v.1

NOTICE.

IT is now considerably more than a hundred years since EPHRAIM CHAMBERS gave to the world his *Cyclopædia, or Universal Dictionary of Knowledge*—the prototype, as it proved to be, of a number of similar works, in Britain as well as in other countries, which must have contributed in no small measure to increase the sum of general intelligence. In nearly all these works there has been a tendency to depart from the plan of their celebrated original, as concerns some of the great departments of science, literature, and history; these being usually presented, not under a variety of specific heads, as they commonly occur to our minds when information is required, but aggregated in large and formal treatises, such as would in themselves form books of considerable bulk. By such a course it is manifest that the serviceableness of an Encyclopædia as a dictionary for reference is greatly impaired, whatever may be the advantages which on other points are gained.

With a view to bring back the Encyclopædia to its original purpose of a *Dictionary of Knowledge*, even down to matters of familiar conversation, the Germans formed the plan of their *Conversations-Lexicon*, a work which, extending to a long series of volumes, has passed through ten editions, and obtained a world-wide celebrity. Believing that a translation of the latest edition of that well-conceived and laboriously executed work would be generally acceptable, the Editors made an arrangement for that purpose with the proprietor, Mr Brockhaus of Leipsic. After some time, however, had been spent in translating, the task of adapting the information to English requirements was found so difficult, that the resolution was taken to bring out a substantially new work, following in its construction the admirable plan of the *Conversations-Lexicon*, but making use of its valuable matter, only so far as it might be found suitable.

CHAMBERS'S ENCYCLOPEDIA, therefore, although constructed on the basis of the latest edition of the *Conversations-Lexicon*, is, in no part, a mere translation of that work. All that specially relates to Great Britain and her colonies, as well as to the states of North and South America, is collected from new and more direct sources. The articles also on the physical sciences and practical arts receive greater prominence than in the German work, and are nearly all original, being mostly the work of contributors having special knowledge of the subjects. Even in the articles of the *Conversations-Lexicon* relating to Germany and other continental countries, as well as

MS. 6-12
Exp. of John J. Coyle, 10 v. 5, 1951, added ed.

NOTICE.

to subjects of a universal interest, the lapse of time (now ten years) since the publication of that work began, as well as the difference in the relative importance of the same subject in different countries, has rendered great alterations necessary in order to adapt the information to the present time and to Great Britain. The employment of illustrative engravings and maps, is another feature in which the present work differs from the German.

The general character of the work, now thus far advanced, is indicated by its title—*A Dictionary of Universal Knowledge for the People*. The several topics are not handled with a view to the technical instruction of those who have to make a special study of particular branches of knowledge or art. The information given may be characterised as *non-professional*, embracing those points of the several subjects which every intelligent man or woman may have occasion to speak or think about. At the same time, every effort is made that the statements, so far as they go, shall be precise and scientifically accurate. One great aim in the arrangement of the work has been to render it *easy of consultation*. It is expressly a Dictionary, in one alphabet, as distinguished on the one hand from a collection of exhaustive treatises, and, on the other, from a set of Dictionaries of special branches of knowledge. To save the necessity of wading through a long treatise in order to find, perhaps, a single fact, the various masses of systematic knowledge have been broken down, as it were, to as great a degree as is consistent with the separate explanation of the several fragments. In the greater number of articles, however, there will be found copious references to other heads with which they stand in natural connection; and thus, while a single fact is readily found, its relation to other facts is not lost sight of. It will be observed, that by means of accentuation, some assistance is given in the pronouncing of the proper names which form the heads of the articles. At the conclusion of the work, it is intended to give a copious General Index, referring not only to the distinct articles, but to subjects casually noticed—an arrangement which cannot fail to be of considerable use to those who wish to consult the work on many matters of interest.

W. & R. CHAMBERS.

A DICTIONARY OF UNIVERSAL KNOWLEDGE FOR THE PEOPLE

is the first letter in almost all alphabets; the only exceptions, perhaps, are the Ethiopian, where it stands thirteenth, and the Runic, in which the order is altogether different (see **RUNES**).

It has in English at least four distinct sounds, as heard in *ale*, *man*, *father*, *all*. Of these, the third may be considered its primitive and proper sound; it is its name-sound in perhaps all languages except English, and is that which is assigned to it in comparative grammar. This sound is the purest and fullest in human speech; it is that which the child learns first and most easily to produce, and its sign stands as if by right at the head of the alphabet. In the oldest languages it is the predominating vowel, and gives them their peculiar fulness and strength. Philologists consider it the *heaviest* of the three fundamental vowels; the other two, *i* and *u* (whose primitive and proper sounds are heard in *me* and *do*), seem to have arisen out of *a*, by lightening or weakening it (Lat. *cadence*—*incidence*, *caleo*—*incuteo*). By combining with these, *a* gives rise to *ai*, *au*, which in their turn coalesce into *ê* and *ô*.—In the Phœnician alphabet, the letter *A* bears the name of *aleph*; i.e., 'ox,' with reference to its most ancient form, which rudely represented an ox's head. From this came the Greek name *alpha*. For engraving or tracing on stone or other hard materials, characters composed of straight lines are best adapted, and such was naturally the earliest form of *A* and the other letters. It is easy to trace the growth of our small *a* or *a* out of the monumental *A*. In Greek and Roman inscriptions executed hastily or carelessly,

the form **A** is often found; and this, written with a flexible reed, became rounded into **a**.

—For *A* and the other letters as abbreviations, see **ABBREVIATIONS**.

A, as a note in Music, is the major sixth of the scale of *C*, major. When perfectly in tune to *C*, it stands in the proportion of $\frac{3}{2}$ of 1. But in this state it would not be a fifth to *D*, the second note of the scale of *C*, being a comma too flat, which difference is as 80 to 81. The ear being sensibly offended with this deficiency, the note *A* is therefore made the least degree higher than perfect—namely, $\frac{96}{101}$, by which the advantage is gained, that *A* is a fifth above *D* ($\frac{108}{101}$), or only deficient in the proportion of $\frac{1}{101}$ —a deficiency so trifling that the ear accepts the fifth, *D*, *A*, and the sixth, *C*, *A*, as perfect, although, mathematically calculated, the one is too great and the other too small.—For *A* Major and *A* Minor, see **KEY**.

A1, a symbol by which first-class vessels are known in Lloyd's Register of British and Foreign Shipping (q.v.), and by which the operations of shippers of goods and insurers are governed. Surveyors appointed by the society examine all vessels in course of building, with a view to ascertaining their character, and inscribing them accordingly in the register. *A* designates the character of the hull of the vessel; the figure 1, the efficient state of her anchors, cables, and stores; when these are insufficient, in quantity or quality, the figure 2 is used. The character *A* is assigned to a new ship for a certain number of years, varying from four to fifteen, according to the material and mode of building, but on condition of the vessel being steadily surveyed, to see that the efficiency is maintained. A vessel built under a roof is allowed an additional year on that account. An additional period of one year, and, in certain cases, of two years, is also allowed to vessels whose decks, outside planking, &c., are fastened in a specified way. After the original period has elapsed, the character *A* may be 'continued' or 'restored' for a time (1–8 years), on condition of certain specified repairs.—When a vessel has passed the age for the character *A*, but is still found fit for conveying perishable goods to all parts of the world, it is registered *A* in red. (The symbol for this class was formerly **Æ**)

asterisk in red).—Ships *Æ* in black form the third class, and consist of such as are still found, on survey, fit to carry perishable goods on *shorter voyages*.—Classes E and I comprise ships sufficient to convey goods not liable to sea-damage; the one class, for voyages of any length, the other, for shorter voyages.

A CAPELLA, or A LA CAPELLA, in Mus., means, in the church style; it is equivalent to Alla Breve (q. v.), a time-signature which frequently appears in church-music. It also denotes that the instruments are to play in unison with the voices, or that one part is to be played by a number of instruments.

AA, the name of a number of rivers and streams in the north of France, Holland, Germany, and Switzerland. As many as forty have been enumerated. The word is said to be of Celtic origin, but it is allied to the Old German *aha*, Gothic *ahva*, identical with the Latin *aqua*, 'water.' Ach or Aach is another form of the same word. Four streams of the name of Ach fall into the Lake of Constance. The word, in both forms, occurs as final syllable in many names of places, as, Fulda (formerly Fuldaha), Biberach, Biberich, &c. In the plural, it is Aachen (waters, springs), which is the German name of Aix-la-chapelle (q. v.). Aix, the French name of so many places connected with springs, is derived from Lat. *Aqua*, which became in old French *Aigues*, and then Aix. Compare the Celtic Esk, Ex, Axe, Ouse.

AALBORG (meaning Eel-town), a seaport in the north of Jutland, with considerable trade; pop. 8000.

AAR, next to the Rhine and Rhone, the largest river in Switzerland, rises in the glaciers near the Grimsel in Berne, forms the Falls of Handeck, 200 feet high, flows through Lakes Brienz and Thun, and passing the towns of Interlaken, Thun, Berne, Solothurn, Aarau, Brugg, and Klingenau, joins the Rhine at the village of Coblenz, in Aargau, after a course of nearly 200 miles. It is a beautiful crystal stream, and, though rapid, is navigable for small-craft from Lake Thun. There are several small rivers of the same name in Germany.

AARGAU (ARGOVIE), a canton of Switzerland, on the lower course of the Aar, and having the Rhine for its north boundary. Its surface is diversified with hills and valleys, is well wooded, and generally fertile. The area is about 530 sq. miles, and the population in 1850 was nearly 200,000, rather more than half being Protestants. Besides agriculture, considerable manufacturing industry in cotton and silk is carried on both in the towns and country, and the prosperity of the population has of late markedly increased. In this canton is the castle of Habsburg or Hapsburg, the original seat of the imperial family of Austria. The chief town is AARAU, situated on the Aar; pop. 4637.

AARHUUS, a seaport on the east coast of Jutland; pop. 6800.

AARON, the elder brother of Moses, was appointed his assistant and spokesman, and at the giving of the Mosaic law received for himself and his descendants the hereditary dignity of the priesthood. Aaron assisted his brother in the administration of public affairs. He died in the 123d year of his age, on Mount Hor, on the borders of Idumea. His third son, Eleazar, succeeded him in the office of high-priest.

ABACA, or MANILLA HEMP, is the fibre of a species of plantain or banana (*Musa troglodytarum*), a native of the Philippine Isles, where it is extensively cultivated. The leaf-stalks are split into long stripes, and the fibrous part is then separated from

the fleshy pulp. A labourer can in this way produce daily 50 lbs. of hemp. Before 1823, the quantity produced was insignificant, but now it amounts to nearly 3000 tons annually. In Manilla there is a steam rope-work for making ropes of it for naval purposes. They are very durable, but not very flexible.—The fibre of a number of species of *Musa* is used in tropical countries. See PLANTAIN.

ABACUS, an instrument seldom seen except in infant-schools, where it is used to make the elementary operations of arithmetic palpable. It consists of a frame with a number of parallel wires, on which beads or counters are strung.

Chinese Abacus.

In ancient times, it was used in practical reckoning, and is said to be so still in China and elsewhere.—*Abacus Pythagoricus* meant the multiplication-table.—ANACUS, in arch., is a square or oblong level tablet on the capital of a column, and supporting the entablature. In the Doric, old Ionic, and Tuscan orders, the abacus is

Doric Abacus.

a regular oblong; but in the new Ionic, Corinthian, and Roman orders, the abacus has concave sides, with truncated angles. Square marble tablets let

Corinthian Abacus.

into walls, and fields with figures in them inserted in mosaic floors, were also included under the term abacus in ancient architecture.

ABAD (allied both in etymology and meaning to the Eng. *abode*), an affix to names of Persian origin, as *Hyderabad*, the 'dwelling' or city of Hyder.

ABAISSE (lowered), a term used in Heraldry. When the fesse, or any other armorial figure is depressed, or situated below the centre of the shield, it is said to be *abaissé*. *Adossé* (back to back), *affronté* or *confronté* (facing or fronting one another), *aiguissé* (sharpened at the point), *ailé* (winged), are other heraldic terms borrowed, like *abaissé*, from the French, and used by English heralds in senses not differing essentially from their ordinary significations in that language.

ABANDON (Abandoning, Abandonment). This term, in its different grammatical and etymological forms, has various applications in legal phraseology, but all more or less corresponding to its popular meaning. The following are examples:

ABANDONING AN ACTION is a technical expression in Scotch legal procedure, signifying the act by which a plaintiff—or 'pursner,' as he is called in Scotland—abandons or withdraws from his action on the payment of the costs incurred, and with the approval of the judge before whom the action had previously been conducted. The same purpose is effected in England by the plaintiff in a Court of Common

Law either entering a *Nolle Prosequi*, or at the trial *withdrawing the record*. In the Courts of Equity, the plaintiff may move the *dismissal* of his own bill, or the defendant may move to dismiss the suit for *want of prosecution by the plaintiff*. Suits may also *abate* by the death or supervening incapacity of the parties. See ACTION.

ABANDONMENT, in Marine Insurance, signifies the relinquishment to the insurer or underwriter of goods or property saved from a shipwreck, and of all interest in the same, previous to the owners' demanding payment in terms of the policy. See INSURANCE.

ABANDONMENT OF RAILWAYS. By the act of parliament 13 and 14 Vict. c. 83, facilities are afforded for the A. of railways, and the dissolution of railway companies by consent of the holders of three-fifths of the shares or stock, and by warrant of the 'Commissioners of Railways,' or, as it now is by the 14 and 15 Vict. c. 64, by warrant of the Board of Trade, who, in this respect, as well as in other matters regarding the regulation of railways, have superseded the former body. See RAILWAY.

ABANDONING or deserting seamen, by masters of merchant-vessels, is, by 9 Geo. IV. c. 31, s. 30, a misdemeanour, and punishable by imprisonment. See SEAMEN.

ABATEMENT. This is a term used in various senses in the law of England, as follows: 1. A. of *Freehold*, where a stranger without right enters and gets possession. See FREEHOLD. 2. A. of *Nuisances*, which is a remedy against injury by nuisance. See NUISANCE. 3. *Plea* in A. by means of which a defendant, on some formal and technical ground, seeks to abate or quash the action. See ACTION. 4. A. of *Legacies and Debts*, where the estate is insufficient for payment in full. See LEGACIES. 5. A. by the death of parties to actions at law and suits in equity, which are in consequence stopped till revived. The marriage of a plaintiff, the change or loss of interest and right, and other similar considerations, have also the effect of abating legal proceedings. See ACTION. 6. A. or discount, in Commercial Law. See COMMERCIAL LAW. 7. A. or deduction of duties levied by the Custom-house. See CUSTOM-HOUSE.

ABATEMENT, in Heraldry, is a mark placed over a portion of the paternal coat-of-arms of a family, significative of some base or ungentleman-like act on the part of the bearer. The coat is then said to be abated, or lowered in dignity. Guillim gives nine such marks, all of which are of either one or the other of the two disgraceful colours, tenné (tawney) and sanguine. Such are the delf tenné, assigned to him who revokes his challenge; the escentcheon reversed sanguine, proper to him who offends the chastity of virgin, wife, or widow, or lies from his sovereign's banner; the point-dexter tenné, due to him who overmuch boasteth himself of his martial acts; and the like. Marks of abatement are generally repudiated by the best heraldic authorities. Menestrier calls them *sottises Anglaises*, and Montagu is of opinion that we shall seek in vain for a more appropriate designation. Abatements are carefully to be distinguished from such subtractive alterations in coats-of-arms as signify juniority of birth, or removal from the principal house or senior branch of the family.

Abatement.

These are commonly called marks of cadency, distinctions, differences, or brisures. The latter term is generally applied to marks of bastardy,

which might with less impropriety be classed with abatements.

ABATTIS, a species of intrenchment, and one of the oldest. It consists of trees felled (*abattu*), and laid side by side, with the branches directed towards the enemy, the softer twigs being cut off. It thus forms a breastwork to fire over, and is very useful in field-works and in the out-works of regular fortifications, for retarding the enemy's advance.

ABATTOIR (Fr. *abatre*, to fell or destroy), a slaughter-house. The use of this term has passed into England from France, where the example was first given of public establishments for the slaughter of animals used as food, on such a scale and with such sanitary arrangements as to obviate the injurious effects that are found to result from the existence of private slaughter-houses in the midst of a crowded population. This great public improvement originated with Napoleon, who passed a decree in 1807 for the erection of public *abattoirs*. The extensive works connected with this design were nearly completed before the fall of the Empire; but it was not till the close of 1818, that the Parisian butchers ceased to slaughter in their private establishments. There are now five of these abattoirs in Paris—three on the right, and two on the left bank of the Seine, containing 240 slaughter-houses in all—which, both in architectural propriety and completeness of internal arrangement, may be regarded as models of their kind. The charge per head is, for an ox 6 francs, a cow 4 fr., a calf 2 fr., and a sheep 50 cents. Of the appearance and management of one of the great Parisian abattoirs, a good account is given by Sir Francis Head, in his amusing work, *A Faggot of French Sticks*. Other towns in France have similar abattoirs; and so have Mantua and Brussels.

The erection of similar establishments in Britain is of comparatively recent date. Public slaughter-houses formed part of the plan in the establishment of the new cattle-market in the Metropolis in Copenhagen Fields. Those built are well arranged; but they are few in number, and the old system is still in full operation, to the great detriment of the public health. In Edinburgh, an establishment of this kind, excellent in its construction and arrangements, was erected by the town-council in 1851.

A BATTUTA (Ital.), in Music, in strict or measured time.

ABAUZIT, FIRMIN, a French savant, was born at Uzès, in Languedoc, 1679, and died at Geneva 1767. His parents were Protestant, and at the revocation of the Edict of Nantes, being only six years of age, he escaped with difficulty, by his mother's contrivance, from the hands of the authorities who wished to educate him into Catholicism, and was sent to Geneva. Here he prosecuted his studies with such intense ardour and diligence, that he became versed in almost all the sciences. He travelled in England and Holland in 1698, where he made the acquaintance of Newton, Bayle, and other eminent writers. Newton, in sending him one of his controversial works, paid him the distinguished compliment of saying: 'You are worthy to decide between Leibnitz and me.' King William wished to retain him permanently in England, and to that end made him several advantageous offers; but his affection for his mother induced him to return to Geneva. He translated the New Testament into French in 1726; and for his lucid investigations into the ancient history of Geneva, he received from its authorities the rights of citizenship. He likewise wrote numerous theological and archaeological treatises, besides leaving one or two scientific and artistic dissertations in manuscript, but the greater portion of these were burned by his heirs, who were Catholics.

His orthodoxy has been disputed. From some of his works we gain the impression that he was a Unitarian. His personal qualities secured him universal esteem. Rousseau, who could not bear to praise a contemporary, penned his solitary panegyric on A.

ABBADIE, ANTOINE and ARNOULD-MICHEL D', two brothers, French travellers, known for their researches in Abyssinia, from 1837 to 1845. According to their own account, their objects were purely ethnological and geographical; but they were regarded by certain English travellers and missionaries as agents employed by the French government for religious and political purposes; and were accused of inducing Prince Ubie to expel the Lutheran missionaries from Adoa. Arnould returned a second time to Abyssinia in 1853, and continued his explorations for a year. The results of their travels appeared from time to time in the French geographical journals. They are chiefly valuable in a philological and ethnological point of view.

ABBANDONAMENTÉ (Ital.), in Music, with self-abandonment; despondingly.

ABBAS, the uncle of Mohammed, the Arabian prophet, and the chief promoter of his religion (d. 652), was the founder of the family of the **ABBASIDES**, who ruled as califs of Bagdad from 749 to 1258, and afterwards exercised the spiritual functions of the califate in Egypt, under the protection of the Mamelukes, till 1517, when that dignity passed to the Turkish sultan. Descendants of this family still live in Turkey and India.—The **ABBASIDES** in Persia were descended from the race of the Sofi, who ascribed their origin to the calif Ali. This race acquired dominion in 1500, and became extinct in 1736. Among them, Abbas I., surnamed the Great, was the most eminent ruler. He came to the throne 1586, and died 1628. His reign was marked by a series of victories over the Turks. In alliance with England, he destroyed, in 1621, the Portuguese colony at Ormuz.

ABBAS-MIRZA, a Persian prince, well known by his wars against Russia, was the son of the Shah Feth-Ali, and was born in 1783. Abbas possessed great talents and acquirements, and a love for the manners and culture of the West. When he was yet young, his father made him governor of the province Azerbijan, where, by the help of English officers, he applied himself to the reform of the army. When Persia, in 1811, influenced by France, declared war against Russia, Abbas was commander-in-chief of the main body of the Persian army, but was unsuccessful. Persia lost, at the peace of Gulistan, in 1813, its remaining possessions in the Caucasus, and was forced to acknowledge the flag of Russia on the Caspian Sea. At the instigation of Abbas, a new war broke out in 1826, between Feth-Ali and Russia. The prince fought a second time with extraordinary bravery at the head of the army, but was again obliged to yield to the superiority of the Russian arms, and to conclude a peace, on February 22, 1828, at Turkmanstchai, by which Persia lost all share in Armenia. In this treaty, Russia had guaranteed to Abbas the succession to the Persian throne, the consequence of which was that he became dependent on Russia, and was obliged to give up his connection with England. When, in 1829, the Russian ambassador at Teheran was murdered in a popular tumult, which he had provoked by imprudence, Abbas went in person to St Petersburg, to prevent any ill consequences, and to maintain the peace. He was received by the emperor with kindness, and went back to Persia loaded with presents. He died in 1833. His death was a great loss to his country, although he could not have prevented the encroachments of Russia.

His eldest son, Mohammed Mirza, mounted the throne in 1834, on the death of Feth-Ali, under the united protection of England and Russia.

ABBATE, NICCOLO DELI, or NICCOLO ABATI, was born at Modena in 1509 or 1512, and died at Paris in 1571. He was an able and skilful artist in fresco-painting, and was a follower both of Raphael and Correggio; yet he rather blended the two styles in one than imitated either separately. His influence is traceable in the art which prevailed during the second half of the 16th century. His earlier works are to be seen at Modena; his later ones at Bologna, among which is his 'Adoration of the Shepherds,' considered his finest; but he is best known by the frescoes which he executed for the Castle of Fontainebleau, from the designs of Primaticcio. These, however, with the exception of the tableaux representing the history of Alexander the Great, were unfortunately destroyed in 1738, at the barbarous suggestion of an architect who wished to enlarge the building.

ABBE, the French name for an Abbot (q. v.), but often used in the general sense of a priest or clergyman. By a concordat between Pope Leo X. and Francis I. (1516), the French king had the right to nominate upwards of 200 *Abbés Communitaires*, who, without having any duty to perform, drew a considerable proportion of the revenues of the convents. The hope of obtaining one of those sinecures led multitudes of young men, many of them of noble birth, to enter the clerical career, who, however, seldom went further than taking the inferior orders (see **ORDERS, HOLY**); and it became customary to call all such aspirants *abbés*—jociously, *Abbés de St Hope*. They formed a considerable and influential class in society; and an *abbé*, distinguished by a short black or violet-coloured frock, and a peculiar style of wearing the hair, was found as friend or ghostly adviser in almost every family of consequence. When a candidate obtained an abbey, he was enjoined to take holy orders; but many procured dispensation, and continued to draw the revenues as secular or lay abbots.

ABBESS, the superior of a religious community of women, corresponding in rank and authority to an abbot (q. v.), except in not being allowed to exercise the spiritual functions of the priesthood—such as preaching, confession, &c.

ABBEVILLE (*Abbatis Villa*), in France, next to Amiens, the most considerable town in the department of Somme, is situated on the river Somme; pop. 18,000. The town is well built, and is the seat of considerable woollen manufactures. Here a factory, founded in 1669, under the patronage of the minister Colbert, still employs above 500 hands. SEE SUP.

ABBEX. SEE MONASTERY.

ABBAY is used in a legal sense in Scotland, and signifies the sanctuary or protection to a debtor against legal process afforded by the A. of Holyrood. SEE SANCTUARY.

ABBOT ('father'). This name, originally given to any aged monk, was afterwards more strictly applied to the superior of a monastery or abbey. Since the 6th c., abbots have belonged to the clerical orders, but at first they were not necessarily priests. After the second Nicene Council (787), abbots were empowered to consecrate monks for the lower sacred orders; but they remained in subordination under their diocesan bishops until the 11th c. As abbeys became wealthy, abbots increased in power and influence; many received episcopal titles; and all were ranked as prelates of the church next to the bishops, and had the right of voting in church-councils. Even

abbesses contended for the same honours and privileges, but without success. In the 8th and 9th c., abbeys began to come into the hands of laymen, as rewards for military service. In the 10th c., many of the chief abbeys in Christendom were under lay-abbots (*Abbatē Milites*, or *Abba-comites*), while subordinate deans or priors had the spiritual oversight. The members of the royal household received grants of abbeys as their maintenance, and the king kept the richest for himself. Thus, Hugo Capet of France was lay-abbot of St Denis, near Paris. Sometimes convents of nuns were granted to men, and monasteries to women of rank. These abuses were, in a great measure, reformed during the 10th c. After the reformation of the order of Benedictines, monasteries arose that were dependent upon the mother-monastery of Clugny and without abbots, being presided over by *priors* or *pro-abbates*. Of the orders founded after the 11th c., only some named the superiors of their convents abbots; most, from humility or other cause, used the titles of prior, major, guardian, rector. Abbesses have almost always remained under the jurisdiction of their diocesan bishop; but the abbots of independent or liberated abbeys acknowledged no lord but the pope. In the middle ages, the so-called *Insulated Abbots* frequently enjoyed episcopal titles, but only a few had dioceses. Before the period of secularisation in Germany, several of the abbots in that country had princely titles and powers. In England there were a considerable number of *Mitred Abbots* who sat and voted in the House of Lords. The election of an abbot belongs, as a rule, to the chapter or assembly of the monks, and is afterwards confirmed by the pope or by the bishop, according as the monastery is independent or under episcopal jurisdiction. But from early times, the pope in Italy has claimed the right of conferring many abbeys, and the concordat of 1516 gave a similar right to the king of France. Laymen who possessed monasteries were styled *Secular Abbots*; while their vicars, who discharged the duties, as well as all abbots who belonged to the monastic order, were styled *Regular Abbots*. In France, the abuse of appointing secular abbots was carried to a great extent previous to the time of the Revolution. (See *ABBÉ*.) Often monasteries themselves chose some powerful person as their secular abbot, with a view of 'commending' or committing their abbey to his protection (*Abbés Commendataires*). In countries which joined in the Reformation, the possessions of abbeys were mostly confiscated by the crown; but in Hanover, Brunswick, and Würtemberg, several monasteries and convents were retained as educational establishments. In the Greek Church, the superiors of convents are called *Hegumeni* or *Mandrites*, and general abbots, *Archimandrites*.

ABBOT, GEORGE, an English prelate under the Stuarts—chiefly remarkable for the position he held, and the part he acted, as the opponent of the policy of Laud and a despotic court—was the son of a cloth-manufacturer in Guilford, and was born 1562. After studying at Oxford, he was appointed chaplain to the Earl of Dunbar (1608), with whom he went to Scotland. This appointment was the basis of A.'s subsequent promotion. For a short time he held the see of Lichfield and Coventry, and in 1610 was made Archbishop of Canterbury. As a learned and able man, but more especially as a friend of toleration, he gained the esteem of all parties in an age of religious animosities. James I. employed the advice of A. in the most important affairs of state, and the prelate often opposed the arbitrary principles of the king. A.'s intolerance

of Arminian doctrines was an exception to his general rule of conduct. His independent and liberal spirit incurred the displeasure of Charles I. A. was employed on the authorised translation of the Bible under James I. His other literary productions are not important. He died at Croydon, 1633, and a monument was erected to his memory in his native town, Guilford.—His brother, ROBERT A., Bishop of Salisbury (b. 1560—d. 1617), was a learned theologian, and the author of a treatise *De Suprema Potestate Regia* (1616), written to controvert the doctrines of Bellarmine and Suarez.

ABBOTSFORD, the seat of Sir Walter Scott, is situated on the south bank of the Tweed, a little above its confluence with the Gala, and about three miles from the town of Melrose. Before it became, in 1811, the property of Sir Walter, the site of the house and grounds of A. formed a small farm known by the name of *Cartley Hob*. The new name was the invention of the poet, who loved thus to connect himself with the days when Melrose abbots passed over the fords of the Tweed. On this spot, a sloping bank overhanging the river, with the Selkirk Hills behind, he built at first a small villa, now the western wing of the castle. Afterwards, as his fortune increased, he added the remaining portions of the building, on no uniform plan, but with the desire of combining in it some of the features (and even actual remains) of those ancient works of Scottish architecture which he most venerated. The result was that singularly picturesque and irregular pile, which has been aptly characterised as 'a romance in stone and lime.' The present proprietor of A. is Mr Hope Scott, who married the granddaughter of Sir W. Scott. A considerable addition has recently been made to the building.

ABBOTT, CHARLES. See TENTERDEN, LORD.

ABBOTT, REV. JACOB, a native of Maine, U.S., was born in 1803, and graduated at Bowdoin College in 1820. He is a remarkably voluminous writer, and has acquired a large measure of popularity from the simplicity and earnestness of his thought. He has addressed himself principally to the young, and it is perhaps not too much to say, that of all works intended for the juvenile mind, his are the best in the English language. So thoughtful an instructor of youth even as Dr Arnold, speaks in high terms of *The Way to do Good*. Nearly all his books have been repeatedly republished in England, and some have been translated into various European and Asiatic languages. His most popular work is *The Young Christian*. Besides this, he has written *The Franconia Stories*, 10 vols.; *Histories for the Young*, 19 vols.; *Marco Paul's Adventures*, 6 vols.; *Harper's Story-books*, 36 vols.; &c.

ABBREVIATIONS are contrivances in writing for saving time and space. They are of two kinds, consisting either in the omission of some letters or words, or in the substitution of some arbitrary sign. In the earliest times, when uncial or lapidary characters were used, abbreviations by omission prevailed, such as we find in the inscriptions on monuments, coins, &c. In these, the initial letter is often put instead of the whole word, as M. for Marcus, F. for Filius. It was after the small Greek and Roman letters had been invented by transcribers for facilitating their work, that signs of abbreviation or characters representing double consonants, syllables, and whole words, came into use. Greek manuscripts abound with such signs, and often only one that has expressly studied Greek palæography can make them out. From the manuscripts, they passed into the early printed editions of Greek books, and it is only recently that they have quite disappeared. Among

ABBREVIATIONS.

the Romans, signs of abbreviation were called *notæ*, and professed scribes who employed them were *notarii*. To such an extent was the system carried, that L. Annæus Seneeca collected and classified 5000 abbreviations. The same practice has prevailed in all languages, but nowhere more than in the Rabbinical writings.—The abbreviations used by the ancient Romans were continued and increased in the middle ages. They occur in inscriptions, manuscripts, and legal documents; and the practice continued in these last long after the invention of printing had made it unnecessary in books. An act of parliament was passed in the reign of George II., forbidding the use of abbreviations in legal documents. Owing to these abbreviations, the deciphering of old writings requires special study and training, and forms a separate science called Diplomatic (q. v.), on which numerous treatises have been written. Tassin's *Nouveau Traité de Diplomatique* (6 vols., Par. 1750-65) contains, in the third volume, an exposition of Roman abbreviations. Other works on the subject are—Gatterer's *Abriss der Diplomatik* (2 vols., Gott. 1798); Pertz's *Schrifttafeln* (4 Nos., Hannov. 1846); and Kopp's *Palæographica Critica* (4 vols., Manh. 1817-29).—In ordinary writing and printing, few abbreviations are now employed. The sign *cl*, originally an abbreviation for the Lat. *cl*, 'and,' is perhaps the only one of the arbitrary kind still to be met with. It does not stand properly for a word, for it is used in different languages, but for an idea, and is as much a symbol as +. The abbreviations by using the initials of Latin words that are still in use, are chiefly confined to titles, dates, and a few phrases; as, M.A. (*magister artium*), Master of Arts; A.D. (*anno domini*), in the year of our Lord; e.g. (*exempli gratiâ*), for example. Many are now formed from English words in the same way; as, F.G.S., Fellow of the Geological Society; B.C., before Christ.—Most of the sciences and arts have sets of signs of abbreviation, or symbols, peculiar to themselves. These are of great use both for brevity and clearness. See CHEMICAL SYMBOLS, &c.

The following is a list of the more important Abbreviations in general use:

- Abp., Archbishop.
- A.C. (*Ante Christum*), Before Christ.
- A.D. (*Anno Domini*), In the year of our Lord.
- A.H. (*Anno Hegiræ*), In the year of the Hegira.
- A.M. (*Ante Meridiem*), Before noon; (*Anno Mundi*), In the year of the world.
- A.R.A., Associate of the Royal Academy (London).
- A.R.S.A., Associate of the Royal Scottish Academy.
- A.U.C. (*Ab Urbe Condita*), From the building of the city—that is, Rome.
- B.A. or A.B. (*Artium Baccalaureus*), Bachelor of Arts.
- Bart. or Bt., Baronet.
- B.C., Before Christ.
- B.C.L., Bachelor of Civil Law.
- B.D., Bachelor of Divinity.
- B.M., Bachelor of Medicine.
- Bp., Bishop.
- C. (*Centum*), A hundred; chapter.
- C.A., Chartered Accountant.
- C.B., Companion of the Bath.
- C.C., Caius College.
- C.E., Civil Engineer.
- Clk., Clerk.
- C.M.G., Companion of the Order of St Michael and St George.
- Crim. Con., Criminal conversation.
- Ct., Count.
- ewt., Hundredweight.
- D.C.L., Doctor of Civil Law.

- D.D., Doctor of Divinity; *Dono dedit*.
- D.G. (*Dei Gratiâ*), By the grace of God.
- Do. (Ital. *dillo*, 'said'), The said; the same.
- Dr., Doctor, or Debtor.
- D.V. (*Deo Volente*), God willing.
- dwt., penny-weight.
- e.g. or ex. gr. (*Exempli Gratiâ*), For example.
- Etc. (*Et cætera*), And the rest; and so on.
- F.A.S., Fellow of the Antiquarian Society.
- F.B.S., Fellow of the Botanical Society.
- F.D. (*Fidei Defensor*), Defender of the Faith.
- F.G.S., Fellow of the Geological Society.
- F.L.S., Fellow of the Linnæan Society.
- F.M., Field-marshal.
- F.R.A.S., Fellow of the Royal Astronomical, or of the Royal Asiatic Society.
- F.R.C.P., Fellow of the Royal College of Physicians.
- F.R.C.S., Fellow of the Royal College of Surgeons.
- E., of England.
- F.R.G.S., Fellow of the Royal Geographical Society.
- F.R.S., Fellow of the Royal Society. L., London; E., Edinburgh.
- F.R.S.S.A., Fellow of the Royal Scottish Society of Arts.
- F.S.A., Fellow of the Society of Antiquaries.
- F.S.A.Scot., Do. of Scotland.
- F.S.S., Fellow of the Statistical Society.
- F.Z.S., Fellow of the Zoological Society.
- G.C.B., (Knight) Grand Cross of the Bath.
- G.C.H., (Knight) Grand Cross of Hanover.
- G.C.M.G., (Knight) Grand Cross of St Michael and St George.
- Gr., Greek; Lat., Latin; Ital., Italian; &c.
- H.E.I.C.S., Hon. East India Company's Service.
- H.M.S., His or Her Majesty's Service, or Ship.
- H.R.H., His or Her Royal Highness.
- Ib. or Ibid. (*Ibidem*), In the same place.
- I.C.T.H.U.S. (*Ἰησοῦς*), *Iesus Christus*, *Theou Huios*, Soter—Jesus Christ, the Son of God, the Saviour.
- Id. (*Idem*), The same; (*Idus*), The Ides.
- i.e. (*Id est*), That is.
- I.H.S.* *Iesus Hominum Salvator*, Jesus the Saviour of men; *In hæc (Cruce) Salus*, In this (cross) salvation.
- Incog. (*Incognito*, Ital.), Unknown.
- I.N.R.I. (*Iesus Nazarenus Rex Iudæorum*), Jesus of Nazareth, King of the Jews.
- Inst. (*Instante—mensæ* understood), Instant, of the present (month); Institute.
- I.P.D. (*In Præsentid Dominorum*), In presence of the Lords (of Session).
- J.C. (*Juris Consultus*), Juris-consult.
- J.P., Justice of the Peace.
- J.V. (or U.) D. (*Juris Utriusque Doctor*), Doctor both of Civil and of Canon Law.
- Kal. (*Kalendæ or Kalendis*), The Kalends.
- K.B., Knight of the Bath.
- K.C.B., Knight Commander of the Bath.
- K.C.H., Knight Commander of the Order of Hanover.
- K.C.M.G., Knight Commander of St Michael and St George.
- K.G., Knight of the Garter.
- K.H., Knight of Hanover.
- K.M., Knight of Malta.
- K.P., Knight of St Patrick.
- K.T., Knight of the Thistle.
- K. τ. λ., *Και τα λοιπομένα (Kai ta leipomena)*, same as 'Et cætera.'

* This was originally ΙΗΣ, the first three Greek letters of the name Jesus; but its origin having been lost sight of, by substituting S for Z, and then mistaking the Gr. Η (*êta*) for Lat. H, a signification was subsequently found out for each letter. The symbol was still further altered by converting the horizontal stroke, which was the usual sign of abbreviation, into a cross, as it now generally appears, ΙΗΣ.

Lb. (*libra*), Pound.
 L.D., Lady Day.
 LL.B. (*Legum Baccalaureus*), Bachelor of Laws (the plural being denoted by the double L).
 LL.D. (*Legum Doctor*), Doctor of Laws.
 L.R.C.S., Licentiate of the Royal College of Surgeons.
 L.S.A., Licentiate of the Society of Apothecaries.
 L.S.D. (*Libre, Solidi, Denarii*), Pounds, shillings, pence.
 M. (*Mille*), A thousand.
 M.A. or A.M. (*Artium Magister*), Master of Arts.
 Mass., Massachusetts; Vt., Vermont; Pa., Pennsylvania; &c. See UNITED STATES.
 M.D. (*Medicinae Doctor*), Doctor of Medicine.
 M.P., Member of Parliament.
 M.R.C.S., Member of the Royal College of Surgeons.
 M.R.I.A., Member of the Royal Irish Academy.
 MS., Manuscript; MSS., Manuscripts.
 Mus. D. (*Musicae Doctor*), Doctor of Music.
 M.W.S., Member of the Wernerian Society.
 N.B. (*Nota bene*), Mark well; observe.
 Nem. con. (*Nemine contradicente*), or Nem. diss. (*Nemine dissidente*), No one contradicting or dissenting; unanimously.
 N.P., Notary Public.
 N.S., New Style.
 O.S., Old Style.
 Oxon. (*Oxoniensis*), Of Oxford.
 oz., Ounce.
 P., President; professor; &c.
 P.C., Privy Councillor.
 P.C.S., Principal Clerk of Session.
 Per ann. (*Per annum*), By the year.
 Per cent. (*Per centum*), By the hundred.
 Ph.D. (*Philosophiæ Doctor*), Doctor of Philosophy.
 P.M. (*Post Meridiem*), After noon.
 P.P., Parish priest.
 pp., Pages.
 Pro tem. (*Pro tempore*), For the time.
 Prox. (*Proximo*), In the next (month).
 P.S. (*Post scriptum*), Postscript.
 Q., Query or Question.
 Q.C., Queen's Counsel.
 Q.E.D. (*Quod erat demonstrandum*), Which was to be demonstrated.
 Q.E.F. (*Quod erat faciendum*), Which was to be done.
 Q.S. (*Quantum sufficit*), Enough.
 q. v. (*Quod vide*), Which see.
 R. (*Rex or Regina*), King or Queen.
 R.A., Royal Academician; Royal Artillery.
 R.E., Royal Engineers.
 R.M., Royal Marines.
 R.N., Royal Navy.
 R.S.A., Royal Scottish Academician.
 S., South; saint; seconds.
 Sc., *Scilicet*, same as viz.
 S.L., Solicitor at Law.
 S.M. (*Sa Majesté*), His or Her Majesty.
 S.P.Q.R. (*Senatus Populusque Romanus*), the Roman senate and people.
 Sq. (*Sequens*), the following; Sqq., do. in the plural.
 S.S.C., Solicitor before the Supreme Courts.
 S.T.P. (*Sanctæ Theologiæ Professor*), Professor of Theology.
 T.C.D., Trinity College, Dublin.
 Ult. (*Ultimo—mense* understood), In the last (month).
 U.P., United Presbyterian.
 U.S., United States; United Service.
 V.D.M. (*Verbi Dei Minister*), Preacher of the Word.
 Viz. (*Videlicet*), To wit; namely.
 W.S., Writer to the Signet.
 Xmas, Christmas. Xtian., Christian, &c.
 Ys, Y'; The, That. (This use of Y originated in the

Anglo-Saxon character þ, which was equivalent to the modern *th*. In manuscripts, this character degenerates into a form like a black letter *y*, which was retained in these contractions after its origin and real sound had been lost sight of.)

Besides the generally current abbreviations given above, other short methods of statement are frequently employed in particular circumstances. In the present work, for instance, in which the saving of space is of great moment, when the title or heading of a subject recurs in the body of the article, it is generally—especially if a proper name—represented by its initial letter: e.g., A. for Abd-el-Kader. Two dates thus (1215—1250), following the name of a king, a pope, &c., indicate briefly the beginning and end of his reign or term of office; or thus (b. 1215—d. 1250), the dates of his birth and death. The meaning of these and similar contractions is in general sufficiently obvious from the connection in which they stand. See CONTRACTIONS.

ABD signifies in Arabic 'slave' or 'servant,' and enters, along with the name of God, into the composition of many proper names; as, Abd-Allah, 'servant of God;' Abd-el-Kader, 'servant of the mighty God;' Abd-ul-Latif, 'servant of the gracious God,' &c.

ABD-EL-KADER, properly El-Hadji-Abd-el-Kader-Ulid-Mahiddin, is the descendant of a Marabout family of the race of Haschem, who trace their pedigree to the califs of the lineage of Fatima. He was born at Ghetna, an educational institution of the Marabouts, near Mascara, which belonged to his family. His father, who died in 1834, being esteemed a very holy man, had exercised great influence over his countrymen, which influence he bequeathed to his son. In his eighth year, A. made a pilgrimage to Mecca with his father; and in 1827, he visited Egypt, where, in Cairo and Alexandria, he first came in contact with western civilisation. Religious enthusiasm and melancholy were the most prominent features of his character. He early shewed an uncommonly gifted mind, and at the chief school of Fez he acquired such knowledge as composes Arabian science. A. was free from the savage cruelty, as well as from the sensuality, of the Arabs; he maintained purity of manners, and did not suffer himself to be misled by anger or passion. Although he firmly adhered to the faith of his nation, and used their fanaticism as one of his most important sources of influence, yet he had no sympathy with the fanatical intolerance of the majority among them. His public career began at the time of the conquest of Algiers by the French. No sooner was the power of the Turks broken, than the Arabian tribes of the province of Oran seized the opportunity to make themselves independent. Having got possession of Mascara, they elected A. as their emir, who soon succeeded in establishing his authority over a number of the neighbouring tribes. He now attacked the French; and some bloody battles, fought on December 3, 1833, and January 6, 1834, against General Desmichels, then commanding in Oran, obliged the latter to enter into a treaty with him. In the interior of the country, the power of A. now spread in an alarming way. In consequence of victories over neighbouring chiefs, he became master of Miliana and Medeah. All the cities and tribes of the provinces of Oran and Titteri acknowledged A. as their sultan; the more distant tribes sent him ambassadors with presents. It was not long before hostilities broke out between him and the French. The commencement was favourable to him, for the first operations of General Tretzel led to that fatal retreat, during

which the French army was attacked at Makta, on June 28, 1835, by the whole assembled forces of A., amounting to nearly 20,000 cavalry, and suffered a disgraceful defeat.

After a protracted struggle of six years, A. found himself obliged (1841) to take refuge in Morocco. Here he succeeded in getting up a sort of crusade against the enemies of Islam; and the arms of France were now turned against Morocco for the contumace given to A. After the decisive battle of Isly (1844) the sultan was obliged to give up A.'s cause, but soon found that the latter was at least his equal in power, and that he could not even prevent him from marching out of Nelem to attack the French again, both in October 1845, and in March 1847. But the star of A. was now about to set. In the night of the 11th December, he made a bold attack on the Moorish camp, in which he was defeated, and had to resolve on flight. He might easily have secured his own safety, but he would not abandon his attached followers, men, women, and children, to the plunder and massacre of the Marroccans. After a heroic combat on the 21st December, he effected their retreat across the Mulua into the territory of Algeria, where they mostly surrendered to the French. He himself, with a few horsemen, resolved to fight his way through to the south; but coming to the Pass of Kerbous, he found the way closed, and was received with musketry. Dispirited at length, A. surrendered, on December 22, 1847, to General Lamoricière and the Duc d'Aumale, upon condition that he should be permitted to withdraw either to Egypt or to St Jean d'Acre. The French government, who at last saw the man in their power who had given them so much trouble for fifteen years, refused to ratify this agreement. A. was embarked with his family and sent to Toulon, whence he was removed, in January 7, 1848, to Fort Lamalgue, afterwards to Pau, and finally to the Chateau d'Amboise. He was liberated in 1852 by Louis Napoleon, and had Brussa, in Asia Minor, assigned as a residence. Since the destruction of Brussa by an earthquake in 1855, he has been permitted to reside in Constantinople. The ex-emir has several children, both male and female. See Delacroix, *Histoire Privée et Politique d'Abd-el-Kader* (Paris, 1845); Bantruche, *Vie d'Abd-el-Kader* (Paris, 1848).

ABDICATION is the act of giving up an office, generally the office of ruler or sovereign. It is rarely done out of pure preference of a private station, but is generally the result of vexation and disappointment. It was perhaps voluntarily, and from being wearied with dominion, that Diocletian, and along with him Maximian, abdicated (305). Christina of Sweden retired from the throne (1654) out of preference for the freedom of private life, but wished still to exercise the rights of a sovereign. Charles V. laid down the crown (1556) because his great schemes had failed. Philip V. of Spain did so (1724) in a fit of melancholy, but resumed it on the death of his son. Amadeus of Savoy abdicated (1494) to become a priest. Victor Amadeus of Sardinia, who abdicated in 1730, wished to recall the step, but was not allowed. Louis Bonaparte resigned the crown of Holland, because he would not consent to treat that country as a province of France. Charles Emanuel of Sardinia retired from the throne in 1802, not finding himself equal to the crisis; and the same was the case with Victor Emmanuel in 1819. William I. of the Netherlands resigned (1840), as his policy had become impossible from the turn of affairs in Belgium. Foreign force compelled the abdication of Augustus of Poland (1707), and later, that of Stanislaus Leszczynski (1735) and of Poniatowski (1795); as well as that of Charles IV. of Spain

(1808), and of Napoleon (1814 and 1815). Insurrections have been the most frequent cause of forced abdications. The early history of the Scandinavian kingdoms abounds in instances. In England, the compulsory abdication of Richard II. (1399) is an early example. In the case of James II., it was disputed whether the king had 'abdicated' or 'deserted.' More recent times saw Charles X. (1830) and Louis-Philippe (1848) retire before the storm of revolution, without the conditions they made being regarded. The abdication of Ferdinand of Austria (1848) was an indirect consequence of the events of the year of revolutions; that of Charles Albert of Sardinia (1849), of the battle of Novara. Of several recent cases among German princes, the chief is that of Ludwig of Bavaria (1848). The latest instance is that of Soulouque, Emperor of Haiti, who has (Jan. 1859) rather been driven from his dominions than abdicated.

In some countries, the king can abdicate whenever he pleases; but in England, the constitutional relation between the crown and the nation being of the nature of a contract, the king or queen, it is considered, cannot abdicate without the consent of parliament. It is, however, said that the king does abdicate, or, to speak perhaps more correctly, an A. may be presumed, and acted on by the people, if his conduct politically and overtly is inconsistent with, and subversive of, the system of constitutional government, of which the qualified monarchy of his office forms part.

At the conference between the two Houses of Parliament previous to the passing of the statute which settled the crown on William III., it would appear that the word 'abdicated' with reference to King James II. was advisedly used instead of 'deserted'—the meaning, it is presumed, being that King James had not only deserted his office, but that by his acts and deeds, of which the said desertion formed part, he had, in view of the constitution, ceased to have right to the throne. From this it may be inferred that A. was considered to have a twofold political signification, involving maladministration as well as desertion. The Scotch Convention, however, more vigorously and distinctly resolved that King James 'had forfeited [forfeited] the crown, and the throne was become vacant.'

ABDO'MEN. The trunk of the human body is divided by the diaphragm into two cavities—the upper being the thorax or chest, and the under, the abdomen or belly. Both the cavity and the viscera

Organs of the Abdomen.

1. Diaphragm. 2. Gall-bladder. 3. Pyloric end of Stomach.
4. Right Lobe of Liver. 5. Duodenum. 6. Great end of Stomach. 7. Spleen. 8. Piece of Caul, or Omentum.
9. Pancreas (Sweetbread). 10. Small Intestine (Jejunum).
11. Great Intestine (Colon). 12. Small Intestine (Ilium).

it contains are included in the term A. It contains the liver, pancreas, spleen, and kidneys, as well as the stomach, small intestine, and the colon. The lower bowel, the bladder, and internal organs of generation lie in the lowest part of the cavity, which is called the pelvis. The A. is lined by a serous membrane, the peritoneum, which is folded over the viscera, allowing them a certain freedom of motion, but keeping them in their proper relations to each other. The A. is divided externally by two horizontal lines into three principal regions—the upper or epigastric, the middle or umbilical, and the lower or hypogastric. These are again subdivided by two vertical lines—the side-divisions being called the hypochondriac, lumbar, and iliac regions respectively; the names epigastric and umbilical are then applied in a restricted sense to the middle divisions of the two upper principal regions; while the middle division of the lower is called the region of the pubis. Diseases of the abdominal viscera are frequent, and chiefly consist either of chronic disorders of the digestive organs, or of derangements of the nerve-plexuses and ganglia there situated. These disorders announce themselves partly in bodily pain, and partly in mental affections, such as hypochondria and hysterics.

ABDOMEN, in Entomology, the last of the three parts into which the body of an insect is divided. It is composed of a number of rings or segments, frequently nine, more or less distinct from each other. It contains a portion of the intestines and the sexual organs. In the perfect insect, its segments bear no legs nor wings; but the hind-legs of larvae or caterpillars, which afterwards disappear, are attached to them. In many insects, its last segments bear appendages of various uses and forms, as pincers, stings, borers or ovipositors, &c.

ABDOMINALES, or Abdominal Fishes, in the Linnaean arrangement, an order of Fishes including all the Osseous Fishes of which the ventral fins are placed upon and beneath the abdomen, and so behind the pectoral fins. Subsequent naturalists have thought it right in classifying Fishes to give a higher place to other characters; and in the system of Cuvier, the name A. is given to an order of much more limited extent, a subdivision of the *Malacopterygii* or Soft-rayed Osseous Fishes, distinguished by having the ventral fins placed beneath the abdomen and not attached to the bones of the shoulder. It includes the *Cyprinidae* (Carp, Minnow, &c.), *Esocidae* (Pike, &c.), *Siluridae*, *Salmonidae* (Trout, Salmon, &c.), and *Clupeidae* (Herring, &c.).

ABDUCTION, in the criminal law of England, signifies the unlawful taking away of the person of a female. Such is the usual limitation of the word; although, under the Jewish law, and subsequently according to the principles of the Civil law, the A. or 'stealing' of the person was applied to the male sex, as well as to women, coming more nearly to what we now understand by *Kidnapping* (q. v.). In the Civil law, the offence was called *plagium*, or *crimen plagii*, under which name it still has a place in the Scotch criminal law, and, in practice, is applied to the A. of children of either sex, or of women generally. The A. may be accomplished either by force or by any fraudulent or sinister means; and this latter quality seems more appropriate to the strict meaning of the term, as derived from the Latin verb *abducere*, to lead off, or induce, or persuade away.

This subject will be best explained under the heads to which we have already referred.

1. ABDUCTION OF CHILD.—It is provided by the 9 Geo. IV. c. 31, s. 21, that if any person shall

maliciously, either by force or fraud, lead or take away, or decoy or entice away, or detain any child under the age of ten years, with intent to deprive the parent or parents, or other person having the lawful charge of such child, of the possession of such child, or with intent to steal any article on its person; or shall with any such intent as aforesaid receive or harbour such child, knowing the same to have been so stolen or enticed, every such offender shall be guilty of felony, and shall be liable to be transported for seven years, or imprisoned, with or without hard labour, for any term not more than two years, and also, if a male, to be whipped, if the court shall so think fit.

The Scotch law on this subject is more severe than the English, and there also a distinction is taken between *stealing* a child, and *enticing it away*. The stealing a child is in that legal system a capital crime. Sir Archibald Alison, in his work on the *Principles of the Criminal Law of Scotland* (p. 280), says: 'This [stealing a child] is obviously a crime of the very greatest atrocity, from the unequalled agony and distress which it necessarily inflicts on the unfortunate parents who are in this cruel manner bereaved of their offspring. . . . From the earliest times, accordingly, this atrocious offence has been punished with death by the Scotch law. Nor is it any defence that the child is taken away for affection to itself, or from any other motive, and not for the sake of lucre, taken in its ordinary sense, for the detainer has at least that advantage and benefit which he coveted in taking away the child; and this is sufficient to constitute theft in the estimation of the law.' The same principle is recognised by the law of England, which holds that as the offence of A. is positively prohibited, the absence of a corrupt motive will not be a defence to the charge. Further on, in the same work (p. 630), Sir Archibald lays it down that 'The wickedly and feloniously enticing or inducing an infant child to leave its parents or guardians without their knowledge or consent is a crime at common law;' and in support of this he refers to a case where the prisoner, who was a teacher of elocution, and was desirous to get a little child to recite poetry to his audience, applied to a girl, an infant of nine years of age, in the Orphan Hospital, and prevailed on her, by promises of fine clothes, and making a lady of her, to leave the hospital, and come to him, where she was soon found after in his custody. This was done at clandestine interviews with the child, and without the knowledge or concurrence of her relations who had placed her in the hospital. The flight of the accused, who was out on bail, prevented any further procedure in the case, beyond his outlawry.

2. ABDUCTION OF WIFE.—Blackstone and Stephen both lay down that this species of A. may be either by fraud and persuasion or open violence; though the law supposes force and constraint in the former case as well as in the latter, the wife having no legal power to consent. The remedy to the husband is an action by which he recovers not the possession of his wife, but damages for the A. of her; and by statute 3 Edw. I. c. 13, the offender shall also be imprisoned two years, and be fined at the pleasure of the crown. Both the crown and the husband may therefore have this action. The husband is also entitled to recover damages against such as persuade and entice the wife to live separate from him without a sufficient cause. But, although such appears to be the existing law of England, it is too antiquated, and is quite unsuited to the present state of society. The remedy for the offence, or rather injury in question, will be more appropriately found in the recent act 20 and 21 Vict. c. 85, to amend the law relating to divorce

and matrimonial causes, and under which the marriage may be either annulled, with, in the case of the adultery of the wife, the punishment of the adulterers; or the parties may be 'judicially separated.'

3. **ABDUCTION OF WARD, OR PUPIL.**—By the law of England, a guardian was always, and is still, entitled to an action, if his ward or pupil be taken from him; but the proper remedy now is by an application to the Court of Chancery, which is the supreme guardian of, and has independent jurisdiction over, all the infants in the kingdom. In Scotland, a similar jurisdiction as to the charge and custody of all Scotch pupils is exercised by the Court of Session.

4. **ABDUCTION OF HEIRESS.**—The law on this subject is very distinct. By 9 Geo. IV. c. 31, it is enacted that where any woman shall have interest, present or future, in any real or personal estate, or shall be heiress presumptive, or next of kin, to any one having such interest, if any person shall, from motives of lucre, take away or detain such woman against her will, with intent to marry or defile her, or to cause her to be married or defiled by any other person; every such offender, and every person counselling, aiding, or abetting him, shall be guilty of felony, subject to transportation for life, or for any term not less than seven years, or to imprisonment, with or without hard labour, for any term not exceeding four years.

By section 20 of the same statute, it is enacted that if any person shall unlawfully take, or cause to be taken, any unmarried girl under sixteen years of age, out of the possession and against the will of her father, or mother, or other person having the lawful charge of her; every such offender shall be guilty of a misdemeanour, subject to fine or imprisonment, or both, as the court shall award.

It is an offence within the statute to take away from the custody of her putative father a natural child under sixteen years of age.

By the 10th Geo. IV. c. 34, the same law is extended to Ireland, with this difference in the case of heiresses, that while the English act applies to 'any woman,' the Irish act provides for the offence against 'any unmarried girl under eighteen years of age.'

The marriage of an heiress under sixteen years of age, when obtained by means of force, may be set aside on that ground. And the force may be actual or constructive. Thus, in law, fraud is here held equivalent to force; and accordingly where (Gibbon Wakefield's case) both the A. and marriage were voluntary in fact, they were held in law to be forcible, the consent to both having been obtained by fraud.

5. **ABDUCTION OF WOMEN GENERALLY.**—The A. and forcible or fraudulent marriage of women and girls is a felony; and by 5 and 6 Vict. c. 38, s. 11, must be tried by a superior court.

ABDUCTION OF VOTERS. See **VOTERS, ABDUCTION OF, ELECTION, PARLIAMENTARY.**

ABD-UL-LATIF, a celebrated Arabian writer of multifarious acquirements, was born at Bagdad in 1161. During his youth, he underwent an amazing amount of mental drudgery, in accordance with the eastern fashion of his time, in order to fit himself for becoming a scholar. The ordeal consisted in his committing to memory a large number of standard works, such as the Koran, the novels of Hariri, and not a few grammatical treatises. To complete his culture in the various branches of Mohammedan lore, he betook himself to Damascus, where the famous Saladin had gathered round him the most learned men of the time. Through the liberality of

the sultan, and the kindness of the Vizir Fadhel, he was enabled to proceed to Egypt, where he delivered lectures while Saladin was fighting the Lion-heart at St Jean d'Acre. Here he became intimate with Moses Maimonides, the great Jewish writer. He now devoted himself chiefly to the study of medicine, although while at Cairo, he also wrote his excellent and accurate work on Egypt, which was translated into Latin by Professor White of Oxford in 1800, and into French by Baron de Sacy in 1810. He died at Bagdad in 1231, on his way to Mecca, in the 70th year of his age.

ABD-UL-MEJJID-KHAN, the Grand Sultan, was born on the 6th of May 1822, and succeeded his father, Mahmud II., July 1, 1839. The Turkish Empire was then in a very dangerous position. The army had been defeated and dispersed by the Egyptians in the battle of Nisib (June 29, 1839), and there was nothing to hinder the victorious Ibrahim Pacha from advancing on Constantinople, where a large party were favourable to the Egyptian power. This party wished to make the viceroy of Egypt, Mehemet Ali, Chakan (the ancient title of the Grand Sultan) of both seas. He was the only man, they maintained, capable of upholding the banner of Islam against the unbelievers both within and without. Had it not been for the intervention of the Christian powers, the House of Osman was lost. The treaty of July 1840, from which France kept aloof, rescued the young Padishah from sure destruction. Mehemet Ali had to submit (November 27, 1840); and the treaty of July 1841, to which France subsequently adhered, settled the future dependent relation of Egypt to Turkey. The sultan, though not very energetic in body or mind, proceeded in the path of reform begun by Selim III. and Mahmud II. In this he had for his chief adviser Reshid Pacha, an intelligent and humane Mussulman, educated in France. The aim of all his measures was to place the Osman population on a footing with the civilised inhabitants of the west. A. wished the happiness of all his subjects, without respect of creed. A sort of proclamation of their rights was issued in the hatt-i-sherif of November 1839. This was followed by numerous reforms in all departments; and in 1850, the professors of all religions were decreed equal in the eye of the law. That these decrees remained, in a great measure, a dead letter, is not attributable to the will of the sultan. The chivalrous part acted by A. (1850) in refusing, at the risk of losing his throne, to give up Kossuth and the other political refugees to the menaces of Russia and Austria, will make his name remembered in the annals of humanity.

The sovereigns of Turkey have long been in an anomalous position. The ambassadors of the great powers have ruled the divan; and the sultan had a specially difficult part to play during the war with Russia (1854-56), and the diplomatic negotiations consequent to it. A. was the thirty-first sovereign of the race of Osman, and the twenty-eighth since the taking of Constantinople. His eldest son, Mohammed Murad, was born September 22, 1840; but according to the law of the empire, his brother, Abdul-Aziz (b. 1830), succeeded to the throne on his death in 1861.

ABD-UR-RAHMAN, the sultan of Fez and Morocco, born 1778, was the rightful heir to the throne when his father died, 1794; but was superseded by an uncle, after whose death he ascended the throne, 1823. His first four years of rule were occupied in quelling insurrections. Next, some danger to the state of Morocco was threatened by the refusal of Austria to pay the tribute for safety against pirates; but the sultan wisely adjusted the

dispute by relinquishing this sort of 'black-mail,' formerly levied by Morocco on European ships in the Mediterranean. The religious war under Abd-el-Kader against the French in Algeria involved the sultan in its movements; but was concluded by the battle of Isly, 1844, and the subsequent mediation of England. The piratical habits of his subjects brought A. to the brink of war with more than one European state. The sultan was a zealous Mussulman, without the wild fanaticism common among his countrymen; as a ruler, he was strict, and often cruel. He was succeeded in 1859 by his eldest son, Sidi-Mohammed (b. 1803).

ABEL appears in the book of Genesis as the second son of Adam, and a shepherd. He was slain by his elder brother Cain, under the influence of jealousy, because the offering of the latter had been rejected by Jehovah, and that of the former accepted. It is not said in Genesis, why Jehovah accepted the sacrifice of Abel; but the Saviour, in the New Testament, speaks of 'righteous Abel,' from which it is concluded that there dwelt in him a spirit of faith or trust in the unseen God, of which his brother was destitute. The writer of the Epistle to the Hebrews opens his enumeration of the 'faithful' in the 11th chapter of Hebrews, with these words: 'By faith Abel offered unto God, a more excellent sacrifice than Cain.' Such, also, has been in all ages the universal opinion of the Christian Church, which has regarded Abel as a type of innocence and faith.

ABEL, CHARLES FREDERICK, a native of Coethen, in Germany, born in 1719, was a distinguished musician. He was a pupil of Sebastian Bach, and for some years a member of the famous Dresden band of the Elector of Saxony, king of Poland. In 1758, when nearly forty years of age, he came to England in a state of great destitution; but his talents were quickly recognised. He was appointed chamber-musician to the queen of George III. His peculiar instrument, the *viola da gamba*, a small violoncello, with six strings, was never played by any one in equal perfection. He also obtained considerable reputation as a composer, though his pieces are not now held in very great estimation. He died in 1787, having shortened his life by his intemperate habits.

ABELARD, PETER, a scholastic philosopher and theologian, unquestionably the boldest thinker of the 12th c., was born in France, in 1079, at Palais or Pallet, not far from Nantes, a village which belonged to his parents, Beranger and Lucie. An irrepressible thirst for knowledge, and a special pleasure in scholastic logic, moved him to resign his rights of primogeniture in favour of his younger brothers. He left Bretagne for Paris, in order to hear the prelections of William of Champeaux, but soon incurred the hatred of his master, whom he puzzled by his wonderful subtlety. He fled to Melun, and afterwards to Corbeil, persecuted and admired wherever he went. He then returned home for the restoration of his health. With renewed strength, he returned to Paris, reconciled himself with his opponents, and moulded, by his influence as a lecturer, some of the most distinguished men of his age, amongst whom were the future Pope Celestine II.; Peter Lombard; Berengar, his future apologist; and Arnold of Brescia. At this time, there lived in Paris, Heloise, the niece of the Canon Fulbert, then seventeen years of age, and already remarkable for her beauty, talents, and knowledge. She soon kindled in the breast of A., then thirty-eight years old, a violent and overwhelming passion, which was returned by Heloise with no less fervour. By means of Fulbert, A. became teacher and companion of Heloise, and the lovers were happy together until A.'s ardent poetical effusions reached the ears of the canon. He sought

to separate the lovers; but it was too late. They fled together to the country, where Heloise bore a son, and was privately married to A., with the consent of her uncle. Not long after, Heloise returned to Fulbert's house, and denied the marriage, that her love might be no hinderance to A.'s advancement in the church. Enraged at this, and at a second flight which she took with her lover, Fulbert, in order to make him canonically incapable of ecclesiastical preferment, caused A. to be emasculated. In deplumiliation, A. entered as a monk the abbey of St Denis, and indeed Heloise to take the veil at Argenteuil. But the lectures which he began to give soon after exposed him to new persecutions. The synod of Soissons (1121) declared his opinions on the Trinity to be heretical. He left St Denis, and built at Nogent-on-the-Seine a chapel and hermitage called Paraclete, which, after being enlarged by his scholars to a monastic foundation, he, on his appointment as abbot of St-Gildas-de-Ruys, in Bretagne, gave over to Heloise and her sisterhood for a dwelling. His residence in St-Gildas was embittered by a continued struggle against his love, and by the hatred of the monks; till at last, in 1140, his doctrine was condemned by Pope Innocent III., and he was ordered to be imprisoned. But Peter the Venerable, abbot of Clugny, after A. had retracted his opinions on the Trinity and Redemption, reconciled him to his enemies. A. died with the reputation of a model of monastic propriety, on April 21, 1142, in the abbey of St Marcel, not far from Chalons-on-the-Saône. Heloise had him interred at the Paraclete, hoping one day to lie by his side. She survived A. twenty years. The ashes of both were taken to Paris in 1808, and in 1828 were buried in one sepulchre in Père la Chaise. —The doctrines advanced by A. in his controversy with St Bernhard, have a decidedly rationalist tendency; and he, and his predecessor Erigena, may be looked upon as the first avowed representatives of that school. A. laid down the principle, that nothing is to be believed but what has been first understood; while the church held that we must believe in order to understand; and Bernhard was for banishing inquiry altogether from the province of religion. In judging of A.'s merits, we are not to look so much to his writings, as to the influence which his wonderful power of public disputation enabled him to exercise on his age. His character, no less than his doctrine, gave great offence. Until recently, it is chiefly the romantic history of his love that has occupied attention. The chief biography that has appeared is that by Rémusat, under the title of *A.* (2 vols., Par. 1815), containing his life, character, writings, and opinions. The Latin writings and letters of A. and Heloise were collected by Amboise, and published by Duchesne (Par. 1616). Some works of A. have been recently discovered; among others *Scilicet et Non*, a collection of doctrinal contradictions from the Fathers; they have been published partly by Cousin (Par. 1850), partly by Rheinwald (Berl. 1831).

ABELLE. See FOPLAR.

ABELITES, a Christian sect of the 4th c., found chiefly in the neighbourhood of Hippo, in North Africa. Their chief distinction consisted in marrying but abstaining from matrimonial intercourse, in order not to propagate original sin. They held that Abel so lived, because the Bible mentions no children of his.

ABELMOSCHIUS. See HIBISCUS.

ABENCERRAGES, a noble Moorish race whose struggles with the family of the Zegrirs, and tragical destruction in the royal palace of the Alhambra, in Granada, in the time of Abu-Hassan (1466-84),

the last but one of the kings of Granada, furnish the materials for a charming Spanish work of fiction, *Historia de las Guerras Civiles de Granada* (Madrid, 1694). From this Chateaubriand composed *Les Aventures du Dernier Abencerrage*, and furnished the text of an opera of Cherubini's. The work, however, seems to be destitute of historical foundation; at least Conde is perfectly silent on the subject in his *Historia de la Dominacion de los Arabes en España* (3 vols., Madrid, 1829).

ABENDBERG, a hill in the canton of Berne, rising abruptly out of the waters of Lake Thun, on the south side. It is interesting as the site of an institution, established by Dr Guggenbühl, for the cure of Cretins (q. v.), and supported by contributions from far and near. The sanguine hopes raised as to the good to be effected by the healthiness of the situation, and the mode of treatment followed, have been greatly disappointed, little alleviation being perceptible. The establishment still exists as an asylum for these unfortunate beings.

ABEN-ESRA, properly Abraham-Ben-Meir-Ben-Esra, born 1093 in Spain, died 1168 in Rome, was one of the most learned Jews of his times. He understood the Hebrew, Arabic, and Aramaic languages; had considerable knowledge of mathematics, astronomy, and medicine; was a scientific observer; and generally distinguished himself as a sagacious thinker. Having left his native land, he visited Lombardy, Provence, France, Egypt, and England, and passed the later years of his life in Rome; everywhere giving lectures on grammar, theology, astronomy, &c., besides writing and translating several works in Hebrew and Arabic. His *Commentaries on the Old Testament* are the most important of his works, which include some treatises on astrology, since published in Latin. The scholastic writers mention Aben-Esra as ABENARE or AVENARD.

ABER is a Celtic word which enters into the composition of several names of places, chiefly in Wales and Scotland. It indicates the mouth or embouchure of a stream, either into the sea, or into another river—as Aberbrothock, at the mouth of the Brothock, in Forfarshire; Abergavenny, at the junction of the Usk and Gaveenny, in Wales.

ABERCROMBIE, JOHN, M.D., in his own day the most eminent of Scottish physicians, and still worthy of remembrance for his professional and moral excellence, was born in 1781, at Aberdeen, where his father was long a parish minister. He studied medicine in Edinburgh, taking his degree in 1801, and thenceforth devoted himself to the practice of his profession in the Scottish capital. At a comparatively early age, he attained a high reputation; and after the death (in 1821) of the celebrated Dr Gregory, he became recognised as the first consulting physician in Scotland. His professional writings contributed to his celebrity, which was still further extended by the publication, in 1830 and 1833, of his works on *The Intellectual Powers* and *The Moral Feelings*. These works have no pretensions to originality or depth of thought, but acquired, from the high personal character of the author, a reputation during his life, which a few years have sufficed to impair. They possess, however, the merit of being more readable than many works of the same class, and are pervaded by a moral and religious feeling, which, in the case of their pious and benevolent author, was perfectly genuine. Dr A. died suddenly, Nov. 14, 1844. Among the honours bestowed upon him during his life were the degree of M.D. from Oxford, the rectorship of Marischal College, the vice-presidency of the Royal Society of Edinburgh, and the office of Physician in Ordinary to Her Majesty for Scotland.

ABERCROMBY, SIR RALPH, was born at Menstry, in Clackmannanshire, in 1734. He was designed by his father for the Scottish bar; and studied from 1752 to 1755 at the universities of Edinburgh and Leipsic. His natural inclination, however, pointed to a military life; and in 1758, he went to Germany as a cornet in the 3d Dragoon Guards. In 1780, he raised a regiment in Ireland, which was called the 103d, or King's Irish. It was disbanded in 1783; and the next ten years were spent by Sir Ralph in the retirement of a country life. He had married in 1767. In 1793, he accompanied the Duke of York to Holland. His conduct throughout that unfortunate campaign, especially during the disastrous retreat in the winter of 1794-5, won him the love and admiration of the whole army. On his return to England, he was appointed to the chief command of the expedition to the West Indies, which, notwithstanding the vexatious obstruction of his designs, he conducted with distinguished success, taking Grenada, Demerara, Essequibo, St Lucia, St Vincent, and Trinidad. Soon after, he was appointed commander of the forces in Ireland; but his enlightened and manly remonstrances against the policy of government towards that country occasioned his removal to a similar command in Scotland. In 1799, he was appointed second in command to the Duke of York in the expedition to Holland, still more unhappy and ignominious in its results than the former. A. alone acquitted himself on all occasions with entire credit. On his return, he was appointed to command the expedition to the Mediterranean. The fleet anchored in Aboukir Bay on the 2d of March. On the 7th, A. reconnoitred the shore in person. Before mid-day of the 8th, the British troops were in possession of the sand-hills that commanded the shore, having landed in the face of a storm of shot that ploughed the water around them. On the 13th, the enemy were driven within the lines of Alexandria. On the morning of the 21st, Menou attempted to surprise the British camp. He found them ready, under arms. In the glorious action that ensued, the British commander was struck by a musket-ball in the thigh; but not till the battle was won, and he saw the enemy retreating, did he shew any sign of pain. He was borne from the field in a hammock, cheered by the blessings of the soldiers as he passed, and conveyed on board Lord Keith's ship. The ball could not be extracted; mortification ensued; and on the 28th he died, in the sixty-eighth year of his age. In the character of A. were combined the qualities that seem peculiarly characteristic of a true British soldier. He was at once gentle and brave, clear-sighted and cool in deliberation, in action prompt and daring, even to hardihood. Apart from his qualities as a soldier, he was a man of liberal accomplishments, free from prejudices, and of sound practical judgment.—The national gratitude to this eminent man took the form of a peerage conferred on his widow, afterwards enjoyed by his eldest son, with the title of Baron Abercromby.—His third son, JAMES ABERCROMBY, after being M.P. for Edinburgh and Speaker of the reformed House of Commons, was raised to the British peerage in 1839, with the title BARON DUNFERMLINE. He died in March 1858.

ABERDEEN, the principal city in the north of Scotland, is situated in the S.E. angle of the county of the same name, at the mouth of the river Dee, which forms its harbour. This city is of high antiquity, its privileges as a royal burgh being supposed to have been conferred by William the Lion as early as the year 1179. In 1336, it was burned by the English; the city erected on the old site was thenceforth locally designated New A. The

present town of Old A. included within the parliamentary boundaries of the city, is situated about a mile distant to the north. In 1494, King's College and University was founded in Old A. Marischal College and University was established in the new town in 1593. In the 17th c., A. had become a place of considerable importance, but it suffered severely from both parties during the civil wars. It is now a flourishing seat of trade and manufactures; and its handsome granite architecture excites the admiration of all visitors. The harbour has been greatly improved. The number of vessels belonging to the port in 1856 was, sailing-vessels, 231—tonnage, 56,867; steamers, 14—tonnage, 4679. The principal exports are, fine cotton and woollen fabrics, granite, cattle, grain, preserved meat, and fish. The granite quarries and polishing-works afford occupation to a large number of people. The manufacture of combs is a chief branch of industry. There are also considerable ironworks, and ship-building is extensively carried on. The A. clippers are celebrated as fast sailers. As a seat of learning, A. has always maintained a high place. Connected with it, ecclesiastically or academically, are the names of Barbour and Boece; Bishops Elphinstone, Dunbar, and Forbes; Arthur Johnston, James Gregory, Arbuthnot, Reid, Beattie, Gerard, and Campbell. The average number of students annually attending both universities is nearly 600. The burgh of A. is governed by a provost, four bailies, and fourteen councillors. Pop., in 1851, of municipal burgh, 53,808; parliamentary burgh, 71,973. (1871—par. burgh, 88,125.)

ABERDEENSHIRE, an extensive maritime county in the E. of Scotland, bounded, N., by Banff and the North Sea; S., by Kincardine, Forfar, and Perth; W., by Inverness and Banff. Its greatest length is about 90 miles; its greatest breadth about 40; its extent of sea-coast about 60. It is the fifth in size of the Scottish counties. Estimated area, 1970 square miles; pop. in 1851, 212,032. It is still described under the five ancient divisions (proceeding from south-west to north-east) of Mor, Strathlogie, Garioch, Formartin, and Buchan. The south-western parts of the county are entirely mountainous, the principal range of the Grampians running along the southern boundary, from which a lesser chain branches to the north and north-east. The highest peaks are, Ben-Macdhui, 4390 feet; Cairntoul, 4095; Cairngorm, 4069; Ben-na-Buirid, 3940; and Loch-nagar, 3815. The predominant rock-formation is mica slate; and, in the mountain district of Braemar, granite, which also underlies the whole neighbourhood of the city of Aberdeen, yielding large supplies of a valuable building-stone. The principal river is the Dee, rising in the mountains of the south-west, and falling, after an eastward course of 96 miles, into the German Ocean. In its upper course are several falls; and on its banks, in the parish of Crathie, amid will mountain scenery, is Her Majesty's favourite residence, Balmoral. Next in size to the Dee is the Don, rising in the west, and flowing into the German Ocean, after a course of about 80 miles. The Ythan rises in the north-west, and flows, with slight variation, south-eastward. Its pearl-fishery was once reckoned of some importance; the pearl-mussel still inhabits its bed, but few pearls of any value are found. The Deveron rises on the borders of Aberdeen and Banff, and flows to the north-east, into the Moray Firth, at Banff, after a course of about 50 miles, chiefly within the boundaries of Banffshire, but partly in A. The arable land of the county lies chiefly in the districts between the Don and Ythan, in the centre of the county, and in its north-eastern angle. Breeding more cattle than any other county in Scotland, A.

also raises about three times as much oats and turnips as any other. The estimated gross produce of the former, in 1855, was 5,317,118 bushels; of the latter, 1,232,007 tons. Clay predominates in the lower coast-lands; in the upper districts, there is a considerable extent of light sandy loam. Agriculture has made great progress; and in no part of the kingdom have natural disadvantages of soil and climate been more successfully overcome. The principal towns and villages are Aberdeen, Peterhead, Huntly, Fraserburgh, Kintore, and Inverury. The county returns one member to parliament; the city, one; and the burghs of Peterhead, Kintore, and Inverury, in conjunction with Elgin, Cullen, and Banff, one. Pop. in 1851, 212,032; day-schools, 543, with 39,271 pupils; places of worship, 237 (70 of the Established, and 76 of the Free Church. Owing to the munificent Dick and Mill bequests for parochial schoolmasters, A. holds a high place in the statistics of education. (Pop. 1871—244,607.)

ABERDEEN, GEORGE HAMILTON GORDON, EARL of, was born at Edinburgh in 1784. He was educated at Harrow and at St John's College, Cambridge, where he took his degree of M.A. in 1804. Before this, on succeeding to the earldom in 1801, he made a tour through Greece, the record of which is preserved in Byron's well-known line—

'The travelled thane, Athenian Aberdeen.'

In his twenty-second year, he was elected one of the sixteen Scottish representative peers, and entered public life as a Tory. In 1813, he was appointed ambassador to the Austrian court, and conducted the negotiations which terminated in the alliance of that power with Britain. At this time he formed that close friendship with Prince Metternich which so decidedly influenced his subsequent policy as a statesman. On the conclusion of the war, he was elevated to the British peerage as Viscount Gordon. From this time till the year 1828, his lordship made no prominent appearance in public life. In that year he took office in the new ministry formed under the Duke of Wellington. The general principle which guided his policy, as Secretary of State for Foreign Affairs, was that of non-interference in the internal affairs of foreign states, which, joined to his well-known sympathy with such statesmen as Metternich, has exposed him—not always justly—to the suspicion of being inimical to the cause of popular liberty. His gradual abandonment of high Tory principles was evinced by his support of the bill for the repeal of the Test and Corporation Acts, and of the Roman Catholic Emancipation Act. From the fall of the Wellington ministry till the Peel administration in 1841, his lordship was out of office, with the exception of his brief administration of the Colonial Office in the Tory ministry of 1834-5. In 1841, he again received the seals of the Foreign Office. M. Guizot was at that time foreign minister in France, and the two statesmen acted in cordial alliance. The conclusion of the Chinese War, the Ashburton Treaty, and the Oregon Treaty, were the principal services rendered to the country during his administration of foreign affairs. His act in 1843 for removing doubts regarding the admission of ministers to benefices in Scotland, was too late to save the disruption of the Church, and in working it does not seem to have proved very satisfactory. He had long been in favour of the repeal of the corn-laws, and from the time that that question became the rallying-point of the Peel party, he became identified with their policy. In 1846, he resigned with Sir Robert Peel. In 1853, on the resignation of Lord Derby, the extraordinary state of parties necessitated a coalition, and Lord A.

was selected as the fittest man to head the new ministry, which for some time was extremely popular. The feeble and vacillating policy displayed in the conduct of the war with Russia, gradually undermined its stability, and the disastrous mismanagement brought to light in the winter of 1854, in all departments of the public business connected with the war, filled up the measure of the popular discontent. On the 1st of February 1855, Lord A. resigned office. His lordship was author of an Essay on Grecian Architecture, published in 1822. He died in 1860.

ABERDEVINE, or **SISKIN** (*Fringilla Siskins*), a song-bird, nearly allied to the goldfinch, with which it is placed by Cuvier and others in the new genus *Carduelis*. It is rather smaller than the goldfinch, and less elongated in form. The crown of the head and the throat are black, the nape, dusky green, and there is a broad yellow streak above and behind each eye. It is only a winter visitant of Britain, and breeds in the north of Europe, building its nest in high trees. It is frequently kept as a cage-bird, being easily tamed; and breeds freely with the canary. It feeds on the seeds of the thistle, alder, birch, and elm, and occasionally does great damage to the hop plantations in Germany. In France it injures the blossoms of the apple-trees. The nest of the A. is rarely found.

ABERNETHY, JOHN, a very eminent English surgeon, was born in London in 1764. His grandfather was the Rev. John Abernethy, an Irish Presbyterian clergyman, who acquired distinction by his writings, and his bold adoption of Bishop Hoadly's views on the right of private judgment and the subscription of Confessions. A.'s early tastes disposed him to the bar; but in 1780 he was apprenticed to Mr (afterwards Sir Charles) Blicke, surgeon of St Bartholomew's Hospital. He attended at the same time the lectures of John Hunter and Sir W. Blizard. In 1787, A. was elected assistant-surgeon to St Bartholomew's, an office which he filled for twenty-eight years; at the end of which time he was appointed surgeon, with a salary. Soon after his election, he began to lecture in the hospital on anatomy and surgery, and may be said to have laid the foundation of its character as a school of surgery. At first, he manifested extraordinary diffidence, but his power soon developed itself; and his lectures at last attracted such crowds, that, in 1790, it was found necessary to build a lecture-theatre in the hospital for his use. His clear, simple, and positive style, illustrated by an inexhaustible variety of apt anecdotes, made him the most popular medical teacher of his day. In 1813, he was appointed surgeon to Christ's Hospital, and in 1814, Professor of Anatomy and Surgery to the College of Surgeons. His practice increased with his celebrity, which the singular eccentricity and occasional rudeness of his manners contributed to heighten. Notwithstanding, however, the irritability and harshness which he so often exhibited, those who knew him best bear unanimous testimony to the generosity and kindness of his character. He married in 1800, and had several children. He died at Enfield, in 1831. Of his works, the most original and important is his *Observations on the Constitutional Origin and Treatment of Local Diseases*, first published in 1806, in which a simple principle, till then little attended to, was made the foundation of much important and ingenious observation. His *Lectures on the Theory and Practice of Surgery* were published in 1834.

ABERRATION OF LIGHT is an apparent alteration in the place of a star, arising from the motion of the earth in its orbit combined with the progressive passage of light. When rain is falling perpen-

dicularly, a drop entering at the top of an upright tube at rest, will go through; but if the tube be carried forward horizontally, a drop entering the top will strike against the side before it goes far; and to make the drop go through the tube in motion, we must incline the top of it forward in the direction of the motion. The amount of this inclination will be the greater, the more rapid the motion of the tube is compared with that of the falling drops. If in the time that a drop takes to fall through the height AB of the parallelogram in the annexed cut, the inclined tube BC is moved horizontally over a space equal to its breadth, AC, a drop entering the top of the tube will descend without touching the sides. For in half the time, the tube will be in the position, B'C', and the drop in the position d; and so for any other portion of the time. This exactly illustrates the astronomical phenomenon in question. The tube

is a telescope directed to receive the light of a star; this tube, and the person looking through it, are moving along with the earth in its orbit, and the light may be conceived as particles coming from the star like drops of rain, moving much faster, no doubt, still requiring time. That a particle or ray of light from the star may pass through the tube, it must be directed, not straight to the star, but at a slight angle in the direction of the earth's motion. Thus the place where we see the star is not its true place. As the earth's motion, however, is slow compared with the velocity of light, the angle of inclination is small—never exceeding about $20'$. The result is, that, if we conceive the true place of a star as a fixed point, the apparent place of the star describes about this true place, in the course of a year, an ellipse whose greater axis is about $40'$. The aberration of light was discovered by the English astronomer Bradley, in 1727, while seeking to determine the parallax of certain fixed stars.

ABERYSTWITH, a seaport and municipal and parliamentary borough, in Cardiganshire, Wales. There are about 280 vessels belonging to the port, with a tonnage of 29,000. A. is much resorted to for sea-bathing, and is well provided with good hotels and lodging-houses. Pop. 5641 (1871—6898).

ABEYANCE, a legal term importing that a freehold inheritance, dignity, or office is not vested in any one, but is in expectation, or suspended, until the true owner appears, or the right thereto is determined. Titles of honour are said to be in A. when it is uncertain who shall enjoy them. A parsonage remaining void is also said to be in A. This A. or suspense, being repugnant to the general principles of the tenure of land, is never allowed except when it is unavoidable. It finds no place in the law of Scotland, where it is a maxim that the *fee* of an inheritance, or the *right* of property, cannot be *in pendent*, but must be somewhere, for this, among other reasons, that creditors must know with whom the right of property is. Titles of honour and office stand on a different footing in Scotland, where, however, the general provisions of the law are so comprehensive as almost to exclude a case of A.

ABIES. See *Fir*.

ABINGDON, a market town in Berkshire, England, situated at the junction of the Ock and the Thames. The name was originally Abbendon (town of the Abbey). It sends a member to parliament. Pop. of parliamentary borough, 5354.

ABJURATION, Oath of. Formerly there were three oaths, called the Oaths of Allegiance, Supremacy, and Abjuration, required of all persons before admission to any public office; but now, by the 21 and 22 Vict. c. 48, one oath is substituted for the three referred to, and is as follows:

'I, A. B., do swear, That I will be faithful, and bear true allegiance to her Majesty Queen Victoria, and will defend her to the utmost of my power against all conspiracies and attempts whatever which shall be made against her person, Crown, or dignity, and I will do my utmost endeavour to disclose and make known to her Majesty, her heirs and successors, all treasons and traitorous conspiracies which may be formed against her or them; and I do faithfully promise to maintain, support, and defend to the utmost of my power, the succession of the Crown, which succession, by an Act, intituled *An Act for the further limitation of the Crown, and better securing the rights and liberties of the Subject*, is and stands limited to the Princess Sophia, Electress of Hanover, and the heirs of her body, being Protestants; hereby utterly renouncing and abjuring any obedience or allegiance unto any other person claiming or pretending a right to the Crown of this realm; and I do declare, that no foreign prince, person, prelate, state, or potentate, hath or ought to have any jurisdiction, power, superiority, pre-eminence, or authority, ecclesiastical or spiritual, within this realm; And I make this declaration upon the true faith of a Christian. So help me God.'

