sagan never dealt with it. Yeah, Sagan and company dealt only with what V wrote, ignoring a large body of secondary material by V's defenders that seemed to people like me that V could be defended on valid grounds. The fact that most of this secondary material was flawed was never pointed out by Sagan and the other AAAS speakers, and later by other commentators, such as George Abell, etc. So, many of the points you choose to highlight have further elaboration beyond the simple case Sagan dealt with.*

The most serious issue I think you should deal with is the notion that Velikovsky took the Bible to be the literal truth, etc. One of the reasons I felt Velikovsky was credible (at the time) was the fact that I recognized that he DID NOT take such texts as the literal truth. It was clear to me that he accepted a realistic underpinning of certain "miracles" and discounted the fantastic aspects as an later elaboration to what was originally a real event. Thus with manna, V gave this credence because it was supported by manna-like accounts from other cultures, e.g., the ambrosia of the Greeks, etc. V

rejected the notion that manna did not fall on the seventh day precisely because it was so unrealistic; yet Sagan criticizes V for accepting this aspect (when V specifically rejected it!) This is not honest debate (but it never was a really debate). This issue is discussed by Velikovsky on pp. 24-25 and pp. 26-27 of V&ES. If you'd like, tell me your street address and I'll mail copies of these pages to you. V also had a explanation why the Egyptian's had a problem with falling buildings, but the Jews did not.

If you read the Physics Today letter cited above you'll see how bad Sagan did with his probabilities. But probability is beside the point. All actual events have a very low probability of happening, yet improbable events happen all the time. The crux is to establish whether or not the events really happened, not how unlikely they are. In July 1946 Einstein read the Venus part of WiC and wrote back on July 8th that V had shown that global catastrophes of extraterrestrial origin happened in 2nd millennium BC, but that Venus, most emphatically, was not the agent. V took comfort from the endorsement and ignored the bad news. Yes, this is ad hominem; but many have seen in certain myths, etc., that at some early time the sky was a threatening source: Whiston, Radlof, Donnelly, Hoerbiger, Bellamy, Beaumont, etc. Clube & Napier, too, were impressed on the basis of Bellamy's (screwball version) work that the myths were trying to tell us something and they came up with their Taurid Complex model which explains Velikovsky's "data" in terms of an astronomically feasible physical model. Sagan and his ilk (such as Chapman and Morrison in 1989) take the position that since V's model of colliding planets is crazy (a word used in correspondence with me), then there is no truth in the myths/data. What absolutely blew me away in the early 90s was reading Bob Kobres's paper on how the story of Phaethon can be seen as an account of a post perihelion comet passing closely BEHIND Earth: from certain longitudes, this body would be seen to rise as a Sun for 5 hrs, stand still for ca. 30 min. (while doubling in diam.) and then crash to the horizon in ca. 15 min. As I note in my SKEPTIC article that you cite, such an occurrence could well be the kernel of truth in the Sun standing still for Joshua. [To show how impoverished some scholarly insights can be, there are several papers in the literature that claim this "long day" is an account of a solar eclipse!-- which I never found persuasive.] And, of course, with Joshua, there is the hail of "barad", which can be taken to be meteorites and Clube & Napier would have no problem with them coming from the debris stream accompanying their proto-Encke, progenitor of the Taurid streams.

Because of all the problems I continue to have with Sagan's specific arguments, I developed my own "Top Ten Reasons Why Velikovsky Is Wrong About Worlds in Collision", which Tim Thompson posted for me on talk.origins in mid-August this year. Search DejaNews on "ellenberger AND Velikovsky" and one of the three or four hits will be the Top Ten.

Despite the foregoing fulminating, I really do like what you have written, especially for the tone, but you really are off base in parroting Sagan on V's literal use of sources and diehards like Ginenthal would take great delight in

skewering you on other "debatable" points.

*Have you seen the two books that Ginenthal put together recently? I have borrowed them from Bauer, to whom they were sent gratis so he'd be on record as having gotten them. Just as Sagan was sent V&ES in 1977, which he promptly ignored. Even when Kogan (V's older daughter) criticized him in *Physics Today* (sponsored by Freeman Dyson in the interests of fair play), Sagan did not reply (as he had replied to Robert Jastrow in *NYT* in late 1979), but David Morrison had a point-by-point rebuttal in 4/81 *P.T.* Well, seeing G'thal's books was very depressing for me. Such obsessiveness. Bauer told me he could not dredge up the energy/interest to read Gould & Velikovsky; but eventually he found the fortitude. So, when I saw Sagan's *Demon-Haunted World* ignored Velikovsky, I wrote Sagan wondering why, since this would have been a good chance for him to show how self-correcting science really was with him acknowledging his mistakes in *SCV* and *Broca's Brain* (note that the latter did undergo much revision, but little correction). His reply in effect denied he was aware of any errors in his treatment of WiC! Well, I wrote back that his App. 3 is totally fallacious; no "cooling" is demonstrated, only the *IDENTITY* that the heat radiated by Sun to Venus in ca. 60 min. equals that radiated by Venus at 79 K in 3500 years. No reply from him. I'll send you copies of this correspondence if you send me your address, as requested above. And, what he heck, I'll forward to you the *Top Ten*.*

Cheers,

Leroy Ellenberger

TOP TEN REASONS WHY VELIKOVSKY IS WRONG ABOUT WORLDS IN COLLISION

10. The "sequence of planetary orbits" that conserves angular momentum does NOT conserve energy, creating an enormous energy surplus, far more serious than Rose's mere "energy disposal problem," which is an example of the *_petitio principii_* fallacy (see *Kronos II*:4, p. 60 [and below]).

9. Orbit of Venus CANNOT circularize on Velikovsky's time scale, regardless what Einstein allegedly said in 1955; electromagnetism is no panacea & chaos theory cannot save the phenomenon, contrary to the wishful thinking of Bass.

8. Circular, resonant orbits of the moons of Earth & Mars betray no sign of recent disturbance, indicated by Velikovsky, or later capture, as Van Flandern noted in 1979 & of which Rose is willfully ignorant.