The act provides for a form of affirmation by Quakers and other persons permitted to decline taking an oath.

By another act passed at the same time, the 21 and 22 Vict. c. 49, it is permitted to either house of parliament to resolve that thenceforth any person professing the Jewish religion, in taking the above oath to entitle him to sit and vote in parliament, may omit the words, 'And I make this declaration upon the true faith of a Christian;' but on the occasion of two members professing the Jewish religion recently taking their seats in the House of Commons, according to a resolution by the House, under the powers of this act, it was decided by the Speaker that such resolution could only remain in force during the continuance of the session when it was adopted; and it would therefore appear that the resolution must be renewed, and of course at the pleasure and discretion of the House during every subsequent session of the parliament in which any Jew or Jews may have been elected to sit. An effective modification on this point has been proposed.

The act further provides, that in all other cases except for sitting in parliament, or in qualifying to exercise the right of presentation to any ecclesiastical benefice in Scotland, whenever any Jew shall be required to take the above oath, he may omit the words already quoted.

The oath to be taken by Roman Catholics, instead of the oaths of Allegiance, Supremacy, and Abjuration, is prescribed by the 10 Geo. IV. c. 7, commonly called the Roman Catholic Relief Act, and is in the following terms:

'I, A. B., do sincerely promise and swear, That I will be faithful and bear true allegiance to her Majesty, Queen Victoria, and will defend her to the utmost of my power against all conspiracies and attempts whatever, which shall be made against her person, Crown, or dignity; and I will do my utmost endeavour to disclose and make known to her Majesty, her heirs and successors, all treasons and traitorous conspiracies which may be formed against her or them; And I do faithfully promise to maintain, support, and defend, to the utmost of my

power, the succession of the Crown, which succession, by an Act, intituled *An Act for the further limitation of the Crown, and better securing the rights and liberties of the Subject*, is and stands limited to the Princess Sophia, Electress of Hanover, and the heirs of her body, being Protestants; hereby utterly renouncing and abjuring any obedience or allegiance unto any other person claiming or pretending a right to the Crown of this realm: And I do further declare, That it is not an article of my Faith, and that I do renounce, reject, and abjure the opinion, that princes excommunicated or deprived by the Pope, or any other authority of the See of Rome, may be deposed or murdered by their subjects, or by any person whatsoever: And I do declare, That I do not believe that the Pope of Rome, or any other foreign prince, prelate, person, state, or potentate, hath, or ought to have, any temporal or civil jurisdiction, power, superiority, or pre-eminence, directly or indirectly, within this realm. I do swear, That I will defend, to the utmost of my power, the settlement of property within this realm, as established by the laws; and I do hereby disclaim, disavow, and solemnly abjure any intention to subvert the present church establishment, as settled by law within this realm: And I do solemnly swear, That I never will exercise any privilege to which I am or may become entitled, to disturb or weaken the Protestant Religion or Protestant Government in the United Kingdom: And I do solemnly, in the presence of God, profess, testify, and declare, that I do make this Declaration, and every part thereof, in the plain and ordinary sense of the words of this oath, without any evasion, equivocation, or mental reservation whatsoever. So help me God.'

This oath itself, however, has been considered objectionable, as covertly imputing disloyalty and insincerity to the Roman Catholic body, and a Bill has been introduced into parliament for the purpose of modifying its terms still further.

ABLATIVE CASE. See DECLENSION.

ABLUTION. See PURIFICATION.

ABO (pronounced *Obo*), the chief town of the government of Abo, in Finland, now belonging to the Russian Empire, is situated on the river Aurajokki, near its embouchure in the Gulf of Bothnia; pop. 14,000. The town was founded by the Swedes in 1157, and remained the capital of Finland until 1819. In the year 1827, a great part of the town, including the university buildings, was destroyed by fire, and consequently the university was removed to Helsingfors, now the capital.—The *Peace of Abo*, concluded August 17, 1743, between Sweden and Russia, put an end to the war commenced by Sweden, under French instigation, in 1741. In this war, Russia had gained possession of the whole of Finland through the misconduct of the two Swedish generals, Lowenhaupt and Buddenbrock, who were beheaded. In this treaty, the river Kymene was made the boundary between the territories of Sweden and Russia; but by another peace, concluded in 1809, the whole of Finland, as far as the Tornea, was ceded to Russia.

ABOLITIONISTS, a term used to designate a party in the U.S., who desire the immediate and total abolition of slavery. See SLAVERY. They are most numerous and powerful in the Northern States, where they comprise a large portion of the educated and thoughtful persons of the community. They are also said to possess, in a larger measure than is generally supposed, the sympathies of the more liberal and enlightened minds of the south. By the advocates of slavery, as well as by many who profess to dislike the institution, the A. are accused of entertaining views so extreme and

impracticable, as to be damaging to the cause which they espouse.

ABORIGINES (Lat.), properly the earliest inhabitants of a country. The corresponding term used by the Greeks was *Autochthones*. The Roman and Greek historians, however, apply the name to a special people, who, according to tradition, had their original seats in the mountains about Reate, now Rieti; but, being driven out by the Sabines, descended into Latium, and in conjunction with a tribe of Pelasgi, subdued or expelled thence the Siculi, and occupied the country. The A. then disappear as a distinct people, they and their allies the Pelasgi having taken the name of Latini. The non-Pelasgic element of the Roman population is supposed to represent these A., who would thus belong to the Oscans or Ausonians.

ABORTION, in Criminal Law. Neither in the law of England nor of Scotland is it murder to kill a child in the mother's womb (although perhaps it would be different where the mother herself dies in consequence of the treatment). But the offence in question falls under the name *A.*, which may be defined as the crime of administering to a pregnant woman any medicine, poison, or noxious drug, or of using any surgical instrument or other means, with the intent of procuring miscarriage. The English law on the subject is now regulated by the 7 Will. IV. and 1 Vict. c. 85, s. 6, which makes the offence felony, and subjects offenders to transportation for life, or for not less than fifteen years, or to be imprisoned for any term not more than three years. In the law of Scotland, the procuring of *A.* is an offence at common law, punishable with 'an arbitrary pain,' and that equally whether the desired effects be produced or not. As in England, transportation or imprisonment, according to circumstances, is the punishment usually awarded. See SUPPLEMENT.

ABOUKIR, the ancient *Canopus*, is now an insignificant village on the coast of Egypt, about 13 miles north-east of Alexandria. The castle of Aboukir stands on the west side of the bay of the same name. This bay is celebrated on account of Nelson's victory here gained over the French fleet, August 1, 1798. The French fleet was stationed in a curved line near a small island guarded by a battery; but Nelson, with his usual intrepidity, forced a passage with half of his fleet of fifteen vessels between the island and the French line of battle, while the other half attacked the enemy in front. The French admiral De Brueys was killed by a cannon-ball, and his flag-ship, *l'Orient*, was destroyed by fire. Only sixty or seventy men were saved out of a crew of 1000. The French fleet was completely defeated, and only two vessels escaped.

ABOUSA'MBUL, or **IPSAMBUL**, a place on the left bank of the Nile, in Nubia, lat. 22° 22', the site of two very remarkable rock-cut temples, perhaps the oldest existing specimens of architecture in the world. The larger temple contains fourteen apartments, hewn out of the solid rock. The first and largest of these is 57 feet long, and 52 broad, and is supported by two rows of massy square pillars (four in each row), 30 feet high. To each of the pillars is attached a standing colossus, reaching to the roof, overlaid with a kind of stucco, and painted with gaudy colours. In front of the temple are four colossal seated figures—the largest pieces of Egyptian sculpture yet discovered. Reproductions of two of these, on the scale of the original (65 feet in height), form very striking objects in the Crystal Palace at Sydenham, where also may be seen a facsimile, on a small scale, of the temple itself. These figures are supposed to represent Rameses the Great

(or Sesostris), whose achievements are described on the painted walls of the temple.

ABRACADABRA, a word said to be of Persian origin, and to designate in that language Mithra, the sun-god. It was, in former times, the most venerated of those magical formulas that were constructed out of the letters of the alphabet, and was supposed to be highly efficacious for the cure of fevers, and especially quartan and semi-tertian agues. Serenus Sammonicus gives the following directions for its use: Write the letters of the word so as to form a triangle, capable of being read many ways, on a square piece of paper. Fold the paper so as to conceal the writing, and stitch it into the form of a cross with white thread.

This amulet wear in the bosom, suspended by a linen ribbon for nine days. Then go in dead silence, before sunrise, to the banks of a stream that flows eastward, take the amulet from off the neck, and fling it backwards into the water. If you open or read it, the charm is destroyed. The adjoining is one of the principal forms of arranging this mystic word.

ABRAHAM, the progenitor of the Israelitish nation. He was a native of Chaldaea, but migrated, with his wife Sarah and his nephew Lot, to Canaan, where he lived a nomadic life, and worshipped the one God, Jehovah, in the midst of the polytheistic Canaanites. The details of the narrative, as given in the book of Genesis, are familiar to every one. *A.* died at the age of 175 (about 1800 B.C.). Of his two sons, Isaac was the ancestor of the Israelites; and the Arabs claim to be descended from Ishmael, whose mother was Hagar, a bond-woman. Later tradition ascribed to *A.* a complete knowledge of astronomy and philosophy, the invention of alphabetic writing, the art of interpreting dreams, &c. Even among Mohammedans, *A.* is reckoned a prophet and the friend of God; and they attribute to him the building of the sacred Kaaba at Mecca.

ABRAHAM-A-SANCTA-CLARA, a very eccentric but popular and useful German preacher, was born 1642, and died in Vienna 1709. His real name was **ULRICH MIEGERLE**, but he is generally known by the name given to him in his monastery. Uncouth puns, coarse expressions, and strange freaks of humour, marked his sermons; but beneath their fantastic shells they had good kernels. *A.* was an honest, faithful, and devoted priest, as was proved by his self-sacrificing conduct during the plague in 1679. Though very severe in his reproof of vice, he was highly esteemed. The singular style of his writings is indicated by their very titles, e.g., *Gack Gack*, i.e., *Wallfarth Maria Stern in Teza*; *Heilsames Gemisch-Gemisch* (Wholesome Hodge-podge). His collected works amount to twenty vols. (1835). A selection was published in 2 vols. (Vien. 1846).

ABRAHAM-MEN, a class of sturdy beggars who simulated lunacy, and wandered about the country in a disorderly manner; at one time working on the sympathy, and at another on the fears of women, children, and domestics. They were common in Shakspeare's time, and, it would seem, existed even as late as the period of the civil wars. The term is a cant one. 'An Abram cove,' as Decker, in his *English Villanies*, calls one of these mendicants, meant one who personated a 'Tom o' Bedlam.' He would 'disguise himself in grotesque rags, with

knotted hair, long staff, and with many more disgusting contrivances to excite pity,' but he did not hesitate to live by thieving too, and when detected pilfering or in any species of depredation, he pleaded the immunities of the real Bedlamite, who was formally permitted to roam about the country when discharged from 'Bethlem Hospital.' A verbal relic of this class is still preserved in the slang phrase, 'to sham Abraham.'

A'BRAHAMITES, or Bohemian deists. Under this name, a number of residents in Bohemia, trusting in the edict of toleration issued by Joseph II., avowed themselves (1782) as believers of the doctrine alleged to have been held by Abraham before his circumcision. As early as the 9th c., a sect of the same name had arisen in Syria, and had denied the divinity of Christ. But the Bohemian deists professed to be followers of John Huss, though they held no Christian doctrine beyond that of the unity of God, and accepted nothing of the Bible save the Lord's Prayer. As they would join neither Jewish nor Christian sects, the emperor refused to tolerate them; and in 1783, expelled them from their native land, and scattered them in various parts of Hungary, Transylvania, and Slavonia, where many were made converts to the Roman Catholic Church, while others died as martyrs to their simple creed.

ABRANTES, DUKE OF. See JUNOT.

ABRAXAS STONES are so called from having the word *abraxas* or *abraxax* engraved on them. They are cut in various forms, and bear a variety of capricious symbols, mostly composed of human limbs, a fowl's head, and serpent's body. These gems, whose value and significance have been greatly exaggerated, are common in collections, and are represented as coming from Syria, Egypt, and Spain. It is certain that the use of the name abraxas was at first peculiar to the Gnostic sect of the Basilidians (q. v.); and probably the word, by taking the numerical value of its Greek letters, may signify the number 365, so that there is no need to have recourse to old Persian or Egyptian, as is sometimes done. The Basilidians, however, did not designate by this name the highest deity, but the spirits of the world collectively. At a later period, the doctrines and practices of the sect were carried by the Priscillianists to Spain, whence many of these stones are got. Gnostic symbols were afterwards adopted by all sects given to magic and alchemy; and thus there is little doubt that the greater part of the abraxas-stones were made in the middle ages as talismans.

ABROGA'TION of laws is the repealing or recalling of them—as where a statute repeals a previous one. Generally, in England, all statutes, no matter how old, or how unsuited soever to the times, remain in force until they are expressly repealed. But in Scotland a statute may become obsolete and virtually repealed, so that it may not owing to the lapse of time be founded on. See STATUTE.

A'BRUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, of which the only known species, *A. precatorius*, is a shrub, originally belonging to India, where it is chiefly found in clayey soils, but now not uncommon in the West Indies and other tropical regions. The roots possess properties exactly similar to those of the common liquorice. The seeds are nearly spherical, as large as small peas, of a scarlet colour, with a black scar, and are familiar enough to most people in Britain, being used as beads. They are narcotic.

ABRUZZO, the north-east corner of the kingdom of Naples, lies between the States of the Church on the west, and the Adriatic on the east, and is divided

into three parts—Abruzzo Ulteriore 1st and 2d, and Abruzzo Citeriore, so called in relation to the rest of Naples. The whole district contains about 5000 square miles, and 800,000 inhabitants. Its chief towns are Chieti, Teramo, Aquila, Sulmona. It forms the wildest and loftiest portion of the Apennines. The streams are numerous, but the only river of any consequence is the Pescara, which flows into the Adriatic. The rent and jagged mountain-groups arrange themselves in picturesque shapes, reaching in Il Gran Sasso d'Italia, or 'the great rock of Italy,' which is the highest of the chain, the elevation of 10,000 feet. The highlands slope precipitously on all sides, but especially towards the north-eastern shore. The climate of A. is raw in the higher regions; snow rests on the hills from October to April, and on some of the peaks all the year round; but the valleys are extremely fertile, though husbandry is in a wretched condition, and the low open plains are left without the slightest protection from inundations of the rivers in spring, or means for irrigation in the arid summer. Dense forests of oak and fir clothe the sides of the mountains; at the base, almond, walnut, and other fruit-trees grow abundantly; olives, in the deep-lying valleys. Fine cattle pasture in these regions; herds of swine roam through the lofty pine-woods; and the remoter fastnesses are the haunt of bears, wolves, and wild boars. The chief importance of A. is its military position as a defence of the kingdom of Naples. There are few roads into it, so that it is very difficult for an enemy to reach Naples from the north. It is admirably suited for the purposes of guerilla warfare. But the people have ceased to possess a reputation as banditti. No trace of the old spirit which made their ancestors, the Marsi, Sabines, and Samnites, so terrible to the Romans, and which in modern times manifested itself in a love of petty plundering, is to be found. They have become a race of rude and simple shepherds, fondly attached to their mountain homes, musical, superstitious, and hospitable; but they are robust and powerful, and during the French invasion of Naples, in 1799, displayed a vigorous courage in opposing the soldiers of the Revolution.

A'BSALOM, the third son of David, king of Israel, remarkable for his beauty, and for his unnatural rebellion against his father. By popular acts, he contrived to win the affections of the people, and then stirred up a formidable rebellion. The adherents of the king having rallied round him, a battle was fought in the forest of Ephraim, in which the rebels were defeated. In the flight, as A. was riding under a tree, his hair caught in the branches, and he was left suspended; in which position Joab, the commander of David's army, thrust him through, contrary to the king's express orders that he should be spared. The grief of David for his loss was excessive. See 2 Sam. c. 18.

ABSALOM, Archbishop of Lund. See AXEL.

A'BSCESS (*Apostema*), a collection of purulent matter formed by disease within some tissue or organ of the body. The process by which an abscess is formed is the following: First, the capillary vessels become overcharged with blood, in consequence of inflammation. From the blood thus made stagnant, or flowing very feebly, a fluid exudes through the walls of the capillary vessels, and, containing a large portion of albumen, becomes pus or purulent matter. This matter, at first contained in the minute interstices of the tissues, gradually dissolves them, and so makes for itself a larger cavity; and frequently, by gradual dissolution of the adjacent parts, works its way either to the surface or to some natural cavity of the body. Pus thus makes its appearance often in a

different part of the body from where it was formed. It also occurs, that when the purulent matter does not find any outlet either naturally or artificially, it is gradually dried up or absorbed. In abscesses superficially seated—either in or close under the skin—the early treatment consists chiefly in promoting the formation of pus by the application of moist and warm bandages or poultices. The next step is the removal of the pus. When this is too long delayed, serious disturbance of the organ, or even poisoning of the blood, may ensue. An abscess must be regarded not as a distinct, original disease in itself, but as the result of another disease—inflammation; or as an effort of nature for the removal of injurious matters from the system.

ABSCISSA. See PARABOLA.

ABSENTEE, a term applied, by way of reproach, to capitalists who derive their income from one country, and spend it in another. It has been especially used in discussions on the social condition of Ireland. As long as Ireland had its own parliament, a great portion of the large landed proprietors lived chiefly in the country during summer, and passed their winters in Dublin; thus spending a large portion of their incomes among their dependents, or at least among their countrymen. The Union changed the habits of the Irish nobility and gentry, who were attracted to London as the political metropolis, or were induced, by the disturbed condition of Ireland, to choose residences on the continent. Such Irish landed proprietors were styled 'absentees;' and it was argued that their conduct was the great source of Irish poverty, as it drained the resources of the land, or, in other words, sent money out of Ireland. One class of political economists—among them McCulloch—maintain that, economically viewed, absenteeism has no injurious effect on the country from which the absentee draws his revenue. An Irish landlord living in France, it is argued, receives his remittances of rent, not in bullion, but in bills of exchange; and bills of exchange represent, in the end, the value of British commodities imported into France. The remittance could not be made unless goods to the same amount were also drawn from Britain. Thus, although the landlord may consume, for the most part, French productions, he causes, indirectly, a demand for as much of British productions; and his income goes, in the end, to pay for them. His residence abroad, then, does no harm to the industry and resources of the country at large, although it is admitted that it may be felt as an evil in a particular locality. The truth of this doctrine, however, in its full extent, is disputed. Among other objections to it, it is argued, that whatever may be true of the amount actually consumed, all the tradesmen and others who supply the absentee's wants have their profits, and have thus the means of accumulating; and that these accumulations which are thus added to the national wealth of a foreign country, would have been added to the wealth of his native country had he been living at home. The result of the controversy would seem to be, that absenteeism does, to some extent, act injuriously on the wealth of a country, though it is not true that the whole revenues thus spent are so much clear loss, there being several indirect compensations.—On the evil of absenteeism, in a moral point of view, all are agreed; especially in a country in the condition of Ireland, where nearly the whole wealth is in the hands of extensive landed proprietors, with almost no middle class. The possessors of land have duties to perform which cannot be deputed; the very least of these obligations being that of setting a good example in a neighbourhood, and one not less important being that of giving personal aid

in effecting local improvements. It is a bad sign of the social condition of a country when its proprietors systematically live abroad, or in great cities away from their estates. The relations between landlord and tenant then become more and more cold and distant; while, too often, the agents of the landlords have no good feeling towards tenants, but strive only to raise as large sums as possible for their principals, and to enrich themselves. But though the evils of such a state of society are evident, it is not easy to propose a sound remedy. Forced residence is opposed to all British ideas of personal liberty. The most desirable object is to make Ireland a more pleasant home for landed proprietors.

ABSOLUTE stands opposed to *relative*, and means that the thing is considered in itself, and without reference to other things. In physics, we speak of the *absolute* velocity of a body—i.e., the rate of its motion through space; and of the *relative* velocity of two bodies—i.e., the rate at which they approach or recede from one another, one or both being in motion. In the language of modern metaphysics, the Absolute is the unconditioned, unalterable original—that which is the ultimate cause and ground of the phenomena of the visible world. Absolute, in politics, is applied to a ruler whose authority is unrestricted by constitutional checks.

ABSOLUTION, originally a term of Roman law, signifying acquittal, is now used in an ecclesiastical sense. In the primitive Christian Church, its form was this: Members that had given scandal by gross and open sins, were excluded from the Lord's Supper or from the congregation altogether, and could be readmitted only if they repented and underwent the penance laid upon them by the church. When they had done so, the presbyter, along with the elders, pronounced the absolution in presence of the congregation—meaning, that the congregation forgave the offence, on their part, and received the sinner again into their number. Down to the 3d c., the concurrence of the congregation continued to be necessary to absolution. But by the 4th c., it had become a right of bishops to absolve, and the public confession had gradually turned into a private confession before the priest, who now imposed the penance of himself, modified or remitted it, and then absolved. Absolution had not, as yet, been extended to any but open and gross sins; but when the dominion of the hierarchy over men's minds had reached its height, and the fourth Lateran Council (1215) had made auricular confession, at least once a year, obligatory, confession and its attendant absolution were extended to all sins whatever; and the absolution was made to convey, not merely, as before, forgiveness on the part of the church, but forgiveness in the sight of God. The formula, *Deus* or *Christus absolvet te*, which was used till the 12th c., was changed into *Ego absolvo te*; thus ascribing to the priest the power to forgive sins in the sight of God. This is still the received theory of absolution in the Roman Catholic Church, sanctioned by the Council of Trent, and grounded on John xx. 21.—The Protestant churches ascribe to the absolution of the clergy only a declarative, and not an exhibitive power; on the ground of repentance, it announces and assures forgiveness on the part of God, but does not impart it. See PENANCE.

ABSORBENTS. See LACTEALS and LYMPHATICS.

ABSORPTION (in Botany).—It is believed that plants absorb carbonic acid gas, and also to some extent fluids, by their leaves and other aerial organs; and it is supposed that this absorption takes place principally through the *stomata* of the

leaves (see LEAVES), and both by the upper and under surface of the leaf, in some plants by both surfaces indifferently, in others much more powerfully by the one surface or the other. But plants principally depend upon their roots for nourishment, and it is at the extremities of their fibrils that absorption takes place most rapidly, according to a peculiar process to which has been given the name of ENDOSMOSE (q. v.).

ABSTINENCE. See FASTING.

ABSTINENCE SOCIETIES, associations for the promotion of abstinence from all kinds of alcoholic liquors, and the members of which usually receive the designation of abstainers or teetotalers—this last phrase inferring an utter and uncompromising abstinence; or at least that the only exception shall be for sacramental and medical purposes. Abstainers usually take a pledge or vow to that effect; the ground of their abstinence from alcoholic liquors being that they are injurious to, or at least no way promotive of, health, and that from the great social evils of intemperance it is important to set an example of entire abstinence. A. S. exist in great numbers in North America and the United Kingdom. In the early growth of this remarkable social movement, A. S. were called Temperance Societies, and under that head the subject will be treated in its various forms of development.

ABSTRACTION is that intellectual process by which the mind withdraws (*abstrahit*) some of the attributes of objects from the others, and thinks of them to the exclusion of the rest. The abstract is opposed to the concrete. John, William, my brother, form concrete images in my mind, each with a multitude of attributes peculiar to himself. But they have also certain attributes common to them and to all individuals of the race; I can overlook the others, and attend to these, and thus form a notion or conception, which is called a *man*. Man is, therefore, an abstract notion, the word connoting, as it is called, a certain though not very well-defined number of attributes. With the exception of proper names, all nouns are thus abstract. There are degrees, however, in abstraction. The abstract notion *animal* rises above that of *man*, embracing all men and innumerable organised beings besides. An *organised being*, again, is a still higher stage, and embraces both animals and plants. Being, time, space, are among the highest abstractions. The higher abstractions rise, the fewer attributes are implied or connoted in the name; hence the propriety of the phrase, *empty abstractions*. On the other hand, the number of objects to which the name is applicable, increases; and thus reasoning in abstract terms has the advantage of being general, or extensive in its application. But such reasoning is apt to become vague and fallacious, unless constant regard is had to concrete instances. Abstract language is best adapted for scientific exposition; concrete, for graphic and poetical effect.—ABSTRACT in Arith. is applied to numbers considered in themselves, and without reference to any objects numbered; thus 7, 20, are abstract numbers; but 7 feet, 20 horses are concrete numbers.

ABSURDUM, REDUCTIO AD, the method of proving a truth by shewing that to suppose the proposition untrue would lead to a contradiction or absurdity.

ABSINTHIUM. See WORMWOOD.

ABU or BU (Arab. for 'father') is prefixed to many Arabic proper names, as the equivalent syllable *Ab* is prefixed to Hebrew names: ex., Abu-bekr, 'Father of the virgin' (Aysha). But *Abu*, like *Ab*, often signifies merely possessor; as in *Abulfeda* (possessor

of fidelity), 'the Trusty;' Abner, 'the Brilliant'—literally, 'father or possessor of light.'

ABU-BEKR ('Father of the virgin' Aysha, the wife of Mohammed), was a man of great influence in the Koreish tribe; and in 632, when Mohammed died, was made the first calif or successor of the Prophet. After defeating his enemies in Arabia, and warring successfully against Babylonia, Syria, and the Byzantine emperor Heraclius, Abubekr died 635 A. D., aged 63, and was buried at Medina, near the remains of Mohammed and his wife Aysha.

ABULPARAJ (Lat. *Abulfaragius*), called also Barhebræus—i. e., Son of the Hebrew, as being by birth a Jew, though afterwards a Christian—was born at Malatia, in Armenia, 1226, and became so distinguished for his knowledge of the Syriac, Arabic, and Greek languages, and of philosophy, theology, and medicine, that he was called the phoenix of the age. At the age of twenty, he was made bishop of Gula, and afterwards of Aleppo; and rose to the rank of Maphrian, the highest dignity among the Jacobite Christians next to Patriarch. Of his numerous Syriac and Arabic writings, most of which yet lie buried in the library of the Vatican, the best known is a *Chronicle*, in Syriac, of universal history from Adam down to his own time. Only the first part has been published, by Bruns and Kirsch (Leipz. 1789). A. himself abridged this work in Arabic, under the title of *History of the Dynasties* (edited by Pococke, Arab. and Lat., Oxf. 1663). Among his writings of a theological kind may be mentioned his *Magazine of Mysteries*, being a Commentary on the Syriac Version of the Bible.

ABU'LFEDA, a Moslem prince, known as a writer of history, was born 1273 A. D., at Damascus; and during his youth, distinguished himself in several campaigns against the Christian kingdom founded by the Crusaders. From 1310 to the time of his death, he ruled over the principality of Hamat, in Syria, was a true ally of the sultan, visited Egypt and Arabia, patronised literature and science, and died in 1331. He left several important works in Arabic, among which are his *Annals*, the earlier portion of which has been edited by Fleischer, under the title of *Historia Anteislamica* (Leip. 1831), and the rest by Reiske, in his *Annales Moslemici* (Copenh. 1789-94). This work was in great part compiled by A. from earlier Arabic authors, and is a valuable source of history, especially of the Arabic Empire. He also wrote a *Geography*, from which extracts are given in Köhler's *Tubula Syriae*, Michaelis's *Descriptio Egypti*, and Rommel's *Arabic Descriptio*. The whole work has been edited, with a French translation, by Reinaud and De Slane, under the title *Geographie d'Abulfeda* (Paris, 1843).

ABUSHEHR (variously written Bushehr, Bushire, in Pers. Bendershehr) is the name of a seaport on the east coast of the Persian Gulf. It is situated at the extremity of a peninsula. The district is liable to be devastated by earthquakes, swarms of locusts, and the simoom, and is deficient in water; but the situation, so favourable for commerce, has raised the town to importance, so that it numbers about 15,000 inhabitants. It is the emporium of the Indian trade with Persia; and the East India government has a factory here. The exports are horses, fruits, shawls, pearls, silk, rose-water, asafetida, &c.; imports, sugar, indigo, iron, cotton goods, &c.

ABUTMENT, in Arch. is the part of a pier or wall from which an arch springs, and which resists the outward thrust. The term *impost* is used when the arch is a semicircle, so that the pressure is vertical. In reference to a bridge, the

abutments are the walls adjoining the land, which support the ends of the roadway, or the extremities of the arch or arches.

ABYDOS, a town in Asia Minor, situated at the narrowest part of the Hellespont, opposite Sestos. It is celebrated as the place whence Xerxes and his vast army passed into Europe in 480 B.C.; also as the scene of the story of Hero (q. v.) and Leander. In the later times of antiquity, the people of A. were reproached for their effeminate and dissolute manners.—There was another ABYDOS, in Upper Egypt (Thebais), on the left bank of the Nile, and on the main route of commerce with Libya. Even in the time of Strabo, this town was in ruins. Here the remains of the Memnonium and of a temple of Osiris are still remarkable. In the former, W. J. Bankes, in 1818, discovered the celebrated Tablet of A., bearing, in hieroglyphics, a genealogy of the eighteenth dynasty of the Pharaohs. It is now in Paris, and copies have been published.

ABYSSINIA, called Habesh by the Arabs, is the large tract of highlands in the east of Africa. From the Red Sea on the north-east, it rises in a succession of terraces towards the south-west. Between the highlands and the Red Sea lies a flat tract called Adal, narrow at the north (in lat. 15° 30'), and widening to the south. The plains of Nubia and Kordofan form the boundaries on the north and west, while the southern limits are not well known. The country consists of high table-lands, intersected by deep ravines formed by the rivers, and steep sandstone terraces. Numerous mountain-chains, mostly of volcanic origin, rise above the table-lands: the highest are the mountains of Samen or Samien, rising to about 15,000 feet above the sea-level. Some of the plains have an elevation of from 7 to 10,000 feet. A. gives birth to numerous rivers, the largest of which are the Abai or Nile (Bahr-el-Azrek or Blue River), and the Takkazie, an affluent of the Nile. In the south is the Hawash—from which the country takes its name—which flows eastward into the salt-lake of Assal in Adal. The largest lake is that of Tzana or Dembea, through which the Abai or Blue Nile flows. The climate in the elevated tracts of Abyssinia is temperate and salubrious; in the low tracts along the coast, and in the north and north-west, the heat is excessive, and the climate noxious. On the whole, A. is a country of great fertility; but, like the climate, the productions of the soil vary greatly with the different degrees of elevation. Wheat and barley are cultivated, also maize, the grains called Tell (*Poa Abyssinica*) and Toccusso (*Eleusine Toccusso*), various leguminous plants, cotton, coffee, sugar-cane, tobacco, &c. The coffee-plant grows wild. Among carnivorous animals, the lion, leopard, hyena, wolf, and jackal, are found. There are also elephants, buffaloes, rhinoceroses, zebras, &c.

The people of A. belong mostly to the Shemitic race, and resemble the Arabs both in physical characteristics and structure of language. See ETHIOPIA. The ethnology of the country is variously given by different authorities. According to Ruppell, there are three principal races. The aboriginal Abyssinians, inhabiting the greater part of Amhara, and numerous also in Tigré, are of middle size, with oval faces, lips not thicker than those of Europeans, pointed noses, and straight or slightly curled hair. In this race he includes the Falashas, or Jews, the Gamant, and the Agows. A second race, abounding most in the north of Tigré, have thick lips, noses blunt and somewhat curved, and thick hair, verging on wooliness. The third are the Gallas, inhabiting the south of Shoa and the regions west of Lake Dembea and

the Abai; a large-bodied race, round-faced, short-nosed, with a depression between the nose and brow, deep-set lively eyes, and thickish lips. The colour of these races is brown of various shades. The only negroes in A. are slaves from the country of the Shangallas, to the west.

The oldest accounts of the Abyssinians are full of fables, but seem sufficient to prove that they attained some degree of civilisation even in remote antiquity. Christianity was introduced about the middle of the 4th c., and soon prevailed extensively. Axum was at that time the capital. Two centuries later, the Abyssinians were powerful enough to invade Arabia, and conquer a part of Yemen. In the subsequent struggles against the invading Moslems, the coast-land Samhara and the country of Adal were lost. In the 10th c., a Jewish princess overthrew the reigning dynasty, the surviving representative of which fled to Shoa. After three centuries of confusion, the empire was restored under Ion Amlac, and some progress was made in improvement. Early in the 15th c., the Abyssinians entered into close relations with the Portuguese, by whose assistance the empire was saved, in 1540, from falling into the hands of the invader Granie, sultan of Adal. The southern provinces, however, were lost, and the seat of empire was removed from Shoa to Gondar. Under the influence of the Portuguese missionaries, the royal family adopted the Roman Catholic faith; and the old Coptic Church was formally united to the see of Rome. The people and ecclesiastics obstinately resisted the innovation; the emperor gave way; and ultimately, in 1632, the Romish priests were expelled or put to death. In consequence of the commotions thus excited, the monarchical power declined, while that of the governors of provinces greatly increased, and, indeed, became almost absolute. The governor (*Ras*) of Gondar now nominates the emperor (*Negus*). The political divisions of the country are subject to continual alteration. Of the existing states, the following are the most important.—1. The kingdom of *Tigré*, extending between the river Takkazie or Bahr-el-Aswad (Black River), and the mountains of Samen on one side, and the district of Samhara on the other. Its chief towns are Antalo and Adowa. 2. The kingdom of *Gondar* or *Amhara*, extending on the west of the Takkazie and the Samen Mountains. The capital, Gondar, is situated in the north-east of the plain of Dembea or Gondar, at an elevation of 7420 feet. 3. The kingdom of *Shoa* (including *Efat*), lying south of Amhara, and separated from the Galla tribes by the Hawash. This is, by all accounts, the best organised and most powerful state now existing in A. The capital, Ankobar, at an elevation of 8198 feet, contains from 8000 to 10,000 inhabitants, and enjoys a delightful climate. The Gallas, a savage but enterprising race, effected a settlement in the south of A. in the 16th c. They inhabit the whole of the eastern part of tropical Africa. Several of their tribes have been modified in character and customs by conversion to Mohammedanism, and have founded kingdoms—such as *Enarea*, one of the highest mountain countries of Africa, and rich in produce; *Kusha*, on the river Goshob, where the slave-trade is actively carried on by the Portuguese; and several smaller independent states of which little is known.

In consequence of invasions and civil warfare, the present social and political condition of A. is very unfavourable. The kingdom of Shoa is in better circumstances than the other states. Though Christianity is still the professed religion of the majority of Abyssinians, it exists among them only in its lowest form, and is little more than ceremonial

Their church is national and independent, but the visible head, or *Abuna* ('our father') is ordained by the Coptic patriarch of Alexandria. The doctrines of the Abyssinian coincide with those of the Coptic Church, especially in the monophysite heresy; but several peculiar rites are observed, including circumcision of both sexes, and observance of the Mosaic laws respecting food, &c.; love-feasts, and adult baptism. The oldest Abyssinian churches are hewn out of rocks. The modern churches are mostly small, round, or conical buildings, thatched with straw, and surrounded by pillars of cedar. Statues and bas-reliefs are not tolerated in churches, but paintings are numerous. The state of manners and morals in A. is as low as might be looked for in a country so long a prey to anarchy and violence. Human life is lightly valued, the administration of justice is barbarously negligent and corrupt, and the marriage-bond is tied and loosed with extreme facility. The land generally yields at least two crops annually; but the agriculture is miserable, and the condition of the lower classes proportionally wretched. Among fruits, the fig is the most plentiful. Wine is used only for the Eucharist; the common drink is *bouza*, a kind of sour beer, made from the fermentation of bread. The manufactures of A. are rude, but sufficient, with a few exceptions, for the wants of the natives; cotton stuffs and leather goods are the staple articles. The foreign trade is carried on principally through Massowah; the chief exports being slaves, gold, bnter, musk-horns, wax, and ivory.

A. has been frequently visited in recent years by Christian missionaries, scientific travellers, and mercantile and political agents; and our knowledge of its literature has received great additions. See the *Travels and Journals of Bruce*, *Lord Valentia*, *Salt*, *Ritter*, *Gobat*, *Isenberg* and *Kraff*, *Rochet d'Hericourt*, *Ruppell*, and *Parkyns*; the Report of the French Scientific Commission (1845); Contributions of MM. d'Abbadie to *Journ. Asiat.*; and of Beke and Kirk in *Journ. of Roy. Geogr. Soc.* See THEODORE in SUPPLEMENT.

ACA'CIA, a genus of plants of the natural order Leguminosæ, sub-order Mimosæ.

The genus *A.* differs from *Mimosa* in the greater number of its stamens (10–200), and in the want of transverse partitions in its bivalvular legumes. The acacias are diffused over all quarters of the globe except Europe. The greater number of them have a singular appearance, because of the leaf-stalks spreading out in a leaf-like form (*phyllodium*); while the leaflets are more or less stunted in appearance, and frequently are altogether absent. Other species

Acacia Arabica (Gum-arabic Tree).

have bipinnate leaves, with a great number of leaflets, and are extremely beautiful. Many are of great importance in an economical point of view, because of the juice which flows from them, which, when inspissated, becomes an article of commerce under the name of Gum (q. v.). The species called *A. gummifera*, *A. Seyal*, *A. Ehrenbergii*, *A. tortilis*, *A. Nilotica*, and *A. vera*, natives of Africa, produce gum-arabic, also *A. speciosa*, and *A. Arabica*, natives of the south of Asia. *A. Arabica* is called the Babul-tree in India, and its

gum, babul. A gum similar to gum-arabic is produced by *A. decurrens*, *A. mollissima* (the Silver Wattle), and *A. affinis* (the Black Wattle), in New Holland, and by *A. karroo*, at the Cape of Good Hope. Gum Senegal is the produce of *A. Ferek*, and *A. Adansonii*, natives of the western coast of Africa. Yet *A. Ferek* is also said to yield true white gum-arabic. Catechu (q. v.) is obtained from the wood of *A. catechu*. The astringent bark and pods of some species are used for tanning. The bark of *A. Arabica* is administered in India as a powerful tonic medicine. The pods of *A. concinna* form an article of commerce in India, its seeds being saponaceous and used in washing. A decoction of the pods of *A. Arabica* is sometimes used in the same way. A considerable number of species afford useful timber. The flowers of many species are fragrant. A number of species from New Holland and other countries have been introduced into the south of Europe. Some are of frequent occurrence in green-houses in Britain; and a few of the Australian species succeed tolerably in the open air in the south of England. The foliage of the acacias with bipinnate leaves shews a peculiar sensitiveness to changes of weather; when a thick cloud obscures the sun, the opposite leaflets close together, and so remain till the sun reappears. The Locust-tree of North America (*Rolania pseud-acacia*) is often called *A.* both in Britain and upon the continent of Europe. Other species of *Robinia* also receive the same name. See LOCUST-TREE and ROSE *A. Flores Acaciv* (*A. Flowers*) is an old medical name for Sloe flowers.

ACA'DEMY, a name originally applied to the philosophical school of Plato, and derived from the place in which that philosopher was accustomed to meet and converse with his pupils. This was a garden or grove in the suburbs of Athens, said to have once belonged to the hero Academus, and by him to have been presented to the citizens for a gymnasium. The spot is at this day known under the name of *Acadēmia*. The variations of doctrine among the successors of Plato gave rise to the distinctive titles of *Old*, *Middle*, and *New A.* The first is applied to the philosophic teaching of Plato himself and his immediate followers; the second, to that modification of the Platonic philosophy taught by Arcesilaus (q. v.); and the third, to the half-sceptical school founded by Carneades (q. v.).

In its common English acceptation, the word academy is loosely applied to any species of school which professes to communicate more than the mere elements of instruction. This, however, though perhaps more in affinity with the original application of the term, must be regarded as an abuse of its more general and strict acceptation in modern usage, as signifying a society of savans or artists, established for the promotion of literature, science, or art. The first institution in ancient times that seems to merit the name, in this sense, of academy, was the celebrated *Museum* founded at Alexandria in the 3d century B. C. by Ptolemy Soter, which concentrated in that intellectual capital all that was most eminent in science, philosophy, poetry, and criticism. After this model, the Jews, and, at a later period, the Arabians, founded numerous institutions for the promotion of learning. During the middle ages, with the exception of the Moorish institutions at Granada and Cordova, in which poetry and music formed prominent subjects of study, we find nothing corresponding to the modern idea of an academy, save the learned society established in his own palace, at the suggestion of his teacher Alcuin, by Charlemagne. This association was dissolved by the monarch's death; and not till the middle of the

15th c., when the conquest of Constantinople drove many learned Greeks to seek an asylum in Italy, do we find any trace of a similar institution. Under the enlightened patronage of Lorenzo and Cosmo de' Medici, the lovers of Greek learning and philosophy were united in the bond of a common pursuit, and zealously laboured to revive the long extinguished light of classic literature. After the decline of the Greek and Platonic Academies of Florence, there arose institutions of a more comprehensive character, the example of which spread from Italy throughout all the states of Europe.

Academies may be divided into those established for general ends, and such as contemplate specific objects. The members are usually classified as *Ordinary*, *Honorary*, and *Corresponding*. The results of their labours in their various departments are reported at the periodic meetings, and printed in the records of the academy. Prizes are generally established as the rewards of distinguished merit in original discovery, or excellence in the treatment of subjects proposed for competition. Among general academies, deserving of mention in the first place is the *A. of Sciences*, at Paris, established by Colbert in 1666, and now entitled the *Institut de France* (see INSTITUTE). The first scientific academy founded in modern times was the *Academia Secretorum Natura*, established at Naples in 1560, and afterwards put down by a papal interdict. It was succeeded by the *A. of the Lincei*, founded at Rome by Prince Cenci, which attained distinguished success. Galileo was one of its members. Subsequently arose the *A. del Cimento*, at Florence, and the *A. degli Inquieti*, of Bologna, afterwards incorporated into the *Accad. della Tracca*, and finally, in 1711, merged in the Institute of Bologna, or Clementine A.—The *Berlin A. of Arts and Sciences*, founded in 1700 by Frederick I., was in 1710 divided into four sections: 1. Physics, Medicine, and Chemistry; 2. Mathematics, Astronomy, and Mechanics; 3. German Language and History; 4. Oriental Literature, in special connection with missions. The first president was Leibnitz, whose extraordinary versatility of genius qualified him for a leading place in all its departments. Under the Great Frederick, new life was infused into the academy by the encouragement offered to learned men of all countries to settle at Berlin. Maupertuis was now appointed president, and the academy was re-organised under the four classes of Physics, Mathematics, Philosophy, History and Philology. The public meetings are held twice a year. The transactions did not appear regularly till after 1811. They were formerly published in French, but now in German.—The *Imperial A. of Sciences of St Petersburg* was planned in 1724 by Peter the Great, with the advice of Leibnitz and Wolf. It was established in the following year by Catherine I., and liberally supported by the empress: fifteen members received pensions as professors of various branches. Of these were Wolf, Billinger, Nicolas and Daniel Bernouilli, and the two De Lisles. After various fluctuations, the academy attained a position of high eminence and utility under the patronage of Catherine II. Among the most important results of her liberality are the travels and researches of such men as Pallas and Klaproth. The academy is still composed of fifteen salaried members, besides a president and director, and four pensioned supernumeraries, who attend the meetings and succeed to the vacant chairs. It possesses an extensive library and a very valuable museum. The first series of its transactions (1725-47) bears the name of *Commentarii*; the second (1748-77), of *Novi Commentarii* the third (1777-82), of *Acta*. Up to this date, they were written in

Latin; thenceforth in Latin or French. From 1783 to 1795, they are called *Nova Acta*; from that time to the present they are entitled *Memoires*.—The *A. of Sciences at Stockholm*, founded in 1739, consisted at first of six members, one of whom was the celebrated Linnæus. It received a royal charter in 1741, but no endowment. Its publications, since 1779, are distinguished as *New Transactions*. Papers on agriculture are separately published, under the title of *Economica Acta*. In 1799, it was divided into six classes: 1. Political and Rural Economy, 15 members; 2. Commerce and Mechanical Arts, 15; 3. Swedish Physics and Natural History, 15; 4. Foreign Physics and Natural History, 15; 5. Mathematics, 18; 6. History, Philology, and Fine Arts, 12. The resident members preside in rotation, during a term of three months: the transactions appear quarterly. At the annual meeting in April, prizes are distributed.—The *Royal A. of Sciences at Copenhagen* owes its origin, like the last mentioned, to six learned men, employed by Christian VI. in 1742 to arrange his cabinet of medals. In 1743, the king, on the recommendation of Count Holstein, their first president, took the academy under his protection, endowed it, and ordered that natural history, physics, and mathematics should be embraced within the sphere of its operations, at first limited to the national history and antiquities. The academy's transactions are in Danish; some of them are translated into Latin.—The *A. of Sciences of Mannheim* was founded in 1755 by the Elector-palatine Karl Theodor, and divided into the sections of history and physical science; the latter was subdivided in 1780 into physics proper and meteorology. The transactions under the two former heads are published under the title of *Acta*; the meteorological memoirs are entitled *Ephemerides*.—The *A. of Sciences of Munich* was founded in 1759. Soon after the erection of Bavaria into a kingdom, it was reorganised on a very extensive footing, under the presidency of Jacobi. Its memoirs are published under the title of *Abhandlungen der Bayerischen Akademie*.—The *A. of Lisbon*, established by Queen Maria in 1779, numbers 60 members; viz., 24 ordinary, and 36 honorary and foreign; and is divided into three sections: 1. Natural Science; 2. Mathematics; 3. Portuguese Literature. It is liberally endowed by government, and has a library, museum, observatory, and printing-office. Its *Memoirs* have appeared since 1787.—The *Royal Irish A.* dates its origin from 1782, when a number of gentlemen, chiefly connected with the university of Dublin, associated themselves for the pursuit of science, history, and literature. The plan of the society was afterwards extended. The first volume of its transactions appeared in 1788.—The *American A. of Arts and Sciences* was established at Boston in 1780: it had previously existed in another form, the original institution being due to Franklin. The first volume of its transactions was published in 1785.—The *A. of Sciences at Vienna* was founded in 1846. It is divided into the sections of History and Philology; Mathematics and Natural Science; Philosophy, Political Economy, and Medicine. It published *Reports* of its meetings since 1848, and since 1850, *Memoirs*.

Among the academies established for the cultivation of particular departments of knowledge, are the following:—1. LANGUAGES. The *Accademia della Crusca*, or *Accademia Furfuratorum* was founded at Florence in 1582, chiefly for the purpose of promoting the purity of the Italian language; whence its somewhat fantastic designation—*crusca* signifying chaff or bran. It first drew attention by its attacks on Tasso. Its principal service has been the compilation

of an excellent dictionary, and the publication of correct editions of the older Italian poets. A new edition of this dictionary is at present in preparation, but from the slow rate of its progress, it is calculated that many centuries must elapse before its completion. For an account of the *Académie Française*, instituted in 1629, as a private society, see *INSTITUT*. The *Royal Spanish A.* was founded at Madrid in 1714, by the Duke of Escalona, for the cultivation and improvement of the national language, in which it has done good service particularly by the compilation of a Spanish dictionary. A similar institution was founded at St Petersburg in 1783, and afterwards united to the Imperial A. At Stockholm, a similar academy was established in 1786; and at Pesh (for the cultivation of the Magyar language) in 1830.—2. *ARCHEOLOGY*. At the head of antiquarian institutions stands the *Académie des Inscriptions*, founded at Paris in 1663, by Colbert. See *INSTITUT*. For the elucidation of northern languages and antiquities, an academy was founded in 1710 at Upsala, in Sweden; a similar institution was established at Cortona, in Italy, in 1727. Both have issued valuable works. The *A. of Herculeum* was founded at Naples in 1755, by the Marquis of Tannucci, for the elucidation of Herculean and Pompeian antiquities. Its publications, commencing in 1775, bear the title of *Antichità di Ercolano*. An academy for the investigation of Tuscan antiquities was established at Florence in 1807; and at Paris, in 1805, a Celtic A. for the elucidation of the language, history, and antiquities of the Celts, especially in France. This society changed its name, in 1814, to *Société des Antiquaires de France*.—3. *HISTORY*. The *Royal A. of Portuguese History* was founded at Lisbon, in 1720, by John V. At Madrid, in 1730, a learned association was formed for the elucidation of Spanish history. It was constituted an academy in 1738, by Philip V. It has published editions of Mariana, Sepulveda, Solis, and the ancient Castilian chronicles, some of which had never before been printed. A historical academy has existed for some time at Tübingen.—4. *MEDICINE*. The *Academia Naturæ Curiosorum* was established at Vienna, in 1652, by the physician Bauschius, for the investigation of remarkable phenomena in the animal, vegetable, and mineral kingdoms. In honour of Leopold I, who patronised it liberally, it took the additional name of *Cæsareo-Leopoldina*; and, since 1808, has had its chief seat at Bonn. Its valuable memoirs have appeared at irregular intervals under the title of *Miscellanea*, *Ephemerides*, and *Acta*. The *Académie Impériale de Médecine* of Paris, was founded in 1820, for the prosecution of researches into all matters connected with the public health, such as epidemics, &c. The *Surgical A.* of Paris (whose functions have partly descended to the preceding) was founded in 1731. It was dissolved during the troubles of the first revolution. The *Vienna A. of Surgery*, established in 1783, is, properly speaking, a college.—5. *FINE ARTS*. The academies of painting and sculpture of St Petersburg (connected with the Imperial A.) and Paris, are institutions for the education of pupils. The French *Académie des Beaux Arts* is a branch of the Institut (q. v.). The *Royal A. of Arts* in London was founded in 1768, for the promotion of the arts of design, painting, sculpture, &c. The number of academicians is 40. Connected with it is a school, with professors selected from among the academicians. The annual exhibition of the academy is open to all artists of merit. The *Royal Scottish A. of Painting, Sculpture, and Architecture*, was founded at Edinburgh in 1825, and received a royal charter in 1838. The number of academicians is 15; the general plan of the institution is similar

to that of the London A. Similar to these also is the *Royal Iberian A.* incorporated at Dublin in 1803. Numerous academies of the fine arts have been established in Italy—at Rome, Milan, Turin, Florence, Mantua, and Modena; as also at Madrid, Vienna, and Stockholm.

Many learned Societies differ from Academies only in name; such are The Royal Society of London, The British Association, The Washington Smithsonian Institution, &c., &c. See *SOCIETIES*.

ACADIE. See *NOVA SCOTIA*.

ACALEPHÆ (Gr. signifying nettles), one of the classes of the Radiata or Radiated Animals, in the system of Cuvier. They are commonly known by such names as *Jelly-fish*, *Sea-blubber*, &c., and are sometimes called *Sea-nettles*, on account of the stinging power which many of them possess. Most of them were included in the Linnæan genus *Medusa*, and the name *Meduse* is still very frequently applied to them. They are all inhabitants of the ocean, in which they swim or float singly and freely. They abound in all parts of it, although some are tropical, and others belong to high latitudes. Some of them are of a large size, reaching to two feet in diameter, others are very small, and the phosphorescence of the sea is caused by multitudes of minute A. They consist of an extremely soft gelatinous tissue, which in most of them, and in all the true Meduse, is unsupported by any harder substance. The quantity of solid matter even in a large Medusa

Medusa.

A, under surface, shewing the mouth in the centre, surrounded by the tentacula, and the ovarial chambers exterior to the origins of these; B, side-view, shewing the tentacula hanging down in their natural position.

is very small, and the appearance of muscular fibre can only be detected by a microscope near the margin of the disk or umbrella-like body, which in most of the genera constitutes the principal part of the animal, by alternate contractions and expansions of which it moves in the water, and on the under side of which is its mouth. The margin of the disk is generally provided with tentacular appendages, which are of very various forms, often thread-like, sometimes foliaceous; and many have also tentacular appendages, presenting a similar variety of form, but often much larger in proportion, connected with the mouth, or attached to a proboscidean prolongation of it. There is no appearance of teeth. From the gastric cavity, a system of vessels proceeds through the body. No appearance of blood has been detected; nor is it certain that the A. possess any of the senses except that of touch; the nature of the organs sometimes called eyes or *ocelli* being by no means satisfactorily determined. These organs are situated on the margin, and in some are protected by membranous hoods or coverings; in others, are unprotected; those which have them protected, having also a much ramified and anastomosing system of vessels; the others, an extremely simple vascular system. The A. feed on

small marine animals, often of much higher organisation than themselves. Small fishes are amongst the prey of the large Meduse. In the class A., as at present constituted, there are included animals differing much from the typical form and characters, as the genera *Berœ*, *Cestum*, &c., having two orifices to the alimentary canal; and others, as *Physalia* (the Portuguese Man-of-war), in which

Berœ.

a a, tentacula; b, mouth;
c, termination of intestine.

Physalia.

there is no proper mouth, but the food is conveyed to the digestive cavity through a number of flask-like appendages, which hang down beneath, each having an orifice and a sort of sucker. The stinging power seems to be used to benumb the prey. Reproduction takes place in the A. both by means of ova and by germination. The organs of the two sexes appear generally to exist in each individual. The young Meduse differ very much in appearance from the mature animal, and in the process of their development, assume forms resembling those of hydraform polypes, and like them are attached by the base; whilst a still more wonderful fact has been discovered of the formation of a number of Meduse from a single polype-like individual of this kind, which become detached, and swim off in the water.—The A. have of late been diligently studied by a number of eminent naturalists, of whom may be mentioned Eschscholtz, De Blainville, Sars of Norway, and the late Professor E. Forbes.

ACANTHOPTERYGII, in Zoology, one of the two primary divisions of the *Oscous Fishes* in the system of Cuvier, distinguished by having spinous rays in the first portion of the dorsal

Perch.

fin, or in the first dorsal, if there are two. The name is derived from the Greek *akantha*, a thorn, and *pteryx*, a wing. The A. are divided by Cuvier into fifteen families, amongst which are *Percidæ* (Perch, Bass, &c.), *Triglidae* (Gurnard, Flying-fish, &c.), and *Scomberidæ* (Mackerel, Tunny, &c.).

ACANTHUS, the name given by the Greeks and Romans to the plants sometimes called Brancursine, of which it is also the botanical generic name. A.

mollis and *A. spinosa*, natives of the south of Europe, are the species best known. The twining habit of the plants, their large white flowers, and, above all,

A. spinosus, natural.

Ornamental A. Leaf.

the beautiful form of their dark and shining leaves, have led to their artistical application, especially in the capitals of Corinthian columns. See ORDERS OF ARCHITECTURE. Roman drinking-cups have been found whose handles are twined with A. leaves.—The ancients made the *A. mollis* chiefly their pattern; but in Gothic ornaments, more use is made of the smaller and less beautiful leaves of *A. spinosa*.

The genus A. is the type of the natural order ACANTHACEÆ, which contains nearly 1400 known species. They are herbaceous plants or shrubs, chiefly tropical; dicotyledonous. The greater part are mere weeds, but the genera *Justicia*, *Aphelandra*, and *Ruellia* contain some of our finest hot-house flowers. The leaves are opposite, rarely in fours, simple; two or three bracts, which are often large and leafy, accompany each flower. The calyx is persistent, usually 5-leaved, occasionally cut into many pieces, sometimes obsolete. The corolla is monopetalous, hypogynous, usually irregular, deciduous. The stamens are generally two; sometimes four, didynamous, the shorter ones sometimes sterile; the anthers 1-2-celled, opening lengthwise. The disk is glandular; the ovary free, 2-celled, with two or more ovules in each cell; placentæ adhering in the axis; style one. The fruit is a capsule bursting elastically with two valves, the dissepiment also separating into two pieces through the axis. The seeds are roundish, hanging by hard, usually hooked processes of the placenta; testa loose; albumen wanting; embryo curved or straight; cotyledons large; radicle subcylindrical, next the hilum.—Some of the *Acanthaceæ* are used in their native countries as medicines. A valuable deep-blue dye, called Room, is obtained in Assam from a species of *Ruellia*.

ACAPULCO, the best harbour belonging to Mexico in the Pacific, and a place of considerable commercial importance; situated in lat. 16° 50' N.; long. 99° 48' W. The harbour is so well sheltered that deeply laden vessels may lie safely at anchor close to the granite rocks. The town, defended by Fort Diego, on an eminence, has a very unhealthy site, and is one of the places most frequently visited by cholera, which proves especially fatal to new settlers. Since the discovery of the California gold-mines, it has become the most important port in Mexico, and the principal point for the embarkation of passengers between the Atlantic and Pacific ports of the United States. Pop. 5000.

ACARNANIA, a country of ancient Greece, separated from Epirus on the north by the Ambracian Gulf, now the Gulf of Arta; from Ætolia on the east by the river Achelôus; and washed south and west by the Ionian Sea. Along with Ætolia, it forms one of the *nomes* or departments of the modern

kingdom of Greece. The western part of A.—from the mouth of the Achelous or Aspropotamo to Cape Actium in the north-west—is occupied by a mass of rocky and thickly-wooded mountains, rising abruptly from the indented coast, and culminating in the summit of Berganti. A considerable part of A. is overgrown with wood—a rare feature in modern Greece. There is no town of importance in the whole district, though naturally it is not destitute of resources.

A'CARUS, a genus of *Arachnides* (q. v.), of the order *Trachearia*, the type of a tribe called *Acarides*, which corresponds with the genus *Acarus* as defined by Linnaeus. The species of the *Acarides* are very numerous. All of them are small; many microscopical. Some are familiar to us under the names of Mites (q. v.), Ticks (q. v.), &c. Some live upon the juices of plants; some in the dung of animals; many species are found in the vegetable and animal substances used for human food, especially when these have been kept for a considerable time, as in cheese, flour, sugar, on the surface of preserves, of dried fruits, &c.; others are parasites upon the bodies of animals, particularly in diseased conditions, as in cases of itch. A minute species has been detected in the follicles of the human skin, and others even in the human brain and eyes. Some insects, particularly beetles, are often covered with *Acarides*. A species (*Trombidium holosericeum*) common in gardens in spring, is remarkable for its blood-red colour; and a nearly allied but much larger species (*T. tinctorum*), found in the East Indies, yields a fine dye. A Persian species (*Argas Persicus*) is poisonous, and causes sores. The bite of many species is annoying, as of the common Harvest-bug (*Leptus autumnalis*). The *Acarides* have the

Acarus (Mite).

mouth furnished with mandibles, others with a sucker. They are oviparous, and extremely prolific. They have generally eight legs; but, when young, many of them have only six, and in some genera the additional pair seems never to be acquired. A few are aquatic, and have legs covered with hairs to adapt them for swimming.

ACATHYSTUS, a hymn sung in the ancient Greek Church in honour of the Virgin.

ACCELERANDO (Ital.), in Music, with gradually increasing velocity of movement.

ACCELERATED MOTION, in mechanics, is motion in which the velocity is continually increasing. When the increments of velocity are equal in equal times, the motion is said to be *uniformly* accelerated. The best example of such a motion is that of a falling body. It is found that near the earth's surface a body, descending from a state of rest, falls $16\frac{1}{2}$ feet in the first second. Now, a little consideration will shew that at the end of the first second, it is moving at the rate of $32\frac{1}{2}$ feet per second. For, since the velocity was nothing at first and increased uniformly, $16\frac{1}{2}$ feet must have been the *mean* velocity, i. e., the velocity at the middle of the time; and therefore the velocity at the end must be double, or $32\frac{1}{2}$ feet: $32\frac{1}{2}$ feet is thus the measure of the accelerative force of gravity. At the end of the second and third seconds, the velocity is found to be doubled, trebled, &c., or $64\frac{1}{2}$, $96\frac{1}{2}$ feet.

ACCELERATION OF THE MOON. It was first observed by Halley, that the time of the moon's revolution round the earth has for several thousand years been decreasing, or her velocity has been increasing. This phenomenon remained for a

considerable time inexplicable; at last, Laplace, in 1787, discovered the cause in the varying eccentricity of the earth's orbit, which has been on the decrease since about 12,000 years B. C. Since that time, the moon has been gradually coming nearer to the earth; and this will go on till 36,900 after Christ, when the eccentricity of the earth's orbit will begin again to increase.—ACCELERATION OF THE FIXED STARS is the excess of a mean solar day over a sidereal day; i. e., a day measured by the transits of a star over the meridian; the excess is about $3' 56''$ sidereal time.

A'C'CENT, in Grammar, is a special stress of voice laid upon one syllable of a word, by which it is made more prominent than the rest; the accented syllable is sometimes indicated by a mark, as *ac'cedy*, *fo'rtify*. Every word in English has one syllable thus brought markedly into notice. When the accented syllable falls near the end of a long word, there may be one or more secondary accents, as in *re'comm'nd*, *sub'o'rdina'tion*. A. depends upon force of vocal or articulative effort, not upon highness or lowness of pitch. Variations of pitch produce what elocutionists call *inflection*. It is the confounding of A. with a rise of tone, and the contrasting of it with a sinking of tone, that has produced so much confusion on this subject, especially as regards the accents of the ancients. In English, many nouns are converted into verbs simply by transposing the A., as *ob'ject—ob'ject*. It is A., and not quantity, that determines English measures or metres in versification. No rule can be given as to what syllable of a word shall be accented. There seems to be an increasing tendency in our language to throw the A. towards the beginning of words. In the Finnish language, the A. is said to be invariably on the first syllable.—*Emphasis* is to sentences what A. is to words; it is a stress laid upon one word of a sentence to make it prominent. If A. is syllabic emphasis, emphasis is logical A.

A'C'CENT, in Music, is analogous with A. in language. It consists of a stress or emphasis given to certain notes or parts of bars in a composition, and may be divided into two kinds—grammatical, and rhetorical or æsthetic. The first kind of A. is perfectly regular in its occurrence—always falling on the first part of a bar. It is true that long or compound measures of time have, besides the chief A. in every bar, some subordinate accents; but these are only slightly marked. As a general rule, we may observe, that the grammatical or regular A. must not be exaggerated. It should be marked only so far as to give a clear sense of rhythm. The æsthetic A. is irregular, and depends on taste and feeling, exactly as does the A. and emphasis used in oratory. In vocal music well adapted to words, the words serve as a guide to the right use of æsthetic accents.

ACCEPTANCE is the act whereby the drawee engages to pay a bill according to the terms of the A. It may be said to consist in the drawee writing the word 'accepted' on the bill and subscribing his name; or writing, as has been decided in England, the word 'accepted' only (although it is not so in Scotland, where the act of A. must be shewn by the actual signature of the acceptor); or merely subscribing his name at the bottom or across the bill. But there are other and various forms of A., in England and Scotland, as to which, and generally, see BILL OF EXCHANGE. In common parlance, the accepted bill is called *an A.*, and the drawee, or party who engages to pay the bill, is called the *acceptor*.

A. is also a term in the Scotch law of contracts. A mutual contract may commence by an offer, and

be completed by A. The offer is viewed as an obligation provisional on the A., but may, before A., be recalled, on condition of making reparation for any loss fairly occasioned by the offer. The offer may be verbal, by letter, or even tacit, as when goods are sent without an order, or contrary to order, in which case, acquiescence is A. The A. may be either tacit or express. The word is not a technical one in the law of England, but the matter to which it relates in that system will be found under CONTRACT.

ACCESSARY or ACCESSORY. In the criminal law of England, an A. is a person who is not the chief actor in a felony, nor even present at its perpetration, but who is in some way concerned, either *before* or *after* the fact committed. An A. *before* the fact is one who procures or counsels another to commit a crime, he himself being absent. An A. *after* the fact is a person who, knowing a felony to have been committed, receives, protects, or assists the felon. In sudden and unpremeditated offences, there can be no accessaries *before* the fact; and in all crimes under the degree of *felony* there are no accessaries at all, either *before* or *after* the fact, but all persons concerned therein are held to be equally guilty as principals.

There are no accessaries in treason, but all are principals, on account of the heinousness of the crime.

In the Scotch law, 'art and part' in the indictment, or formal accusation, is the phrase by which accession to a crime is signified; and it applies to all offences against the criminal law, there being, according to the practice of the Scotch courts, no distinction in this respect between felonies, properly so called, and misdemeanours.

ACCESSORY ACTIONS, in the practice of the Scotch law, are those which are, in some degree, subservient or ancillary to other actions. For example, actions for reviving a cause, or prosecuting it against the heir of a deceased defendant, or for restoring lost deeds or other documents, are of the nature of A. A.

ACCESSORY OBLIGATION is a technical term in the Scotch law signifying an obligation annexed to another obligation which is antecedent or primary. Thus, an obligation for the regular payment of interest, or by way of further security, is an A. O.

ACCESSION. In the law both of England and Scotland, property may be acquired by A., and this A. may be either natural or artificial. The young of cattle and other animals, for example, belong to the person who is the owner of the mother, and the fruits and produce of the earth to the proprietor of the soil; and for the same reason, the gradual addition to lands on the bank of a river belongs to the proprietor of the land receiving the addition. These are instances of *natural A.* Property, again, is said to be acquired by *artificial A.* when it is the result of human industry; thus trees planted, or buildings erected, on the ground of another, belong to the owner of the ground itself, and not to the planter or builder; and so with regard to the conversion of wood or metal, which, in whatever form, remain the property of the original owner.

ACCESSION TO THE THRONE signifies the commencement of the sovereign's reign.

ACCESSION, Deed of. In the practice of Scotch conveyancing, this is a deed by which the creditors of a bankrupt or insolvent debtor approve of a trust-settlement executed by the debtor for the general behoof, and consent to the arrangement proposed. The corresponding deed in English practice

is a deed of trust for creditors, or, under the Bankrupt Law Consolidation Act, 12 and 13 Vict. c. 106, a deed of arrangement for creditors.

ACCIDENTAL COLOURS. See LIGHT.

ACCIDENTS, in Mus., occasional sharps, flats, and naturals placed before notes in the course of a piece.

ACCIDENTS, in Log., are opposed to Essentials, or to Substance. An Accident is a property of an object which may be modified, or even be altogether abstracted, without the object ceasing to be essentially what it is. But many of the distinctions made by the older philosophers between accidental and essential are fallacious.

ACCIPITRES (plural of the Lat. *accipiter*, a hawk), the name given by Linnæus to an order of Birds, including, according to his system, the genera *Vultur* (Vultures), *Falco* (Eagles, Falcons, Hawks,

Head and Foot of Golden Eagle.

&c.), *Strix* (Owls), and *Lanius* (Shrikes), and principally distinguished by a hooked bill, short strong feet, and sharp hooked claws. The name has not generally been adopted by subsequent ornithologists, but the order, as a truly natural one, has been retained under the names *Rapaces*, *Raptores*, &c.; the Shrikes, however, being generally excluded from it.

ACCLIMATISE, to accustom an animal or plant to a climate not natural to it. The process, of course, varies widely, according to the amount of difference between the old and the new climate. In cases where the difference is extreme, important changes take place in the constitution, and are often attended with certain diseases described as 'diseases of acclimatisation.' Thus, Europeans settling in tropical parts, are liable to disease of the liver, while natives of tropical lands, when resident in England, are exposed to pulmonary disease. The power of bearing changes of climate, or the capability of acclimatisation, is remarkable in mankind, but especially in the Anglo-German race, now so widely spread over the globe. Among animals, we find great powers of adaptation to various climates in the horse, dog, cat, rat, &c.; and among plants, in the various cereals, in potatoes, and several weeds common to almost all climates. Intelligence, of course, assists the physical power of man in bearing changes of climate; but there seems to be a limit to the power, at least as seen in the individual. To A. beyond a certain point is the work of some few generations. —The *Acclimatising of domestic animals* is one of the most important triumphs of human enterprise. Almost all the domestic animals now commonly spread over Europe, and even in high northern latitudes, were originally natives of warm climates. The change produced by the acclimatising of animals may be either an improvement or a deterioration; of the latter, we have an instance in the Shetland pony; of the former, we see an example in the

merino sheep of Spain. As an instance of want of the faculty of being acclimatised, the reindeer may serve. Removed from the mosses and lichens of the cold north to the fertile valleys of a temperate elime, the reindeer degenerates and dies. On the other hand, the horse, whose native land is the East, arrives at its highest development in England; and the Syrian sheep, brought northwards as far as Spain, becomes remarkable for its fine fleece. Spain, on the whole, has a climate much warmer than that of Silesia and Pomerania; and yet the merino sheep, bred in these countries, have become superior to their ancestors imported from Spain. This is a proof that art may do very much in modifying the influences of climate. Silk-worms, brought from China first into Italy, have been acclimatised not only in the south of France, but even on the coast of the Baltic. Recently, attempts have been made to A. in France the llama, the vicugna, and the alpaca of Peru, and with some success in the last instance, as alpacas have been found to thrive pretty well in the Pyrenees.—*Acclimatising of Plants.* It has been very generally believed that plants may become gradually inured to a climate so different from that to which they have been accustomed, that if they had been at once transferred to it, they would have perished; and that their adaptation to it becomes more perfect when successive generations are raised by seed. On the other hand, it is maintained by some of the most distinguished hotanists of the present time, that each species of plant has certain limits of temperature, within which it will succeed, and that alleged instances of acclimatising have been merely instances of plants formerly supposed to be more delicate than they really were. But as it is certain that different varieties of the same species are often more and less hardy, it would seem that in the production of new varieties by seed, there is still a prospect of the acclimatising, to a certain extent, of species of which the existing varieties are too delicate to grow well in the open air.

ACCOLADE, the term applied to the ceremony with which a knight was admitted into the order of chivalry. The grand-master, in receiving the neophyte, embraced him by folding the arms round the neck (*ad collum*).—In music, the A. is the couplet uniting several staves, as in part-music or pianoforte-music.

ACCOMPANIMENT, in Music, is the assisting or aiding of a solo part by other parts, which may consist of a whole orchestra, or a single instrument, or even subservient vocal parts. It serves to elevate and beautify the solo part, and is subject to certain rules for composition as well as for performance. It must be subservient, and therefore should not predominate, but merely assist to place the solo part in its brightest light. In this point of view, modern composers have often erred by making the A. too full, and causing it to stand out so independent and engrossing that the solo part is often, as it were, entirely lost. This abuse takes place mostly in vocal music; and not only is the effect destroyed, but the vocal organ of the singer is frequently ruined. Were it not too true that this bad practice has become the fashion, it would be difficult to believe that a composer would lend himself to it. In proper A., after faithfully fulfilling its duty to the solo part, there always remains opportunity enough for display in the ritornells and symphonies. The Italians in their best period were celebrated for the simplicity and effectiveness of their A. Now, they have entirely lost this claim. In A., the composer must keep three principal points in view—namely, harmony, rhythmical figure, and suitable choice of instrumentation, in respect to number and

character of tone; but all must be subservient to the ruling character of the solo part. Right or proper harmony is, or should be, easily found by every experienced composer. It is, as it were, born at the same time with the melody, and only requires to be here and there adjusted with care. When this is not the case, there arises a double character, which interrupts and totally destroys the melody. The figure of the A. should be chosen so as to be conformable to the solo part, having to express what the solo part cannot be expected to do, and may also, by a succession of secondary ideas, render clear and certain the individuality of the principal solo part, such as the blustering of the poltroon, the daring of the courageous, or the fear of the timid. The necessity of a judicious choice of instrumentation for the proper support of the solo part is evident. The A. should, above all things, by its certainty and firmness, prevent wavering. Good A. is as creditable as solo playing; and all qualified orchestras view it as of great importance.—The word also means the art of playing harmony from a figured bass; this, though more in use formerly, is still a necessary study for the A. of recitative. See FIGURED BASS.

ACCORDION, a simple musical instrument, but little better than a toy, which produces its tones by the vibration of metallic tongues of various sizes, while wind is supplied by the action of bellows. The *concertina* and the *harmonium* are superior instruments, constructed on the same principle—the action of a gust of air on metallic tongues.

ACCUM, FREDERICK, a native of Westphalia, came to London in 1803. He is known in this country chiefly on account of his work, *A Practical Treatise on Gas-light*, which had the effect of introducing that method of illumination into London and all the large towns of England. It was translated into several languages, and became very popular. Subsequently, he wrote a book upon practical chemistry, which was well received, and is still held in considerable estimation. Ultimately, he quitted England, and went to Berlin, where he obtained employment. He died in 1838.

ACCUSATIVE CASE. See DECLENSION.

ACEPHALA. See MOLLUSCA.

A'CER and ACERACEÆ. See MAPLE.

ACETIC ACID, the sour principle in vinegar, is the most common of the vegetable acids. If alcohol, diluted with water, be mixed with a ferment, such as yeast, and exposed to the air at, or a little above, its ordinary temperature, it is rapidly converted into vinegar or A. A. The change is accompanied by the absorption of oxygen, 2 atoms of which combine with as many of hydrogen to form water, whilst other 2 take the place of the hydrogen which has become water, so that A. A. is produced from alcohol by the substitution of 2 atoms of oxygen for 2 of hydrogen. Thus alcohol is $C_4H_10O_2$. If we take from this 2 atoms of hydrogen, and add 2 of oxygen, it becomes $C_4H_6O_4$. But from the mode in which A. A. acts when it combines with bases, it is certain that one of the equivalents of hydrogen and one of oxygen are united as water, so that the formula of A. A. is $C_4H_4O_4 + H_2O$. A striking experiment may be made illustrating the mode in which alcohol is converted into A. A. If slightly diluted alcohol be dropped upon *platinum-black*, the oxygen condensed in that substance acts with great energy on the spirit, and A. A. is evolved in vapour. Here the whole office of the platinum is to determine the oxygen of the air, and the hydrogen of the alcohol to unite. In the commercial processes

for manufacturing vinegar, some vegetable substance containing nitrogen (one of the albuminous principles) takes the place of the platinum-black, and determines the same change. A. A. is not known in the anhydrous form. In its most concentrated state it contains an equivalent of water, $C_2H_3O_2 + 110$. When it combines with metallic oxides, they take the place of the water; acetate of soda, for example, consisting of anhydrous soda and anhydrous A. A., $NaO.C_2H_3O_2$. The salts of A. A., called ACETATES, are numerous and important in the arts. The most important is acetate or sugar of lead. See LEAD. For the commercial processes of manufacturing A. A., see VINEGAR.

ACHAIA, a small district in the north of the Peloponnesus, was divided into twelve little states; and was bounded E. by the Saronic Gulf; N. and W. by the Bay of Corinth; and S. by Arcadia and Elis. The land, rising gradually from the coast to the hills of the interior, was famed, in ancient times, for fertility in the produce of oil, wine, and fruits. When the Romans divided the whole of Greece into Macedonia and A., the latter included all Greece excepting Thessaly. In the modern kingdom of Greece, A. forms, along with Elis, a *nome* or department, in the extreme north-west of the Morea, and its chief town is Patras (q. v.). Excepting the west coast, the land is fertile, and produces corn, wine, and oil.—The ancient Achæans were, in a great measure, separated from the other people of Greece. Their twelve little towns, of which Egium was the chief, formed a confederacy which was dissolved in the Macedonian times; but was renewed in 280 B. C., and subsequently extended itself, under the name of the *Achæan League*, throughout Greece, until 146 B. C., when Grecian liberty fell under the power of Rome.

ACHARD, FRANZ KARL, a meritorious naturalist and chemist, born April 28, 1754, in Berlin, chiefly distinguished himself by his improvements in the process of preparing sugar from beet-root. In these labours he was supported by the king of Prussia. The results of his experiments were acknowledged as partly successful in 1799 and 1800; but were not carried into extensive application until the king gave to A. a farm in Lower Lusatia, where he founded a model manufactory of beet-root sugar. Here, after six years of experiments, conducted with the aid of Neubeck, a medical man, A. found out the true method of extracting beet-sugar; and in 1812, when the factory had become a very profitable investment, the king annexed to it a school for teaching the process of manufacture. A. was called to Berlin as director of the physical class in the Academy of Sciences, and died April 20, 1821. He wrote, among other similar essays, one on the *European Manufacture of Sugar from Beet* (Leip. 1809).

ACHELO'US, now called ASPROPOTAMO (i. e., White River, from the cream-colour of its waters), the largest river in Greece, rises in Mount Pinlus, flows through the land of the Dolopians, divides Ætolia from Acarnania, and falls into the Ionian Sea. The extensive alluvial deposits at the mouth of this river have been observed from ancient times. It is said that the banks of the A. were anciently the haunt of lions.

ACHENIUM, ACHENIUM, or AKENIUM, a term now very frequently employed by botanists, to designate a dry, hard, one-seeded, indehiscent fruit, in which the integuments of the seed are closely applied to it, but distinct from it. Such are what are popularly called the *seeds* of borage, and other plants of the same natural order. They were termed

nuts by Linnaeus. Sometimes the achenia are aggregated upon a common receptacle, forming what is called an *cluster*, as in the ranunculus, in which they are placed upon a dry receptacle, or in the strawberry, in which the receptacle is fleshy. Sometimes the aggregated achenia are enclosed within the fleshy tube of the calyx, as in the rose. The fruit of the *Compositæ* is also sometimes called an A.; but a different appellation (*cypsela*) has been given to it, because the tube of the calyx coheres with the fruit, the name A. being limited to *superior* fruits.

A'CHERON, the name given to several rivers by the ancients, always with reference to some peculiarity, such as black or bitter waters, or mephitic gases. The A. in Thesprotia, which flows through the lake Acherusia, and pours itself into the Ionian Sea; another river of the same name in Elis, now called Sacuto; and several streams in Egypt, were supposed to have some communication with the infernal world. According to Pausanias, Homer borrowed from the river in Thesprotia the name of his infernal A., which the later poets surrounded with many imaginary horrors. Other lakes besides that above mentioned, bore the name of Acherusia; e. g. the lake near Hermione in Argolis.

A'CHIEVAL POSITION. When troops are arranged so that a river or highway passes through the centre and forms a perpendicular to the front, they are said to be drawn up in A. P. Wellington's army at Waterloo was *à cheval* on the road from Charleroi to Brussels. In cases where a river forms the perpendicular to the front, secure possession of a bridge is necessary; otherwise one-half of the troops might be routed, while the remainder stood idly as spectators.

A'CHILL, or 'Eagle' Isle, off the west coast of Ireland, is reckoned within the county of Mayo. It is $15\frac{1}{2}$ miles long by $12\frac{1}{2}$ miles broad, and has a very irregular coast-line, though its general shape is almost that of a right-angled triangle. It has a wild and desolate appearance; most of the surface is boggy; of the 35,000 acres which the island contains, not half a thousand are cultivated. There are three villages in A., and a number of hovels or huts scattered over its barren moors, sometimes in small clusters, forming hamlets, but so wretched as hardly to be fit for beasts. A. rises towards the north and west coast, where the mountains attain an elevation of 2000 feet. One of them, composed, like the rest of the island, wholly of mica-slate, presents, towards the sea, a sheer precipice from its peak to its base, a height of 2208 feet. There is a mission-station in the island, which forms an exception to the general wretchedness of the houses. It possesses, amongst other agencies of civilisation, a printing-press. The population is decreasing, from emigration and other causes: in 1841, it amounted to 5000; in 1851, to 4000.

ACHILLÆA, a genus of plants of the natural order *Compositæ* (q. v.), having small flowers (heads of flowers) disposed in corymbs, and the receptacle covered with chaffy scales (small bractææ). The florets of the ray are female, and have a short, roundish tongue or lip; the florets of the disk, are hermaphrodite, the tube of the corolla flatly compressed and two-winged; the involucre is imbricated.—The common YARROW or MILFOIL (*A. millefolium*) abounds in all parts of Europe and in some parts of North America—into which, however, it has perhaps been carried from Europe—growing in meadows, pastures, &c. It is about a foot in height: its leaves bipinnate, the pinnae deeply divided, the segments narrow and crowded. It has white or rose-coloured flowers. The leaves have a bitterish aromatic,

somewhat austere taste, and little smell; the flowers have a strong aromatic smell, with an aromatic bitter taste, and contain an essential oil, a resin, bitter extractive, gum, several salts, and traces of sulphur. Both leaves and flowers are used in medicine as a powerful stimulant and tonic. The leaves were formerly much used for healing wounds, and are still so employed by the common people in the Highlands of Scotland and in some parts of the continent. The expressed juice is a popular spring medicine in Germany. Yarrow is often sown along with grasses intended to form permanent pasture for sheep; and *A. moschata*, sometimes called MUSK MILFOIL, is cultivated as food for cattle in Switzerland. *A. moschata*, *A. atrata*, and *A. nana*—all natives of the Alps—are very aromatic, and bear the name of GENIFI or GENIPP. The inhabitants of the Alps value them very highly, and use them for making what is called *Swiss Tea*. They are very stimulating and tonic; as are also *A. selacca* and *A. nobilis*, both natives of Switzerland and other middle parts of Europe, and *A. agetatum*, a native of the south of Europe, used by the French as a vulnerary, and called *Herbe au Charpentier*.—SNEEZEWORD (*A. Ptarmica*) is a native of Britain and other parts of Europe, 1–3 feet high, with lanceolate leaves, and much larger flowers than the common Milfoil. It grows in meadows and damp places. The root, which is aromatic, is used as a substitute for *Pellitory of Spain* (q. v.), and the whole plant is pungent and provokes a flow of saliva.

ACHILLES, the hero of Homer's *Iliad*, was the son of King Peleus and Thetis, a sea-goddess, belonging to a line descended from Jove. Of his life before the Trojan war, and of his death after the fall of Troy, the poets after Homer first profess to give accounts. We are told that he was dipped in the river Styx by his mother, and was thus made invulnerable, except in the heel, by which he was held during the process; hence 'the heel of A.' became a proverbial phrase to denote any vulnerable point in a man's character. It had been prophesied at his birth that his life would be short; and, therefore, when the seer Calchas announced that without A. Troy could not be taken, his mother, to keep him from the dangers of the expedition, concealed him at the court of King Lyncomedes, among whose daughters the boy lived disguised as a girl. But Ulysses discovered him by a stratagem. He offered to the young ladies a number of articles, some of feminine attire and others of arms; and the young warrior was betrayed by his choice. A., in the Greek campaign against Troy, appeared with fifty vessels manned by his followers, the Myrmidons; but remained sullen and inactive during a great part of the contest. When the city of Lyrnessus was taken, he had seized and carried away the beautiful Briseis. A pestilence in the Greek camp being ascribed to the anger of Apollo, whose priest had been robbed of his daughter, Chryseis, by Agamemnon; Agamemnon was compelled by the army to send Chryseis back to her father. On this, he took away Briseis from A., which greatly offended the latter. With this incident, the *Iliad* begins. Neither the splendid offers made by Agamemnon, nor the disasters of the Greeks, could afterwards move A. to take any part in the contest, until his friend Patroclus was slain by Hector. The hero then buckled on his armour, which had been made for him by Vulcan, and of which the shield is described at great length by Homer. The fortunes of the field were now suddenly changed in favour of the Greeks; and the vengeance of A. was not satiated until he had slain a great number of the Trojan heroes, and lastly, Hector, whose body he fastened to his chariot, and dragged into the Grecian camp. He then buried his friend Patroclus

with great funereal honours. King Priam, the father of Hector, came by night to the tent of A., and prayed that the body of his son might be given back to the Trojans. A. consented; and with the burial of Hector the *Iliad* closes. We are told, that soon after the fall of Hector, A. made a contract of marriage with Polyxena, the daughter of the Trojan king, but was slain by her brother Paris, in the temple of Apollo, where the marriage should have been celebrated. According to other accounts, he was slain by Apollo, who assumed the likeness of Paris as a disguise. His ashes were placed in an urn, with those of his friend Patroclus, and were buried on the promontory of Sigeum, where, after the fall of Troy, the princess Polyxena, who had been made a prisoner, was offered as a propitiatory sacrifice.

Achilles, from an ancient statue.

ACHILLES' TENDON (*Tendo Achillis*), attaches the soleus and gastrocnemius muscles of the calf of the leg to the heel-bone. It is capable of resisting a force equal to a 1000 lbs. weight: and yet is frequently ruptured by the contraction of these muscles in sudden extension of the foot. The name was given with reference to the death of the Grecian hero Achilles by a wound in the heel. Ancient surgeons regarded wounds or serious bruises of the A. T. as fatal.

ACHIMENES, a genus of plants of the natural order *Gesneraceæ* (q. v.), much cultivated in stoves and greenhouses for the beauty of their flowers. The species are numerous—natives of the warm parts of America.

ACHROMATIC (without colour), the name applied to lenses and telescopes through which objects are seen without false colours, or, in other words, free from that coloured fringe which, in the old telescopes, surrounded the object, and diminished its distinctness. The white, or rather colourless ray of light is composed of several coloured rays which have various degrees of refrangibility. See REFRACTION, LIGHT, COLOUR. When the direct ray is refracted, it divides itself into coloured rays, deviating in various degrees from the right line of the primitive ray. The rays thus refracted by the convex object-glass do not meet exactly in one point, the focus of the glass, but rather at several points, so as to produce the various colours, red, blue, and yellow, which surround the object. Newton, misled by imperfect experiments, believed it impossible to find any remedy for this defect; but Euler, in 1747, expressed his conviction that the desired A. improvement was practicable, and this belief was confirmed by the researches of the Swedish mathematician Klingenstierna. The practical solution of the difficulty was reserved for John Dollond; though, when he obtained a patent for his A. telescope, a priority of invention was claimed for a gentleman of the name of Hall. Dollond succeeded in forming an A. object-glass by a combination of crown-glass and flint-glass, which follow one law as to their relative refractive powers, and another as to their powers of dispersing the colours. By uniting a convex lens of crown-glass with a concave one of flint-glass, in certain relative dimensions, a reunion of the coloured rays may be effected, and

the object will be seen without false colours. In the construction of A. telescopes, Dollond was followed by his son Peter, and also by the optician Ramsden. A further improvement was made by Fraunhofer of Munich, who succeeded in producing perfectly pure glass—a very difficult achievement in the case of flint-glass. We owe an important improvement of the A. telescope to the Viennese optician Plössl, who has lately invented what he calls the dialytic telescope, in which the several kinds of glass composing the compound object-glass are not placed close together, but at regulated distances apart. This arrangement allows a shortening of the tube. See TELESCOPE.

ACI REALE, a town of Sicily, in the district of Catania. It lies at the foot of Mount Etna, on the coast, where the small river Aci, flowing from Etna, enters the sea. The town is built of lava, is defended by a fortress, and contains 19,000 inhabitants, who are employed chiefly in the manufacture of linen and silk; it also carries on a not inconsiderable trade in flax and grain. Many of the edifices are very handsome. A. R. is famed for its mineral waters, and for the cave of Polyphemus and the grotto of Galatea in its vicinity.

ACIDS. An acid is a chemical compound distinguished by the property of combining with bases in definite proportions to form salts (q.v.). The most striking characteristics of A. are a sour taste, and the property of reddening vegetable blues. They are also mostly oxidised bodies; and at one time oxygen was thought to be essential to an acid, as the name *oxygen* (the acid-producer) indicates. Subsequent experience has extended the definition. There is an important class of undoubted A. that contain no oxygen; and silic, or flint, which, being insoluble, neither tastes sour nor reddens litmus-paper, is held to be an acid because it combines with bases and forms compounds like acknowledged A. The oxygen A., which are by far the most numerous class, are formed of elements (sulphur, nitrogen, chromium, &c.), with two or more equivalents of oxygen. The elements that form the strongest A. with oxygen are the non-metallie, and most of them have more than one stage of acid oxidation. Thus sulphur, with two equivalents of oxygen, forms sulphurous acid, symbol SO_2 ; with three equivalents it forms sulphuric acid, symbol SO_3 . Similarly, arsenic gives rise to arsenious acid (AsO_2) and arsenic acid (AsO_3). The higher stage of oxidation forms the stronger and more stable acid. All metals, except arsenic, that form A. with oxygen, have also, at a lower stage of oxidation, one or more oxides. To these oxygen A. must be added the organic A., composed either of carbon and oxygen, as oxalic acid (C_2O_3), or of these two along with hydrogen, as acetic acid ($C_2H_3O_3$) and formic acid (C_2HO_3). There are also A. found in animal fluids or resulting from their decomposition which contain nitrogen in addition to the three elements above named; such is uric acid ($C_{10}N_4H_4O_6$). The *hydrogen A.* are formed of hydrogen and a radical, either simple or compound. The most important of these, and the type of its class, is hydrochloric or muriatic acid (ClH); others are hydriodic (IH) and hydrocyanic A. (NC_2H). As all A., however, even oxygen A., possess acid properties—i. e., combine with bases—only when in combination with water, a new view of the constitution of A. is beginning to prevail, which makes hydrogen the real acidifying element in all A. Thus, instead of considering vitriol as a compound of sulphuric acid and water ($SO_3 + HO$), the hydrated acid is held to be the real sulphuric acid, and its rational formula to be (SO_3H) . It thus becomes analogous to hydro-

chloric acid (ClH). This view has not only the advantage of bringing all A. into one class, but makes the theory of their combination with bases and of their capacity of saturation uniform and simple. See CHEMISTRY, in SUPPLEMENT.

ACKERMANN, RUDOLPH, a native of Saxony in Germany (b. 1764—d. 1834), came to London, where he opened a repository of the fine arts in the Strand, which succeeded well. He introduced the art of lithography into England, and was the originator of the 'Annals' (q.v.), which he commenced by his *Forget-me-not*, published in 1823 and following years. Among his numerous illustrated publications may be mentioned his *Repository of Arts, Literature, and Fashions; Microcosm of London; Westminster Abbey; and Universities of Orford and Cambridge*. English wood-engraving, the art of water-proofing, and the introduction of gas-light into shops, were greatly promoted by this enterprising German. His kindness to the poor relatives whom he had left in Saxony ought not to be left unmentioned.

ACOLYTES, a name occurring first about the 3d c., and applied to functionaries who assisted the bishops and priests in the performance of religious rites, lighting the candles, presenting the wine and water at the communion, &c. They were considered as in holy orders, and ranked next to sub-deacons. These services have, since the 7th c., been performed by laymen and boys, who are improperly called A.; but in the Romish Church, aspirants to the priesthood are still at one stage consecrated as A., receiving candles and cups as the symbols of the office. See ORDERS, HOLY

ACONITE (*Aconitum*), a genus of plants of the natural order *Ranunculaceae* (q.v.), having five petaloid sepals, of which the upper one is helmet-shaped, and two hammer-headed petals concealed within the helmet-shaped sepal. The fruit consists of 3—5 follicles. *A. Napellus*, the common WOLF-SBANE or MONK'S-HOOD, often cultivated in flower-gardens for the sake of its erect racemes of blue

Monk's-hood (*Aconitum Napellus*):
a, fruit; b, root.

flowers, is a somewhat doubtful native of England, but common in some parts of Europe. The roots are fusiform and clustered. The root and whole plant are very poisonous, containing an alkaloid, called *Aconita*, or *Aconitine*, one of the most virulent of all known poisons; but an extract of the leaves is a valuable medicine, administered in small doses for nervous and other diseases. An A., sometimes called *A. Stoerckianum*, but generally regarded as a

variety of *A. Cammarum* (also known as *A. paniculatum*), was brought into great repute on the continent during last century by Dr Stoerck, an Austrian imperial physician, and is still much cultivated for medicinal use. The same properties seem in greater or less degree to belong to a number, if not to all, of the species of this genus, and they contain the same alkaloid. The virulent *bikh* poison of India, equally fatal in its effects whether introduced into wounds or taken into the stomach, is prepared from the roots of several species. The *A. ferox* of Nepal, from which much of it is obtained, has been identified by Drs Hooker and Thomson with *A. Napellus*. Two other Himalayan species, *A. palmatum* and *A. luridum*, are equally employed in its preparation. *A. album*, or white-flowered monk's-hood, a native of the Levant, and *A. lycoctonum*, yellow-flowered monk's-hood, or wolf's-bane, a native of the Alps, are not infrequent in our flower-gardens.

ACORN-SHELL. See BALANUS.

ACORUS, a genus of plants of the natural order *Aroidæ* (see ARUM), or, according to other botanists, of the natural order *Orontiaceæ*, which is regarded as a connecting-link between *Aroidæ* and *Juncææ*. The plants of this genus have a leaf-like scape, which bears upon its side a dense, cylindrical, greenish spike of flowers, with 6-partite herbaceous perianth and six stamina in each flower. To this genus belongs the SWEET FLAG (*A. calamus*), which was long ago brought from Asia, and in the 15th c. was planted in the gardens of princes and rich men, but has now become naturalised in England, Germany, &c., growing in marshes and ditches. Its root (rhizome) is perennial, divided into long joints about the thickness of the thumb, has a bitterish acid taste, and is very aromatic. It is a powerful medicine of transient tonic effect, occasionally used, especially in cases of weak digestion. In many places of the continent it is to be found in every confectioner's, cut into slices, and prepared with sugar. It is also used to correct the empyreumatic odour of spirits, and to give them a peculiar flavour. It is called *Calamus Root*. In Britain it is chiefly employed by perfumers in the manufacture of hair-powder.—The other species of *A.* are likewise aromatic, and are applied to the same uses. *A. gramineus* is cultivated in China.

ACOSTA, GABRIEL, a Portuguese nobleman, descended from a Jewish family, born at Oporto in 1587. After being educated in the doctrines of the Roman Catholic Church, he became sceptical, and leaving Portugal, went to Amsterdam, where he adopted the Jewish faith. He did not remain long contented with his new creed; but wrote against the Pentateuch, disputed the doctrine of the soul's immortality, and became involved in controversy with his rabbinical teachers. On account of his work, entitled *Examen de Tradições Pharisæas conferidas com a ley Escrita* (Examination of Pharisaic Traditions compared with the Scriptures), 1624, he was charged with atheism by the Jews before a Christian magistracy. Having lost his property, and being sentenced to a seven years' excommunication, he sought reconciliation with the synagogue, and submitted to very ignominious chastisements, which were repeatedly inflicted as often as his religious doubts arose again; until, in a state of insanity, he ended his career by suicide in 1640, or, as others say, in 1647. His autobiography was published in Latin and German (Leip. 1847).

ACOTYLEDONOUS PLANTS (*Acotyledones* of Jussieu), one of the great primary classes into which the vegetable kingdom is divided, according to the structure of the seed and whole development

therewith connected. See COTYLEDON. The class of *Acotyledones* contains those plants which, in the Linnean system, form the class *CRYPTOGAMIA* (q. v.). It consists partly of *Acrogenous Plants* (q. v.), as Ferns and Mosses, and partly of *Thallogamous Plants* (q. v.), as Lichens, Fungi, and Alge. It thus includes the vegetable tribes of lowest organisation, whose embryo exhibits no distinct seed-lobes (cotyledons), but is a mere cell or *spore*, with granular matter in its interior, and germinates indifferently from any point of its surface.

ACOUSTICS (Gr. *akouo*, I hear) is the science of sound. This part of physics is often treated in connection with the atmosphere—an arrangement that seems inappropriate; for the atmosphere is only the most common conductor of sound; and every substance, whether solid or fluid, is capable, as well as air, of sounding itself, or of conveying the sound of other bodies. *A.* is rather a part of the science of motion. All motion is either rectilinear, circular, or vibratory; and when a vibratory motion is quick enough to affect the sense of hearing—for which at least thirty vibrations in a second are required—it constitutes a sound. A definable, uniform sound is a note or tone, and the rapidity of the vibrations is its pitch; a confused indeterminate sound is a noise. The chief subjects treated of in *A.* are: 1. Musical sounds, or Notes (q. v.). Here the question is concerning the absolute and relative velocities of the vibrations, and those modifications, called temperament, to which their original proportions are subjected for the practical purposes of music. 2. The origin of Sound (q. v.), and the laws which guide the vibrations of sounding bodies, and which give rise to different phenomena in different substances. In all sounding bodies, it is elasticity that is to be looked upon as the moving power. The elasticity of a sounding body may arise from stretching, as in the strings of a violin or the head of a drum; or from its own stiffness, as in rods, bells, &c. 3. The propagation of sound, as well through the air and other gases as through solids and liquids; and the reflection of sounds or echoes. All elastic bodies conduct sound, many much more powerfully than air. In water the conducting power is four times stronger than it is in air; in tin, seven times; in silver, nine times; in iron, ten times; in glass, seventeen times. 4. Perception of sound, or the structure and functions of the Ear (q. v.).

The ancients had made attempts to cultivate *A.* Pythagoras and Aristotle were aware of the way that sound is propagated through the air, but as a science independent of its application to music, it belongs almost entirely to modern times. Bacon and Galileo laid the foundation of this new mathematical science; Newton shewed by calculation how the propagation of sound depends upon the elasticity of the atmosphere or other conducting medium. He observed that a sounding body acts by condensing the portions of air that lie next it, and in the direction of the impulse. These condensed portions then spring back by their elasticity, and at the same time impel forward the portions lying next them. Each separate portion of air is thus driven forwards and backwards; and thus all round the sounding body there is an alternate condensation and rarefaction of air, constituting, as it were, waves of sound. In determining the velocity of sound, Newton, Lagrange, and Euler erred in their calculations; the best researches on this subject are those of Laplace. Chladni first raised *A.* to an independent science. In recent times, comparatively little has been done in this branch of physics. Savart has determined more exactly the number of vibrations in a second necessary to produce an audible sound; and Cagniard de Latour invented the *sirene*,

and discovered many of the conditions under which both solids and fluids sound. The sounding of heated metals, when laid on cold metallic supports, has occasioned much discussion. See *Edinb. Phil. Journal*. Faraday and Marx have examined the figures of sound; Wheatstone, the phenomena of sympathetic sounds; and Willis, the formation of vowel-sounds by the human voice.

While the principles of A. are well known in theory, they are seldom carried out to a satisfactory result in practice. We allude more particularly to the many instances in which costly assembly halls and churches are defective as regards public speaking; it being seemingly a mere chance that new edifices of this kind exhibit proper acoustic qualities. In some cases, the sounds uttered cause echoes and reverberations, perplexing alike to a speaker and his auditory, and in others the sounds are dispersed at a high elevation and are lost. This subject urgently demands consideration in connection with architecture. As a general rule, the ceilings of halls should be at a moderate elevation; the lowering of a ceiling and the removal of chandeliers, have been known to improve the speaking and hearing properties; and the hanging up of flags and draperies has, in a variety of instances, had a similarly good effect. The whispering gallery of St Paul's, London, offers an interesting example of one of the phenomena in acoustics. See *ECCHO*.

A'CQUI (Lat. *Aque Statielle*), a walled town of Piedmont, on the left bank of the Bormida, and distant 18 miles from Alessandria. It derives its name from its hot sulphur springs, which were known to the Romans, and which are much frequented by invalids from the north of Italy. The town is of great antiquity, and contains many remarkable buildings, especially of an ecclesiastical character. It has some silk-factories, &c. Pop., 8000.

ACRE. The word is identical with Lat. *ager*, Gr. *agos*, 'a field'; the Ger. *acker* means both 'a field' and a 'measure of land.' Most nations have some measure nearly corresponding; originally, perhaps, the quantity which one plough could plough in a day; uniformity, therefore, is not to be looked for.

The English statute A. consists of 4840 square yards. The chain with which land is measured is 22 yards long, and a square chain will contain 22 x 22, or 484 yards; so that 10 square chains make an acre. The acre is divided into 4 roods, a rood into 40 perches, and a perch contains 30½ square yards. The Scotch A. is larger than the English, and the Irish than the Scotch. 121 Ir. ac. = 196 Eng., nearly; 48 Sc. ac. = 61 Eng. The following table shews the values of the more important corresponding measures compared with the English A.:

English acre,	1.00
Scotch "	1.27
Irish "	1.62
Austria, Joch,	1.42
Baden, Morgen or Acre,	0.89
Belgium, Hectare (French),	2.47

Greek Plethron (ancient),	0.23

A'CRE, **ST JEAN D'**, the biblical *Accho*, known as *Ptolemais* in the middle ages, is a seaport town situated on the coast of Syria, not far from the base of Mount Carmel, and contains 10—15,000 inhabitants. The harbour is partly choked with sand, yet is one of the best on this coast. A. has often been the arena of warfare, and has suffered many changes of fortune. In 1004, it was taken by the Genoese; in 1187, by the Sultan Saladin; afterwards, it became the chief landing-place of the Crusaders, the seat of a bishop and of the Order of St John; next, it fell into the hands of the Egyptians; and in 1517 was captured by the Turks; in 1799, it was besieged by the French for sixty-one days, but was successfully defended by the garrison, aided by a body of English sailors and marines under Sidney Smith. In 1832, it was stormed by Ibrahim Pacha, son of the viceroy of Egypt, and continued in his possession till it was bombarded and taken, in 1810, by a combined English, Austrian, and Turkish fleet. See *EGYPT*.

A'CROBAT, a word derived from the Greek, and nearly synonymous with rope-dancer. It literally signifies one who walks on tip-toe (*akron*, an extremity, and *baino*, I go); and is employed to designate those who perform difficult feats, vaulting, sliding, tumbling, and dancing on a slack or tight rope, stretched either horizontally or obliquely. These feats require great skill, suppleness, and steadiness. For a long time, acrobats were contented to divert and astonish only children or the most ignorant of the populace; but the extraordinary skill of some recent performers has given this perilous art a great celebrity. Within the present century, Farioso, Madame Saqui, and Signor Diavolo have excited the admiration of all Paris by their marvellous agility. The acrobats of antiquity appear to have closely resembled those of our own day.

ACROGENOUS PLANTS (Gr., growing at the summit) are plants in which the structure of the stem is *acrogenous*—that is, in which the vascular bundles are developed simultaneously, and not in succession, the stem increasing by the coherence

Section of Acrogenous stem.

Tree Fern.

of the bases of the leaves and by elongation at the summit. In a transverse section of the stem, a circle of vascular tissue is found near the circumference, and the centre is composed of cellular tissue, some portion of which frequently disappears, so that the stem, although solid when young, becomes hollow in a more advanced stage of its growth. Tree-ferns afford the finest specimens of the acrogenous stem. All A. P. have *stomata*, or breathing-pores, on the surface. In general, they have a distinct stem and leaves arranged with

most perfect symmetry. Some plants, in which the distinct stem is absent, are ranked with A. P., because the *thallus* has the texture of leaves, and exhibits a higher organisation than in *Thallogamous Plants* (q. v.). A. P. are all *Acotyledonous* (q. v.); and under this designation are included *Ferns*, *Equisetacea*, *Lycopodiaceae*, *Marsileaceae*, *Mosses*, and *Hepatica*.

ACROLITHS (Gr. *acron*, extremity; *lithos*, a stone), the name given to the oldest works of Greek plastic art, in which wood-carving is seen in transition into marble statuary. The trunk of the figure is still, in the old style, of wood, covered with the usual temple-vestments; but the extremities—head, arms, feet—which are meant to appear naked from below the drapery, are of stone.

ACRO'POLIS, 'the highest point of the city.' Many of the important cities of Greece and Asia Minor were protected by strongholds, so named. The A. occupied a lofty position, commanding the city and its environs; inaccessible on all sides except one, which had, for the most part, artificial defences. It contained some of the most important

Acropolis at Athens.

public buildings, especially temples, besides affording a last refuge in case of a hostile attack. The A., like the castle of the middle ages, had formed the centre or nucleus around which the town gradually grew. Among the most celebrated of the ancient Acropolises was that of Argos, whose name, Larissa, indicates its Pelasgic origin; that of Messenia, which bore the name of Ithome; that of Thebes, called Cadmea; that of Corinth, known as Aero-Corinthus; but especially that of Athens, which was styled pre-eminently the A. See **ATHENS**.

ACRO'STIC is a Greek term for a number of verses the first letters of which follow some predetermined order, usually forming a word—most commonly a name—or a phrase or sentence. Sometimes the final letters spell words as well as the initial, and the peculiarity will even run down the middle of the poem like a seam. Sir John Davies composed twenty-four *Hymns to Astrea* (Queen Elizabeth), in every one of which the initial letters of the lines form the words **ELISABETHIA REGINA**. The following is one of the twenty-four:

E v'ry night from ev'n to morn,
L ove's chorister amid the thorn
I s now so sweet a singer;
S o sweet, as for her song I scorn
A pollo's voice and finger

B ut, nightingale, sith you delight
E ver to watch the starry night,
T ell all the stars of heaven,
H eaven never had a star so bright
A s now to earth is given.

R oyal Astrea makes our day
E ternal with her beams, nor may
G ross darkness overcome her;
I now perceive why some do write
N o country hath so short a night
A s England hath in summer.

In the A. poetry of the Hebrews, the initial letters of the lines or of the stanzas were made to run over the letters of the alphabet in their order. Twelve of the psalms of the Old Testament are written on this plan. The 119th Psalm is the most remarkable. It is composed of twenty-two divisions or stanzas (corresponding to the twenty-two letters of the Hebrew alphabet), each stanza consisting of eight couplets; and the first line of each couplet in the first stanza begins, in the original Hebrew, with the letter *aleph*, in the second stanza, with *beth*, &c. The divisions of the psalm are named each after the letter that begins the couplets, and these names have been retained in the English translation. With a view to aid the memory, it was customary at one time to compose verses on sacred subjects after the fashion of those Hebrew acrostics, the successive verses or lines beginning with the letters of the alphabet in their order. Such pieces were called *Abecedarian Hymns*. See *Hook's Church Dictionary*.

ACROTERION (Gr., the summit or extremity), a term in Arch. for a statue or other ornament placed on the apex or at one of the lower angles of a pediment. Some understand by A., the pedestal on which such ornament stands.

ACT, in the Drama, is a distinct part of the general plot or action, and its conclusion is usually marked by a fall of the curtain. An act should be, in a certain sense, complete in itself, and at the same time should form a necessary part of the whole drama. As every dramatic plot naturally divides itself into three parts—the exposition, the development, and the conclusion or catastrophe—a division into three acts would seem most natural; but in practice it has been found inconvenient to enclose extended plots in such limits, and since the time of the ancient Greek tragedy, five acts have generally been considered necessary. In the first act, the general nature of the drama is indicated, the characters are introduced, and the action commences. The plot should rise in interest in the second, and reach its climax in the third act. In the fourth act, the conclusion or catastrophe should be prepared, but should by no means be anticipated so as to weaken the effect of the *dénouement*, which must occupy the fifth act. This is a rather difficult task; and, accordingly, many dramas fail in the fourth act.

ACT, in the University sense, is an exercise preparatory to receiving a degree. The student who 'keeps the Act,' and who is called the 'Respondent,' reads a Latin thesis on some proposition which he has announced that he is to maintain. Three other students, who have been named by the Proctor as 'Opponents,' then try, one after another, to refute his arguments syllogistically in Latin. The practice of keeping Acts is still adhered to, as a form at least, at Cambridge.

ACT, in Law, has various meanings. In its more general acceptation it is used to denote the solemn accomplishment of some distinctive proceeding, as when a person in England, when executing a legal instrument, declares it to be his *act and deed*. Formerly, in Scotland, the word A. was frequently applied to the procedure in a litigated

cause; and to this day the technical term to signify a plaintiff in Scotch pleading is *Actor*—hence also *Acts of Sederunt* (q.v.). By an A. is sometimes meant an act or proceeding, or rather the record of an act or proceeding, of a public nature—and in this sense it is used when we speak of an *A. of Parliament* (q.v.). This use of the word appears to be derived from the Romans, who employed *Acta* to signify specially public official transactions, and oftener perhaps the records of such transactions. The *Acta Diurna* was a kind of official Roman gazette, giving an account of the public transactions and events of the day. The Germans use *Acten*, and the French *Actes*, to signify official or legal documents, or papers generally. The title *Actu* has been applied in modern times to the journals or records of learned societies: *Acta Societatis Regiæ*—the Transactions of the Royal Society. *Acta Eruditorum*, the oldest journal of erudition in Germany, was begun at Leipsic in 1680, and ceased publication in 1782, when it had extended to 117 quarto volumes. To these may be added (shewing the close connection between the Roman and Scotch legal institutions and their phraseology) the *Acta Auditorum*, or the records of the proceedings of the Lords Auditors, who were a committee of the old Scotch Parliament appointed to hear causes, by way of appeal, and otherwise to exercise supreme jurisdiction. Also the *Acta Dominorum Concilii*, or ancient records of the supreme court in Scotland.

But the word *A.* has at the present day several precise legal applications, the principal of which we now proceed to mention and explain:

ACT OF BANKRUPTCY, by which is meant a certain ostensible indication of insolvency on the part of a debtor, sufficient to bring him within the operation of the bankrupt laws. Section 67 of the existing Bankrupt Law Consolidation Act, 12 and 13 Vict. c. 106, defines Acts of B. in the following terms: 'That if any trader, liable to become bankrupt, shall depart this realm, or being out of this realm, shall remain abroad, or shall depart from his dwelling-house, or otherwise absent himself, or begin to keep his house, or suffer himself to be arrested or taken in execution for any debt not due, or yield himself to prison, or suffer himself to be outlawed, or procure himself to be arrested or taken in execution, or his goods, money, or chattels to be attached, sequestered, or taken in execution, or make or cause to be made, either within this realm or elsewhere, any fraudulent grant or conveyance of any of his lands, tenements, goods, or chattels, or make or cause to be made any fraudulent surrender of any of his copyhold lands or tenements, or make or cause to be made any fraudulent gift, delivery, or transfer of any of his goods or chattels, every such trader doing, suffering, procuring, executing, permitting, making, or causing to be made any of the acts, deeds, or matters aforesaid, with intent to defeat or delay his creditors, shall be deemed to have thereby committed an A. of B.'—The expression, *A. of B.*, is unknown in the phraseology of the Scotch law; but in the definition of *notour bankruptcy*, and of mercantile bankruptcy in the Scotch sequestration statutes, there will be found an enumeration of the evidences of insolvency analogous to the English Acts of B.

ACT OF GOD is a legal expression, and signifies any natural or accidental occurrence, not caused by human negligence or intervention; such as the consequences arising from storms, lightning, tempests, &c., and which are deemed fatalities and losses such as no party under any circumstances (independently of special contract) is bound to make good to another. It has been ruled in England that the loss must be immediate, and the necessary consequence of the accident.

ACT OF GRACE is the name given to an old Scotch act (1696, c. 32) for the maintenance of poor persons imprisoned for debt. It is usually applied in England to insolvent acts, and general pardons, at the beginning of a new reign or on other great occasions.

ACT OF INDEMNITY is an annual act of parliament passed for omissions in taking the oaths and assurances required by law of persons admitted to any public office or employment. See **ABJURATION**.

ACT OF PARLIAMENT is a resolution or law passed by all the three branches of the legislature—the King [or Queen], Lords, and Commons. The expression is generally used to signify the record of an A. of P., and such records are strictly synonymous with the term 'statutes' or 'statutes of the realm.' An A. of P. thus made is the highest legal authority acknowledged by the constitution. It binds every subject in the land, and even the sovereign himself, if named therein. And in England it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament. In Scotland, however, a long course of contrary usage or of disuse may have the effect of depriving a statute of its obligation, for, by the Scotch law, a statute may become obsolete by disuse, and cease to be legally binding. It was formerly held in England that the king might in many cases dispense with penal statutes; but by the statute 1 W. and M. st. 2, c. 2, it is declared that the suspending or dispensing with laws by royal authority, without consent of parliament, is illegal.

An A. of P. or statute is either *public* or *private*. A public act regards the whole community, but the operation of a private act is confined to particular persons and private concerns, and some private acts are *local*, as affecting certain places only. As the law till lately stood, the courts of law were bound *ex officio* to take judicial notice, as it is called, of public acts, that is, to recognise these acts as known and published law, without the necessity of their being specially pleaded and proved; but it was otherwise in regard to private acts; so that in order to claim any advantage under a private act, it was necessary to plead it, and set it forth particularly. But now, by the 13 and 14 Vict. c. 21, s. 7, every act made after the then next session of parliament is to be taken to be a public one, and judicially noticed as such, unless the contrary be expressly declared.

Acts of P. are also sometimes described as *declaratory*, or *penal*, or *remedial*, according to the nature of their object or provisions. Declaratory statutes are where the old custom of the kingdom has almost fallen into disuse, or become disputable, in which case the parliament has thought proper (*in perpetuum rei testimonium*), and for avoiding all doubts and difficulties) to declare what the common law is and ever has been. Penal acts are those which merely impose penalties or punishments for an offence, as in the case of the statutes relative to game. Remedial acts are such as supply some defect in the existing law, and redress some abuse or inconvenience with which it is found to be attended, without introducing any provision of a penal character. There is also a distinction of Acts of P. as being either *enlarging* or *restraining*, *enabling* or *disabling* acts.

An A. of P. begins to operate from the time when it receives the royal assent, unless some other time be fixed for the purpose by the act itself. The rule on this subject, in England, was formerly different; for at common law, every A. of P., which had no provision to the contrary, was considered, as soon as it passed (i. e., received the royal assent), as having been in force, retrospectively, from the first day of the session of parliament in which it passed, though, in fact, it might not have received the royal assent,

or even been introduced into parliament, until long after that day; and this strange principle was rigidly observed for centuries. The ancient acts of the Scotch parliament were proclaimed in all the county towns, burghs, and even in the baron courts. This mode of promulgation was, however, gradually dropped as the use of printing became common; and in 1581, an act was passed declaring publication at the Market Cross of Edinburgh to be sufficient. British statutes require no formal promulgation; and in order to fix the time from which they shall become binding, it was enacted by the 33 Geo. III. c. 13, that every A. of P. to be passed after 8th April 1793 shall commence from the date of the endorsement by the clerk of parliament, stating the day, month, and year when the act was passed and received the royal assent, unless the commencement shall, in the act itself, be otherwise provided for.

An A. of P. consists of various parts—such as the title, the preamble, the enacting sections and clauses, and sometimes certain forms or schedules added by way of appendix—and it is referred to by the year of the sovereign's reign, and the chapter of the statutes for that year. The old acts of the Scotch parliament, before the union with England, are cited by the year in which they were passed, and the order of the number or chapter. See STATUTES, SCOTCH STATUTES, and PARLIAMENT.

ACTS OF SEDERUNT are ordinances of the Court of Session or supreme civil court in Scotland, made originally under authority of the Scotch Act 1540, c. 93, whereby the judges are empowered to make such rules or ordinances as may be necessary for the regulation of legal procedure and the expediting of justice. The power thus conferred was exceeded, and it became necessary to ratify several of the A. of S. in the Scotch Parliament. In so far, however, as A. of S. are confined to declarations of the purposes of the court to decide in a particular way, on an occurrence of similar circumstances, they seem to amount to little more than authoritative announcements of the intention of the court to adhere judicially to certain precedents; and for upwards of a century and a half, they have been almost exclusively confined to the regulation of judicial procedure, and to matters therewith connected. In several recent statutes, express power is given to the Court of Session to pass A. of S., for carrying the purpose of the legislature into more complete effect; and it is usually provided that the A. of S. made in virtue of such power shall be laid before parliament within a limited time. The old quorum of nine judges is requisite in passing an Act of S., 45 Geo. III. c. 151, s. 11.

ACT OF SETTLEMENT, a name given to the statute 12 and 13 Will. III. c. 2, by which the crown was limited to the family of her present Majesty, Queen Victoria. It was towards the end of King William III.'s reign, when all hopes of other issue died with the Duke of Gloucester, that, as we are told by Blackstone, the king and parliament thought it necessary again to exert their power of limiting and appointing the succession, in order to prevent another vacancy of the throne, which must have ensued upon their deaths, as no further provision was made at the Revolution than for the issue of Queen Mary, Queen Anne, and King William. The parliament had previously, by the statute of 1 W. and M. st. 2, c. 2, enacted, that every person who should be reconciled to, or hold communion with, the see of Rome, should profess the Roman Catholic religion, or should marry a Roman Catholic, should be excluded from succession to, and be for ever incapable to inherit, possess, or enjoy the crown; and that in such case the people should

be absolved from their allegiance, and the crown should descend to such persons, being Protestants, as would have inherited the same, if the person so reconciled, holding communion, professing or marrying, were naturally dead. To act, therefore, consistently with themselves, and, at the same time, pay as much regard to the old hereditary line as their former resolutions would admit, they turned their eyes on the Princess Sophia, Electress and Duchess-dowager of Hanover; for upon the impending extinction of the Protestant posterity of Charles I., the old law of regal descent directed them to recur to the descendants of James I.; and the Princess Sophia, being the youngest daughter of Elizabeth, Queen of Bohemia, who was the daughter of James I., was the nearest of the ancient blood-royal who was not incapacitated by professing the Roman Catholic religion. On her, therefore, and the heirs of her body, being Protestants, the remainder of the crown expectant on the death of King William and Queen Anne without issue, was settled by statute 12 and 13 Will. III. c. 2. And at the same time it was enacted, that whosoever should thereafter come to the possession of the crown, should join in the communion of the Church of England as by law established.

This is the last limitation of the crown that has been made by parliament; and the several actual limitations, from the time of Henry IV. to the present, clearly prove the power of the king and parliament to re-model or alter the succession. It is even made highly penal to dispute such power, for by the statute 6 Anne, c. 7, it is enacted, that if any person maliciously, advisedly, and directly, shall maintain, by writing or printing, that the kings of this realm, with the authority of parliament, are not able to make laws to bind the crown and the descent thereof, he shall be guilty of high treason; or if he maintains the same by only preaching or advised speaking, he shall incur the penalties of *premunire*.

The Princess Sophia dying before Queen Anne, the inheritance, thus limited, descended on her son and heir, King George I.; and having, on the death of the queen, taken effect in his person, from him it descended to King George II.; from him to his grandson and heir, King George III.; from him to his son, George IV., who was succeeded by his brother, William IV.; and from the monarch last mentioned the crown descended to his heiress, the daughter of his brother Edward, Duke of Kent, our present gracious sovereign, Queen Victoria.

'Hence,' Blackstone remarks, 'it is easy to collect that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly; and the common stock or ancestor from whom the descent must be derived, is also different. Formerly, the common stock was King Egbert, afterwards William the Conqueror, and now it is Princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly, the descent was absolute, and the crown went to the next heir without any restriction; but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only of the body of the Princess Sophia as are Protestants, members of the Church of England, and are married to none but Protestants.'

ACT OF TOLERATION is the name commonly given to the act of parliament 1 William and Mary, statute 1, c. 18, confirmed by 10 Anne, c. 2, by which all persons dissenting from the Church of England (except Roman Catholics and persons denying the Trinity) were relieved from such of the acts against nonconformists as prevented their assembling for religious worship according to their own

forms, or otherwise restrained their religious liberty, on condition of their taking the oaths of allegiance and supremacy, and subscribing a declaration against transubstantiation; and in the case of dissenting ministers, subscribing also to certain of the Thirty-nine Articles. The clause of this act which excepted persons denying the Trinity from the benefits of its enactments, was repealed by 53 Geo. III. c. 160.

The Protestant dissenters, however, still remained, notwithstanding these provisions, subject to the obligation imposed by the Test and Corporation Acts (q. v.) on all those who were admitted to any office, of taking the sacrament of the Lord's Supper according to the rites of the Church of England; but this disability was at length removed by the 9 Geo. IV. c. 17. And to this list of concessions we are now to add the act of 15 and 16 Vict. c. 36, allowing the dissenters to certify their places of worship to, and register them with, the Registrar-general of Births, Deaths, and Marriages, instead of the Archbishop, Bishop, or Court of Quarter-sessions.

These various Acts of T. operated, however, to the exclusive benefit of *Protestant* dissenters, and afforded no relief to Roman Catholics. With respect to the latter, the progress of emancipation was slower and more reluctant. By statutes, however, of 18 Geo. III. c. 60, 31 Geo. III. c. 32, and 43 Geo. III. c. 30, most of the severer penalties and disabilities to which they were formerly subject, were removed; and by 10 Geo. IV. c. 7, commonly called the Catholic Emancipation Act, Roman Catholics were restored in general to the full enjoyments of all civil rights, being only excluded from holding ecclesiastical offices, and certain high appointments in the state. By another act of the 2 and 3 Will. IV. c. 115, it was provided that Roman Catholics should be subject in this particular to the same laws as were applicable to Protestant dissenters; the effect of which provision is to empower them to acquire and hold property for such purposes. And now, by the acts of 7 and 8 Vict. c. 102, 9 and 10 Vict. c. 59, and 21 and 22 Vict. c. 48, Roman Catholics and Jews are relieved from all enactments calculated to oppress them, and are thus practically admitted to all the privileges of the constitution.

In Scotland, toleration in religious matters is secured by various old Scotch statutes passed before the Union with England, particularly by the act 1690, c. 27; and this was followed up after the Union by the British statute 10 Anne, c. 7, s. 5, which declares that 'it shall be free and lawful for all the subjects in that part of Great Britain called Scotland to assemble and meet together for divine service without any disturbance; and to settle their congregations in what forms or places they shall think fit to choose, except parish churches;' an enactment which amounts to a legal recognition of dissenters, if, indeed, it may not be called their charter in Scotland.

ACT OF UNIFORMITY is the name by which the statute 13 and 14 Car. c. 4, is usually described. By that statute it was enacted, that the Book of Common Prayer, as then recently revised, should be used in every parish church and other place of public worship in England, and that every schoolmaster and person instructing youth should subscribe a declaration of conformity to the Liturgy, and also to the effect of the oath and declaration mentioned in the act of 13 Car. II. st. 2, c. 1. It further enacted that no person should thenceforth be capable of holding any ecclesiastical promotion or dignity, or of consecrating or administering the sacrament, till he should be ordained priest according to episcopal ordination, and with respect to all ministers who then enjoyed any ecclesiastical benefice, it directed that they should, within a certain period, openly read morning

and evening service, according to the Book of Common Prayer, and declare before the congregation their unfeigned assent and consent to the use of all things therein contained, upon pain of being *ipso facto* deprived of their spiritual promotions. By this statute, two thousand of the clergy, who refused to comply with its provisions, were deprived of their preferments. This statute also contained a regulation that no schoolmaster in a private house should instruct youth without having obtained a licence from the Ordinary; but this regulation was repealed by 9 and 10 Vict. c. 59.

ACTS, TEST AND CORPORATION. See TEST AND CORPORATION ACTS.

ACTA SANCTORUM or MARTYRUM (Acts of Saints or Martyrs), the collective title given to several old writings, respecting saints and martyrs, in the Greek and Roman Catholic churches, but now applied especially to one extensive collection begun by the Jesuits in the 17th c., and intended to serve as a better arrangement of the materials found in ancient works. This great undertaking, which was commenced by the Jesuit, Heribert Rosweyd of Antwerp, has considerable importance, not only in a religious and ecclesiastical point of view, but also with regard to history and archeology. After Rosweyd's death, in 1629, J. Bolland was commissioned by the order of Jesuits to continue the work; and with the assistance of G. Henschen, he prepared two volumes, which appeared in 1643. After the death of this editor (1665), the work was carried on by a society of learned Jesuits, who were styled 'Bollandists,' until 1794, when its further progress was prevented through the invasion of Holland by the French. In recent times, the undertaking has been resumed; and in 1846 the fifty-fourth volume was published at Brussels. Three or four additional volumes have appeared since. The lives are arranged in the order of the calendar. The first two volumes, published in 1643, contained the lives of the saints for January. The volumes last published are for October. For notices of other collections of the same kind, see the articles SAINTS, MARTYR, and MARTYROLOGY.

ACTEÆA, a genus of plants of the natural order *Ranunculaceæ* (q. v.), the type of the sub-order *Acteæ*, distinguished by the coloured imbricated calyx and indehiscent succulent fruit. The genus *Acteæ* has four deciduous sepals, four petals, and a single bacate carpel.—*A. spicata*, the Baneberry or Herb Christopher, is a native of the north of Europe, found in bushy places in some parts of England. It is a perennial herbaceous plant, about 1—2 feet high, with triternate leaves, and the leaflets deeply cut and serrated, the flowers in racemes, the berries black and poisonous. The root is anti-spasmodic, expectorant, and astringent, and is sometimes useful in catarrh. *Botrophis actaeoides* (*Acteæ racemosa* of Linnæus) is a native of the United States, whose roots are said to possess similar qualities, and are also reputed as a remedy for the bite of the rattlesnake.

ACTEÏON, a mythical personage, a grandson of Cadmus. He was trained as a hunter by Chiron. Having once surprised Diana while bathing in a fountain, he was changed by the offended goddess into a stag, and his own dogs, not knowing him, tore him in pieces. According to Euripides, Diana was jealous because Acteion had boasted that he excelled her in hunting.

ACTINIA, a genus of marine animals closely allied to the Hydraform Polypi, but of much greater size, and always living separately, very generally affixed by the base to rocks or shells. The old genus Actinia has been subdivided into a number

of genera, and is now the type of a family, *Actiniadr*. They consist of a fleshy sac with one orifice, around which are numerous tentacula, and when these are expanded, much resemble flowers, and have therefore been called *Animal Flowers* and *Sea Anemones*. They are found on all shores; those of Britain

Actinia seen from above.

Section of Actinia :
a, cavity of stomach; b, surrounding chambers.

possess a number of very beautiful species, but they are most abundant, and attain their greatest size and beauty in tropical seas. They are capable of moving by alternate contractions and expansions of the fleshy base, and can also make use of their tentacula for locomotion. The tentacula appear to act as suckers in capturing prey, which they promptly convey to the mouth, and which consists of small fishes, mollusks, crustacea, &c. They produce living young, the germs of which are formed in ovarian chambers, divided by radiating vertical partitions in the fleshy substance around the stomach cavity, and which pass into the stomach cavity, and are ejected from the mouth; but simple gemmules, furnished with cilia, are also discharged through the tentacula. The Actiniadr possess a remarkable power of reproducing parts which have been cut away, and may be multiplied by division. They are very sensitive to light. In many parts of the world they are eaten, and are esteemed a delicacy. A small A. was kept by Sir John G. Dalyell for twenty-six years.

ACTINISM, the property of the sun's rays which produces chemical changes. See **SPECTRUM**.

ACTION, in its large and general sense, means a judicial proceeding before a competent tribunal for the attainment of justice; and in this sense it is applied to procedure, whether *criminal* or *civil*. In its more limited acceptation, it is used to signify proceedings in the *civil* courts, where it means the form prescribed by law for the recovery of a right, or what is one's due. And it is in this sense that it is regarded by the Roman law, which defines an action as *jus persequendi in judicio quod sibi debetur*. In the law of England, the term A. is usually applied to proceedings in the courts of *common law*, as distinguished from those of *equity*, where the word *suit* is commonly used to denote litigation. Thus, in the courts of Queen's Bench, Common Pleas, and Exchequer, we speak of an A.-at-law; whereas in the courts of Chancery, the forensic controversy is described as a suit in equity.

In the Scotch law, which recognises no distinction in legal administration between law and equity, the word A. is defined comprehensively as a demand regularly made and insisted on before the judge competent for the recovery of a right. Accordingly, while in Scotland there is, as in England, a remedy for every wrong, the law recognises and gives effect to the right of a party to claim and to have *declared* a particular interest or right, even although that interest or right may not be withheld, or called in question. It is sufficient that it is doubtful, and that the ascertainment of it is necessary for the position and purposes of the plaintiff, or *pursuer*, as the Scotch law calls the

active party. This procedure is known by the name of an *A. of declarator*, which has been described as a suit in which something is prayed to be decreed in favour of the plaintiff, but nothing sought to be paid, performed, or done by the defendant. Lord Stair, in his *Institutes of the Law of Scotland*, says 'such actions may be pursued for instructing or clearing any kind of right relating to liberty, dominion, or obligation;' and he further observes, 'there is no right but is capable of declarator.' Various attempts have been made to introduce this mode of proceeding into the practice of the law in England, but as yet without success. The idea of the declarator has been said to have been derived by the Scotch lawyers from the French legal system, according to whose forms the existing administration of the Scotch law was originally moulded. In the *Institutes of Justinian* there are, however, indications of the partial use of this form of A. by the Roman lawyers.

We may add that the word A. is derived from the Latin *actio* (*agere*), and that the plaintiff in a suit or action was originally said to be the *actor*, which, indeed, in the recorded pleadings of the Scotch courts, his counsel or advocate still is called.

ACTION (now Azio), a town and promontory on the west coast of Greece, at the entrance of the Ambraciot Bay, now the Gulf of Arta, is memorable for the sea-fight which took place near it, 2d September, 31 B. C., between Octavianus (afterwards the Emperor Augustus) and Marcus Antonius. These two had for some time ruled the Roman world between them—the former in the west, the latter in the east; it now came to a struggle for the sole sovereignty. The two armies were encamped on the opposite shores of the gulf: Octavian had 80,000 infantry, 12,000 cavalry, and 260 ships of war; Antony, 100,000 infantry, 12,000 cavalry, and 220 ships. Antony's ships were large, and well provided with engines for throwing missiles, but clumsy in their movements; Octavian's were smaller and more agile. Antony was supported by Cleopatra, Queen of Egypt, with sixty vessels, who induced him, against the opinion of his most experienced generals, to determine upon a naval engagement. The battle continued for some hours undecided; at last, Agrippa, who commanded Octavian's fleet, succeeded, by a skilful manœuvre, in compelling Antony to extend his line of battle, whose compactness had hitherto resisted all attempts of the enemy to break through. Cleopatra, whose ships were stationed behind Antony's line, apprehensive of that line being broken, took to flight with her auxiliary fleet, and Antony recklessly followed her with a few of his ships. The deserted fleet continued to resist bravely for some time, but was finally vanquished; the land-army, after waiting in vain seven days for Antony's return, surrendered to Octavian. As a memorial of the victory that had given him the empire of the world, and out of gratitude to the gods, Octavian enlarged the temple of Apollo at A., dedicated the trophies he had taken, and instituted games to be celebrated every five years. He also built, on the spot where his army had been encamped, the splendid city of Nicopolis (city of victory), near where Prevesa now stands.

ACTON, JOSEPH, PRINCE, prime-minister of Ferdinand IV. of Naples, was the son of an Irish physician, and was born at Besançon in 1737. After acquiring distinction in the naval service of France and Tuscany, he gained a position in the Neapolitan government, and became the favourite of Queen Caroline. His measures, prompted by his extreme hatred of France, were cruel and intolerant, and ultimately caused a reaction against the royal family

of Naples, and in favour of the French party and the Carbonari. When left unaided by English influence, A. lost the power he had so often abused, and died in 1811, deservedly condemned by all parties.

ACTS OF THE APOSTLES, the fifth book of the New Testament, the authorship of which is ascribed by tradition, and with the highest probability, to the Evangelist Luke. Beginning with the ascension of Christ, it gives an account of the spread of the Christian Church; confined, however, chiefly to the part taken therein by the Apostle Paul. Notwithstanding its title, little is said of the other apostles, with the exception of Peter. The narrative closes with the year 62 A.D., Paul being then a prisoner at Rome. The book has always been received as canonical, except by a few Manichean heretics. In the early centuries, numerous spurious ACTS OF THE APOSTLES were put in circulation by various sects.

ACTUARY. The *Actuarii*, in ancient Rome, were clerks who recorded the *Acta* of the senate and other public bodies. The term might therefore, so far as its etymology is concerned, be applied to men of business in general. But in the constantly increasing tendency to subdivide labour and specialise functions, there has arisen, in recent times, a distinct branch of business, embracing all monetary questions that involve a consideration of the separate or combined effect of Interest and Probability, especially as connected with the duration of human life; and it is to one who devotes himself to this department of business that the name of A. has been specially assigned. The investigations and calculations of the A. supply the principles of operation for the numerous institutions now engaged in the transaction of Life-assurance, Annuity, and Reversionary business. His functions might be briefly defined as *the application of the doctrine of probabilities to the affairs of life*. There are two Societies of Actuaries in this country: 'The Institute of Actuaries of Great Britain and Ireland,' established in London in 1848; and the 'Faculty of Actuaries in Scotland,' established in Edinburgh in 1856.

ACULEUS, in Botany. See PRICKLE.

ACUPUNCTURE (Lat., puncturing or pricking with a needle [*acus*]), is a very ancient remedy, and one practised extensively in the East, for the cure of headaches, lethargies, &c. In Europe it is principally employed to relieve neuralgic pains, and those of chronic rheumatism. Steel needles are made use of, about three inches long, and set in handles. The surgeon, by a rotatory movement, passes one or more to the desired depth in the tissues, and leaves them there from a few minutes to an hour. Their insertion is accompanied by no pain, except the first prick—a fact the quacks of the 16th c. did not fail to take advantage of. According to Jerome Cardan, they travelled from place to place practising A., and before inserting the needle, they rubbed it with a peculiar kind of magnet, either believing, or pretending, that this made the operation painless. The relief to pain afforded by this simple operation is sometimes astonishing, and the wounds are so minute as to be perfectly harmless.—The needles are sometimes used as conductors of the galvanic current to deep-seated parts, and are sometimes made hollow—on the suggestion of Dr Alexander Wood of Edinburgh—to allow of a small quantity of some sedative solution being injected into the tissues, by which even the terrible pain of Tic Douloureux may be almost immediately relieved. See NEURALGIA.

ADAGIO, a slow movement or measure of time in Music, between *largo*, *grave*, and *andante*. In our more extended compositions of instrumental or

chamber music, the second or third *movement* is generally marked *adagio*, and serves as a contrast with the rapid and energetic movement of the preceding and following parts of the sonata or symphony. The A. must be written in a measure of time which will afford scope for a flowing and expressive slow melody with a gracefully varied accompaniment. Without contrasted movement and a lively variety in the accompaniment, the slow air would have a monotonous or dull effect. A clear and expressive execution of the A. is a sure test of ability and good taste in the player or singer, as it demands a pure and beautiful intonation, a true reading and phrasing of the cantilena, even in its most minute details, and a careful attention to all points of effect. The finest specimens of the A. are found in the works of the old masters, Haydn, Mozart, and Beethoven, and are as distinct in their features as were the composers in their personal characteristics. In recent works, our composers have generally succeeded better in their rapid movements than in the A.

ADAL and **ADEL**. The name Adal is applied by geographers to the flat country lying between Abyssinia and the Red Sea, from Massowa in N. lat. 15° 40', to the Bay of Tadjarra, lat. 11° 30'. Adel would seem to designate the coast-country from Tadjarra to Cape Guardafui, part of which is known as the country of the Somauli.

ADALIA, anciently *Attalia*, the chief seaport on the south coast of Asia Minor, in N. lat. 36° 52'; E. long. 30° 45'. The streets rise like the seats of a theatre, up the slope of the hill behind the harbour. Pop. 13,000.

ADAM and **EVE**. The narrative of the creation and fall of A. and E. is given in Genesis. To the Scriptural account, the later Jewish writers in the Talmud have made many tasteless additions. They tell us that the stature of A., when first created, reached to the heavens, while the splendour of his countenance surpassed that of the sun. The very angels stood in awe of him, and all creatures hastened to worship him. Then the Lord, in order to shew the angels his power, caused a sleep to fall on A., and removed a portion of every limb. A. thus lost his vast stature, but remained perfect and complete. His first wife was *Lilith*, the mother of demons; but she fled from him, and afterwards E. was created for him. At the marriage of A. and E., angels were present, some playing on musical instruments, others serving up delicious viands; while the sun, moon, and stars danced together. The happiness of the human pair excited envy among the angels, and the seraph Samael tempted them, and succeeded in leading them to their fall from innocence.—According to the Koran, all the angels paid homage to A., excepting Eblis, who, on account of his refusal, was expelled from paradise. To gratify his revenge, Eblis seduced A. and E., and they were separated. Adam was penitent, and lived in a tent on the site of the temple of Mecca, where he was instructed in the divine commandments by the archangel Gabriel. After 200 years of separation, he again found E. on Mount Ararat. Many other traditions of the Jews and the Mohammedans respecting A. and E. may be found in Herbelot's *Bibliothèque Orientale*.—In the system of the Christian Gnostics and Manicheans, A. is one of the highest *Æons*.—According to the Calvinistic theology, A. was the *covenant head* or *federal representative* of the whole human race, who were thus involved in the consequences of his breach of the *Covenant* (q. v.) which God made with him at his creation. This view is supported by reference to the parallel drawn between A. and Christ in Rom.

v. and 1 Cor. xv., in the latter of which chapters Christ is called, in contradistinction to A., 'the second man,' and 'the last A.'

ADAM (of Bremen), an old historical writer, whose work entitled *Gesta Hammensurgensis Ecclesie Pontificum*, gives a history of the archbishopric of Hamburg from 788 A.D. to the death of the Archbishop Adalbert in 1072. This work has great historical value; in addition to its notices of ecclesiastical affairs, it gives accounts of the northern Slavonic tribes, which the author collected during a visit to the Danish king Svend-Estrithson. A. was canon and *magister scholarum* at Bremen from 1067 to the time of his death, which took place in 1076.

ADAM, ALEXANDER, LL.D., an eminent scholar and teacher, was born in the parish of Rafford, near Forres, in 1741. His father was a small farmer, with limited means and a numerous family, so that young Adam had to struggle through much hardship in the pursuit of the learning for which he thirsted. While studying at the University of Edinburgh, he had to support himself by giving private lessons, for which he was paid at the rate of one guinea a quarter. He breakfasted and supped on porridge and small-beer; a penny loaf served him for dinner. Such was the stern initiation—not, indeed, a singular case in Scotland—of the brave young scholar. His patient merits, however, soon gained recognition. A.'s first public office was that of classical master in Watson's Hospital, Edinburgh; and not long after (1761), he succeeded to the head-mastership of the institution. In 1768 he was appointed rector of the High School; and this situation he filled for nearly forty years with distinguished ability and success, giving himself to its duties with singular devotion, and raising the reputation of the school beyond what it had ever been before. In some of his efforts to that end he encountered such opposition as now seems almost fabulous. He composed a new Latin grammar (1772), in which he aimed at combining the study of English and Latin; but the town-council prohibited him from teaching it. In 1791 he published his *Roman Antiquities*, the work which did most to promote his reputation, and which, though now generally superseded by more accurate and comprehensive dictionaries, was for many years the best manual of the kind in existence. His *Summary of Geography and History* appeared in 1794, his *Classical Biography* in 1800, and his *Latin Dictionary*—an abridgment of a larger work unfinished at his death—in 1805. On the 18th of December 1809, Dr A. died of a fit of apoplexy, the effect of intense study, by which he had been seized in his class-room five days before. 'Amidst the wanderings of mind that accompanied it,' says the writer of the biography in the *Encyclopædia Britannica*—who afterwards filled his chair—'he was constantly reverting to the business of the class, and addressing his boys; and in the last hour of his life, as he fancied himself examining on the lesson of the day, he stopped short and said: "But it grows dark; you may go," and almost immediately expired.'

ADAM, ROBERT, a distinguished architect, was born at Edinburgh in 1728. His father, William Adam of Maryburgh, in Fifeshire, was also an architect of no mean repute. After receiving a university education, Robert A. proceeded in 1754 to Italy, and thence to Dalmatia, where he devoted some time, in conjunction with Clerisseau, a French architect, to exploring and making drawings of the ruins of Diocletian's palace at Spalatro. On his return to Britain he rapidly rose to distinction, was appointed architect to the king, and obtained extensive employment. The publication, in 1764, of the

results of his labours at Spalatro, contributed to his reputation. In opposition to the heavy style of architecture prevalent at the time, A. introduced a taste for lightness and decoration, which, however, tended to the opposite extreme of weakness and triviality. Those, however, who form the lowest estimate of the general character of his designs, grant him the merit of having effected great reforms in British domestic architecture generally. In 1768 A. was elected M.P. for the county of Kinross. During upwards of twenty-five years, his practice, in partnership with his brother James, was more extensive than that of any other architect of the time. In 1773, the brothers commenced to publish a series of engravings of their chief designs, which was continued for some years. Robert died in 1792, and was buried in Westminster Abbey. The most generally admired of his works is the Register House, Edinburgh. Reddleston Hall, near Derby, is regarded by some as his greatest work. Among his other principal works are the University buildings and St George's Church, Edinburgh (both altered from the original design), the Glasgow Infirmary, the Adelphi buildings, London, the screen to the Admiralty, Caen Wood House, Luton House (altered), Lansdowne House, &c.

ADAMA'NTINE SPAR. See CORUNDUM.

ADAMITES, a sect of fanatics who spread themselves in Bohemia and Moravia in the 15th and 16th centuries, but had no connection with the Hussites. One Picard is said to have been the founder of the sect about 1400. He styled himself Adam, the son of God, rejected the sacrament of the supper and the priesthood, and advocated the community of women. After his death, his followers spread themselves in Bohemia under several leaders. They even fortified themselves on an island in a tributary of the Moldau, and committed depredations around. They were detested as much by the followers of Huss as by the Catholics. Ziska (q.v.) made war against them, and slew great numbers; but they were never entirely rooted out. Even as recently as 1849, when the Austrian government declared religious liberty for all its subjects, certain members of this sect appeared and endeavoured to gain proselytes. The official investigation into their character which took place at that time, represents their creed as a mixture of freethinking, quietism, and communism. The members belong to the peasant or labouring class; and both men and women are generally industrious, temperate, and discreet in their ordinary course of life; but at their nightly meetings, at which they dispense with clothes, the utmost licentiousness is said to prevail.—As early as the 2d c., there was a sect of Gnostic tendency, called *Adamites*, who sought, by abstaining from all indulgence of the senses, to recall the state of innocence men were in before the fall. They therefore rejected marriage, and in order to exercise the virtue of continence, went naked. They held that for those who had once attained the state of innocence, all actions were alike indifferent—neither good nor evil. This doctrine led directly to the greatest licentiousness. Aberrations of this kind, under various disguises and modifications, have made their appearance from time to time in all ages of the world.

ADAM'S BRIDGE, a chain of shoals extending across the Gulf of Manaar, between Ceylon and the peninsula of Hindostan. It forms a great obstruction to vessels proceeding through the channel.

ADAM'S PEAK, the name given by Mohomedans, and after them by Europeans, to a mountain summit in the south of Ceylon, 7420 feet high (not, however, the highest of the group). The native

name is Samanahela. The cone forming the summit is a naked mass of granite, terminating in a narrow platform, in the middle of which is a natural hollow, five feet long, artificially enlarged, having a rude resemblance to a human footstep. Mohammedan tradition makes this the scene of Adam's penitence, after his expulsion from Paradise; he stood a thousand years on one foot, and hence the mark. To the Buddhists, the impression is the *Sri-pada*, or sacred footmark, left by Buddha on his departure from Ceylon. Over the sacred spot stands a temple, like a wooden canopy, and multitudes of devotees, Buddhist, Hindu, and Mohammedan, frequent it.

ADAMS, JOHN, the second president of the United States of North America, was born at Braintree, in Massachusetts, on the 19th of October 1735. His parents were descended from a Puritan family which had emigrated from England to Massachusetts in 1640. Before the revolution, A. had distinguished himself as a jurist, and wrote in the *Boston Journal* an essay on *Canon Law and Feudal Law* (1765). He was sent by Massachusetts to the congress which commenced its sittings in Philadelphia in 1774. With Lee and Jefferson, he boldly argued for a separation from the mother-country; and Lee's proposition of a declaration of independence was carried on the 4th of July 1776. A. and Jefferson had been appointed to draw up the Declaration of Independence, but it appears that Jefferson is the sole author of it. In succeeding years, A. was employed on many important negotiations with European powers; among others, he assisted Franklin, Jay, Jefferson, and Laurens, in 1782, in settling the conditions of peace with England. In 1785 he came to London as the first ambassador from the Union. George III. expressed his pleasure in receiving an ambassador who had no prejudices in favour of France, the natural enemy of the English crown, and A. replied: 'I have no prejudices but in favour of my native land.' He published in London his *Defence of the Constitutions of Government of the United States* (3 vols. 1787). On his return to America, in the same year, he was elected as vice-president of the United States, and on the retirement of Washington (in 1797) became president. The enmity of the democratic party, which had already been excited against him, was now increased by the measures which he judged necessary to uphold the national honour against the pretensions of France, and still more by his decided favour for a hereditary aristocracy. In 1801, when his term of four years of office had expired, his adversary Jefferson was elected by a majority of one vote. A. now retired to his estate of Quincy, near Boston, where he occupied himself with agricultural pursuits. After this retirement, he received many proofs of respect and confidence from his countrymen. When 85 years old, we find him still in his place as member of the convention appointed (1820) to revise the constitution of Massachusetts. He died on the 4th of July 1826, on the fiftieth anniversary of the day when he had proclaimed in congress the independence of the United States.

ADAMS, JOHN COUCH, discoverer, simultaneously with Le Verrier, of the planet Neptune, was born near Launceston in Cornwall, 1816. He early manifested an aptitude for mathematics; and after the usual amount of school-training, he was sent to St John's College, Cambridge, where he attained the honour of senior wrangler, and became a mathematical tutor. In 1841, he undertook to find out the cause of the irregularities in the motion of Uranus, anticipating, indeed, his own and Le Verrier's discovery—namely, that they are due to the influence

of an unknown planet. Le Verrier did not commence his researches till the summer of 1845; but on the 10th of November published the results of his calculations, demonstrating the existence of an unknown planet, declaring it to be the cause of the known disturbance, and assigning to it almost the same place as A. had done in a paper which he left with the Astronomer Royal at Greenwich Observatory in the previous October, but which he neglected to publish. Le Verrier has thus acquired, naturally, the whole honour of the discovery; but the merit of A. is not less. The researches of the latter commenced earlier; his discovery, too, was earlier; and it was only unfortunate for the reputation of the young astronomer that he omitted to publish the results he had obtained. The council of the Royal Astronomical Society shewed that they appreciated the value of A.'s labours, by awarding equal honours to both. In 1858, A. was appointed to the chair of mathematics in St Andrews, which, however, he vacated within a few months, on being nominated to the Lowndean Professorship of Astronomy, Cambridge.

ADAMS, JOHN QUINCY, the sixth president of the United States of North America, and son of the second president, was born in Massachusetts, July 11, 1767. In his boyhood he accompanied his father on an embassy to Europe, and passed a considerable part of his youth in Paris, at the Hague, and lastly in London. When his father was elected president, the younger Adams was sent on an embassy to Berlin, and travelled through Silesia. Of this country he gave a description in his letters, which were first published in the *Portfolio*, a Philadelphia journal, and afterwards translated into French and German. In his political views, A. perfectly agreed with his father, and, consequently, he was recalled from Berlin when Jefferson was elected president in 1801. On his return to America, he was engaged as professor of rhetoric, at Harvard University, in Massachusetts, the stronghold of the federalists; but he soon left his academical post to engage again in politics, and was chosen as senator for Massachusetts. He soon became prominent as a leader of the federal party; but in later years he adroitly changed his course, and seemed inclined towards the party of Madison. By Madison he was sent as plenipotentiary to Russia, and afterwards to England. On this embassy he took a part in the negotiation of peace with England, and assisted with his counsel the deputies sent from America to Ghent. When Monroe was elected president, he recalled A. from Europe, and made him secretary of state. On the retirement of Monroe from office, A. gained the presidency, after a hard contest against Jackson, in February 1825. He had now to strive against democratic majorities; for, though he endeavoured to make himself popular by betraying the schemes of his former political associates, he could never win the confidence of the growing party of democrats; and on the expiration of his term of office, he had to give place to General Jackson. A. retired to his estate of Quincy, near Boston; but in 1830 was chosen as representative of his district. He now joined the party of abolitionists, and frequently raised the whole House of Representatives against himself by his incessant petitions on the slavery question. On one occasion (in 1842), in order to assert strongly in the abstract the right to petition, he went so far as to present a petition for the dissolution of the union! This was misunderstood, and turned against him. He died at Washington during the session of congress, February 17, 1848. Among American statesmen of the old school, he was one of the most able, and, as a diplomatist, was well acquainted with foreign relations.

ADAMS, SAMUEL, one of the leading men of the American revolution, was born at Boston, U.S., September 27, 1722. His political leanings were early manifested; on taking the degree of A.M. at Harvard College, 1743, he maintained the affirmative of the question: Whether it be lawful to resist the supreme magistrate, if the commonwealth cannot be otherwise preserved? He intended at first to become a clergyman, but afterwards commenced a small business, and was made a collector of taxes. He displayed on all occasions an unflinching zeal for popular rights, and was, by the patriotic party, placed in the legislature in 1766. A. was a member of the first congress, and signed the declaration of independence in 1776. He took an active part in framing the constitution of Massachusetts, and was for several years president of the senate of that state. He held the office of its lieutenant-governor from 1789 to 1794, and of governor from that time till 1797. He then retired from public life, and died at Boston, October 2, 1802, poor as he had lived. A.'s character was one of great courage and determination. He was, at the same time, somewhat narrow-minded and bigoted, both in religion and politics. He was prejudiced against Washington, whose conduct of the war his ignorance of military matters led him to think weak and dilatory; and the confidence reposed in Washington, as first president of the republic, seemed to A. to savour of aristocracy.

ADANA, a Turkish ejalet or province in the south-east of Asia Minor, derives its name from its chief city Adana, containing 25,000 inhabitants. The city is distant almost thirty miles from Tarsus, on the way to Aleppo, commands the pass of the Taurus mountains, and carries on a considerable trade between Syria and Asia Minor. Pompey peopled the territory of Adana with pirates. The Syrian kings made the place a city, under the name of *Antiochia ad Sarum*, and on the ruins of Antiochia the caliph Haroun al Raschid built Adana. The present inhabitants are mostly Turks, mixed with some Greeks and Armenians.

ADANSON, MICHEL, a celebrated French botanist, born at Aix, April 7, 1727. He soon left the clerical profession, for which he was educated, and devoted himself to the study of natural history. In his early career, he entertained the ambition of superseding the Linnæan system by a clearer and more comprehensive method of arrangement. When about twenty-one years old, he went to Senegal in Africa, and, fearless of the unwholesome climate, stayed there five years, afterwards returning to France, with a large collection of specimens in natural history. Soon after his return, he laid before the French East India Company his plan of a colony on the African coast, in which all colonial produce was to be raised without slave-labour. But his plan was neglected. He published, in 1757, his *Histoire Naturelle du Sénégal*, and, in 1763, his *Familles des Plantes*, in which he endeavoured to give a new form to botany; but he could not prevail against the established Linnæan system. His next undertaking was one on a vast scale—nothing less than a complete Encyclopedia, for which he hoped to gain the patronage of Louis XV. and the Academy; but though his bold plan was regarded with admiration, he received little substantial encouragement. This, however, did not check his enthusiasm; he proceeded with the work until he exhausted his means. During the Revolution he fell into very indigent circumstances. When invited to become a member of the National Institute, he answered that he was unable to attend for want of a pair of shoes. Afterwards, he received a pension, and until

the time of his death, August 3, 1806, he was earnestly devoted to the prosecution of his plan, too vast to be carried out by an individual.

ADANSONIA, a genus of the natural order *Sterculiaceæ* (q. v.), sub-order *Bombacææ*, named by Linnæus in honour of the botanist Adanson (q. v.), and distinguished by a simple deciduous calyx, a very long style, with numerous stigmas, and a woody capsule containing a farinaceous pulp. The only known species, *A. digitata*, the *Baobab*, also called the *Monkey-bread Tree*, is a native of the tropical parts of Western Africa, but now introduced into the East and West Indies. It is the largest known tree—not indeed rising to a very great height, but exceeding all other trees in the thickness of its trunk (20—30 feet). Even its branches (60—70 feet long) are often as thick as the stems of large trees, and they form a hemispherical head of 120—150 feet in diameter; their outermost boughs drooping to the ground. The leaves are digitate or 7-fid; the flowers are white and extremely large, on drooping peduncles of a yard in length. The fruit (*Monkey-bread*) is of the size of a citron. The bruised leaves (*Lalo*) are mixed with the daily food of the inhabitants of tropical Africa; and Europeans in that country employ them as a remedy for diarrhœa, fevers, and diseases of the urinary organs. The pulp of the fruit, which is slightly acid and pleasant to the taste, is eaten with or without sugar; and the expressed juice mixed with sugar is much esteemed as a beverage, being very refreshing, effectual in quenching thirst, and regarded as a specific in putrid and pestilential fevers. The bark is said to be powerfully febrifugal.

ADDA, the Latin *Addua*, a river of Lombardy, rising in the Rhetian Alps above Bormio. It flows into the Lake of Como, issuing from which below Lecco, it traverses the plain of Lombardy in a direction S.S.E., passing Lodi and Pizzighetone, and falls into the Po about 8 miles above Cremona. It formerly bounded the republic of Venice and the duchy of Milan.

ADDER, a common English name of the Viper (q. v.), but also often more vaguely used for poisonous serpents of the family *Viperidæ*. Where the name occurs in the authorised version of the Scriptures, it appears to be always in this vague sense; although the terms in the same places of the original may probably be more precise. A very venomous serpent of New South Wales (*Acanthophis tortor*) is sometimes called the *Death* or *Black A.*

ADDISCOMBE. See CADET.

ADDISON, JOSEPH, the son of an eminent clergyman of the Church of England, was born at Milston, near Amesbury, in Wiltshire, on the 1st May 1672. After a preliminary education at various schools, he entered the university of Oxford when only fifteen years of age, where he greatly distinguished himself, especially by the facility with which he wrote Latin verse. He was originally intended for the church, but various circumstances conspired to draw him aside into literature and politics; the principal of which were, his acquaintance with Dryden, who honoured the young poet with his patronage, and his intimacy with Lord Somers, whose favour he gained by dedicating a poem to him on one of King William's campaigns. In 1699 he received a pension of £300 a year, and then set out on a continental tour. While in France, he perfected himself in the language of the country. On the outbreak of the Spanish war of succession, he departed to Italy, where he penned his charming 'Letter' to Lord Halifax. Towards the end of 1703, he returned home by way of Switzerland and Germany; but his expectations of a 'place' were disappointed, for the Whigs were out of office. The battle of Blenheim, however,

which occurred in the next year, presented a brilliant opportunity to him, which he did not fail to make the most of. The ministry wished the victory commemorated in verse, and A. was appointed to do it. Lord Godolphin, the treasurer, was so excessively delighted with the first half of the triumphal poem, that before the rest was finished, he made A. a Commissioner of Appeals. The poet was now fairly involved in politics. He accompanied Halifax to Hanover; became under-secretary of state in 1706, and in 1709 went to Ireland in the capacity of secretary to the Lord-lieutenant, where he also obtained the office of Keeper of the Records, worth £300 a year. In the same year, his friend Steele commenced *The Tatler*, to which A. soon became a frequent contributor. He also wrote a number of political articles in the *Whig Examiner*. On the 1st of March 1711, appeared *The Spectator*,

J Addison.

the most popular and elegant miscellany in English literature. It ceased to appear on the 6th of December 1712. A.'s fame is inseparably associated with this periodical. The quality of his genius is now determined by it, rather than by the cold, sonorous, artificial rhetoric of his *Tragedy of Cato*, which was extravagantly admired in his own day, and even later. He was the animating spirit of the magazine, and by far the most exquisite essays and criticisms which appeared in it are the work of his hand. Next followed a similar work, entitled *The Guardian*. In 1713 appeared *The Tragedy of Cato*, the popularity of which, considering its total absence of dramatic power, was amazing. It was generally understood to have a political as well as a poetical inspiration; but so prudently had A. expressed himself, that both parties, Whig and Tory, received its frigid declamation with rapture. It was translated into various European languages; and even the monarch of French criticism, Voltaire, held Shakspeare a barbarian in tragedy compared with our author. 'All the laurels of Europe,' says Thackeray, 'were scarcely sufficient for the author of this "prodigious" poem.' Every one in England praised it except Dennis. A. was called the 'great Mr A.' after that wonderful night in the theatre, when, as Pope says, 'the numerous and violent claps of the Whig party on the one side, were echoed back by the Tories on the other.' This enthusiasm was a delusion which time has effectually dispelled. In 1716, A.

married the Dowager-countess of Warwick, and in the following year was appointed secretary of state. For neither of his new situations was he at all suited. Lady Mary Wortley Montague, in a letter to Pope, expressed her fear that 'a day might come when he would be heartily glad to resign both.' He was so extremely timid and awkward in large companies, that it was out of the question for him to attempt debating in parliament—a thing indispensable to one in his position. He consequently resigned in 1718. Then as to the other matter, Dr Johnson sarcastically remarks, that 'the lady was persuaded to marry him on terms much like those on which a Turkish princess is espoused—to whom the sultan is reported to pronounce: "Daughter, I give thee this man for thy slave." No one can doubt that this marriage was a mistake on the part of A. His health had been for some time in a very precarious state; and at length, after an illness of a few months, he died at Holland House, Kensington, on the 17th June 1719, in the 48th year of his age, three years after what Thackeray calls 'his splendid but dismal union.' A. had appointed Mr Tickell his literary executor, who published his works shortly after in 4 vols. quarto. Besides those to which we have incidentally alluded, he wrote *A Treatise on the Usefulness of Ancient Medals, Especially in Relation to the Latin and Greek Poets*, which, however, excited little interest. He also left an unfinished work on *The Evidences of the Christian Religion*. But the most delightful and original of all his productions is that series of sketches in *The Spectator* of which Sir Roger de Coverley is the central figure, and Sir Andrew Freeport and Will Honeycomb the side ones. Sir Roger himself is an absolute creation; the gentle yet vivid imagination, the gay and cheerful spirit of humour, the keen, shrewd observation, and fine raillery of foibles which A. has displayed in this felicitous characterisation, render it a work of pure genius. But A. in prose is always excellent. He has given a delicacy to English sentiment, and a modesty to English wit which it never knew before. Elegance, which in his predecessors had been the companion of immorality, now appeared as the advocate of virtue. Every grace was enlisted in the cause of a benign and beautiful piety. His style, too, is perfect after its fashion. There are many nobler and grander forms of expression in English literature than A.'s, but there are none comparable to it in sweetness, propriety, and natural dignity. 'Whoever wishes,' says Dr Johnson, 'to attain an English style, familiar but not coarse, and elegant but not ostentations, must give his days and nights to the volumes of A.' His various writings, but especially his essays, fully realised the purpose which he constantly had in view; 'to enliven morality with wit, and to temper wit with morality.' They materially helped to reform the manners of their time, and created, in addition, that class of readers, which has now become so prodigious in numbers, and on which all literature now depends for its support—the middle class. It must, however, be admitted, that since the beginning of the present century, their popularity has undergone a considerable decline. The chief cause of this is, that much in them relates to temporary fashions, vices, rudenesses, and absurdities which are now out of date. Yet, after making every abatement, it is certain that there are in the collected works of A. so many admirably written essays on subjects of abiding interest and importance, on characters, virtues, vices, and manners, which will chequer society while the human race endures, that a judicious selection can never fail to present indescribable charms to the man of taste, piety, philanthropy, and refinement.

A'DELAAR, CORD SIVERTSEN, one of the greatest naval commanders of the 17th c., was born at Brevig, in Norway, in 1622, and in his twentieth year was employed in the naval service of Venice against the Turks. Courage and good-fortune conspired in his favour. On one occasion, he broke through a line of sixty-seven Turkish galleys which surrounded his ship, sunk fifteen, burned several others, and destroyed about 5000 of the enemy. The various naval powers now contended for his services. Frederic III., by the offer of the then unheard-of salary of 7200 dollars per annum, engaged him as admiral of the Danish fleet; and, in 1675, under Christian V., he commanded the whole of the Danish naval force in the war with Sweden. He died at Copenhagen in 1675.

ADELAIDE, the capital of the colony of South Australia, is situated on the Gulf of St Vincent, where the first settlers arrived on the 27th July 1836, without knowing where they were to locate themselves. It was not till March 1837 that the site of the capital was fixed, and the town-lands surveyed, the settlers living in the meantime in tents or in huts of mud, reeds, and brushwood. The town stands on both sides of the river Torrens, but at some distance from the sea. It is connected by railway with Port Adelaide, which stands on a creek about seven miles distant, and has a very fair harbour. The plan of the town is extensive, and the streets are broad. There are many fine buildings recently erected, and an unusual number of churches. Water is abundantly supplied by the river and by sinking wells. Around the city, a public demesne has been reserved, called the Parklands. Pop. (1871) 27,208.

A'DELSBERG, a district and market-town in Carniola, in the vicinity of which is a large stalactite cavern called the *A. Grotto*, through which flows a rapid stream. This cavern, the largest in Europe, is divided into the Old and the New Grotto: the former is 858 feet in length; the latter, 8550 feet in length, contains some most remarkable stalactites, among which is 'the curtain' (*vorhang*), a white semi-transparent wall. The grotto ends in two paths, one of which leads to a lake, beyond which more wonders of nature are likely to be discovered. The cavern is shut, and can only be entered in company with an appointed guide. The town of A. is 22 miles N.E. of Trieste.

A'DELUNG, JOH. CHRISTOPH, a distinguished linguist and lexicographer, was born, 1732, in Pomerania, and died, 1806, at Dresden, where he had held the office of chief-librarian. His chief works are his *Wörterbuch der Hochdeutschen Mundart* (Dictionary of High German), in which he took Dr Johnson as his model; and his *Mithridates oder allgemeine Sprachkunde*, a work on general philology.

A'DEN, a peninsula and town on the south-west coast of Arabia. The most southern promontory of the peninsula, Cape Aden, is in N. lat. 12° 47', and E. long. 45° 9'. This peninsula, the area of which is 18–20 square miles, is doubtless of volcanic origin, and consists chiefly of a range of hills not exceeding 1776 feet in height. It is joined to the mainland by a narrow, level, and sandy isthmus. In a valley which forms the crater of a submarine volcano, stands the town of A., which is also named from the neighbouring promontory, Bab-el-Mandeb, or the Gate of Mandeb. It was styled by the native Arabs Aden or Eden (Paradise), on account of its fine climate and great commerce, for which it was celebrated from the oldest times. It enjoys almost perpetual sunshine; a cloudy day is of rare occurrence; the heat is pleasantly tempered by the sea-breezes; and the inhabitants are generally healthy. Many the Elder seems to have known the native name of the

place, for which he writes 'Athana.' It was also known by the name of 'Emporium Romanum.' Up to the time of the circumnavigation of Africa, A., so favourably situated at the entrance of the Red Sea, was the chief mart of all Asiatic produce and manufactures, and even the Chinese traded here. Marco Polo and other voyagers of the middle ages told wonders of the riches and splendour of the place. In the course of time, however, it was reduced to a small village, which in 1838 contained only about 600 inhabitants, including some 250 Jews and about 50 Indian merchants. The Anglo-Indian government had long been on the outlook for a speedy route by steam from India to Europe. The explorations on the river Euphrates afforded no satisfactory results, and ultimately the old commercial route by the Red Sea was chosen. This, of course, gave to the shores and harbours of that sea a new importance, and the English soon saw the advantages of a position like that of A. About this time, a British vessel suffered shipwreck off the coast of A., where the passengers were plundered and in other ways ill treated by the natives. A vessel was therefore despatched from Bombay, in 1838, to compel the sultan of the country to make restitution, and also to learn on what terms the Arabs would be willing to cede A. to the English. Captain Haynes, by fair promises, succeeded in gaining a cession of the country from the sultan, a weak and covetous old man. Afterwards, fearing the displeasure of some neighbouring tribes, and partly moved by the suggestions of religious sheiks, the sultan repented of the transaction, but was held to his contract by force of arms; and on January 11, 1839, after a few hours' contest, A. fell into the hands of the British. Here they have now a strong garrison and fortifications. In its mediæval prosperity, A. had had a magnificent system of cisterns for collecting the rain-water from the circle of hills that surround it. Who built them is unknown; but it is conjectured that they had been begun about the 6th or 7th century. They had been allowed to fall into disuse, and were filled with rubbish, and in ruins; but recently a considerable number have been excavated and restored by the British government. If all restored, they seem capable of containing 30 million gallons. Owing to the hard and naked character of the rocks, there is little absorption, and a few hours of rain send torrents down the ravines, which soon fill the cisterns. A. is of great importance in a mercantile and nautical point of view, having a position between Asia and Africa like that of Gibraltar between Europe and Africa. The population and resources of the place have rapidly increased since 1838. It has now a busy population of 20,000, gathered from every nation under heaven. There is a telegraph cable from Suez to Aden, laid down in 1870.

A'DERSBACH ROCKS, a remarkable labyrinthine group of sandstone rocks situated near the village of Adersbach, in Bohemia. The aspect of some parts of the group has been compared to that of a city ruined by a conflagration. One of the pinnacles rises to a height of 218 feet. The structure of the rocks has been produced, not by any commotion of the earth, but by the influences of rain, frost, and other atmospheric changes, wearing down the soft sandstone into many fantastic forms. During the Thirty Years' War, the miserable people of Bohemia often found refuge in this locality.

ADHESION is the species of attraction that is manifested between two separate bodies when their surfaces are brought to a considerable extent into close contact. It is nearly allied to Cohesion (q. v.). Adhesion is seen in the case of two solid bodies

when their polished surfaces are laid on one another; but it acts more powerfully between solids and fluids, owing to their intimate contact. We have instances of this in the film of water adhering to any body dipped in that fluid, and in water running down the side of an inclined vessel from which it is being poured. All solids and liquids do not exhibit this mutual attraction. Thus, though bright metals are wetted by mercury, glass and wood are not; nor does water adhere to fat. Capillary attraction (q. v.) is a special manifestation of adhesion.—The adhesion of gases to the surface of solids is described by Liebig as playing an important part in many processes. A more or less condensed atmosphere of gases surrounds every body, and every particle of a powdered or porous body; and gases, such as oxygen, have in this condition an intensified chemical action. Platinum in the state of powder condenses 800 times its volume of oxygen; and when hydrogen comes in contact with the oxygen in this state, the two gases combine, though, when free, they require the application of flame before they will combine.

ADHESION, in Pathology, is when two surfaces of a living body become united. If they have been separated by the cut of a sharp instrument, and are immediately and accurately placed in apposition to each other, they may adhere at once without any apparent bond of union. But, generally, the blood-vessels of the part pour out, between the surfaces, a fluid, consisting of the watery part of the blood holding fibrine in solution. The liquid part of this is reabsorbed or escapes from the wound, leaving the fibrine, in which first cells are developed, and then blood-vessels: it is now a living tissue, and forms a uniting medium between the sides of the wound.

Serous membranes, as the pleura, pour out this fluid when inflamed; and hence the adhesions so often the result of pleuritis.—If two granulating (see **GRANULATION**) surfaces be kept in contact, the opposite granulations may fuse together, and the wound unite by secondary adhesion.

ADIANTUM. See **MAIDENHAIR**.

ADIGÙ, after the Po, the most important river in Italy, rises in the Rhetian Alps. Various streamlets descend from these mountains, and, uniting at Glarus, form the Etsch, which is, properly speaking, the beginning of the A., and the name by which the entire river is known in Germany. From Glarus it flows east into the Tyrol, then, after a slight *détour* to the south-east, it flows due south past Trent and Roveredo, into Lombardy, and, passing Verona, takes a south-eastern sweep, discharging its waters into the Adriatic, between the mouths of the Po and the Brenta. In ancient times (when it was called the *Athesis*), it had a more northerly *embouchure*. It is very rapid, and subject to sudden swellings and overflows, which cause great damage to the surrounding country. The two most remarkable inundations on record are those which occurred in 1721 and 1724. During the Italian wars, its banks were repeatedly the scenes of bloody engagements. Its length is about 250 miles; its breadth in the plain of Lombardy, 650 feet; its depth, from 10 to 16 feet. It is navigable as far as Trent, but the navigation is rendered extremely arduous, on account of the swiftness of the current. The A. is a transit-river for the trade of Germany and Italy.

ADIPOCERE (Lat. *adeps*, fat, and *cera*, wax), a substance resembling a mixture of fat and wax, and resulting from the decomposition of animal bodies in moist places or under water. Human bodies have been found, on disinterment, reduced to this state. Lean beef kept under running water for three weeks, was found reduced to a fatty sub-

stance. A piece of a liver that has suffered what is called fatty degeneration, if immersed for some time in water, is said to become exactly like A.

ADIPOSE TISSUE is a peculiar kind of animal membrane or tissue, consisting of an aggregation of minute spherical pouches or vesicles filled with fat or oil. The tissue itself is organic and vital, the vesicles secreting the fatty matter from the capillary blood-vessels with which they are surrounded; the secreted product, or fat (q. v.), is inorganic, and devoid of vitality.

The adipose tissue differs from cellular or filamentous tissue in having the vesicles closed, so that the fat does not escape even when fluid. A dropsical effusion, which infiltrates the filamentous tissues, does not affect the adipose tissue. There is a considerable layer of adipose tissue immediately under the skin; also around the large vessels and nerves, in the omentum and mesentery, around the kidneys, joints, &c.

Adipose Tissue, magnified.

ADJECTIVE is the name of one of the classes into which grammarians have divided words. An adjective is so called, not so much from its *being added* to a substantive, as because it *adds* to the meaning, or more exactly describes the object, than the simple substantive or general name does. The effect of an adjective is also to limit the application of the name to which it is joined. Thus, when *tall* is joined to *man*, there is more meaning conveyed; there are more properties suggested to the mind by the compound name *tall man*, than by the simple name *man*; but *tall man* is not applicable to so many individuals as *man*, for all men that are not tall are excluded.—Nouns, or names of things, are often used in English as adjectives; thus, we say a *silver chain*, a *stone wall*. In such expressions as 'Income Tax Assessment Bill,' *Income* plays the part of an adjective to *Tax*, which is, in the first place, a noun; the two together then form a sort of compound adjective to *Assessment*; and the three, taken together, a still more compound adjective to *Bill*, which, syntactically, is the only noun in the expression. This usage seems peculiar to English.—Languages differ much in their way of using adjectives. In English, the usual place of the adj. is before the noun. This is also the case in German; but in French and Italian, it comes after. In these languages, again, the adj. is varied for gender, number, and, in the German, for case. In English it is invariable; and in this simplicity there is a decided superiority; for in modern languages these changes in the adj. serve no purpose. The only modification the Eng. A. is capable of is for degrees of comparison.

ADJUDICATION is a technical term used in the practice both of the English and Scotch law, but with a totally different meaning in the two systems. In the law of England, the term A. is commonly used to denote the judicial determination at a certain stage of the proceedings in bankruptcy. The procedure is regulated by 32 and 33 Viet. c. 71. The petition prays that the trader may be adjudicated a bankrupt, and, after proof of the petitioning creditor's debt, and of the Act of Bankruptcy (q. v.), which must have been committed within twelve months before the issuing of the fiat, an A. is made by the court that the party is bankrupt. Formerly, a trader might be adjudicated bankrupt summarily, and without previous petition for A.—namely, where, after filing a petition for arrangement with his creditors, he appeared not entitled to the benefit of the arrangement. See **BANKRUPTCY**. In *Insolvency*, which differs from bankruptcy in this

respect, that it is not confined in its operation to traders, or to any particular class of men, but applies to the community at large, the A. is made by the debtor delivering into the London Bankruptcy Court, if the debtor resides or carries on business within the district of that court, or in the Bankruptcy Court of the district within which he resides or carries on business, a declaration admitting his inability to pay his debts, which may be used as the ground of an A. by his creditors, if the court think it requisite; or if the creditors neglect to pass a resolution for liquidation or composition, or resolve in favour of bankruptcy; or if after the passing of a resolution for liquidation or composition, the court shall for some sufficient cause adjudge the debtor bankrupt. This A. authorises the discharge of the prisoner from custody as to all debts and sums of money due or claimed to be due to his several creditors. See **INSOLVENCY**.

The distinction between bankruptcy and insolvency has for some time been generally disapproved in England; and it may now be held as practically abolished. The Insolvent Debtors Court is abolished, and its jurisdiction transferred to the Bankruptcy Court. Insolvent persons can now be adjudged bankrupts in every case in which their creditors wish that, or the court think it proper.

In the law of Scotland, *A.* signifies a process by which creditors may attach heritable or real property of their debtors. It applies to real estate in its most extensive signification, including not only feudal rights, but all rights or interests affecting or connected with land, such as bonds and mortgages, as also annuities, and all rights 'having a tract of future time,' life-interests, reversions, rights of lease, offices of dignity or jurisdiction, personal rights to lands, a certain class of personal bonds, rights of patronage, stock of any chartered bank, with, where the process of arrestment (the process, in the Scotch law, for attaching personal estate; see **ARRESTMENT**) is excluded, the husband's right in his wife's real estate, fair, harbour, and ferry duties, entailed estates during the life of the heir, and the like.