7. Since close encounters drastically increase inclination, the small inclinations of the orbits of Venus & Mars belie the multiple near-collisions outlined by Velikovsky. [This point is obscured by the 2-dimensional n-body simulations that were performed on talk.origins in 1994 while testing

Grubaugh's model.]

6. The debris Venus allegedly deposited in Earth's atmosphere causing 40 years of darkness after the Exodus left no trace in the world's ice caps or ocean bottoms, a test ignored by Rose.

5. The bristlecone pine survived the global catastrophe at 3500 BP that Velikovsky claimed killed all trees, to which he replied [to Ellenberger on Palm Sunday 1978] "So? They survived," indicating a cavalier attitude toward disconfirming evidence.

4. The continuity of flora & fauna on islands such as Hawaii [first noted by Roger Ashton at San Jose, Ca, Conf. in 1980 and later in C&C Workshop 1986:1, p. 5] shows they were not overrun by globe-girdling tidal waves at 3500 BP when the "Sun" stood still for Joshua, as Velikovsky claimed, an illusion produced by a post-perihelion comet passing *behind* Earth, as Bob Kobres explained for Phaethon; [see 3. The year was not 360 d. between 3500 BP & 2700 BP, as Velikovsky claimed, because at 3200 BP the Chinese reckoned the summer solstice recurred 548 d. after the winter solstice, i.e., $365.25 \times 1.5 = 547.875$, a datum smugly ignored by Rose in "From Calendars to Chronology," making the "Velikovsky Divide" a fraud & delusion, [in D.A. Pearlman (ed.), Stephen J. Gould and Immanuel Velikovsky (1996) wherein Rose avers "I have always wanted revenge on the various villains of the Velikovsky Affair, whether from 1950 or from 1965 or from 1974" (p. 702). The book is a petty, ponderous, mean-spirited, wrong-headed, and vindictive collaboration of Ginenthal, Wolfe, Rose, Cardona, D.N. Talbott, & Cochrane].

2. Magellan images of Venus reveal a crust too thick to have been molten 3500 years ago, & if the 900 large craters on Venus were so young then Earth would be expected to have more than the <20 craters of comparable size it does have. [NOTE Added by Tim Thompson: Also see my article "Is the Planet Venus Young?" <http://www.talkorigins.org/faqs/venus-young.html>]

1. Since Venus is too massive EVER to have had a VISIBLE tail, cometary behavior ascribed to the DEITY Inanna-Ishtar applies NOT to PLANET Venus, as Velikovsky & such naive epigoni as Cardona, Cochrane & Rose claim, but to a real COMET, now defunct or absent, which was ALSO sacred to Inanna-Ishtar, as Clube & Napier propose in *The Cosmic Winter* (1990); lesson: Inanna does not necessarily refer to Venus since she was ALSO associated with Moon, Sirius, etc. Thus, Inanna, NOT Venus, was hailed by the Mesopotamians as "Queen of the Zenith" [--an allusion to Sirius, a position never occupied by Venus in the putative "polar configuration"].

0. The revised chronology fares no better because the 10th century BCE, where Velikovsky places the XVIIIth Dynasty pharaohs coeval with the Minoan eruption of Thera, contains no signal for this eruption [in the

Greenland ice cores].

[These reasons present a prima facie difficulty for Velikovsky's position and support R.G.A.Dolby's arguments in S.I.S. Review I:3, 1976, 26-30 (adapted from Social Studies of Science 5, 1975, 165-175) and implicitly refute H. Meynell's reply to Dolby in which he claimed "...the impressiveness of Velikovsky's thesis is due as much to its coherence within itself as to its correspondence with ascertainable fact....that _one_ at first sight extremely improbable hypothesis, which should be liable to falsification in any number of ways, is in fact apparently confirmed in as many ways" (S.I.S. Review I:4, 1977, 5-8). The foregoing "Top Ten" would appear to contradict this assessment.]

Rose says "To undermine [an] argument, we need simply identify [the] false premisses[sic]." His false premises include (a) equating Inanna solely with Venus, a crude, ignorant reductionism, (b) treating religious texts as historical evidence for actual events instead of metaphors, & (c) over-emphasizing predictive power. In Kronos II:4, he should have said "to prove Velikovsky right you must assume Velikovsky right" & thereby ignore all the contrary physical evidence, which has priority over "historical" evidence which is subject to interpretation. Since Rose denies the absolute veto power of relevant evidence, he ignores it when he cannot pervert it. When Rose says "Velikovsky's critics had no decent arguments against him" & Wolfe says "there is no reason why Velikovsky...should be wrong _a priori_" [in Pearlman (ed.)] they merely show they, too, along with Ginenthal are each TRULY "an ignoramus masquerading as a sage"--deluded beyond redemption. [One of the gimmicks in Pearlman (ed.) is the classic Velikovskian tactic of turning a critic's words against him so that at every opportunity Henry Bauer is shown to be "an ignoramus masquerading as a sage", as Bauer showed Velikovsky to be in Beyond Velikovsky (1984).] Comments/questions welcome.

Leroy Ellenberger, 3929A Utah Street, St. Louis, MO 63116, USA Jan. 1997

reply: What more can I say? When I wrote to Mr. Ellenberger that I haven't had a student in years who has even heard of Velikovsky and that I no longer use *Worlds in Collision* as an example of pseudoscience in my critical thinking classes, he replied:

13 Sep 1997

I am getting into the swing of things in Skeptic's Dictionary and just read the reader comments on the Velikovsky entry and see much of what I wrote earlier has already been covered. Thus, I am surprised to see that, while you admit to having revised your entry on one point, you did not revise it regarding the literal use of the bible--which is a flat out misrepresentation on

Sagan's part. I'll also mention that the 1974 version of his analysis referred to the Motz & Bargmann letter in Science (12/62, I think) and also said that is only 20% of V's sources were valid, there was something to be explained, but by 1977 when Scientists Confront Velikovsky came out the Science letter was gone and there was nothing to explain.