The arrangements for the equitable administration of this law are regulated by various orders of the Scotch courts and by different statutes.

There are various other forms of the A. in the Scotch law, one of the most important and useful of which is called the A.-in-implemēt, a form of legal proceeding devised for the completion of defective titles to landed property.

ADJUSTMENT, in the Law of Insurance, is the ascertaining the exact amount of indemnity which the party insured is entitled to receive under the policy, and fixing the proportion of the loss to be borne by each underwriter. The nature and amount of damage being ascertained, an endorsement is made on the back of the policy, declaring the proportion of loss falling on each underwriter; and on this endorsement being signed by the latter, the loss is said to have been adjusted. After an A. has been made, it is usual for the underwriter at once to pay the loss. As a question of law, however, it does not appear to have been decided how far the A. is conclusive and binding upon the underwriters. In the opinion of some mercantile lawyers, the A. is merely presumptive evidence against an insurer, and it is, notwithstanding, open to the underwriter to shew facts which, if proved, would have the effect of relieving him from liability.

ADJUTANT, as the derivation of the word implies (*adjuvare*, to help), is the title of an officer who assists the commanding-officer of a garrison or regiment in all the details of duty. He receives orders, and promulgates them to the several

companies; he inspects escorts and guards before proceeding on their duty; attends to the drill of recruits, is accountable for the keeping of the regimental books, and ought to note every infraction of established rules. An *Adjutant-general* performs analogous duties for the general of an army. He keeps an account of the strength of each regiment, distributes the orders of the day to the brigade-majors, and sees the troops drawn up for action. The *Adjutant-general of the Forces* is an officer of high rank at the Horse-Guards. To him all communications are addressed regarding leave of absence, discharging, recruiting, &c. Besides the adjutant-general at the Horse-Guards, there are deputy and assistant adjutants-general for special military districts.

ADJUTANT (*Ciconia Argala*), a bird closely allied to the Stork, made by some naturalists the type of a separate genus, *Argala*. Adjutant is the popular name given to it by the English in India—*Argala* the native name. It is a native of the warmer parts of India. It is of large size, and has

Indian Adjutant.

very long legs; in its erect attitude, it is about five feet high; its extended wings measure fourteen or fifteen feet from tip to tip; its head and neck are nearly bare; a sausage-like pouch hangs from the under part of the neck; the bill is of enormous size. It is very voracious, swallows a cat or a leg of mutton quite readily, and is of great use in devouring snakes, lizards, and all sorts of offal. It sometimes catches birds upon the wing. The beautiful Marabou feathers are obtained from the under side of the wings of this bird, and of another very similar species which inhabits Senegal.

AD LIBITUM (in Ital., *a piacere*, or *a piacimento*) is a musical term which implies that the part so marked may be performed according to the taste of the performer, and not necessarily in strict time. When there is an accompaniment to the music thus marked, it must strictly follow the *ad libitum* time of the principal performer. Sometimes the words, *colla parte*, meaning with the leading part, are written over the accompanying parts. *Ad Libitum* also frequently means, that a part for a particular instrument or instruments, in instrumental scores or pianoforte arrangements, may either be played or entirely left out; thus: 'Overture arranged for the pianoforte as a duet,

with ad libitum accompaniments for the violin, flute, or violoncello.

ADMINISTRATION, in Politics, in its widest sense, is equivalent to the executive government of a state, as distinguished from its permanent constitution, and embraces not only the political ministry, but all the offices of judicature, &c. In a more restricted sense, as used in England, it designates the Privy Council (q. v.), and more especially that select committee of it known as the Cabinet or Ministry (q. v.).

ADMINISTRATION and **ADMINISTRATOR**. An administrator, in the law of England, is the person to whom, in default of an executor named in the will, the ordinary or bishop of the diocese commits the administration or distribution of the estate of a person dying intestate.

ADMINISTRATION OF CHARITIES falls in the last resort to the sovereign as *parens patrie*; and in the case of any charity being dilapidated or abused, the attorney-general will file an information in the Court of Chancery. The A. of C. is now, however, chiefly regulated by 16 and 17 Vict. c. 137, by which the crown is empowered to appoint commissioners and inspectors for the purpose. The act contains a reservation of the rights of the Church of England; and it does not extend to the universities, or to such charities as are partially dependent on voluntary contributions. Charities for Roman Catholic purposes were also excluded from its operation for two years, and this term has been extended by subsequent enactments.

ADMINISTRATOR-IN-LAW. In the Scotch law, a father is A.-in-L. for his children, and as such, is their guardian during minority. This power in the father ceases by the child's discontinuing to reside with him, unless he continues to live at the father's expense; and in the case of daughters, it ceases on their marriage.

ADMIRAL, the title of the highest rank of naval officers. The word is generally supposed to have been derived from the Arabic *Emir* or *Amir*, a lord or chief (*Amir-al-Mumenim*, 'Commander of the Faithful'; *Amir-al-Omra*, 'Commander of the Forces'). Thus the early English form was *Amiral* or *Ammiral* (occurring once in *Par. Lost*); and so it is still preserved in French. In Spanish the word is *Admirante* or *Almirante*; in Italian, *Ammiraglio*. The term seems to have been introduced into Europe during the Crusades, and to have been first used in a definite sense by the Sicilians, and afterwards by the Genoese. About the end of the 13th c. it came into use in France and England. The first English Admiral of the Seas (*Amiral de la Mer du Roy d'Angleterre*) of whom there is record was William de Leybourne, 1256. His office, however, was not that of a commander, but embraced those general and extensive powers afterwards associated with the title of Lord High Admiral of England; that is, both the administrative functions now vested in the *Lords Commissioners of the Admiralty* (five in number), and the judicial authority belonging to the present *High Court of Admiralty*. The office of Lord High Admiral was last filled by H.R.H. the Duke of Clarence, afterwards William IV. It had previously been in commission from 1708 to 1827. On his resignation in 1828, the office was again put in commission. See **ADMIRALTY COURT OF**.

In the British navy, the admirals are distinguished into three classes: Admirals, Vice-admirals, and Rear-admirals; the admiral carrying his colour at the main, the vice-admiral at the fore, and the rear-admiral at the mizzen mast-head. In former times, each grade was subdivided into three sections,

known as Admirals (or Vice or Rear-admirals) of the Red, of the White, and of the Blue, respectively. The flag hoisted by the admiral (thence called a flag-officer) agreed in colour with his section; and all the ships under his command carried ensign and pendant of the same hue; but the distinction was otherwise without practical effect. *Admiral of the Fleet* is a higher rank, conferred at the will of the sovereign. The rates of full or sea pay of flag-officers are as follow: Admiral of the fleet, per day, £6; admiral, £5; vice-admiral, £4; rear-admiral, £3. An admiral commanding-in-chief receives £3 a day additional at home, and £1, 10s. abroad, as table-money, when his flag is flying within the limits of his station. By an order in council, 1870, the number of flag-officers in the British navy was reduced to 50: viz. 3 admirals of the fleet, 7 admirals, 15 vice-admirals, and 25 rear-admirals. The number of admirals on 'reserved half-pay' and 'retired' amounts (1873) to 159. The admiral of the fleet takes rank with a field-marshal, admirals with generals, vice-admirals with lieutenant-generals, and rear-admirals with major-generals.

ADMIRALTY COURT. This court, the object of which is to try and decide maritime causes, is said by Sir Henry Spelman and Lambard to have been first erected by Edward III. Till recently, the maritime courts of England were divided into the *Instance Court* and the *Prize Court*; and these courts were in reality separate tribunals. The same judge usually presided in both, but his authority to hear and decide questions as to prizes of war was under a special and separate commission, issued at the commencement of each war; and the court itself existed only during the war, or until the litigations to which it had given rise were brought to a conclusion. In this respect it differed from the Instance Court, which was a permanent institution. The jurisdiction in question of booty of war, and the distribution thereof, has now, however, been conferred on the A. C. itself, and the Prize Court has thus been virtually abolished (3 and 4 Vict. c. 65, s. 22; see also Kerr's *Blackstone*, viii. p. 77). By a later statute, jurisdiction relating to the attack and capture of pirates is vested in the A. C. in this country, and in the vice-A. courts abroad (13 and 14 Vict. c. 26, 27). Whilst there was a Lord High Admiral, the judge of the A. C. usually presided in virtue of a patent from him; but since the office has been intrusted to commissioners, the judge holds a direct commission from the crown under the great seal. By 3 and 4 Vict. c. 65, s. 1, the Dean of the Arches is authorised to sit for the judge of the A. C. in certain cases; and advocates, surrogates, and proctors of the Court of Arches are admitted to practise in the A. C. (s. 2). The proceedings of the A. C., like those in the ecclesiastical courts, were originally based on the civil law, and upon this account it is usually held at Doctors' Commons. But it is merely as the basis of the earlier mercantile codes, such as the Rhodian laws and those of Oleron, and by no means exclusively, that the civil law is of authority in these courts. Questions of the utmost nicety in the law of nations fall to be decided by maritime courts in time of war; and it was as an A. judge that many of the most remarkable of Lord Stowell's famous judgments were pronounced. The appeal from the A. C., which was originally to the king in Chancery, and afterwards to certain commissioners of appeals, consisting chiefly of the privy council, and not of judges delegated by that body, is now to the judicial committee of the privy council (3 and 4 Will. IV. c. 41). The jurisdiction of the vice-A. courts in the colonies and foreign dominions of the Queen has been extended and defined, and

their procedure regulated by statute (2 Will. IV. c. 51). Appeals from these courts formerly lay to the A. C. in England, and were also competent to the Queen in council; but, like those from the A. C. itself, they are now carried to the judicial committee (3 and 4 Will. IV. c. 41, s. 2). The civil jurisdiction of the A. Courts was greatly extended by 3 and 4 Vict. c. 26, by which their practice was much improved. It now extends generally to all marine contracts and other questions of maritime right, such as disputes between part-owners of a ship, suits for mariners' and officers' wages, suits for pilotage, suits on bottomry and respondentia bonds, and relating to salvage, wreck, collision of ships, &c. In criminal matters, the A. C. formerly took cognizance of piracy and other offences on the sea, or on the coasts beyond the limits of any county, and, concurrently with the common law courts, of certain felonies committed in the main stream of great rivers below the bridges. The criminal jurisdiction of the A. is regulated by 4 and 5 Will. IV. c. 36, and 7 and 8 Vict. c. 2. By the former statute, the judge of the A. is made one of the judges of the Central Criminal Court, and that court is empowered to try offences committed within the jurisdiction of the A. By the latter, any court of assize, oyer and terminer, or jail-delivery, may inquire of and determine such offences without special commission. Since the passing of these enactments, the criminal jurisdiction of the A. C. may be regarded as obsolete. There is a separate Court of A. in Ireland. The A. C. of Scotland has been abolished, and its ordinary jurisdiction transferred to the Court of Session, the Court of Justiciary, and the sheriffs; questions of prizes, captures, condemnations, and the like, being vested exclusively in the High Court of A. in England.

ADMIRALTY DROITS are a portion of the hereditary revenues of the crown, arising from enemies' ships detained in the prospect of a declaration of war, or coming into port in ignorance of the commencement of hostilities, or from such ships as are taken by non-commissioned captors, the proceeds of wrecks, the goods of pirates, and the like. The proceeds of the Droits of A. are now paid into the Exchequer for the public use.

ADMIRALTY ISLAND lies on the N.W. coast of N. America, between 57° 2' and 58° 24' lat. N., and 134° 52' and 135° 30' long. W. It is about 80 miles long, well wooded and watered. It is inhabited, and belongs to Russia.

ADMIRALTY ISLANDS, a group of about 40 islands, to the N.E. of New Guinea, between 2° and 3° lat. S., and 146° 18' and 147° 46' long. E. They were discovered by the Dutch in 1616. The largest is about 50 miles long from E. to W. They abound in cocoa-nut trees, and are inhabited by a race of tawny frizzle-headed savages.

ADONIS, a mythical personage, whose beauty as a child so attracted the love of Venus and Proserpine, that they quarrelled about the possession of him. Jupiter, appealed to, settled the dispute by deciding that A. should spend part of the year with Venus, and part with Proserpine, so that he lived eight months of the year in the upper world, and four in the under. A. was afterwards killed by a boar while hunting, and Venus, coming too late to his rescue, changed his blood into flowers.—A yearly festival was celebrated in honour of A., and consisted of two parts—a mourning for his departure to the under world, and a rejoicing for his return to Venus. This festival, widely spread among the countries bordering on the Mediterranean,

was celebrated with peculiar pomp at Alexandria. Connected therewith were the Gardens of A., as they were called. Before the festival, wheat, fennel, and lettuce were sown in earthen, and even in silver

Adonis.

pots, and forced by heat; intended to indicate, doubtless, by their brief bloom, the transitoriness of earthly joy. The myths connected with A. belong originally to the east. They display a worship of the powers of nature conjoined with that of the heavenly bodies, and A. himself appears to be the god of the solar year. The similarity of the name to the Phœnician *Adon*, which signified 'lord,' is unmistakable; and this word *Adon* was specially applied to the king of heaven, the sun.—In reference to the brilliant beauty ascribed to A., a beautiful man is called 'an Adonis.'

ADONIS, a genus of plants of the natural order

Ranunculaceæ (q. v.), in which the flower has 5 sepals and 5—10 petals without scales at the base, and the fruit consists of awnless pericarps. The species are all herbaceous—some of them annual and some perennial. Several are natives of Europe, but only one, *A. autumnalis*, sometimes called Pheasant's Eye, is a doubtful native of Britain. Its bright

*Adonis autumnalis.*

scarlet petals have obtained for it the name of *Flos Adonis*, their colour having been fancifully ascribed to their being stained with the blood of Adonis. It is a well-known ornament of our gardens; in which also *A. astivalis* frequently appears, and *A. vernalis*, a perennial species common upon the lower hills of the middle and south of Germany, with early and beautiful flowers.

ADOPTIAN CONTROVERSY, The, was an echo of the Arian controversy, and originated about the end of the 8th c. in Spain, the country in which the doctrine of Arius had longest held out. Elipandus, Archbishop of Toledo, and Felix, the learned Bishop of Urgel, advanced the opinion that Christ, in respect of his divine nature, was doubtless by nature and generation the Son of God; but that as to his human nature, he must be considered as only declared and adopted, through the divine grace, to be the first-born Son of God (Rom. viii. 29), just as all holy men are to be adopted as sons of God, although in a less lofty sense. The flame of controversy thus kindled, spread into the Frankish empire, the special domain of 'Catholic' Christianity, and gave occasion to two synods, one held at Ratisbon (792), and another at Frankfort (794), in which Charlemagne took part in person, and which condemned Adoptianism as heresy. The Catholic doctrine of the unity of the two natures of

Christ in one divine person, and the consequent impossibility of there being a twofold Son—an original and an adopted—was upheld by Alcuin and the other learned men of Charlemagne's court. At a subsequent synod at Aix-la-Chapelle, Felix, yielding to compulsion, recanted his opinions, without, as it would seem, being convinced. Elipandus adhered fanatically to his views, which were, in after-times, defended by Folmar (1130), Duns Scotus (d. 1308), Durandus (d. 1322), the Jesuit Vasquez (1696), and the Protestant divine Calixtus (1643).

ADOPTION (Lat. *adoptio*). A legal institution of much importance in both of the classical nations of antiquity. A., in the stricter sense, in the Roman law, applied only to the case in which a person in the power of his father or grandfather was transferred to that of the person adopting him. Where the person adopted was already emancipated from the paternal power (*patria potestas*), and was regarded by the law as his own master (*sui juris*), the proceeding was called adrogation (*adrogatio*). A., however, was also used as a generic term comprehending the two species; and in Greece, where there was nothing corresponding to the paternal power of the Romans, this distinction did not obtain. At Athens, the adopted child was transferred from his own family and parish or tribe (*demos*), into those of the adoptive father, whose property he inherited in the absence of legitimate children, and whose sacred rights he was bound to maintain. Only Athenian citizens could be adopted, so that not only the next of kin, but the whole community were interested in preventing fraudulent adoptions. With this view, registration in the *demus* of the adoptive father was requisite, in order to entitle the son to the rights of citizenship as a member of it. In Rome, the adopted child assumed the name, and became bound to discharge the religious duties, of the adoptive father, which usually consisted in sacrifices to the *penates* or other divinities. These observances were for the most part connected with the *gens* or tribe to which the individual and his family belonged; and Savigny has even denied the existence of *sacra* peculiar to the family. A. was effected under the authority of a magistrate, the prætor at Rome, or the governor (*præses*) in the provinces. Adrogation originally required a vote of the people in the *Comitia Curiata*; but under the emperors, it became the practice to effect it by an imperial rescript. A patrician was sometimes adrogated into a plebeian family for political purposes. Clodius, the enemy of Cicero, was so adrogated, in order that he might be eligible to a tribuneship of the people. If a father, having children in his power, was adopted, both he and his children passed into the power of the adoptive father. It was requisite that the adoptive father should have no children at the time, and no reasonable prospect of having any. He was also required to be older than the person adopted. Females could not be adrogated, nor, from their not sharing in the paternal power, could they adopt in any form. An opposite rule has prevailed where the institution has been received in modern times. A. was unknown to the law of the Teutonic nations; and though most of the states of the continent have borrowed it from the Roman law, it has never existed as an institution either in England or Scotland. The patrimonial benefits of A. may, however, be conferred by deed; and there is no illegality in any one assuming the name, arms, and other distinguishing characteristics, and corresponding responsibilities, of a person who does not belong to his family. In France, A. is recognised only in a very modified form (*Code Civil*, art. 343, *et seq.*).

ADOUR, a river in France, rises near Tour-

malet, in the department of the Upper Pyrenees, waters in its course of 200 miles the department Gers, and the fertile part of the department Landes, and enters the Atlantic below Bayonne. It receives several tributaries, and is navigable to the extent of 80 miles. Bagnères-de-Bigorre, celebrated for its hot baths, is situated on the A.

ADRIA, in the delegation of Rovigo in Lombardy, is situated between the river Po and the Adige, contains about 10,000 inhabitants, and is chiefly remarkable as being one of the oldest cities in Europe. According to tradition, it was founded by the Pelasgi, 1376 B.C. In the time of the Romans, A. was one of the most frequented harbours in the Adriatic Sea; but by the continual deposition of alluvium on the east coast of Italy, it has been gradually separated from the sea, from which it is now almost ten miles distant. It still retains several interesting remains of Etruscan and Roman antiquity; but its wine, formerly so celebrated, is now deplorably bad.

ADRIAN, the name of six popes, none of them very remarkable. A. IV. was by birth an Englishman, the only one of that nation that ever sat in the papal chair. His name was Nicolas Breakspeare. He was a native of Langley, near St Albans, became first a lay-brother or servant in the monastery of St Rufus, near Avignon, and in 1137 was elected abbot. His zeal for strict discipline raised a combination to defame his character, and he had to appear before Eugenius III. at Rome. Here he not only cleared himself of all charges, but acquired the esteem of the pope, who appointed him cardinal-bishop of Albano in 1146. On the death of Anastasius in 1154, he was raised to the papal see. A. was at first on friendly terms with the Emperor Frederic I.; but his high notions of the papal supremacy, which he carried as far as even Gregory VII., led to the beginning of that long contest of the popes against the house of Hohenstaufen, which ended in the destruction of the dynasty. He was about to excommunicate Frederic, when he died at Anagni, 1159. It was in A.'s time that the doctrine of Transubstantiation (q. v.), advanced by Petrus Lombardus, was established.

ADRIANOPOLE, the second city in the Turkish empire, was founded by the Emperor Hadrian on the left bank of the navigable river Hebrus (now Maritza). Here the sultans ruled from 1366 to 1453, when Constantinople was made the capital. The city has now about 50,000 inhabitants, the half of whom are Turks. Two palaces, forty mosques, twenty-four public schools, twenty-two baths, and the numerous gardens laid out on the banks of the Maritza, may be named as the principal features of A. Its trade consists in opium, oil of roses, with silk and other manufactures.—The Russian-Turkish war was here concluded, September 19, 1829, by the Peace of A., which left the Porte in possession of Wallachia, Moldavia, and the conquests made by Russia in Bulgaria and Roumelia. On the other side, Russia got possession of the whole of the coast of the Black Sea, from the mouth of the Kuban, in lat. 45° 15', to the haven of St Nicholas, lat. 42°, with the territories of the Caucasus, and the greater part of the pachalik of Akalzik. This Peace of A. served greatly to confirm the power of Russia in Eastern Europe and in Western Asia.

ADRIATIC SEA, a large arm of the sea, extending, in a north-westerly direction, between the east coast of Italy and the west coast of the opposite continent, being connected with the Ionian Sea by the Strait of Otranto. In the north, it forms

the Gulf of Venice, and in the north-east, the Gulf of Trieste; while, on the Italian side, it forms the bays of Ravenna and Tremiti, and the narrower and deeper Gulf of Manfredonia. On the other side, the coasts of Illyria, Croatia, Dalmatia, and Albania are steep, rocky, and barren, and begirt with a chain of almost innumerable small rocky islands. The chief bay in this side is that of Quarnero, lying south of the peninsula of Istria. The most considerable rivers flowing into the A. S. are the Adigé and the Po, which are continually depositing soil on the coast, so that places once on the shore are now inland. The extreme saltness of the A. is probably owing to the comparatively small quantity of fresh water poured into it by rivers. Navigation in the A. is safe and pleasant in summer, but in winter the north-west gales are formidable, on account of the rocky and dangerous coasts on the east. Trieste, Ancona, and Sinigaglia are the chief places of commerce.

ADULE, an ancient town on the coast of the Red Sea, was the port of Axum, and is noticed chiefly on account of an inscription, of some importance relative to the ancient geography of those regions, the *Monumentum Adulitanum*, first published, in the 6th c., in the *Topographia Christiana* of Cosmas Indicopleustes. The modern town is called Zulla.

ADULTERATION OF FOOD, &c. The more important adulterations will be noticed under the various articles. See also Food.

ADULTERY (Lat. *adulterium*) has been well defined as 'the voluntary sexual intercourse of a married person with a person other than the offender's husband or wife.' (*Bishop on Marriage and Divorce*, § 415). By the Roman law, there was no A. unless the woman was married, and the same was the rule in Athens. It was in this limited form also that A. was recognised by the Mosiac law. By the canon law, the husband and wife were placed on the same footing; and this view has been adopted by all the nations of modern Europe. In the American state of New Jersey, it has been decided that a married man does not commit this crime in having connection with an unmarried woman. (*Bishop, ibid.*) But such has not been the prevalent doctrine even in America; and it has never been doubted that the offence necessary to found the sentence of divorce is committed by unlawful sexual intercourse equally whether the *particeps criminis* were married or single. A. was recognised as a crime even before Moses (*Gen. xxxviii. 24*), and it is probable that in affixing to it the punishment of death (*Lev. xx. 10*), he followed the prevailing custom. A very remarkable law was introduced for the trial of A., by causing the woman suspected to drink the bitter waters of jealousy (*Numb. v. 26*). In Rome, the Julian law, enacted in the time of Augustus (17 B.C.), revised the previous legislation on the subject, and imposed special penalties, consisting of forfeiture of goods and banishment, both on the adulteress and the paramour. The husband, in certain cases, was permitted to kill the latter, and the father might sometimes kill both. A constitution of Constantine, the authenticity of which has been doubted, made A. a capital offence on the man's part. Whatever Constantine's law was, it was confirmed by Justinian, who further condemned the wife to be whipped, and imprisoned in a convent for the rest of her days, unless relieved by her husband within two years (*Novel. 134. c. 10*). The offence was visited in Athens with punishments closely resembling those of the earlier Roman legislation. In many continental countries, A. is still treated as a criminal offence, but in none of them

does the punishment now exceed imprisonment for a limited period, which is frequently accompanied with a fine. Lord Coke says, that by the law of England in early times, A. was punished by fine and imprisonment (3 *Inst.* 306). During the Commonwealth, it was made a capital offence (*Scobell's Acts*, part ii., p. 121); but this law was not confirmed at the Restoration. In Scotland, the records of the Court of Justiciary shew that capital punishment was frequently inflicted. At the present day, it is punishable in Great Britain only by ecclesiastical censure; and even this may be regarded as in desuetude. But when committed by the wife, it was regarded as a civil injury, and, till the passing of the stat. 20 and 21 Vic. c. 85 and 59, formed the ground of an action of damages for criminal conversation (commonly known as an action of *crim. con.*) by the husband against the paramour. No corresponding action was competent to the wife, either in England or America; and her only remedy consisted in obtaining a separation or divorce. In Scotland, A. forms a ground for dissolution of the marriage, at the suit of the injured party. See SEPARATION, DIVORCE.

ADVENT, or Time of Advent (Lat. the approach, or coming), a term applied, by the Christian Church, to certain weeks before Christmas. In the Greek Church, the time of A. comprises forty days; but in the Romish Church, and those Protestant Churches in which A. is observed, only four weeks. The origin of this festival, as a Church ordinance, is not clear. The first notice of A., as an appointment of the Church, is found in the Synod of Lerida (524 A.D.), at which marriages were interdicted from the beginning of A. until Christmas. The four Sundays of A., as observed in the Romish Church and the Church of England, were probably introduced into the calendar by Gregory the Great. It was common from an early period to speak of the coming of Christ as *fourfold*: his 'first coming in the flesh'; his coming at the hour of death to receive his faithful followers (according to the expressions used by St. John); his coming at the fall of Jerusalem (*Matt. xxiv. 30*); and at the day of judgment. According to this fourfold view of A., the 'gospels' were chosen for the four Sundays, as was settled in the Western Church by the *Homiliarium* of Charlemagne. The festival of A. is intended to accord in spirit with the object celebrated. As mankind were once called upon to prepare themselves for the personal coming of Christ, so, according to the idea that the ecclesiastical year should represent the life of the founder of the Church, Christians are exhorted, during this festival, to look for a spiritual advent of Christ. The time of the year when the shortening days are hastening toward the solstice—which almost coincides with the festival of the Nativity—is thought to harmonise with the strain of sentiment proper during A. In opposition, possibly, to heathen festivals, observed by ancient Romans and Germans, which took place at the same season, the Catholic Church ordained that the four weeks of A. should be kept as a time of penitence; according to the words of Christ: 'Repent, for the kingdom of heaven is at hand.' During these weeks, therefore, public amusements, marriage-festivities, and dancing were prohibited; fasts were appointed, and sombre garments were used in religious ceremonies. The Protestant Church in Germany has also abstained from public recreations and celebrations of marriage during A. It was perhaps a natural thought to begin the ecclesiastical year with the days of preparation for the coming of Christ. This was first done by the Nestorian Church in the East in the 6th c.; the example was soon followed in

Gaul, and afterwards became general throughout the west.

ADVERB. As an adjective is joined to a noun, so is an A., for analogous purposes, to a verb, an adjective, or another A. From the frequency with which adverbs are joined to verbs, they get their name. An A. cannot be the subject, the copula, or the predicate of a proposition; and is, therefore, a secondary part of speech, logically speaking. According to their signification, adverbs may be divided into—1. Adverbs of Place, as, *where, towards*; 2. of Time, as, *ever, immediately*; 3. of Degree, as, *very, almost*; 4. of Manner, as, *thus, wisely*; 5. of Belief or Doubt, as, *perhaps, no, &c.*—It is commonly said, that 'some adverbs admit of comparison;' as if in this respect they differed from adjectives. The truth is, that adverbs admit of comparison under the same limitations, neither more nor less, that restrict the comparison of adjectives. Thus, *soon* is compared as naturally as *hard*. If *now* or *thus* cannot be compared, neither can *woolen* nor *circular*; and in both cases, for the same reason—the sense forbids it. The laws of euphony prevent alike *measurable* and *miserably* from being compared grammatically, i. e., by the addition of *er* and *est*; but both admit of logical comparison by the use of *more* and *most*.—A large class of adverbs in English are formed from adjectives by annexing the syllable *ly*, which is just the word *like*. Most languages have some such means of distinguishing the A. from the adjective, except the German, in which they are alike. Adverbs in general may be looked upon as abbreviations of phrases; thus, *here* = *in this place*, *then* = *at that time*, *wisely* = *like a wise man*. Combinations of words that can thus be represented by a single adverb, and all combinations that are analogous, though they may have no single word equivalent to them, are called adverbial expressions.

ADVERTISEMENT (Fr. *avertissement*). The public notification of a fact. This is now commonly effected either by means of the ordinary newspapers, or of newspapers, printers' lists, and other publications specially devoted to the purpose. Advertisements, both printed and written, are still posted on church-doors, and other places of public resort, in which case they are commonly called bills or placards. The most formal kind of A., and that which is employed in the case of royal proclamations and the like, is publication in the *Gazette* (q. v.); but so little is the *Gazette* read by private persons, that the courts of law have held that publication in it alone is not a sufficient notice of a dissolution of partnership to free the partners from debts afterwards contracted in name of the company. Public notifications are frequently enjoined by statute; as, for example, under Road and Bridge Acts, the Bankrupt Statutes, &c. In many other ways, their legal effects are important. Advertisements by public carriers, railway companies, and the like, are equivalent to offers whereby the advertiser will be bound to those who send goods on the faith, and in accordance with the terms of the A. By advertising a *general ship*, for a particular voyage, the master places himself on the footing of a public carrier, and is bound to receive goods for the port to which the vessel is advertised to sail. A merchant in such circumstances can insist on his goods being received, unless the ship be full, or the entire freight engaged. The contract of affreightment is completed by the A., and the shipping of the goods in conformity and with reference thereto. See CHARTER-PARTY, CARRIER.—In 1833, the duty on advertisements, which was 3s. 6d. in Great Britain, and 2s. 6d. in Ireland for each A., was reduced to 1s. 6d. in the former country, and 1s. in the latter (3 and 4 Will. IV. c. 23). In 1853,

it was wholly repealed (16 and 17 Vict. c. 62). In 1832, the year previous to the reduction, the duty amounted to £170,650; in 1841 it was £131,608; and in 1853, the year of the repeal, it had increased to £180,000, thus exceeding the amount before the period of reduction. Advertisements are found in England as early as the middle of the 17th c.; but advertising was not general till the beginning of the 18th. In America, where advertising has never been taxed, it has long been practised to an enormous extent; and since the repeal of the duty, it has increased in this country at a very rapid rate. Most newspapers are rendered remunerative to their proprietors only by means of the advertisements which they contain. See NEWSPAPER.

ADVICE. See BILL OF EXCHANGE.

ADVOCATE (Lat. *advocatus*). An A. is generally defined 'the patron of a cause,' though it does not appear that the 'patrons' who, in ancient Rome, assisted their clients with advice and pleaded their causes, were ever called by that name. Even in the time of Cicero, the term *advocatus* was not applied to the patron or orator who pleaded in public, but rather, in strict accordance with the etymology of the word, to any one who in any piece of business was called in to assist another. There can be no doubt, however, that the forensic orators and juriconsults of the later period of the republic, who followed law as a profession, and received fees (*honoraria*) for their services, occupied a position closely analogous to that of the A. of modern times, and thus it has been said that the profession is older than the name. The occupations of a juriconsult and a forensic orator seem to have differed pretty much as those of a consulting and a practising counsel do with us. They might be exercised separately, but were generally combined; and thus Cicero speaks of his master, Scævola, as 'the most eloquent of the learned, and the most learned of the eloquent' (*jurisperitum eloquentissimus, eloquentium jurisperitissimus, De Or.*, i. 39). Ulpian defined an A. to be any person who aids another in the conduct of a suit, or action (*Dig.* 50, *tit.* 13), and in other parts of the digest it is used as equivalent to an orator (see also Tacit. *Annal.*, x. 6), so that the word would seem gradually to have assumed its modern meaning. The office of the A. or barrister who conducted the cause in public, was, in Rome, as with us, altogether distinct from that of the procurator, or, as we should say, attorney or agent, who represented the person of the client in the litigation, and furnished the A. with information regarding the facts of the case. The distinction between these two occupations, however, obvious and important as it seems to us, does not everywhere prevail; and in many of the states of Germany, in Geneva, in America, and in some of our own colonies, as, for example, in Canada, they are united in the same person. In England and Ireland, advocates are called *Barristers*, under which title will be found a statement of the duties and responsibilities which the A. undertakes to his client, and of the state of the profession in these countries. In Scotland, as in France, the more ancient name has been retained. See ADVOCATES, FACULTY OF.

In France, the *avocat* and *avoué* correspond very nearly to the barrister and attorney in England. The advocates do not form a corporation, in the technical sense, but are a free society or association (*ordre*), which has the power of protecting its members, and of exercising internal surveillance and discipline over them. Neither do they exercise any ministerial functions like those which public authority has conferred, under certain conditions and responsibilities, on *avoués* and notaries. The French A. is

simply a free man, who has graduated in law, and possesses the privilege of addressing the tribunals. The advocates who practise in each court form a separate college, admission to which can be obtained only with the approval of those who are already members. Enrolment in the books of the college does not confer the title of A., for this title belongs to every licentiate who has taken the oaths before a court; but it gives the right of communicating (*droit de communiquer*) with the other members of the body, without which the exercise of the profession would be impossible. As a necessary consequence of this arrangement, erasure of the name of any individual from the list is equivalent to a prohibition to practise. The French A. possesses the same privileges as to irresponsibility for his advice, and for the facts contained in his instructions, which belong to members of the corresponding branch of the legal profession in this country. He is also entitled to plead covered (see BARRETTE), and as he has no action for his fees, they are, as with us, paid in advance. The French advocates have, on several occasions, resisted, as an encroachment on their privileges, the attempt to compel them to grant receipts for their fees. It further belongs to the etiquette of the bar of France that, in communicating articles of process to each other, no acknowledgment shall be exchanged; and we are told, with honest pride, that during the many centuries that this custom has existed, not one single instance of its abuse has occurred.

In Belgium, in Geneva, and also in those of the German states by which the Code Napoleon has been received, the organisation and discipline of this branch of the legal profession are similar to those which prevail in France. In the other German states, with the exception of Saxony, the formation of the advocates into a body has been perseveringly resisted by the governments. A general assembly of German advocates was attempted at Mayence in 1844, and in Hamburg in 1846; and in the latter city, it actually took place in the following year, but it led to no permanent results.

ADVOCATE, LORD. The L. A. for Scotland, called also the King's or Queen's A., is the public prosecutor of crimes, senior counsel for the crown in civil causes, and a political functionary of very great importance in the management of Scottish affairs. He may issue warrants for arrestment and imprisonment in any part of Scotland, and possesses many other discretionary and indefinite powers. Previous to the Union, the King's A. had a seat in the parliament of Scotland *ex officio*; and since that event, he has been almost invariably a member of parliament. He is appointed by the crown, and his tenure of office ceases with that of the administration of which he is a member. As first law-officer of the crown for Scotland, the L. A., when in parliament, is expected to answer all questions relating to the business of Scotland, and to take the superintendence of legislation for that portion of the United Kingdom. Notwithstanding his multifarious official duties, the L. A. accepts ordinary practice at the bar, and, indeed, is usually the most extensively employed practitioner connected with the party in power. He is assisted in the duties of public prosecutor by the solicitor-general, and by four junior barristers, called advocates-depute, appointed by himself. The L. A. and solicitor-general are alone entitled to plead within the bar, and they are the only barristers in Scotland who have the distinction of silk gowms. When the L. A. declines to prosecute, it is competent for a private party to do so; and in this case the concurrence or 'concourse,' as it is called, of the L. A., which is granted as a matter of course, must be obtained. Such a proceeding, however, is scarcely known in

practice in Scotland. The best historical account of this important, and, in many respects, anomalous office, with which we are acquainted, is contained in the judgment of the late Lord Medwyn in King's A. against Lord Douglas, December 24, 1836. In England, the sovereign pursues in his own name; and such was the practice in Scotland also, till about the middle of the 16th c., when we find Queen Mary prosecuting by her advocate; probably in imitation of the French custom. For some time after the institution of the College of Justice in 1532, the A. for the crown was always one of the judges of the Court of Session, and as in France the king's advocates were also at the same time judges, this coincidence has been mentioned by Sir George Mackenzie in proof of the French origin of the office; but a combination of offices, now held to be incompatible, was not then uncommon. Lord Medwyn informs us that among the original fifteen ordinary judges, was Sir Adam Otterburne, who was King's A. from 1525 to 1538, and also provost of Edinburgh from 1524 to 1535. So late as 1686, Sir George Lockhart, when president of the court, was ordered by a letter from King James VII. to officiate as his A. in parliament. It is not certain that the King's A. was originally authorised to act as public prosecutor in crimes; but he certainly possessed that power in 1587 (c. 77), and it seems to be implied in an earlier statute (1579, c. 78). It was indeed, as Lord Medwyn remarks, less of an anomaly that a judge of the Court of Session should act as the representative of the crown in criminal than in civil causes, seeing that the former were adjudged in another court. The King's A. is first mentioned as *Lord A.* in the record of the Court of Justiciary in 1598. But although it was not till the institution of the College of Justice that this office was placed on its present footing, we have mention of its existence in 1479; but the King's A. was not then one of the officers of state, a dignity, indeed, which he does not seem to have attained till 1540. In 1582, the salary of the L. A. was only £40 Scots. His present salary is £2387, and he is entitled to perquisites which raise his emoluments greatly above that sum. The L. A.'s deputies have £500 a year, and his secretary in London £350. The crown-agent, who is a Writer to the Signet (q. v.), and who performs in reference to crown causes pretty much the same duties that fall to an attorney or agent in ordinary litigation, receives £1400. As to the relation in which the L. A. stands to the public prosecutors of crimes in the inferior courts, see **PROCURATOR-FISCAL**. The L. A., though not a privy-councillor, is, by courtesy, addressed as the Right Honourable during his tenure of office.

ADVOCATES, FACULTY OF, in Scotland. The constitution of this body, like the name by which its members are known, was unquestionably derived from France. The profession seems to have existed in Scotland from a very early time; and in 1424 (c. 45) a statute was passed for securing the assistance of A. to the poor. The words of the statute are remarkable, and its spirit, when we consider the period, highly creditable to the humanity and enlightenment of the Scotch. 'And gif there bee onie pure creature, for faulte of cunning, or dispenses, that cannot, nor may not follow his cause, the king, for the love of God, sall ordaine the judge before quhom the cause sulde be determined, to purwey and get a leill and a wise advocate, to follow sik pure creatures causes; and gif sik causes be obtained [grained], the wranger [wrong-door] sall assyith baith the partie skaithed, and the advocatis coastes and travel.' This institution has remained with little alteration to the present time (see **POOR'S ROLL**). But though existing as a profession, the A. of Scotland did not form a Faculty or society till the institution of the

College of Justice (q. v.) in 1532. At first, their number was limited to ten, but there is now no limit. The number on the rolls of the body is about 425; but the number of those who practise does not exceed 120. Even of these a very small fraction live by the practice of the profession. From the improvements which have been made in the sheriff-courts, and from other causes, the amount of litigation in the Court of Session has greatly diminished since the beginning of the present century, and the continued accession of new members to the Faculty of A. is to be accounted for only by the fact that the Bar is still regarded as the regular avenue to public and official life in Scotland. Two examinations are imposed on candidates for admission, the one in general scholarship, the other in law; the first, however, being dispensed with in case the inrant shall produce evidence that he is a Master of Arts of any British university, or that he has attained such degree in a foreign university as, in the opinion of the Dean of Faculty and his council, affords evidence of the same amount of scholarship as that afforded by the degree of Master of Arts of a Scottish university. Should no such degree be possessed, an examination takes place before a committee of the Faculty, assisted by three or more persons of learning (generally professors in the university of Edinburgh), on the following subjects: 1. Latin; 2. Greek, or (in the inrant's option) any two of the following languages, namely, French, German, Italian, Spanish; 3. Ethical and Metaphysical Philosophy; 4. Logic, or (in the inrant's option) Mathematics. If the inrant be found qualified in general scholarship, he may, after the expiry of a year, go in for his private examination on law. The examiners, however, cannot take him on trial if, during the year before such examination, he have been engaged in any trade, business, or profession, either on his own account, or as assistant to, or in the employment of another. Proof of attendance on the law-classes in the university of Edinburgh is also requisite. An advocate is entitled to plead in every court in Scotland, civil, ecclesiastical, or criminal, superior or inferior; and also before the House of Lords. A party may manage his own cause in the Court of Session (q. v.), so far as oral pleading is concerned, but with exception of defences, every paper in process must be signed by an advocate. There is a widow's fund belonging to the body, which is also regulated by statute. The supreme judges of Scotland, and principal sheriffs, are always, and the sheriff-substitutes generally, selected from the bar. The fees on admission to the Faculty of A. are about £336.

ADVOCATES' LIBRARY. This library, which belongs to the Faculty of Advocates in Edinburgh, was established by Sir George Mackenzie in 1682. It had at first no fixed fund; the Faculty, from time to time, set apart sums for its maintenance, and donations were made for its use, not only by advocates, but by others. By the copyright law of 1709, it obtained, along with eight other libraries, the privilege of receiving a copy of every new book. This privilege is still continued to the A. L. (5 and 6 Vict., c. 45, s. 8), although withdrawn from the other Scottish libraries; and to this is mainly owing the complete character of the collection in British books. It is comparatively deficient in foreign literature and science; for the Faculty have no other funds at their disposal than the fees derived from 'inrants,' and the sum they are able to devote to the maintenance of the library is quite inadequate. The number of volumes is estimated at 160,000—perhaps twice as many as any other Scottish library. It is particularly rich in law; in Scottish history and antiquities;

in the works of the fathers and schoolmen, and in theology generally. The Spanish department is particularly valuable. The building containing the library, notwithstanding the recent improvements, is dark and inconvenient, most of the rooms being under the Parliament House, where the courts of law sit. Although the library belongs strictly to the Faculty of Advocates, yet, under their liberal management, it has in a great degree the character of a public institution. Any stranger arriving in Edinburgh is admitted to see the library; and with an introduction, any one may resort to it to consult books. Books may even be borrowed through the members of the Faculty, who are remarkably liberal in this respect. Thomas Ruddiman and David Hume both held the office of librarian or 'keeper of the A. L.'

ADVOCATION, a form of process in the law of Scotland, the object of which is to remove a cause from an inferior court to the supreme court, either for the purpose of review, or that the cause in its future stages may be conducted in the Court of Session. Final judgments of inferior courts are thus brought under review of the Court of Session by lodging a written note of A. with one of the depute-clerks of Session or his assistant (1 and 2 Vict. c. 86). A certified notice of this proceeding puts a stop to all further steps in the original cause. The party advocating must find caution for the expenses already incurred, or which may be incurred, in the Court of Session. See **CAUTION** and **JURATORY CAUTION**. As a general rule, A. is competent, unless debarred either by statute or confirmed practice; but no cause can be advocated unless it exceed the value of £25 (16 and 17 Vict. c. 80, s. 22). A. is incompetent in actions limited to particular courts by express statute, e. g., by the Small Debt Acts, Road Acts, &c. Every case in which the claim exceeds £40, may be removed into the Court of Session, so soon as an order allowing a proof has been pronounced, should either party be of opinion that it ought to be tried by jury. It is now competent in all advocations for either party, at the first calling of the cause before the Lord Ordinary, to move for its removal to the Inner House by report. On the other hand, the parties have it in their power to enter into a judicial contract, whereby they consent that the Lord Ordinary's judgment shall be final, and not subject to review; but the express consent of both parties is necessary (16 and 17 Vict. c. 86, s. 25).

ADVOCATUS DIA' BOLI, the Devil's Advocate. In the Romish Church when it is proposed that a deceased person shall be canonised, an examination of his past life takes place. In this process, one party holds the office of accuser, or *advocatus diaboli*; and it is his duty to bring forward all possible objections against the proposed canonisation; while, on the other side, the *Advocatus Dei* (God's Advocate) undertakes the defence. Hence the term A. D. has been applied to designate any person who brings forward malicious accusations.

ADVOWSON. The right of presentation to a church or ecclesiastical benefice in England. Advowsons are either *appendant* or *in gross*. Lords of manors were originally the only founders, and, of course, the only patrons of churches; and so long as a right of patronage continues annexed or appended to the manor, it is called an A. *appendant*. Such rights are conveyed with the manor as incident thereto, by a grant of the manor only, without adding any other words. But where the property of the A. has been once separated from the property of the manor by legal conveyance, it is called an A. *in gross*, or at large, and is annexed to the person of its owner, and

not to his manor or lands. Advowsons are further divided into *presentative, collative, or donative*. The first is where the patron has the right of presentation to the bishop or ordinary, and may demand of him to institute his clerk, if he find him canonically qualified. This is the most usual A. The second or collative A. is where the bishop and patron are one and the same person. In this case, the bishop cannot present to himself, but he does by the one act of collation the whole that is done in common cases by both presentation and institution. The third or donative A. is when the sovereign, or a subject by his licence, founds a church or chapel, and ordains that it shall be at the sole disposal of the patron, subject to his visitation only, and not that of the ordinary, and vested in the clerk by the patron's deed of donation, without presentation, institution, or induction. This is said to have been anciently the only way of conferring ecclesiastical benefices in England; the method of institution by the bishop not being established more early than the time of Archbishop à Becket, in the reign of Henry II.—*Kerr's Blackstone*, vol. ii. p. 20.

ÆDILES, Roman magistrates, who had the care of public buildings (*ædes*), especially the temples, and also attended to the cleansing and repairing of the streets, the preparations for funerals, public games and spectacles, the inspection of weights and measures, the regulation of markets, &c.—At first there were only two Æ., who were chosen from the plebeians, and styled *Æ. plebis*; afterwards, two others, styled *Æ. curules*, were chosen from the patricians (366 B.C.), and Julius Cæsar appointed a new order of *Æ. cærules* to take charge of the public granaries.

ÆGINA, now written Egina, an island forming part of the kingdom of Greece, of about forty square miles, in area, in the ancient Saronicus Sinus, now the Gulf of Egina. It is mountainous, with deep valleys and chasms; and the coast affords only one haven on the north-west. The modern town of Egina stands on the site of the ancient town, at the north-west end of the island. The island contains about 7000 inhabitants, who are chiefly occupied in trade, navigation, and agriculture. The soil produces the best almonds in Greece, with wine, oil, corn, and various fruits. Partridges abound in such numbers that the people find it necessary to thin them by destroying their eggs. The most ancient name of the island was Enone, and, according to tradition, the Myrmidons dwelt in its valleys and caverns. In ancient times, the people of Æ. had considerable importance in Greece; and their fleet distinguished itself for valour in the battle of Salamis. Their prosperity excited the envy of the Athenians, who made the island tributary, and afterwards expelled altogether the original inhabitants. The language, manners, and style of art among the ancient people of Æ. were Dorian.

ÆGINE/TAN SCULPTURES. The small island of Egina holds an important position in the history of Grecian art. A severely natural character belongs to its works of sculpture, of which several have been discovered in modern times. On an eminence in the eastern part of the island stand the ruins of a temple, usually called the temple of Jupiter Panhellenius, but now believed to have been a temple of Pallas or Minerva. Among these ruins a series of statues were excavated by a company of Germans, Danes, and Englishmen, which, in 1811, were purchased by Louis, then crown-prince of Bavaria, and are now the most remarkable ornaments of the Glyptothek at Munich. They are of various heights, and were evidently

intended to decorate the tympana of the temple beside which they were found. The group that

Ruins of Temple of Ægina.

seems to have been designed for the hinder tympanum is superior in preservation, and represents a combat of Greeks and Trojans for the body of a

Front elevation of Temple of Ægina, restored.

fallen hero. The other group is the contest of Telamon with Laomedon. The figures are true to nature, as in the old Greek style, with the structure of bones, muscles, and even veins, distinctly marked; but the faces have that unpleasant, forced smile which is characteristic of all sculpture before the time of Pheidias.

ÆGIS, the shield of Jupiter, which had been fashioned by Hephestus (Vulcan). When Jupiter was angry, he waved and shook the Æ., making a sound like that of a tempest, by which the nations were overawed. The Æ. was the symbol of divine protection, and became, in course of time, the exclusive attribute of Jupiter and Minerva.

Minerva, with Ægis. From an ancient statue.

ÆGLÉ, a genus of plants of the natural order *Aurantiacæ* (q. v.), distinguished by a five-toothed calyx, linear elongate mucronate anthers, and a many-celled fruit. *Æ. Marmelos*, the tree which produces the *bhel* fruit of India, has ternate petiole, ovate-oblong leaves, and the flowers in panicles. It is found from the south of India to the base of the Himalaya Mountains. The fruit is delicious, fragrant, and nutritious. In an imperfectly ripened state, it is an astringent of great effect in cases of diarrhoea and dysentery; and as such has lately been introduced into English medical practice. The root, bark, and leaves, are also used as medicinal. The Dutch in Ceylon prepare a perfume from the rind of the fruit; and the mucus of the seed is employed as a cement for many purposes.

ÆGOSPO'TAMI or **ÆGOSPO'TAMOS** (Gr. Goat-riber), in the Thracian Chersonese, is famous for the defeat of the Athenian fleet by the Lacedæmonians under Lysander, which put an end to the Peloponnesian War and to the predominance of Athens in Greece, 405 B. C.

ÆLFRIC, or **ALFRIC**, a distinguished Saxon ecclesiastic of the 10th c., regarding whose age, writings, and personality even, there has been a great difference of opinion amongst antiquaries. He appears to have been the son of the Ealdorman or Earl of Kent; but early manifesting a devotional spirit, he entered the monastery of Abingdon, the members of which belonged to the Benedictine order. Towards the close of the 10th c., he became a priest in the cathedral of Winchester. He was next appointed Abbot of St Albans, then Bishop of Wilton, and finally Archbishop of York, although others appear to think him that *Æ.* who was Archbishop of Canterbury. *Æ.*, Archbishop of York, died in 1059; *Æ.*, Archbishop of Canterbury, in 1005. The writer *Æ.*, whether of York or of Canterbury, was a man of superior attainments for his time, of excellent character, and one whose religious convictions were less disfigured by superstition than those of his contemporaries. The principal works ascribed to *Æ.* are—1. A Latin and Saxon glossary, printed at Oxford in 1659; 2. A Saxon version of most of the historical books of the Old Testament; 3. A charge to his clergy; 4. Two volumes of Saxon homilies; 5. A Saxon grammar in Latin.

ÆMILIAN PROVINCES. See **EMILIAN PROVINCES**.

ÆMILIUS PAULUS. The most remarkable of this name was the son of the consul *Æ. P.*, who fell in the battle of Cannæ, 216 B. C. Young *Æmilins* inherited his father's valour, and enjoyed an unwonted degree of public esteem and confidence. In 168 B. C. he was elected consul for the second time, and intrusted with the war against Persens, king of Macedon, whom he defeated in the battle of Pydna. During the war, his two younger sons died; and *Æ.* is said to have thanked the gods that they had been chosen as victims to avert calamity from the Roman people.

ÆNEAS, the hero of Virgil's *Æneid*, was, according to Homer, the son of Anchises and Venus, and was ranked next to Hector among the Trojan heroes. The traditions of his adventures before and after the fall of Troy are various and discordant. Virgil gives the following version: *Æneas*, though warned by Priam in the night when the Greeks entered Troy, to take his household gods, and flee from the city, remained in the contest until Priam fell, when, taking with him his family, he escaped from the Greeks, but, in the confusion of his hasty flight, lost his wife Creusa. Having collected a fleet of twenty vessels, he sailed to Thrace, where he began building the city of *Ænos*, but was terrified by an

unfavourable omen, and abandoned his plan of a settlement here. A mistaken interpretation of the oracle of Delphi now led him to Crete; but from this place he was driven by a pestilence. Passing the promontory of Actium, he came to Epirus, and then continued his voyage to Italy and round Sicily to the promontory of Drepanum on the west, where his father, Anchises, died. A storm afterwards drove him to the coast of Africa, and landing near Carthage, he was hospitably received and entertained by Queen Dido. His marriage with Dido was prevented by Jupiter, who sent Mercury with a command that *Æneas* must return to Italy. Accordingly, he sailed away, leaving the disappointed queen, who committed suicide. During his stay in Sicily, where he celebrated the funeral of his father, the wives of his companions and seamen, weary of long voyages without certainty of finding a home, set fire to his fleet. After building the city Acesta, he sailed for Italy, leaving behind him the women, and some of the men belonging to his fleet. On landing in Italy, he visited the Sibyl at Cumæ, and received intimations of his future destiny. Then, sailing along the Tiber, and landing on the east side of the river, he found himself in the country of Latins, king of the Aborigines. Lavinia, the daughter of Latinus, had been destined to marry a stranger; but her mother had promised to give her in marriage to Turnus, king of the Rutuli. A war ensued, which terminated in the marriage of *Æneas* with Lavinia. Their son, *ÆNEAS SYLVIVS*, as the ancestor of the kings of Alba Longa, and also of Romulus and Remus, was regarded as the founder of the Roman empire. It is hardly necessary to add that all these statements are merely mythical, having no historical basis.

ÆOLIAN HARP. a very simple musical instrument which produces harmonic sounds when placed in a current of wind. It is formed by stretching eight or ten strings of catgut, all tuned in unison, over a wooden shell or box, made generally in a form sloping like a desk. The sounds produced by the rising and falling wind, in passing over the strings, are of a drowsy and lulling character, and have been beautifully described by the poet Thomson, as supplying the most suitable kind of music for the *Castle of Indolence*.

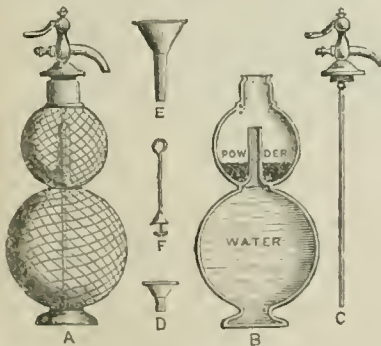

ÆOLIANS, one of the principal races of the Greek people, who were originally settled in Thessaly, from which they spread and formed numerous settlements in the northern parts of Greece and in the west of Peloponnesus. In the 11th c. B. C., some part of them emigrated to Asia Minor, where they founded, on the N. W. coast, in Mysia, and the adjacent isles, more than thirty cities; among them, Smyrna, and Mitylene in the island of Lesbos, where the *Æolian* dialect of the Greek language chiefly developed itself in the forms employed in the poetry of Alcæus and Sappho. The *Æolian* shared the fate of the other Grecian colonies in Asia Minor. First oppressed by the Lydian kings, then deprived of their independence by the Persians, they became a portion of the great empire founded by Alexander, and, passing through a stage of subjection to the dynasty of the Seleucids, were ultimately absorbed in the Roman empire.

ÆON, a Greek word signifying an age, and also eternity. The Gnostics spoke of *Æons*, in a peculiar sense, as powers that had emanated from God before the beginning of time, and existed as distinct entities or spirits. They were called *Æons* either as partaking of the eternal existence of God, or because they were thought to preside over the various ages and transformations of the world. See **GNOSTICISM**.

ÆRATED BREAD, a term that has been applied to bread prepared by a process very recently

patented, and likely to come into use. In ordinary bread-making, the wheat-flour is moistened with water and worked into dough, to which common salt and yeast are added. The latter causes the flour to ferment or decompose, when carbonic acid is given off at every part; and when the fermented dough is placed in an oven, the bubbles of carbonic acid gas expand, and cause the formation of the spongy mass characteristic of well-made loaf-bread. The new process of preparing A. B. consists in placing the flour in a strong enclosed iron box, and moistening it with carbonic acid water, prepared as stated under A. WATERS. The dough is then worked up by machinery inside the box, and in ten minutes or so, it is taken out, shaped into loaves, and placed in an oven, when the carbonic acid, previously introduced with the water within the dough, expands, and forms a light palatable bread. The advantages which this method of working bread has, as set forth by the patentees, are—1. There is a saving of the whole of the waste caused by fermentation, which averages fully 10 per cent. Thus 10 per cent. more bread is made out of a sack of flour than by the old process. 2. The process, instead of occupying eight or ten hours, is completed in half an hour. 3. The cost of machinery and gas is less than that of yeast used in the old process. 4. The dough requires scarcely any handling to form it into loaves. 5. The bread is absolutely pure—it is simply flour, water, and salt. Finally, should the whole of the bread in the kingdom be thus made, a saving would be effected in one year equal in amount to the entire ordinary importation of foreign wheat.

AERATED WATERS are employed largely as refreshing, refrigerant beverages to allay thirst during warm weather, and during feverish conditions of the animal frame. The most common A. beverage is *Carbonic acid water*, generally spoken of as Soda-water, though it seldom contains any soda. It is prepared on the large scale by placing whiting, chalk, or carbonate of lime (CaO, CO_2) in a lead vessel

Gazogène.

with water and sulphuric acid (SO_3), when the sulphuric acid combines with the lime to form stucco or sulphate of lime (CaO, SO_3), and carbonic acid (CO_2) is evolved as gas. The latter is received in a reservoir, and is thereafter forced into water, so that the latter dissolves about five times its own volume of the gas. The water then constitutes a brisk sparkling liquid, with a pungent, but pleasant acidulous taste. On the small scale, and for family use, carbonic acid water may be conveniently prepared in the apparatus known as the *gazogène* or *seltzogenè*. The complete apparatus is seen at A, and dissected at B and C. In proceeding to use the vessel, the lower globe at B is filled with water by means of the long funnel E, taking care that no water runs into the smaller and

upper division. The powders, consisting of bicarbonate of soda ($\text{NaO}, \text{HO}, 2\text{CO}_2$) and tartaric acid (T), are then placed in the upper globe by means of the small funnel D, and care is taken, by plugging up the tube communicating with the lower part by the stopper F, that no powder passes into the larger globe. The long tube, C, is then inserted into the globes, and screwed well in. The apparatus is inclined till water from the lower globe enters and fills the upper globe about one-third; then it is placed erect, and allowed to be at rest for two hours, when, if the screw stop-cock at the upper part be opened, the carbonated water will flow out readily into any vessel placed to receive it. The explanation of the action which goes on in the vessel is, that tartaric acid and bicarbonate of soda have no action on each other so long as they are dry; but whenever water is admitted, the tartaric acid combines with the soda and water to form tartrate of soda and water ($\text{NaO}, \text{HO}, \text{T}$), and at the same time, carbonic acid (CO_2) is given off, and descending the tube into the lower globe, dissolves in the water contained therein. Occasionally, bisulphate of potash is used instead of the tartaric acid, to save the greater expense of the latter.—The *gazogènes* can likewise be used in the preparation of true soda-water, or *Eau de Vichy*, by adding a little carbonate of soda to the water in the lower globe before charging with carbonic acid. *A. wine* may be obtained by placing white wine with a little sugar-candy in the lower globe instead of water. *Sparkling lemonade* is procured when the carbonic acid water is run into a tumbler containing a little sirup of sugar; and *A. fruit-beverages*, when the water charged with carbonic acid is received in a glass containing about a table-spoonful of either of the fruit-sirups.

The less common A. W., prepared on the large scale, are—1. *A. soda-water* (true soda-water), obtained by adding 15 grains of crystallised carbonate of soda to each bottle before it is charged with the carbonic acid water; 2. *A. potash-water*, by employing in a similar way 20 grains of bicarbonate of potash; 3. *A. Selters-water*, when carbonate of soda and chloride of sodium (common salt) are dissolved in carbonic acid water; 4. *A. Carrara-water*, when finely divided Carrara marble is dissolved in the acid-charged water; 5. *A. lime-water*, when other forms of lime than the Carrara marble are used; 6. *A. magnesian-water*, when magnesia, or the carbonate of magnesia, is used; and *A. chalybeate-water*, when a compound of iron is dissolved in the carbonic acid water. The latter beverage has lately been employed in medicine, as an easy means of introducing iron into the blood, and with good effect. A. Carrara and lime waters are now administered in cases where the bony structure requires to be strengthened; and A. magnesia-water is a very agreeable mode of giving a dose of magnesia. The well-known effervescing draughts called *soda-powders*, and *seltz-powders*, are two other kinds of A. drinks. In the former, bicarbonate of soda and tartaric acid are added to water in a tumbler, and a refreshing draught instantaneously prepared. *Seltz-powders* contain tartrate of soda and bicarbonate of soda in one paper, and tartaric acid in the other; and when both are added to water, effervescence ensues, and the liquid is then partaken of.

A. W. likewise occur naturally. Water, as it is drawn from a spring, tastes differently from the same water after being boiled and cooled; and this is due to the unboiled water containing the gases oxygen, nitrogen, and carbonic acid—especially the latter—dissolved in it. Spring-water is therefore a natural A. beverage. Rain-water has a mawkish,

insipid taste, mainly because of the minute quantity of gas therein dissolved; but when that rain-water trickles down the mountain-side, and is dashed from ledge to ledge of rock, it absorbs and dissolves the gases from the air, and is thus naturally aerated. Many waters are aerated in a natural but peculiar way, which confers upon them important medicinal properties; and these will come before us under their more popular title of *Mineral Springs*.

AERIAL POISONS. See MIASMA.

AERODYNAMICS is that branch of science which treats of air and other gases in motion. It examines first the phenomena of air issuing from a vessel, which correspond in many respects with those of water. See **HYDRODYNAMICS**. Much depends, as in the case of water, upon the nature of the orifice, whether a mere hole in the side of the vessel, or a tube or adjutage. Another subject of A. is the motion of air in long tubes, where the resistance of friction, &c., has to be ascertained. That resistance is found to be nearly in proportion to the square of the velocity, to the length of the tube, and inversely to its width. A. examines also the velocity of air rushing into a vacuum, of wind, &c. The instrument used for the latter purpose is called an anemometer. See **WINDS**. Air is found to rush into a void space at the rate of from 1300 to 1400 feet per second. One of the most important inquiries in A. is the resistance offered to a body moving in air, or—which is the same thing—the pressure exerted by air in motion upon a body at rest. The law may be stated, with sufficient accuracy for practical purposes, as follows: *The resistance or pressure is proportional to the square of the velocity.* We might conclude from reason, without experiment, that such would be the case; for if one body is moving through the air four times faster than another of the same size, not only will it encounter four times as many particles of air, but it will give each of them four times as great an impulse or shock, and thus encounter 4×4 , or sixteen times as much resistance.

This resistance is greatly increased by another circumstance, especially with great velocities. The air in front of the moving body becomes accumulated or condensed, and a partial or even entire vacuum is formed behind it. With a velocity of 1700 feet per second, for instance, the resistance is found to be about three times as great as the simple law of the square of the velocity would give. By the operation of these laws of resistance, a heavy body let fall with a parachute attached to it, comes, after a certain time, to move with a velocity approaching more and more nearly to a uniform motion.

AEROLITES (Gr. *aer*, air, and *lithos*, stone), or **METEORIC STONES**, **FIREBALLS**, and **SHOOTING-STARS**, are now classed together as being merely varieties of the same phenomenon. Aërolites that fall during the day, are observed to be projected from a small dark cloud, accompanied by a noise like thunder, or the firing of cannon; at night, they proceed from a fireball, which splits into fragments with a similar sound. It is believed that the dark cloud that accompanies the fall of aërolites by day, would be luminous at night; and smoking, exploding fireballs have sometimes been seen luminous even in the brightness of tropical daylight. The connection between aërolites and fireballs is thus established. Fireballs, again, cannot be separated from shooting-stars, the two phenomena being sometimes blended, and also being found to merge into one another, both with respect to the size of their disks, the emanation of sparks, and the velocities of their motion.

There are numerous records and stories in all ages and countries of the fall of stones from the sky; but until recent times, they were treated by philoso-

phers as instances of popular credulity and superstition. It was not till the beginning of the 19th c. that the fact was established beyond a doubt.—According to Livy, a shower of stones fell on the Alban Mount, not far from Rome, about 651 n.c. The fall of a great stone at Ægospotami, on the Hellespont, about 467 n.c., is recorded in the Parian Chronicle (q. v.), and mentioned by Plutarch and Pliny. It was still shewn in the days of Pliny (d. 79 A. D.), who describes it as of the size of a wagon, and of a burned colour. In the year 1492 A. D., a ponderous stone, weighing 260 lbs., fell from the sky near the village of Ensisheim, in Alsace; part of it is still to be seen in the village church. An extraordinary shower of stones fell near L'Aigle, in Normandy, on the 26th April 1803. The celebrated French philosopher, M. Biot, was deputed by government to repair to the spot and collect the authentic facts; and since the date of his report, the reality of such occurrences has no longer been questioned. Nearly all the inhabitants of a large district had seen the cloud, heard the noises, and observed the stones fall. Within an elliptical area of seven miles by three, the number of stones that had fallen could not be less than two or three thousand; the largest were 17 lbs. in weight. These are only a few out of hundreds of instances on record.

As was natural with objects of such mysterious origin, meteoric stones have always been regarded with religious veneration. At Emesa, in Syria, the sun was worshipped under the form of a black stone, reported to have fallen from heaven. The holy Kaaba of Mecca, and the great stone of the pyramid of Cholula, in Mexico, have all the same history.

The existence of such bodies once admitted, led to assigning a meteoric character to strange ferruginous masses found in different countries, and which had no history, or were only adverted to in vague tradition. Of this kind is the immense mass seen by Pallas in Siberia, now in the Imperial Museum at St Petersburg. The largest known is one in Brazil, estimated at 14,000 lbs.

One constant characteristic of meteoric stones is the fused black crust, like varnish, with which the surface is coated. From the circumstance of this coat being very thin, and separated from the inner mass by a sharply defined line, it is thought to indicate some rapid action of heat, which has not had time to penetrate into the substance of the stone. This view is favoured by the fact that the stones are found in a strongly heated, but not incandescent state, when they fall. Their specific gravity ranges from two to seven or even eight times that of water.—As to their chemical composition, the predominating element is iron, in a native or metallic state, generally combined with a small proportion of nickel. According to Humboldt, the aërolites that fell in the neighbourhood of Agram, in Croatia, in 1751, the Siberian stone, and specimens brought by that philosopher from Mexico, contain 96 per cent. of iron; while in those of Sienna the iron scarcely amounts to 2 per cent., and in some rare instances, metallic iron is altogether wanting. A writer in the *Quarterly Review*, No. CLXXXIII., thus sums up the result of all the chemical analyses hitherto made: 'We find the actual number of recognised elements discovered in aërolites to be nineteen or twenty—that is, about one-third of the whole number of elementary substances (or what we are yet forced to regard as such) discovered on the earth. Further, all these aërolitic elements actually exist in the earth, though never similarly combined there. No new substance has hitherto come to us from without; and the most abundant of our terrestrial metals, iron, is that which is largely predominant in aërolites, forming frequently, as in some of the instances just

AEROLITES.

mentioned, upwards of 90 parts in 100 of the mass. Seven other metals—copper, tin, nickel, cobalt, chrome, manganese, and molybdena—enter variously into the composition of these stones. Cobalt and nickel are the most invariably present; but the proportion of all is trifling compared with that of iron. Further, there have been found in different aërolites, six alkalis and earths—namely, soda, potash, magnesia, lime, silica, and alumina; and, in addition to these, carbon, sulphur, phosphorus, and hydrogen. Finally, oxygen must also be named as a constituent of many aërolites, entering into the composition of several of the substances just mentioned. As respects the manner of conjunction of these elements, it is exceedingly various in different

aërolites. A few there are, especially examined by Berzelius and Rose, containing olivine, augite, hornblende, and other earthy minerals; and closely resembling certain crystalline compounds which we find on the surface of the earth.

Besides those solid masses of considerable size, numerous instances are on record of showers of dust over large tracts of land; and it is remarkable that such dust has generally been found to contain small hard angular grains resembling augite. Stories of the fall of gelatinous masses from the sky are ranked by Humboldt among the mythical fables of meteorology. It has been supposed that such fables may have originated in the very rapid growth of gelatinous alga, as *Nostoc* (q. v.).

Shower of Shooting-stars witnessed in North America.

Fireballs and Shooting-stars.—From the height and apparent diameter, the actual diameter of the largest fireballs is estimated by Humboldt to vary from 500 to 2800 feet; others allow a diameter of about a mile. Shooting-stars are thought to have diameters varying from 80 to 120 feet. In most cases of luminous meteors, a train of light many miles in length is left behind. One or two instances are on record where the train of the fireball continued shining for an hour after the body disappeared. The heights of shooting-stars are found to range from 15 to 150 miles, at the points at which they begin and cease to be visible. Their velocities vary from 18 to 36 miles in a second. When it is remembered that the velocity of Mercury in its orbit is 26.4 miles in a second, of Venus 19.2, and of the Earth 16.4, we have in this fact a strong confirmation of the planetary nature of meteorites.

One of the most remarkable facts connected with shooting-stars is, that certain appearances of them are *periodic*. On most occasions they are *sporadic*—that is, they appear singly, and traverse the sky in all directions. At other times, they appear in swarms of thousands, moving parallel; and these

swarms are periodic, or recur on the same days of the year. Attention was first directed to this fact on occasion of the prodigious swarm which appeared in North America between the 12th and 13th of November 1833, described by Professor Olmsted of Newhaven. The stars fell on this occasion like flakes of snow, to the number, as was estimated, of 240,000 in the space of nine hours, and varying in size from a moving point or phosphorescent line to globes of the moon's diameter. The most important observation made was, that they all appeared to proceed from the same quarter of the heavens—the vicinity, namely, of the star γ , in the constellation Leo; and although that star had changed greatly its height and azimuth during the time that the phenomenon lasted, they continued to issue from the same point. It was afterwards computed by Encke, that this point was the very direction in which the earth was moving in her orbit at the time. Attention being directed to recorded appearances of the same kind, it was observed with surprise that several of the most remarkable had occurred on the same day of November, especially that seen by Humboldt at Cumana in 1799, and by other observers over a

great extent of the earth. The November stream was again observed in the United States in 1834, between the 13th and 14th, though less intense. Though often vague, and in some years altogether absent, this phenomenon has recurred with such regularity, both in America and Europe, as to establish its periodic character.

Another periodic swarm of considerable regularity is that appearing between the 9th and the 14th of August, and noticed in ancient legends as the 'fiery tears' of St Lawrence, whose festival is on the 10th of that month. There are other periodic appearances; and Humboldt gives the following epochs as especially worthy of remark: 22d to 25th of April; 17th of July; 10th of August; 12th to 14th of November; 27th to 29th of November; 6th to 12th of December.

It remains to notice briefly the various opinions that have been advanced as to the origin of aërolites, and the theory of meteors in general. The hypotheses that have been formed in answer to the question—Whence come those solid masses that fall upon the earth?—are of two kinds; some ascribing to them a telluric origin, and others making them alien to the earth. Of the first kind, is the conjecture that they may be stones ejected from terrestrial volcanoes, revolving for a time along with the earth, and at last returning to it. Another theory, which at one time found considerable favour, supposed that the matter of which aërolites are composed existed in the atmosphere in the form of vapour, and was by some unknown cause suddenly aggregated and precipitated to the earth. These conjectures are untenable in the face of the facts of the phenomena stated above, and are now completely given up.

In seeking a source beyond the earth, the moon readily presented itself. Olbers was the first to investigate, 1795, the initial velocity necessary to bring to the earth masses projected from the moon. This 'ballistic problem,' as Humboldt calls it, occupied during ten or twelve years the geometricalians Laplace, Biot, Brandes, and Poisson. It was calculated that, setting aside the resistance of air, an initial velocity of about 8000 feet in a second, which is about five or six times that of a cannon-ball, would suffice to bring the stones to the earth with a velocity of 35,000 feet. But Olbers has shewn, that to account for the actual measured velocity of meteoric stones, the original velocity of projection must be fourteen times greater than the above. It is against this lunar theory, that we have no proof of active volcanoes now existing in the moon; and with the improvement of the telescope, the probability of the contrary is increasing. It is, accordingly, giving place to the planetary theory, which we noticed at the outset—a theory which harmonises better with the tendency of physical research and of speculation generally.

The discussion of hypotheses as to the genesis of the recognised planets out of portions of the gradually contracting vaporous mass of the sun; the continued discovery of hitherto unobserved planets between the orbits of Mars and Jupiter; the countless multitudes of comets that are observed traversing our system in all directions, and undergoing appreciable alteration both of consistency and orbit;—all prepare us for the idea, that matter may exist in the inter-planetary spaces, in every variety of form and condition. To account for the phenomena of meteors as above described, we must suppose that there are both detached masses, each revolving in an independent orbit, and giving rise to *sporadic* meteors; and also connected systems, forming rings or zones round the sun. The intersection of the earth's orbit by such zones or streams, would account for the periodic swarms of meteors; and if we

suppose the asteroids composing it to be irregularly grouped, we see a reason why the same stream should not be always of equal intensity. There may even be periodicity in this respect too. Between 1799 and 1833—the two most brilliant manifestations of the November stream on record—there elapsed 34 years; and Olbers has predicted that the next brilliant appearance will be in 1867.

We have not space to enter upon such questions as: What causes the luminous and ignited condition of aërolites? The height at which many meteors are seen, puts the action of the atmosphere in causing ignition out of the question, and the terrestrial magnetism has been suggested as the exciting cause. As to those meteors that are unattended by aërolites, we may suppose that they are merely deflected from their path by the proximity of the earth, are rendered luminous through a short arc, and continue their course with altered orbit. But we are not to assume, that where no precipitation of matter is visible, none takes place; it may escape observation, or be dissipated in powder. See METEORS in SUPP.

AERONAUTICS, the art of navigating the air. See BALLOON.

AEROSTATICS. This branch of science treats of the equilibrium and pressure of air and other gases, and of the methods of measuring it by the barometer and other instruments. The expansive force or pressure of atmospheric air varies with time and place. In a medium condition of the atmosphere, and near the sea-level, barometrical observations give the pressure or weight equal to that of a column of mercury, 30 inches high, or of a column of water about 34 feet high. This makes the mean pressure of the atmosphere nearly 15 lbs. on every square inch. This mean pressure of the atmosphere is generally taken as the unit or measure of expansive or elastic forces generally; any particular pressure is said to be equal to so many atmospheres. Aërostatics also investigates the phenomena of the compression of gases; in other words, the relation between the elasticity and the density or volume of a gas. According to the law of Mariotte, the expansive force of one and the same body of gas is proportional to its density; or, which is the same thing, the expansive force of a body of gas under different degrees of compression, varies inversely as the space which it occupies. If its elastic force, at one stage, be measured by 50 lbs., when compressed into half the space, that force will be 100 lbs. Connected with this is the investigation of the variation of density and pressure in the several vertical strata of the atmosphere. It is obvious that the weight of the atmosphere must diminish as we ascend, as part of it is left below; and it results from Mariotte's law, that, at different distances from the earth's surface, increasing in arithmetical progression, the atmospheric pressure diminishes in geometrical progression. This principle furnishes the means of measuring heights by the Barometer (q. v.).

The elastic force of air and other gases is very much increased by heat; and consequently, when allowed, they expand. It is found that a rise of temperature of 1° of Fahrenheit, causes any gas to expand $\frac{1}{480}$ of its own bulk; and this expansion is uniform. If adding 10° to the temperature of a body of gas increases its bulk 3 cubic inches, an addition of 20° will give an increase of 6 inches; of 50°, 15 inches, and so on. This law was discovered by Gay-Lussac, and has been verified by subsequent investigators. Both it, however, and that of Mariotte, can be looked upon as only nearly true, and that within certain limits.

AEROSTATIC PRESS. This is a machine used for extracting the colouring-matter from dye-woods

and such like. A vessel is divided by a horizontal partition pierced with small holes. Upon this the substance containing the colour is laid, and a cover, also perforated, is placed upon it. The extracting liquid is then poured on the top, and the air being drawn from the under part of the vessel by a pump, the liquid is forced through the substance by the pressure of the atmosphere.

ÆSCHINES, an Athenian orator, second only to Demosthenes, whose contemporary and rival he was. Philip of Macedon was then pursuing his designs for the subjugation of the several Greek states to his own sway; and while Demosthenes advocated the policy of opposing him before it was too late, Æ. was the head of the peace-party. Æ. was a member of more than one embassy sent by the Athenians to deal with Philip; and Demosthenes accused him of receiving bribes from the Macedonian monarch, and of betraying the cause of Athens and of her allies. There is no proof that this was the case; and perhaps Æ. was deceived by the wily Philip into believing that he meant no harm to the liberties of Athens, and that peace was the best policy for his countrymen. The result justified the sagacious fears of Demosthenes, and condemned the selfish, isolating policy of Æ. When it was proposed to reward Demosthenes with a golden crown, for his patriotic exertions in defence of his country, Æ. brought an accusation of illegality against the proposer, Ctesiphon. Demosthenes replied, and Æschines being vanquished, and having thus incurred the penalty attached to an unfounded accusation, was obliged to retire from Athens. He finally established a school of eloquence in Rhodes, which enjoyed a high reputation. On one occasion, he read to his audience in Rhodes his oration against Ctesiphon; and some of them expressing their astonishment that he should have been defeated in spite of such a powerful display, he replied: 'You would cease to be astonished if you had heard Demosthenes.' The oration against Ctesiphon and two others are the only authentic productions of Æ. that have come down to us. He was born 389 B.C., and died at Samos 314 B.C.

ÆSCHYLUS, the father of Greek tragedy, was born at Eleusis, in Attica, 525 B.C. We have but scanty notices of his life. He fought in the battles of Marathon, Salamis, and Platea, witnessed the fall of Darius and Xerxes, and shared in the exulting sentiments which afterwards pervaded liberated Greece. Of the seventy or ninety tragedies ascribed to Æ., only seven have been preserved—*Prometheus Bound*, the *Seven against Thebes*, the *Persians*, *Agamemnon*, the *Choëphori*, *Eumenides*, and the *Suppliants*. These are sufficient to prove that Æ. was the creator of the Greek drama in its higher form. He introduced action in place of the perpetual chorus, and dramatic dialogue to supersede the long narrations of his predecessors Thespis and Choerilus. Scenic effects, masks, and dresses, were other improvements introduced in the plays of Æ. The plots of his pieces are very simple, and display no ingenuity of construction or solution. His general tone is elevated and earnest, and shews a preference of strong to gentle emotions. Destiny is represented in its sternest aspect; gigantic heroes, Titans, and gods, rather than men, appear on the scene, and the lofty grandiloquence of the language is in accordance with the characters. In the choruses, the language is often turgid and obscure. For some reason, not well known, Æ. left his native city, and went to Sicily, where he was honourably received by King Hiero. Here he died at Gela, 456 B.C., and the inhabitants of the city raised a monument to his memory. In the poetical translation by Blackie,

the non-classical reader may get a very tolerable notion of the grandeur and fire of this greatest of all ancient dramatists.

ÆSCULAPIUS appears in Homer as an excellent physician, of human origin; in the later legends, he becomes the god of the healing art. The accounts given of his genealogy are various. According to one story, he was the son of Coronis and the Arcadian Isehyus. Apollo, enraged by the infidelity of Coronis, caused her to be put to death by Diana, but spared the boy, who was afterwards educated by Chiron. In the healing art, Æ. soon surpassed his teacher, and succeeded so far as to restore the dead to life. This offended Pluto, who began to fear that his realm would not be sufficiently peopled; he therefore complained to Jove of the innovation, and Jove slew Æ. by a flash of lightning. After this he was raised to the rank of the gods by the gratitude of mankind, and was especially worshipped at Epidaurus, on the coast of Laconia, where a temple and grove were consecrated to him. Here oriental elements, especially serpent-worship, seem to have been mingled with the rites and ceremonies. From Epidaurus the worship of the healing god extended itself over the whole of Greece, and even to Rome. According to Homer, Æ. left two sons, Machaon and Podalirios, who, as physicians, attended the Greek army. From them the race of the Asclepiades descended. Hygieia, Panacea, and Ægle are represented as his daughters. His temples usually stood without the cities in healthy situations, on hillsides, and near fountains. Patients that were cured of their ailments, offered a cock or a goat to the god, and hung up a tablet in his temple, recording the name, the disease, and the manner of cure. Many of those votive tablets are still extant. The statue of the god at Epidaurus, formed of gold and ivory by Thrasymedes, represented Æ. as seated on a throne, and holding in one hand a staff with a snake coiled round it, the other hand resting on the head of a snake; a dog, as emblem of watchfulness, at the foot of the deity. Praxiteles and other sculptors represented the god as an ideal of manly beauty, and closely resembling Jupiter; with hair thrown up from the brow, and falling in curls on each side. The upper part of the body was naked, and the lower was covered by a mantle falling in folds from the shoulders. He had sometimes a laurel-wreath on his head, and a cock or owl at his feet; or was attended by a dwarf-figure named Telesphorus.—ASCLEPIADES, the followers of Æ., who inherited and kept the secrets of the healing art; or, assuming that Æ. was merely a divine symbol, the Asclepiades must be regarded as a medical, priestly caste who preserved as mysteries the doctrines of medicine. The members of the caste, or medical order, were bound by an oath—the *Hippocratis jusjurandum*—not to divulge the secrets of their profession. In Rome, 292 B.C., when a fatal pestilence prevailed, the Sibylline books commanded that Æsculapius must be brought from Epidaurus. Accordingly, an embassy was sent to this place, and, when they had made their request, a snake crept out of the temple into their ship. Regarding this as the god Æ., they sailed to Italy, and, as they entered the Tiber, the snake sprang out upon an island, where, afterwards, a temple was erected to Æ. and a company of priests appointed to take charge of the service and practise the art of medicine. Hippocrates is said to have descended from the Asclepiades of Cos, who traced their descent, on the mother's side, from Hercules.

ÆSOP, an ancient Greek writer, whose name is attached to the most popular of the existing collections of Fables. His history is very uncertain, and some critics have even denied his existence. First among these is Luther, in his preface to the *German Æsop*,

1530. We are told, however, on the authority of Herodotus (ii. 134.), Diog. Laertius (i. 72.), and Plutarch (*Sept. Sap. Conviv.*, and *De Sera Num. Vindl.*), that Æsop lived in the latter half of the 6th century B. C.; that he was a slave at Samos; that, on receiving his freedom, he visited Cressus and Pisistratus, by the former of whom he was commissioned to distribute some money among the citizens of Delphi, and that, on his refusal to pay it, in consequence of a dispute, he was thrown over a precipice by the infuriated mob. We are further informed that the Athenians erected a statue to him from the chisel of Lysippus. Whether this person was the author of the existing Æsopian collection or not, we know, from Aristophanes, and other authorities, that fables bearing his name were popular in the most brilliant period of Athenian literature. The conjecture of Bentley, however, seems well founded, that these fables were transmitted entirely through oral tradition. Socrates (*Phædo*, p. 61) turned such of them as he could remember into verse, of which Diog. Laertius has preserved a specimen; and the same was done by Demetrius Phalereus, 320 B. C. The only Greek version, however, of which any entire fables remain, and which, as shewn by Bentley, has furnished materials to subsequent collections, is that of Babrius (q. v.), a writer of some mark, who is supposed to have lived in the age before Augustus. Of the fables now bearing the name of Æsop, there are three sets, the first from a MS. of the 13th c., published at Florence in 1809; the second, a collection by Maximus Planudes, a monk of the 14th c., containing a life (supposed to have been the work of Planudes, till it was found in the earlier MS.) of Æsop, full of fabulous particulars; and the third a collection published in 1610, from MSS. found at Heidelberg. All these are contained in the edition of Schneider, Breslau, 1810. The resemblance between some of the fables, and the personal peculiarities attributed in common to Æsop and to the Arabian fabulist Lokman, have led some persons to conclude that the two men were identical; and others, that the fables attributed to them in common belong to the same eastern source. See PHÆDRUS. —A Roman actor of this name, CLAUDIUS ÆSOPUS, a contemporary and friend of Cicero, was as eminent in tragedy as Roscius was in comedy.

ÆSTHETICS, a term invented about the middle of last century by Baumgarten, a professor of philosophy in the university of Frankfurt-on-the-Oder, to denote the science of the Beautiful, particularly of Art, as the most perfect manifestation of the Beautiful. It has the merit of being at once comprehensive and clear, and has therefore been pretty widely adopted, of late years, by critics both in France and England.

The Beautiful (Gr. *to kalon*) was a favourite subject of contemplation amongst the ancients. The name of Plato is inseparably associated with it, but in his philosophising, he nowhere separated the Beautiful from the Good. Aristotle, again, from the immense acquaintance which he possessed with objects of art, deduced the most admirable laws and rules (Canons of Criticism), so that his *Poetics*, according to Schiller, constitute a true Rhadamanthine tribunal for poets. But the results he arrived at are regarded by the *a priori* school of æstheticians as empiricism rather than science. Baumgarten they hold to be the first who considered the subject from the true scientific point of view, and therefore entitled to be called the founder of the philosophy of art. All sensuous apprehension, not in one form or manifestation only, but in every possible form or manifestation, was included in his view of the subject, and this conception he expressed by the word Æsthetics, from the Greek *aïsthanomai*, I feel,

indicating not absolute or objective knowledge of things, but such as is conditioned subjectively by the play of our sensibilities. The term is thus not confined to the limits of the Beautiful, though in point of fact we employ it in this partial signification. Beauty was, with Baumgarten, the result of the highest and purest æsthetic perception, to the realisation of which the finer portion of our nature aspires; and to trace which through the whole sphere of art, was the work of æsthetic philosophy (*Sinneskenntniss*). Kant subsequently, from his point of view, carried out this theory of the æsthetic faculty in his critical treatise on the power of the Judgment. Everything he conceived may be regarded æsthetically as well as absolutely, in reference to ourselves as well as in reference to nature. An object may be in harmony with our sensibilities, as well as in harmony with the totality of material phenomena; or it may not be in harmony with the former, and yet truly accord with the latter. So, too, with the judgment. It may choose to apprehend things in their adaptation to man, or in what is called the teleological point of view—that is, their final end or objective adaptation to each other. Hence the æsthetic judgment considers objects as beautiful, agreeable, or useful; while the teleological judgment strives to reach their absolute design, and remains indifferent to personal predilections. Why certain objects excite in us a purely selfish interest, and others a purely unselfish pleasure, Kant does not venture to determine, for he never investigates the objective quality of the Beautiful, but confines himself strictly to its influence upon the feelings and desires. Schelling was the first to undertake this inquiry after Schiller had paved the way for him in his treatise on Æsthetics. The latter, perhaps the most lucid and intelligible of German æstheticians, in a note to his twentieth letter on Æsthetic Culture, explains his conception of the new science as follows: All things that can ever be objects of perception may be considered under four different relationships. A fact can relate directly to our sensuous condition—that is its physical quality; or to the understanding—that is its logical quality; or to the will—that is its moral quality; or to the entirety of our different powers, rather than to any particular manifestation of these—that is its æsthetic quality. There is a culture for the health, for the understanding, for morality, and for taste or beauty; the last of which has for its design to bring out the totality of our sensuous and spiritual powers in their greatest possible harmony. Schiller's idea of the Beautiful is necessarily as comprehensive as his conception of the sphere of Æsthetics. He will not admit that it is the result of a mere limited experience, taught us through the operation of phenomena, animate and inanimate, on our senses, but of pure abstract reflection. It is, therefore, a transcendental idea. It originates in the perfect union of matter and spirit. From this it follows, that 'Beauty can be exclusively neither mere *life*, as some ingenious observers have maintained, nor mere *form*, as has been decided by some speculative philosophers and philosophising artists' (for instance, Burke and Raphael Mengs).

Passing over Schelling's transcendental speculations, which are couched in a style not very intelligible to the English mind, we come to the theory of Hegel. Like that of Schelling, it also proceeds from the so-called metaphysics of the Beautiful. It is the absolute ideal realising itself. Nothing is truly beautiful except this. Nothing, therefore, which exists can be termed such. Out of the sphere of the pure reason we have only an eternal aspiration. In the finite mind, the absolute ideal is always striving to realise itself, but never completely succeeds. There is only a ceaseless approximation. Hegel then traces the

growth and development of the Beautiful, the first form of whose existence is *natural Beauty*, and, as Vischer justly adds, the Beauty unfolded in history. But this Beauty, whether of nature or history, is rare, accidental, fugitive, and tarnished by intermixture with the not-beautiful. This deficiency or limitation arises from its being unconscious of itself. The Beautiful is, so to speak, as yet in its infancy. It does not know either that it is or what it is. It first passes into self-recognition in the dawn of human intelligence, and its conscious realisation of itself increases in proportion to the culture of the race or the individual. The highest finite realisation of it is Art; for though the form of art be material, it is matter shaped according to an idea. The artist looks on the form simply as the objective embodiment of the idea, every remnant of rude nature being stripped off. Form, though springing out of matter, is thus a deliverance from matter, and the particular Arts may consequently be regarded as the gradual working of the mind out of materialism. The formative Arts—Architecture, Sculpture, Painting—are silent, heavy, still partly material. Music is an advance on these. It breathes in a higher region. The materialism of Sound becomes all but ideal. Poetry is a further advance. It is the pathway of the intellect to pure thought. Æsthetics, in this point of view, is a science, based on a knowledge of the historic development of the Beautiful. It wanders through its whole kingdom, of which Art is only a province, though, as has been seen, the richest and most valuable.

Such was the aspect in which Hegel regarded the new science. He fused it into his historico-transcendental metaphysic, and so stirred up regarding it the old quarrel which had agitated the latter. Realists made their appearance, who vigorously assailed the principles of Fichte, Schelling, and Hegel, in their various applications to Philosophy, Theology, and Æsthetics. The reaction was and is most conspicuous in the second of these, but has as certainly manifested itself in the others also. It is denied that the Ideal conceived by man is superior to the Real, as it is in itself. It is man who lowers it by his inadequate apprehension of its harmony and perfection. The greatest artist does not strive to outshine or even to reach the beauty of nature, but to surpass himself in it. The whole historic theory of Hegel is likewise rejected, after severe and searching criticism, from a rationalistic point of view. Hegel conceives the first effort of art to have arisen from a longing on the part of the human spirit to emancipate itself from the thralldom of matter. This is the idealistic view of its beginning. Kugler, on the other hand, affirms that it arises from 'the necessity which man is under to bind his thoughts to one firm spot, and to give to this memorial a form which may be expressive of the thought.' The origin of Art is thus made retrospective, not prospective. This may be considered the realistic view of its beginning. So the question stands at present in Germany.

In France, the founder of the Eclectic School of Philosophy, Victor Cousin, has eloquently expounded the Platonic view of Æ. In the second part of his treatise *Du Vrai, du Beau, et du Bien* (On the True, the Beautiful, and the Good), he has a chapter on 'the Beautiful in Objects,' in which, after discussing the principal theories of the materialists and geometricians, and pointing out what he conceives to be the errors and limitations of such theories, he proceeds to a consideration of physical, intellectual, and moral beauty, endeavours to discover the quality or qualities in which they agree, from this rises to the apprehension of an ideal beauty whose realisation he finds in God. 'God,' says Cousin, 'in whom is combined absolute unity

with infinite variety, is necessarily the realised ideal of all beauty.'

Speculations on this subject in Britain have been mostly limited to the Beautiful in form and colour. We have not in general sought, like the Germans, to discover the *idea* of the Beautiful, but the Beautiful itself. Our criticism may, and indeed does seem meagre and unphilosophical to them, but it is at least clear, and its purpose obvious. We have put to ourselves this question: Are there, or are there not, constant qualities in certain objects which make them what we call Beautiful? Does beauty arise from anything inherent in these, or does it depend upon accidents in us, such, for instance, as the complex and numberless phenomena of Association? Is it objective or subjective?

The first publication on this subject of any consequence—if we except Lord Shaftesbury's *Characteristics*, in which there is set forth a 'rapturous Platonic doctrine' impossible to criticise, because unintelligible—was Dr Hutcheson's *Inquiry* (1725). In this work, the existence of an 'internal sense,' through which we either obtain a perception of the Beautiful or are made in some way conscious of its presence, was maintained. The notion of a sixth sense has been very severely criticised by Jeffrey in his celebrated article on Beauty.

Certain explanations and modifications of this theory were made by the followers of Hutcheson, but nothing really new was brought out till Edmund Burke published his *Treatise on the Sublime and the Beautiful* (1756). There is no work upon the subject so popular or so worthless. Every one has heard of it, large numbers have read it, and yet the fundamental principle is weak and absurd. He confounds the beautiful with the luxurious. 'All objects appear beautiful which have the power of producing a peculiar relaxation of our nerves and fibres, and thus inducing a certain degree of bodily languor and sinking!'

Sir Joshua Reynolds, a contemporary of Burke, maintained a very remarkable theory of the Beautiful, which he borrowed from the celebrated Père Buffier, and illustrated at great length. Beauty was conceived to be the mean between two extremes. This doctrine is open to the fatal objection that the most ordinary is therefore the most beautiful, and that, consequently, the greatest poem or the finest landscape must be that which is the most commonplace. Nevertheless, Sir Joshua does not hesitate to push his theory to extremities, declaring that if what we term the deformed or monstrous were only more common than what we call the beautiful, they would exchange names and sensations—a statement which may safely be left to refute itself.

The next work on this subject that excited any measure of popular attention was Alison's *Essays on the Nature and Principles of Taste* (1790). The theory propounded by this writer is generally known as the theory of Association. The most powerful exposition of the Association theory is that given by Jeffrey, in his famous article in the *Encyclopædia Britannica*, and in his critique on Alison in the *Edinburgh Review* (1811). According to Jeffrey: 'These emotions (that is, those excited by the contemplation of certain objects) are not original emotions, nor produced directly by any qualities in the objects which excite them; but are reflections or images of the more radical and familiar emotions to which we have already alluded, and are occasioned not by any inherent virtue in the objects before us, but by the accidents, if we may so express ourselves, by which these may have been enabled to suggest or recall to us our own past sensations or sympathies.' In his defence of this theory, Jeffrey is obliged to consider those of

Stewart and Payne Knight, the former of which is partly, and the latter entirely, opposed to his own. So long as he confines his argument to association in connection with *landscapes*, it seems very conclusive; but when he comes to combat Payne Knight's doctrine as to the intrinsic beauty of colours, it ceases to be satisfactory. This writer maintains that colours possess a primitive and original beauty, which may be enriched by association, but which does not depend upon it. Jeffrey denies this, and attempts to prove that our perception of the beauty of colour, instead of being a 'mere organic sensation,' arises from association alone. In the same way, he refuses to believe that there is any independent or intrinsic beauty in form; and conceives that architecture owes its beauty not to the essential harmony of its proportions, but to a variety of curious considerations on our part. He considers Alison's analysis of this beauty, with special reference to Greek architecture, 'perfectly satisfactory.' It arises, 1st, from the association of utility; 2d, of security; 3d, of the skill of the architect; 4th, of magnificence; 5th, of antiquity; 6th, of Grecian greatness! To this it may be replied, that such associations *increase*, but do not *create*, our perception of the beauty of Greek architecture.

The theory of Association in this its primitive nakedness cannot be said to be held now by any who think on the subject. It is felt to be more plausible and ingenious than sound or adequate. Ruskin, Professor Blackie, and others, have nearly destroyed its popularity. Professor Blackie's three essays on Beauty, which are remarkable for the brisk and biting humour with which they assail the Association theory, as well as for the passages of fine eloquence which they contain, make a vigorous effort to indoctrinate the Saxon brain with the ideal speculations of Plato. Professor Blackie is a Platonist in theory, but the elaboration of that theory is entirely modern and original. 'Beauty,' he says, 'does not consist in one element, or in one power, or in one proportion, but in many elements, powers, and proportions; the principal of these are—order, congruity (or harmony), actuality, perfection (in the Platonic sense—viz., the full result of a creative energy), expressiveness, smoothness, delicacy, and curvature. With reference to this last principle, Professor Blackie points to the fact that nature everywhere avoids angular lines, especially in the human figure, and most of all in the sex which has ever been considered the highest symbol of the beautiful. In the second volume of his *Lectures on Metaphysics*, the late Sir William Hamilton (Lecture 46th) distinguishes Beauty into Absolute and Relative. 'In the former case,' he says, 'it is not necessary to have a notion of what the object ought to be before we pronounce it beautiful or not; in the latter case, such a previous notion is required. Flowers, shells, arabesques, &c., are freely or absolutely beautiful. We judge, for example, a flower to be beautiful, though unaware of its destination, and that it contains a complex apparatus of organs all admirably adapted to the propagation of the plant. When we are made cognizant of this, we obtain, indeed, an additional gratification, but one wholly different from that which we experience in the contemplation of the flower itself apart from all consideration of its adaptations.' Sir William thus states his theory of Free or Absolute Beauty: 'In the case of beauty—free beauty—both the imagination and the understanding find occupation; and the pleasure we experience from such an object is in proportion as it affords to these faculties the opportunity of exerting fully and freely their respective energies. Now, it is the principal function of the understanding, *out of the*

multifarious presented to it, to form a whole. Its entire activity is, in fact, a tendency towards unity; and it is only satisfied when this object is so constituted as to afford the opportunity of an easy and perfect performance of this its function. In this case, the object is judged beautiful or pleasing.' Sir William concludes by defining the beautiful to be that 'whose form occupies the imagination and the understanding in a free, full, and consequently an agreeable activity.'

There would seem, on the whole, to be a tendency at present towards an amalgamation of what have hitherto been considered irreconcilable doctrines—towards the belief that there is an essential beauty in the harmony of forms and in the combination of colours, and that the keen delight which we experience in beholding them is incapable of being explained by any number of associations; while it is admitted, on the other hand, that many things are made beautiful by association, that all things have their beauty enriched by it, and that some things even have their intrinsic beauty called forth by it operating in the form of *suggestion*.

ÆSTIVATION, in Botany (from the Latin *astivus*, belonging to summer), a term employed to denote the manner in which the parts of the flower are disposed in the flower-bud prior to its opening. Sometimes the Æ. is *valvate* or *valvular*, when the parts of the same verticil exactly meet together by their edges, like valves. But if the edges are turned in, the Æ. is *induplicate*; if they are turned out, it is *reduplicate*. In many flowers, the Æ. is *contorted* or *twisted*; sometimes it is spirally *imbricated*. In pentamerous flowers, it is very generally *quincunxial*, two of the parts being external, two internal, and one intermediate. In Papilionaceous Flowers (q. v.), the other parts of the corolla are generally included in the standard or vexillum, and this is sometimes called *revillary* Æ. In poppies, the petals are generally crumpled together before flowering. The Æ. of the calyx is frequently of a different kind from that of the corolla. Thus, in *Geraniaceæ*, the Æ. of the calyx is imbricated, that of the corolla twisted. The manner in which the stamens and pistils are disposed in the bud is not so much taken into account in the characters of orders and genera, but is sometimes also noticed; thus, it is a character of *Rosaceæ* that the stamens are curved inwards in Æ.

ÆTOLIA, a district of ancient Greece, lying on the north coast of the Gulf of Corinth. The ancient Æ. was divided from Aetarnania by the river Achelous, and extended as far as the river Euenos. On the E. it was bounded by Loeris and Doris; on the N., by Thessaly and Epirus; on the W., by Acarnania; and on the S., by the Bay of Corinth. In later times, these boundaries were considerably extended to the N. and E. The country had few cities, was generally wild and barren, and, according to Herodotus and Aristotle, was infested by lions on the banks of the Achelous and in other places. Here, according to the legend, Meleager slew the Calydonian boar (q. v.). The Ætolians make a great figure in the heroic age of Greece; but at the time of the Peloponnesian war, they were rude and barbarous. The Ætolian Confederacy, first called into existence by the Lamiæan war (323 B. C.), became more important in the time of the Achaean League (q. v.). The several states assembled annually in autumn at Thermum. This assemblage was styled the *Panætolicon*. At first, they called in the aid of the Romans against the Achaean League; but as they saw that the Romans had designs against the independence of Æ., they next allied themselves with Antiochus of Syria, afterwards with Perseus of

Macedonia. In 189 B.C., they were compelled to share the fate of Macedonia, and were subjugated by the Romans.—Æ, now forms a governmental department, or nome, of the modern kingdom of Greece. The mountains in the N.E.—now styled Viena—form a wild offset of the Pindus chain, and slope steeply on the S.W. down to the central plains, partly covered with morasses and partly cultivated. S. of the lakes Apokuro (anciently, Trichonis) and Zygos (Hyria) rise a range of mountains—the *Aracynthus* mountain of the ancients—which fall on the S.W. to a broad coast-level, occupied by morasses and lagoons; but on the S.E. side extend to the gulf, where the promontory of Antirrhion reaches to within 2400 yards of the opposite cape Rhion, thus forming the Strait of Lepanto (Naupactos). The chief rivers of Æ. are the Aspropotamo (Achelous), in the W., and the Fidaros (Euenos), in the E. The people in the plains are employed in agriculture and fishing; while in the mountain-districts some traces of the rude and martial character of ancient Æ. may still be found. The chief towns are Missolonghi and Lepanto (q.v.).

AFFIDAVIT, an oath in writing, or a written declaration made before a magistrate, or other person legally authorised to administer an oath, the truth of which is confirmed either by an oath sworn, or a solemn affirmation emitted in terms of 18 Vict. c. 25, and the other statutes referred to under **AFFIRMATION**. Where evidence is required in England to be laid before a court or a judge, it is usually reduced to the form of an A., in place of being delivered orally, as in jury trial. An A. ought to set forth the matter of fact only, and not to declare the merits of the cause, of which the court is to judge (21 Car. I. B. R.). The name and designation of the party making the A. are written at length, and he signs it at the foot. When the paper is shewn to him, he is required to swear or affirm that its contents are true, and that the name and handwriting are his. Affidavits in the High Court of Chancery must be taken and expressed in the first person of the deponent. The *Jurat*, with which the A. closes, specifies the officer before whom, the place where, and the time when it was sworn, and this is signed by the officer or magistrate. When an A. is sworn in open court, that circumstance is mentioned, and no officer is named. In Scotland, voluntary affidavits are not generally received as evidence, because they are *ex parte* statements, no opportunity being afforded for cross-examination. To this rule, however, there are exceptions. Claimants are required by the Bankrupt Statute to lodge their claims with A. or oaths of verity; and there are other similar statutory provisions. An A. is sometimes required also at common law, as in applications for warrants *in meditatione fugæ*. By 5 and 6 Will. IV. c. 62, various unnecessary oaths and affirmations were abolished, and declarations substituted in lieu thereof, and voluntary and extrajudicial oaths and affidavits were suppressed. The oath of allegiance, and all oaths in courts of justice, were expressly exempted from the operation of the statute; and by 6 and 7 Vict. c. 43, this exemption was extended to ratifications by married women. The Lord Chancellor of England is empowered by 6 and 7 Vict. c. 82, to grant commissions for taking affidavits, affirmations, and declarations in Scotland.

AFFINITY (Lat. *affinitas*), the relationship created by marriage between the husband and the blood-relations of the wife, and between the wife and the blood-relations of the husband. The relations of the wife stand to the husband in the same degree of A. in which they stand to the wife by blood or consanguinity, and *vice versa*. But between the

relations of the two parties by A. there is no A. Thus, there is no A. between the husband's brother and the wife's sister; and by our law, there is no impediment to their marriage. The question as to whether those who are related by A. stand in all respects in the same position as regards marriage with those connected by blood, is one on which much difference of opinion at present prevails. Marriage between a man and the sister of his deceased wife is at present forbidden by statute (5 and 6 Will. IV. c. 64); but an attempt is annually made in parliament to obtain its repeal. See **MARRIAGE**.

AFFINITY. Chemical A., or chemical attraction, is the force which produces all chemical phenomena. It differs from the attraction of gravitation in acting, not between masses, but between atoms, and only when the atoms are at insensible distances. It differs also from cohesion, which unites the particles of the same substance, while A. unites atoms of different substances. The compounds thus formed are new bodies, often bearing no resemblance in appearance or other properties to the elements which combine to produce them. Thus, water results from the combination of two gases.

The strength of chemical A. is different between different substances. Sulphuric acid combines with lime, and forms gypsum; but if potash is added, the sulphuric acid leaves the lime, and combines with the potash. As a sort of choice is here manifested, it is called a case of *elective A.* These elective affinities, however, are often altered by a change of temperature, or other accompanying circumstance.

AFFIRMATION, a solemn declaration, which, in the case of members of certain religious persuasions, is admitted in lieu of an oath. By 3 and 4 Will. IV. c. 49, 3 and 4 Will. IV. c. 82, and 1 and 2 Vict. c. 77, it is provided that Quakers, Moravians, and Separatists (q.v.) who, from conscientious scruples, refuse to take an oath in courts of justice, may, both in civil and criminal cases, make a solemn A., according to a prescribed formula. For Quakers and Moravians the formula is: 'I do solemnly, sincerely, and truly declare and affirm.' In the case of Separatists, this A. further bears to be emitted 'in the presence of Almighty God.' The penalties of perjury are imposed on those who shall be proved to have affirmed falsely. A later statute (18 Vict. c. 25) has extended the privilege of substituting an A. for an oath to all persons who refuse to be sworn from conscientious motives—the *judge being satisfied that the motives are conscientious*. See **OATH**.

AFFRE, DENIS AUGUSTUS, Archbishop of Paris, who fell in the insurrection of June 1848 (b. 1793). At the time of the Restoration, he was professor of theology at the seminary of St Sulpice; and on account of his prudent and temperate character, was made Archbishop of Paris by the government of Louis Philippe in 1840. Though not yielding a blind submission to all the measures of the government, he abstained from all offensive opposition. When Louis Philippe became an exile, and a republic was proclaimed, the archbishop kept aloof from political strife, but displayed earnest care for the public welfare. During the insurrection in Paris, 1848, he climbed upon a barricade in the Place de Bastille, carrying a green bough in his hand, as a messenger of peace, and wished to persuade the insurgents to lay down their arms. He had scarcely uttered a few words, when the insurgents and the troops commenced firing again, and he fell, mortally wounded by a musket-ball, coming apparently from a window above. He was carried by the insurgents into the

house of a priest, and the next day was removed to his palace, where he died, June 27, 1818. He was the author of several theological writings, and of a work on Egyptian hieroglyphics.

AFGHANISTAN, the land of the Afghans, formerly known by the names of Drangiana and Ariana, lies in lat. from 28° to 36° N., and in long. from 62° to 73° E. Its length from north to south is nearly 450 miles; its breadth, 470, with an area of 212,000 square miles. Afghan is a Persian name; the inhabitants style themselves *Pashtaeh* (plural of *Pushta*). Their country is bounded on the N. by Turkistan; on the E. by Peshawur and Sinde; on the S. by Beloochistan; and on the W. by the Persian highlands of Khorassan. It has been calculated to contain from five to six millions of inhabitants. In the N.E., the alpine region of the Hindu Kush, a wild mountain isthmus cleft by numerous ravines, and towering up into the clime of perpetual ice, unites the high masses of land in Eastern, with those in Western Asia, and presents formidable obstructions to communication between the territory of the Oxus and that of the Indus. In the E., the parallel chains of the Soliman Mountains, together with those of Kalabagh and Khyber to the N., abruptly divide the country from the flat region of the Punjab and the plains of the Lower Indus. There are only two passes leading through the highlands of Afghanistan to the Indus; that in the north, formed by the deep valley of the Cabul river, has strong positions of defence at Jelalabad and Peshawur, not far from the Khyber Pass; while that in the south, the Bolan Pass, forms a way of communication with Sinde. The mountain-labyrinth of Paropamisus, as the Greeks called the ranges of the Hazareh and Eimack, has been little explored either in its eastern parts or in the highlands stretching out towards Persia, although the historical importance of this region has been long known. The elevated terraces of Cabul and Ghiznee slope gently down towards the south-west. This general outline of the country is sufficient to shew that A. holds a very important position between East and West Asia, and may be regarded by India as a vast, natural fortification against all inroads from the west. Though the climate has generally a continental character, yet the differences of elevation and unequal distribution of water render it various. The date-palm ornaments the oases in the sandy desert to the south-west, and in the deep sheltered valleys of the east, the cultivation of cotton and sugar succeeds; but the high terraces of Cabul and Ghiznee (8—9000 feet above the level of the sea) are exposed to a severe winter, with heavy falls of snow. Still, the average temperature of this table-land is about 48°, and the heat of the summer ripens the finest grapes. The vine flourishes here in company with apricots, apples, pears, plums, cherries, and fields of European corn. Tulips, aromatic herbs, rhubarb, tobacco, and asafetida are extensively grown; and in the well-watered valleys, pomegranates and oranges, with a profusion of roses, display the luxury and splendour of an Indian clime. The mulberry-tree flourishes in the cool valleys. In particular, vast plantations of it are grown in the valleys of the Hindu Kush, where the fruit exhibits many varieties, and when dried and ground into flour is largely used for food by the inhabitants. The animal life found in the country corresponds in variety with the climate and vegetation. In the colder mountainous regions, we find the bear, the wolf, and the fox; in the tropical valleys, the lion, tiger, leopard, jackal, and hyena; while fertile pastures support sheep, goats, horses, and horned cattle. Horses, mules, and asses are numerous, and the camel is used in the table-lands. A. is rich in

minerals; iron and copper especially, are abundant. The former is of such excellent quality that, if more carefully prepared, it is believed that it would rival the most valuable European iron; while the ore of the latter is said to yield in some places nearly 80 per cent. of the metal. Lead, plumbago, saltpetre, sulphur, salt, and alum, are also extensively obtained. The four principal places—Cabul, Ghiznee, Candahar, and Herat (q. v.)—have importance as stations on the highway of commerce from India to Central and Western Asia. Cabul and Jelalabad guard the passage to India on the N., as does Candahar on the S.; while in the extreme W., Herat guards the border near Persia.

The variety which nature has given to the country is also found in the people; but all are united by national sentiment. Love of independence and equality, attachment to old customs and simple modes of life, free hospitality, carried indeed to a pernicious excess, and a martial spirit, are their characteristics. The Afghans are generally powerfully made; and, though the features of the men may be styled harsh, the cheek-bones being high, and the nose very large, they are often expressive of candour, earnestness, and deliberation. Their language, the Pushtu, is allied to the Persian; at least, a great proportion of the words are Persian, though the primitive roots of the language belong to some unknown stock. The only authors in the Pushtu language are lyrists and ballad-writers, but the Persian is employed in prose composition, and the Persian authors are familiar to the educated Afghans. In religion they are Mohammedans according to the version of the Sunites, and are strongly opposed to the Persians and the Sikhs, who belong to other sects. Yet they are not bigoted, for those of the heretical Shiite sect may hold almost any official position in the state, while Hindus and Christians enjoy the utmost toleration. The Afghans are distinguished among orientals for their truthfulness, the respect with which they treat women, their indifference to rank, and their reverence for age. They cannot be said to be well armed, as they employ matchlocks, and their artillery is unwieldy; but, like other eastern people, they are expert in the use of the sabre.

The first appearance of A. as an independent power took place during the internal discords of Persia after the death of Nadir Shah. Ahmed Khan, of the race of Abdalli (1747—1773), took advantage of these feuds, and liberated A. from Persian rule. His success founded the Dourance dynasty. When his son Timur died, in 1793, a contest for the throne took place between the brothers Zemaun, Mahmud, and Shah Sujah, which ended in the success of Mahmud, who, however, was compelled to abdicate the throne in 1823, and died in 1829. The empire now fell into the hands of three brothers, of whom the oldest, Dost Mohammed, ruled at Cabul, the most important of the three divisions of the country, where he had a reveque of 1,400,000 dollars, and an army of 18,000 men. Still, the country was in an unsettled state; for Dost Mohammed was at war with Lahore in the east, and in the west, the Persians had invaded Herat. On the 1st of October 1838, the governor-general of India (Lord Auckland) declared war against A., on the grounds, that Dost Mohammed had unlawfully attacked the British ally, Runjeet Singh; that the military operations of the Afghans had betrayed a hostile purpose towards India; and that Shah Sujah, as the rightful heir to the Afghan throne, had placed himself under British protection. All this was true, but did not make the invasion of A. by the Anglo-Indian forces either just or politic. However, the British forces advanced through the Bolan Pass to

Candahar, where Shah Sujah formally claimed possession of the country. On the 21st of July, the army encamped before Ghiznee, and after some hard fighting, that fortress was taken. On the 7th of August, Shah Sujah, with the British forces, entered Cabul, and the conquest was regarded as complete. It was a gross mistake of the nature of the country and the character of the people. The land had been invaded, but was by no means conquered. Dost Mohammed had surrendered to the English; but his son, Akbar Khan, was actively engaged in a conspiracy, of which Sir Alexander Burnes and the envoy Macnaghten were not aware until it was too late. At the beginning of winter, when help from India was impossible, the outbreak took place at Cabul, when Burnes, Macnaghten, and several British officers were slain. Another serious error was now committed: instead of making some decided and bold movement, which might have inspired respect for the British forces, humiliating terms of capitulation were acceded to by Major Pottinger. It was agreed that the invaders should leave the country; while, on the other hand, Akbar Khan and his confederates stipulated to provide an escort, and make other necessary arrangements for the retreat. Depending on these promises, the British army left Cabul on the 6th of January 1842, in order to return by the Khyber Pass into India; but neither escort nor provisions were supplied by the Afghan leaders, and the severity of the season increased the misery of the retreat. The fanatical tribes of the districts harassed the flanks and rear of the army, and slew women and children as well as men. Out of a host of 16,000—or, if we include women and children, about 26,000—only one man (Dr Brydon) escaped to carry the dismal tidings to General Sale, who still held his position at Jelalabad. Almost against his own will, the new governor-general, Lord Ellenborough, sent other forces into A. General Nott marched from Candahar to Ghiznee, which was again taken after a slight resistance, and then proceeded to meet the army which, under General Pollock, had marched through the Khyber Pass to Cabul. Here the force of Akbar Khan was defeated and routed, and the place was as far as possible desolated. The English officers and their ladies who had surrendered themselves as prisoners to Akbar Khan, were restored to liberty; and soon afterwards, the troops marched back to India. It was believed now that the Afghans were deprived of all power to confederate against the government of India; but this conclusion was too hasty, for in 1846 they formed an alliance with the Sikhs against the British; and the disturbances in the Punjab were not quelled without several sanguinary engagements. After the decisive battle of Gujerat (February 21, 1849), the Sikhs were forsaken by the Afghans; and Dost Mohammed, with about 16,000 men, fled over the Indus. Once more the British army marched through the Khyber Pass, and renewed the work of subjugating the several Afghan tribes. Since the close of the Sikh war, they have remained tranquil; and there is every probability that, as they learn to recognise the intention of England not to extend the boundaries of her conquest beyond the Indus, they will cease to exhibit that hostile jealousy of feeling which has long characterised their relations and intercourse with her. See *A Journal of the Disasters in Afghanistan*, by Lady Sale (Lond., 1843); *Eyre's Military Operations at Cabul* (Lond., 1843); and *A History of the War in Afghanistan*, by J. W. Kaye (2 vols. Lond., 1851).

AFRICA, one of the great divisions of the globe—the second in point of size, but by far the least important as regards the civilisation and progress of the human species. This continent, so long a land of mystery, has, in modern times, been partly opened

for us by the enterprise of explorers, the zeal of missionaries, the perseverance of commercial speculation, and the military aggressions of Europeans. The extreme N. and N.E. borders, which in ancient times were the seats of civilisation, while all the other parts lay hid in darkness, had fallen back into a state of barbarism, but are now partially restored to a position of importance in connection with the political and commercial interests of Europe. Great progress has also been made, from the south or Cape Colony, in exploring the elevated land of the interior, and introducing commerce among the natives. The efforts of England to suppress the slave-trade, and to open new channels for manufacturing industry, seem likely, in the course of time, to make great alterations in the condition of the countries and tribes of people on the western coast, while the recent and present attempts to navigate the Quorra, or Niger, have considerably advanced our knowledge of the interior. The chief hindrances are found in the comparatively few accessible points on the coast, the pestilential climate of the marshy lowland bordering on the sea, the barrenness of vast tracts like the desert of Sahara, over which one must travel rapidly, and only by certain routes; and lastly, the barbarism and sanguinary character of the natives. On the other hand, the position of A. is favourable to its exploration by Europeans. Its most remote harbours are almost as near as North America—nearer than the Brazils, and much nearer than British India. A sailing-vessel from Bristol can reach the river Senegal in about twenty days; Sierra Leone in thirty; Cape Coast in thirty-five; and the Congo in fifty. Of course, steam-communication is far more rapid.

The valley of the Nile was known in the earliest period of history as the nursery of commerce, arts, and sciences; but while Egypt was flourishing, the rest of A. was almost totally unknown, and was vaguely spoken of as Libya. In later times, the Greeks and the Romans became more acquainted with the shores of the Mediterranean Sea, and penetrated into A., probably as far as the Niger; but they had scarcely any definite knowledge of the countries lying beyond Numidia, while South A. was entirely unknown. The tradition that Jewish and Tyrian merchants, on their voyages to Ophir, explored the east coast of A., is dubious; but another account, that, in the time of Pharaoh-Necho, the Phœnicians circumnavigated A., seems to be well authenticated; and it is probable that the Carthaginians had a better knowledge of the interior than we have in the present day. For a history of the older discoveries in A., we may refer to Murray's *Historical Account of Discoveries and Travels in Africa* (2 vols., Edin. 1817), and to Leyden's *Sketch of the Discoveries in Northern and Western Africa* (Edin. 1799).

The 15th c. was marked by an extension of geographical knowledge in A. as elsewhere. Henry the Navigator sailed round the formidable Cape Nun (*non plus ultra*); Diaz and Vasco de Gama discovered the Cape of Good Hope; and both the western and the eastern coasts were partly explored by several European voyagers. The older travels and discoveries may be arranged in the following order: in the 14th c., the travels of the Arabian Ebn Batuta in the north of A. In the 15th c., the Portuguese discoveries of Madeira, Cape Blanco, Senegal, Guinea, Benin, the Cape of Good Hope, &c., and the navigation of the east coast by the Portuguese Covilliam, who first travelled in Abyssinia. In the 16th c., the travels of Leo Africanus through Barbary and Sahara to Abyssinia; the travels of the German Ranwolf in North A., and Windham's voyage to Guinea, which was followed

by several other expeditions in 1554 and 1562. In 1570 and 1600 the Portuguese visited Monomotapa, then a powerful state near the Mozambique coast. In the 17th c., the Englishmen Jobson and Thomson, in their journey to Timbuktu, opened British commerce with A., and the slave-trade immediately followed. In 1662, we find a French colony on the Senegal, and many exploring journeys to the interior by Lionard and others. In 1624, the Jesuit Lobo endeavoured to find a way from the equator through the interior as far as Abyssinia. Thevenot's journey to Egypt in 1652, the English occupation of Cape Coast in 1664, Bruce's voyage to Senegambia, and several other visits to the western coast, mark the progress made in the latter half of the 17th c. One German traveller, Wansleben, gave a description of his journeys on the west coast; and another, Von Groben, in 1683, founded in Upper Guinea the colony of Fredericksburg, which afterwards fell into the hands of the Dutch, but is now abandoned.

In the course of the 18th c., various additions were made to our store of information on Africa; but they are not all trustworthy. In the year 1788, the African Society was founded in London, and, under its direction, Ledyard and Lucas were sent to explore the Niger, and were followed by Major Houghton. The English colony of Sierra Leone was founded in 1790. The French expedition to Egypt, towards the close of this century, gave a new impulse to researches in A.

In the 19th c., the most various motives have operated in favour of an extended knowledge of this vast continent. The captains of English cruisers, employed to suppress the slave-trade, have supplied some valuable information; the governors of the colonies and private merchants have contributed their share; and enterprising travellers from all sides of the coast have endeavoured to strike out paths to the interior. The works published on A. since the year 1800 are consequently very numerous. It would be useless to specify the whole of these, inasmuch as many of them are only hasty and fragmentary sketches by casual travellers, and have recently been superseded by volumes containing the results of more accurate and extensive researches. A few of the more important may be mentioned. In 1802—1805, Lichtenstein travelled in the district north of the Cape of Good Hope, and first furnished information regarding the Betchuanua tribe. The travels of Mungo Park from Timbuktu to Bussa are familiar to every one. In 1809, Burekhardt was sent out by the African Society, and his explorations, rich in manifold results, occupied the years 1812—1816. To the French we are indebted for much valuable information concerning Morocco, Algeria, and the neighbouring parts of Sahara. In 1821, Oudney, Clapperton, and Denham set out from Tripoli, in a southerly direction, through the border-land that separates the Libyan from the Sahara Desert, intending to proceed to Bornu, and explore the course of the Niger. Oudney died in 1824; but Clapperton and Denham continued their journey, and reached Sokoto or Sacatoo, the residence of the ruler of Sudan. They discovered the fresh-water lake Tchad. In the following year, Clapperton, accompanied by three friends, started from Benin, intending to travel through the whole region lying between Timbuktu and Abyssinia, but died of dysentery at Sokoto, April 13, 1827. His servant, Richard Lander, after giving an account of their discoveries, was employed in another exploration of the Niger, and traced its lower course to the embouchure in the Bay of Benin. During the last twenty years, our knowledge of South A. has received many important additions from the missionaries stationed there, especially Moffat; while David Livingstone, who, since 1843,

has been earnestly endeavouring to open the countries north of the Cape of Good Hope, penetrated in 1849 as far as Lake N'gami, in 20° S. lat.; and in 1853, ascending the Lecambe (Zambesi) northward for several hundred miles, succeeded in crossing the continent to Loando on the W. coast, in the Portuguese province of Angola. Having retraced his steps to the point of the Zambesi from which he had started, the adventurous traveller next followed that stream, which there bends eastward, till he reached the E. coast, in 18° S. lat. He is still (1859) engaged in prosecuting discoveries in that rich and interesting region. Further north, the geography, language, and manners of the inhabitants of Abyssinia, Senmaar, and Kordofan, have, during late years, been greatly illustrated by the efforts of various Europeans, who have travelled thither with the hope of exploring the course of the Nile. Finally, the extensive and long-continued researches of Dr Earth and his companions, proceeding by the same general route from Tripoli as Clapperton and Denham, and investigating, though more comprehensively, the same central division of the continent, have enriched our store of knowledge regarding this land of mystery. (Notices of subsequent explorations will be found under NILE, NYANZA, NYASSA, ZAMBESI; and ALBERT NYANZA and SPEKE in SUPPLEMENT.)

A. is situated in the eastern hemisphere, to the S. of Europe, and the S. W. of Asia, and lies between lat. 37° 20' N., and 34° 50' S., and long. 17° 30' W., and 51° 30' E. It is of an irregular triangular form, with the vertex towards the S., having the Mediterranean on the N., the Isthmus of Suez, Red Sea, and Indian Ocean on the E., and the Atlantic on the W. It is thus almost insular, the connecting isthmus being only 72 miles across, of no great elevation above the sea-level, and even in part occupied by salt lakes and marshes—offering in this respect every facility for the connection of the Red Sea and Mediterranean by canal. The coast-line is marked by few indentations or projections; the most important gulf being that of Guinea, on the W.; and Capes Bon, Verde, Good Hope, and Guardafui, the extreme points respectively on the N., W., S., and E. The greatest length of the continent, taken from north to south, is about 4935 miles; its greatest breadth, from east to west, 4615; and its area, including the adjacent islands, not less than 11,554,000 square miles.

What is known of the physical features of A. may be shortly sketched under the following heads: 1. The triangular region south of Cape Guardafui and the Gulf of Guinea, is mostly a high table-land, having fringes of mountains crowning its edges. Between the coast and the beginning of the elevation runs a belt of lowlands, varying from 50 to 300 miles in breadth. The Lupata range, seen running parallel with the coast, forms the eastern crest of the table-land. Between 3° and 4° S. lat., it reaches, in the snow-clad Kilimandjaro and Kenia, the height of 20,000 feet. These are believed to be the real Mountains of the Moon, which have hitherto been represented as running across the continent from E. to W. The mountainous country of Abyssinia is the eastern prolongation of the plateau and its elevated crest; in the summit of Abba Yared, at the northern extremity, it rises to 15,000 feet. At the south, the hills of Cape Colony rise in stages from Table Mount to the summits of the Nieuwveld and Sneeuwberg, in the N. of the colony, which are estimated at 7—10,000 feet; the spaces between the ranges being shrubby *kloofs* or valleys, and broad elevated terraces or *karroos*. From the elevated crest that runs parallel to the west coast

from Cape Colony to Vallish Bay, Mr Galton describes the country as sloping both W. and E., thus giving a cup or basin-shaped appearance to the interior of the continent. Towards the N.W. the border of the table-land rises in the Cameroons to the height of 13,000 feet. Its northern boundary is not determined; but it is likely that the valley of the western branch of the Nile penetrates into it, dividing it into two portions, an eastern and a western. A mountain seen lying south from Lake Tchad is supposed to be one of its northern outposts.

2. North of the great triangular table-land lies Sudan or Central Nigritia, under which name may be comprehended the countries watered by the Senegal, Gambia, and Niger, along with the coast of Lower Guinea; and the basin of Lake Tchad. In the west of this section is a mountainous table-land of no great elevation, in which the rivers above named take their rise; the Kong Mountains, which run parallel to the Guinea coast, are a branch of this elevation. Eastward of the Niger, the country is hilly, alternating with rich, often swampy plains. In the basin of Lake Tchad is a vast alluvial plain, one of the largest on the globe, and of great fertility.

3. Between Sudan and the cultivated tract which borders the Mediterranean, stretches the Sahara or Great Desert. It extends south nearly to the Senegal, the northern bend of the Niger, and Lake Tchad, northward to the Atlas range in Morocco and Algeria, and towards Egypt it reaches to the Mediterranean. Its average breadth from N. to S. is about 1000 miles. Its length from the Atlantic to the western edge of the valley of the Nile is 2000. Over a great part of this region, rain never falls, and everywhere it is rare; it is thus condemned to sterility. It consists partly of tracts of fine shifting sand, which frequent storms of wind raise into the air, so as often to overwhelm travellers. But the greater part of the surface consists of naked but firm soil, composed of indurated sand, sandstone, granite, and quartz-rocks, often rising into ridges or hills. The desolation is interrupted at intervals by patches, sometimes of considerable extent, covered with bushes and coarse grass, and often of great beauty and fertility. These *oases*, or *wadies*, as they are called, which are occasioned by subterranean springs, are most numerous and fertile in the eastern portion of the Desert. The easiest route across the Desert to Sudan runs from Tripoli through the kingdom of Fezzan to Lake Tchad. Fezzan enjoys periodic rain from the moist winds of the Mediterranean, which extend further into the continent here than elsewhere. The portion of the Desert lying east of the route above described is called the Libyan Desert. It is chiefly in this region that the oases are susceptible of cultivation; the tracts of vegetation in the western portion are fit for little else than pasture, mainly for goats and sheep. The principal production of the more fertile oases is dates; but other fruits and grain are also cultivated. Gum-arabic is another production. Some of the larger oases support thousands of inhabitants living in villages. Commerce is carried on across the Desert by various routes by means of caravans, consisting of from 500 to 2000 camels, with their attendants. The distance between the wells sometimes exceeds ten days' journey; and when a well is found dry, men and animals are in danger of perishing. The inhabitants consist of independent tribes of Moors, Berbers, and Arabs.

4. The Atlas region, comprehending the mountainous countries of Morocco, Algeria, and Tunis. The northern slope towards the Mediterranean, called the Tell, is, in aspect, climate, and productions,

similar to the opposite coast of Europe; the southern side merges gradually into the Sahara. Some parts of the chain are considerably above the snow-line, and the highest summits may reach 15,000 feet.

5. The region bordering on the Red Sea, consisting of Abyssinia, Nubia, and Egypt. Abyssinia, we have seen, is the mountainous termination of the great southern plateau. Between this and the Mediterranean extends the low valley of the Nile, separated from the Red Sea on the east by a rugged mountainous region, and from the Libyan Desert on the west by a low ridge of limestone and sandstone.

Regarding the hydrography of A., much is still to be ascertained. The portion which, until recently, was termed the 'unexplored territory,' seems to be anything but the barren and riverless desert that we imagined; still it may be safely stated that A., as a whole, is far from being a well-watered continent, though hardly one of its streams has been traced throughout its entire course, while nearly the entire tributaries of these, if (as is probable) such exist in abundance, are almost wholly unknown. Those of the south, which mostly rise in the neighbouring highlands, are, in many instances, little better than mountain-torrents, having short and rapid courses; and the embouchure, generally in the delta form, is commonly obstructed by a bar of sand. The Orange liver, for instance, is filled with sand at its mouth.

Rivers.—The great rivers of A. are the Nile, the Niger, the Zambesi, the Orange, the Congo, the Senegal, and the Gambia. See arts. NILE, NIGER, &c. The first of these is formed by the junction of two rivers—the White Nile (Bahr-el-Abiad) and the Blue Nile (Bahr-el-Asrak). The former flows from an unknown source near the equator, through a region as yet unvisited by Europeans, skirts the eastern edge of Kordofan, and passes into Nubia, where it is joined by the Blue Nile at Khartoum, after the latter has broken through the highlands of Abyssinia. The single stream then sweeps circuitously through Nubia in a succession of cataracts, and descending into Egypt, reaches the Mediterranean through the far-famed Delta. The second of the great rivers the Niger, Joliba, or Quorra—for it goes by these and other names in different parts of its course—rises in the Kong Mountains of Guinea, about 9° 25' N. lat., 9° 45' W. long., and flows first N.E. till it reaches Timbuktu, where it bends E. for a short distance, and then descends in a S.E. direction into the Gulf of Guinea. Its length is estimated at 2500 miles; and its navigability has been ascertained for a distance of upwards of 400 miles; but its banks are very pestilential. Its principal tributary is the Tchadda or Benué. At the extreme west of the mountains of Kong, and not far from the source of the Niger, rises the Senegal, which flows with a crescent sweep to the N.W. through Senegambia, and enters the Atlantic north of Cape Verde. The Gambia, a smaller river, runs in a similar direction through the same country, and falls into the sea south of Cape Verde. The Congo, which has its origin somewhere in that great division of A. south of the equator that has recently been opened to us, is very imperfectly known. It empties its waters into the Atlantic at Cape Padrone, in South Guinea. The Orange River flows from east to west with many windings through what is popularly termed 'the country of the Hottentots;' while the Zambesi, though only partially explored, seems rich in affluents, and runs in a general easterly direction, entering the channel of Mozambique about 18° S. lat.

Lakes.—The lakes of A. are, as yet, no better known to us than its rivers. *Tchad*, *Chad*, or more correctly, according to Dr Barth, *Teud*, the chief lake

of Sudan or Central A., has a circumference of about 200 miles, with a depth varying from 8–15 feet, and an elevation of 850 feet above the sea-level. Though it has no outlet, its waters are cool and clear, and abound with fish. Besides a multitude of temporary streams, it is the recipient of several large rivers. The chief is the Shary or Asu, from the south-east. *Demba* or Tzana, in Abyssinia, through which the Blue Nile flows, is about 65 miles long, and 30 broad, and lies 6000 feet above the sea-level. Lake N'gami, in Southern A., has been already mentioned. From the concurring accounts of Arab travellers and natives, it is ascertained that there is a large lake in the interior called Nyassi or Uniamesi, about 5° S. lat., and 29° E. long. It is in the midst of a fertile and populous country, and feeds a large river, the Lulia, which flows eastward into the sea on the Zanzibar coast.

Geology.—The geology of A. is known as yet only from cursory observations made at isolated points. The character of the Sahara has been already indicated. The section traversed by Dr Livingstone presents a variety of schists, shales, sandstones, and tufa, through which protrude granite and trap-rocks. In one place towards the east side of the continent, the sandstone is found overlying coal. Between Tripoli and Murzuk there is a plateau, the dark sandstone of which disintegrated, fills up the inequalities of the surface, from which the black rock stands out in fantastic cones. The lofty barrier of limestone which forms the western boundary of Egypt, reappears in the rugged ranges of hills which break the monotonous waste of Sahara; they sometimes contain marine shells. Secondary limestone also constitutes the lower skirts of the Atlas Mountains, but what constitutes their basis has not yet been discovered.

Climate.—There are three great varieties of climate, corresponding to the physical structure of the continent: first, that of the plateaus; second, that of the terraces which lead to them; and third, that of the coasts. In the vast desert of Sahara, extending over an area equal to that of the Mediterranean Sea, almost destitute of water and vegetation, and partly covered with tracts of sand and bare low rocks, the heat of the day is uniformly contrasted with the coldness of the night; while on the terrace-land of Limbu, for instance, situated behind the Sierra Leone region, we find a temperate and wholesome climate; and in that rising behind the Slave Coast, we have beautiful landscapes, abundant springs, new forms of vegetation, and a mild Italian air. The natives of Congo call their terrace-lands, which are well cultivated and thickly peopled, 'the Paradise of the World.' But the flat coasts, which are often over-flooded in the rainy season, have a very oppressive atmosphere, and from the morasses at the mouths of the rivers, a malaria arises which is pestilential to Europeans. This malaria has been supposed to arise from the decay of the vegetable matter brought down by the rivers from the dense mangrove-woods, which, mixing with the salt water on the coast, produces sulphuretted hydrogen gas. Nothing can be more unfavourable to the health and energy of Europeans than the climate of Sierra Leone, the Gambia, and M'Carthy's Island. In the last, the thermometer is often at 106° in the shade during the dry season, and the whole island is little better than a morass in the four rainy months. The region of pestilential air has been calculated to extend about 100 miles inland; but only 40 miles out at sea, and to rise to a height of 400 feet above the sea-level.

Productions.—The vegetation of A. is decidedly less varied than that of Europe or Asia. Along the Mediterranean sea-board, it greatly resembles that of Southern Europe. The tropical regions are not

so rich in species of plants as those of South America, but still they exhibit many peculiar genera. As we leave the sultry coasts, and ascend the terraces towards the interior, we pass gradually from tropical productions to those of the temperate zones, which all flourish well in several parts of A. Though the forests cannot rival those of Brazil, they are rich in valuable woods, especially the harder kinds; some of them excellent for ship-building. Here we find the gigantic *Adansonia* (q. v.) *digitata* or baobab. Ebony, certain kinds of rosewood, and the timber called African teak, are among the productions of the tropical forests. The Butter-tree (*Bassia*, q. v.) is one of the most remarkable productions of the central regions. Extensive level tracts are covered with acacias. Certain palms are very characteristic of different parts of A., and are of the greatest importance to the inhabitants, particularly the Date-palm (q. v.) in the north, and in an inferior degree, the Doom-palm (q. v.), both of them growing in regions comparatively arid, and often surrounded by the very sands of the desert; whilst the Oil-palm (q. v.) flourishes amidst the tropical luxuriance of the west, and supplies an article of commerce which now attracts the ships of Europe, in constantly increasing numbers, to shores once frequented only for the prosecution of the slave-trade. The Cocoa-palm (q. v.) flourishes on many parts of the tropical coasts. A large quantity of oil is produced also by a plant of a very different description, the Ground-nut (*Arachis*, q. v.), a leguminous herbaceous plant, which has the remarkable peculiarity of thrusting its pods into the ground to ripen there, and which is now so extensively cultivated, that nine millions of bushels of ground-nuts are annually exported from the Gambia. The southern extremity of A. is remarkable for the vast number of its species of mesembryanthemums and heaths. Pelargoniums, iridaceæ and proteaceæ, are also among the most characteristic features of its vegetation. Euphorbiaceæ abound in most parts of the continent. Many of the productions of other countries have been introduced, both in the tropical and temperate parts of A. Maize is now extensively cultivated, as well as rice, wheat, and millet. A peculiar kind of grain, called fundi, or fundungi (*Paspalum exile*), is cultivated in the west, and grains called teff and tocusso (*Poa Abyssinica* and *Elyusine Tocusso*) in Abyssinia. Coffee grows luxuriantly, and of good quality. Indigo and tobacco are easily cultivated, and cotton has succeeded well where it has been introduced, as in Egypt, where, however, it requires artificial and laborious irrigation; while in the rich and well-watered soil of Sennaar, it flourishes even with a most careless style of cultivation, and might, without doubt, be produced in enormous quantity. Other regions, as Natal, seem likely soon to produce it abundantly. The vine is cultivated with success at the Cape of Good Hope, and the sugar-cane in different parts of the continent.

In the animal kingdom, we find the lion, the leopard—often called the tiger, but the tiger is not yet known except as a native of Asia and the Asiatic isles—hyenas, jackals, and others of the canine family, a species of elephant, differing in some particulars from that of Asia, several species of rhinoceros, the hippopotamus, wart-hogs (*Phascogærus*), and many kinds of monkeys, particularly within the tropics. The giraffe, the zebra, and the quagga, are peculiar and characteristic, as are also numerous species of antelope, which occupy, in African zoology, the place of deer in other parts of the world. The gau is one of the most remarkable of the antelope genus. Some of the smaller species occasionally appear in prodigious numbers,

devastating the fields of the colonists. The ostrich is found in almost all parts of A. Parrots, flamingoes, and guinea-fowls may also be mentioned among the birds. Crocodiles are found in the rivers, and many kinds of lizards and serpents occur, not a few of the latter being poisonous. There are also tortoises and turtles of different species. The domestic animals succeed well. Camels are said to have been introduced by the Arabs, and are plentiful in the northern regions.

It would be hazardous to assert that A. is deficient in *mineral wealth*, though, judging from our present imperfect knowledge, it does not seem to be extremely rich. Gold is much more plentiful than silver, being found abundantly in the sands of the great rivers that flow out of the central region, on the coast of Guinea, and also in the south-east of A. The Sierra Leone coast has valuable iron ore, which is also found in the Upper Senegal, the region of Timbuktu, the Congo chain of mountains, Egypt, and Darfur. Copper is plentiful at Majomba, and in some other places; salt may be obtained from almost every district in A. except Sudan, and sal-ammoniac, saltpetre, sulphur, and emery in various portions of the continent.

Population.—The population is vaguely estimated at above 100,000,000. The native inhabitants belong to one of the three great divisions of the human family, called, by Dr Latham, Atlantide, the Ethiopic of other ethnologists. The subdivision into tribes is endless, but they may be all classed in six groups; 1st, The *Negro Atlantide*.—These have, in an exaggerated form, the black unctuous skin, woolly hair, projecting jaws, flat nose, and thick lips, characteristic of the whole variety. But it is important to observe the comparatively narrow area to which the negroes proper are confined. They occupy Western A., from the Senegal to the Gaboon, Sudan in the centre, and the low parts of the Upper Nile. The dusky or brown hue is more prevalent through A. as a whole than the jet-black of the negro; which seems nearly coincident with river valleys and deltas lying within the tropics. 2d, *Kafir Atlantide*.—In physical conformation, they are modified negro; the jaws are less projecting; their language has some singular peculiarities. They occupy from north of the equator to south of the Tropic of Capricorn. 3d, *Hottentot Atlantide*.—These, according to Dr Latham, have a better claim to be considered a second species than any other section of mankind. Their colour is brown rather than black; the hair grows in tufts. The stature is low, and the bones of the pelvis peculiar. Their language has a characteristic *click*. They inhabit the south of the continent, and are divided into Hottentots and Saabs, or Bushmen. 4th, *Nilotic Atlantide*, occupying the water-system of the Upper and Middle Nile. The leading tribes are the Gallas, Agows, Nubians, and Bishari, forming the population of Abyssinia, Adel, and Nubia. It connects by imperceptible gradations the Coptic and Semitic groups with the rest of the African. 5th, *Amazigh Atlantide*, usually called Berbers. In conformation, they vary from the negro to the Arab type. The language is *sub-Semitic*. They inhabit the ranges of the Atlas, the Sahara, the Canary Isles, and are found as far south even as the centre of Sudan. 6th, *Egyptian Atlantide*, or old Egyptians, represented by the modern Copts. Both language and physical conformation connect them, on the one hand, with Berbers and Nubians; on the other, with the Assyrians, Jews, &c.

In *religion*, the natives are as various as in language; but it may be questioned whether some of the tribes, especially in South A., can be fairly described as having any religion. In not a few of these, the religious consciousness seems wholly

extinguished, and the very terms which express it, to have dropped out of their language. Such, at least, was the result of Moffat's observations, though perhaps the degradation in which he found some tribes plunged was in itself a barrier to a just and adequate communication with them; for the lower that races or individuals sink, the less easy is it to understand them. Throughout the north, and to a considerable extent in the interior, the creed of Mohammed is received, but held very loosely by many. The Mohammedan tribes on the west coast divide themselves into two classes—the *Marabouts* and the *Sonnachees*; but it is not easy to understand the exact nature of this distinction, beyond the simple fact, that the Marabouts profess to adhere rather strictly to the laws of the Prophet, while the Sonnachees are more secular, make little profession of sanctity, but eat pork and will drink spirituous liquors. The lowest form of superstition, styled *fetichism*, prevails among the uncultured negro tribes, as well as among the Gallas, a nation widely spread south-east of Abyssinia; and the practice of offering human sacrifices is found in many tribes. The Abyssinians hold by tradition a crude form of Christianity.

Of the forms of *government* among the several nations and tribes, our knowledge is not sufficiently definite. Though there is despotism, it appears to be limited to some extent by a respect for the 'head-men' in every tribe, who form a sort of aristocracy, and whom the king must consult on all important affairs. The liberty of speech employed in a native parliament, or rather 'palaver,' is often considerable. Though women are generally found in a degraded position, the wives of the king often take a part in council, and exercise their influence in the affairs of state. Civilisation, in the proper sense of the term, is only to be met with in the settlements of the Europeans; for the condition of the *Moors*, *Arabs*, and *Egyptians* is scarcely entitled to rank higher than that of semi-civilisation.

Of *science, art, and literature*, we can say little; for all that had been achieved under the Pharaohs and Ptolemies disappeared with the conquest of the Moslems. A schoolmaster is found in almost every Mohammedan village; but the Koran is the only book studied. Medicine is little understood, though the tribes in the south and elsewhere have great faith in its powers, and practise it in a very absurd and superstitious style. Among many tribes, the religion might be styled medicine-worship. Inoculation, as a preservative against the small-pox, is common among the Mohammedan tribes. Mechanical skill is generally respected; and the smith or worker in iron is reckoned among the 'head-men' in every tribe. To the African mind, the products of European skill and industry are the strongest arguments that can be brought forward to prove the superiority of our religious doctrines: thus commerce seems indispensable to prepare the way for any extensive changes of creed.

Of the interior *commerce* or barter of the natives among themselves, our knowledge is scanty. Caravans of camels pass over the wide deserts by such routes as lead them to the greatest number of springs, brooks, and oases, or comparatively fertile places. The chieftains in the desert are the principal traders; and one feature in their character, though carried to a cruel extreme, is certainly favourable to commerce: debtors are treated with great severity. When payments are delayed, not only the debtor himself, but, if he is absent, any member of his family, may be seized as a slave. Timbuktu, on the southern edge of Sahara, is the chief commercial depot and central station for the caravans which arrive from Tafilet, Tripoli, and other places in

North A. From Timbuktu they proceed on their route along the course of the Niger to Kashna, another station of commercial importance, which is also visited by the caravans from Sudan and Bornu. From Kashna the caravan-route leads to Bornu and Lake Tchad or Tsad; thence to the territories of the Tibbous and the Twareks, and on to Murzuk in the oasis of Fezzan. Kulfra is another great meeting-place of the caravans coming from Dahomey in the south-west, Borgu in the north-east, and Niffe in the south-east. There seems to be no doubt that these caravans are in communication with others from the east, and thus connect, in a primitive style of commerce, the Indian Ocean with the Atlantic and the Mediterranean Sea. The principal places of commerce in the east are Marnegar, Berbera, Ancobar, Gondar, Sennaar, and Kobbe. In Benguela and Angola, negro caravans from the interior arrive at the chief places on the coast, bringing slaves, ivory, and gold-dust, which are bartered for various commodities.

Though A. is so rich in natural productions, and capable of maintaining a thriving commerce with other parts of the world, it is still a painful fact that along its coasts, and in the caravan-roads of the interior, the principal trade is in slaves. Regarding the cruelty and wickedness of this traffic, it is unnecessary that a single word should be said here. The verdict of enlightened Christendom has condemned it, but the prejudice against the negro race remains, and they are still considered by a large number incapable or unworthy of culture. It is probable that a more thorough knowledge of the Africans will dissipate so erroneous and pernicious an idea. As yet, we have chiefly come into contact with the barbarous tribes who dwell around our settlements on the coast; and it is unfair to judge the whole population by these. We must remember that several tribes have independently, and by their own exertions, arrived at a certain stage of culture, and seem to be on their way to civilisation. As we advance towards the interior, we do not find the people in a condition which can be fairly described as savagism; but with fixed dwellings, though they are merely mud-huts, defended by stockades, and possessed of some laws or customs which are favourable to commerce. Among several tribes, the native merchant is highly respected; and his goods are safe even in times of feud or warfare. The land is cultivated; the natives wear dyed cotton dresses, thicker and more durable than those exported from England, and consequently far dearer. Gold and iron are manufactured with ingenuity. The principal tribes on the Gambia, the Fulahs, the Joliffes, and the Mandingoes, have qualities which forbid us to despair of the progress of A. in culture. All that is wanted is a free commercial intercourse with the civilised world. Commerce must carry into A. the doctrine that it is better to employ men in trade, such as collecting palm-oil, than to sell them as slaves. Ability to understand such a truth will not be wanting; and when it is known and practised, the negro will prove that he is human, and will break through all the natural obstacles placed in the way of his development and improvement.

That portion of A. which is known is divided as follows: Native states and regions—Ashanti, Dahomey, Fezzan, Barca, Bornu, Dariur, Kordofan, Dongola, Guinea, Abyssinia, Marocco, Senegambia, Sennaar, Sudan with Sahara, the territory of the Imaum of Muscat, and the countries of the interior, with others on the east coast. British possessions are—Cape Colony and Natal, at the south; the island of Mauritius, St Helena, Ascension, Sierra Leone, Cape Coast, and the Gambia Colony.—The French have settlements on the Senegal, with the islands

of St Louis and Gorée, the Isle de Bourbon, St Marie, and the great colony of Algeria.—Egypt, Nubia, Tunis, and Tripoli belong nominally to Turkey.—Danes and North Americans, as well as the Dutch, have forts and settlements in Guinea.—The Portuguese have the Azores and Cape Verde Islands, with Madeira, Porto Santo, St Thomas, Angola, Benguela, and Mozambique.—The Canary Islands belong to Spain.—The large island of Madagascar and the Comoro group are under native rulers; but in some of these islands on the east coast the French have recently established themselves, as at Mayotta.

AGA or AGHA, the Turkish title of a superior military commander; also of the higher officers of the seraglio.

AGADES, formerly a very important city of Central Africa, but at present in a declining condition. It is the capital of Air or Asben (q. v.), and is built upon the eastern edge of a great table-land, at an elevation of not less than 2500 feet, in lat. 16° 33' N., long. 7° 30' E. It holds little intercourse with the northern cities, such as Murzuk, which, indeed, is never visited, except by pilgrims on their way to Mecca; but its merchants still frequent the markets of Katsena, Tasawa, Maradi, Kano, and Sokoto. At one time A. was a sort of entrepôt for the vast traffic carried on with Gogo—the ancient capital of the Songhay empire (q. v.)—but the conquest and destruction of this city, the centre of the gold-trade, has fatally injured the prosperity of the former, 'cutting away the very roots through which it received life.' A. was founded some hundreds of years ago, in all likelihood by the Berbers, who were expelled by the great Songhar conqueror, Haj, Mohammed Askia, in 1515. Its highest degree of power had been reached previous to this, when it probably contained 60,000 inhabitants. At present, it has not more than 6000 or 7000. The language is the Engedesiyé, the same as that spoken at Timbuktu, with which place, however, it has no intercourse now. There is a large admixture of Berber blood in the people of A. The trade and manufactures are trifling in extent. Dr Barth is of opinion that A. would form, for a European agent, a very good and comparatively healthy place from which to open relations with Central Africa. See Barth's *Travels in Central Africa*, vol. i.

AGAMA, a genus of Saurian Reptiles, the type of a family called *Agamida*. The Agamas are allied to the Iguanas, and have a lax skin, which they have the power of inflating with air. None of them are of a large size. They are found in warm climates, and are of various habits, some of them living in trees, and others confined to the ground. The Egyptian A. (*A. Egyptiaca* or *Trapelus Egyptiacus*)

Frilled Agama.

is remarkable for changing colour, like the chameleon. Some of the most common lizards of Australia are of this family. The Frilled A. (*Chlamydosaurus*) is a remarkable Australian lizard, having a sort of frill around the neck, which usually lies

back in plaits, but is raised when the animal is alarmed.

AGAMEMNON, son of King Atreus, and brother of Menelaus. After his father's death, he reigned in Mycenæ, and married Clytemnestra, by whom he had three children—Iphigenia, Electra, and Orestes, afterwards celebrated in the Greek drama. When Paris, son of the Trojan king, Priam, seduced and carried away Helena, the wife of Menelaus, A., with his injured brother, made a tour throughout Greece, exhorting all the leaders of the people to unite their forces in an expedition against Troy. Having gained their alliance, A. was appointed general-in-chief of the united forces assembled at Aulis in Bœotia, where they were delayed some time. In the following campaign against Troy, which forms the subject of Homer's *Iliad*, A. is described as a very stately and dignified character. After the fall of Troy, he returned home, taking with him Cassandra, the daughter of Priam. Shortly afterwards, he was murdered by Clytemnestra, aided by Ægisthus, in whose care he had left his wife and children. A tragical fate had always lowered over the house of A.; and the destinies of his children—Iphigenia, Electra, and Orestes—were the favourite subjects of the Greek drama.

AGAMI (*Psophia*), a genus of South American birds, allied to Cranes. Only two species are known. They are sometimes called *Trumpeters*, from a peccidiar

Agami.

sound which they make. The best known species is the Gold-breasted Trumpeter (*P. crepitans*), which is of the size of a large pheasant, but with much longer legs and neck, and a very short tail. It runs very quickly; so much so, that a tame one in England has been known to keep up with hounds. It is capable of the most perfect domestication.

AGAPÆ were love-feasts, or feasts of charity, usually celebrated by the early Christians in connection with the Lord's Supper. The name is derived from the Greek word *agape*, which signifies love or charity. At these feasts, the rich Christians presented their poorer brethren in the faith with gifts, and all ate together, in token of their equality before God and their brotherly harmony. The meetings were opened and closed with prayer; and during the feast, spiritual songs were sung. At first, a bishop or presbyter presided, who read a portion of Scripture, proposed questions upon it, and received the various answers of the brethren. Afterwards, whatever information had been obtained regarding the other churches, was read—such as the official letters of overseers, or private communications from eminent members; and thus a spirit of practical sympathy was engendered. Before the conclusion of the proceedings, money was collected

for widows, orphans, the poor, prisoners, and those who had suffered shipwreck. Then the members embraced, and the feast was ended with a 'philanthropic prayer.' As early as the 2d c., the custom of celebrating the A. and the Lord's Supper together had ceased, on account of the persecutions. Justin, when writing on the latter subject, does not speak of the former; but Ignatius, on the other hand, seems to regard them as identical. Generally, the feast of the A. preceded the celebration of the Lord's Supper. But during the period of the persecutions, when the Christians had often to hold divine service before dawn, the A. were, for the most part, delayed till the evening. Later, a formal separation was made between the two rites. In the 3d and 4th centuries, the A. had degenerated into a common banquet, where the deaths of relatives, and the anniversaries of the martyrs, were commemorated, and where the clergy and the poor were guests; but with the increase of wealth, and the decay of religious earnestness and purity in the Christian Church, these A. became occasions of great riotousness and debauchery. Councils declared against them, forbade the clergy to take any share in their celebration, and finally banished them from the church. At the same time, it must be admitted that the heathens ignorantly calumniated the practices of the Christians in these A., and that the defences made by Tertullian, Minucius, Felix, Origen, &c., are eminently successful. The Moravians have attempted to revive these A., and hold solemn festivals, with prayer and praise, where tea is drunk, and wheat bread, called Love-bread, is used.

AGAPEMONE (Gr. love-abode), a conventual establishment of a singular kind, consisting of persons of both sexes, founded at Charlynech, near Bridgewater, in the county of Somerset, by Mr Henry James Prince, formerly a clergyman of the Church of England. The inmates are called Lampeter Brethren, and belong to a new religious sect originating with Mr Prince, and a Mr Starkey, also a clergyman. The adherents of the sect generally, of whom there are many in the south-western counties, are known as Princeites or Starkeyites.

As curate in a village on the coast of Dorsetshire, Mr Starkey, who possessed the gift of eloquence to an extraordinary degree, effected real good. His parishioners, most of them lawless smugglers, and those who flocked to hear his discourses, listened to him as to one inspired; and many who did not follow him in his wild theories, ascribe their first real impressions of religion to his ministry while he was yet a clergyman of the Established Church. Gradually, his doctrine changed, and in company with Mr Prince, he began to hold forth in barns, whence loud howlings were heard by the passers-by. People of all classes flocked to hear the new preachers; even clergymen's families were infected with the taint of this heresy, which spread through the secluded villages on the coast, obtaining especial hold among the farmers, several of whom, as in the times of the apostles, brought their wealth, and laid it at 'Brother Prince's' feet—community of goods being the tenet most strenuously insisted upon.

Meanwhile, funds accumulated rapidly. Three of the Brothers—Messrs Price, Thomas, and Cobb—married three sisters, daughters of a wealthy widow lady named Nottidge. These young women, handsome, clever, and of independent fortune, began by listening, against the wish of their parent, to Mr Prince's preaching, and finally left their home to marry his disciples. A fourth sister afterwards followed their example. So strong was the feeling under which they acted, that, on their aged mother coming in person to remonstrate on their conduct,

they rejected her claims of authority, saying that the devil was speaking to them by her voice.

The affairs of the A. have several times given rise to proceedings in the courts of law, on which occasions the public obtained some glimpses into the internal regulations of the establishment. In 1846, one of the ladies above mentioned, having become dissatisfied with the doctrine and rule of life in the A., was expelled from the society, and put away by her husband, Mr Thomas, though then about to give birth to a child. After she had lived four years with her mother, who had made provision for the child, Mr Thomas wrote, renouncing her for ever, and claiming the custody of his son. This was resisted; and in the course of the law proceedings (1850) that took place, much that was offensive in the conduct of the Agapemomians transpired. Although the inmates were married couples, it appeared that they entertained some religious objection to the increase of population, as if believing that the perfection of all things will be the extinction of the human race. In short, the doctrines or peculiar notions of this remarkable sect are seemingly a natural and not unusual consequence of allowing an excited imagination to overrule the judgment; and, hence, Agapemomanism is but a new or revived form of extreme religious fanaticism.

Mr Prince's first establishment was at Weymouth. The present A., which has existed now (1859) for about ten years, is a beautiful and spacious building, most luxuriously fitted up, and containing a magnificent music-hall, with all kinds of melodious instruments. When summoned thither, the farmer leaves his flocks, herds, and crops, even in the midst of harvest, and goes to Charlynoch to do the will of his 'Lord'—such is the title by which Mr Prince's followers speak of him. At other times, the yeoman receives at his own dwelling large parties of the Princites, and entertains them with lavish hospitality. For this, it is to be supposed, he has his reward, since one of Mr Prince's disciples, upon being offered assistance towards the recovery of a large sum which he had lost, replied that the money 'had been repaid by the Lord—the friend of friends, who sticketh closer than a brother.'

Letters intended for Mr Prince pass through the post-office directed to 'The Lord;' and his followers have been heard to say that he is their 'creator.' In 1851, Mr Prince took up a party of them to London to see the Great Exhibition. He drove about town and in the parks in a carriage, constantly attended by out-riders, bareheaded, because they were in the presence of 'the Lord.'

Mr Prince has put forth many pamphlets, some in the highest degree objectionable; others, in which the tenets of the Christian religion are mingled with his own peculiar doctrines. Christ came to redeem the soul. Prince affirms that *his* errand is to redeem the body. One test applied to his disciples, from which many shrank, was, that they were to see the eternal punishment of those whom they best loved, and to rejoice in it as redounding to their Master's glory. When this was proposed, several persons of respectability, who had hitherto gone along with Mr Prince, declined to proceed further; others agreed to it cordially. There is now, it is said, no necessity for prayer; mourning for deceased relatives is forbidden; a sort of millennium is attained, in which no exertion is demanded—nothing but joy and thanksgiving. Pain and grief, sorrow and sickness, have for ever lost their dominion over the Princites; yet still, to the incredulous, it appears that consumption, rheumatism, and other infirmities of human nature, do affect them, and that they die, and are buried, like other men. In one of Mr Prince's latest pamph-

lets, the following words occur, which may serve to elucidate his somewhat mysterious doctrine: 'God in Jesus Christ has again entered into covenant with man at the resurrection of mankind, and this is the first resurrection, and now Brother Prince is His witness.' 'This one man, Brother Prince, has Jesus Christ selected and appointed His witness to His counsel and purpose to conclude the day of grace, and to introduce the day of judgment. To close the dispensation of the Spirit—the Gospel—and to enter into covenant with flesh.'

In 1859 appeared *Brother Prince's Journal, an Account of the Destruction of the Works of the Devil in the Human Soul by the Lord Jesus Christ through the Gospel*. It was commenced, according to Brother Prince, twenty-three years ago, and more than nineteen years have elapsed since its completion. Its aim is simply this: to shew the work of grace in the writer's soul, from its first struggling manifestations to that absolute harmony in which self is utterly absorbed and swallowed up in God. Brother Prince, at the close of his journal, deliberately states that he considers himself perfect, and incapable of further improvement. These are his words: 'Having neither wishes nor desires, my will can have no disposition whatever to move in any one direction rather than another, but like the finely poised beam of a well-adjusted balance, it hangs delicately suspended on the divine will, in a holy equilibrium of inward passiveness.' It was some time after Brother Prince had reached this Buddhist-like annihilation of self-consciousness, that he started his singular establishment at Weymouth.

It would appear that a society, similar in its aims and character, though not conventual in its form, existed in England in the 16th and 17th centuries. It was called the 'Family of Love.' Its founder is generally supposed to have been Henry Nicholas, a native of Münster, in Westphalia, but who lived a considerable time in Holland. He held himself to be greater than Moses or Christ, for the former only taught men to *hope*, and the latter to *believe*, while he first announced the doctrine of *Love*. He made his appearance about 1549. Others, however, are of opinion that the real father of this 'Family' was one David George, a fanatical Anabaptist of Delft, in Holland, who died in 1556, and who imparted his 'damnable errors' to Nicholas, an old friend of his. In the reign of Edward VI., according to Fuller, Nicholas came over to England, and commenced the perversion of silly people in a secret way. By 1572, they had apparently increased in numbers considerably, for in that year one John Rogers published a work against them, entitled, *The Displaying of an Horrible Secte of Grosse and Wicked Heretiques, naming themselves the Family of Love, with the Lives of their Authors, and what Doctrine they teach in Corners*. In 1580, Queen Elizabeth issued a proclamation for the hunting out and punishing of the 'damnable sect.' The Family of Love, 'or Lust, rather,' as old Fuller has it, tried to insinuate themselves into the good graces of King James, by presenting a petition, casting aspersions on the Puritans. At length, the society expired from continual exposure to the effects of ridicule in prose and verse, as well as from its own intrinsic worthlessness. Their doctrines seem to have been a species of pseudo-spiritual sentimentalism, resulting in gross impurity. See MUCKERS, in SUPPLEMENT.

AGARIC and AGARICUS. See MUSHROOM.

AGASSIZ, LOUIS, one of the most distinguished of modern naturalists, was born at Orbe, in the Canton de Vaud, in 1807. After passing through the usual course of elementary learning at Biel and Lausanne, he prosecuted his studies at Zurich and

Heidelberg, and lastly, studied medicine at Munich. In early youth, he had displayed a strong love of natural history; and at Heidelberg and Munich comparative anatomy was his favourite occupation. In Munich he became acquainted with Martius and Spix, the well-known travellers in Brazil; and when Spix died (in 1826), his collection of 116 species of fish collected in Brazil was left in the care of A., who published it under the title *Pisces, &c., quos collegit et pingendos curavit Spix, descripsit A.* (Munich 1829—1831, with 91 illustrations in lithography.) Led by this work to study ichthyology more closely, A. next undertook a systematic arrangement of the fresh-water fishes found in Central Europe. Of this work, the first fasciculus, containing the family of the Salmonide, appeared at Neuchâtel in 1839, with 34 illustrations, and descriptions in French, English, and German. A second fasciculus, prepared by his friend Vogt, *Embryologic des Salmones*, was published in 1840; and a third, *Anatomie des Salmones*, appeared in 1845 as a part of the third volume of the *Memoirs of the Neuchâtel Society of Natural History*. Beyond this, the work was not continued. A. at the same time devoted his attention to the fossil remains of fishes, and during his stay in Paris (1831—1832), examined several private and public fossil collections. The results of his studies were given in his work *Recherches sur les Poissons Fossiles*, published at Neuchâtel, with 311 lithographed illustrations, 1833—1842. Meanwhile, he had been invited to take the professorship of natural history at Neuchâtel; and here he found two active young friends, Desor and Vogt, who afforded considerable aid in the completion of his works. With their assistance, his work on fossil fishes was brought to a conclusion in 1842. During several visits to England, A. made himself well acquainted with the collections of fossils in this country; and in 1844, published a monograph on fossil fishes found in the old red sandstone of the Devonian system. His study of these remains led him to examine other fossils; and the results appeared in his works *Description des Echinodermes Fossiles de la Suisse*, and *Monographies d'Echinodermes Vivants et Fossiles*. In the latter work, Professor Valentin of Berne supplied the section on the 'Anatomy of the Sea-urchin.' A. next turned his attention to the mollusca, and produced his *Critical Studies on Fossil Mollusca*, which was soon followed by his *Memoirs on the Muscles in Living and Fossil Mollusca*. His work on *Glaciers* excited great interest, as it opened new views in geology. The results of further study were given in a second work on *The System of Glaciers; or Researches on Glaciers* (Paris, 1847). In preparing this work, he was assisted by his friends Guyot and Desor. In 1846, A. went to North America, where he was appointed to a professorship in Harvard College, near Boston; from which he was subsequently removed to occupy the chair of comparative anatomy in the University of Charleston. He recently declined the offer of a chair in Paris, made him by the Emperor of the French. He has published in America *Principles of Zoology, for the Use of Schools and Colleges* (Boston, 1848); and *Lake Superior; its Physical Character, Vegetation, and Animals* (Boston, 1850). In *Outlines of Comparative Physiology*, written in conjunction with Mr A. A. Gould, Professor A. upholds the doctrine of the successive creation of higher organised beings on the surface of the earth. *An Essay on Classification*, by A., has just been published (Lond., 1859). He is at present engaged on a great work, *Contributions to the Natural History of the United States* (Boston, 2 vols. 4to—to be completed in 10 vols.).

A GATE, a mineral composed of layers of quartz, generally of different varieties or colours, intimately

joined together. The layers are often concentric, and in the section sometimes appear nearly circular or elliptical, sometimes angular. Chalcedony, amethyst, common quartz, jasper, flint, &c., occur as layers in A. It takes a fine polish, and is much used for ornamental purposes. It is common in amygdaloids. Many agates are found in Scotland, and are sold under the name of *Scotch Pebbles*.

A'GATHA, ST, a noble Sicilian lady of great beauty, who rejected the love of the Prefect Octavianus, and suffered a cruel martyrdom in the persecution of Christians under Decius (250). She holds a high rank among the saints of the Roman Catholic church; her day falls February 5.

AGA'THOCLES, one of the boldest but most unworthy adventurers of antiquity, was born at Therme, in Sicily, in 361 B.C. He rose from humble circumstances through the patronage of Damas, a noble citizen of Syracuse, and received a command in the expedition against Agrigentum. Afterwards he married the widow of Damas, and became one of the most wealthy men in Syracuse. Under the rule of Sosistratus, he was obliged to flee into Lower Italy, where he collected a band of partisans. Returning to Syracuse, after the death of Sosistratus, he gained the supremacy, confirmed it by a massacre of several thousands of respectable citizens, and took possession of the greater part of Sicily. To establish his power, and keep his army employed, he now attempted to expel the Carthaginians from Sicily; but in this undertaking he was defeated. His next plan was to pass over to Africa with a part of his army, and there attack the Carthaginians. This war he carried on with success for four years, or until 307 B.C., when disturbances in Sicily compelled him to leave the army for a time. On his return to Africa, he found his troops in a state of mutiny against his son Archagathus, whom he had left in command, but pacified them by promises of large booty. Soon afterwards, he suffered a serious defeat, and with deliberate treachery, left his own son exposed to the vengeance of the disappointed soldiers. The son was put to death, and the troops surrendered themselves to the enemy, while A. escaped safely into Sicily, where, by fraud and cruelty, he soon recovered his former power, and was afterwards engaged in predatory inroads upon Italy. It was his intention to leave the throne to his youngest son, A.; but his grandson, Archagathus, made an insurrection, slew the royal heirs, and persuaded Manon, one of the favourites of the aged tyrant, to destroy him by means of a poisoned toothpick. This took place in 289 B.C., when A. was 72 years old, and had reigned 28 years.

AGAVE, a genus of plants belonging to the natural order *Amaryllidæ* (q. v.), and having a tubular perianth with 6-partite limb, and a triangular, many-seeded inferior capsule. They are herbaceous plants, of remarkable and beautiful appearance. There are a number of species, all natives of the warmer parts of America. By unscientific persons they are often confounded with Aloes (q. v.); and *A. Americana* is generally known by the name of AMERICAN ALOE. The Agaves have either no proper stem, or a very short one, bearing at its summit a crowded head of large, fleshy leaves, which are spiny at the margin. From the midst of these shoots up the straight, upright scape, 24—36 feet high, and at the base often one foot in diameter, along which are small, appressed, lanceolate bractes, with a terminal panicle, often bearing as many as 4000 flowers. In South America, these plants often flower in the eighth year, but in our hot-houses not until they have reached a very advanced age; whence arises the gardeners' fable of their flowering only once in one

hundred years. After flowering, the plant always dies down to the ground, but the root continuing to live, sends up new shoots. The best known species is *A. Americana*, which was first brought from South America to Europe in 1561, and being easily propagated by suckers, is employed for fences in Italian Switzerland, and has become naturalised in Naples, Sicily, and the north of Africa. By maceration of the leaves, which are 5 to 7 feet long, are obtained coarse fibres, which are used in America, under the

American Aloe.

name of *maguey*, for the manufacture of thread, twine, ropes, hammocks, &c. This fibre is also known as Pita Flax. It is now produced to some extent in the south of Europe. It is not very strong nor durable, and if exposed to moisture, it soon decays. The ancient Mexicans employed it for the preparation of a coarse kind of paper, and the Indians use it for oakum. The leaves, cut into slices, are used for feeding cattle.—Another species, *A. Mexicana*, is particularly described by Humboldt upon account of its utility. When the innermost leaves have been torn out, a juice continues to flow for a year or a year and a half, which, by inspissation, yields sugar; and which, when diluted with water, and subjected to four or five days' fermentation, becomes an agreeable but intoxicating drink, called *pulque*, to which the Mexican Indians not unfrequently sacrifice both fortune and life. It is made likewise from *A. Americana*, and from several other species.—The roots of *A. saponaria* are used in Mexico for washing, being a powerful detergent, and forming a lather with salt water as well as with fresh. The juice of the leaves, made into cakes, is used for the same purpose.

AGDE, an ancient French town in the department of Herault, founded by the Greeks, and situated about a league from the Mediterranean Sea, on the left bank of a navigable stream. To the north, under the walls of the town, flows the Languedoc Canal. The mouth of the stream forms a harbour, which is entered by 400 vessels yearly. The coast-trade

of A., in particular, is very brisk, while it is also the entrepôt for the traffic of the south and west of France. It has, besides, considerable intercourse with Italy, Spain, and Africa. It carries on a large and prosperous trade in wine, oil, salt, corn, timber, wool, silk, and cloth; but the general aspect of the place is sombre and forbidding, on account of the black basalt of which the houses are built, whence it has popularly received the name of the Black Town. It possesses a Naval Academy, and is noted in history as the place at which Alarie, king of the Goths, convened a council. Pop., 9000.

AGE. The legal divisions of human life, being sometimes arbitrary, and sometimes founded on nature, differ considerably in different countries. In England, the whole period previous to twenty-one years of A. is usually spoken of as *infancy*, a term which has a totally different signification in those countries that have followed the civil law. But notwithstanding this general division, which is common to both sexes, the ages of male and female are different for different purposes. 'A male, at twelve years old, may take the oath of allegiance; at fourteen, is at years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, may be an executor, although he cannot act until of age; and at twenty-one, is at his own disposal, and may alien and devise his lands, goods, and chattels. A female, also, at seven years of age, may be betrothed or given in marriage; at fourteen, is at years of legal discretion, and may choose a guardian; at seventeen, may be an executrix; and at twenty-one, may dispose of herself and her lands. So that full A. in male or female is twenty-one years, which A. is completed on the day preceding the anniversary of a person's birth, who, till that time, is an infant, and so styled in law.'—(Kerr's *Blackstone*, vol. i. p. 493.)

By the law of Scotland, again, life is divided into three periods—*pupilarity*, *minority*, and *majority*. The first extends from birth to the age of legal puberty, which is fourteen in males and twelve in females, at which ages they may respectively marry; the second embraces the period from the termination of pupilarity till the attainment of majority, which takes place at the age of twenty-one in both sexes; and the third includes the whole of after-life. The term *Minority*, however, is often applied to the whole period anterior to majority, and is thus equivalent to infancy or nonage in England. Infancy in Scotland can scarcely be said to possess a technical meaning; but when used at all, it is always in the sense of the Roman *infantia*, to indicate the period from birth till seven years of age, during which a child, unless in very unusual circumstances, is intrusted to the care of the mother. The office of *tutory* corresponds in duration to pupilarity, that of *curatory* to minority. See TUTOR, CURATOR. By the Roman law, an *approach* to majority was held to modify the character of minority, and so of the other periods; but this rule has not been followed by the law of Scotland; and a youth who wants but a day of twenty-one, is as much incapacitated as if he were fifteen. In France, the marriageable A. is eighteen in males, and fifteen in females (Code Civile, art. 144), an arrangement which seems more reasonable than that which we have borrowed from the Romans, and which, however suitable it may have been to the climate of Italy, could never have been free from inconveniences in this country. Twenty-one is generally the age at which men are eligible for public offices; and at this age they may elect, and be elected members of parliament. But a man must be twenty-four before he can be admitted to priests' orders, and thirty before he can be a bishop. In

America, a member of the Senate must be thirty, and a member of the House of Representatives, twenty-five; this latter was also the period of majority by the civil law. The legal disabilities attaching to the different stages of minority, or, to speak more correctly, the privileges which the law confers on minors for their protection, will be treated of under the different subjects to which they relate. See GUARDIANSHIP, CONSENT, CONTRACT, CRIME, MARRIAGE, &c.

AGEN, the chief town of the department of Lot-et-Garonne in France, is situated in a fertile region on the right bank of the Garonne. The town is old and gloomy in appearance; but carries on an active trade in woollen and linen fabrics, leather, coloured paper, colours, cordage, and sail-cloth. It forms the connecting-link of the intercourse between Toulouse and Bordeaux, and exports plums, brandy, hemp, flax, and poultry. Close by it is the old-fashioned house in which Joseph Scaliger, the prince of scholiasts, was born. In ancient times A. was the scene of many a fierce martyrdom of the Christians, when it was under the rule of Roman prætors. Afterwards it suffered the miseries of war, during the barbaric irruptions from Germany, to a most incredible extent, having been taken and plundered by Goths, Vandals, and Huns, in their turn. Next it came under the thralldom of the English, in their early French wars, and, at a later period, was twice taken by the Huguenots, in the religious contests of the 16th c. Pop., 16,000.

AGENT (Lat. *agens*). An A. is one who is authorised or delegated to transact business for another (who in this relation is called his Principal or constituent) in whose place he comes, and who is bound by his acts in the business to which the agency extends. The appointment of an A. may either be *general*, having reference to all the principal's affairs, or *special*, concerning some particular object. It may further be *limited* by instructions as to the conduct he is to pursue, or *unlimited*, in which case his conduct is left to his own discretion. Even in the last case, however, the A. is not freed from all responsibility for his conduct; he is bound to do his best for his employer, and he ought not to accept or retain the agency unless he is competent to its performance. The mutual relations of principals and agents, and their respective responsibilities to the public in mercantile transactions, will be treated under PRINCIPAL AND AGENT. See also FACTOR, BROKER, COMMISSIONER, COMMISSION-AGENT.