With Velikovsky and Einstein, from 1921-23 in Berlin, Einstein was the editor of a volume of collected science papers by Jewish scientists in a series whose general editor was Velikovsky, whose father funded the project. Einstein read the Venus part of WiC in July 1946, as I said previously, but they were not in contact again until 1952 when V moved to Princeton and chanced upon E at Lake Carnegie, where they exchanged pleasantries. When V addressed the Graduate Forum at Princeton in Oct 1953 (text in Earth in Upheaval) Einstein sent his secretary and another woman from his household. They gave a favorable report to E so that he and Velikovsky, then, met and corresponded often during the last 18 months of E's life. When E died, a copy of the German edition of WiC was open on his desk. This volume can be inspected at the Einstein archives in Israel, as several scholars have done.

Also, V spoke a more open-minded game than he played. At PSA 1974 at Notre Dame, IN, Friedlander pointed out several instances where V had misrepresented his sources, one being what Lyttleton said about a fission origin for Venus from Jupiter. V had changed Lyttleton's "it is even possible" to "must", but V balked at owning up to this faux pas while demanding to be shown the texts, which Michael had with him. Similarly, at Brown Univ. in 1965 (where V hoped to confront Neugebauer), Abraham Sachs took Neugebauer's place when N refused to be on the program, "ambushing" V on a host of points. After Sachs spoke, V said he had a reply to each of Sachs' points as he would reveal the next day at the Q&A session at Diman House. Well, Sachs did not appear and V volunteered nothing. When he got back to Princeton, he prepared finished typed rebuttals to all the other speakers at Brwown, except Sachs, for whom only partial pencilled comments exist.

However, since the 1960s when LYttleton and McCrea toyed with fissioning of gas giants to form inner planets (this would have to have been early in solar system history, for once a core forms, it would not participate in any fissioning), this process has been shown to be ineffective, or inoperable in practice. But V's supporters still trot out Lyttleton fissioning even in 1997. Cheers,

Leroy Ellenberger (who knows more than anyone wants to know about Velikovsky)

P.S.: Yes, interest in V is not what it used to be. In 1986 25 people sent for the additional info I offered in my SI letter. In 1995 I offered four obscure papers in my refs to readers for a 32 cent stamp each. Only one reader responded. My letter in S/O SI now has the URL for my Velidelu article, but no one so far

has e-mailed me from the link in the web version. But people do continue to get attracted to V's ideas by various means, as I've noted before. Just yesterday I got a slick, full color catalog from Truth Seekers in San Diego offering books and video tapes for all sorts of b.s., including the Kronia tape "Remembering the End of the World" along with the tapes from the SSE's conference last Sept "Return to the Source"--many of whose speakers were nuts, such as Hancock, West and Flem-Ath, but others on the program had real information to convey, such as Frank Edge (see Sept. Griffith Observer) who has deduced that the Great Bull in the cave at Lascaux (15,000 BC) represents Taurus. Dots in the bull's head represent the Hyades and dots over its shoulder represent the Pleiades AND at that epoch the full moon at the summer solstice rested in the bull's horns. Cool. CLE

Mr. Ellenberger is not quite finished:

Dear Prof. Carroll,

Thank you for your reply. I still think, however, your Worlds in Collision critique should be amended, if not corrected/re-written to acknowledge that Velikovsky did not, contrary to Sagan's analysis, take Biblical stories literally. I shall send you a copy of Velikovsky's rebuttal to Sagan on this point as I indicated yesterday.

On the one hand I have heard your comments about student awareness before and on the other hand I see what the neo-Velikovskians are doing on the 'net and elsewhere to obtain followers, as my recent memorandum to 30 or so skeptics, etc., describes (which I'll also send to you); see the kronia site: and judge for yourself. AND, I know recent college graduates who "discover" Velikovsky by one way or another and are persuaded by the propaganda, even now. This suggests to me that your sampling of students is not a valid indicator of the potential interest in Velikovsky and related issues that is "out there"--where the truth should also be. I'll also send you a revised and enlarged version of my Su 1986 Skep. Inq. letter "A lesson from Velikovsky."

Further to my concerns yesterday, I do not recall seeing Skeptical Dictionary deal with Wilhelm Reich and orgonomy, which is still going strong and is also a lacunae in CSICOP's recent Encyclopedia of the Paranormal, Gordon Stein, ed. (and which volume I do not recall seeing offered in your electronic bookstore. If I misspeak myself here, I apologize. I really am not trying to be a "pill", just concerned about covering all the relevant bases.

Oh, yes, I'm sure the point is not lost on you that for someone like Sagan to promote good science and critical thinking and then use erroneous physics and fallacious logic to debunk Velikovsky is not "good form"--and I think groups like CSICOP should be concerned with such lapses in procedure, even when their fair-haired boy is a culprit. When you see my correspondence last year with Sagan you will see what I mean.

Cheers,

Leroy Ellenberger

reply: Sagan ignored the charges that he intentionally used "erroneous physics" and "fallacious logic" to debunk Velikovsky. Sagan and the Veikovskians were never two scientific schools battling it out for domination. At best, their confrontation could be called "philosophical." It had nothing to do with the nature of science. I have seen your correspondence with Sagan (for which I thank you) but I do not read from it any more than that he didn't have a clue as to what you were talking about when you demanded him to "self-correct."

reader comments:

wicca

29 Dec 2000

*You briefly make mention of the Inquisition's role in persecuting witches in your article on Wicca. This is a myth carried over from 19th century scholarship. I mention the mistake only because it perpetuates an inaccurate picture of the Catholic Church during medieval times. True, "witches", or people accused of witchcraft, were condemned at times by Christians, but mostly post-Reformation and by non-Catholics. The greatest numbers of executions occurred in Germany, Switzerland, and eastern France. The usual official Catholic position was that there are no such thing as witches and would be more quick to condemn the accusers than the "witches." For more information, see *Those Terrible Middle Ages : Debunking the Myths* by Regine Pernoud or here is a web-page: http://www.cog.org/witch_hunt.html.*

(According to Pernoud, the number of people executed by the Inquisition ever, for any reason, is much less than the number of "witches" put to death by post-Renaissance secular courts.)

Todd Pellman

reply: Interesting. Sounds like Pernoud is doing some revisionist history. What next? A denial of the Inquisition?

The two of you might want to reflect on the following, taken from the [Catholic Encyclopedia entry on "witchcraft."](#)

In the Holy Scripture references to witchcraft are frequent, and the strong condemnations of such practices which we read there do not seem to be based so much upon the supposition of fraud as upon the "abomination" of the magic in itself. (See Deuteronomy 18:11-12; Exodus 22:18, "wizards thou shalt not suffer to live" — A.V. "Thou shalt not suffer a witch to live".) The whole narrative of Saul's visit to the witch of Endor (I Kings 28) implies the reality of the witch's evocation of the shade of Samuel; and from Leviticus 20:27: "A man or woman in whom there is a pythonical or divining spirit, dying let them die: they shall stone them: Their blood be upon them", we should naturally infer that the divining spirit was not a mere imposture. The prohibitions of sorcery

in the New Testament leave the same impression (Galatians 5:20, compared with Apocalypse 21:8; 22:15; and Acts 8:9; 13:6). Supposing that the belief in witchcraft were an idle superstition, it would be strange that the suggestion should nowhere be made that the evil of these practices only lay in the pretending to the possession of powers which did not really exist....

...after the middle of the thirteenth century, the then recently-constituted Papal Inquisition began to concern itself with charges of witchcraft. Alexander IV, indeed, ruled (1258) that the inquisitors should limit their intervention to those cases in which there was some clear presumption of heretical belief (*manifeste haeresim saparent*), but Hansen shows reason for supposing that heretical tendencies were very readily inferred from almost any sort of magical practices. Neither is this altogether surprising when we remember how freely the Cathari parodied Catholic ritual in their "*consolamentum*" and other rites, and how easily the Manichaeism of their system might be interpreted as a homage to the powers of darkness. It was at any rate at Toulouse, the hot-bed of Catharan infection, that we meet in 1275 the earliest example of a witch burned to death after judicial sentence of an inquisitor, who was in this case a certain Hugues de Baniol (Cauzons, "*La Magic*", II, 217). The woman, probably half crazy, "confessed" to having brought forth a monster after intercourse with an evil spirit and to having nourished it with babies' flesh which she procured in her nocturnal expeditions. The possibility of such carnal intercourse between human beings and demons was unfortunately accepted by some of the great schoolmen, even, for example, by St. Thomas Aquinas and St. Bonaventure....

...there can be no doubt that during the fourteenth century certain papal constitutions of John XXII and Benedict XII (see Hansen, "*Quellen und Untersuchungen*", pp. 2-15) did very much to stimulate the prosecution by the inquisitors of witches and others engaged in magical practices, especially in the south of France. In a witch trial on a large scale carried on at Toulouse in 1334, out of sixty-three persons accused of offences of this kind, eight were handed over to the secular arm to be burned and the rest were imprisoned either for life or for a long term of years. Two of the condemned, both elderly women, after repeated application of torture, confessed that they had assisted at witches' sabbaths, had there worshipped the Devil, had been guilty of indecencies with him and with the other persons present, and had eaten the flesh of infants whom they had carried off by night from

their nurses (Hansen, "Zauberwahn", 315; and "Quellen und Untersuchungen", 451). In 1324 Petronilla de Midia was burnt at Kilkenny in Ireland at the instance of Richard, Bishop of Ossory; but analogous cases in the British Isles seem to have been very rare. During this period the secular courts proceeded against witchcraft with equal or even greater severity than the ecclesiastical tribunals, and here also torture was employed and burning at the stake. Fire was the punishment juridically appointed for this offence in the secular codes known as the "Sachsenspiegel" (1225) and the "Schwabenspiegel" (1275). Indeed during the thirteenth and fourteenth centuries no prosecutions for witchcraft are known to have been undertaken in Germany by the papal inquisitors. About the year 1400 we find wholesale witch-prosecutions being carried out at Berne in Switzerland by Peter de Gruyères, who, despite the assertions of Riezler, was unquestionably a secular judge (see Hansen, "Quellen, etc.", 91 n.), and other campaigns — for example in the Valais (1428-1434) when 200 witches were put to death, or at Briançon in 1437 when over 150 suffered, some of them by drowning — were carried on by the secular courts. The victims of the inquisitors, e.g. at Heidelberg in 1447; or in Savoy in 1462, do not seem to have been quite so numerous. In France at this period the crime of witchcraft was frequently designated as "Vauderie" through some confusion seemingly with the followers of the heretic, Peter Waldes. But this confusion between sorcery and a particular form of heresy was unfortunately bound to bring a still larger number of persons under the jealous scrutiny of the inquisitors.

It will be readily understood from the foregoing that the importance attached by many older writers to the Bull, "Summis desiderantes affectibus", of Pope Innocent VIII (1484), as though this papal document were responsible for the witch mania of the two succeeding centuries, is altogether illusory. Not only had an active campaign against most forms of sorcery already been going on for a long period, but in the matter of procedure, of punishments, of judges, etc., Innocent's Bull enacted nothing new. Its direct purport was simply to ratify the powers already conferred upon Henry Institoris and James Sprenger, inquisitors, to deal with persons of every class and with every form of crime (for example, with witchcraft as well as heresy), and it called upon the Bishop of Strasburg to lend the inquisitors all possible support.

It is little comfort to know that one part of the Protestant Reformation by

such men as Luther and Calvin included an even more vehement and violent attack on witchcraft and consorting with Satan. But to claim that it is a myth that the Catholic Inquisition persecuted witches is a bit much.

**Of course, revisionist history is no stranger to Wicca. For those interested in an article critical of Wiccan revisionism see "The Scholars and the Goddess" by Charlotte Allen, [Atlantic Monthly](#) (Jan 2001).
[thanks to Mary Fairchild]**

October 30, 2002

The fact is that until the last few decades there had been only a smattering of scholarly research on the subject, and the recent surge in research has shown that much previous accepted knowledge on the subject is little more than myth.....The Catholic Encyclopedia paraphrases Jacob Hansen....Unfortunately, Hansen's primary source is "Histoire de l'Inquisition en France" (1829) by Etienne Leon de Lamothe-Langon. This work - which formed the foundation of much nineteenth century "scholarship" on witchcraft - has long been demonstrated to be a complete fabrication![1] (In fact no record can be found of any witch trials in Toulouse in 1275, and the sex-with-demons stuff is also anachronistic.) Thus we must suspect that "the Catholic Encyclopedia" article is rather out of date.