AGENT AND CLIENT. The employer of a law-agent is entitled to presume that he is possessed of competent professional knowledge, and the A. is consequently responsible to his C. for the consequences of gross professional ignorance, or flagrant negligence in the conduct of the business intrusted to him. It is not enough to entitle the C. to damages that the A.'s proceedings have not had the effect which was expected, or which he himself predicted from them. It has been observed in the House of Lords, that it is of the very essence of an action against a professional man by his employer, that there shall be *gross ignorance* (Purves v. Landell, 4 Bell, 46). See ATTORNEY, SOLICITOR, WRITER TO THE SIGNER.

AGENT, ARMY. A person authorised by the government to manage the monetary affairs of regiments in the army, as a kind of military banker. Formerly, persons were employed to effect the purchase and sale of commissions in the British army (the only army in which this strange system of purchase exists), without much reference to honesty or fitness; but to prevent pernicious trafficking, no

one is now permitted to manage these transactions except the authorised Army Agents, under a heavy penalty. The Army Agents are also bound down by restrictions, in relation to any pecuniary advantage derivable by themselves from the sale and purchase. Their business, however, is more intimately connected with the regular expenditure of government money. Every regiment has an agent, selected by the colonel, and empowered by him to be his representative in the monetary arrangements of the corps. The colonel is responsible to the Crown for the honesty of the Army A.; but the agent is in many ways regarded as a servant of the public. When money is wanted for the regular expenses of the regiment, the agent applies to the War-office; whereupon the Secretary of State for War issues an order to the Paymaster of the Forces to advance the requisite sum; the Paymaster does so, and takes a receipt from the agent. There is an annual settlement of accounts between the Paymaster and the agent, each one paying or receiving, according to the side on which excess or deficiency may appear. The agent then distributes the pay and other charges of the regiment. The percentage allowed to Army Agents for their trouble in paying the full-pay of officers, is allowed for by the state, and is included among the annual army estimates; but the officer generally bears this charge in relation to half-pay and allowances. The Army Agents conduct all correspondence, and send all the requisite notices concerning pay and payment; the colonel of the regiment takes no part in the matter. The details of the system have varied considerably at different times, and in different portions of the British dominions. Sometimes the agent receives twopence in the pound on the amount of pay; sometimes three-halfpence in the pound, with an addition varying from sixpence to one shilling per day for each company of infantry or troop of cavalry; sometimes (in Ireland, and in the colonies) a fixed annual salary. The amount paid for this agency is about £40,000 a year. Many experienced government-officers have recommended the abandonment of the system, and the paying of all moneys by the War-office direct, as a measure of simplification and economy; but there is not a unanimity of opinion on this point. When the colonels of regiments provided the men's clothing, under a system now abandoned, the Army Agents were very intimately mixed up with the transactions; but at present, the duties of those agents are limited to the following: applying monthly to the War-office for the money required for each regiment; receiving that money; applying part of it to the payment of officers; disbursing the regimental paymasters' bills for the cost of the expenditure; paying soldiers' remittances for the benefit of their families; settling the effects and credits of soldiers; distributing prize-money; and managing the sale and purchase of commissions.

AGENT, NAVY, a naval banker, who bears some such relation to Admiralty expenditure as the Army A. (q. v.) to War-office expenditure. His employment consists in managing the pecuniary matters of naval officers and seamen, in all that concerns pay, prize-money, &c. All such agents must be sanctioned by the government, and must conduct their operations according to certain prescribed rules. The *Navy List* for 1858 contained the names of 17 navy and prize agents for officers of the royal navy, resident in London; 1 agent for officers of the Royal Marines; and 16 licensed Navy Agents for petty officers and seamen, of whom four had their offices in London, and the rest at Portsea, Liverpool, Chatham, Plymouth, and Birmingham.

AGES, a term employed to designate the epochs

of civilisation in the history of the human race. The old poets and philosophers described these in harmony with what they conceived to have been the moral and political condition of their ancestors. The idea of a succession of A. presented itself at a very early period to the Greek mind. The life of the race was likened to that of the individual—hence the infancy of the former might easily be imagined to be, like that of the latter, the most beautiful and serene of all. Hesiod mentions five A.—the golden, simple and patriarchal; the silver, voluptuous and godless; the brazen, warlike, wild, and violent; the heroic, an aspiration towards the better; the iron, in which justice, piety, and faithfulness had vanished from the earth, the time in which Hesiod fancied that he himself lived. Ovid closely imitates the old Greek except in one particular—he omits the heroic age. This idea, at first perhaps a mere poetic comparison, gradually worked its way into prose, and finally became a portion of scientific philosophy. These A. were regarded as the divisions of the great world-year, which would be completed when the stars and planets had performed a revolution round the heavens, after which destiny would repeat itself in the same series of events. Thus mythology was brought into connection with astronomy. The golden age was said to be governed by Saturn; the silver, by Jupiter; the brazen, by Neptune; and the iron, by Pluto. Many curious calculations were entered into by ancient writers to ascertain the length of the heavenly year, and its various divisions. The greatest discrepancy prevailed, as might naturally be expected; some maintaining that it was 3000, and others, as many as 18,000 solar years. The Sibylline books compared it to the seasons of the solar year, calling the golden age the spring, &c.; and on the completion of the cycle, the old order was renewed. The idea of a succession of A. is so natural, that it has inwrought itself into the religious convictions of almost all nations. It is sanctioned by Scripture, for it is symbolically adopted in the Apocalypse to a certain extent; it also manifests itself in the sacred books of the Indians. Modern philosophy, at least in Germany and France, has also attempted to divide human history into definite A. or periods. Fichte numbers five, of which he conceives that we are in the third; Hegel and Auguste Comte reckon three, placing us in the last. Fortunately, the course of history is not arrested by such speculations, but proceeds in quiet indifference to all metaphysical dogmatism.

AGESILAUS, king of Sparta (399—360 B.C.), was elevated to the throne chiefly by the exertions of Lysander. Being called upon by the Ionians to assist them against Artaxerxes, he commenced a splendid campaign in Asia; but was compelled by the Corinthian war, in which several of the Grecian states were allied against Sparta, to leave his conquest over the Persians incomplete, and return to Greece. At Charonea (394 B.C.), he gained a victory over the allied forces, and in 378 the war was concluded by a treaty of peace in favour of Sparta. Afterwards, in the Theban war, though hard pressed by Pelopidas and Epaminondas, he bravely and ably defended his country. He died in his 84th year. A. is described as of small stature but commanding aspect, blameless in his private character, and, in public life, just, as far as his partiality for his own country allowed. His biographers are Xenophon, Plutarch, and Cornelius Nepos.

A'GINCOURT. See **AZINCOURT**.

A'GIO, an Italian word, signifying 'accommodation,' was first used in Italy to denote the premium taken by money-changers in giving gold for silver, on account of the greater convenience of gold for

transport. The same word is now used to denote the difference between the real and the nominal value of money; also the variations from fixed pars or rates of exchange. It corresponds very nearly to the English word 'premium.'

A'GIS, the name of several kings of Sparta. Mention is made of a king A. as early as about 1000 years B.C., who subdued the old inhabitants of Sparta, and made the Helots vassals or slaves. Of the others, A. I. reigned during the greater part of the Peloponnesian war, from 420 to 397 B.C.—A. II. ascended the throne in 338 B.C. His hatred of the Macedonian supremacy led him to form alliances with several Persian satraps against Alexander the Great. A., after extending his conquests to almost all the cities of Peloponnesus, fell in battle 330 B.C.—A. III. came to the throne in 244 B.C., when the state of Sparta had fallen into a ruinous condition through long-continued war. Though only twenty years old when he began to reign, he boldly resolved to restore the old institutions and severe manners of Sparta; but intrigues and self-interest in the higher classes frustrated his designs. The riches of the state were now in the hands of a few persons, while a great majority of the people were in extreme indigence. A., therefore, in accordance with the old laws of the state, proposed a redistribution of landed estates by lottery. The new ephorus, Agesilaus, who was rich in landed property, but burdened with many debts, astutely proposed that first all debts should be cancelled, and next the lands should be divided. The first part of this plan was soon effected; but great hindrances were opposed to the carrying out of the remainder. Meanwhile, the disappointed people were easily persuaded that A. had endeavoured to introduce measures inimical to the welfare of the state. Pursued by his enemies, he fled for refuge to a temple, but was betrayed by false friends into the hands of the magistrates, who immediately ordered him to be put to death by strangulation (240 B.C.). His mother and his grandmother, who had favoured his measures, were barbarously executed in the same manner. Alfieri, the Italian poet, wrote a powerful tragedy on the fate of A. III.

AGNANO, a small lake near Naples, is about sixty feet in depth, and has no visible outlet. The surrounding country is volcanic and mountainous. Formerly, the lake was named *Anguano*, from the number of snakes in the neighbourhood. On the right of Lake A. lies the *Grotto del Cane*—so called from the stratum of carbonic acid gas, some 18 inches deep, which always covers the floor, and which suffocates a dog (*canè*) or other small animal taken into it—and on the left are found the natural vapour-baths of *San Germano*, used for the cure of gout, rheumatism, &c., but inferior in virtue to the baths (*Stufe di Nerone*) at Baia. The volcanoes surrounding the lake have been extinct since 1198 A.D. Further on the left from A. lies the lake of *Astroni*, which occupies the crater of an extinct volcano, and is surrounded by beautiful woodlands.

AGNATE (Lat. *agnatus*). Agnates, in the law both of England and Scotland, are persons related through the father, as cognates are persons related through the mother. In the Roman law, both of these terms had a somewhat different signification. Agnates, by that system, were persons related through males only, whilst cognates were all those in whose connection, though on the father's side, one or more female links intervened. Thus, a brother's son was his uncle's A., because the propinquity was wholly by males; a sister's son was his cognate, because a female was interposed in that relationship. With us the intervention of females is immaterial, provided the connection be on the male, or paternal,

side of the house. The cause of our having thus changed the meaning of terms manifestly borrowed from the Roman law, seems to be that in Rome the distinction between agnates and cognates was founded on an institution which has not been adopted in the Roman sense by any modern nation—that, namely, of the *patria potestas* (q. v.). Roman agnati are defined by Hugo to be all those who either were actually under the same *paterfamilias*, or would have been so had he been alive; and thus it was that, as no one could belong to two different families at the same time, the agnation to the original family was destroyed, and a new agnation created, not only by marriage, but by adoption (q. v.). The foundation of cognation, again, was a legal marriage. All who could trace up their origin to the same marriage were *cognati*; and thus the term *cognatus*, generally speaking, comprehended *agnatus*. But though an agnatus was thus almost always a cognatus, a cognatus was an agnatus only when his relationship by blood was traceable through males. Justinian abolished entirely the distinction between agnates and cognates, and admitted, both to legal succession and to the office of tutor of law, not only kinsmen by the father, though a female had been interposed, but even those by the mother (*Nov.* 118, c. 4, 5). As to the legal effects of the distinction in the modern sense, see SUCCESSION, GUARDIANSHIP.

AGNESI, MARIA GEFANA, a woman remarkable for her varied attainments, was born at Milan, 1718. In her ninth year she could converse in Latin, and gave a lecture in this language, in which she argued that a knowledge of the ancient languages was a proper accomplishment in women. In her eleventh year she could also speak Greek fluently, and subsequently acquired with great facility several of the Oriental languages, and also French, Spanish, and German. She was jocosely styled 'the walking polyglot.' This precocious development of intellect was encouraged by her father, who invited parties of learned men to his house, with whom Maria disputed on philosophical points. Of her discourses in these parties, her father published some specimens, entitled *Propositiones Philosophicæ* (Milan, 1738). After her twentieth year, she devoted her mind to the study of mathematics, wrote an unpublished treatise on *Conic Sections*, and published her *Institutioni Analitiche* (2 vols., Milan, 1748). This work so extended her reputation, that, when her father was disabled by infirmity, she took his place as Professor of Mathematics in the University of Bologna, by the appointment of Pope Benedict XIV. It is said that, after her devotion to the study of mathematics, her cheerfulness vanished, she avoided society, and at last became a nun, and gave the whole of her time to attendance on the poor and the afflicted. Maria A. was a remarkable exception to the general rule of precocious intellect and short life, as she lived to the age of 81.

AGNUS DEI (Lat. 'Lamb of God'), one of the titles of Christ (John i. 29); also the name given to a certain prayer used in the Roman Catholic service of Mass. The litanies generally conclude with the same prayer: 'O Lamb of God, that takest away the sins of the world, have mercy upon us.'—The figure of a lamb bearing a cross, stamped upon an oval of wax, silver, or gold, is also styled an *A. D.* Such medals have been consecrated by the popes since the 14th c., and are generally distributed among the faithful on the first Sunday after Easter. In the ancient church, candidates for baptism received similar medals of wax, and wore them as amulets. See AMULET. In the Greek

Church, the cloth which covers the cup in the

Agnus Dei.

communion-service bears the image of a lamb, and is styled the *A. D.*

AGOUTI (*Dasyprocta Agouti*), a small quadruped nearly allied to the Cavy or Guinea-pig, very abundant in some parts of the West Indies and of South America. It is often very injurious to the fields of

Agouti.

sugar-cane. It is gregarious. Its flesh resembles that of the hare or rabbit. Other species are found in the same regions, and even in the colder parts of South America. The *Pampas Hare* is *Dasyprocta Patagonica*.

A'GRA, a British district in the lieutenant-governorship of the North-western Provinces, bounded N. and E. by the districts of Muttra, Minporee, and Etawah, S. and W. by the territories of Dhorthpore, Gwalior, and Bhurtpore. Its area is 1860 square miles. The surface of the country is for the most part very level, the principal elevation of the Futchpore Sikri hills, a sandstone range on the west frontier, being about 700 feet. The principal rivers are the Junna—flowing along the north-east frontier, and its tributary the Chumbul (along the southern boundary), both of which are too deep in the channel to be of much avail for irrigation. The district generally is, in consequence, deficient in water; and the failure of the rains in some seasons (as in 1837, 1838) has been followed by severe famine. The temperature has a wide range, being, during the hot winds of April, May, and June, so high that the city of A. is scarcely habitable by Europeans, while in January, severe frosts occur at night, though the thermometer at mid-day is high. The most important commercial product is cotton, which generally occupies about a tenth of the arable land. There are two crops yearly—the spring crop, consisting of various grains (wheat, barley, oats, &c.), leguminous plants, flax, tobacco, &c., the autumnal crop of maize, mung, moth, melons, &c. The cultivation of rice is very limited, owing to the want of water. The population in 1848 was 828,220, of whom 86,557 were Mohammedans, Europeans, &c., the rest Hindus. Of the Hindu population, about two

thirds are agricultural; of the rest, about one-fourth. —The 'division' of A. which constitutes one of the six North-western Provinces, embraces the districts of A., Muttra, Furruckabad, Minpooree, and Etawah, and contains an area of about 9000 square miles, with a population in 1849 of 3,500,000. In 1833 it was resolved (3 and 4 Will. IV. cap. 85) to divide the Bengal Presidency into two, one of which was to be called the A. Presidency. This act was never carried into effect, and a subsequent act suspended its operation, substituting the present arrangement. See NORTH-WESTERN PROVINCES. The seat of the lieutenant-governor is at A., from which circumstance that functionary is sometimes called the lieutenant-governor of A.

AGRA, the capital of the British North-western Provinces in India, is situated in the district of the same name on the right bank of the Jumna, 139 miles S.E. from Delhi, and 783 N.W. from Calcutta. The ancient walls of the city embrace an area of about 11 square miles, of which about one-half is at present occupied. The houses are for the most part built of the red sandstone of the neighbouring hills. The principal street, running north-west from the fort, is very spacious, but the rest are generally narrow and irregular, though clean. Some of the public buildings, monuments of the house of Timour, are on a scale of striking magnificence. Among these are the fortress built by Akbar, within the walls of which are the palace and audience-hall of Shah Jehan, and the Moti Masjid or Pearl Mosque, so called for its surpassing architectural beauty. Still more celebrated is the Taj Mahal, situated without the city, about a mile to the east of the fort. This extraordinary and beautiful mausoleum was built by the Emperor Shah Jehan for himself and his favourite wife, Arjimanah Banoo (surnamed Mumtaz Mahal). 20,000 men, says Tavernier, who saw the work in progress, were employed incessantly on it for twenty-two years. The principal parts of the building are constructed or overlaid outside and in with white marble; and the mosaic work of the sepulchral apartment and dome is described by various travellers in terms of glowing admiration. It is composed of twelve kinds of stones, of which lapis-lazuli is the most frequent, as well as the most valuable. Of British edifices in and near the city, the principal are the Government House, the College (for the education of natives), the Metcalfe Testimonial, the English Church, and the barracks. The climate at A., during the hot and rainy seasons (April to September), is very injurious to Europeans; but on the whole, the average health of the city is equal to that of any other station in the North-western Provinces. As the seat of the lieutenant-governor of these provinces and of the administrative, judicial, and military establishments, A. is a place of considerable importance, independently of its past history. The population, before the late revolt, was estimated at 70,000. The principal articles of trade are cotton and salt, which are conveyed in large quantities down the Jumna to the lower provinces. This city is held in great veneration by the Hindus, as the scene of the incarnation of Vishnu under the name of Parasu Rama. It first rose to importance in the beginning of the 16th c., and from 1526 to 1658, it was the capital of the Mogul sovereigns. In that year, Aurungzebe removed to Delhi; henceforth, A. declined. It was taken in 1784 by Scindia, and surrendered in 1803 to Lord Lake, after a bombardment of a few hours. Among the spoils on that occasion was a cannon of 23 inches calibre, 11½ inches metal at the muzzle; length, 14 feet 2 inches; weight, 96,000 pounds. The balls, of cast iron, weighed 1500 pounds.

This stupendous piece of ordnance is said to have been wantonly reduced to fragments by blasting by some artillery-officers in 1833. (*Thornton's Gazetteer of India*.) During the late mutiny, A. was one of the places in which the Europeans were shut up. At the outbreak, the garrison consisted of the 44th and 67th regiments of B. N. Infantry, the 3d European Fusiliers, and a few artillery. The native regiments were disarmed in June 1857; and the defence of this important city devolved upon the Europeans. The ladies resorted at night to places of refuge appointed by the governor, while the gentlemen patrolled the streets; but matters growing worse both in the city and country, it was resolved, after a battle with the mutineers, to abandon the city and retire to the Fort or Residency. It was time; for some thousands of prisoners getting loose, began to fire all the European buildings in the city. Hardly a house escaped destruction; numbers of traders were ruined, and had to endure the misery of beholding their ruin from the Fort. As the Fort was both large and strongly defended, fugitives flocked in from all parts of the country, and the numbers soon swelled to 5846. Heroic sallies were occasionally made. Major Montgomery's march to Allypurl, and his defeat of the rebels, though twenty times as numerous, was a feat worthy of Havelock. When Delhi fell, its rabble of defenders hurried off in the direction of A., which place was seriously threatened by them, but was relieved by the rapid and brilliant march of Colonel Greathed, who discomfited the enemy, and despoiled them of nearly all their baggage.

AGRAM, the capital of Croatia, finely situated at the foot of a richly wooded range of mountains, is about two miles from the Save, in lat. 45° 49' N., long. 16° 4' E. King Bela IV. raised it in 1266 to the dignity of the royal town, in consequence of its having assisted him against the Tatars. The town is divided by a small stream into three parts, each of which is under a separate jurisdiction. These are—the royal town proper, or upper town, built upon two eminences; the capital, or lower town; and the episcopal town, under the jurisdiction of the bishop. The inhabitants are principally Croats, who carry on an insignificant trade in wood, corn, and tobacco. The lower town is the newest and finest in appearance, many of the houses having Italian roofs. A. is the residence of the governor of Croatia, of the military commander-in-chief of the Croats, and of a Catholic bishop. It also possesses a royal academy, with a public library, and various other educational institutions. Pop. 14,800.

AGRARIAN LAW. With the name of A. L. used to be associated the idea of the abolition of property in land, or at least of a new distribution of it. This notion of the A. laws of the Romans was not only the popular one, but was also received by most scholars. The French Convention, in 1793, passed a law punishing with death any one who should propose an A. L., understanding by the term an equal division of the soil among all citizens. Now, it would have been strange if the Romans, with whom private property was so sacred, could ever have been brought to sanction any measure of the kind. It was the German scholars, Heyne, Savigny, and especially Niebuhr, who first explained the true nature and character of the Roman A. laws. There are still some disputed points on this matter, but one thing seems made out—that those laws had no reference to private lands held in absolute property, but to public or state lands.

As the dominion of Rome extended, a portion more or less of each conquered territory was confiscated to the state, and became public domain. All

laws respecting the disposition of these lands were called A. laws; which are therefore of various kinds. What made these laws be so long mistaken for an interference with private rights, and excited such opposition to them at the time, was the use which was made of the public domains while unappropriated. 'It was the practice at Rome,' says Dr Arnold, 'and doubtless in other states of Italy, to allow individuals to occupy such lands, and to enjoy all the benefits of them, on condition of paying to the state the tithe of the produce, as an acknowledgment that the state was the proprietor of the land, and the individual merely the occupier. Now, although the land was undoubtedly the property of the state, and although the occupiers of it were in relation to the state mere tenants-at-will, yet it is in human nature that a long undisturbed possession should give a feeling of ownership; the more so as, while the state's claim lay dormant, the possessor was, in fact, proprietor, and the land would thus be repeatedly passing by regular sale from one occupier to another.'

The state, however, was often obliged to interfere with these occupiers of the public lands, and resume its rights. The very idea of a citizen, in ancient times, involved that of a landholder, and when new citizens were to be admitted, they had each to receive their portion out of the unallotted public domain; which was attended, of course, with the ejection of the tenants-at-will. It appears, also, that the right to enjoy the public lands in this temporary way was confined to the old burghers or patricians. This, taken in conjunction with the tendency, strong at all times, of larger possessions to swallow up smaller, kept up an ever-increasing number of landless commons, whose destitution and degradation came from time to time to such a pitch, that alleviation was necessary, to prevent the very dissolution of the state. It is easy, however, to see what motive the patricians, as a body, had to oppose all such measures, since it was their interest, though not their right, to keep the lands unallotted.

The enactment of A. laws occasioned some of the most memorable struggles in the internal history of Rome. Most of the kings of Rome are said to have carried an A. L., that is, to have divided a portion of the public land among those whom they admitted to the rights of citizenship. 'The good king,' Servius Tullius, may be looked upon as the first victim of the hostility of the nobles to A. laws. About twenty-four years after the expulsion of the Tarquins, the distress of the commons called aloud for remedy, and the consul, Spurius Cassius, proposed an A. L. for a division of a certain proportion of the public land, and for enforcing the regular payment of the rent or tithe from the occupiers of the remainder. The aristocracy, however, contrived to defeat the proposal, and when the year of his consulship was out, Cassius was accused of trying to make himself king, was condemned, scourged, and beheaded, and his house razed to the ground.

The first important A. L. of a permanent nature, actually passed, was that proposed by the tribune, Licinius Stolo, and carried, after a struggle of five years, in the year of Rome 383. The provisions of Licinius's bill, or *rogation*, were as follows: 'Every Roman citizen shall be entitled to occupy any portion of the unallotted state land not exceeding 500 *jugera* (see ACRE), and to feed on the public pasture-land any number of cattle not exceeding 100 head of large, or 500 head of small, paying in both cases the usual rates to the public treasury. Whatever portions of the public land beyond 500 *jugera* are at present occupied by individuals, shall be taken from them, and distributed among the poorer citizens as absolute property, at the rate of seven *jugera* apiece.

Occupiers of public land shall also be bound to employ a certain number of freemen as labourers.'

This law produced for a time very salutary effects. But before the year 621, when Tiberius Gracchus was elected tribune, the Licinian law had been suffered to fall into abeyance; and although vast tracts had been acquired by the Italian, the Punic, and the Greek wars, no regular distribution of land among the destitute citizens had taken place for upwards of a century. Numerous military colonies had indeed been founded in the conquered districts, and in this way many of the poorer Romans or their allies had been provided for; but still there remained large territories, the property of the state, which, instead of being divided among the poorer members of the state, were entered upon, and brought into cultivation, by the rich capitalists, many of whom thus came to hold thousands of *jugera*, instead of the five hundred allowed by the Licinian law. To a Roman statesman, therefore, looking on the one hand to the wretched pauper population of the meaner streets of Rome, and on the other, to the enormous tracts of the public land throughout Italy which the wealthy citizens held in addition to their own private property, the question which would naturally present itself was—Why should not the state, as landlord, resume from these wealthy capitalists, who are her tenants, as much of the public land as may be necessary to provide little farms for these pauper citizens, and so convert them into respectable and independent agriculturists? This question must have presented itself to many; but there were immense difficulties in the way. Not only had long possession of the state lands, and the expenditure of large sums in bringing them into cultivation, given the wealthy tenants a sort of proprietary claim upon them, but in the course of generations, during which estates had been bought, sold, and inherited, the state lands had become so confused with private property, that in many cases it was impossible to distinguish between the two. Notwithstanding these difficulties, Tiberius Gracchus had the boldness to propose an A. L., to the effect, that every father of a family might occupy 500 *jugera* of the state land for himself, and 250 *jugera* additional for each of his sons; but that, in every case where this amount was exceeded, the state should resume the surplus, paying the tenant a price for the buildings, &c., which he had been at the expense of erecting on the lands thus lost to him. The recovered lands were then to be distributed among the poor citizens; a clause being inserted in the bill to prevent these citizens from selling the lands thus allotted to them, as many of them would have been apt to do.

According to the laws and constitution of Rome, there was nothing essentially unjust in this proposal, which was, in private, at least, approved of by some of the most distinguished men of the time. The energy of Gracchus carried the measure, in spite of the opposition of the aristocratic party, whose vengeance, however, could only be satisfied with the assassination of Gracchus and his brother. See GRACCHUS. The attempts to carry out the 'Sempronian law,' as it was called, were attended with great difficulties, and although not formally repealed, it continued to be evaded and rendered inoperative. Various A. laws were subsequently passed, some by the victorious aristocratic party, in a spirit directly opposed to the Licinian and Sempronian laws.

Besides A. laws having for their object the division among the commons of public lands usurped by the nobles, there were others of a more partial and local nature, for the establishment of colonies in particular conquered districts; these naturally met with less opposition. Still more different were those violent

appropriations of territory made by the victorious military leaders in the latter times of the republic, in order to reward their soldiers, and establish exclusively military colonies. In these the private rights of the previous occupants were often disregarded.

AGRICOLA, GNAEUS OR CNEIUS JULIUS, a Roman of the imperial times, distinguished not less by his great abilities as a statesman and a soldier than by the beauty of his private character, was born at Forum Julii (now Fréjus in Provence), 37 A.D. Having served with distinction in Britain, Asia, and Aquitania, and gone through the round of civil offices, he was, in 77 A.D., elected consul, and in the following year proceeded as governor to Britain—the scene of his military and civil administration during the next seven years. He was the first Roman general who effectually subdued the island, and the only one who displayed as much genius and success in training the inhabitants to the amenities of civilisation as in breaking their rude force in war. In his seventh and last campaign (84 A.D.), his decisive victory over the Caledonians under Galgacus, at the foot of the Grampians, established the Roman dominion in Britain to that extent northward. At the close of this campaign, his fleet circumnavigated the coast, for the first time, discovering Britain to be an island. Among the works executed by A. during his administration, were a chain of forts between the Solway and the Tyne, and another between the Clyde and Forth. Numerous traces of his operations are still to be found in Anglesey and North Wales, and in Galloway, Fife, Perthshire, and Angus. The news of A.'s successes inflamed the jealousy of Domitian, and he was speedily recalled. Thenceforth he lived in retirement; and when the vacant proconsulships of Asia and Africa lay within his choice, he prudently declined promotion. The jealousy of the emperor, however, is supposed to have hastened his death, which took place at the early age of 55. His life, by his son-in-law Tacitus, has always been regarded as one of the choicest specimens of biography in literature.

AGRICOLA, JOHN (whose true name was Schnitter or Schneiler, but who was also called Magister Islebius and John Eisleben, after the name of his native town), born 1492, was one of the most zealous founders of Protestantism. Having studied at Wittenberg and Leipsic, he was sent (1525) by Luther, who highly appreciated his talents and learning, to Frankfort-on-the-Main, to institute there, at the desire of the magistrates, the Protestant worship. On his return, he resided as a teacher and preacher in his native town of Eisleben, till 1536. In 1537, he became a professor at Wittenberg, where the Antinomian controversy, already begun between him and Luther and Melancthon, broke out openly. See ANTI-NOMIANISM. The troubles in which he was thus involved obliged him to withdraw (1538) to Berlin, where he was reduced to extreme want, and was thus induced to make a recantation, never altogether sincere. He then found a protector in the Elector John of Brandenburg, who appointed him preacher to the court and general superintendent. He made great exertions for the spread of the Protestant doctrine in the Brandenburg states; but ere his death, which took place at Berlin, 22d September 1566, he had become as much hated for his share in the drawing up of the Augsburg *Interim* (q. v.), as he had formerly been for his Antinomian opinions. Besides his numerous theological writings, his country possesses a truly national work of his, entitled *Die Gemeinen Deutschen Sprichwörter mit ihrer auslegung* (Common German Proverbs, with their Explanation; Hagenau,

1592; and a very complete but somewhat altered edition at Wittenberg, 1592). The patriotic feelings, pure morals, and pithy language of this book, have procured for it one of the first places among the German works of that age.

AGRICOLA, RUDOLPHUS, one of the most learned and remarkable men of the 15th c., and a chief instrument in transplanting the taste for literature, just revived in Italy, into his native country of Germany, was born, 1443, in the village of Ballo, near Gröningen. His name was properly Rolef Huysmann (i.e., houseman or husbandman), which was Latinised by him into A., after the usage of the time. He was also called Frisius, and Rudolf of Gröningen, from his native place; and sometimes Rudolf of Ziloha, from the monastery of Silo, where he spent some time. Having been first a disciple of Thomas à Kempis at Zwolle, he went to Louvain, then to Paris, and thence to Italy, where, during the years 1476 and 1477, he attended the lectures of the most celebrated men of his age. Here he entered into a close friendship with Dalberg, who afterwards became Bishop of Worms. He was the first German who distinguished himself in Italy in public speaking and lecturing, and this he did not only by his erudition, but by the elegance of his language and the correctness of his pronunciation. He likewise acquired reputation as an accomplished musician; and his pieces were popular throughout Italy. On his return to Germany, he endeavoured, in connection with several of his former co-disciples and friends, among whom were Alexander Hegius and Rudolphus Lange, to promote a taste for literature and eloquence in Germany. Several cities of Holland vainly strove with each other to obtain his presence, by offering him public functions; but not even the brilliant overtures made to him by the court of the emperor Maximilian I., to which he had repaired in connection with affairs of the town of Gröningen, could induce him to renounce his independence. At length yielding (1483) to the solicitations of Dalberg, who was now chancellor to the Elector Palatine, and Bishop of Worms, he established himself in the Palatinate, where he sojourned alternately at Heidelberg and Worms, dividing his time between private studies and public lectures, and enjoying high popularity. He distinguished himself also as a painter; and at the age of 40 set with ardour to learn Hebrew, in order to study theology. He went again (1484) with Dalberg into Italy, and died shortly after his return to Germany (on the 25th October 1485). His fame rests chiefly on the personal influence he exerted. His compositions, which are written in Latin, are neither so numerous nor so important as those of many of his learned contemporaries. The first nearly complete edition of them was that published by Alard (2 vols., Cologne, 1539). Consult Tresling, *Vita et Merita R. A.* (Gröningen, 1830).

AGRICULTURE (Lat. *ager*, a field, and *colo*, I till) is the art of rearing those plants and animals that are best suited to supply the wants of man. Man has found the earth, in almost every clime, covered with vegetation, yet this often yields little that he can use. The spontaneous growth of nature affording but a limited quantity of food, he at first attempts to supply the deficiency by capturing the wild animals, which often feed upon what is unsuited for his sustenance. Sometimes, however, the most fertile lands under luxuriant forests, or other natural vegetation, only support a small number of animals. In the most favourable circumstances, a given area of territory cannot maintain many of the human family, so long as they depend upon the natural vegetation or on the chase. It is only after those

plants which yield man an abundant supply of food are selected and made the objects of cultivation, that population augments, and civilisation takes its rise.

Man has selected a great variety of plants for cultivation to afford him food and clothing. In northern latitudes, wheat, barley, oats, rye, and the potato form the chief plants from which he derives subsistence. These crops are most productive when grown in summer in the temperate climates of the earth, being unsuited to the heats of the torrid zone. Their geographical limits, however, are greatly extended by growing them as winter crops on the borders of, and even within, the tropics. In these regions, however, rice, maize, millet, and other grains

become far more productive of food than the already mentioned cereals are in high latitudes, as they flourish during the heats of summer. Where heat and moisture are almost perennial in the tropics, the banana, the bread-fruit tree, and other herbaceous plants and trees, are most productive of human food.—A short historical outline of the A. of different parts of the world will exhibit the chief elements that regulate the practices of the husbandman.

The early civilisation of *Egypt* claims for it the first notice in a passing outline of the chief systems of A. The teeming population that existed in ancient times in the narrow valley of the Nile, the large standing army which was maintained, the extraordinary works of engineering and architecture still visible

Modern Shadoof.

in our day, and the exportation of corn to other nations, indicate an advanced state of the art of A. Rain is a rare phenomenon in Upper Egypt, and fertility is only maintained by the waters of the Nile, which are subject to annual floods. The risings and ebbings are as regular now as they were in the days of Herodotus; and the agricultural systems are also in a great measure the same. The inundation which, unless prevented by embankments, covers the whole land, occurs at the hottest season. As the waters retire in October, the land is sown with what are there styled *winter crops*, consisting of wheat, barley, lentils, beans, flax, lupines, chick-pease, &c. All these crops require no further watering, as the moisture which the soil

has imbibed during the inundation is sufficient to bring them to maturity about the end of April, or even a month sooner in Upper Egypt. Only one crop in the year is grown upon most of the inundated lands. But on those lands which are protected from the inundation, *three crops a year* may be raised by means of artificial watering. Few of the plants used as winter crops can be grown in summer in Egypt. The plants adapted for summer consist of rice (largely grown in the Delta), durra, millet, maize, sesame, melons, onions; they are sown from April to August, and of several of them two crops in the season ripen under the cloudless sky of Egypt. A vast amount of manual labour and animal power is expended in watering the ground for the summer crops.

The peasants use the *shadoof* for the purpose, which is a simple contrivance, used in drawing water, over a large portion of the East. The Persian wheel, driven by oxen, is largely employed; so much so, that about 50,000 of these machines are at present in use in the valley of the Nile. Besides these crops, cotton, indigo, and sugar-cane are now cultivated to a small extent. When the waters rest long on the land, it answers all the ends of a fallow, by extirpating the land-weeds and disintegrating the soil. The ground, in such cases, requires no further culture than treading in the seed by animals, or slightly scratching the surface with bushes. On the other hand, the summer crops require a great deal of tending, both in cultivating and watering the soil. The diminution of the population in Egypt has in some measure deprived the country of the means of its former advanced state of A.; nor is its present political condition at all likely to lead to much improvement.

Few historical records of the state of *Babylonian A.* have come down to us. We can only judge of its productiveness by the dense population that was supported in the plains bordering the Euphrates, where the summer climate is almost as arid as that of Egypt. That river also was subject to overflow, when the snows melted on the mountains of Armenia in summer. Further than this, however, we have no knowledge of the systems pursued or crops cultivated.

The Scriptures are full of allusions to the operations of the husbandman in *Palestine* as well as in Egypt. The operations in the two countries necessarily formed striking contrasts—the crops in the former being chiefly dependent on the rains for growth; in the latter, on the inundations of the Nile. In the Holy Land, there are extensive plains of fertile soil which yielded the finest wheat. The hillsides were covered with vines and olives, often planted on terraces formed with much labour, to afford a larger mass of soil, in which the plants might flourish in the almost rainless summers. The valleys were well watered, and afforded pasture for numerous flocks. Of the smaller cultivated plants, millet was the chief summer crop, but it was only cultivated to a limited extent, being confined to those spots that could be artificially watered. Wheat and barley were the chief cereals, as the winter rains were sufficient to bring them to maturity. The large number of inhabitants that Palestine supported under the Jews is the wonder of all modern travellers, who are struck with the ruins of ancient cities and the desolation of the country. The means of cultivation, however, disappeared with the inhabitants; and the destruction of the wood has added to the aridity of the climate. Concurring testimony indicates that the systems of cultivation were somewhat similar in all the countries bordering on the Mediterranean, which are characterised by arid summers, and autumn and winter rains. Irrigation, therefore, was had recourse to wherever it was practicable.

The A. of *Italy* in the present day exhibits great contrasts in its condition; for while a garden-like cultivation is seen in Lombardy, the utmost rudeness and backwardness prevail in the southern parts of the peninsula. Into the social causes that have led to these results our limits forbid us to enter. The literature of the A. of the ancient Romans, throws much light on the systems that then existed in the countries bordering on the Mediterranean. As is well known, the wide-spread dominion of Rome rose out of a diminutive colony planted on the banks of the Tiber. In the time of the early kings, its original territory did not extend above five miles towards the Alban Hills, and still less in other directions. Romulus is said to have divided a portion of

his small territory among his subjects, at the rate of little more than an acre to each. This allotment, granted in perpetuity, was not liable to be taxed, and could be sold by its owner. The whole territory was not assigned to the citizens, but the larger part was kept as domain lands, which yielded a revenue to the state, by being let to the wealthy classes. These domain lands were either cultivated or allowed to remain in pasture. The common conditions were, that the occupants of the corn-land paid one-tenth of the produce as rent; of vines and fruit-trees, one-fifth; and a moderate rate a head for sheep or cattle pastured. The occupants were merely tenants-at-will, and the state could resume and sell their lands at any time. A similar policy seems to have been pursued by the numerous states of ancient Italy. As these were all conquered in succession by the Romans, their lands became the property of the Roman state. Sometimes the inhabitants were wholly extirpated, or sold into slavery, and their lands were partly assigned to the poorer citizens engaged in the war; the remainder, which was always the much larger part, became domain lands. In other instances, only a portion of the lands was taken from the conquered nations; the former owners were allowed to retain them as tenants, paying the ordinary rent. Thus, from the earliest times, two classes of cultivators were in existence—the small proprietors, and the wealthy tenants, holding the lands of the state. Betwixt the two, there was almost a perpetual strife—the one demanded the distribution of the state domains, while the others constantly resisted it. Even after the Romans became masters of the whole of Italy, the citizens had little more than four acres of land assigned to each; and the domain lands increased enormously. Attempts were constantly made to restrict the extent of domain held by the patricians, but generally without effect. See *AGRARIAN LAWS*. The great extent of domain lands gave rise to the employment of slave-labour in their cultivation by the wealthy citizens. This led to the discouragement of small proprietors, so that the free population engaged in A. diminished throughout Italy. The evil was further aggravated by the policy that the Romans pursued towards the inhabitants of the conquered provinces: there, none of the land was held as freehold, but it was solely vested in the Roman people, being all let out for the benefit of the state. On the conquest of Sicily, the wealthy Romans flocked over, and farmed the rents, as well as cultivated the lands by means of slave-labour. Indeed, the chief supplies of grain sent to Rome from Sicily, Sardinia, and Carthage, were raised by means of slaves. A. was long the only source of wealth open to the patricians; and it was deemed the most honourable of occupations. Its operations were then directed by men of wealth and learning; and no wonder that its literature was so copious, and held in so high estimation. Cato, the first and most celebrated agricultural writer (who died aged 88, 150 B.C.), was in the middle period of life at the end of the second Punic war. The large farming system had then been fully established; and he gives us, not only the most minute particulars regarding the management of the slaves on his Sabine farm, but all the details of husbandry, from the ploughing of the fallows to the reaping and threshing of the crop.

The chief grain cultivated by the Romans was wheat, but barley was also cultivated to a considerable extent. Land devoted to grain was fallowed for a whole year every alternate year; in other words, the rotation consisted of 1st, wheat, 2d, fallow. One-third of the fallow was manured and sown with some green crop as cattle-food. Fallow received from four to five furrows before the wheat was sown in

autumn. The last ploughing left the land in narrow ridges; and as the seed was sown broadcast, it came up in rows, which admitted of the crop being several times hand-hoed. The crops of wheat ripened about the middle of June, but the summers were too dry to allow of millet and other summer crops being raised with certainty. Rye, hemp, flax, beans, turnips, lupines, vetches, and lucerne are also mentioned as occasionally cultivated. Meadows were highly esteemed, and irrigation to some extent adopted. Cattle were fed in the plains in winter, and driven towards the Apennines as the snows melted in spring, and when the pastures below became parched by the heat. The greater proportion of the surface of Southern Italy consists of thin calcareous soils, ill adapted for the growth of grain or grass; and the vine, the olive, and the mulberry become the chief objects of culture. The principal districts for growing wheat are, in the neighbourhood of Naples, and in the ancient Apulia, where Hannibal generally wintered when he overran Italy. Some of these rich plains are still held directly from the government, and cultivation is of the rudest character. One-third of the land is in pasture, and the other two-thirds in fallow and grain. Three or four crops are taken in succession, and the soil is then allowed to recruit its exhausted strength by remaining under pasture.

In the great plain of Northern Italy watered by the Po, agriculture is now in a very advanced condition. A great part of it is of great natural fertility; it drew forth the praises of Polybius, who visited it about fifty years after it came into the hands of the Romans. The oak-groves which he found scattered over the plain, fed the immense droves of swine that were then raised in Italy. Now, however, rich and poor soils are subjected to the fertilising influences of irrigation, and the region has become the best cultivated in Europe. No less than 1,600,000 acres of land are under irrigation, and the results are of the most striking character. The land is forced to produce a constant succession of grass and grain. The irrigated meadows, like the pastures of Ireland and Scotland, are made the corner-stone of the systems of rotation. In general, three years in meadow are succeeded by three years in rice; two years in Indian corn and flax; one year in wheat sown out with grass-seeds. Large numbers of cattle are kept on the farms of Lombardy, where the land is often a complete net-work of canals, with their smaller distributing channels. There is a large exportation both of grain and dairy produce. The vast ranges of snowy mountains that bound the plain to the north, afford a never-failing supply of water during the heats of summer. The vine and mulberry beautify the country, and also give employment to the dense population.

The lower latitude of *Spain* gives it a still more arid summer climate than Italy. Rains commonly fall only during the autumn and winter, and the supply is scanty and irregular. This renders Spain a poor and unproductive country, excepting where the soil can be irrigated. For this reason, the resources of its agriculture are chiefly confined to its well-watered valleys, which are capable of being made to outstrip Egypt itself in productiveness. The Moors early introduced the art of irrigation in the south of Spain, and carried it to a high pitch in the kingdom of Granada. Before the conquest of that country by Ferdinand and Isabella, the valley of Granada was one well-cultivated garden. Though the undiminished powers of the land are still attested by a few spots in the *vegas* of Murcia and Granada, its present condition cannot be compared to its condition under the Moors. The high temperature admits of a succession of crops being raised in one

year, as in Egypt. After wheat has been gathered in June, a crop of maize or millet, or of vegetables, is got. Maize is scarcely grown in Spain except where the land is irrigated, so that every valley is more or less under the productive influences of water. The melting of the snows in summer on the high ranges of mountains, affords a supply when it is most needed in the plains below. Vines, olives, and oranges find a genial climate for their growth in the southern parts, and are important objects of culture.

France must be regarded as one of the richest agricultural countries in Europe. In the south, the climate is sufficiently hot for olives, maize, the mulberry, and the vine. The summer rains, too, are more abundant than in Spain, and permit maize to be extensively grown alternately with wheat, which forms a most productive course of crops. Irrigation has received considerable attention in the southern valleys, and the reclamation of the barren wastes of the Crau in Provence, testifies to its fertilising effects. Much of the soil is poor in the southern provinces, and not suited to the growth of grain; but such soil admits of the growth of the mulberry, the olive, or the vine. All these crops demand a large amount of labour in their culture, and sustain a dense population. Normandy is celebrated for its pastures. The north-west of France generally is the most fertile tract of land in Europe. In the less advanced districts, fallow, wheat, and oats is the rotation still followed. Clovers and lucerne are largely sown in the chalky districts. In the best cultivated districts in the north, wheat and beet-root or poppy are sown alternately. Beet forms a most important plant in the agriculture of France in the present day, as a large part of the sugar consumed in the country is derived from it. Much of France is divided into small properties, which is more especially the case in the less fertile provinces. This division of property is, so far, a necessity, as no other industrial occupation is open to the people. As soon as manufactures raise the standard of living in the town, it will influence the condition of the rural population, and lead to the enlargement of properties.

In *Austria*, *Hungary*, and the countries on both sides of the Danube, the climate resembles that of the southern half of France. Maize and wheat are the chief products, but the agriculture labours under so many impediments to progress, that it is yet in a backward state. In Southern *Russia*, there are vast tracts of rich land bordering on the rivers flowing into the Black Sea and Sea of Azov, from which Western Europe derives large supplies of wheat and flax-seed, as well as some maize. The northern parts of Russia are less fertile, and as yet the means of transport is defective and limited. Oats, flax, skins, and tallow are the chief products sent to market. Rye forms the common bread-corn of the lower classes. *Prussia*, unless along the shores of the Baltic, has no great proportion of fertile land within her territory: the chief article exported is wheat from the Baltic provinces, which is of fine quality. The potato enters largely into the food of the common people in Prussia, and is also used in the manufacture of ardent spirits. Its agriculture, however, has no peculiarities deserving of special notice in this cursory sketch.

Flanders has long been celebrated for its farming, and its cultivators are generally supposed to have carried improved systems into the eastern counties of England. It is characterised by painstaking management, and, at the same time, liberal application of manure. The general size of the farms would be considered rather small in England, but considerable capitals are invested in stock and

implements, and several kinds of crops are raised unknown to British A. A large part of the stock is stabled throughout the year, the grass being cut and carried from the fields. The rearing and the feeding of cattle, as well as the dairy, are often combined on the same farm. Flax is a crop which receives a great deal of careful management. Hemp and beet-root require liberal treatment with respect to manure, and only enter into the rotation where lugh farming is followed. The crops are so arranged in the rotation, that two cereal crops do not succeed each other. In no country are the fields kept so free from weeds as they are in Flanders, and in none do the agriculturists suffer so little from fluctuations in the prices of grain, owing to the great variety of crops that are raised.

England had made considerable advances in A. so far back as the 16th c. This fact may be gathered from the writings of Fitzherbert, Tussor, and others. At an earlier period, her chief article of export had been wool, which supplied the seats of manufacturing industry in Holland, but now she also exports a large quantity of wheat. The increasing prosperity of the country caused a demand for butcher-meat, which began to rise in price much sooner than it did in Scotland. By the middle of the 17th c., turnips and red clover were introduced as field-crops, and by the end of it, the two were extensively cultivated in many parts, in alternation with corn. In 1750, the four-course shift was not uncommon in many parts of Norfolk. Under this system of 1st, wheat; 2d, turnips; 3d, barley; 4th, grass, one half of the land was constantly under corn-crops, and the other under cattle-crops. Large numbers of sheep and cattle were fattened on the turnips and clover. In the preparation of the land for turnips, it was well cultivated and weeded, and the consumption of the roots on the land increased the yield of the barley. The four-course shift has formed the basis upon which further improvements have been made in the southern and eastern parts of England. The strong soils of Suffolk and Essex yield good pasture, and about a century ago, they were mostly devoted to dairy-farming. The high price of corn, however, encouraged the conversion of these lands into arable-farms. The course followed was 1st, wheat; 2d, fallow; 3d, barley; 4th, clover. Instead of the fallow, mangel-wurzel is now largely substituted, which enables the farmers to feed large numbers of bullocks in the yards, without so large an expenditure in the purchase of oil-cake as was at one time thought necessary. In the western counties, where the climate is more suitable for grass, and less so for wheat, dairy and stock-rearing become greater objects of attention. The demand for dairy produce in the neighbourhood of the large manufacturing towns of the west, renders the land of much greater value under grass than under corn, more especially where the soil is tenacious. In the more friable soils of the north-western counties of England, the systems of A. resemble somewhat that of Scotland. Instead of the land lying one year under grass, it lies two, followed by oats, then turnips or potatoes, and the wheat-crop is taken after this green crop, and not after the grass. This is the characteristic which distinguishes the arable farming in the western from that in the eastern counties of England. A large portion of the surface of England is under permanent pasture, and the beauty of the meadows is unrivalled in any part of the world. The surface of England is very unequally farmed, for while A. has attained a great degree of perfection in such counties as Suffolk, Norfolk, and Lincoln, it is in a comparatively primitive state in others. The causes which have led to this state of things are often difficult to trace. The spirit of improve-

ment now seems, however, far more generally diffused, and spirited farmers are everywhere springing up, who, before long, will find many imitators.

In Ireland, the want of manufactures has continued to act as a great hindrance to agricultural improvement. The competition that arose among a generally indigent population in taking small farms, led to extravagant rents, the payment of which involved the starvation of the tenants. The faithful pictures, which Arthur Young drew, towards the close of the last century, shewed the workings of such a system. The general introduction of the potato, upon which the people chiefly subsisted, enabled rents to be paid by selling the scanty produce of grain, or the pigs that were reared. The failure of the potato-crop in 1846 produced the most heart-rending scenes of misery that have been witnessed in our times. When Young made his tour, it was the common practice, among the small farmers, to take from four to six crops of oats or barley in succession, after which the land was allowed to renovate its powers by the growth of the natural grasses. On the moderate-sized farms, the cultivation was better; but turnips had little place in a course of cropping for nearly a century after they were largely cultivated in Norfolk. The Protestant population in the north of Ireland introduced, at an early period, the culture of flax, which still forms a peculiar feature in the A. of that part of the country. The large amount of manual labour which it requires in its preparation for market, has so far served to preserve the cultivators from descending so low in the scale of social existence as those in the south. As a general rule, it is found that the worst land is most densely peopled; the secondary descriptions are in moderate-sized farms; while the best land has hitherto been devoted to pasture, for which the climate is admirably suited. The winters are so mild in the south, that cattle are often not stabled. In Young's time, the Irish graziers were the only class of agriculturists that were possessed of capital. The exodus which took place after the potato-failure, has relieved the country of a portion of the redundant population, but it is still too dense in many places.

Scotland made comparatively little or no advance in A. for ages previous to the beginning of the 18th c. Donaldson, who published his *Husbandry Anatomised* ten years before the Union, affords a pretty accurate picture of the art as then practised. The farms were small, and divided into outfield and infield land. On the former, which was furthest from the homestead, the rotation consisted of two years in grass, succeeded by two years in oats. On the infield land, barley, oats, and pease were sown in succession, and the whole manure was commonly applied to the barley-crop. The yield of corn was from three to four times the quantity of seed. Pastures were of the poorest description, as no artificial grasses were sown. Little encouragement was held out to rear cattle, for a heifer did not bring more than twenty shillings in the market—scarcely the price of two quarters of barley at that time. At the Union, however, Scotland gained free trade with her wealthier rival, from which flowed the happiest consequences. Every branch of industry shared in the new field opened up, and none more so than A. A large trade soon arose in sending the lean cattle and sheep that were reared on the mountainous wastes, as well as in the low country, to be fattened on the pastures and green crops in the south. A great rise in the prices of stock soon followed, which not only encouraged improved breeds, but enabled cultivators to devote a certain portion of the arable-lands to the growth of artificial grasses and turnips. Neither of these were grown previous to the Union; but in little more than fifty years

afterwards, one farmer in Roxburghshire is said to have had 100 acres of turnips in one year. Towards the end of the century, turnips and artificial grasses formed the basis of improved A. in every county. A great rise in the value of land took place. The war-prices in the beginning of the present century gave a further stimulus to the reclamation of land. The improvements, however, were not effected without a great revolution in the state of the rural population. Formerly, the farms were small, and often laboured by the members of a single family. A consolidation of farms took place, which necessitated a great change in the social condition of employers and employed, producing often painful contrasts. Of late years, the commercial prosperity of the country has greatly helped to elevate the rural population, and necessitated improvements in cottage accommodation.

Scottish A. is distinguished for great economy in labour, forming a contrast in this respect to that in the chief corn districts of England. Few farms are to be seen in the richer districts without having a fixed steam-engine for driving the barn and other machinery. Labour-saving machines have also been freely introduced. With soil, climate, and situation, the mode of cropping varies greatly over the country. In the Lothians, the six-course shift is common; namely, 1st, wheat; 2d, beans or potatoes; 3d, wheat; 4th, turnips; 5th, barley or wheat; 6th, grass-seeds. In certain situations, the potato-crop has lately been still more extensively planted, occupying the place of the bean or the turnip. On secondary farms, the five-course rotation becomes more common: 1st, wheat, or barley; 2d, grass; 3d, grass; 4th, oats; 5th, turnips or potatoes. The larger proportion of the surface of Scotland, however, is devoted to pasture for sheep and cattle. The mountainous tracts are generally unfit for cultivation. Little else has been done in the way of improving them than digging a few surface-drains, and improving the breeds of the stock they feed. Sheep-farms vary in extent from 1000 to 60,000 acres. A few of the best stock-farms may summer and winter a sheep to the acre, but most require three acres. The black-faced are reared upon the most elevated and exposed ground, while the Cheviots thrive on those parts that are less so. No other food is usually given in winter than what is left on the fields in autumn. Cross-breeds between the Cheviot and the Leicester are reared in the lower ranges, where a supply of turnips may be had to give to the ewes while suckling their offspring. When the sheep are to be fattened, they are taken to the arable districts. The opening of steam-navigation, and lately, the system of railways, have been of infinite benefit to Scottish A. in getting a market for fat animals.

In *North America*, the same crops are raised as in corresponding latitudes in Europe. The winters in Canada and the United States are much more severe than those of Western Europe, while the summers are quite as hot, and far more moist, and hence arise considerable variations in the practices of agriculture. In Canada and the northern states, wheat is the staple article of export. In all the chief exporting districts, wheat and red clover are grown as alternate crops. Betwixt latitudes 42° and 39°, wheat is often grown alternately with maize, after the land has been under pasture for some years. Again, betwixt latitudes 39° and 35°, the climate is better suited for maize than wheat, which becomes less productive. The best pastoral regions are in south Ohio and throughout Kentucky. Below latitude 35°, maize is much less productive, and the climate becomes suitable for cotton. This plant furnishes the staple article of production from latitude 35° to

the shores of the Gulf of Mexico. Rice is the most profitable crop in the southern states; but its culture is chiefly confined to the tidal swamps, which can be flooded by fresh water. The sugar-cane is limited to the rich alluvial lands on the banks of the Mississippi as far north as latitude 31°. Tobacco is a principal crop in Virginia and some other states. The West India Islands, surrounded by the warm waters of the gulf, are free from the cold north winds of the American continent. This circumstance favours the growth of the cane, which is so susceptible of injury from frosts. The rich lands of these islands produce large crops of sugar. Coffee is also grown to a considerable extent on several of the Antilles. On the Pacific coast, the climate is characterised by mild winters and dry summers, so that the methods of agriculture must conform to those of the countries bordering on the Mediterranean.

The soil of *South America* appears to be much more fertile than that of North America. In the southern parts, the winters are comparatively mild, when contrasted with those on the same latitudes in the British possessions. The valley of the Rio de la Plata is admirably suited for rearing sheep and cattle, which are found in immense herds in the interior. Brazil is densely wooded, shewing the abundance of the rains, and the capabilities of the country for the growth of the sugar-cane. In the north, where the dry seasons are of longer duration, there are immense grassy plains called savannahs, covered with herds of wild-cattle. Though no cattle were found on the continent when discovered by Europeans, it has been asserted that more cattle are now running wild in South America than the whole domesticated cattle of Europe.

China possesses a climate having a great similarity to that of the United States, east of the Rocky Mountains. The winters are cold, and the summers moist and hot. Rice forms the great staple crop in the warmer regions of the south, wherever the land can be irrigated. This plant is also cultivated to a limited extent on dry lands, along with millet and maize. The density of the population in China, is an indication of the advanced state of its A. The careful manner in which all the refuse of the towns and villages is husbanded and applied to the land, while weeds are not suffered to grow among the crops, is the true secret of the productive A. of the Chinese.

The condition of A. in China shews what we might expect from enlightened policy in the promotion of that of *India*. The monsoons which prevail over Hindustan during summer cause a great luxuriance of vegetation while they last; but the extreme droughts that precede and follow them parch and wither up the shallower-rooted plants. Over a large part of India, irrigation is required to produce many of the crops with certainty. In the tropical latitudes, rice is the most abundant grain-yielding plant, and forms the chief food of the people. The numerous rivers of Northern India supply the means of irrigation, and the production of food then becomes a matter of comparative certainty. Where the winters are cool, wheat and barley are grown at that season, and rice, maize, millet, &c., in summer, just as we find in the irrigated valleys of the south of Spain. At the present time, the principal drawbacks to the better cultivation of land are the deficiency in the means of transporting the produce, and the tenure by which the land is held. The immense quantities of cotton and flax which are grown and literally lost for want of a market, is a subject that is beginning to attract attention, since our manufacturers are suffering from the scarcity of raw material.

It would be out of place to give an outline of the

A. of the other intertropical countries of the world, which have contributed so little to the common civilisation of mankind. Where rains are abundant, the ease with which a subsistence can be got from large herbaceous plants, and trees yielding fruit at all seasons of the year, has been justly regarded as inimical to the progress of society. The productiveness of the banana and the bread-fruit tree, considering the small amount of cultivation they require, is calculated to strike natives of colder climates with astonishment. Captain Cook eloquently remarks: 'Whoever has planted the bread-fruit trees, has fulfilled his duty to his own and succeeding generations as completely and amply as an inhabitant of our rude clime who, throughout his whole life, has ploughed during the rigour of winter, reaped in the heat of summer, and not only provided his present household with bread, but painfully saved some money for his children.'

In the southern hemisphere, the extent of sea greatly predominates over the land. The vapours which are raised over so vast an expanse of water flow towards the equator, and are chiefly deposited there in copious rains. They are not diverted by the peninsulas of South America, South Africa, or New Holland, as they are by the continents of America and Asia. Comparatively sterile regions are the result. Australia and the Cape of Good Hope are sparingly supplied with rains, so that their soil is not very productive of grain. Cultivation languishes, and the agriculturist devotes his attention to the rearing of cattle and sheep. New Zealand, however, possesses a climate having considerable resemblance to that of England, and is favourable for the production of grass and grain.

Under the heads of Cultivated Plants, Dairy, Domestic Animals, Drainage, Irrigation, Implements, Manures, Soil, Rotation of Crops, Lease, &c., will be more particularly treated the systems and rationale of farm-management pursued in the British Islands.

AGRICULTURAL CHEMISTRY, that branch of chemical science which treats of the composition of soils and manures, and of the vegetable and animal substances which it is the object of agriculture to produce. Instead of considering the subject by itself, it will receive attention under the heads of Drainage, Irrigation, Manures, Soils, &c.

AGRICULTURAL EDUCATION, as at present understood, is a comprehensive term, including instruction in chemistry, geology, botany, zoology, mechanics—embracing, in short, the science as well as the practice of agriculture. However important the branching off of education into this special track, it is only of late years that adequate attention has been paid to it. The first agricultural school was founded by Fellenberg at Hofwyl, in Switzerland, in 1806. His pupils were taken from the poorest class of peasantry, of whom he truly observed, that having 'no other property than their physical and mental faculties, they should be taught how to use this capital to the best advantage,' by a combination of 'discipline, study, and manual labour.' No fewer than 3000 pupils were trained in this school, which flourished for thirty years under the able direction of Wehrli. Since then, various institutions of the same character have sprung up on the continent. In France, several have been supported by the state—the principal being the one at Grignon, to which an old royal palace with its domain of 1185 acres has been given up. One of the first duties undertaken by the new government of Marshal MacMahon, in 1873, has been the nomination of a commission to re-organise the system of agricultural education. In Prussia, there

is scarcely a province that does not boast its agricultural school and model farm; and, indeed, throughout Germany, as well as in Russia, we find educational institutions supported by the state, in all of which, with some slight difference of detail, agriculture is practically as well as theoretically taught. More recently, experimental stations have been established in various parts of the empire.

In England, there are as yet no state institutions of this kind. In 1845, an Agricultural College was established, by private enterprise, at Cirencester, for the education of both resident and non-resident pupils—the former paying as high as £130 per annum, the latter £50, and the course of instruction extending over two years. A large farm is attached to the school. In Scotland, special instruction in agriculture has taken the form of lectures at universities, provincial associations, &c., by which, as well as by the labours of the Highland Society, much valuable educational knowledge has been disseminated. Private agricultural instruction is also given by farmers, who board and educate students for a stipulated sum per annum. Many of the counties in Scotland are exceedingly well adapted for agricultural students, as the nature of the ground permits of both sheep and ordinary farming being practised together.

But it is in Ireland, where peculiar circumstances rendered it eminently expedient, that the most systematic and successful efforts have been made. For several years past, the Commissioners of National Education have judiciously paid special attention to agriculture. Altogether, Ireland has 205 farm-schools, with land attached of very various extent, ranging from 2 to 180 acres. These schools may be divided into three classes, and present a gradual ascent from small to great: 1st, There are 169 Ordinary National Agricultural Schools, where, by a slight addition to the ordinary salary of a national schoolmaster, the teachers are encouraged to cultivate school-gardens and small holdings, and thus to give daily practical lessons to the children under their care. 2d, There are 36 Model Agricultural Schools in various parts of Ireland; 16 of them under local management, 20 under the exclusive management of the Board. These, whether their scale of culture be small or extensive, present to the inferior schools standards of excellence and imitation, linking the lowest of the agricultural establishments—namely, the cottar farm attached to the Ordinary Agricultural School—with, 3d, the highest establishment of the kind, the Central, or Albert School at Glasnevin, containing 180 acres, and cultivated by some 60 pupils, from all parts of the country. With regard to these minor schools, which are annually visited by two inspectors, the reports are, with very few exceptions, highly favourable, both as to the success of the establishments themselves, and their influence on the surrounding population. An Irish rector has given it as his opinion that they tend to make districts 'more orderly and quiet, to diminish drunkenness, and to keep down agrarian disturbances.' Another good authority states that their example has introduced 'rotation of crops,' and encouraged 'attention to winter-feeding of stock, and to the collection and preservation of manure.' Glasnevin Training Farm was established by the Commissioners of National Education in 1838, and considerably enlarged in 1849. Its professed design is to supply young men with instruction in the science and practice of agriculture. Three classes are admitted to its benefits. The first class consists of prospective land-stewards or farmers, drafted, as we have seen, from minor institutions, undergoing an entrance-examination, and receiving

a two-years' training, and who are admitted free by competitive examination; the second, of farmers' sons, prospective tenant-farmers, who desire to advance themselves in life by pursuing new modes of managing, and who pay for the bare cost of their board and lodging. The third class is composed of young men who board and lodge, at their own expense, in the immediate neighbourhood, and who are admitted on the payment of two guineas a quarter. For all these classes alike, labour and study systematically alternate, the entire number of pupils being formed into two divisions, the one devoting the morning of one day to the farm, the other to the school-room, and *vice versa* on the morrow, both working together on the land in the afternoon, and winding up the day with two hours of study. Obedience, punctuality, and habits of cleanliness and order are strictly insisted upon. Various rotations of crops are exemplified upon separate divisions of the farm, and the system of house-feeding cattle is carried on, both summer and winter. The training institution situated on the farm comprises, in addition to dormitories, school and lecture room, &c., a museum, library, and laboratory. The chief supervision of the whole establishment devolves upon Professor Baldwin, head of the agricultural department, who makes it his headquarters. The chief labours of the farm, including draining operations, are performed by the pupils, under the direction of a resident agriculturist. Practical horticulture is also taught, and a good general education imparted by two competent literary instructors. Two seasonal courses of lectures are annually delivered on animal and vegetable physiology, chemistry, geology, botany, and practical agriculture. Between January 1847 and December 1872, no fewer than 1116 young men left the Albert Institution at Glasnevin, to carry out its principles either on farms of their own, or, in the still more responsible post of land-stewards or of teachers, to impart them to hundreds.

The ordinary schoolmasters trained in the literary department, to the number of about 150 yearly, also receive two lectures on agriculture weekly, and practical instruction on the model farm twice a week. The Templemoyle Agricultural Seminary, established in the county of Londonderry 40 years ago, and placed, some years since, in connection with the national system of education, is also worthy of special notice, as having sent forth fully 1000 well-trained agriculturists. The benefits of the system are obvious, and it is gratifying to add that their annual cost is comparatively small; the actual current expenses of all the agricultural schools throughout Ireland amounting to somewhat less than £7000 a year, while the number of pupils who attend them is estimated at 8000.

AGRICULTURAL SOCIETIES, associations for the purpose of promoting the science and practice of agriculture. Such societies were established in the north of Italy in the beginning of the last century. As early as 1723, a 'Society of Improvers in the Knowledge of Agriculture in Scotland' was instituted. This had a short existence; but the necessity of such an association was felt, and another arose in 1755. This also did not succeed well; however, in 1783 a number of gentlemen met in Edinburgh and founded one destined for permanency, the well-known 'Highland Society.' The first annual meeting of this body was held in 1784, and it was incorporated by royal charter in 1787. Originally designed for the improvement of the Highlands, it extended its operations over the whole of Scotland, and confined its efforts more to the advancement of agriculture. Its title is now, under a royal charter granted in 1834, the 'Highland and Agricultural Society of Scotland.' Its earliest efforts

were aided by a grant of £3000 out of the moneys paid for the estates of the noblemen and gentlemen who were attainted in consequence of their accession to the rebellion of 1745. The funds required to defray the expense of the charter, however, were raised by subscription, and the members then were only about 150. In 1799 the Society began to publish its Transactions or prize essays. At present (1873) its members number 4500. The ordinary subscription is £1, 3s. 6d. annually, which may be redeemed by one payment of £12, 12s. Tenant-farmers are admitted on a subscription of 10s. annually, or £5, 5s. for life. The more important objects aimed at by the society are—

1. Agricultural meetings and general shows of stock, implements, and dairy produce held in the principal towns of Scotland.

2. Encouraging a system of district shows, for the improvement of breeds of stock most suitable to the different parts of the country.

3. The encouragement and promotion of a proper system of agricultural and forestry education, by means of powers conferred by a supplementary royal charter in 1856, authorising 'the Council of the Highland and A. Society on Education' to prescribe a curriculum of study, and to grant diplomas and certificates to students of agriculture who shall pass the requisite examination.

4. The advancement of the veterinary art, by conferring the Society's certificate on students who have passed through a regulated curriculum in the Edinburgh Veterinary College, and who are found by a rigid examination qualified to practise.

5. The appointment of two chemists for the purpose of analysing soils, manures, &c. to members, and for promoting the application of science to agriculture.

6. The establishment of an agricultural museum, illustrative of the vegetable products of the country; but this collection has been handed over to the Edinburgh Museum of Science and Art.

7. The annual publication of reports and prize-essays on all branches of agriculture and arboriculture, as well as the proceedings of the laboratory.

The general shows of stock, &c., are held once every year, at Edinburgh, Glasgow, Aberdeen, or some other principal town, and are attended by vast numbers of persons. The business of the society is conducted by a secretary at an office in Edinburgh.

The writings of Arthur Young directed attention to the agricultural condition of England, shortly after the middle of the last century. In 1793 the 'Board of Agriculture' was incorporated. This was a private association, but being supported by parliamentary grants, it so far partook of the nature of a public institution. Its 'surveys' of the different counties collected and diffused an immense amount of information of the most valuable kind. It latterly encouraged experiments and improvements of all kinds in agriculture, but was dissolved in 1816. Various societies have sprung up since then in different parts of England; of these, the 'Smithfield Cattle Club,' 'The Bath and West of England Society,' and the 'Yorkshire A. Society,' may be mentioned as the most influential. The growth and vigour of the national society, 'The Royal A. Society of England,' has been beyond all precedent. It was established in May 1838, and then consisted of 466 members, but in 1873 the members were as many in number as 6000. The objects which it pursues are almost identical with those of the Highland and A. Society of Scotland. Ordinary members pay £1 annually, or £10 for life. The *Journal*, containing interesting and original reports on A. subjects is sent free to all the members. Ireland also boasts of its 'Royal A. Society of Ireland.'

It was formed in 1844, and has greatly assisted in advancing the agriculture of the country, especially by introducing improved breeds of cattle.—Most of the countries of continental Europe have followed the example of Great Britain in the formation of A. Associations of various kinds.

In the free states of America, where the land is mostly owned by those who farm it, A. S. have sprung up in great numbers. Every state has its central Society, which in its turn fosters a number of local associations. Indeed, in all the chief grain-producing districts, each county boasts of its own society. These being all partly supported by state money, useful information is collected, published, and sold at a cheap rate in Reports. Canada follows in the wake of her enterprising neighbours, and supports by grants of money a provincial show in each province, while the county societies are numerous, and supply materials for the Reports of the Boards of Agriculture at Toronto and Montreal. In Canada and the United States, the A. S. are of a highly popular character. Prizes are given, not only for animals, implements, and dairy produce, but also for fruits. Being more of a general nature, combining agriculture, horticulture, and domestic economy, such exhibitions are frequented by all classes. They are usually denominated 'fairs,' though partaking little of the character and appearance of what is understood by a 'fair' in Britain. The diffusion of education among the farmers of the free states has made them eager readers of A. writings, and the numerous societies soon diffuse a knowledge of improved stock, implements, and seeds, over their wide territories.

AGRIGENTUM (Gr. *Akragos*), the modern Girgenti, a town on the south coast of Sicily, in lat. 37° 17' N., and long. 13° 28' E., founded by a colony from Gela (582 B.C.), and, in the earlier ages, one of the most important places in the island. In its palmy days, it is said to have contained 200,000 inhabitants. After being at first free, and then subject to tyrants, it was demolished by the Carthaginians (405 B.C.); but very soon rose again. In the course of the Punic wars, it was compelled to submit to the Romans. From 825 to 1086 A.D., it was in the possession of the Saracens, from whom it was conquered by Count Roger Guiscard. The modern city contains about 15,000 inhabitants, and exhibits numerous and splendid ruins, which, glittering in the brilliant light of a southern sky, afford inexhaustible materials for pictorial representation. Among the best preserved of these remains of antiquity is the Temple of Concord, of which only the roof and part of the front are wanting. The most extensive of the temples was that of Jupiter, 340 feet long, 120 feet high, and 160 feet wide, which, at the time of its destruction, appears not to have been finished. Only the basement and some fragments remain. Considerable ruins of the temples of Juno Lucina, of Hercules, and Æsculapius, are still found. The trade of the modern city is inconsiderable. Some corn, fruit, oil, &c., is exported, but the harbour is little frequented.

AGRIMONY (*Agrimonia*), a genus of plants of the natural order *Rosaceæ* (q. v.), sub-order *Potentillæ*. The calyx is five-cleft, without bracts; the hardened tube at length invests two carpels, and is covered with hooked bristles.—The **COMMON AGRIMONY** (*A. Eupatoria*) is a native of Britain and other parts of Europe, growing in borders of fields, on waysides, &c. It has an upright habit, attains a height of two feet or more, and has interruptedly pinnate leaves, with the leaflets serrate and downy beneath. The flowers are small and yellow, in close racemes. The whole plant has a pleasant, slightly aromatic

smell, and is bitter and styptic. A decoction of it is used as a gargle; the dried leaves form a kind of herb tea; and the root has some celebrity as a

Common Agrimony.

vermifuge.—Very similar to this is *A. marcoviana*, a native of Virginia, Carolina, &c. It has a very agreeable fragrance.

AGRIPPA, CORNELIUS HENRY, a remarkable character of the 16th c., distinguished as writer, philosopher, and physician, who united great ability and extensive acquirements with quackery, was born of a noble family at Cologne, 1486. He led an adventurous and unsettled life, quite in the spirit of his times. As early as 1509, he was appointed teacher of theology at Dôle, in Franche Comté, and attracted great attention by his lectures; but having by his bitter satires on the monks drawn upon himself the hatred of that body, he was accused of heresy, and obliged to leave Dôle. He next taught theology for some time in Cologne, occupying himself at the same time with alchemy, and then went to Italy, where he took military service under Maximilian I., and was knighted. He was afterwards made Doctor of Laws and of Medicine, and gave lectures at Pavia, until, burdened with debt, he fled to Casale. After a time, he was appointed Syndic of Metz; but in 1520, he was again in Cologne, having excited the hostility of the inquisition and of the monks by his defence of a witch. His old enemies, the monks, persecuted him still in Cologne, so that he went to Freiburg in Switzerland, where he began to practise as a physician. In 1524, he went again to Metz, and there he gained such a reputation that the mother of Francis I. chose him as her physician. As he declined to prophesy the issue of the campaign that Francis I. undertook in 1525 in Italy, he lost his post, and went to Holland. Here he wrote his celebrated book, *De Incertitudine et Vanitate Scientiarum* (Colog. 1527), a biting satire on the sciences as they then existed. An accusation against him having been brought before Charles V., on account of this book, he again became a fugitive, and repaired to Lyon. He there found the hatred he had early excited in France not yet extinguished, and was imprisoned; but being liberated, through the exertions of his friends, he retired to Grenoble, where he died (1535). A. was a clear-headed man, and had the merit of successfully combating many of the prejudices of his age. His book, *De Occulta Philosophia*, which contains the most systematic account of the Cabbala (q. v.), stands in direct contradiction with the work above mentioned. The most complete collection of his writings appeared at Lyon, in two vols. without date (about 1550).

AGRIPPA, HEROD, I., son of Aristobulus and

Berenice, and grandson of Herod the Great, was educated at Rome. He lived there in a very extravagant style, giving splendid entertainments, especially to the princes of the imperial family, and scattering his money lavishly in gifts to the freedmen of the emperor, until his debts rendered it unsafe for him to remain longer in the city. He then took refuge in Idumea. From this period almost to the death of Tiberius, he suffered a variety of misfortunes, but having formed a friendship with Caligula, the latter, on his accession to the throne, gave him the tetrarchies of Abilene, Batanaea, Trachonitis, and Auranitis. After the banishment of Herod Antipas, he received his tetrarchy also—namely, Galilee and Perea. Claudius, whom A. helped to secure the possession of the empire, added to his dominions Judea and Samaria, and he was thus the ruler of a more extensive territory than even Herod the Great had been. His government was mild towards the Jews, with whom he was remarkably popular; but he severely persecuted the Christians. He caused James, the brother of John, and the head of the Church at Jerusalem, to be beheaded, and Peter to be thrown into prison. He died of a peculiarly loathsome disease at Cæsarea, in Palestine, while celebrating games in honour of the emperor, in the 55th year of his age, and the 44th of the Christian era. The account given of this in the Acts of the Apostles, substantially agrees with that of Josephus.

AGRIPPA, HEROD, II., son of Agrippa I., was at Rome when his father died, and only 17 years of age. Claudius, therefore, resolved to detain him for some time, and in the meanwhile re-transformed the kingdom into a Roman province, but presented him with the little territory of Chalcis when his uncle Herod, who was its ruler, died. In 53 A.D., he left Rome, and received from the emperor nearly the whole of his paternal possessions, which were subsequently enlarged by Nero. Like his father, A. was fond of fine buildings, a taste which he probably acquired by his long sojourn at Rome. He spent great sums in adorning Jerusalem, Berytus, and other cities; but he was not prudent in the distribution of his favours, or just in his treatment of the high-priests, so that he failed to secure the good-will of the Jews. He did all in his power, however, to dissuade them from rebelling against the Romans; but when he found his advices and warnings neglected, he abandoned his countrymen, and joined the imperial troops. When Jerusalem was taken, he went with his sister to live at Rome, where he was made pretor, and where he died in the 70th year of his age—the last of the Herods. It was before him Paul made his memorable defence.

AGRIPPA, MARCUS VIPSANIUS (63—12 B.C.), a Roman, who, though not of high birth, rose to an exalted position through his own talents. He first espoused Marcia, the niece, and then Julia, the daughter of Octavius. He was eminent both in war and in peace; and as a general, counsellor, and friend of the emperor, did good service to him and to the Roman state. As a general, he laid the foundation for the sole dominion of Octavius, and commanded his fleet in the battle of Actium (31 B.C.). He was generous, upright, and a friend to the arts; Rome owed to him the restoration and construction of several aqueducts, and of the Pantheon, besides other public works of ornament and utility.

AGRIPPINA.—I. The daughter of M. Vipsanius Agrippa, by his wife Julia, was one of the most heroic and virtuous women of antiquity. She was married to Cesar Germanicus (see GERMANICUS), whom she accompanied in all his campaigns. She openly accused Tiberius before the senate

of having hired the murderers of her husband; and the tyrant, who hated her for her virtues, and the esteem in which she was held by the people, banished her to the island of Pandataria, near Naples, where she voluntarily died of hunger (33 A.D.). The antiquarian museum at Dresden possesses four excellent busts of her.—II. A very different character was AGRIPPINA, the daughter of the last mentioned, one of the most detestable women that have lived. In her second widowhood, she induced the Emperor Claudius, her own uncle, to marry her, and espoused his daughter, though already betrothed to another, to her son Nero. In order to bring the latter to the throne, she ruined many rich and noble Romans, excluded Britannicus, the son of Claudius by Messalina, and finally poisoned the emperor, her husband. She then endeavoured to govern the empire through her son Nero, who was chosen emperor; but her ascendancy proving intolerable, Nero caused her to be put to death (60 A.D.). She enlarged and adorned her native city, Cologne, which received from her the name of Colonia Agrippina.

AGTELEK, Cavern of (in Hungarian, *Baradlo*, i. e., a suffocating place), one of the largest and most remarkable stalactitic caverns of Europe, is situated near the village of Agtelek, in the county of Gomor, not far from the road from Pesth to Kaschau. It opens at the foot of a mountain with an entrance scarcely 3½ feet high by 5 feet wide. It consists of a labyrinth of caverns communicating with one another, many of which it is difficult, and even dangerous, to explore, when the streams that flow through them are high. Numerous stalactitic structures occur in all the caverns, which, from their singular shapes, have given rise to the various names of 'the Great Church,' 'the Mosaic Altar,' 'the Image of the Virgin,' &c. The largest and most imposing of those caverns, situated about 200 paces from the entrance, is called the *Flower-Garden*. It is 96 feet high, 90 feet wide, and runs nearly 900 feet in a straight line.

AGUADO, ALEXANDER MARIA, Marquis de Las Marismas del Guadalquivir, one of the wealthiest bankers of modern times, was born at Seville, 1784, and died 14th April 1842. He was descended from a Jewish family, and in his youth bore arms as a soldier. During the Spanish war of independence, he fought with distinction on the side of Joseph, rose in the French army to the rank of colonel, and acted as aide-de-camp to Marshal Soult, but retired in 1815, and began a commission business at Paris. In this he soon realised such wealth as enabled him to found a bank. Good-fortune, energy, and boldness, with a singular talent for concerting schemes, advanced him in a short time to be one of the first bankers in Paris. He also obtained a political reputation by negotiating the Spanish loans of 1823, 1828, 1830, and 1831. In these operations, the Spanish government frequently invested him with unlimited powers, which he dexterously employed to save his country from national bankruptcy. Ferdinand VII. conferred on him the title of Marquis de Las Marismas del Guadalquivir. His services were also recompensed by privileges in mining and in executing public undertakings. All the Spanish bonds issuing from his house received the name of *Aguados*. It was through A. that the Greek loan of 1834 was effected. He was naturalised in France in 1828, and at his death left a fortune of above 60 million francs, of which he had invested part in landed property; the castle of Château-Margaux, celebrated for its wine, belonged to him. His distinguished collection of pictures gave occasion to Gavard for the publication of the *Galerie A.* (Paris, 1837—1842).

AGUAS CALIENTES, a well-built town in Mexico, in the province of Zacatecas. It is situated in N. lat. 21° 53', and W. long. 101° 45', in a plain 6000 feet above the sea-level, and on a stream of the same name, which is tributary to the Rio Grande de Santiago. It contains a population of 20,000; and besides the cultivation of fields and gardens, the manufacture of woollen cloth is very considerable, and is carried on on the factory system. The town is favourably situated for trade, as the great road from Mexico to Sonora and Durango is here crossed by that from San Luis Potosi to Guadalupe. The environs abound in hot springs, from which the town takes its name.

AGUE (Febris intermittens) is the common name for an intermittent fever, accompanied by paroxysms or fits. Each fit is composed of three stages; the cold, the hot, and the sweating stage. Before a fit, the patient has a sensation of debility and distress about the epigastrium; feels weak and disinclined for exertion; the surface of his body becomes cold, and the bloodless skin shrivels up into the condition termed goose-skin (*cutis anserina*). A cold sensation creeps up the back, and spreads over the body; the patient shivers, his teeth chatter, his knees knock together; his face, lips, ears, and nails turn blue; he has pains in his head, back, and loins. This condition is succeeded by flushes of heat, the coldness gives place to warmth, and the surface regains its natural appearance. The warmth continues to increase, the face becomes red and turgid, the head aches, the breathing is deep and oppressed, the pulse full and strong. The third stage now comes on; the skin becomes soft and moist, the pulse resumes its natural force and frequency, and a copious sweat breaks from the whole body.

These paroxysms recur at regular intervals. The interval between them is called 'an intermission.' When they occur every day, the patient has *quotidian* A.; every second day, *tertian*; and when they are absent for two days, *quartan*. All ages are liable to this disease; and a case is on record of a pregnant woman having a tertian A. which attacked her of course every other day; but on the alternate days, when she was well, she felt that the child also had A., although the paroxysms did not coincide with her own.

The exciting causes of this disease are invisible effluvia from the surface of the earth (marsh miasmata). A certain degree of temperature seems necessary—higher than 60° Fahrenheit—for the production of the poison. It does not exist within the Arctic Circle, nor does it appear in the cold seasons of temperate climates, and seldom beyond the 56° of N. lat. (Watson). It also requires moisture. In England, A. is almost exclusively confined to the eastern coast; and the extension of drainage has rendered agues far more rare than before. James I. and Oliver Cromwell died of A. contracted in London. The Pontine Marshes to the S. of Rome have long been notorious as a source of aguish fevers. Peat bog, or moss, is not productive of malaria, as is seen in parts of Ireland and Scotland. Neither is A. ever seen among the inhabitants of the Dismal Swamp—a moist tract of 150,000 acres on the frontiers of Virginia and North Carolina in North America.—The treatment of aguish fever consists generally in calomel given in purgative doses, followed by preparations of cinchona-bark, and in applying, during the paroxysm, external warmth to the body.

AGUE'SSEAU, HENRI FRANÇOIS D', a distinguished lawyer and chancellor of France, and pronounced by Voltaire to have been the most learned magistrate that France ever possessed, was born at Limoge, 1668 A. D. He received his earliest education

from his father; and afterwards devoted himself to the study of law, became *avocat-général* at Paris in 1690, and at the age of thirty-two, *procureur-général* of the parliament. In this office, he effected many improvements in the laws and in the administration of justice. He displayed great benevolence during a famine which occurred in the winter of 1709, applying all the means in his power for the alleviation of the calamity. As a steady defender of the rights of the people, and of the Gallican Church, he successfully opposed the decrees of Louis XIV. and the Chancellor Voisin in favour of the papal bull *Unigenitus* (q. v.). During the government of the Duke of Orleans, he became chancellor; but in the following year fell into disgrace by opposing Law's system of finance, and retired to his country-seat at Fresnes. When, however, the ruin induced by Law's system produced a general outcry of dissatisfaction, A. was reinstated, in order to appease the people. But his well-meant efforts could not retrieve the desperate state of affairs. A. was afterwards exiled a second time, in consequence of his opposing Cardinal Dubois; and though he (in 1727) obtained from Cardinal Fleury permission to return, yet he did not again resume the office of chancellor till 1737. He resigned in 1750, and died, Feb. 9, 1751. His works, consisting of pleadings and speeches at the openings of the parliament, occupy thirteen volumes (Paris, 1759—1789. Newest edition, Paris, 1819).

AGULHAS, CAPE, (meaning Needles), the most southern point of Africa, lies about 100 miles E.S.E. of the Cape of Good Hope, in lat. 34° 51' S., long. 19° 55' E. In 1849, a light-house was erected on it, at an elevation of 52 feet above high-water. The A. Bank extends along the whole southern coast of Africa. It is 560 miles in length, and, opposite the Cape of Good Hope, as many as 200 in breadth.

A'HAB, the son and successor of Omri, was king of Israel from 918 to 897 B. C. He married Jezebel, the daughter of Ethbaal, king of Sidon; through whose injurious influence the Phœnician worship of Baal was introduced, the king himself seduced to idolatry, and the priests and prophets of Jehovah cruelly persecuted. Yet the prophets retained their influence over the people; and Elijah dared openly to attack the priests of Baal, and reprove the wickedness of the king with the most severe threatenings of punishment. A. prosecuted three wars, with various success, against Benhadad, king of Syria; but in the last campaign he was killed by an arrow. His whole family was afterwards extirpated under King Jehu.

AHASUERUS is the name, or rather, perhaps, the title, by which several kings of Media and Persia are mentioned in Scripture. The best known of these is Esther's husband (see ESTHER), who is probably the same as the Persian king Xerxes; the Hebrew form of his name (*Achschverosh*) pointing to the old Persian form of the name Xerxes (*Khschyárschan*).

A-HULL, a maritime term, used to denote the position of a ship when all her sails are furled, and her helm lashed on the lee-side; in such a position, she lies nearly with her side to the wind, but with the head turned a little towards the direction of the wind.

It may be convenient to mention in this place that the phrasology adopted by British naval officers and seamen, whether belonging to the royal navy or to the mercantile marine, comprises a large number of words formed on a principle similar to that of *ahead*, with the vowel *a* (a corruption of the Anglo-Saxon preposition *an*, meaning *in, at*) prefixed to a noun. Such are the following: *Aback, abaft, aboard, abreast, a-cockbill, adrift, afloat, afore, aground, ahead, a-hull, a-lee, aloft, aloof, amain,*

amidships, an-end, apeak, ashore, astern, atrip, avast, a-weather, a-weigh. Such of these terms as seem to require it, will be found briefly explained under their proper headings.