Anyway, to address the three particular points raised:

a) Chronology: Despite the common myth that witch trials were a feature of the Mediaeval period, in fact modern research has found that very few occurred in that period; the overwhelming majority of witch trials and executions were post-Renaissance [2]. This surprises many people who think of the Mediaeval period as regressive and the Renaissance as enlightened, but the explanation is forthcoming when one looks at geography and chronology in more detail. For in fact the highest peaks of witch persecutions are at times of social chaos when local authority has broken down, such as during the German reformation, Thirty Years War and so on. For example, the only significant outbreak of witch mania in England was during the Civil War.

b) Geography: Once again, popular myth would associate most witch trials with Spain or perhaps France. In fact, by far the greatest concentrations occur in the German states [3], with high levels also in Switzerland and Scandinavia. Spain, Portugal and France all had relatively low levels. While it appears that one was more likely to be accused of witchcraft in a Protestant area than a Catholic one, this very likely has more to do with the chaos of change than Protestantism.

c) The Inquisition: No Hollywood witch trial would be complete without an Auto da Fe and a burning at the stake. Once again popular myth is way off

mark. The Inquisition was a very real horror, but its mandate was rooting out heretics (especially Jews and Muslims), and this specifically excluded witchcraft: "The Inquisitors, deputized to investigate heresy, must not intrude into investigations of divination or sorcery without knowledge of manifest heresy involved." [4] In fact the overwhelming majority of witch trials were conducted by secular courts, and of those conducted by the church only a tiny percentage were by the Inquisition. [5]

yours,

Roger Fleming

PS. For what it's worth, I am an agnostic from a Protestant background.

26 Jun 2000

Kind Sirs:

I have been a Pagan for most of my life. There have been times when I would have considered myself a Wiccan as well. It works for me. And I guess that is what most religions are about. A matter of faith, a hope, a feeling that connects us to others so we do not feel alone.

I have ventured through many different religions in the hope of finding a

purpose other than to trod upon this wondrous planet of ours and deplete its natural resources. I believe that it all boils down to what each individual is most comfortable with, and finding spiritual practices that feel in-line with one's personal spiritual goals.

Religion is a very personal matter. Unlike other religions, Wiccans and Pagans do not seek to convert others to their belief system. We do not say ours is the only way. Just as there are many routes to travel from San Francisco to New York, so too are there many paths to our "Glorious End". It is a matter of free will.

Your statement regarding Wiccan as not being a religion leaves me little nonplussed, for what is a "religion"? According to the New Heritage Dictionary of the English Language - ...3. The spiritual or emotional attitude of one who recognizes the existence of a superhuman power or powers. 4. Any objective attended to or pursued with zeal or conscientious devotion. 5. Sacred rites or practices. coming from the Latin word religio - a bond between man and the gods...

To my way of thinking, Wicca would then be a religion. Like Christianity that has many different facets (Baptist, Catholicism, Lutheran, and on and on) so too are there different facets of the Wiccan belief system.

Regarding your statement that Wiccans do not cast spells - well, some do and some don't. Just as not all Christians attend Sunday services and not all Jewish people attend Temple, not all Wiccans cast spells.

In my most recent past I have worked many spells, and all have worked, unfortunately so. I say unfortunately because the end was not always what I had expected. The goal was reached, but twisted a bit mainly because of my selfish nature coming through. And there in lies the rub. Any task or goal set upon with purely selfish intent is bound to "fail" or turn out differently than how one intended.

The axiom "And ye harm none, do what ye will" provides great freedom but also comes with a very high price tag and responsibility. One must clearly think through what it is they want, and make sure that no other being will suffer in the process.

It is true we build no temples or churches, for how could we possibly improve upon the wondrous surroundings that are here already - parks, gardens, forests - for these truly show the wonder and magnificence that is found in Nature, of which we are all a part.

The candles and incense we burn are used as visualization tools - as is seen in many other more widely accepted religions. Herbs and Charms and the preference for herbs over more traditional medicinal treatments are quite

widespread among many different cultures all over the world. To wit - St. Michael's medals, crucifixes, rosaries, prayer beads and prayer wheels. Herbs (like St. John's Wart, Echinacea, Gingko Biloba) are being sought as alternatives to traditional medicine by those other than Wiccans. Herbs have been used as medicine for centuries, and not just by Wiccans.

It is true we don't pray for harm to our enemies. Another "golden rule" of Wicca is that what we do comes back to us threefold. Why set out to purposefully attract negativity in our lives? Surely it would be better to commit random acts of kindness and love.

In Nature one finds a very common denominator - abundance. There is more than one Oak tree, and it has more than one branch, leaf or acorn. There are many antelopes in a herd, many leaves of grass in a plain. So too is there abundance for us humans. It is the way of Nature of which we are all a part.

Alicia May

All That Is and Ever Will Be Bless your day with warmth and light

reply: Thanks. I hope you have a long and peaceful life.

1 Jan 2000

I have just recently visited your sceptical dictionary page. I applaud your writing skills; I applaud your scepticism; I applaud your willingness to educate the public on little known facts; I applaud your ability to tell the truth with what seems to be a (mostly) unbiased slant, but (and I'm sure you heard that but a mile away) you are partially uninformed on the subject of Wicca. I am Wiccan, and I can tell you with first hand knowledge, Wiccan's cast spells.

reply: Well, of course, we *all* cast spells. But can you cast a spell that works? I doubt it, unless you can find some sucker who can be manipulated by the power of suggestion.

I plan on casting a spell tomorrow. The way that magick works is none of my concern, if it works is none of my concern, but many Wiccans will tell you that as a spell is cast the elements (earth, water, fire and air), which are only aspects of the God and Goddess, will cause the desired effect. Wiccan's are only pantheistic to the point that we call on the names of different Gods and Goddesses. In Wiccan phylosophy all the names of Goddesses belong to the one Goddess, and all the names of the Gods belong to the one God. Wicca is not anymore friendly to women then to men. Equality is a huge rule, strictly taught, as is the Wiccan Reed ("An it harm none, do as ye will") and the Rule of Three ("Ever mind the Rule of Three, Three times what ye gives returns to ye")(my assumption has always been that the "ye" in replacement of "you" was for rythmic/asthetic effect). Wicca in the 80's was shockingly feminist, but we are a changing people and have a tendency to correct our hypocrisies, the original

feminist wicca, Dianic Wicca has taken a noticeably large drop in membership, and the number of men professing to be Wiccan has doubled. To say that Christianity is not woman friendly is not accurate either. Catholicism, which previously has been very sexist has taken a radical turn, women may now (again) be Deaconesses, and many say that Vatican3 [sic] may come hard on the heels of the next Pope, and will allow women to be priests. One can only guess. I was surprised that you quite so bitterly accused us as not caring about death, or mass death. Perhaps if you understood our slant: Death is a natural process in the cycle of life. As the mother kills the child, so the mother kills the trees. In nature animals and plants are killed daily, everywhere, but they will live again. The true tragedy is that we have halted the process of natural death. No more do wildfires kill trees, but in order to preserve the natural cycle we must clear cut. If you could include this information on your web page I would be much obliged, as a Wiccan I feel it is my duty to educate the world in our truths so that we aren't cast in a bad light. And as a Wiccan saying goes: Merry Meet, and Merry Part, and Merry Meet again.

Blessed Be,

WillowRose

reply: There are few who respond to the *Skeptic's Dictionary* entry who are more annoying than Wiccans or witches. They have no formal dogma or ritual, and they each proclaim like infallible popes on whatever subject pleases them. According to them, nobody ever accurately characterizes their beliefs or practices. How could they?

Here's a typical example:

1/5/00

Mr. Carroll, I am a Wiccan of 5 years, although I do realize that this is a skeptical page, I do wish that you would get your information correct. You information on witchcraft is all wrong! You are sending the wrong message to those who already have the wrong picture of my people. I do wish that you would post the correct info, when you skeptics do these sites. We need not your help in swaying the people to the wrong side of our troubles. Too many people already do not care to know the truth about us, and too many are trying to stop our practices. I do hope that you will correct your information or at least attempt to. May I ask where you got your information from?

Blessed Be!

Selene

06 Jun 1999

*In the **Skepdic's Dictionary** you said that wiccans don't have a form of law. Yes, we do. To find some information on our law search the Internet. It will be under Wiccan Rede, 13 goals of a witch, Charge of the God, Charge of the goddess, The witches Rune, and The witches' creed.*

Secondly, we do cast spells and make potions.

Ryan Fliginger

reply: Wiccans don't have a written creed that the orthodox must adhere to.

10 Sep 1998

I am a practicing Wiccan. While I was glad that your "skeptic's" article on Wicca did not classify it as a satanic religion, or blather about the inherent evil of witchcraft, I was disappointed that you portrayed Wicca as more or less a piece of fluff -- "barefoot circle dancing," and whatnot -- and said that Wiccans worship only the "cute and fuzzy" side of nature with a "hug a tree" mentality, and are completely blind to the fact that nature can be a blindly destructive force. Wicca has a lot of depth to it. If you did your research thoroughly, you know that we worship, among other things, the Triple Goddess -- Maiden, Mother, Crone -- and the Dual God, the Horned God and the Hooded God. The Crone and the Hooded God are both deities embodying death and destruction, as well as rebirth. We do not deny that nature can be dangerous and destructive. However, we see this -- as you said -- as part of a natural cycle. If we learn to live in harmony with the earth, even the hard seasons can be survived. There are, I would remind you, Goddesses of volcanoes, Goddesses of thunderstorms, and Goddesses of earthquakes. It is a simple fallacy to assume that Wiccans are so blind as to deny the destructive side of the natural cycle. Of course, I would point out, this is a question that can be raised of any deity, not just the Wiccan one. We might just as easily ask how Christians or Jews can worship their god despite floods, tsunamis, tornadoes, and so on.

Wicca really isn't a religion designed for women's revenge, either. We stress EQUALITY of the sexes, not SUPERIORITY of women over men, or vice versa. And as for saying that Wiccan magick has never turned aside a hurricane or an earthquake -- well, there are some forces that are too great for us to handle. However, if you research "Weather Witches" I'm sure you will find some very interesting cases, that will give you pause in your skepticism, if nothing else.

One more thing. You say "They do not worship the mother of Dionysus, seared to the soul with a lightning bolt." (Okay, so that's a loose paraphrasing.) But in the cult of Dionysus, worship of Semele -- who was later led up from the underworld by Dionysus, and made Queen of the Maenads -- is quite common. She is seen as an aspect of the Goddess; her death is the Descent of the Goddess, a common theme in Wiccan theology. (Not a typo. Thea = goddess; theology = study of the goddess.) The Descent of the Goddess -- a cycle of death, suffering, sacrifice, and ultimate rebirth -- also ought to give pause to your insistence that Wicca is an ultimately shallow religion of blind, self-satisfying worship of only those aspects of nature that we choose to see. I appreciate you doing your utmost to portray Wicca honestly. A skeptical view is

always welcome in any forum, though it may ultimately prevent faith, which, while not perfectly "logical," can transform the world in many ways. You are a professor of philosophy -- I am sure you are familiar with this quote. "There are more things in heaven and earth, Mr. Carroll, than are dreamt of in your philosophy."

Haima Talib

reply: I've revised the "Wicca" entry regarding destructive natural forces. (p.s. Even professors of philosophy read Shakespeare. The quote is from *Hamlet*: "There are more things in heaven and earth, Horatio, Than are dreamt of in your philosophy.")

2 Jun 1998

The Skeptic's Dictionary is a simply magnificent work! I've been reading it voraciously, though surreptitiously (I'm at work). I hope you don't mind that I downloaded a few chunks of it to give to friends who send both "white light healing energy" and substantial sums of money to the operators of "positive, holistic chain letters."