AHMEDABAD, or more properly AHMADABAD, the chief town in the district of the same name, in the Presidency of Bombay, is situated on the left bank of the Sabermutty, which flows nearly due south into the Gulf of Cambay. It was built in the year 1412, by Ahmed or Ahmad Shah, and underwent all the vicissitudes of government incident to the cities of Hindustan, till the year 1818, when it finally came under the power of the British. It was formerly one of the largest and most magnificent capitals in the East—in the opinion of a native writer, 'the handsomest city in Hindustan; perhaps in the world.' Its architectural relics are gorgeous, even in the midst of decay. The Jumna or Juma'ah Masjid, or Great Mosque, rises from the centre of the city, and is adorned by two superbly decorated minarets, 'each of which contains a circular flight of steps, leading to a gallery near the summit. Its domes are supported by lofty columns, regularly disposed; the concave of these cupolas is richly ornamented with mosaic and fret-work. The pavement is of the finest marble.' The mosque of Sujaat Khan is extremely elegant. There is likewise an ivory mosque, which has obtained that name from the circumstance, that although built of white marble, it is 'curiously lined with ivory, and inlaid with a profusion of gems, to imitate natural flowers, bordered by a silver foliage on mother-of-pearl.' There are also the Fire Temple and the Tower of Silence of the Parsis. A. once abounded in gardens, aqueducts, reservoirs, &c.; but these, especially the gardens, are now sadly defaced and injured. Its prosperity has been almost wholly destroyed by the rapacity of the Mahrattas, although at one time it was famous for its manufacture of rich fabrics of silk and cotton, articles of gold, silver, steel, and enamel. 'It employed many artists in portrait-painting and miniatures,' and had extensive trade in indigo, cotton, and opium. The old city-walls, built in 1485, which had in the course of ages, and through the assaults of enemies, become very dilapidated, were repaired in 1834 at an expense of 250,000 rupees, and water conveyed from the river through the city by means of pipes. It is distant from Bombay 290 miles north; in lat. 23° N., long. 72° 36'. Pop. 130,000.

AHMEDNUGGUR, or AHMADNUGGUR, an important town in the Presidency of Bombay. It was founded in 1494 by Ahmad Nizam Shah. During the reign of his son, Boorhan Nizam Shah, it reached a high degree of prosperity; but after his death, it witnessed an incessant series of wars, confusions, and murders. In 1797, it fell into the hands of the Mahrattas; and in 1803 was surrendered, after a trivial resistance of two days, to General Wellesley. It was, however, shortly after restored to the Peishwa; but in 1817, the fort was again occupied by the British. The town has increased rapidly since it came under British protection and rule. It possesses a most singular defence, in addition to its wall; this consists of an 'immense prickly-pear hedge about 20 feet high, which is so full of sap that no fire will kindle it, and so vigorous that it is almost impossible to force one's way through it.' A. contains an English church, a *dhurmsalah* (or place of entertainment for travellers) capable of holding 250 persons. It also possesses a good supply of water by means of aqueducts. It is distant from Bombay 122 miles east, in lat. 19° 6', long. 74° 46'. There are several places of the same name in Hindustan.

A'HRIMAN (in the Zend, *aidro mainyus*, i. e., the malignant, destroying spirit) is, according to the dualistic doctrine of Zoroaster, the personification of malignity, the original source of all moral and physical evil, the chief of the devils and malignant spirits, the king of darkness and of death, and consequently the eternal enemy and opponent of Ormuzd and of his kingdom of light. See ZOROASTER.

AIDE-DE-CAMP, an officer who may be regarded as a kind of superior confidential attendant upon a general in active service. The A. is the organ of the general. He carries all orders on the field of battle: these he is to deliver in the plainest terms, so as to be distinctly understood; and when so understood, the orders are to be as implicitly obeyed as if the general himself were present and speaking. As an example of the importance of this matter, may be adduced the brilliant but disastrous light-cavalry charge at Balaklava in the autumn of 1854. Lord Raglan sent a message, partly verbal and partly written, to the Earl of Lucan, concerning a particular piece of strategy at a certain time and place; the message was misconceived, and the Earl of Cardigan was directed to make a military movement, perfectly hopeless in its character, resulting in a very serious cavalry loss; although the incident presented a fine display of heroism united with discipline. An A. also acts as secretary to the general, and assists him in his correspondence, when he has not specifically a military secretary. He aids likewise in dispensing the courtesies of the general's house or tent. Generals are much accustomed to appoint their sons or other relations to this confidential post. The Aides-de-camp vary from one to four in number, according as the commander is a brigadier-general, major-general, lieutenant-general, general, or field-marshal: each receives 9s. 6d. a day besides regimental pay. Before an officer can be appointed as A., he must have been two years with his regiment, and must pass an examination. Aides-de-camp are not removed from the list of their regiments; and, most commonly, are captains. Besides these Aides-de-camp to generals, the Queen has the power to appoint any number of Aides-de-camp to herself, in her capacity of nominal head of the army. There are no particular duties attached to the office; but it is much sought after, both as an honour, and as conferring on the holder the rank of colonel in the army. There are 6 who receive daily pay as Aides-de-camp, and who take it in turn to attend the Queen on state occasions. In the year 1873, there were no fewer than thirty-three military Aides-de-camp to the Queen, of whom seven were peers of the realm; but of the thirty-three, only nineteen belonged to the army, the rest, except two of the marines, being militia officers, whose appointments are purely honorary. In addition to all the above, there are naval Aides-de-camp to the Queen, of whom there were eleven in the year 1873.

AIDE-TOI ET LE CIEL T'AIDERA (Help yourself, and Heaven will help you). This moral aphorism was the cry of certain French political writers to the middle classes, about the year 1824, and became the watch-word and title of a society, having for its object to agitate the electoral body in opposition to the government. This, however, was to be done by means strictly legitimate, and chiefly by correspondence and political publications. Most of its founders and active members belonged to the party of *Doctrinaires* (q. v.), as Guizot, who was president for some time, Duchatel, Duvergier de Hauranne, Dubois, Remusat, Thiers, Cavajgnac, &c. *Le Globe* newspaper was the organ of the association, and afterwards *Le National*. It had

a great share in bringing about the revolution of July 1830, and was at first countenanced by the new government; but after a short time it was dissolved (1832).

AIDIN, or **GUZEL-HISSAR**, a town of Asiatic Turkey, on the river Meander, in the pachalic of Anatolia, built out of the ruins of the ancient Tralles, which was situated on a plateau above the present town. It lies sixty miles south-east of Smyrna, contains 6000 houses, and a population estimated at from 35,000 to 60,000 inhabitants, is four miles in circuit, and carries on a trade next in importance to that of Smyrna. It is adorned, like all eastern cities, with numerous mosques and other religious edifices, and has a picturesque appearance.

AIDS. These were originally mere benevolences granted by a tenant to his lord, in times of distress; but gradually they came to be regarded as matters of right, and not of discretion. There were three principal objects for which A. were demanded: 1st, To ransom the person of the lord when taken prisoner; 2d, To make his eldest son a knight; and 3d, To provide a suitable portion to his eldest daughter on her marriage. These A. were abolished by 12 Car. II. c. 24.

AID OF THE KING is where the king's tenants pray A. of the K. on account of rent demanded of them by others. In such cases, the proceedings are stopped till the king's or queen's counsel are heard to say what they think fit for avoiding the king's prejudice.

AIGRETTE, a French word, used to denote the down or plume (botanically, *pappus*) which is found attached to many vegetable seeds, as the thistle and dandelion. It is also used in reference to the feathery tuft on the heads of several birds, as the heron; and in English zoology the name aigret or egret (q. v.) is applied to the lesser white heron, an elegant bird, with a white body and a feathery crest. Hence the term A. came to be used to designate the long, delicate white feathers which, being stuck upright in a lady's head-dress, are calculated to give a majestic appearance to the person. More recently, the usage has been still further extended, and any head-dress bearing an analogy to a plume, even a bouquet of flowers, fastened with precious stones, is denominated an A.

AIGUES MORTES (*Aqua Mortua*), a small town in France (pop. 3833), in the department of Gard, which claims to have been founded by the Roman Marius. It is situated in an extensive marsh, impregnated with sea-salt, and is about three miles from the Mediterranean, with which it is connected by a canal. It was from A. M. that St Louis sailed in 1248, and again in 1270, for the Crusades—a proof that the sea then reached this spot. In 1538, Francis I. had an interview at A. M. with Charles V.

AIGUILLE (Fr. a needle), an instrument often used by military engineers, to pierce a rock for the reception of gunpowder, when any blasting or blowing-up is to be effected.

AIGUILLETTE, a part of the decorations of military dress. It was formerly worn on the right shoulder by general officers of various grades; but is now chiefly confined to officers of the Life-Guards and Horse-Guards. It is merely an ornament, composed of gold or silver cords and loops.

AIGULET, a rope called a lashing-rope, employed in ships-of-war for securing the breaching of a gun.

AILANTO (*Ailanthus glandulosa*), a lofty and beautiful tree, of the natural order *Xanthoxylaceae* (see *XANTHOXYLON*), a native of China, but now

frequently planted to shade public walks in the south of Europe, and not uncommon in England. The styles are combined at the base, the fruit consists of 3-5 *samara* (or winged *achenia*, q. v.). The leaves are large and pinnate, with an odd leaflet, resembling those of the ash. The tree grows better than almost any other on chalky soils, and is hardy enough to endure the climate even of the north of Scotland. It is easily propagated by suckers and cuttings of the roots. The wood is fine grained, satiny, and suited for cabinet-making.

AILETTES (Fr. little wings) were appendages to the armour worn by knights in the 13th c. They were sometimes made of leather, covered with a kind of cloth called *carda*, and fastened with silk laces. The form was sometimes circular, sometimes pentagonal, cruciform, or lozenge shaped, but more usually square. Sometimes they were not larger than the palm of the hand; in other instances, as large as a shield. In most instances, the A. were worn behind or at the side of the shoulders. Whether the purpose of these appendages was as a defence to the shoulders in war; as an ensign or mark, to indicate to the followers of the knight his place in the field; or as armorial bearings, is not now clearly known; but the first supposition is the most probable. A. are figured on many effigies, monumental brasses, and stained windows, in our cathedrals and old churches.

AILSA CRAIG, a remarkable islet about 10 miles from the southern coast of Ayrshire, opposite Girvan, lat. 55° 15' 12" N.; long. 5° 7' W. Rising abruptly out of the sea to a height of 114 feet, it forms a most striking object, even at a considerable distance. It is about two miles in circumference, and is accessible only at one point, where the accumulation of débris has formed a rough beach. The rock may be described generally as a mass of trap, assuming in some places a distinct columnar form, with dimensions far exceeding those of the basaltic pillars of Staffa. On the north-west, perpendicular cliffs rise to a height of from 200 to 300 feet; on the other sides, the Craig descends to the sea with a steep slope, covered with grass and wild-flowers, with numerous scattered fragments of rock. The only inhabitants are goats, rabbits, and wild-fowl. Solan geese, in particular, breed in the cliffs in countless numbers. About 200 feet from the summit are some springs, and on the ledge of a crag on the eastern front, are the remains of an ancient stronghold. In 1831, the late Earl of Cassillis, the proprietor of A. C., was raised to the dignity of Marquis of Ailsa.

AIN, a river in France, rises in the mountains of the Jura, flows through the departments of Jura and Ain, and after a course of about 100 miles, falls into the Rhone, 18 miles above Lyon.

AIN, a frontier department of France, is bounded on the N. by the departments of Jura and Saône-et-Loire, on the E. it is separated from Switzerland and Savoy by the Rhone, which also divides it from Isère on the S., while on the W. the Saône separates it from the departments of the Rhone and Saône-et-Loire. The eastern part is mountainous; but the southern portion of that part which lies to the west of the Ain, forms an argillaceous plateau, abounding with marshes, which occasion epidemic fevers. This dep. is divided into five *arrondissements*—Bourg, Belley, Gex, Nantua, Trévoux, and into 35 cantons. Area, 2258 sq. m. Pop. 363,200. Chief town, Bourg.

AINMÜLLER, MAX. EMAN., to whom we owe the restoration of the art of painting on glass, was born at Munich, 1807. He began the study of architecture, but afterwards entered the royal porcelain manufactory as decorator; and it was here

that he first succeeded in overcoming the technical difficulties in the execution of glass-painting. A separate institution was now established for the art; and A., as inspector, succeeded in raising it to a high degree of perfection. He is said to have first conceived the happy thought of laying coloured glass on coloured, instead of the process hitherto followed, of laying coloured glass on white; thus giving the command of above 100 variously coloured glasses, in all gradations of tint. He was also the first, in conjunction with Wehrstorfer, to execute pictures on glass, and thus revive the art of miniature glass-painting. Nor was it only technical improvements and inventions that he contributed to the new art; his artistic culture qualified him powerfully to aid the regeneration of taste that has accompanied it. The first work of the new institution was the restoration of the windows of the cathedral of Ratisbon (1826—1833), to which A. contributed the ornamentation, and painted several of the figures. He made a like contribution to the splendid windows of the church of Maria-Hilf (1833—1838), in Munich. In the contribution of King Ludwig of Bavaria to the cathedral of Cologne, and the numerous other windows executed at Munich for all parts of the world—England among the rest—A. displayed the highest artistic faculty in giving to the figures a rich setting of architectural ornamentation, in such a way as to harmonise with the style of the building.—A. has also acquired a great reputation as an architectural painter in oil. Among his pieces are St Mark's Church, in Venice; the interior of St Stephen's Church, Vienna; the interior of Windsor Chapel, of Westminster Abbey, and the Poets' Corner. He died December 1870.

AINSWORTH, ROBERT, the author of a once extensively used Latin Dictionary, was born at Woodvale, near Manchester, in 1660. He was educated at Bolton, and taught a school there for some time, but afterwards went to London, where he was engaged for many years in educational pursuits. In 1714, he commenced his Dictionary (Latin-English and English-Latin), which, however, was not published until 1736. A. died near London on the 4th of April 1743. He wrote also some Latin poems, and a few treatises on various subjects; but nothing keeps his memory alive except the Dictionary, which itself is now fast passing away into oblivion. The labour expended on such a production was indeed highly honourable to the author, but the work has no claim to the character of an accurate or philosophical lexicon, and, in spite of the numerous emendations it has received, it remains essentially what it was at first. It has been superseded by Riddell's, and more recently by Smith's, Andrews's, and other Lexicons.

AINSWORTH, WILLIAM FRANCIS, an English physician, geologist, and traveller, a relation of the foregoing, was born at Exeter, 1807. He studied medicine at Edinburgh, and, after receiving (1827) his medical diploma, he travelled in France, and prosecuted geological investigations in the Auvergne and Pyrenean mountains. Returning to Edinburgh in 1828, he conducted the publication of the *Journal of Natural and Geographical Science*, and delivered lectures on geology. In 1835, he was attached as physician and geologist to the Euphrates expedition under Colonel Chesney, at the recommendation of Colonel Sabine, and returned homo in 1837 through Kurdistan, the Taurus, and Asia Minor. In the following year, he went again to Asia Minor, being sent with Rassam and Russell by the Geographical Society, and the Society for the Diffusion of Christian Knowledge. The objects were chiefly to explore the course of the Italy, and to visit the Christians

in Kurdistan. On his return (1841) he published *Researches in Assyria, etc.* He has published also *The Claims of the Christian Aborigines in the East*, and *Travels in the Track of the 10,000*. He has edited Xenophon's *Anabasis and Memorabilia*; and published, among other works, *The Euphrates Valley Route to India*, and *On an Indo-European Telegraph by the Valley of the Tigris*—a project which the Turkish government has since carried out. He is (1873) proprietor and editor of the *New Monthly Magazine*.

AINSWORTH, WILLIAM HARRISON, a well-known writer of fiction, was born Feb. 1805, at Manchester, where his father was a solicitor. His creative fancy began early to shew itself in ballads and tales, which appeared in the local newspapers, and in contributions to the *London Magazine* and other periodicals. Being destined to succeed his father, he entered a writer's office; but after a while he forsook law for literature, and at first began a publishing business in London, which, however, he soon gave up in disappointment. He had previously published his first novel, *Sir John Chiverton* (1825). After spending some time on the continent, he returned to England, and wrote *Rookwood* (1831), which was favourably received. It was followed by *Crichton* (1837) and *Jack Sheppard* (1839). A. edited for a time *Bentley's Miscellany*, and in 1812 began his own *Ainsworth's Magazine*; in 1815 he acquired also the *New Monthly Magazine* from Colburn. He published the *Lancashire Witches* in 1849; six years later, appeared the *Star Chamber*; in 1860, *Ovingdean Grange*; the *Lord Mayor of London* was published 1862, *Cardinal Pole* the following year, and *John Law, the Projector*, in 1864. His more recent works are the *Spanish Match*, the *Constable de Bourbon*, *Old Court*, *Middleton Pomphret*, and *Hilary St Ives*.

AIR, or ASBEN, a kingdom of Central Africa, extending from about 17° to 19° N. lat., and from 8° to 9° E. long. Agades (q.v.) is the capital, and residence of the sultan, but his power is in a large measure merely nominal. The country contains various towns and villages, and is principally inhabited by three large tribes—the Kel-owi, the Kel-geres, and Itisan, each of which has numerous subdivisions. There are, besides, the Kel-n-Negarru, the Imghad, &c. The word *kel* means 'people,' but specially denotes *settled* people, in opposition to *nomads*. Thus, Kel-owi is people settled in the valley of Owi. Many of the tribes and families live not in fixed dwellings, but movable tents made of mats. The valleys of A. are naturally rich, but they are poorly cultivated. Food and clothing are both imported. The population, which is very considerable, could not be sustained, were it not for the salt-trade of Bilna, a town lying to the east of A., in the Tebu country. Although the valleys of A. are in the region of the tropics, the climate is comparatively temperate. See *Barth's Travels in Central Africa*, vol. i.

AIR is the name given to that compound of gases constituting the substance of our atmosphere. Formerly, all æriform fluids were called 'airs,' but in this sense the word *gas* is now used. The chief properties of air, and the phenomena they give rise to, will be found treated under Atmosphere, Aerodynamics, Aerostatics, Air-pump, Barometer, Balloon, &c.

AIR, in Music. See AIIA.

AIR-BEDS and AIR-CUSHIONS. Air-beds were known as early as the beginning of the 18th c., but being made of leather, were expensive. It was only after the invention of air-tight or Macintosh cloth that it became possible to use air in this way at a moderate cost. An air-bed consists of a sack in

the form of a mattress, divided into a number of compartments, each air-tight; a projection at one end forms a bolster. Each compartment has a valve, through which the air is blown in by a bellows. The advantages of such beds, in point of cleanness, coolness, lightness, and elasticity are obvious. They are specially valuable in many cases of sickness. The *travelling-cushion* is another contrivance of the same kind. Recently, vulcanised India-rubber, instead of cloth, has been used in the fabrication of such articles. The chief drawback to these contrivances is the liability to being spoiled by a rent or other injury.

AIR-BLADDER, or SWIMMING-BLADDER, in Fishes. An organ apparently intended to aid them in ascending in deep water, and for the accommodation of their specific gravity to various depths. It is made to serve this purpose by the increase or diminution of its volume, according to the degree of pressure exerted upon it by the ribs. Its place is in the abdomen, under the spine; and it is very various in size and form in different kinds of fishes. It generally has an opening into the oesophagus, or into the stomach, but apparently only for the ejection, and not for the admission of air. In some fishes, it has no opening. The air with which the A. is filled appears to be the result of secretion; and in fresh-water fishes, consists in general almost entirely of nitrogen, but contains a larger proportion of oxygen in sea-fishes; the oxygen in deep-sea fishes having been found to amount to 87 per cent. The A. is in some fishes very small; in others, it is entirely wanting, particularly in fishes that are destined to live chiefly at the bottom of the water, as flat fishes,

Air-bladder of Carp:
Consisting of two parts—B and C, joined by a narrow neck; A, D, a canal communicating with oesophagus, E.

cells, &c.; but there are remarkable instances of its absence also in species of very different habits, such as the common mackerel, whilst it exists in other species of the same genus or family. The A. of fishes affords the finest kind of isinglass.

AIR-CELLS, or AIR-SACS, in Birds, are remarkable cavities connected with the respiratory system. They are distributed along the inside of the whole cavity of the chest and abdomen; and in birds of strong wing and rapid flight, often send prolongations into the bones. They are connected with the extremely active respiratory system, and communicate with the lungs, giving an immense extension to the surface with which the air inhaled comes in contact. The cells in the lungs of

Lungs, &c., of Ostrich:
a a a a, air-cells; b b, lungs;
c, heart; d, stomach;
e, intestines.

the mammalia, into which the air is conveyed by minute ramifications of the windpipe, in order to be brought into contact with the blood distributed on their walls, Air-tubes of Insect, are very small; in man, only about one-hundredth part of an inch in diameter.—Air-

cells, or air-sacs, may be said to form the whole respiratory apparatus in some of the lower kinds of animals (see ANNELIDA), whilst in others, higher in the scale of organisation, particularly in insects, *air-tubes* arising from these ramify throughout the whole body. The air-tubes of insects are formed of a spiral fibre within a membranous coat, like the spiral vessels of plants, so that they possess great elasticity.

AIR-CELLS in plants are cavities containing air in the stems or leaves. The orifices of the inter-cellular passages are closed up, so as to prevent the juices of the plant from entering them. They are very variable in size, figure, and arrangement, but are formed according to a uniform rule in each particular species in which they are found. They are large and numerous in many aquatic plants, evidently serving the purpose of buoying them up in the water. Besides A. of regular form, there are irregular cavities, also called by the same name, which seem to be formed by the tearing of the cellular tissue in the rapid growth of the plant, as in grasses and umbelliferous plants.

AIR-ENGINE. See CALORIC ENGINE.

AIR-GUN, an instrument for firing bullets or other projectiles, by the force of compressed air instead of gunpowder. Various forms of construction have been adopted. The most usual plan is to insert a condensing syringe in the stock of the gun. The piston of this syringe is worked by an apparatus which passes through to the exterior of the gun; and this working causes a small body of air to be condensed into a chamber. The chamber has a valve opening into the barrel, just behind the place where the bullet is lodged. The gun is loaded from the muzzle, as ordinary muskets or fowling-pieces; and there is at that time just behind it a small body of highly compressed air, ready to rush out at any opening. This opportunity is afforded by a movement of the trigger, which opens the valve; the air rushes forth with such impetuosity as to propel the bullet. By a certain management of the trigger, two or three bullets, successively and separately introduced, can be fired off—if firing it can be called—by one mass of condensed air. Another form of A. contains several bullets in a receptacle or channel under the barrel; by the movement of a cock or lever, one of these bullets can readily be shifted into the barrel; and thus several successive discharges can be made after one loading—on a principle somewhat analogous to that of the revolving pistol. Some varieties of A. have the condensing syringe detached, by which means a more powerful condensation of air may be produced; this done, the air-chamber is replaced in its proper position behind the bullet in the barrel. Those air-guns which present the external appearance of stout walking-sticks, and are thence called air-canes, have a chamber within the handle for containing condensed air, which can be unscrewed, and subjected to the action of the condensing syringe. One inventor has devised a form of A. with two barrels—one of small bore for the reception of the bullets, and another of larger bore for the reservoir of condensed air; the condensing syringe being within the stock of the gun. An attempt has more recently been made to combine the action of elastic springs with that of compressed air, in an A.; springs of gutta-percha, or of vulcanised india-rubber, are employed in substitution of, or in co-operation with, a condensing syringe. No form of A. hitherto made has had power enough to propel a bullet to any considerable distance; and therefore the instrument is scarcely available in war; there are, however, circumstances in which

such an arm may be useful—seeing that there is no expense for gunpowder, no noise, no smoke, no unpleasant odour. The A. was known in France more than two centuries ago; but the ancients were acquainted with some kind of apparatus, by which air was made to act upon the shorter arm of a lever, while the larger arm impelled a bullet.

AIR-PLANTS. See EPIPHYTES.

AIR-PUMP, an instrument for removing the air from a vessel. The essential part is a hollow brass or glass cylinder, in which an air-tight piston is made to move up and down by a rod. From the bottom of the cylinder, a connecting tube leads to the space which is to be exhausted, which is usually formed by placing a bell-glass, called the receiver, with edges ground smooth, and smeared with lard, on a flat, smooth plate or table. When the piston is at the bottom of the barrel, and is then drawn up, it lifts out the air from the barrel, and

Air-pump.

a portion of the air under the receiver, by its own expansive force, passes through the connecting tube, and occupies the space below the piston, which would otherwise be a vacuum. The air in the receiver and barrel is thus *rarefied*. The piston is now forced down, and the effect of this is to close a valve placed at the mouth of the connecting tube, and opening inwards into the barrel. The air in the barrel is thus cut off from returning into the receiver, and, as it becomes condensed, forces up a valve in the piston, which opens outwards, and thus escapes into the atmosphere. When the piston reaches the bottom, and begins to ascend again, this valve closes; and the same process is repeated as at the first ascent. Each stroke thus diminishes the quantity of air in the receiver; but from the nature of the process, it is evident that the exhaustion can never be complete. Even theoretically, there must always be a portion left, though that portion may be rendered less than any assignable quantity; and practically the process is limited by the elastic force of the remaining air being no longer sufficient to open the valves. The degree of rarefaction is indicated by a *gauge* on the principle of the barometer. By means of the partial vacuum formed by the A., a great many interesting experiments can be performed, illustrating the effects of atmospheric pressure, and other mechanical properties of gases.—The A. was invented by Otto Guericke (q. v.), 1654; and though many improvements and varieties of structure have been since devised, the principle of all is the same. Two barrels are generally used, so as to double the effect of one stroke. In some air-pumps, stop-cocks turned by the hand take the place of valves; and in others, the entrance of the connecting tube into the cylinder is so contrived that the valve through the piston is not required.

AIRD, THOMAS, a poet of considerable genius, born at Bowden, in Roxburghshire, in 1802. He received the rudiments of education at schools in his native county, from which he passed to the

university of Edinburgh. While in the metropolis, he made the friendship of many distinguished men, especially Professor John Wilson, who was accustomed to speak of him in the highest terms. In 1835, he became editor of *The Dumfries Herald*, a new journal, started on Conservative principles. His genius is of a purely literary character, and not calculated to be effective in the discussion of political questions. His works are not so well known as they deserve to be, from their intrinsic merit. In spite of very warm eulogy from some of the greatest names in popular criticism, and in spite of many elaborate and discriminating reviews in various important magazines, they have failed to secure a large measure of public approbation. *The Devil's Dream* is perhaps an exception to the rest, for it is both well known and admired. Competent judges have asserted that there is something almost Dantesque in the stern, intense, and sublime literalness of the conception. This power of realisation in painting objects is the grand characteristic of Mr A.'s mind. Whether the scenes are colossal, as in *The Devil's Dream*, or minute, as in *The Summer's Day*, there is the same clear, vigorous, and picturesque word-painting. Herein lies Mr A.'s chief originality, for his thought and sentiment, though always pure and fine, are not strikingly novel. In 1827, he published *Religious Characteristics*, a piece of exalted prose-poetry; in 1845, *The Old Bachelor*, a volume of tales and sketches; in 1848, a collected edition of his poems—a second edition of which appeared in 1856; and in 1852, he edited the select poems of David Macbeth Moir (the 'Delta' of *Blackwood*), prefixing a memoir for the benefit of Dr Moir's family.

AIRDRIE, a town recently separated from the parish of New Monkland, and erected into a *quoad sacra* parish, Lanarkshire, 11 miles E. of Glasgow. The high-road between Edinburgh and Glasgow intersecting it, forms its principal street. It has risen rapidly, and is now one of the most flourishing inland towns in Scotland. Little more than a century ago, it consisted of a solitary farmhouse or two; but the abundance of iron and coal in the vicinity has given its progress an impetus like that of an American city (see GARTHERIE). The Monkland Canal and the Caledonian Railway receive the produce of the coal-pits and iron mines. The town has some neat buildings, is well paved, and lighted with gas. The weaving of cotton goods for the Glasgow manufacturers is carried on to a considerable extent, as is also the distillation of spirits, silk-weaving, and paper-making. Pop. in 1871, 15,671.

AIRY, GEORGE BIDDELL, D.C.L., M.A., Astronomer Royal, was born at Alwick in 1801. He was educated principally at Colchester, from which he passed in 1819 to the university of Cambridge. In 1822, he was elected Scholar; in 1823, he took the degree of B.A., with the honour of Senior Wrangler; and in 1826, that of M.A. In the same year, he was elevated to the chair of Science founded by Lucas, which he rescued from the reproach of being a sinecure, by delivering a course of public lectures on experimental philosophy. In 1828, he was made Plumian professor, and had the management of the newly erected Cambridge Observatory intrusted to him. On account of his severe and unintermitting labours in connection with this office, his income was augmented from the funds of the university. He published his observations (*Astronomical Observations*: Cambridge, 1829—1838, 9 vols.), arranged in a clear and simple manner; and they have served as a model ever since for those of Greenwich and other observatories. In 1835, the office of Astronomer

Royal becoming vacant, Mr A. was appointed to it by Lord Auckland, then First Lord of the Admiralty. He has introduced new or more perfect scientific instruments, more rapid methods of calculation, and researches in magnetism, meteorology, photography, &c. He contributed the well-known article on 'Gravitation,' to the *Penny Cyclopaedia* (1837). Equally excellent and popular is his treatise on *Trigonometry*, which was written for the *Encyclopaedia Metropolitana* (1855). He has deservedly obtained the reputation of being one of the most able and indefatigable of living savans. He served on the Royal Commission appointed in 1868, to inquire into the standard weights and measures. In 1869, he communicated, in a 'Note' to the Royal Astronomical Society, a remarkable discovery on 'Atmospheric Chromatic Dispersion, as affecting Telescopic Observation, and the mode of correcting it.' He was nominated a Companion (Civil) of the Bath in 1871. Mr A. is an F.R.S.; an Honorary Member of the Institution of Civil Engineers, Corresponding Member of the French Institute, a D.C.L. of Cambridge and Oxford, and LL.D. of Edinburgh.

Aisle (Melrose Abbey).

AISLE (from Lat. *ala*, a wing) means any lateral division of any part of a church, whether nave, choir, or transept. The number of aisles varies in the churches of different countries. In England, there is only one on each side of the nave or choir; in most foreign countries, there are generally two, and at Cologne there are even three. The continental edifices, it would seem, have antiquity in their favour for this arrangement (see **BASILICA**). The word is often incorrectly applied to the open space in the nave of churches between the seats of the congregation.

AISNE, a tributary of the Oise, in France, rises in the department of Meuse, and flows north-west through the departments of Marne and Ardennes, and then west through that of Aisne and part of Oise, where it falls into the river Oise, above Compiègne. Its course extends to 150 miles, of which 70 are navigable.

AISNE, a department in the north of France, formed of a part of ancient Picardy and the Isle of France. It belongs to the basin of the Seine, and is intersected by the river A., and by other navigable streams and canals. The soil is fertile; the chief culture is wheat, and other grain. Its rich meadows supply Paris with hay. The area is 2830 square miles, with a population of (1871) 552,439. It is the seat of considerable cotton and other manufactures, the centre of which is St Quentin (q. v.), and at St Gobin is the famous manufactory of mirrors. The department is divided into 5 *arrondissements* and 37 cantons. The chief town is Laon (q. v.).

AIX, a town in France, formerly the capital of Provence, now the chief town of an *arrondissement* in the department of the Bouches-du-Rhône. It is believed to have been built by the Roman consul, C. Sextius (120 B.C.), on account of the mineral springs in the neighbourhood, and thence called *Aqua Sextie*. A. is the seat of a court of appeal; and possesses an academy for theology and law, and a public library which

reckons nearly 100,000 vols., and 1100 MSS. The baptistery of the cathedral is believed to have been originally a temple of Apollo. The numerous public fountains give a cheerful air to the place. One of them has a sculpture of the Good King René, executed by David. There is also an old clock-tower, the machinery of which, when the clock strikes, sets various quaint-looking figures in motion. The industry of this again flourishing town consists chiefly in the cultivation of the olive, in cotton-spinning, leather-dressing, and trade in oil, wine, almonds, &c. The warm springs are slightly sulphureous, with a temperature from 90° to 100° F., clear and transparent as the purest well-water, almost free from smell, yet with a slightly bitter taste. They have the reputation of improving the beauty of the skin, and are on this account especially frequented by the fair sex. The field on which Marius defeated the Teutones lies in the plain between A. and Arles. In the middle ages, under the Counts of Provence (see **RÉNÉ**), A. was long the literary capital of Southern Europe. The population of the municipality of Aix in 1871 was 18,905.

AIX (Aqua Gratiava, Allobrogum), a small town of Savoy, pop. 2—3000, in a delightful valley near Lake Bourget, seven miles north from Chambéry. It was a much frequented bathing-place in the times of the Roman empire, and among its numerous remains of ancient times, are the arch of Pomponius, the ruins of a temple and of a vaporarium. The king of Sardinia has a palace here. The hot springs, two in number, are of sulphurous quality, and of a temperature above 100° F. They are used both for drinking and as baths, and attract annually above 2000 visitors.

AIX-LA-CHAPELLE (Ger. Aachen) is the capital of a district in Rhenish Prussia. It is situated in a fertile hollow, surrounded by heights, and watered by the Wurm; N. lat. 50° 47', E. long. 6° 5'; pop. (1871) 74,238, of whom a very small proportion are Protestants. A. is the centre of numerous thriving manufactories, especially for spinning and weaving woollen fabrics, and for needle and pin-making. There are also immense manufactures of machinery, bells, glass-buttons, chemicals, cigars, &c. As a principal station on the Belgian-Rhenish railways, A. is an important staple place of Prussian trade. The city is rich in historical associations. It emerges from historical obscurity about the time of Pepin, and Charlemagne founded its world-wide celebrity. Whether it was the birthplace of Charlemagne, is doubtful, but it became his grave 814 A.D. In 796 A.D., Charlemagne caused the already existing palace, called the Imperial Palace, to be entirely rebuilt, as well as the chapel, in which Pepin had celebrated Christmas in 765 A.D. The two buildings were connected by a colonnade, which fell into ruins a short time before the emperor's death, probably from the effects of an earthquake. The present town-house has been built on the ruins of the palace; the chapel, after being destroyed by the Normans, was rebuilt on the ancient plan by Otto III., in 983, and forms the nucleus of the present cathedral. This ancient cathedral is in the form of an octagon, which, with various additions round it, forms, on the outside, a sixteen-sided figure. In the middle of the octagon, a stone, with the inscription 'CAROLO MAGNO,' marks the grave of Charlemagne. Otto III. opened the vault in the year 997 A.D. The body of the emperor was found in a wonderful state of preservation, seated upon a marble chair, dressed in his robes, his sceptre in his hand, the Gospel on his knee, a piece of the holy cross on his head, and a pilgrim's scrip attached to his girdle. Otto caused the tomb to be built up again, after repairing the injuries of the arch. In

1165 A.D., when the emperor Frederick I. caused the vault to be re-opened, the bones of the great emperor were enshrined in a casket of gold and silver, and a large and beautifully wrought chandelier was hung up over the tomb as a memorial. In 1215 A.D., Frederick II. caused the remains of the emperor to be enclosed in a costly chest, in which they are yet kept in the sacristy. The marble chair was, in later times, overlaid with gold plates, and used till 1558 A.D. at the imperial coronations, as a throne for the newly crowned emperor. The imperial insignia were removed to Vienna in 1795.—In the 14th c., a choir in the Gothic style was added to the east side of the octagon, which had been built in the Byzantine style; while on the west side, a square belfry was joined to it, as well as two small round towers, with winding stairs leading to the treasury. Here are kept the so-called 'great relics,' which, once in seven years, are still shewn to the people, in the month of July, from the gallery of the tower. This spectacle attracts many thousands of strangers to A. Much has of late years been done to restore this venerable pile. The columns brought by Charlemagne from the palace of the Exarch at Ravenna, to decorate the interior of the octagon, had been carried off by the French; and although part of them had been restored at the peace of Paris, they were not replaced in the building till recently.

The town-house—which encloses the remains of the Imperial Palace—adorns the market-place, having the Bell or Market Tower on the left, and on the right the Granus Tower, a memorial of old Roman times. The coronation-hall, 162 feet long, by 60 feet wide, in the interior of the town-house, was, in the last century, divided in the middle by a wooden partition. This noble hall, in which thirty-seven German emperors and eleven empresses have been crowned, has been restored to its original form, and the walls are in process of being decorated with large fresco-paintings of scenes from the life of Charlemagne, by Rethel. Before the town-house stands a beautiful fountain, with a bronze statue of Charlemagne. In the church of the Franciscans, are to be seen a fine picture of the Taking Down of Christ from the Cross, by Vandeyck, and two other pictures representing the Crucifixion, by A. Diepenbeeck. At a short distance from A., and surrounded by the river, stands Frankenburg, once the favourite abode of Charlemagne and of Fastrada, and still rich in legends. It has been rebuilt from its romantic ruins. As a town, A. has recently been much improved. It now possesses many fine buildings, among which are several large and splendid hotels. From being a quiet old city of historical interest, it has become a busy centre of manufacturing industry. In 1870, a new Polytechnic School was erected. A. was formerly noted for its gambling-tables; but these are now disallowed.

The name of Aix or Aachen is evidently derived from the springs, for which the place has been always famous. (See AA.) The name Aquis Granum, which it received about the 3d c., may possibly be derived from Granus, one of the names of Apollo, who was worshipped by the Romans near springs. The French name, A., refers to the Chapel of the Palace. Charlemagne granted extraordinary privileges to this city. The citizens were exempted, in all parts of the empire, from personal and military service, from imprisonment, and from all taxes. The city also possessed the right of sanctuary; 'the air of A. made all free, even outlaws.' In the middle ages, this free imperial city (then included in the circle of Westphalia) contained more than 100,000 inhabitants; and held an important place among the confederated cities of the Rhine. The emperors were crowned in A. from Louis the Pious

to Ferdinand I. (813—1531 A.D.). 17 imperial diets and 11 provincial councils were held within its walls. The removal of the coronations to Frankfort, the religious contests of the 16th and 17th centuries, a great fire which in 1656 A.D. consumed about 4000 houses in the city, combined with other causes to bring into decay this once flourishing community. In January 1793, and again in 1794, A. was occupied by the French. By the treaties concluded at Campo Formio and Lunéville, it was formally ceded to France, and became the capital of the department of Roer; at length, in 1815, the city fell to Prussia. See Quix, *Geschichte der Stadt A.* (History of A.), 2 vols., A., 1811.

The MINERAL SPRINGS of A., of which six are hot, and two cold, were known in the time of Charlemagne, and were much frequented as early as 1170. The hot springs are strongly sulphurous, and contain also hydrochlorates. The temperature varies from 111°—136° F. They chiefly act on the liver, and on the mucous surfaces and skin, and are therefore efficacious in cases of gout, rheumatism, cutaneous diseases, &c. The most remarkable is the 'Emperor's Spring,' which rises in the middle of the Hôtel Kaiserbad. The baths themselves are from 4 to 5 feet deep, and are built quite in the old Roman style. The cold springs are chalybeate, and not so copious. The new 'Eisenquelle' (iron spring), first discovered in 1829, is provided with an elegant bath-house. The well-proved medicinal virtues of the mineral springs of A. bring yearly to the city many thousands of strangers.

TREATIES OF PEACE, and CONGRESS OF A.—The first Peace of A. ended the war carried on between France and Spain for the possession of the Spanish Netherlands. On the death of Philip IV., Louis XIV. laid claim to a large portion of those territories in the name of his wife, Maria Theresa, the daughter of Philip, urging the law of succession prevailing in Brabant and Namur respecting private property. The victorious progress of Louis was checked by the triple alliance between England, Holland, and Sweden; and a treaty of peace was concluded at A. in 1668, by which France retained possession of the fortresses of Charleroi, Lille, &c., which she had already taken.

The second Peace of A. concluded the war respecting the succession of Maria Theresa to the empire. See SUCCESSION, WARS OF. After the war had been carried on with various success for eight years, peace was concluded in 1748. In general, the possessions of the several states remained as before the war. Austria ceded Parma and Placentia to the Spanish infanta, Phdip; and the possession of Silesia was guaranteed to Prussia. The privilege of the Assiento Treaty (q.v.) was anew confirmed to England for four years, and the pretender was expelled from France. Owing chiefly to the exertions of her minister, Kaunitz, Austria came off with but small sacrifice, while England, notwithstanding her splendid victories, derived little solid advantage, and was left with a debt raised to 80 millions.

The Congress of A. was held in 1818, for regulating the affairs of Europe after the war. It began on the 30th September, and ended on the 21st November. Its principal object was the withdrawal from France of the army of occupation, 150,000 strong, as well as the receiving of France again into the alliance of the great powers. The emperors of Russia and Austria, and the king of Prussia, were personally present. The plenipotentiaries were—Metternich, Castlereagh, and Wellington, Hardenberg and Bernstorff, Nesselrode and Capo d'Istrias, with Richelieu on the part of France. France having engaged to complete the payment of the stipulated sums of

money, was admitted to take part in the deliberations, and the five great powers assembled, signed a protocol announcing a policy, known as that of the 'Holy Alliance' (q. v.) (1867—pop. 68,000.)

AJA'CCIO, the chief town of the island of Corsica, which forms a department of France. Pop. in 1872, 13,580. The chief employments are the anchovy and pearl fisheries, and the trade in wine and olive-oil, which the neighbourhood produces in abundance, and of good quality. The harbour is protected by a strong fort. A. is remarkable as the birthplace of Napoleon; the house is still to be seen.

AJA'N, a portion of the E. coast of Africa, extending from Cape Guardafui nearly to the equator.

AJAX was the name of two of the Greek heroes of the Trojan war. One of them was called A. the Less, or the Locrion, being the son of Oileus, king of the Locrions. At the head of forty Locrion ships, he sailed against Troy, and was one of the bravest of the Greek heroes; in swiftness of foot, he excelled all except Achilles. When Cassandra fled to the temple of Minerva, after the taking of Troy, it is said that A. tore her from it by force, and dragged her away captive. Others make him even violate the propheticness in the temple. Though he exculpated himself by an oath when accused of this crime by Ulysses, yet he did not escape the vengeance of the goddess, who caused him to be engulfed in the waves.

The other A., called by the Greeks the Greater, was the son of Telamon, king of Salamis, and, by his mother's side, a grandson of Æacus. He sailed against Troy with twelve ships, and is represented by Homer as, next to Achilles, the bravest and handsomest of the Greeks. After the death of Achilles, A. and Ulysses contended for the arms of the hero, and the prize was adjudged to Ulysses, which threw A. into such a state of rage and despair that he killed himself with his sword. This melancholy fate of the hero is the subject of one of the extant tragedies of Sophocles.

AJMEER, a British 'non-regulation' district in the North-west Provinces of India, lying between lat. 25° 43'—26° 42'; long. 74° 22'—75° 33'. Its length from south-east to north-west is about 80 miles; breadth, 50; area, 2029 square miles. The surface of the country towards the south-east is generally level. In the north, north-west, and west, it is broken by mountains and hills belonging to the Aravalli range. The mountain of Taragurh, above the city of Ajmeer, contains carbonate of lead, manganese, copper, and abundance of iron ore. The general elevation of the plain of A. is about 2000 feet, and the frosts in winter are sometimes severe. Strong breezes are prevalent, and the climate on the whole is healthy. The scarcity of water, however, often occasions great distress. The only permanent stream is the Koree, the water of which is so impregnated with mineral salts as to be unfit for alimentary use except during the rains. To compensate for this deficiency, water-tanks are numerous. The staple crop is bajra (*Holcus spicatus*). Sheep are reared in great numbers, and wool is cheap, affording the material of their clothing to the lower orders. Among the more prevalent diseases are small-pox and ophthalmia. The population in 1848 was 224,891, of whom 27,288 were Mussulmans, &c., the rest Hindus. The principal race are the Rajpoots, the conquerors of the native Bheels, Mhairs, and Neenas. The present limits of this district by no means correspond to its former importance. In the 12th c., at the time of the Mussulman invasion, the sultan of A. and Delhi was the most powerful monarch in India. Under Akbar also, who acquired this territory in 1559, A. was a large and important province. It after-

wards fell into the hands of the Mahrattas, from whom it was wrested by the British in 1817.

AJMEER, an ancient city of Hindustan, the capital of the British district of the same name, 228 miles west from Agra. It is situated in a picturesque and rocky valley, at the foot of the mountain of Taragurh, which is crowned by a fort, once strong, but now dismantled. The city is surrounded by a stone wall, with five lofty and handsome gateways on the west and north. Most of the streets are narrow and dirty, but some of them are spacious, and contain many fine residences, besides several mosques and temples of very massive architecture. A. is the seat of a British political agency, a medical school, and an English and Oriental school. The tomb of the Mussulman saint, Kwajah, within the town, is held in great veneration, and pilgrimages are made to it even by Hindus. The Emperor Akbar journeyed to it from Agra on foot in 1570, in fulfilment of a vow after the visit of his son Jehanghir. In October, a great annual fair is held in honour of the saint, at which ridiculous miracles are pretended to be wrought. The pop. of A. is probably about 30,000.

AKBAR (i. e., 'Very Great'), properly JELAL-ED-DIN-MOHAMMED, emperor of Hindustan, the greatest Asiatic monarch of modern times. His father, Humayun, was deprived of the throne by usurpers, and had to retire for refuge into Persia; and it was on the way thither, in the town of Amerkote, that A. was born, in 1542 A. D. Humayun recovered the throne of Delhi after an exile of twelve years; but died within a year. The young prince at first committed the administration to a regent-minister; but finding his authority degenerating into tyranny, he, by a bold stroke, shook it off, and took the power into his own hands (1558). At this time, only a few of the many provinces once subdued by the Mongol invaders were actually subject to the throne of Delhi; in ten or twelve years, A.'s empire embraced the whole of Hindustan south of the Deccan; but although great in subduing, A. was yet greater in ruling. The wisdom, vigour, and humanity with which he organised and administered his vast dominions, are unexampled in the east. He promoted commerce by constructing roads, establishing a uniform system of weights and measures, and a vigorous police. He exercised the utmost vigilance over his viceroys of provinces and other officers, to see that no extortion was practised, and that justice was impartially administered to all classes of his subjects. For the adjustment of taxation, the lands were accurately measured, and the statistics taken, not only of the population, but of the resources of each province. For a Mohammedan, the tolerance with which he treated other religions was wonderful. He was fond of inquiries as to religious beliefs; and Portuguese missionaries from Goa were sent at his request to give him an account of the Christian faith. He even attempted to promulgate a new religion of his own, which, however, never took root. Literature received the greatest encouragement. Schools were established for the education both of Hindus and Mohammedans; and numbers of Hindu works were translated from Sanscrit into Persian. Abu-l-Fazl, the able minister of A., has left a valuable history of his master's reign, entitled *A. -nameh* (History of A.); the third volume, containing a description of A.'s empire, derived from the statistical inquiries above mentioned, and entitled *Ayin-i-Akbari* (Institutes of A.), has been translated into English by Gladwin (3 vols., Calcutta, 1786; and London, 1800). A.'s latter days were embittered by the death of two of his sons from dissipation, and the rebellious conduct of the

third, Selim (known as Jehanghir), who succeeded his father at his death in 1605.

AKEE' (*Cupania* or *Blighia sapida*), a fruit-tree belonging to the natural order *Sapindaceæ* (q. v.), a native of Guinea, introduced into Jamaica in the end of last century. It grows to the height of 20—25 feet or upwards, with numerous branches and alternate pinnate leaves, resembling those of the ash. The flowers are small, white, on axillary racemes; the fruit is about the size of a goose's egg, with three cells and three seeds, and its succulent aril has a grateful subacid flavour. The fruit is little inferior to a nectarine. Boiled down with sugar and cinnamon, it is used as a remedy for diarrhoea. The distilled water of the flowers is used by negro women as a cosmetic. The A. sometimes produces fruit in stoves in Britain. In order to obtain this, the roots should be cramped in pots.—The AKI of New Zealand is a totally different plant, *Metrosideros buxifolia*, of the natural order *Myrtaceæ*, a hard-wooded shrub, which sends out lateral roots, and by means of them, climbs to the summits of the loftiest trees.

A'KENSIDE, MARK, an author of considerable celebrity, in his own day, on account of his didactic poem, *The Pleasures of the Imagination*, and some medical works. He was born November 9, 1721, at Newcastle-on-Tyne, where his father was a butcher. Being intended for the Presbyterian Church, he was sent to study theology at Edinburgh, but soon abandoned it for that of medicine. He graduated as a physician at Leyden in 1744, and practised at Northampton, then at Hampstead, and finally in London. His success as a practising physician was never very great, owing, it is said, to his haughty and pedantic manner. He died in London (June 23, 1770), soon after being appointed one of the physicians to the queen. At Leyden, he had formed an intimacy with Jeremiah Dyson, and this rich and generous friend allowed him £300 a year. Some of his medical treatises, as those on the lymphatic vessels and on dysentery, possess considerable merit. His later poetry, consisting chiefly of odes and hymns, did not attain the same reputation as his *Pleasures of the Imagination*, which was written in his twenty-third year, and to which is owing whatever celebrity has attached to his name. Dyson published his poetic works in 1772, and another edition appeared in 1807. In *Peregrine Pickle*, Smollett has satirically sketched the character of A., under that of the pedant who undertakes to give an entertainment after the manner of the ancients. A. has little originality of conception, or even of expression; the reader is carried along for a time by the evident enthusiasm of the poet, and rapid and stately march of lofty images and ideas; but, as it has been well expressed, 'all is operose, cumbrous, and cloudy, with abundance of gay colouring and well-sounding words, but filling the eye oftener than the imagination, and the ear oftener than either.' A. became dissatisfied with his juvenile production, and at his death, had written a portion of a new poem on the same subject. Both poems were published in the complete edition of his works, Lond. 1773. His life has recently been written by Bucke: *Life, Writings, and Genius of A.* (Svo, Lond. 1832).

AKETON, another name for a portion of armour, used in the feudal times, called the Gambeson (q. v.).

A'KJERMANN or **AKKERMANN**, a town in Bessarabia on the Black Sea, at the mouth of the Dniester, with a citadel and harbour; pop. 29,600. It is the Alba Julia of the Romans; and called, by the Poles, Bialogrod, which, as well as A., signifies the white town. It is considered a town of some

importance, on account of its harbour, fortifications, commerce, and especially its extensive salt-pits.

The Treaty (supplementary of that of Bucharest, 1812) concluded at A. in 1826, between Russia and Turkey, secured to Russia the free navigation of the Black Sea, and indemnification for losses sustained by her subjects from the Barbary corsairs; the institution of divans in Moldavia and Wallachia, and the power of re-electing the hospodars after their term of office; and the restoration of the privileges of Servia, in which Turkish troops were only to retain possession of the fortresses. The boundaries in Asia were to remain as they then stood; Russia consequently retaining the Turkish fortresses of which she had gained possession. The non-fulfilment of this treaty on the part of the Porte, occasioned the war of 1828, which was terminated by the peace of Adrianople.

ALABAMA, one of the states composing the Union of North America, was first known to Europeans in the year 1541, half a century after the discovery of America. The celebrated exploring expedition of De Soto had to fight its way fiercely through the tribes who peopled its wilds at that period, and who were much less savage and far more numerous than the northern aborigines. In one instance, a chief's house measured 120 feet by 40, and included small buildings like offices. Upon the Savannah River, at Silver Bluff, there was found a remarkable temple, 100 feet long, 40 feet wide, and proportionably high. In the beginning of the 18th c., the French built a fort on Mobile Bay, but the city of that name was not commenced till nine years later (1711). In 1763, when the entire French possessions east of the Mississippi (except New Orleans) fell into the hands of the English, A. was incorporated first with Georgia, afterwards, in 1802, with the Mississippi territory; but finally, in the year 1819, it became an independent member of the great American confederacy, and is now the fourth in point of population among the southern states.

A. very nearly forms a rectangle, widening a little towards the south-east and south-west, so that we would naturally expect a fine sea-board; but of this it is deprived by Florida, which occupies fully three-fourths of the coast-line. It lies between 30° 10' and 35° N. lat., and between 85° and 88° 30' W. long.; being about 330 miles in extreme length from north to south, and 300 miles in breadth. It contains an area of 50,722 square miles, or 32,462,050 acres, only 6,385,724 of which, or rather less than one-fifth, were improved in 1860. The country is neither mountainous nor level, but rugged and broken, especially in the centre, with many picturesque views and wild romantic gorges. The Alleghanies terminate in the north in a series of elevated hills, and the ground gradually slopes to within 60 miles of the Gulf of Mexico, when it becomes level. There are three bays in A., the principal of which is Mobile Bay, stretching north for about 30 miles. There are also three large rivers—the Tennessee, the Tombigbee, and the A.; the first of which only makes a sweep into the state at the north-east angle, and then another sweep out at the north-west; the second comes into A. from Mississippi, receives an affluent (Black Warrior), and flows due south, until it is joined by the A., flowing out of Georgia in a south-westerly direction. After the union, the river is called the Mobile, and discharges its waters into the Gulf of Mexico. The Tombigbee is about 500 miles in length, and navigable for steam-boats throughout its entire course in Alabama. The A. is about 600 miles long, and may be ascended in steam-boats to Wetumpka (on the Coosa branch), 460 miles from the Gulf; but the navigation of the Tennessee, which has 130 miles of its course in A., is obstructed by the Muscle-shoals, a series of rapids.

The climate of this state is almost tropical, reaching to within 7° of the torrid zone, and its productions are allied to those of the tropics. Rivers rarely freeze. In 1850, 1851, the maximum temperature of the three winter months was ascertained to be 82°, the minimum, 18°, and the mean at 3 o'clock p. m., 48° 25'. The lowlands are very unhealthy, near the rivers and muscle-shoals, but the hilly regions are salubrious. The soil is exuberantly fertile in many places, yielding more cotton in 1860 than any other state except Mississippi. There are fine grazing-lands in the low hills of the north, where the Alleghanies terminate, and the long flat valleys between them are extremely rich. The central part is a great, broken, and swelling prairie, remarkably fertile; while the southern, though often sandy and inferior in productiveness, has many fertile alluvial bottoms, which yield rice. Besides cotton, A. produces large quantities of Indian-corn, oats, sweet potatoes, and butter; a considerable amount of wheat, rye, rice, wool, hay, pease, beans, potatoes, fruits, market-vegetables, and sugar; some tobacco, barley, buckwheat, wine, cheese, grass-seeds, hops, flax, and silk, are also raised. In 1860 there were nearly 50,064 farms in A., with a live-stock valued at 43,411,711 dollars, and farming implements and machinery worth more than 7,133,000 dollars. There is abundance of wild deer and turkeys; and wild geese and ducks frequent the Muscle-shoals of the Tennessee in immense numbers. Bears, wolves, and foxes are likewise still met with. The trees, like the animals, are numerous, but not remarkably varied. In the centre and north, there are oaks, poplar, hickory, chestnut, and mulberry; in the south, cypress and loblolly: pine is also abundant south of the mountains. A. is, however, very rich in mineral treasures, particularly in coal, iron, limestone, and marble. Red ochre, lead, and manganese are also found. A vein of bituminous coal of a superior quality runs eastward from Tuscaloosa into Georgia. There are, in various sections of the state, salt, sulphur, and chalybeate springs. At Blount's Springs, a fashionable watering-place, there are several different varieties of sulphur waters. A gold-mine was also wrought for a short time in St Clair county, while the statuary granite of A. is admitted to be the best in the whole of the United States.

A. does not excel in manufactures, though it is beginning to improve. According to the census of 1860, there were in the state 1459 manufacturing establishments, employing 7889 persons, consuming raw material worth \$5,489,963, producing goods to the value of \$10,588,571 annually. Total amount of capital invested, \$9,098,181. Of these, 31 were cotton manufactories, 336 saw-mills, 236 flour establishments, 27 turpentine distilleries, 3 liquor distilleries, 16 machine shops, 62 carriage manufactories, 132 leather establishments, 140 blacksmiths' shops. Value of home-made manufactures, \$1,817,520.

In 1860, there were in A. 743 miles of railroad completed, and several hundred in course of construction. The commerce of A. is very extensive; for the steamboat navigation on her rivers (1500 miles in all) affords an outlet not only for her own productions, but also for those of Mississippi and Georgia.

Education is progressing satisfactorily in A. In 1860, there were 17 colleges, 1903 public schools, and 206 academies and other schools. The number of pupils attending school was 74,649. The annual income of the state university, located at Tuscaloosa, is \$15,000. The newspaper and periodical literature, as everywhere else in America, is very prolific. There are 96 publications of different kinds; the circulation being, dailies, 8820; tri-

weekly, 2886; semi-weekly, 400; weekly, 74,289; monthly, 7200. Religious denominations exhibit a similar fecundity; but the Baptists and Methodists have a vast preponderance over the others. There are various public institutions in A., such as a lunatic asylum at Tuscaloosa, a blind asylum at Mobile, and a state penitentiary at Wetumpka. An asylum for the deaf and dumb was also recently organised. The buildings of A. University are very fine, and cost \$150,000. In 1850, there were 56 libraries, with 20,623 volumes in the state.

A. was one of the slave-states. Its government resembles that of the other states in its general features. The senate consists of 33 members, elected for 4 years; and the house of representatives of 100, elected for 2, both by the people. The judiciary consists of a supreme court, a court of chancery, nine circuit courts, and the city court of Mobile. The preponderance of the farming interests is very remarkable; though, of course, extremely natural, and even inevitable. While grocers, shoemakers, engineers, wheelwrights, masons, &c. are reckoned only by the hundred, there are upwards of 66,000 farmers, that is, more than eight times the number of persons employed in manufacturing establishments throughout the state. A. has not received a very great infusion of modern European blood. After the war, the government of A. became provisional. On July 14, 1868, the requirements of Congress having been complied with, General Meado restored to the civil powers the direction of affairs in the state. At the presidential election in that year, the Democrats polled a majority of 40,000 votes. The commercial metropolis is Mobile, with a population, in 1870, of 32,039; but the state metropolis is Montgomery, with a population of 10,588. The other chief towns are Huntsville, Selma, and Marion. The population of A., in 1860, was 964,201; in 1870, 996,992.

ALABASTER. This name is given to two kinds of white stone, chemically distinct, but resembling each other in appearance, and both used for ornamental purposes. A. proper is a white, granular, semi-transparent variety of gypsum (q. v.) or *sulphate*

Alabaster.

of lime. It occurs in various countries, but the finest is found near Volterra, in Tuscany, where it is worked into a variety of the smaller objects of sculpture, vases, time-piece stands, &c. Gypseous A. of good quality is also found in Derbyshire, and many ornamental articles are made of it at Matlock and other places. Not being quite insoluble in water, it cannot be exposed to the weather; and its softness makes the surface easily become rough and opaque. Nor is it generally found in sufficient masses for large works. The other stone is a compact, crystalline *carbonate* of lime deposited from water in the form of stalagmite, &c. It is distinguishable from the gypseous alabaster by its effervescing with an acid, and by its hardness; real

alabaster may be scratched with the nail.—The name is derived from Alabastron, a town in Upper Egypt, where this kind of stone was abundant, and was manufactured into pots for perfumes. Such pots were called *alabastra*, even when made of other materials.

ALAGOAS, a maritime province of Brazil, which formed at one time a district of the province of Pernambuco. It is bounded on the N. and W. by Pernambuco, and on the S. is divided from the province of Sergipe by the navigable river San Francisco. The country, which is mountainous in the north-west, and low, marshy, and unhealthy on the coast, contains 300,000 inhabitants. The chief productions are the sugar-cane, cotton-plant, mandioc or cassava, maize, rice, &c., and also timber and dye-woods. The capital, A., is situated on the Lake Manguaba. The name A. is derived from the lakes (*lagos*) in which the province abounds.

ALAMA'NNI, LUIGI, a distinguished Italian poet, born at Florence, October 28, 1495. His father, a man of noble birth, was a zealous partisan of the Medici, and Luigi stood high in their favour, till, in revenge for some real or fancied wrong, he conspired against the life of Cardinal Guiliano, the representative of Leo X. This being found out, A. fled to Venice, and thence, on the accession of the cardinal to the papal chair, to France. In 1527, encouraged by the pope's reverses, he returned to Florence, and urged the Republic to seek the protection of Charles V., by means of Andrea Doria's friendly mediation. The Republic declared such a proposal treachery, and A. sailed with Doria for Spain. Finally, he settled in France, employed as a diplomatist by Francis I. and Henry II. A. died at Amboise in 1536. He wrote epics, dramas, and minor poems, much admired in their day, and disputes with Trissino the claim of first introducing blank verse into Italian poetry.

ALAND ISLANDS (pronounced Oland), a numerous group of small islands and rocks at the entrance of the Gulf of Bothnia, opposite Abo, about 25 miles from the Swedish coast, and 15 from that of Finland. They are called, by the Finns, Ahvenanmaa. About 80 of them are inhabited. Although these rocky isles are covered with but a thin stratum of soil, they bear Scotch fir, spruce, and birch trees, and with proper cultivation, produce barley and oats, besides affording subsistence to a hardy breed of cattle. The inhabitants are of Swedish origin, skilful sailors, fishermen, and seal-hunters. The total population is about 16,000. The largest of the islands, which gives its name (signifying 'Land of Streams') to the whole group, is about 18 miles long by 14 broad. It is tolerably wooded and fruitful, and contains nearly 11,000 inhabitants. These islands belonged formerly to Sweden, but were seized by Russia in 1809. Previous to this, they had several times changed hands between these two powers. In 1717, the Swedes were defeated by the Russians in a naval engagement near Aland, the first important exploit of the Muscovite navy. The importance of these islands as a military position led to the construction, in the reign of the Emperor Nicholas, of those strong fortifications at Bomarsund which, in August 1854, were destroyed by the Anglo-French force, commanded by Sir Charles Napier and Baraguay d'Hilliers. Two thousand prisoners were taken. This extensive fortress (which is supposed to have been but the first of an intended series of similar menacing fortifications in the Baltic) commanded the anchorage of Ytternæs, capable of containing a large fleet.

ALANGIA'CEÆ, a natural order of dicotyledonous plants, allied to *Myrtaceæ* (q. v.), and

containing only about eight known species, trees and large shrubs, of which the greater number belong to the American genus *Nyssa* (see *TUPELO*), differing from the rest of the order in the absence of petals. The one-celled fruit, and pendulous albuminous seeds, constitute marks of distinction from Myrtaceæ. The fruit of *Alangium decapetalum* and *A. hexapetalum*, natives of the East Indies, are eatable, but mucilaginous and insipid. The timber is good, the roots aromatic.

ALARCON Y MENDOZA, JUAN RUIZ DE, one of the most eminent of Spanish dramatists, born at the town of Tasco in Mexico, about the end of the 16th c. He belonged to the ancient family of the Ruizes of Alarcon, of which a branch had emigrated to America. Having studied at the college that had been instituted in Mexico, he removed to Spain, where he is mentioned as *Relator del real consejo de las Indias* (Reporter of the royal council of the Indies) in 1622. The success that early attended his pieces, joined to the haughty disdain with which, in the consciousness of his own powers, he treated the opinion both of the public and of his brother-writers, excited the envy and jealousy of his contemporaries, so that he became the object of venomous epigrams by the most famous poets of the time, in which the deformed upstart from New Spain, with his pride and contemptuousness, was held up to public ridicule. This kind of persecution continued till his death, which occurred in 1639. Even during his lifetime, his best pieces were attributed to others, and were printed and represented under the names of more favoured poets. This early withdrawal and oblivion of his name, together with the scarcity of his works, have been the cause that he has seldom been mentioned, and still less appreciated by historians of literature, even down to the latest times. Yet some of the best critics rank him next to Calderon and Lope de Vega as a dramatic writer. Besides many single or detached pieces printed in collections, he published a number in his *Comedias* (vol. i., Madrid, 1628; vol. ii., Barcelona, 1634). Hartzenbusch began a collected edition at Madrid, 1848. A. attempted almost all the kinds of drama in vogue in his time; and was especially eminent in the heroic, as the best specimens of which may be mentioned, *El Tjedor de Segovia*, and *Ganar Amigos*, or *La que mucho vale mucho chesta*. A.'s mastery in delineating character is shewn in the *Comedias de Costumbres*, or character-comedies, of which he may be held as the creator. The best known are *La Verdad Sospechosa* (imitated by Corneille in his *Menteur*) and *Las Paredes Ojen* (Walls have Ears), which are yet represented on the Spanish stage. Of his comedies of intrigue, the best specimen is *Todo es ventura*.

It does not appear that A. wrote any *Autos* (q. v.), though his two pieces, *El Anticristo*, and *Quien mal anda en mal acaba*, betray a tendency to ascetic mysticism. Although, through the artifices of his contemporaries, as well as the *déat* of Lope de Vega's and Calderon's dramas, the compositions of A. were soon driven from the stage, yet he remains, together with Tirso de Molina, the most distinguished and original among the successors of Lope. Lope and Calderon, the coryphæi of that age, are the only dramatists that excel A. Combining, in no mean degree, the characteristics of both, he excels them in purity of language and elevation of moral feeling.

ALARIC I. (in German Al-ric, i. e., all rich) belonged to one of the noblest families of the Visigoths. He makes his first appearance in history in 394 A. D., as leader of the Gothic auxiliaries of Theodosius in his war with Eugenius; but after the death of the former, he took advantage of the

dissensions and weakness that prevailed in the Roman Empire to invade (395) Thrace, Macedonia, Thessaly, and Illyria, devastating the country, and threatening Constantinople itself. Rufinus, the minister of Arcadius, appears to have sacrificed Greece in order to rescue the capital, and Athens was obliged to secure its own safety by ransom. A. proceeded to plunder and devastate the Peloponnese, but was interrupted by the landing of Stilicho in Elis with the troops of the west. Stilicho endeavoured to hem in the Goths on the Peneius; but A. broke through his lines, and escaped with his prisoners and booty to Illyria, of which he was appointed governor by the Emperor Arcadius, who was frightened by his successes, and hoped, by conferring this dignity on him, to make him a peaceful subject instead of a lawless enemy (396). In 402, he invaded Upper Italy, and Honorius, the emperor of the west, fled from Rome to the more strongly fortified Ravenna. On the way to Gaul, A. was met and defeated by Stilicho at Pollentia on the Tanaro; but it was not till the following autumn that the result of the battle of Verona forced him to retire into Illyria. Through the mediation of Stilicho, A. concluded a treaty with Honorius, according to which he was to advance into Epirus, and thence attack Arcadius in conjunction with the troops of Stilicho. The projected expedition did not take place, yet A. demanded indemnification for having undertaken it; and Honorius, by the advice of Stilicho, promised him 4000 pounds of gold. When, after the death of Stilicho (q. v.), Honorius failed to fulfil his promise, A. advanced with an army, and invested Rome, which he refused to leave till he had obtained the promise of 5000 pounds of gold, and 30,000 of silver. But neither did this negotiation produce any satisfactory result, and A. again besieged Rome (409 A.D.). Famine soon rendered it necessary that some arrangement should be made; and in order to this, the senate proclaimed Attalus, the prefect of the city, emperor instead of Honorius. But Attalus displayed so little discretion, that A. obliged him publicly to abdicate. The renewed negotiations with Honorius proved equally fruitless with the former, and A. was so irritated at a perfidious attempt to fall upon him by surprise at Ravenna, that he advanced on Rome for the third time. His victorious army entered the city on August 24, 410, and continued to pillage it for six days, A. strictly forbidding his soldiers to dishonour women or destroy religious buildings. When A. quitted Rome, it was only to prosecute the conquest of Sicily; the occurrence of a storm, however, which his ill-constructed vessels were not able to resist, obliged him to abandon the project for the time; and his death, which took place at Cosenza, in Calabria, soon after (410), prevented his resuming it. In order that his remains might not be discovered by the Romans, they were deposited in the bed of the river Busento, and the captives who had been employed in the work were put to death. Rome and all Italy celebrated the death of A. with public festivities; and the world enjoyed a momentary repose. But A. himself was much less barbarous than his followers. He admired those monuments of civilisation with which the Eternal City abounded, and sought to preserve them; he checked the excesses of his fierce soldiery, and at times gave indications that the lessons of Christianity which he had learned from the Arian missionaries had not been altogether forgotten. Yet through him, the Goths learned the way to Rome.

ALARIC II., eighth king of the West Goths, or Visigoths, succeeded his father in 484 A. D. He was of

a peaceful disposition, and wished to live on friendly terms with the Franks. His dominions were very extensive. Besides Hispania Tarraconensis and Bætica, he possessed numerous rich provinces in Gaul, and formed an alliance, which still further increased his power, with Gondeband and Theodoric, the latter of whom was his father-in-law, and king of the East Goths. At length, however, he came into collision with the Frankish monarch, Clovis, whose cupidity had been excited by the extent and fertility of the territories over which A. ruled. An excuse was found for breaking the peace which existed between the two nations, in the fact that A. was a zealous Arian. This circumstance had given great offence to many of his subjects, who were orthodox Catholics; and ostensibly to vindicate the true doctrine, the newly converted barbarian, Clovis, declared war against him. The result was fatal to A. He was slain by the hand of Clovis himself at Vouillé, near Poitiers, and his forces completely routed.

A. is said to have been indolent and luxurious in his youth; but this may simply imply that he was not fond of those sanguinary pleasures which captivated his savage contemporaries. He was tolerant in his religious convictions. Though an Arian, he did not persecute the Catholics. He even permitted the orthodox prelates to hold a council at Agde in 506. In his secular capacity, he displayed an appreciation of the blessings of law and order. He enacted several useful statutes, and kept a watchful eye on all parts of his kingdom. It was during his reign that the *Breviarium Alaricianum*, or code of A., was drawn up. It is a selection of imperial statutes and writings of the Roman juriconsults. A. sent copies of it to all his governors, ordering them to use it, and no other. An edition of it was published by Sichard, at Basle, in 1523.

ALARM. In military matters, the word alarm has a more defined meaning than mere terror or fright. An alarm, among soldiers in an army, is not so much a danger, as a warning against danger. An alarm, signified by the firing of a gun or the beating of a drum, denotes to an army or camp that the enemy is suspected of intending a sudden surprise, or that the surprise has actually been made. There is an *alarm-post* in camp or garrison arrangements, to which the troops are directed to hasten on any sudden alarm being given.

ALASKA or ALIASKA, a peninsula, formerly part of Russian America, occupying nearly the same latitudes as Kamtchatka and Britain. Forming the south-eastern boundary of the Sea of Kamtchatka, it may be regarded, physically, as a continuation of its southern limit, the Aleutian Isles. It was, accordingly, assumed by the Russians to be an island—a link in that great chain of stepping-stones, which had certainly guided them, and perhaps successive shoals of adventurers before them, to the New World. The connection of A. with the continent was left to be ascertained by Captain Cook, whose explorations in search of an Arctic passage—for Behring's Strait was still a matter of doubt—were recorded in the adjacent names of Bristol Bay to the westward, and Cook's Inlet to the eastward. Thus A., though materially known only as a home for the hunter and his game, becomes morally a word of interest in connection with the history of discovery and colonisation. All that was formerly Russian America now belongs to the United States.

ALATERNUS, according to some, a genus of plants of the natural order *Rhamnaceæ* (q. v.), akin to *Rhamnus* (see BUCKTHORN); but more generally regarded as a sub-genus of *Rhamnus*, consisting of evergreen shrubs, of which the best

known is *Rhamnus A.*, or *A. phillyrea*, a large shrub, densely branched, with shining alternate leaves, which are more or less ovate. The flowers are dioecious, racemed, numerous, and small, much sought after by bees. This shrub is abundant in the south of Europe, and is often planted in town-gardens in England to conceal walls and other objects, being of rapid growth, readily propagated by cuttings, bearing to be clipped into any shape, and not easily injured by smoke. Both the bark and wood have been used in dyeing.

ALAVA, DON MIGUEL RICARDO DE, a Spanish general, born at Vittoria, in 1771, of a noble family in the province of Alava. He entered the navy in early life; but afterwards changed to the land-service. After the abdication of Ferdinand VII., he was for a time a zealous partisan of France; however, in 1811, when he saw the fortunes of Joseph beginning to wane, he abandoned the cause of this prince, to embrace that of the national party, and accepted the office of Spanish commissary on the staff of Wellington. He gained the confidence of this general, and from this time manifested the strongest predilection for England and English institutions. The war of independence furnished him with numerous occasions of distinguishing himself. After the restoration of the king, however, he was arrested, on the suspicion of entertaining liberal opinions; but on the application of his uncle, Ethenard, the inquisitor, seconded by the influence of Wellington, he was not only liberated, but appointed ambassador to the Hague. He returned to Spain in 1820, after the revolution; became captain-general of Aragon, made himself conspicuous among the Exaltados, and figured in the ranks of the militia on occasion of the revolt of the royal guard at Madrid, July 7, 1822. In the Cortes assembled at Seville in 1823, he voted for the suspension of the royal authority, and took part in the negotiations carried on with the Duke of Angoulême, at Cadiz. The re-establishment of absolute monarchy in the Peninsula drove him, as a political refugee, to Brussels and England, till, at the death of Ferdinand, he was recalled by the regent, Maria Christina. In 1834, he was appointed Spanish ambassador to London; and towards the end of 1835, he undertook a mission to Paris. Under the administration of Isturiz, A. shewed himself as zealous for the moderate system as he had been for the preceding one, and advocated the French intervention, which he had opposed during his embassy to London. After the insurrection of La Granja, he refused to swear to the constitution of 1812, declaring that he was tired of constantly taking new oaths; he gave in his resignation accordingly, and retired to France, where he died in 1843.

ALBA, or ALVA, FERDINAND ALVAREZ VON TOLEDO, Duke of, prime-minister, and general of the Spanish armies under Charles V. and Philip II., was born in 1508, of one of the most illustrious families of Spain. He was educated under the eye of his grandfather, who instructed him in the arts of war and of government. He fought, while yet a youth, at the battle of Pavia, and had the custody of Francis I. while a prisoner. He commanded under Charles V. in Hungary, was present at the siege of Tunis, and accompanied the expedition against Algiers. He defended Perpignan against the dauphin, distinguished himself in Navarre and Catalonia, and was in consequence created Duke of A. His cautiousness and his taste for political intrigue afforded as yet no very high evidence of his military talents; and even Charles V., whom he counselled, when in Hungary, to build a bridge of gold for the Turks,

rather than hazard a decisive battle, seems to have intrusted him with the command rather as matter of personal favour than recognition of his abilities. His pride was hurt at the low estimation in which he was held; and his real genius began to shew itself. The victory which Charles V. gained at Mühlberg over John Frederic, Elector of Saxony, in 1547, was due to the able generalship of the Duke of A. Under his influence, as president of the council of war, the captive elector was condemned to death; and it was entirely against his wish that the emperor commuted the sentence. He took part under the emperor in the expedition against Henry II., king of France, who had taken possession of Metz; but here his exertions, as well as those of the emperor, proved unavailing. He was more fortunate in Italy against the combined armies of the pope and the French king, which he repeatedly defeated during the campaign of 1555. After the abdication of the emperor Charles V. in 1556, he continued to hold the command of the army, and overran the States of the Church, which, after the retreat of the French army in 1557, lay entirely at his mercy. He was obliged, however, by the command of Philip II., to conclude a peace with Pope Paul IV., and restore all his conquests. Being recalled from Italy, he appeared in 1559 at the court of France, with which Spain had become reconciled by the peace of Châteaubreais (April 3, 1559); and, as proxy for his sovereign, espoused Elizabeth, Henry II.'s daughter.

When the inhabitants of the Netherlands, who had been accustomed to freedom, revolted against the tyranny of Spain, and especially against the hated inquisition, the Duke of A.'s counsel was to suppress the insurrection forcibly and with rigour. The king accordingly committed the matter to his hands, and sent him to the Netherlands, 1567, with unlimited power and a large military force. His first step on arriving was to establish what was called the 'Bloody Council,' in which he himself at first presided, and over which he afterwards appointed the sanguinary Don Juan de Vargas. This tribunal condemned all without distinction whose opinions appeared dubious, or whose wealth excited jealousy. The present and the absent, the living and the dead, were subjected alike to trial, and their property confiscated by the council. A number of the merchants and mechanics emigrated to England; above 100,000 abandoned their native country, and many others enlisted under the banners of the proscribed princes, Louis and William of Orange. A., rendered still more savage by a defeat which befel his lieutenant, the Duke of Areberg, put to death the Counts Egmont and Horn on the scaffold. He afterwards defeated Prince Louis, and compelled William of Orange to retire to Germany; upon which he entered Brussels in the greatest triumph on the 22d December 1568. The pope presented him with a consecrated hat and sword, as Defender of the Catholic faith; an honour which, having been hitherto conferred only on crowned heads, increased his insolence to the highest degree. He caused a statue to be cast, in which he was represented as trampling under foot two human figures, representing the nobles and people of the Netherlands; and this he set up in Antwerp. His executioners shed more blood than his soldiers; and none now withstood his arms except Holland and Zealand. But these provinces continually renewed their efforts against him, and succeeded in destroying the fleet which had been equipped by his orders. This disaster, and perhaps still more the apprehension that he might lose the king's favour, induced him to request that he might be recalled. Philip gladly acceded; as he perceived that the obstinacy of the rebels was only increased by these cruelties; and he was desirous of

trying the effect of milder measures. A. accordingly resigned the command of the troops to Don Louis de Requesens, and (December 18, 1573) left the country, in which, as he himself boasted, he had executed 18,000 men. The war which he had kindled burned for sixty-eight years, and cost Spain 800,000,000 dollars, her finest troops, and the loss of seven of the richest provinces of the Netherlands.

A. was received at Madrid with the highest distinction, but did not long enjoy his former consideration. Don Frederic, one of his sons, having seduced one of the queen's ladies of honour under promise of marriage, and being arrested on this account, the father assisted him to escape, and in opposition to the desire of the king, united him in marriage to one of his relatives. He was in consequence banished from the court to his castle of Uzeda, where he lived two years. But now the troubles in Portugal, the crown of which Philip claimed as his hereditary right, induced the king to draw A. anew from his retreat. The duke accordingly led an army into Portugal, and drove out Don Antonio, who, as grandson of John III., had taken possession of the throne. The whole country was speedily conquered (1581); and A., with his accustomed cruelty and rapacity, seized the treasures of the capital himself, while he allowed the soldiers to plunder without mercy the suburbs and the surrounding country. Philip, dissatisfied with these proceedings, desired to have an investigation of the conduct of the duke; but the haughty bearing of the latter, and the fear of a revolt, induced him to abandon it. A. died at Lisbon, December 11, 1582, at the age of 74. He had a fine countenance, with a haughty air and a robust frame; he slept little, while he both laboured and wrote much. It has been said of him, that during sixty years of military service he never lost a battle, and never allowed himself to be surprised.

ALBA LONGA, one of the most ancient cities of Italy, situated on the rocky ridge that runs along the eastern shore of the Alban Lake, between the lake and the Alban Mount. See ALBANO. According to legendary history, it was built by Ascanius, the son of Æneas, about 300 years before the foundation of Rome, which is represented as a colony of A. Notwithstanding this, the Romans, under Tullus Hostilius, destroyed the city, and removed the inhabitants to Rome. It seems certain that A. was an important city long before the existence of Rome, and the head of a confederation of Latin towns, and that when it was destroyed, many of its inhabitants settled at Rome. Some traces of its walls are yet to be seen.

ALBAN, St, the first martyr of Britain, was born at Verulam, in the 3d c., and after having long lived as a heathen, was converted to Christianity, but put to death at the commencement of Diocletian's persecution of the Christians. His anniversary is celebrated on the 22d June. The town of St Albans (q. v.), which bears his name, is believed to stand on the site of his birthplace, or the scene of his martyrdom.

ALBANI is the name of a rich and celebrated family of Rome, who came originally from Albania in the 16th c., and settled first at Urbino. The great influence of the family dates from the accession (1700) of Giovanni Francesco A. to the papal throne, as Clemens XI. It has since furnished a succession of cardinals. It was Cardinal Alessandro A. (b. 1692—d. 1779) who formed the famous collection of objects of art in the VILLA A., outside the Porta Salaria at Rome. It is still a rich collection, although part of it was carried off by the French. The pieces taken away were restored in 1815; but the then possessor being unable to pay for their removal to Rome, sold them to the king of Bavaria.

ALBANI, FRANCESCO, a painter of the Bolognese school, of the time of the Caracci; born at Bologna, 1578, and died there in 1660. He studied, along with Guido Reni, first under Calvert, and afterwards under the Caracci. He has painted above fifty altar-pieces, worthy of the Caracci school; but his inclination lay more to the representation of scenes of a playful and pastoral, or of a mythical kind, and of this nature are the greater part of his pieces. He had by his second wife a family of twelve children of extraordinary beauty, in whom he found exquisite models for his Venuses, Galateas, and angels' heads; with the disadvantage, however, of imparting a certain uniformity to the countenances of his figures. His representation of the Four Seasons, so often imitated, gained him great renown. A.'s chief defect lies in the expression of life and feeling.

ALBANIA (allied to ALP, and meaning 'mountain region') forms the south-west province of European Turkey, having Montenegro, Bosnia, and Servia on the N., Macedonia and Thessaly on the E., Greece on the S., and the Ionian and Adriatic seas on the W. It is divided into four circles, following the four confederations of tribes that people it—the Jegani, Tokkani, Liapuri, and Jamuri. These circles differ both in climate and in the manners of their inhabitants. A distinction is also made between Upper Albania, the Illyria of the Romans, in the north, and Lower Albania, the ancient Epirus, in the south. On the east boundary, forming the water-shed of the peninsula, rises the range of the Bora-dagh and the Pindus. The first detaches itself from the wild masses of the Tshar-dagh (dagh in Turkish means *mountain*) and Argentaro mountains; and west of it lie parallel chains, enclosing on the one side, long elevated valleys, and sinking on the other in terraces, down to level strips along the coast, consisting mostly of unhealthy swamps and lagoons. Pindus, to the south, is also flanked by isolated basins or hollows, whose western edges pass into the jagged and thick-wooled Epirotic highlands. These highlands advance to the sea, forming steep rocky coasts; one promontory, the Acroceraunian, projecting in Cape Linguetta far into the sea, reaches a height of 4—5000 feet.

The chief rivers are the Bojana, the Drin, the Skombi, Ergent, Vojussa, Glykys or Acheron (which follows for some distance a subterranean channel, and on reappearing, is called Mauroptomos), the Arta, and the upper course of the Aspropotamos. Among the lakes, those of Bojana, Ochri, and Janina, are the most important.

A fine climate, the heat of which is tempered by high mountains and the proximity of the sea, and a favourable soil, would seem to invite the inhabitants to agriculture; but for the most part in vain. In the north, little or nothing is cultivated but maize; in the moist valleys, a little rice and barley are produced; but the mountain-terraces are used as pastures for numerous herds of cattle and sheep. In Epirus, there is more variety. Here the slopes of the lower valleys are covered with olives, fruit and mulberry trees, intermixed with patches of vines and maize, while the densely wooded mountain-ridges furnish valuable supplies of timber. The plateau of Janina yields abundance of grain; and in the valleys opening to the south, the finer fruits are produced, along with maize, rice, and wheat. Even cotton and indigo might be profitably cultivated in the moist valleys; but in its present wretched condition, the country can barely support its scanty population.

The inhabitants, estimated at about a million, form a peculiar people, the Albanians or Arnauts; they call themselves Skypetars. They are descendants of the ancient Illyrians, mixed with Greeks and Slaves, and not to be confounded with the Albani that live

on the Caspian Sea. The Albanians are half-civilised mountaineers, frank to a friend, vindictive to an enemy. They are constantly under arms, and are more devoted to robbery and piracy than to cattle-feeding and agriculture. They live in perpetual anarchy, every village being at war with its neighbour, and even the several quarters of the same town carrying on mutual hostilities. Many of them serve as mercenaries in other countries, and they form the best soldiers of the Turkish army. At one time, the Albanians were all Christians; after the death of their last chief, the hero Scanderbeg, and their subjugation by the Turks, a large part became Mohammedans, who distinguished themselves by cruelty and treachery towards the tribes that remained true to their old faith. The steep valleys of the Acheron in the south, forming the district of Sudi, are inhabited by a powerful tribe, the Suliotes, who till their fields sword in hand, and conceal their harvests in the earth. They made themselves famous by their long resistance to Ali Pacha. In the north, between the Black Drin and the sea, is the country or circle of the Mirdites, i. e., the brave, who are always ready with weapons in their hands to defend their freedom and their religion—the Roman Catholic. A. is divided into the pachalics of Janina, Ibessan, and Scutari, and the sandjaks of Delvino and Avlona. The chief towns are the ports of Durazzo, Avlona, Prevesa, and Parga; the more inland towns, Scutari, Berat, Argyro Castro, and Arta; and in the eastern mountain districts, Akhrida and Joannina.

ALBANO, a town formerly in the States of the Church, on the declivity of the lava-walls which encompass the lake Albano, about 18 miles from Rome. It is the seat of a bishop, numbers 5000 inhabitants, and is surrounded with handsome mansions of the wealthier Romans. It is on the opposite side of the lake from where Alba Longa stood, and owed its origin to the villas of ancient Roman magnates, such as Pompeius, Domitian, and Clodius. A valuable wine is produced in the environs. At a short distance from the town, on the old Appian Way, are found the remains of an amphitheatre, and a sepulchre of Etruscan architecture.

The ALBAN LAKE, or Lago di Castello, is formed in the basin of an extinct volcano, and has a circumference of 6 miles, with the enormous depth of more than 1000 feet. Its elevation is nearly 1000 feet above the sea-level. While the Romans were at war with the Veientes (390 B.C.), this lake rose to an extraordinary height in the heat of summer, and without any apparent cause. Etruscan diviners declared that the conquest of Veii depended upon letting off the waters of the lake. Stimulated by this, the Romans, under the direction of the Etruscans, opened an emissary or tunnel through the lava-wall which bounds it. In the execution of this work they acquired the art of mining, which they now applied to undermine the walls of Veii. The tunnel, which still remains, and still fulfils its ancient office, is 1½ miles in length, with a height of 7 feet, and a width of 4 feet. On the eastern bank of the lake, rises Monte Cavo, the ancient Mount Albanus, 3000 feet high, affording an extensive and magnificent view from its summit. Upon it once stood the magnificent temple of Jupiter Latiaris, which was approached by a paved way, for the ascent of the solemn processions of the Latin confederation (*Feria Latina*), and for the ovations of Roman generals. The road remains, in great part, perfect to this day.