*I've come to skepticism in my late twenties, after a protracted and embarrassing adolescence in which I was enamored of any occult or magical theory to come down the pike. I just thought I'd offer you the benefit of my skeptical perspective on the Wiccan faith, as there's a *lot* more hooey out there than you expose in the current version of the article.*

There's a "sacred history" in Wicca, which has about the same relation to empirical history that Genesis has; many Wiccan writers assert that

1) nature worship of the Horned God and Mother Goddess was universal throughout Paleolithic and Neolithic Europe; some Wiccan writers also insist on the universal peace-loving matriarchy pseudohistory.

*2) this worship persisted into the Christian era as *deliberate and self-conscious religious activity**

3) the practitioners of this religion were considered "wise ones", and that this is the basis of the modern term "witch;" they are also asserted to be midwives, healers, and herbalists.

4) the witchcraft persecutions of the sixteenth and seventeenth centuries were directed at the destruction of the old Pagan tradition; the term "Old Religion" used in post-Reformation English writings relates to Witchcraft or nature religion; nine million Witches (that is, Goddess-worshippers) were supposedly killed between 1485 and 1600.

5) modern Wiccan practice (as described by Gerald Gardner in the early 1950s) is a direct descendant of these preChristian practices. The five statements above are, in my opinion as a folklorist and a vaguely lapsed Wiccan, absolute and unmitigated hooey. Would you be interested in hooey sources and sound-fact sources, or both?

*In my experience, the standard Wiccan doctrine -- the "sacred history" story -- is about as historically sound as Afrocentrism or other pseudohistories. One of the other writers mentioned Margaret Murray's *Witch-Cult in Western Europe*; around the time of its publication in 1921, it was a seminal source in interpretation of the witchcraft persecutions. Modern Wiccan myth-history owes a great debt to Murray's interpretation; I know of no sources prior to 1921 that equate witchcraft with nature-centered folk religion. The problem with this, which another reader commented on, is that Murray has been almost **completely** discredited within anthropological circles.*

Wicca is based in a large part on etymological, anthropological, and folkloric research done between 1900 and 1940. The theories and approaches of those disciplines have evolved considerably since then; the Wiccan sacred history has not.

Thanks again for the wonderful contribution to the discourse on the Web.

Please don't post my name on the web page; I spend enough of my life arguing with Wiccans as it is.

27 Nov 97

An excellent Wicca page.. If only pages such as yours OPENED minds rather than incited the zealots, it would be a fairer world indeed.

Tom M.

20 Aug 1996

I've enjoyed browsing through your Dictionary. I especially appreciate your article on Wicca. Several of my friends are Wiccans and you've exactly described their religion. (Well, exactly as possible for what I call a disorganized religion.) Thanks for dispelling a few nasty myths. Hopefully the end result will be a few more people who don't automatically lump Wiccans in with Devil Worshipers.

Maria Bartz

19 Sep 1996

I stopped by to check out your excellent info on Landmark Forum -- a friend has been trying to get me involved, and I decided to learn more about it (now that I know Erhard is behind it, I'm staying away!) but as a Wiccan I thought I'd look over your piece on Wicca. You are dead-on with one exception -- I am at least one "barefoot Wiccan" who stands in awe before the lashing wind of the tornado, the baking drought Sun. Most sincere and knowledgeable Wiccans are well aware of the balance between creation and destruction. The Triple Goddess symbol, acknowledged by most of my co-religionists, is a representation of that very dichotomy. The Maiden is all that is new. The Mother is the Creator of Life. The Crone is endings, Death and Destruction. We see this in a cycle, a great circle. It is not "birth, life, death, full stop." but rather, "birth, life, death, rebirth, etc."

The awesome, powerful and destructive elements of the Earth, from volcanoes to tornadoes to wildfires to floods, are the natural processes of the planet, and we seek to find our place in that process. It is not all chanting and butterflies. There is also a dark half in the Yin-Yang symbol -- that balance is necessary. To ignore the shadow of a thing is to ignore half the thing itself. Isn't that why you do this page? To explore the shadow?

For whatever reason, I am glad you do it. Thanks for creating such a wonderful resource!

Laurie Atwater

reply: Some say I always find the cloud in the silver lining. But I sometimes think that the cloud's more interesting, if not more real.

25 Oct 1996

*I found your dictionary via a link of criticism of the Celestine Prophecy - well done indeed - and I wanted to thank you for your balanced portrayal of Wicca. As a Wiccan myself, I must say that it is refreshing not to be called a "satanist" or to be accused of sacrificing small animals to dark forces (of course, as a vegetarian and animal rights supporter, I guess I'd have to sacrifice a *rubber* chicken, which would actually be pretty funny).*

One bit of information you've gotten slightly wrong is that Wiccans are not all about light, sunshine, and joy. Our "religion" (although I hesitate to call it so) is about balance and cycles. Thus we honor the archetypes of the triple Goddess of Maiden (beginnings), Mother (fruition), and Crone (death and rebirth), and the God as divine sun child, lover/hunter/protector, and then king who dies that life may continue. The idea that life feeds on life is fundamental to many of our celebrations, and at each holiday there is the acknowledgment of the "opposite" holiday (for instance, at Beltane, the holiday at which we honor the fertility of the earth and her creatures, we remember Samhain, the holiday

at which we remember and honor those who have passed over). The wheel of the year is about the cycle of light and darkness, of birth, life, death, and rebirth, of extroversion and action as well as introversion and contemplation.

My point is that we're not all a bunch of airy-fairy, white light optimists - we acknowledge and revere the dark side of life, nature, and the universe equally.

Blessings to you,
Elizabeth Weaver Engel

17 Dec 1996

I read your entry on "wicca" and can say that you have accurately portrayed our "religion" as it is. This, to say the least, is a great comfort, for many people not directly connected with the beliefs of wicca (whatever religion they themselves follow) many times take with them the ideas that society has presented to them since they were children. I mean, who wouldn't hear the word witch and see an old green-skinned lady with a black pointy hat and a broom. (oh goddess, did i forget the black cat??)

*However (ah yes, there always is a however...) I *am* a person that worships all forces of nature, whether they be destructive or no. Every part of nature works together, and although they may not bring desirable consequences to humanity, they do shape the earth and keep it alive and well. That is, if one sees the earth as a living organism...it *is* a big rock..*

*If you could add one thing though about the "satan worshipping". It seems a surprise to many people that after we deny worshipping satan that we tell them wiccan's don't even *believe* in satan. But this is true. Satan, in my opinion (needless to say there are countless others) is a creation of Christianity. God, being the all powerful, all *good* entity, needed a counterpart. So there is the Devil, all powerful, all *bad*. You can't have one without the other it seems.*

*When Wiccans worship, we don't usually have a very specific god or goddess we speak or pray to. There are, in many traditions, "deities for every occasion". These include all things that are "good and bad" (put in quotations because that black and white saying is rather open for speculation itself. What *is* good and what *is* bad?)*

*Yes, there *are* Satan worshipers in this world, and they do perform terrible things. These many times are also people just looking for an excuse to commit crimes and say "oh hey, lets start a satanic cult so we can kill cats and stuff." The majority of "satanists" around today are adolescent boys. That ought to say something in itself.*

I look forward to the day when the word "witch" doesn't bring up the picture of

that old green woman again.

Caillean Grey

reply: As I was reading your note, I couldn't help but see the parallel between satanists and modern politicians. Of course, I just saw Tim Burton's *Mars Attacks!* and will have jaded perception for a week or so before I pretend again to see our political leaders as important players in the quest for world peace and good will toward humanity. Say, when are wiccans going to get their own TV show?!!

5 Oct 1997

I'm rather surprised that instead of adopting a skeptical attitude toward Wicca you chose to present it in such a positive light that the Wiccans have fallen all over themselves to congratulate you. Your article seems to me more an attack on Christianity than a critical look at Wicca.

reply: I think the Wiccans were happy to be raked over the coals by a non-Christian for a change. They probably aren't as hateful in their letters as some from other religions (whose denominations shall remain secret) because I don't accuse them of devil worship or of eating or sacrificing children.

*You make no mention, for instance, of Dr. Margaret Murray's 1921 book *The Witch Cult in Western Europe*, which first promulgated the idea the witchcraft was an "organized" religion (loosely organized to be sure) that survived the persecution of a Christian patriarchy during the Middle Ages. This book has had many detractors among Medieval scholars.*

If Margaret Alice Murray's *The witch-cult in Western Europe : a study in anthropology* (Oxford : Clarendon Press, 1921) has had many detractors among medieval scholars, why would you want me to mention it?

You make no mention of the controversy over the etymology of the word "witch."

reply: If this is so important, why didn't you share this knowledge with us?

You make no mention of the founder of Wiccan, Gerald Gardner, a man who can best be described as a plagiarist and a liar.

reply: Here I admit to failure. Perhaps I have been intimidated by the very vocal devoted fans of Aleister Crowley who have been relentless in their criticism since I accused him of much worse things than being a plagiarist and a liar.

You make no mention of pre-Christian views of witches in the works of Roman authors like Pausanius. Indeed you seem not to have done any homework at all on this subject.

Very soft skepticism indeed!

Bob Champ

reply: Actually, Bob, Pausanius was the first thing I thought about when considering doing an entry on "wicca" but I guess I just got sidetracked on too many side issues. Maybe you can fill in the gaps and write the history of witches from Pausanius to Gardner from the perspective of a hard skeptic.

10 Jan 1998

I read with interest your article on Wicca/Witchcraft. As a practicing Witch for over 13 years, a legally-ordained minister, and the Nat'l VP of WADL (see below), I must admit that I was very impressed by your description.

The one thing I take exception to is your putting down of "magick". I hear the same remarks from "BURN Again Christians"! You are missing the point -- Wicca is a RELIGION, NOT a "Cosmic Santa Claus" that will grant our every desire by waving a magic wand! (I think you've watched too many movies!). It, like any other faith, is a way of THANKING the Creator for what It has given us in our lives.

You might just as well say that the "goal/purpose" of Christianity is to "get things thru prayer", and, unfortunately, that IS all it is to some/most people. I call this the "Aladdin's Lamp Syndrome".

(Novices come to me, asking how to attract "Mr. Right", and all that, and I tell 'em the SAME THING!).

Being a skeptic, you probably don't believe in a Creator, which is your right. But... WE DO!!!!

I invite you to [check out my site](#) to help you understand us better.

Norm Vogel National VP and NJ Director [Witches Anti-Discrimination League](#)

reply: Thanks for setting the record straight. By the way, many skeptics believe in a Creator.

10 Jan 1998

Hi again!

I just read your essay on "Witches". sigh. I really wish people would lose the "consort with satan" crap! WITCHES NEVER WORSHIPPED SATAN! NEVER! That was BS that was created by the Christian church to stamp out a rival faith (Witchcraft). Witches perceive the Male Aspect of Deity as having horns, and the early Christians said that "satan has horns" (although nowhere in the Bible does it say this); ergo, "witches worship satan". BS!

Why do you insist on explaining Witchcraft from a Christian standpoint, esp. since you call yourself a "skeptic", and presumably don't believe in God in the FIRST place! Tell what Witchcraft WAS and IS -- not something clouded by another faith!

Norm Vogel

reply: I think I make it pretty clear that much of what is believed about witches is Christian mythology. When you Wiccans are the victors, then you can rewrite history to your liking. But why pretend that most of what is believed in the western world about witches did not originate with Judaism and Christianity?

wizard

A wizard is, literally, a wise person (from the 15th century Middle English *wysard*). The term came to refer to someone who claims to have supernatural knowledge or power, such as a [sorcerer](#) or one devoted to [black magic](#).

Today, the term is extended to refer to anyone who has a seemingly magical skill.

Zermatism

Zermatism is a [pseudoscience](#) invented by Stanislav Szukalski (1893?-1987), a gifted Polish [artist](#) and immigrant to the United States, in a 39-volume work. Zermatism maintains that all human culture derived from Easter Island after the flood which destroyed all living creatures except those on [Noah's ark](#). All languages derive from a single source (the Protong) and all art is a variation on a few themes that can be distilled down to a single series of universal symbols. Zermatism explains the differences in races and cultures by claiming that they are due to the cross breeding of species. The first humans were nearly perfect but they mated with [Yeti](#) with abominable results.