The Albano stone, called Peperino, was much used in Roman buildings. It is a kind of volcanic tufa, of an ash-colour, and is still quarried extensively at A.

ALBANS, Sr, an ancient borough in Hertford-

shire, situated on the top and northern side of a picturesque hill, 21 miles north-west from London. The Ver, a small tributary of the Colne, separates it from the site of the ancient Verulamium (Verulam), an important station in the time of the Romans, and the scene of a terrible slaughter in the insurrection under Boadicea. In honour of St Alban, said to have suffered martyrdom here in 297, a Benedictine monastery was founded by Offa, king of Mercia, in 796. The foundation of the town is supposed to be due to Ulsig (or Ulsin), who was abbot about 150 years later. Two battles were fought near St A. during the Wars of the Roses, in 1455 and 1461. In the first, Henry VI. became a captive; in the other, he was set at liberty by his brave queen, Margaret of Anjou. The most noteworthy object in the town is the old abbey-church, a cruciform building, of irregular architecture, 517 feet in length, by 206 in breadth, with an embattled tower 146 feet high. The Abbot of St A. had a seat in the House of Peers, and had precedence of all other English abbots. In St Michael's Church is to be seen a monument to the memory of the great Bacon, who bore the titles of Baron Verulam and Viscount St A. More recently, the Beauclerk family have taken from this place the title of duke, and the Grimston family that of earl. The population, in 1871, was 8293, many of whom are employed in straw-plaiting and silk-spinning. In the neighbourhood are great numbers of corn-mills. The borough, which formerly returned two members, was disfranchised in 1852 for notorious bribery.

ALBANY, or ALBAINN, an ancient name for the Highlands of Scotland, and retained in some degree of use down to our own day. Connected with it is the term *Albiones*, applied to the inhabitants of the entire British island in Festus Avienus's account of the voyage of Hamilear, the Carthaginian, in the 5th c. B. C.; also the term *Albion*, which appears as the name of the island in Aristotle's Treatise of the World. It may, indeed, be pretty safely assumed that Albion or Albany was the original name of Britain among its Celtic population; and that it only became restricted to the north-west provinces of Scotland, when the Celts had for the most part become confined to the same region. Albainn means a country of heights (the root being *alb* or *alp*, a height); and it is remarkable to find Albania also a mountainous country. The modern use of the name A. may be said to have taken its rise in an act of a Scottish council held at Seone in June 1398, when the title of Duke of A. was conferred on the brother of King Robert III., then acting as regent of the kingdom. The title, being forfeited in the son of the first holder, was afterwards conferred on Alexander, second son of King James II., in the person of whose son, John, it became extinct in 1536. Subsequently it was conferred in succession on Henry Lord Darnley, on Charles I. in infancy, on James II. in infancy, and (as a British title) on Frederick, second son of George III. The unfortunate Prince Charles Stuart, in his latter years, assumed the appellation of Count A. as an incognito title, and gave the title of Duchess of A. to his legitimated daughter.

ALBANY, the capital of New York, is situated on the west bank of the Hudson River, 145 miles north of New York city, in lat. 42° 39' N., and long. 73° 45' W. After Jamestown and St Augustine, in Virginia, it is the oldest town in the Union, having been founded by the Dutch in 1623, though it did not receive its present appellation until 1661, when it came into the possession of the English, and was so named in honour of the Duke of York and Albany. It is situated in the midst of a fertile and

well-cultivated country, and is one of the most flourishing cities in the States, being the chief emporium for the transit-trade of the coast-towns with those of the north and north-west. It is advantageously built for commerce, at the head of the sloop-navigation on the Hudson, communicating by means of canals with Lake Erie, Lake Ontario, and Lake Champlain. It is also the centre in which a number of railways meet, connecting it with New York, Buffalo, Boston, &c. One of the most important articles in its commerce is timber. It is one of the largest timber-markets in the world; the quantity received in 1863 amounting to 243,611,500 feet of boards and scantling, and 146,746,000 lbs. of staves, and thousands of cubic feet of other articles—the whole valued at over 7,000,000 dollars. Viewed from some parts of the river, A. has a picturesque and imposing appearance. In general, it is not very remarkable for the regularity of its streets or the elegance of its houses; nevertheless, it contains some of the most splendid edifices in the Union. A new state capitol, in the Renaissance style, is being erected, at a cost of 4,000,000 dollars, which will be one of the finest public buildings in America. A. is honourably distinguished for its educational and literary institutions. The university, incorporated in 1852, has for its aim the discipline of the American youth in the most important branches of practical science. The medical college, founded in 1839, has one of the best museums in the States, and is otherwise amply furnished with the means of instruction. There is likewise a large number of public schools. Pop. in 1870, 69,422.

ALBANY, LOUISA-MARIA-CAROLINE, also **ALOYSIA**, COUNTESS OF, wife of the unfortunate Prince Charles-Edward (q. v.), grandson of James II. of England. She was the daughter of the Prince Gustavus Adolphus of Stolberg-Gedern, who fell in the battle of Leuthen in 1757. This lady was born in 1753, and, during her married life, bore the name of the Countess of A. She had no children; her marriage proved an unhappy one; and in order to escape from the ill-usage of her husband, who lived in a state of continual drunkenness, she sought refuge in a nunnery, 1780. At the death of the prince in 1788, the court of France allowed her an annual pension of 60,000 livres. She outlived the House of the Stuarts, which became extinct at the death of her brother-in-law, the Cardinal of York, in 1807. She died at Florence, which was her usual place of residence, on the 29th of January 1824. Her name and her misfortunes have been transmitted to posterity through the works and autobiography of Alfieri (q. v.), to whom she was privately married. Their remains repose in the same tomb in the Church of Santa Croce at Florence, between the tombs of Macchiavelli and Michael Angelo.

ALBATROSS (*Diomedea*), a genus of web-footed birds of the family of the *Larida*, nearly allied to Gulls and Petrels. Their feet have no hind-toe nor claw; they have a large strong beak—the upper mandible, with strongly marked sutures, and a hooked point. The common Albatross (*D. exulans*), also called the Wandering A., is the largest of web-footed birds, the spread of wing being sometimes twelve feet, and the weight twenty pounds or upwards. The wings are, however, narrow in proportion to their length. This bird is often seen at a great distance from land, and abounds in the southern seas, particularly near the Cape of Good Hope, whence sailors sometimes call it the Cape Sheep. It often approaches very near to vessels, and is one of the objects of interest which present themselves to voyagers far away from land, particularly when

it is seen sweeping the surface of the ocean in pursuit of flying-fish. It seems rather to float and glide in the air than to fly like other birds, as, except when it is rising from the water, the motion of its long wings is scarcely to be perceived. The plumage is soft and abundant, mostly white, dusky on the upper parts, some of the feathers of the back and wings black. The bill is of a delicate pinky-white, inclining to yellow at the tip. The A. is extremely voracious; it feeds chiefly on fish and mollusca, but has no objection to the flesh of a dead whale, or to any kind of carrion. It is not a courageous bird, and is often compelled to yield up its prey to sea-eagles,

Albatross.

and even to the larger kinds of gulls. When food is abundant, it gorges itself, like the vultures, and then sits motionless upon the water, so that it may sometimes be taken with the hand. Not unfrequently, however, on the approach of a boat, it disgorges the undigested food, and thus lightened, it flies off. Its cry has been compared to that of the pelican; it also sometimes emits a noise which has been likened to the braying of an ass. Its flesh is unpalatable. It heaps up a rude nest of earth not far from the sea, or deposits its solitary egg in a slight hollow which it makes in the dry ground. The egg is about four inches long, white, and spotted at the larger end; it is edible. There are seven species of this genus. One of these (*D. fuliginosa*), chiefly found within the Antarctic Circle, is called by sailors the Quaker Bird, on account of the prevailing brown colour of its plumage. Albatrosses appear in great numbers towards the end of June, about the Kurile Islands and Kamtchatka. The Kamtchadales take them by baited hooks, blow up the entrails for floats to their nets, and make tobacco-pipes and various domestic articles of the wing-bones.

ALBE, or **ALB** (Lat. *albus*, white), the long white linen vestment worn in early times by all ecclesiastics at divine service. It differed from the more modern surplice (q. v.), which is only a modification of it, in having narrower sleeves. At the foot and wrists were embroidered ornaments called *apparels*. In the ancient church,

Albe.

newly baptised persons were obliged to wear a similar garment for eight days; and hence catechumens were called *albat*; and the Sunday after Easter, on which they usually received baptism, came to be called *Dominica in Albis*. See WHITSUNDAY.

ALBERONI, GIULIO, CARDINAL, the son of a poor vine-dresser, was born on the 31st of May 1664 at Firenzuola in Parma. From being merely a chorister in a church at Piacenza, he quickly rose, through his abilities, to the dignity of chaplain and favourite of Count Roncovieri, Bishop of St Donino. He was afterwards sent to Madrid as *chargé d'affaires*, by the Duke of Parma, where he gained the favour of Philip V. of Spain, and had the honours successively conferred on him of grandee, cardinal, and prime-minister. In this last capacity he was of singularly great service to Spain, overthrowing the intriguing family of Ursini, bringing about the second marriage of Philip V. with Elizabeth Farnese, and stimulating the expiring energies of Spain. A new life dawned upon the nation, which learned to forget the hardships it had suffered in the Spanish Wars of Succession; although, on the other hand, it must be admitted that it was principally through his instrumentality that the last liberties and rights of the people were sacrificed in favour of absolutism. He was ambitious, and ambition is always despotic and unscrupulous; hence, to gratify the covetous desires of his new mistress, he suddenly invaded Sardinia, in violation of the Peace of Utrecht, cherishing the hope of re-establishing the monarchy of Charles V. and Philip II., and startling Europe by his insolent audacity. The Regent of France broke off his alliance with Spain, and united himself with England and the Emperor; but A. was not dismayed. Even when the Spanish fleet in the Mediterranean was destroyed by an English one, he contemplated an extensive war by land, in which all the European powers would have been entangled. He patronised the Pretender, to annoy England, and the French Protestants, to annoy Louis. He sought to unite Peter of Russia and Charles XII. with him, to plunge Austria into a war with the Turks, to stir up an insurrection in Hungary, and, through his influence with one of the parties at the French court, he actually accomplished the arrest of the Regent himself (the Duke of Orleans). But so universal became the complaints against A., that Philip lost courage, and concluded a treaty of peace, the chief condition of which was that the cardinal should be dismissed, which was effected through the influence of Elizabeth herself, now weary of the arrogance of her late favourite. On the 20th of December 1720, A. received a command to quit Madrid within twenty-four hours, and the kingdom within five days. Exposed to the vengeance of every power whose hatred he had drawn upon himself, he knew no land where he could remain. Not even to Rome could he venture, for Clement was more bitterly inimical to him than any secular potentate. He wandered about in disguise, and under fictitious names. At length, he was imprisoned in the Genoese territory, through the solicitation of the pope and the Spanish monarch; but he speedily recovered his liberty, and two years after the death of Clement, was reinstated by Innocent XIII. in all the rights and dignities of a cardinal. In 1740 he retired to Piacenza, where he died twelve years after (June 26, 1752) at the age of 88. He bequeathed his possessions in Lombardy to Philip V., while his cousin and heir, Cæsar A., became possessor of 1,000,000 ducats.

A'LBERT, ALEXANDER MARTIN, a member of the Provisional Government of France after the revolution of February 1848, was born at Bury (Oise) in 1815. His father was a peasant, and he himself

learned a mechanical trade at Paris. He took part in the revolution of July 1830, and was implicated in the celebrated trial of 1834; after which he devoted himself to the study and discussion of political questions, yet not abandoning his workshop. He commenced at Lyon the republican journal called *La Glaneuse*, on account of which he was condemned to a fine of 5000 francs when the insurrection broke out at Lyon. In 1840 he began *L'Atelier*, a paper conducted exclusively by operatives, and devoted to their interests. On the evening before the proclamation of the republic in February 1848, he was making buttons in his workshop; and on the nomination of Louis Blanc, he was called to take part in the Provisional Government. He was afterwards chosen president of the Commission for National Rewards; but he soon resigned this post. He was elected by a large majority of voices as the representative of the department of the Seine in the National Assembly; but involving himself in the attempt of May 15, 1848, against the government as it then existed, he was arrested the same day, and condemned to a lengthened imprisonment.

ALBERT, COUNT OF BOLLSTÄDT, usually called Albertus Magnus, also Albertus Teutonius, a man less distinguished for originality, than for the extent of his acquirements and his efforts for the spread of knowledge, especially of the works and doctrines of Aristotle, was born at Lauingen, in Swabia, in 1205, or, as some say, in 1193. After finishing his studies at Padua, he entered the order of the Dominican friars, and taught in the schools of Hildesheim, Ratisbon, and Cologne, where Thomas Aquinas became his pupil. In 1230 he repaired to Paris, where he publicly expounded the doctrines of Aristotle, in spite of the prohibition of the Church. In 1249, he became rector of the school at Cologne; and in 1254, provincial of the Dominican order in Germany. In 1260, he received from Pope Alexander IV. the bishopric of Ratisbon. But in 1262, he retired to his convent at Cologne, to devote himself to literary pursuits; and here he composed a great number of works, especially commentaries on Aristotle. He had fallen into dotage some years before his death, which occurred in 1280. The fullest edition of his works was prepared by Pierre Jammy, the Dominican (21 vols., Lyon and Leyden, 1651); but it is far from being complete. Many of the writings attributed to A. seem to be spurious; among others, that entitled *De Secretis Mulierum*, which was widely circulated during the middle ages. The extensive chemical and mechanical knowledge which A. possessed, considering the age in which he lived, brought upon him the imputation of sorcery; and in German tradition he has a very ambiguous reputation. It is recorded, for instance, that in the winter of 1240, he gave a banquet in the garden of his convent, at Cologne, to William of Holland, king of the Romans; and that during the entertainment, the wintry scene was suddenly transformed into one of summer bloom and beauty. This myth rests most likely on the fact of A. having had a green-house.—The scholastics who followed A.'s opinions took the name of *Albertists*.

ALBERT, FRANCIS (ALBERT) AUGUSTUS-CHARLES-EMMANUEL, Prince of Saxe-Coburg-Gotha, Consort of Victoria, Queen of Great Britain, born August 26, 1819 was the second son of the late Duke of Saxe-Coburg-Gotha, by his first marriage with Louisa, daughter of the Duke of Saxe-Gotha-Altenburg. The Prince, after a careful domestic education, along with his elder brother, the reigning Duke, attended the university of Bonn, where, in addition to the sciences connected with state-craft, he devoted

himself with ardour to the study of natural history and chemistry, and displayed great taste for the fine arts, especially painting and music. Several compositions of his obtained publicity, and an opera was afterwards performed in London, said to have been composed by him. Gifted with a handsome figure, he attained expertness in all knightly exercises. It was this accomplished Prince that the young Queen of Great Britain selected as her partner for life. The marriage was celebrated in London on the 10th of February 1840. On his marriage, Prince Albert received the title of Royal Highness, was naturalised as a subject of Great Britain, and obtained the rank of Field-marshal, the knighthood of the Order of the Bath, and the command of a regiment of Hussars. As the union proved, in the highest degree, a happy one, the prince was loaded with honours and distinctions both by the Queen and the nation. The title of Consort of Her Most Gracious Majesty was formally conferred in 1842, and that of Prince Consort, in 1857, made him a prince of the United Kingdom. He was also made a member of the Privy Council, Governor and Constable of Windsor Castle, Colonel of the Grenadier Guards, Acting Grand Master of the Order of the Bath, Chancellor of the University of Cambridge, Master of the Trinity House, &c. Notwithstanding his high and favoured position, the Prince, with rare prudence and tact, abstained from meddling with state affairs, and thus escaped the jealousy and detraction of parties. When the Whig ministry of 1840 proposed for him the income of £50,000, as Consort of Queen Victoria, the Tories, in conjunction with the Radicals, succeeded in limiting the sum to £30,000. This appears to have been the only instance of any manifestation of party feeling with reference to the Prince. On the other hand, he opened for himself an influential sphere of action, in the encouragement and promotion of science and art, appearing as the patron of many useful associations and public undertakings. The Industrial Exhibition of 1851 owed much to the suggestions and encouragement of the Prince. He died 14th December 1861, to the profound grief of the whole nation.

ALBERT or ALBRECHT. Five sovereign dukes of Austria (q. v.) bore this name, of whom two (I. and V.) were also emperors of Germany. A. I., Duke of Austria and Emperor of Germany, was the eldest son of Rudolph I., and born in the year 1248. Rudolph, about the close of his career, made an effort to have A. appointed his successor; but the electors, tired of his authority, and emboldened by his age and infirmities, refused to comply with his request. After Rudolph's death, Austria and Styria revolted; but A., having vigorously crushed the insurrection, had the audacity to assume the insignia of the empire without waiting for the decision of the Diet. This violent measure induced the electors to choose, in preference to him, Adolphus of Nassau. Disturbances in Switzerland, and a disease which cost him an eye, now rendered him more humble; he delivered up the insignia which he had so rashly assumed, and took the oath of allegiance to the new emperor, who, however, after some years, so completely disgusted his subjects, that A. began to entertain hopes of recovering his imperial dignity. In 1298, Adolphus was deposed, and A. elected; but the former having resolved to maintain his title, A. was obliged to fight for the crown. The rivals drew up their forces near Worms, where a battle ensued, in which Adolphus was defeated and slain. A., feeling that he might now safely display magnanimity, voluntarily resigned the crown which had been recently conferred upon him; and, as he had anticipated, was unanimously re-elected. His

coronation took place at Aix-la-Chapelle, in August 1298. But the pope, Boniface VIII., denied the right of the princes to elect A., declared himself the only true emperor and legitimate king of the Romans, summoned the former before him, required him to ask pardon and do penance, forbade the princes to acknowledge him, and released them from their oath of allegiance. A., on the other hand, with his usual intrepidity, defied his Holiness, formed an alliance with Philip the Fair of France, secured the neutrality of Saxony and Brandenburg, invaded the electorate of Metz, and forced the archbishop to break off his alliance with Boniface and to form one with himself for the next five years. The pope was alarmed by his success, and entered into negotiations with him. A., whose duplicity and unscrupulousness equalled his courage, suddenly broke off his alliance with Philip, admitted the western empire to be a papal grant, and declared that the electors derived their right of choosing from the Holy See. Moreover, he promised upon oath to defend the rights of the Romish court whenever he was called upon. As a reward, Boniface gave him the kingdom of France, excommunicating Philip, and declaring him to have forfeited the crown; but the latter severely chastised the pope for his insolence in daring to give away what was not his own. In the following year, A. made war unsuccessfully against Holland, Zealand, Friesland, Hungary, Bohemia, and Thuringia. Shortly afterwards, news reached him that a rebellion had broken out amongst the Swiss in Unterwalden, Schwitz, and Uri, in January 1308. A. had not only foreseen, but desired this, in order that he might find a pretext for completely subjugating the country. A new act of injustice, however, occasioned a crime which put an end to his ambition and life. His nephew, Duke John, claimed Swabia as his rightful inheritance, and had set his claims before A., but in vain. When the latter was departing for Switzerland, the former renewed his demand. A. scotfully refused; and Duke John resolved to be revenged. Along with four others, he conspired against his uncle's life, and assassinated him on the way to Rheinfelden, while separated from his followers by the river Reuss. The emperor expired May 1, 1308, in the arms of a beggar-woman sitting by the wayside—a spectacle calculated to excite stern reflection on the vanity of human ambition. His daughter Agnes, queen of Hungary, frightfully revenged her father's death. See JOHN, THE PARRICIDE. A. left five sons and five daughters, the children of his marriage with Elizabeth, daughter of the Count of Tyrol.

ALBERT THE BEAR (so called, not from any peculiarity of character or appearance, but from the heraldic cognizance that he assumed), Margrave of Brandenburg, one of the most remarkable princes of his age, was born 1106. He was the son and successor of Otho, the rich Count of Ballenstädt, and of Eliea, eldest daughter of Magnus, Duke of Saxony. Having proved faithful to the Emperor Lothario, he received from the latter Lusace, to be held as a fief of the empire; but the Duchy of Saxony, to which he had the best claim, was given to Henry of Bavaria (1127), the son of the youngest daughter of the duke. As a compensation, A. was made Margrave (Markgraf) of the Northern March or Marek (Salzwedel); but in the year 1138, Henry having been put under the imperial ban, the duchy reverted to the former, when he took the title of Duke of Saxony. Henry, however, again got the upper hand, and A. was compelled to fly, and to content himself with the margraviate of Northern Saxony, and the government of Swabia, which was given him as an indemnity.

Returning to his own country, he got himself invested with the lands which he had conquered from the Wends as a hereditary fief of the empire, and thus became the founder and first Margrave of the new state of Brandenburg. Under A. the Margravedom was afterwards raised to be an Electorate, and he himself became Elector of Brandenburg. After he had quelled a revolt of the Wends in 1157, he determined to take extreme measures against the vanquished. He almost depopulated their country, and then colonised it with Flemings. On his return from a pilgrimage to Palestine in company with his wife in 1159, he exerted himself to suppress the language and paganism of the Wends, and to introduce Christianity amongst them. He died in 1170, at Bullenstädt, where he was buried. Brandenburg continued in the possession of his descendants for two centuries, and finally (1415) fell to the house of Hohenzollern (q. v.).

ALBERT, last grand-master of the Teutonic Order, and first Duke of Prussia, was born in 1490. He was the son of the Margrave Frederic of Anspach and Baireuth, who, having several children, wished to make him enter the church. He was educated under the care of Archbishop Hermann, of Cologne, where he became canon. He did not, however, neglect knightly exercises. He accompanied the emperor Maximilian I. in his expedition against Venice, and was present at the siege of Pavia. In 1511, when scarcely twenty-one years old, he was chosen grand-master of the Teutonic Order, the knights expecting their feudal allegiance to Poland to be abolished, on account of his near relationship to Sigismund, the monarch of that country, while they also hoped for protection against the latter from his friends in Germany. He was consecrated at Mergentheim with his father's consent. In 1512 he removed to Königsberg, having been acknowledged by Poland likewise; but refusing to take the oath of allegiance, he was plunged into a war with Sigismund in 1520. The year after, a four years' truce was agreed to at Thorn. A. next made his appearance at the imperial Diet at Nürnberg, as a German prince of the empire, to induce the other princes to assist him against the Poles. But Germany could at that time grant no assistance to any one. Disappointed in his hopes, A. threw himself into the cause of the Reformation, which had rapidly spread into Prussia, and broken the last strength of the declining order, whose possessions now appeared a certain prey to Poland. A. still hoped to preserve these, by acting upon Luther's advice, which was, to declare himself secular Duke of Prussia, and place his land under the sovereignty of Sigismund. This was done with great pomp at Cracow, on the 8th April 1525, the duchy being secured to him and his descendants. During the remainder of his life, A. zealously sought to further the welfare of his duchy. He regulated the administration of all affairs, both secular and ecclesiastical, established the dual library, founded in 1543 the university of Königsberg, gathered many literary men around him, and caused their works to be printed. In 1527, he married Dorothea, daughter of Frederick, king of Denmark. A. earnestly desired peace, but his was not an age in which peace could be purchased. The transition period from the old to the new is always violent, and the duke found himself entangled in conflicts with the nobles, and in theological disputes, which, along with other crosses of a more personal character, saddened the close of his life. He died in 1568. See PRUSSIA.

ALBERT, Archbishop of Magdeburg, and Elector of Mentz, generally called A. of Brandenburg,

younger son of the elector, John Cicero of Brandenburg, was born in 1489. In 1513 he became Archbishop of Magdeburg; in the same year, also, Administrator of the bishopric of Halberstadt, and in the following year, Archbishop and Elector of Mentz. Leo X. having granted him permission to sell indulgences, on condition that he should deliver up half the booty to the papal exchequer, A. appointed the Dominican Tetzel 'indulgence-preacher,' who, by the shameless manner in which he went about his work, first stirred Luther to post up his well-known ninety-five theses. Even in the archbishop's own diocese, the reformer's doctrines found not a few adherents, so that A. was compelled, at the imperial Diet at Angsburg, to act the part of peace-maker. When he joined the Holy Alliance against the Treaty of Schmalkald, Luther made a fierce attack on him in writing. He was the first of all the German princes who received the Jesuits into his dominions. In 1541, he granted religious liberty to his subjects, under the condition that they should pay his debts, amounting to 500,000 florins. He did this, not from any love of religious liberty, but either because of the consideration referred to, or from a dread of popular compulsion. The last days of his life were spent in Aschaffenburg, where he died in 1545.

ALBERT, or ALBRECHT, Archduke of Austria, born in 1559, was the third son of the emperor Maximilian II. He was brought up at the Spanish court, and dedicated himself to the church. In 1577 he was made cardinal, in 1584, Archbishop of Toledo, and during the years 1594—96, held the office of viceroy of Portugal. He was next appointed Stadtholder of the Netherlands, where he continued, until his death, the representative of the Spanish monarch, discharging the duties of his function with prudence and dignity. Cardinal Bentivoglio, who resided a considerable time at his court, praises his uprightness, his moderation, his love of serious study, his industry, his perseverance, and his discretion, though he does not conceal the fact that he was a prince better fitted for peace than for war. He displayed at first both courage and enthusiasm, but afterwards he was accused of dilatoriness and timidity. Meanwhile, he did not receive from Spain the promised help; and, moreover, affairs had reached such a pitch, that they could hardly become worse. A., however, did the best that could be done. His mild, moderate, and unpersecuting character, essentially contributed to the re-establishment of the Spanish authority in the Netherlands. Philip employed him to mediate amid the disturbed provinces. A. now abandoned his ecclesiastical profession, and married (1598) the Infanta, Isabella, who received the Netherlands for her dowry. He died in 1621.

ALBERTUS MAGNUS. See ALBERT OF BOLLSTÄDT.

ALBI, capital of the department of Tarn in France, is built on a height. It is very old, and suffered greatly during the religious wars which devastated the land in the time of the Albigenes. Besides the usual government offices, it possesses a public library of 12,000 volumes, and a museum. The most remarkable buildings are the cathedral, built in the style of the 13th c., the old palace of the Count of Albigeois, and the theatre. There is considerable trade in corn, wine, anise, prunes, and clover-seed. The chief manufactures are table-linen, cotton and woollen goods, leather, &c. Pop. 13,698.

ALBIGENSES is a name applied loosely to the 'heretics,' belonging to various sects, that abounded in the south of France about the beginning of the 13th c. The chief sect was the Cathari (q. v.); but they all agreed in renouncing the authority of the popes

and the discipline of the Romish Church. The name arose from the circumstance that the district of Albigeois in Languedoc—now in the department of Tarn, of which Albi is the capital—was the first point against which the crusade of Pope Innocent III., 1209, was directed. The immediate pretence of the crusade was the murder of the papal legate and inquisitor, Peter of Castelnau, who had been commissioned to extirpate heresy in the dominions of Count Raymond VI. of Toulouse; but its real object was to deprive the count of his lands, as he had become an object of hatred from his toleration of the heretics. It was in vain that he had submitted to the most humiliating penance and flagellation from the hands of the legate Milo, and had purchased the papal absolution by great sacrifices. The legates, Arnold, Abbot of Cîteaux and Milo, who directed the expedition, took by storm Beziers, the capital of Raymond's nephew, Roger, and massacred 20,000—some say 40,000—of the inhabitants, Catholics as well as heretics. 'Kill them all,' said Arnold; 'God will know his own!' Simon, Count of Montfort, who conducted the war under the legates, proceeded in the same relentless way with other places in the territories of Raymond and his allies. Of these, Roger of Beziers died in prison, and Peter I. of Aragon fell in battle. The conquered lands were given as a reward to Simon of Montfort, who never came into quiet possession of the gift. At the siege of Toulouse, 1218, he was killed by a stone, and Counts Raymond VI. and VII. disputed the possession of their territories with his son. But the papal indulgences drew fresh crusaders from every province of France, to continue the war. Raymond VII. continued to struggle bravely against the legates and Louis VIII. of France, to whom Montfort had ceded his pretensions, and who fell in the war in 1226. After hundreds of thousands had perished on both sides, a peace was concluded, in 1229, at which Raymond purchased relief from the ban of the church by immense sums of money, gave up Narbonne and several lordships to Louis IX., and had to make his son-in-law, the brother of Louis, heir of his other possessions. These provinces, hitherto independent, were thus, for the first time, joined to the kingdom of France; and the pope sanctioned the acquisition, in order to bind Louis more firmly to the papal chair, and induce him more readily to admit the inquisition. The heretics were handed over to the proselytising zeal of the order of Dominicans, and the bloody tribunals of the Inquisition; and both used their utmost power to bring the recusant A. to the stake, and also, by inflicting severe punishment on the penitent converts, to inspire dread of incurring the church's displeasure. From the middle of the 13th c., the name of the A. gradually disappears. The remnants of them took refuge in the east, and settled in Bosnia. Compare Fauvel, *Croisade contre les Albigeois* (Par. 1835); Faber, *Inquiry into the History and Theology of the Vallenses and Albigenes* (Lon. 1835).

ALBINOS—called also Leucæthiopes, or white negroes, and by the Dutch and Germans Kakerflaken—were at one time considered a distinct race; but closer observation has shewn that the same phenomenon occurs in individuals of all races, and that the peculiar appearance arises from an irregularity in the skin, which has got the name of *leucopathy* or *leucosis*. It consists in the absence of the colouring matter which, in the normal state, is secreted between the cuticle and the true skin, and also of the dark pigment of the eye; so that the skin has a pale, sickly white colour, while the iris of the eye appears red, from its great vascularity. As the pigment in the coats of the eye serves to diminish the

stimulus of the light upon the retina, A. generally cannot bear a strong light; on the other hand, they see better in the dark than others. The colouring matter of the hair is also wanting in A., so that their hair is white. All these differences are of course more striking in the darker varieties of the species, and most of all in the negro albinos.

Albinoism is always born with the individual, and occurs not only in men, but also in other mammalia, in birds, and probably in insects. It is not improbable that the peculiarity may, to some extent, be hereditary. The opinion that A. are distinguished from other men by weakness of body and mind, is completely refuted by facts.

ALBION is the most ancient name on record of the island of Great Britain. See ALBANY or ALBAINN.

ALBOIN, the founder of the Lombard dominion in Italy, succeeded his father in 561 A. D., as king of the Lombards, who were at that time settled in Pannonia. His thirst for action first vented itself in aiding Narses against the Ostrogoths; and afterwards, in a war with the Gepidæ, whom he, in conjunction with the Avari, defeated in a great battle (566), slaying their king Cunimond with his own hand. On the death of his first wife, Klodoswinda, he married Rosamond, daughter of Cunimond, who was his prisoner. Some of his warriors, who had accompanied Narses into Italy, brought back reports of the beauties and riches of the country. This determined A., in 568, to enter Italy with his own nation of Lombards, the remains of the Gepidæ, and 20,000 Saxons. He soon overran and subdued the north of the country as far as the Tiber, fixing his principal residence at Pavia—which long continued to be the capital of the Lombards; when his barbarity cost him his life. During a feast at Verona, he made his queen drink out of the skull of her father, which he had converted into a wine-cup. In revenge, she incited her paramour to murder her husband, who fell 574. Strangely enough, A. was a just and beneficent ruler. He was beloved by his subjects, whom he stimulated into that vital activity that characterised their descendants for ages. For several centuries, his name continued to be illustrious among the German nations, who celebrated his praises in martial songs. To escape the fury of the Lombards, Rosamond fled with her associate and the treasure to Longinus, the exarch, at Ravenna. Longinus becoming a suitor for her hand, she administered poison to Helmichis, her paramour, who, discovering the treachery, caused her to swallow the remainder of the cup, and die with him.

ALBORNOZ, ÆGGIDIUS ALVAREZ CARILLO, a warlike prelate of the middle ages, was born at Cuenca. He studied at Toulouse, and subsequently became almoner to Alfonso XI., king of Castile, who appointed him Archdeacon of Calatrava, and finally Archbishop of Toledo. He took part in the wars against the Moors, saved the life of the king in the battle at Tarifa, and was present at the siege of Algeciras, where the king dubbed him knight. On account of the Christian boldness with which he denounced the criminal excesses of Peter the Cruel, he fell into disgrace, and had to flee to Pope Clement VI., at Avignon, who made him a cardinal. Innocent VII. also recognised his political talents, and sent him as cardinal-legate to Rome, where, by his tact and vigour, he secured, in spite of the intricate complication of affairs, the restoration of the papal authority in the States of the Church (1353—62). Pope Urban V. owed the recovery of his dominions to him, and out of gratitude, appointed him legate at Bologna, in 1367. In the same year he died at Viterbo, but

expressing a wish to be buried at Toledo, almost royal honours were rendered to his dead body by the Spanish monarch, Henry of Castile; and Urban even granted an indulgence to all who had assisted in the transference of his remains from Viterbo to Toledo. He left a valuable work upon the constitution of the Romish Church, printed for the first time at Jesi in 1473, and now very rare.

ALBUERA, in the Spanish province of Estremadura, an insignificant hamlet, famous for the battle of May 16, 1811, between the combined English, Spanish, and Portuguese forces under General Beresford; and the French under Marshal Soult, who were scarcely so numerous, but had abundant artillery. The object of the latter was to compel the English to raise the siege of Badajoz. The result was, that Soult was obliged to retreat to Seville, with the loss of 9000 men; the loss of the allied forces was about 7000. In proportion to the numbers engaged, the battle was the most sanguinary in the whole contest. The French had at first got possession of a height which commanded the whole position of the allied army, but they were driven from it by 6000 British, only 1500 of whom reached the top unwounded.

ALBUFERA (an Arabic word meaning 'The Lake'), a lake near Valencia, in Spain, about 10 miles in length and the same in breadth, divided from the sea by a narrow tongue of land; a canal connects it with the city of Valencia. It is rich in fish and fowl, and is said to have been excavated by the Moors. From it, Marshal Suchet (q.v.) took the title of Duke.

ALBUM, amongst the Romans, was a white tablet overlaid with gypsum, on which were written the *Annales Maximi* of the pontifex, edicts of the pretor, and rules relative to civil matters. It was so called, either because it was composed of a white material, or because the letters used were of that colour. To tamper with the names written on an A. was regarded by the Romans as a serious offence, and involved a severe penalty. In the middle ages, the word was used to denote any list, catalogue, or register, whether of saints, soldiers, or civil functionaries. In the gymnasia and universities on the continent, the list of the names of the members is called the A. The name is also applied to the 'black board' on which public notifications of lectures, &c., are written up. But its popular signification in modern times is that of a blank book of ornamental exterior fitted for a drawing-room table, and intended to receive fugitive pieces of verse, or the signatures of distinguished persons, or sometimes merely drawings, prints, marine plants, &c.

ALBUMEN is an organic compound, found both in animal and vegetable substances. It forms the chief ingredient in the white of egg, and abounds in the blood and chyle, and more or less in all the serous fluids of the animal body; it also exists in the sap of vegetables, and in their seeds and other edible parts. A. forms the starting-point of animal tissues, for in an egg during incubation all the parts of the chick are formed out of it. The organised substances, fibrine and caseine, have a chemical composition similar to A.; and hence, along with A., they are called albuminous compounds. A. may be considered the raw material of fibrine, and fibrine as animalised A.

The chief component elements of A. are carbon, hydrogen, nitrogen, and oxygen, with small proportions of phosphorus and sulphur. It is believed to be a definite chemical compound, though the exact proportions and the rational formula have not been definitely ascertained. Carbon forms about 54 per cent. of it; nitrogen, 16; and sulphur, 2. It

is the sulphur of the A. that blackens silver when brought in contact with eggs, and the smell of rotten eggs arises from the formation of sulphuretted hydrogen during the decomposition.

A. is soluble in water, and in such a state of solution is found in the egg, the juice of flesh, the serum of blood, and the juice of vegetables; but when heated from 140 to 160° it coagulates, and is no longer soluble in water. With bichloride of mercury (corrosive sublimate), sulphate of copper (blue vitriol), acetate of lead (sugar of lead), nitrate of silver (lunar caustic), it forms insoluble compounds, and is therefore used as an antidote to these poisons. The property of coagulating with heat adapts A. for the purpose of clarifying in sugar-refining and other processes. The A. is added to the liquid in the cold state, allowed to mix thoroughly therein, and then, when heated, it coagulates, entangling and separating all the impurities suspended in the liquid. A. is likewise coagulated by the majority of the mineral acids, but not by acetic acid. Alcohol, ether, creasote, and tannic acid likewise cause the coagulation of A., and hence the efficacy of these substances, especially the two latter, in coagulating and thereby killing the nerves which cause so much pain in toothache. The importance of A. as an article of diet, will be discussed under Food.

ALBUMEN, in Botany, a store of nutritive matter, distinct from the embryo, but enclosed along with it within the integuments of the seed. It is also known by the names *Perisperm* and *Endosperm*. When a seed has a store of A. separate from the embryo, it is said to be *albuminous* or *perispermic*. When the nutritive matter is stored up in the cotyledons or lobes of the seed itself, as in the bean, pea, wall-flower, &c., the seed is said to be *exalbuminous* or *aperispermic*. In these the A., as a distinct part of the seed, is wanting, and the entire seed consists of embryo and integument. When the A. is present, it is sometimes very small, as in the nettle; in other instances, on the contrary, it is very much larger than the embryo, as in the cocoa-nut, of which it forms the edible part. It is also the edible or useful part of many other seeds—as in the different kinds of corn—and in coffee, nutmeg, &c. It is sometimes *mealy* or *farinaceous*, as in the cereals; *oily*, as in the poppy; *horny*, as in coffee; *cartilaginous*, as in the cocoa-nut; *mucilaginous*, as in the mallow. Vegetable ivory is the A. of a palm (genus *Phytelphas*) which grows on the banks of the Magdalena, and is used in place of ivory. The presence or absence, and various peculiarities of A., afford botanical characters of great value. The A. appears to be a store provided for the nourishment of the embryo, and consists of starchy, oily, and albuminous matter. *Vegetable A.*, in a chemical sense, exists, and often in large quantity, even in seeds, which, according to the language of descriptive botany, are exalbuminous or destitute of A.; and to prevent confusion, *perisperm* has begun to be employed as the botanical term; but it is not yet in general use.

ALBUQUERQUE, ALFONSO THE GREAT, viceroy of the Indies, and also called the Portuguese Mars, was born, in 1453, near Alhambra, a town not far from Lisbon, of a family of the royal blood of Portugal. In that age, the Portuguese people were distinguished for heroism and a spirit of adventure. They had discovered and subjugated a great part of the western coast of Africa, and were beginning to extend their dominion over the seas and the people of India. A. being appointed viceroy of these new possessions, landed on the coast of Malabar on September 26, 1503, with a fleet and some troops; conquered Goa, which he made the seat

of the Portuguese government, and the centre of its Asiatic commerce; and afterwards the whole of Malabar, Ceylon, the Sunda Isles, the peninsula of Malacca, and (in 1515) the island of Ormuz at the entrance of the Persian Gulf. When the king of Persia sent for the tribute which the princes of this island had formerly rendered to him, A. presented bullets and swords to the ambassador, saying: 'This is the coin with which Portugal pays her tribute.' He made the Portuguese name profoundly respected among the princes and people of the East; and many of them, especially the kings of Siam and Pegu, sought his alliance and protection. All his undertakings bore the stamp of an extraordinary mind. He maintained strict military discipline, was active, far-seeing, wise, humane, and equitable, respected and feared by his neighbours, while beloved by his subjects. His virtues made such an impression on the Indian people, that long after his death, they resorted to his grave, to implore his protection against the misgovernment of his successors. Notwithstanding his valuable services, A. did not escape the envy of the courtiers and the suspicions of King Emmanuel, who appointed Lopez Soarez, a personal enemy of A., to supersede him as viceroy. This ingratitude affected him deeply. Ismaël, the shah of Persia, offered his assistance to resist the arbitrary decree of the Portuguese court; but A. would not violate his allegiance. A few days after, commending his son to the king in a short letter, he died at sea near Goa, December 16, 1515. Emmanuel honoured his memory by a long repentance, and raised his son to the highest dignities in the state. His life is well portrayed in the *Commentarios do Grande Alfonso de A.* (Lisbon, 1576 and 1774), published by his son Blasius.

ALBURNUM, or **SAP-WOOD**, in Botany, is that part of the wood of exogenous trees which is still imperfectly hardened, and, consisting of the woody layers most recently formed, is interposed between the bark (q. v.) and the heart-wood or duramen (q. v.). There is often a very marked division between it and the duramen, in trees whose age is such that the latter has been perfected. The A. differs from the duramen in having its tubes still open for the passage of fluids; and these tubes appear to be the vessels which chiefly serve for the ascent of the sap. (See **SAP**.) It gradually hardens, and is transformed into duramen, new layers being added externally. It is almost always of a white or very pale colour, whilst in many trees the duramen is highly coloured. The A. is pale even in ebony, in which the duramen is black. In general, the A. is much inferior in value to the hardened or perfected wood, and the different proportions which they bear to each other in the thickness of the stem, go far to determine the relative values of some kinds of trees. These proportions, however, are different not only in trees of different kinds, but even in trees of the same kind at different ages, and according as circumstances have been favourable or otherwise to rapidity of growth. When there is a great proportion of A., the wood dries slowly, and with difficulty, owing to the quantity of sap it contains.

ALCA and **ALCADE**. See **AVK**.

ALCÆUS, of Mitylene, one of the greatest lyric poets of Greece, flourished about the end of the 7th, or the beginning of the 6th c. B. C. His odes, in the Æolic dialect, are occupied with his grief for the dissensions of his country, his hatred of tyrants, his own misfortunes, and the sorrows of exile; while on other occasions he celebrates the praises of love and wine. He is said to have been

an admirer of Sappho, who was a contemporary. A. himself took part in the civil war, first as the coadjutor of Pittacus, but afterwards against him, when he proved tyrannical. Being banished from Mitylene, he endeavoured, at the head of the other exiles, to force his way back; but in this attempt he fell into the hands of Pittacus, who, however, granted him his life and freedom. He was the inventor of the form of verse which after him is called the Alcaic, and which Horace, the happiest of his imitators, transplanted into the Latin language. Of the ten books of A.'s odes, only fragments remain, which are collected in the *Cambridge Museum Criticum*, and in Bergk's *Poete Lyrici Græci* (Leip. 1843).

ALCALA' DE HENARES (*El Calat*, in Arabic, means 'the castle'), a town in Spain, in the province of New Castile, situated on the Henares, 22 miles from the capital, pop. 5300. It is built in the old style, and boasts of a university, which was founded by Cardinal Ximenes in 1510, and once enjoyed a world-wide fame, second to that of Salamanca alone. When Francis I. visited it, while a prisoner in Spain, he was welcomed by 11,000 students. The library contains the original of the celebrated polyglot Bible which was printed in this town, and called the Complutensian, from the ancient name of the place (Complutum). A. has, besides, a military academy, and a celebrated powder and leather factory. It is said to have been the birthplace of Cervantes, and various other distinguished persons. — There are several other towns in Spain which bear the name of **ALCALA**; as A. of Chisberte, in Valencia (pop. 6000); A. de Guadaira, near Seville (5200), and A. la Real, in Jaen (10,000), with superior wine, fruit, sheep, &c.

ALCALDE, a corruption of the Arabic *el-cadi*, 'the judge,' a word introduced by the Moors. It is still used in Spain as the general title of judicial and magisterial office, the special function being denoted by another term. Thus, there are *alcaldes de aldea*, village-justices; *alcaldes pedaneos*, justices of the peace; *alcaldes de corte*, judges of the court, &c.

ALCANTARA (*Al-kantarrah*, Arabic, 'the bridge'), the Norba Cesarea of the Romans, an old fortified Spanish town, built by the Moors in the province of Estremadura. The present population is about 4000. It was plundered by the French under General Lapisse in 1809. The bridge from which it takes its name was built for Trajan, 105 A. D. It consists of six arches, the two central ones with a span of 110 feet; the whole length is 670, and the height 210 feet. This remarkable structure was partially blown up by the English in 1812, and was again destroyed during the civil war of 1836; and though it might be easily repaired, it is left in a state of ruin, the lazy Spaniards being ferried over in a lumbering boat.

THE ORDER OF A. (formerly St Julian), one of the religious orders of Spanish knighthood, was founded (1156) as a military fraternity for the defence of Estremadura against the Moors. In 1197, Pope Celestine III. raised it to the rank of a religious order of knighthood; bestowed great privileges on it, and charged it with the defence of the Christian faith, and the maintenance of eternal war with the infidel. Alphonso IX., having taken the town of Alcantara,

Order of Alcantara.

ceded it in 1218 to the order of Calatrava (q. v.); but the knights of this order, unable to hold it along with their other great possessions, yielded it to the knights of St Julian, who transferred to it their seat, and henceforth were known by its name. At length the grand-mastership of the order was, by Pope Alexander VI., united to the Spanish crown in 1495. The order is still richly endowed. The knights, who follow the rule of St Benedict, take now only the vows of obedience and poverty, having, since 1540, been absolved from that of celibacy. A special vow binds them to defend the immaculate conception of the Virgin. At their nomination, they must prove four generations of nobility. For a time, the knights of A. acknowledged the superiority of the knights of Calatrava, but they were latterly absolved from it. Both the costume, however, and the cross are still the same, with the exception of the colour, which is green. The crest of the order is a peacock.

ALCEDO. See KINGFISHER.

ALCHEMILLA. See LADY'S MANTLE.

ALCHEMY is to modern chemistry what astrology is to astronomy, or legend to history. In the eye of the astrologer, a knowledge of the stars was valuable only as a means of foretelling, or even of influencing, future events. In like manner, the genuine alchemist toiled with his crucibles and alembics, calcining, subliming, distilling, not with a view to discover the chemical properties of substances, as we understand them, but with two grand objects, as illusory as those of the astrologer—to discover, namely, (1) *the secret of transmuting the baser metals into gold and silver*, and (2) *the means of indefinitely prolonging human life*.

Tradition points to Egypt as the birthplace of the science. Hermes Trismegistus (q. v.) is represented as the father of it; and the most probable etymology of the name is that which connects it with the most ancient and native name of Egypt, *Chemí* (the Scripture Cham or Ham). The Greeks and Romans under the Empire would seem to have become acquainted with it from the Egyptians; there is no reason to believe that, in early times, either people had the name or the thing. *Chemia* (Gr. *chemia*) occurs in the lexicon of Suidas, written in the 11th c., and is explained by him to be 'the conversion of silver and gold.' It is to the Arabs, from whom Europe got the name and the art, that we owe the prefixed article *al*. As if *chemia* had been a generic term embracing all common chemical operations, such as the decocting and compounding of ordinary drugs, the grand operation of transmutation was denominated the *chemia (al-chemy)*—the chemistry of chemistries. The Roman emperor Caligula is said to have instituted experiments for the producing of gold out of orpiment (sulphuret of arsenic); and in the time of Diocletian, the passion for this pursuit, conjoined with magical arts, had become so prevalent in the empire, that that emperor is said to have ordered all Egyptian works treating of the chemistry of gold and silver to be burnt. For at that time, multitudes of books on this art were appearing, written by Alexandrine monks and by hermits, but bearing famous names of antiquity, such as Democritus, Pythagoras, and Hermes.

At a later period, the Arabs took up the art; and it is to them that European A. is directly traceable. The school of polypharmacy, as it has been called, flourished in Arabia during the kalifates of the Abbassides. The earliest work of this school now known is the *Summa Perfectionis*, or 'Summit of Perfection,' composed by Gebir (q. v.) in the 8th c.; it is consequently the oldest book on chemistry proper in the world. It contains so much of what

sounds very much like jargon in our ears, that Dr Johnson ascribes the origin of the word 'glibberish' to the name of the compiler. Yet when viewed in its true light, it is a wonderful performance. It is a kind of text-book, or collection of all that was then known and believed. It appears that these Arabian polypharmists had long been engaged in firing and boiling, dissolving and precipitating, subliming and coagulating chemical substances. They worked with gold and mercury, arsenic and sulphur, salts and acids; and had, in short, become familiar with a large range of what are now called chemicals. Gebir taught that there are three elemental chemicals—mercury, sulphur, and arsenic. These substances, especially the first two, seem to have fascinated the thoughts of the alchemists by their potent and penetrating qualities. They saw mercury dissolve gold, the most incorruptible of matters, as water dissolves sugar; and a stick of sulphur presented to hot iron penetrates it like a spirit, and makes it run down in a shower of solid drops, a new and remarkable substance, possessed of properties belonging neither to iron nor to sulphur. The Arabians held that the metals are compound bodies, made up of mercury and sulphur in different proportions. With these very excusable errors in theory, they were genuine practical chemists. They toiled away at the art of making 'many medicines' (polypharmacy) out of the various mixtures and reactions of such chemicals as they knew. They had their pestles and mortars, their crucibles and furnaces, their alembics and aludels, their vessels for infusion, for decoction, for cohabitation, sublimation, fixation, lixiviation, filtration, coagulation, &c. Their scientific creed was transmutation, and their methods were mostly blind gropings; and yet, in this way, they found out many a new body, and invented many a useful process.

From the Arabs, A. found its way through Spain into Europe, and speedily became entangled with the fantastic subtleties of the scholastic philosophy. In the middle ages, it was chiefly the monks that occupied themselves with A. Pope John XXII. took great delight in it, though it was afterwards forbidden by his successor. The earliest authentic works on European A. now extant are those of Roger Bacon (b. 1214, d. 1294) and Albertus Magnus (b. 1205, d. 1280). Roger Bacon (q. v.) appears rather the earlier of the two as a writer, and is really the greatest man in all the school. He was acquainted with gunpowder. Although he condemns magic, necromancy, charms, and all such things, he believes in the convertibility of the inferior metals into gold, but does not profess to have ever effected the conversion. He had more faith in the elixir of life than in gold-making. He followed Gebir in regarding potable gold—that is, gold dissolved in nitro-hydrochloric acid or *agua regia*—as the elixir of life. Urging it on the attention of Pope Nicholas IV., he informs his Holiness of an old man who found some yellow liquor (the solution of gold is yellow) in a golden phial, when plunging one day in Sicily. Supposing it to be dew, he drank it off. He was thereupon transformed into a hale, robust, and highly accomplished youth. Bacon no doubt took many a dose of this golden water himself.—Albertus Magnus (q. v.) had a great mastery of the practical chemistry of his times; he was acquainted with alum, caustic alkali, and the purification of the royal metals by means of lead. In addition to the sulphur-and-mercury theory of the metals, drawn from Gebir, he regarded the element water as still nearer the soul of nature than either of these bodies. He appears, indeed, to have thought it the primary matter, or the radical source of all things—an opinion held by Thales, the father of Greek

speculation.—Thomas Aquinas (q.v.) also wrote on A., and was the first to employ the word *amalgam* (q.v.).—Raymond Lully (q.v.) is another great name in the annals of A. His writings are much more disfigured by unintelligible jargon than those of Bacon and Albertus Magnus. He was the first to introduce the use of chemical symbols (q.v.), his system consisting of a scheme of arbitrary hieroglyphics. He made much of the spirit of wine (the art of distilling spirits would seem to have been then recent), imposing on it the name of *aqua vite ardens*. In his enthusiasm, he pronounced it the very elixir of life. One of the most celebrated of the alchemists was Basil Valentine (q.v.), (b. 1304), who introduced antimony into medical use. He, along with some previous alchemists, regarded salt, sulphur, and mercury as the three bodies contained in the metals. He inferred that the philosopher's-stone must be the same sort of combination—a compound, namely, of salt, sulphur, and mercury; so pure, that its projection on the baser metals should be able to work them up into greater and greater purity, bringing them at last to the state of silver and gold. His practical knowledge was great; he knew how to precipitate iron from solution by potash, and many similar processes, so that he is ranked as the founder of analytical chemistry.

But more famous than all was Paracelsus (q.v.), in whom alchemy proper may be said to have culminated. He held, with Basil Valentine, that the elements of compound bodies were salt, sulphur, and mercury—representing respectively earth, air, and water, fire being already regarded as an impalpable—but these substances were in his system purely representative. All kinds of matter were reducible under one or other of these typical forms; everything was either a salt, a sulphur, or a mercury, or, like the metals, it was a 'mixt' or compound. There was one element, however, common to the four; a fifth essence or 'quintessence' of creation; an unknown and only true element, of which the four generic principles were nothing but derivative forms or embodiments: in other words, he inculcated the dogma, that there is only one real elementary matter—nobody knows what. This one prime element of things he appears to have considered to be the universal solvent of which the alchemists were in quest, and to express which he introduced the term *alcahest*—a word of unknown etymology, but supposed by some to be composed of the two German words *alle geist*, 'all spirit.' He seems to have had the notion, that if this quintessence or fifth element could be got at, it would prove to be at once the philosopher's-stone, the universal medicine, and the irresistible solvent.

After Paracelsus, the alchemists of Europe became divided into two classes. The one class was composed of men of diligence and sense, who devoted themselves to the discovery of new compounds and re-actions—practical workers and observers of facts, and the legitimate ancestors of the positive chemists of the era of Lavoisier. The other class took up the visionary, fantastical side of the older alchemy, and carried it to a degree of extravagance before unknown. Instead of useful work, they compiled mystical trash into books, and fathered them on Hermes, Aristotle, Albertus Magnus, Paracelsus, and other really great men. Their language is a farrago of mystical metaphors, full of 'red bridegrooms' and 'lily brides,' 'green dragons,' 'ruby lions,' 'royal baths,' 'waters of life.' The seven metals correspond with the seven planets, the seven cosmical angels, and the seven openings of the head—the eyes, the ears, the nostrils, and the mouth. Silver was Diana, gold was Apollo, iron was Mars, tin was Jupiter, lead was Saturn, and so forth.

They talk for ever of the powder of attraction, which drew all men and women after the possessor; of the alcahest, and the grand elixir, which was to confer immortal youth upon the student who should approve himself pure and brave enough to kiss and quaff the golden draught. There was the great mystery, the mother of the elements, the grandmother of the stars. There was the *philosopher's-stone*, and there was the *philosophical-stone*. The philosophical-stone was younger than the elements, yet at her virgin touch the grossest calx (ore) among them all would bluish before her into perfect gold. The philosopher's-stone, on the other hand, was the first-born of nature, and older than the king of metals. Those who had attained full insight into the arcana of the science were styled Wise; those who were only striving after the light were Philosophers; while the ordinary practisers of the art were called Adepts. It was these visionaries that formed themselves into Rosicrucian Societies and other secret associations. It was also in connection with this mock-A., mixed up with astrology and magic, that quackery and imposture so abounded, as is depicted by Scott in the character of Dousterswivel in the *Antiquary*. Designing knaves would, for instance, make up large nails, half of iron and half of gold, and laquer them, so that they appeared common nails; and when their credulous and avaricious dupes saw them extract from what seemed plain iron an ingot of gold, they were ready to advance any sum that the knaves pretended to be necessary for pursuing the process on a large scale. It is from this degenerate and effete school that the prevailing notion of A. is derived—a notion which is unjust to the really meritorious alchemists who paved the way for genuine chemistry.

It is interesting to observe that the leading tenet in the alchemists' creed—namely, the doctrine of the transmutability of other metals into gold and silver—a doctrine which it was at one time thought that modern chemistry had utterly exploded—receives not a little countenance from a variety of facts every day coming to light. The multitude of phenomena known to chemists under the name of *Allotropy* (q.v.), are leading speculative men more and more to the opinion that many substances hitherto considered chemically distinct, are only the same substance under some different condition or arrangement of its component molecules, and that the number of really distinct elements may be very few indeed. See Kopp's *Geschichte der Chemie*, also *Alchemy and the Alchemists*, by Dr Samuel Brown, in Chambers's *Papers for the People* (No. 66), from which the above sketch is chiefly condensed.

ALCIBIADES, a son of Clinias and Dinomache, born at Athens, 450 B.C. He lost his father in the battle of Chæronea; and was in consequence educated in the house of Pericles, his uncle. In his youth he gave evidence of his future greatness, excelling both in mental and bodily exercises. His handsome person, his distinguished parentage, and the high position of Pericles, procured him a multitude of friends and admirers. Socrates was one of the former, and gained considerable influence over him; but was unable to restrain his love of luxury and dissipation, which found ample means of gratification in the wealth that accrued to him by his union with Hipparete, the daughter of Hipponeus. His public displays, especially at the Olympic games, were incredibly expensive. He bore arms for the first time in the expedition against Potidæa (432 B.C.) where he was wounded, and where his life was saved by Socrates—a debt which he liquidated eight years after at the battle of Delium, by saving,

in his turn, the life of the philosopher; but he seems to have taken no part in political matters till after the death of the demagogue Cleon, when Nicias brought about a treaty of peace for fifty years between the Athenians and Lacedæmonians. A., jealous of the esteem in which Nicias was held, persuaded the Athenians to ally themselves with the people of Argos, Elis, and Mantinea, and did all in his power to stir up afresh their old antipathy to Sparta. It was at his suggestion that they engaged in the celebrated enterprise against Sicily, to the command of which he was elected, along with Nicias and Lamachus. But while preparations were being made, it happened during one night that all the statues of Mercury in Athens were mutilated. The enemies of A. threw the blame of this mischief upon him, but postponed the impeachment till he had set sail, when they stirred up the people against him to such a degree, that he was recalled, in order to stand his trial. On his way home, he landed at Thurii, fled, and betook himself to Sparta, where, by conforming to the strict manners of the people, he soon became a favourite. He induced the Lacedæmonians to send assistance to the Syracusans, persuaded them to form an alliance with the king of Persia, and after the unfortunate issue of the Athenian expedition in Sicily, to support the people of Chios in their endeavours to throw off the yoke of Athens. He went thither himself, and raised all Ionia in revolt against that city. But Agis and the other leading men in Sparta, jealous of the success of A., ordered their generals in Asia to have him assassinated. A. discovered this plan, and fled to Tissaphernes, a Persian satrap, who had orders to act in concert with the Lacedæmonians. He now resumed his old manners, adopted the luxurious habits of Asia, and made himself indispensable to Tissaphernes. He represented to the latter that it was contrary to the interests of Persia entirely to disable the Athenians. He then sent word to the commanders of the Athenian forces at Samos that he would procure for them the friendship of the satrap if they would control the extravagance of the people, and commit the government to an oligarchy. This offer was accepted, and Pisander was sent to Athens, where he got the supreme power vested in a council of 400 persons. When it appeared, however, that this council had no intention of recalling A., the army at Samos chose him as their commander, desiring him to lead them on instantly to Athens, and overthrow the tyrants. But A. did not wish to return to his native country till he had rendered it some service, and he accordingly attacked and defeated the Lacedæmonians both by sea and land. Tissaphernes now ordered him to be arrested at Sardis on his return, the satrap not wishing the king to imagine that he had been accessory to his doings. But A. found means to escape; placed himself again at the head of the army; beat the Lacedæmonians and Persians at Cyzicus; took Cyzicus, Chalcedon, and Byzantium; restored to the Athenians the dominion of the sea; and then returned to his country (407 B.C.), to which he had been formally invited. He was received with general enthusiasm, as the Athenians attributed to his banishment all the misfortunes that had befallen them.

The triumph of A., however, was not destined to last. He was again sent to Asia with 100 ships; but not being supplied with money for the soldiers' pay, he was obliged to seek assistance at Caria, where he transferred the command in the meantime to Antiochus, who, being lured into an ambuscade by Lysander, lost his life and part of the ships. The enemies of A. took advantage of this to accuse him and appoint another commander. A. went to

Thrace, where he lived in voluntary exile in Pactyæ, one of the castles which he had built out of his earlier spoils. But being threatened here with the power of Lacedæmonia, he removed to Bithynia, with the intention of repairing to Artaxerxes, to gain him over to the interests of his country. At the request of the Thirty Tyrants of Athens, and with the concurrence of the Spartans, Pharnabazus, a satrap of Artaxerxes, received orders to put A. to death. He was living at this time in a castle in Phrygia; Pharnabazus ordered it to be set on fire during the night, and as his victim was endeavouring to escape from the flames, he was pierced with a volley of arrows. Thus perished A. (404 B.C.), about the forty-fifth year of his age. He was singularly endowed by nature, being possessed of the most fascinating eloquence (although he could not articulate the letter *r*, and stuttered in his speech), and having in a rare degree the talent to win and to govern men. Yet in all his transactions, he allowed himself to be directed by external circumstances, without having any fixed principles of conduct. On the other hand, he possessed that boldness which arises from conscious superiority, and shrunk from no difficulty, because he was never doubtful concerning the means by which an end might be attained. His life has been written by Plutarch and Cornélius Nepos.

ALCMAN, an ancient lyric poet, was born at Sardis, the capital of Lydia, in Asia Minor, but lived first as a slave, and afterwards as a freeman in Sparta. He is the earliest erotic poet, and is said to have introduced some new metrical forms called *Alcmanica metra*. He composed in the Doric dialect a poem on the Dioscuri, Parthenia, or songs sung by choruses of virgins, bridal-hymns, verses in praise of love and wine, &c. We possess only a few fragments of A., nor do these justify the high opinion entertained of his merits by the ancients, though some of them exhibit considerable beauty. A. died of a loathsome disease (*morbus pedicularis*).

ALCO, a variety of dog, domesticated in Mexico and Peru before the discovery of America by Europeans, and also found in a wild state in these countries. But whether it is originally a native of them, or has escaped from domestication, is uncertain, nor is the variety well known to naturalists. It is described as having a very small head and pendulous ears: the latter being in dogs one of the ordinary results of domestication. Humboldt supposed it to be allied to the shepherd's dog. It has been attempted to elevate it into a species under the name of *Canis A.* It is not improbable that the name A. was given to more varieties than one.

ALCOHOL is a limpid, colourless liquid, of a hot pungent taste, and having a slight but agreeable smell. It is the characteristic ingredient of fermented drinks, and gives them their intoxicating quality. Looking at the extraordinary consumption of these liquors, and to the extensive application of A. for other purposes, it becomes one of the most important substances produced by art.

There is only one source of A.—namely, the fermentation of sugar or other saccharine matter. Sugar is the produce of the vegetable world. Some plants contain free sugar, and still more contain starch, which can be converted into sugar. The best vegetable substances, then, for yielding A. are those that contain the greatest abundance of sugar or of starch. See DIASTASE, FERMENTATION, and DISTILLATION.

Owing to the attraction of A. for water, it is impossible to procure pure A. by distillation alone. Common spirits, such as brandy, whisky, &c., contain 50 or 52 per cent. of A.; in other words, they are about half A., half water. *Proof-spirit*, which is the

standard by means of which all mixtures of A. and water are judged, contains 57.27 per cent. by volume, and 49.50 per cent. by weight of A. The specific gravity of proof-spirit is 918.6; and when a spirit is called *above proof*, it denotes that it contains an excess of A.; thus, *spirit of wine*, or rectified spirit, with specific gravity 838, is 54 to 58 overproof, and requires 51 to 58 per cent. of water to be added to it, to bring the strength down to that of proof-spirit; whilst the term *under-proof* has reference to a less strong spirit than the standard. See **AREOMETER**. The most primitive method of learning the strength of A. was to drench gunpowder with it, set fire to the spirit, and if it inflamed the gunpowder as it died out, then the A. stood the test or proof, and was called proof-spirit. The highest concentration possible by distillation gives 90 per cent. of A., still leaving 10 per cent. of water. In order to remove this, fused chloride of calcium, quicklime, or fused carbonate of potash, is added to the alcoholic liquid, the whole allowed to stand for twelve hours, and then the spirit may be distilled off quite free from water. Spirit of wine may also be deprived of its remaining water by suspending it in a bladder in a warm place; the bladder allows much of the water to pass through and evaporate, but little of the A. The latter method is called Soemmering's process, and depends on the different degrees of rapidity with which the bladder admits of water and A. passing through it. Thus, introduce into one bladder eight ounces of water, and into a second, eight ounces of A., and allow both bladders to be similarly exposed on a sandbath, till all the water has evaporated through the pores of the membrane, which will be accomplished in about four days, and it will then be observed, that whilst eight ounces water have made their exit from the bladder, that only one ounce of A. has thus evaporated, and seven ounces still remain in the bladder. This experiment explains why smugglers, a few generations ago, could supply a whisky which was stronger, and hence esteemed preferable, as they carried the whisky in bladders around their persons, and the water escaping therefrom in much greater proportion than the A., a stronger spirit was left.

A. is used medicinally, both internally and externally. The more common form for internal use is brandy, and is that generally recommended by physicians. As a *stomachic stimulant*, A. is used in sea-sickness and indigestion. As a *stimulant and restorative*, it is employed with advantage in the later stages of fever. It is also employed internally as a *powerful excitant* to prevent fainting during operations, and to assist in restoration in cases of suspended animation. In cases of diarrhoea, unaccompanied by inflammation, it is often of great benefit. Externally, A. is applied to stop hemorrhage, to harden the cuticle over tender parts, as the nipples of females for some time before delivery, and to feet which have been blistered from long walking or tight-fitting shoes.

Absolute or anhydrous A. has a specific gravity of 793 at the temperature of 60°. It boils at 173°, and has not been frozen by any cold hitherto produced. Reduced to a temperature of -130°, A. becomes of an oily and greasy consistence; at -146°, it assumes the aspect of melted wax; and at -166°, it gets still thicker, but does not congeal at the lowest attainable temperature. This property of non-freezing at any degree of cold to which the earth is subjected, has led to the employment of A. coloured red by cochineal, in the thermometers sent out to the Arctic regions. It acts as a poison by abstracting the water from the parts it touches. It is highly inflammable; its combustion yielding only

carbonic acid and water. When mixed with water, heat is evolved, and a condensation takes place. The formula of A. is C_2H_6O . In 100 pounds, therefore, of A., about 53 are carbon, 13 hydrogen, and 34 oxygen. Besides the A. consumed in wine, beer, and spirits, it is much employed in pharmacy and in the arts. It is a powerful solvent for resins and oils; and hence is employed in the preparation of varnishes. In Germany, a cheap spirit made from potatoes is much used for cooking on a small scale. See **METHYLATED SPIRIT**.—The use and abuse of alcoholic drinks will be considered under **FOOD AND DRINK**, and **TEMPERANCE**.

ALCOHOLOMETRY is the process of estimating the percentage of absolute alcohol in a sample of spirits. See **AREOMETER**.

ALCORAN. See **KORAN**.

ALCOVE (Spanish, *alcoba*, which is derived from the Arabic, *El-kauf*, a tent), an architectural term, denoting a sort of niche or recess in a chamber where one may recline, or where a bed may be placed. An A. is either hung with curtains or closed with doors during the day. It was known to the ancients, and at one time very common in France, when the immoderate size of the apartments rendered it absolutely necessary as a preventive against the cold during sleep. It is no longer fashionable, the most eminent physicians having declared it to be prejudicial to health.

ALCOY, a town in the province of Valencia, Spain, about 24 miles north-west of Alicante. It is 'built in a funnel of the hills, on a tongue of land hemmed in by two streams, with bridges and arched viaducts.' The old, quaint-looking houses hang picturesquely over the terraced gardens and ravines. The walls of A. are of clay, and suffered considerable damage during the last war; but the town contains some new edifices, and has numerous manufactories. 'Here is made the *papel de hilo*, the book *Librito de fumar*, which forms the entire domino library of nine-tenths of Spaniards, and with which they make their *papelitos*, or little paper-cigars.' 200,000 reams are annually made, of which 10,000 are used for writing, 10,000 for packing, and 180,000 for the paper-cigars! A. is also famous for its sugar-plums. It has a parish church, schools, consistory, town-hall, poor asylum, public granary, &c. Pop. 27,000.

ALCUDIA, MANUEL DE GODOY, DUKE OF, known as the Prince of Peace, was born at Badajos, in Spain, 12th of May 1767. Poor, but handsome and musical, at the age of twenty, he entered the king's body-guard at Madrid, and soon became a favourite of the weak Charles IV., as well as of his queen. Honours and emoluments flowed in rapidly. In 1801, he led the Spanish army against the Portuguese, and signed the treaty of Badajos. In 1804, he was made generalissimo of the Spanish forces on sea and land, and invested with unlimited power. The alliance of Spain with France, and the war with England which ensued, in spite of the sums paid by Spain to secure neutrality, the defeat of Trafalgar, and consequent check to commerce—all tended to exasperate the public mind, and a court-party was formed against him, with the Prince of Asturias at its head. A. now resolved to shake off the French alliance, and to treat secretly with the Lisbon court. But however cautiously taken, his warlike measures reached the ears of Napoleon, and determined him to carry out his project of dethroning the Bourbons. Meanwhile, the people had been further exasperated against the favourite by his unprincipled accusations against the Prince of Asturias; and when, in 1808, Charles abdicated in favour of his son, the duke's life was only saved by the promise of his trial.

This trial, however, never took place. Napoleon, who knew his influence over the minds of their Spanish majesties, had him liberated, and brought to Bayonne, where he instigated all measures taken by the ex-king and queen, retaining their favour till their death. After his fall, he lived chiefly in France. In 1808, his income had been estimated at five million piastres. After the revolution of 1830, we find him subsisting in Paris upon a small pension bestowed by Louis-Philippe. In 1847, his return to Spain was permitted, and his titles, together with great part of his wealth, restored. He died at Paris, 4th October 1851.

ALCUIN, or FLACCUS ALBINUS, the most distinguished scholar of the 8th c., the confidant and adviser of Charlemagne, was born at York about the year 735. He was educated under the care of Archbishop Egbert, and his relative, Aelbert, and succeeded the latter as master of the School of York. Charlemagne became acquainted with him at Parma, as he was returning from Rome, whither he had gone to bring home the *pallium* for a friend; and in the year 782, this monarch invited him to his court, and availed himself of his assistance in his endeavours to civilise his subjects. A. became the preceptor of Charlemagne himself, whom he instructed in the various sciences. To render his instructions more available, Charlemagne established at his court a school called *Schola Palatina*, the superintendence of which, as well as of several monasteries, was committed to him. In the learned society of the court, A. went by the name of Flaccus Albinus. Most of the schools in France were either founded or improved by him. Among others, he founded the school in the Abbey of St Martin, in Tours (796), taking as his model the School of York; and in this school he himself taught after his retirement from court (801). While living at Tours, he frequently corresponded with Charlemagne. At his death, in 804, he left, besides numerous theological writings, a number of elementary works on philosophy, mathematics, rhetoric, and philology; also poems, and a great number of letters. His letters, while they betray the uncultivated character of the age generally, shew A. to have been the most accomplished man of his time. He understood Latin, Greek, and Hebrew. The most complete edition of his works appeared at Ratisbon in 1777. See the life of A. by Lorenz (Halle, 1829), translated into English (Lond. 1837).

ALCYONIUM, a genus of Zoophytes, the type of a family called *Alcyonidae*, belonging to the class

polypes. *A. digitatum* is extremely common on the British shores, on stones, old shells, &c., in deep water. It sometimes appears as a mere crust, about the eighth of an inch in thickness, but commonly rises up in rounded cones, and often assumes forms which have procured for it the popular name of *Dead Man's Fingers*, and other similar appellations. The polype-mass is gelatinous within, and covered with a sort of leathery skin, the mass being traversed by a multitude of minute canals, terminating on the outer surface in starlike figures, which, if the whole is placed in sea-water, are seen to project considerably from the surface, and appear as polypes with eight tentacula or feelers; so that what seems to be a disgusting fleshy mass in the fisherman's net, proves to be, when placed in its proper element, a structure of wonderful beauty and full of animal life, existing under peculiar and wonderful conditions. The manner in which the polypes protrude and retract themselves, has been likened to that in which the horns of a snail are protruded and retracted. Their tentacula are short, obtuse, and elegantly fringed at the margins. The external part of the body of the polype is a membrane so transparent, that by the employment of a magnifying-glass the whole internal structure can be seen through it. See fig. 3, b.

3. *Alcyonium digitatum* :

b, the polype fully protruded, magnified; c, the polype partially protruded, magnified.

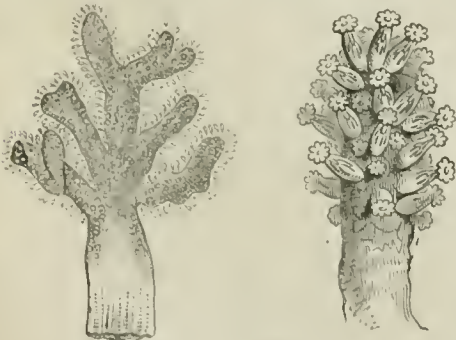

This delicate membrane, however, is composed of two very thin membranes, intimately united, the outer of which increases in thickness at the base of the polype, coalesces with that of adjacent polypes, and is continuous with the common leathery skin of the polype-mass. The inner membrane retains its extreme delicacy throughout; it extends into and lines the cell of the polype (see fig. 4) and the tube or canal which proceeds from the cell into the mass, and is thus also continuous with the corresponding membranes of other polypes; for the canals divide into branches in their course from the base of the polype-mass to the surface, and the intimacy of union in the whole is increased

by a fine tubular network which occupies the spaces between the principal canals. If a portion of an *A.* is irritated, not only the particular polypes immediately subjected to irritation retract themselves as to withdraw from danger, but the gradual collapse

Anthozoa, and order *Asteroida*, and consisting of a polype-mass with starlike pores and protrusive

and contraction of the whole polype-mass shews that the irritation has been felt through it all. The contraction of the mass is owing to a discharge of water, which the polypes, when protruded, imbibe, and which circulates through and distends the polype-mass, so that when the polypes are undisturbed, and in full activity, it has twice or three times the size which it has as we find it cast out upon the beach. The stomach of each polype is cylindrical (as may be seen in fig. 3, *b*, immediately under the oval disk or expanded tentacula), and beneath it is a comparatively large cavity, into which hang loosely (as may also be seen in the figure just referred to) eight twisted filaments or threads, the use of which is not well ascertained, and has been the subject of very different opinions among naturalists. In the gelatinous substance of the polype-mass, which fills the interstices of the tubular net-work, numerous crystalline calcareous spicula lie immersed, like the *raphides* (q. v.) found in the intercellular passages of some plants. They are toothed on the sides, but are of various forms, and have no organic connection with any part of the animal structure; their only use apparently being to impart some degree of strength to the whole. These spicula are of general occurrence in zoophytes of this order, and are secreted by the common skin of the polype-mass. The polype-mass increases by *gemme* or buds, which grow into new branches; but the propagation of the species takes place by *ova* or eggs, which first appear as minute smooth warts on the membrane of the canals in the interior. The constriction of the neck, by which they grow, separates them from the parent membrane, and they move through the canal by means of very minute vibrating cilia or hairs with which they are furnished, until they reach the stomach of a polype, into which they enter, and through which they more slowly proceed till at last they are ejected by the mouth (the only opening), and committed to the waves and tides. The ova seem as if capable of feeling whilst within the parent mass, and may be observed to move backwards and forwards, and to contract their sides as if by voluntary action in their passage through the body of the polype. These wonderful phenomena of nature are the more easily observed, because the ova are of a deep vermilion colour, beautifully contrasting with the pure white of the polype, through the tunic of which they are seen.—One of the most remarkable known species of *A.*, and the largest, is that called *A. poculum* or Neptune's Cap, which was discovered by Sir Stamford Raffles upon the coral-reefs of Sumatra, and is found in the neighbourhood of Singapore. It grows erect, sometimes attaining nearly three feet in height and eighteen inches in diameter. Specimens are now frequent in museums in this country.

The name *Alcyonium* was formerly also given to many zoophytes now found to be of very different structure, some of which now bear the name *Alcyonidium*, others that of *Alcyonella*. The genus *Alcyonidium* belongs to the class of Zoophytes called *Polysoa*, order *Infundibulata*. See ZOOPLYTES. The most common British species is *Alcyonidium gelatinosum*. It resembles

a sponge in appearance, but is more pellucid and gelatinous, and is full of polypes, each having 15 or 16 long slender tentacula. It is attached to old shells and stones, and is sometimes much lobed, as in the preceding figure, sometimes almost simple. The colour varies from a very pale brown to clear yellow; the surface is speckled with minute dots, from which, when it is placed in sea-water, the polypes protrude. The polype differs widely from that of *Alcyonium* in having an intestine, which, proceeding from the stomach to the aperture of the cell, opens there by an orifice distinct from the mouth, a difference characteristic of the classes to which they respectively belong. The ova are clothed with cilia, and their motions either are or most strikingly resemble voluntary motions.—*Alcyonella* belongs to the class *Polyzoa*, order *Hippocrepia*. See ZOOPLYTES. There is one British species, *Alcyonella stagnorum*, found in stagnant waters, especially in autumn, in shapeless, jelly-like masses, of a blackish-green colour, usually adhering to the leaves of aquatic plants. The jelly-like mass is traversed from base to surface by multitudes of tubes, which open by a roundish or 5-angled aperture; the heads of the polypes project a little way from the aperture, and expand into a circle of about fifty tentacula. About 1600 polypes are situated on a square inch of the surface of the mass. The number of tentacula on a specimen of moderate size has been computed at more than 5,000,000. The tentacula are covered with minute cilia, only to be observed with a high magnifying power, by means of which a constant whirlpool is maintained centering in the mouth of the polype, and essential, probably, for breathing as well as for the supply of food. Each polype is organically connected with the mass, its tunic being continuous with the tube. The alimentary canal has two openings. The ova are to be found in vast numbers in the tubes which traverse the mass. They are dark brown, whilst the tubes are colourless or tinted with green, of a lens-like form and destitute of cilia. They are produced from all parts of the inner side of the gelatinous tubes; and as there seems to be no aperture for their escape, it is supposed that they are liberated from the parent mass only on its death and decomposition. The *Alcyonella* is an interesting object in a fresh-water aquarium, but is rather difficult to preserve. It is not, however, always to be found even in ponds where it might be expected, and is abundant in particular seasons and rare in others. The ova are probably capable of remaining long dormant, until some concurrence of circumstances favours the development of the germ of life which they contain. See Johnston's *History of British Zoophytes*, 2 vols., Lond. 1847—a most interesting and valuable work.

ALDEBARAN, the Arabic name of a star of the first magnitude in the constellation Taurus. It is the largest and most brilliant of a cluster of five which the Greeks called the Hyades. From its position in the constellation, it is sometimes termed 'the Bull's Eye.'

ALDER (*Ahnus*), a genus of plants of the natural order *Betulaceæ* (regarded by many as a sub-order of *Amentaceæ*; see BIRCH and AMENTACEÆ). The genus consists entirely of trees and shrubs, natives of cold and temperate climates; the flowers in terminal, imbricated catkins, which appear before the leaves; the male and female flowers in separate catkins on the same plant; the male or barren catkins loose, cylindrical, pendulous, having the scales 3-lobed, and each with three flowers whose perianth is single and 4-partite; the fertile catkins oval, compact, having the scales sub-trifid, and each with two flowers destitute of perianth; styles two; fruit, a compressed

Alcyonidium gelatinosum.
Reduced.

nut without wings.—The COMMON or BLACK A. (*A. glutinosa*) is a native of Britain, and of the northern parts of Asia and America. It has roundish, wedge-shaped obtuse leaves, lobed at the margin and

Alder Tree.

serrated. The bark, except in very young trees, is nearly black. It succeeds best in moist soils, and helps to secure swampy river-banks against the effects of floods. It attains a height of 30–60 feet. Its leaves are somewhat glutinous. The wood is of an orange-yellow colour, not very good for fuel, but affording one of the best kinds of charcoal for the manufacture of gunpowder, upon which account it is often grown as coppice-wood. Great numbers of small A. trees are used in Scotland for making staves for herring-barrels. The wood is also employed by turners and joiners; but it is particularly valuable on account of its property of remaining for a long time under water without decay, and is therefore used for the piles of bridges, for pumps, sluices, pipes, cogs of mill-wheels, and similar purposes. The bark is used for tanning and for dyeing, also for staining fishermen's nets. It produces a yellow or red colour,

Alder leaves, &c.:

a, a branchlet with male and female catkins, reduced; b, a branchlet with leaves and female catkins in a more advanced stage, reduced; c, the fruit-bearing female catkin; d, the same, cut across, to shew the small nuts or seeds.

or with copperas, a black colour. The leaves and female catkins are employed in the same way, by the tanners and dyers of some countries. The bark is bitter and astringent, and has been used for gargles, and also administered with success in ague. The seeds are a favourite food of greenfinches.—The Alder is one of the ornaments of many of the most exquisite landscapes in Britain. The dark green of its foliage, and the still darker hue of its bark, contrast beautifully with the colours of the other trees with which it is usually associated on the banks of our rivers. In boggy grounds it is often almost the only kind of tree that appears, and in many parts of the Highlands, groups of alders are scattered over the lower and moister parts of the mountain-slopes. The individual tree viewed by itself may be regarded

as somewhat stiff and formal in appearance; but in groups or clusters, it is always far otherwise.—The common A. ceases on the Swedish shore of the Gulf of Bothnia, in the south of Angermannland, and is there called the *Sea A.*, because it is only in the lowest grounds near the sea that it occurs.—The GRAY or WHITE A. (*A. incana*), a native of many parts of continental Europe, especially of the Alps, and also of North America, and of Kamtchatka, but not of Britain, differs from the common A. in having acute leaves, downy beneath, and not glutinous. It attains a rather greater height, but in very cold climates and unfavourable situations appears as a shrub. It occurs on the Alps at an elevation above that to which the common A. extends, and becomes abundant also where that species disappears in the northern part of the Scandinavian peninsula. The wood is white, fine-grained, and compact, but readily rots under water. The bark is used in dyeing.—*A. cordifolia* is a large and handsome tree, with cordate acuminate leaves, a native of the south of Italy, but found to be quite hardy in England. Some of the American species are mere shrubs. The bark of *A. serrulata* is used in dyeing.—Several species are natives of the Himalayas.—The BERRY-BEARING A., or A. BUCKTHORN, is a totally different plant. See BUCKTHORN.

ALDERMAN, a title derived from the Anglo-Saxon *caldorman*, compounded of *caldor* (older) and *man*. Whether any definite and invariable functions were connected with the ancient rank of *caldorman*, does not seem to be very clearly ascertained. The term was generally applied to persons of high and hereditary distinction, such as princes, earls, and governors. Its special signification in the titles 'A. of all England' (*Aldermannus totius Angliæ*) and 'King's A.' (*Aldermannus Regis*), is not distinctly indicated. There were also aldermen of counties, hundreds, cities, boroughs, and castles. In modern times, aldermen are officers invested with certain powers in the municipal corporations of England, Wales, and Ireland, either as civil magistrates, or as assessors of the chief civil magistrates in cities and towns corporate. The corresponding title in Scotland is Bailie. The London Court of Aldermen consists of twenty-six aldermen, including the Lord Mayor, and constitutes the bench of magistrates for the city, besides having judicial and legislative authority in the corporation.

ALDERNEY (Fr. *Aurigny*, Lat. *Aurinia*), an island in the English Channel (see CHANNEL ISLANDS), lat. 49° 45' N., long. 2° 13' W., separated from the coast of Normandy by a strait about 7 miles in breadth, called the Race of Alderney. Through this channel, which is very dangerous in rough weather, the remnant of the French fleet escaped after their defeat at La Hogue in 1692. The distances between Alderney and the nearest points of Guernsey, Jersey, and Great Britain, are respectively about 15, 33, and 60 miles. The length of the island is about 4 miles, the breadth about 1½. The coast to the south-east is bold and lofty, to the north-east and north, it descends, forming numerous small bays, one of which, that of Crabby, affords the only anchorage in the island. A harbour of refuge and breakwater have been constructed on the north side of the island, the extensive works connected with which have greatly increased the population. Six miles to the west are the Caskets, a small cluster of rocks, on which are three light-houses. The soil in the centre of the island is highly productive; and the A. cows, a small but handsome breed, have always been celebrated. The climate is mild and healthy, and good water abounds. The population had decreased between 1813 and 1841 from

1308 to 1030; in 1851 it amounted to 3333. Education to some extent is universal. The population was originally French, but half the inhabitants now speak English, and all understand it. Protestantism has prevailed here since the Reformation. A. is a dependency of Guernsey, and subject to the British crown. The civil power is vested in a judge appointed by the crown, and six *jurats* chosen by the people. These, with twelve popular representatives or *doutainiers* (who do not vote), constitute the local legislature. The court of justice is composed of the judge and jurats, the royal procureur and comptroller and the registrar (*greffier*), nominated by the governor. There is a local militia, consisting of two companies of infantry, and a brigade of artillery. The 'Town,' situated in a picturesque valley near the centre of the island, contains a few public buildings, among which is the old church, said to have been erected in the 12th c., and a new one in the early English style, with a tower 104 feet high. The living is a perpetual curacy in the archdeaconry and diocese of Winchester.

ALDRSHOTT CAMP. When England and France declared war against Russia in 1854, in relation to Turkish affairs, the British army was known to be in an unsatisfactory state. Thirty-nine years of peace had allowed many important elements in military organisation to fall into a state of inefficiency. Among others, the power of acting well together in brigades and divisions had scarcely been taught to our soldiers, who had been familiar with little more than the discipline and tactics of battalions and companies. To remedy in part these defects was the object held in view in establishing the camp at A. It was to be a permanent camp, with barracks and huts, instead of mere canvas tents; and was to be provided with all the appliances for a military school, valuable to officers as well as to privates. A dreary waste, on the confines of Surrey, Hants, and Berks, called A. Heath, was purchased by the government as the locality for the new camp. The area was 7063 acres, and the purchase-price about £130,000. The spot was deemed suitable as being distant from any thickly inhabited district; as being within easy reach of three or four stations on the South-western and South-eastern railways; and as being conveniently placed for the quick transmission of troops to any part of the southern coast. The camp was ready for the reception of troops in 1855. At first, no brick structures were attempted. The soldiers were accommodated in wooden huts, each furnishing living and sleeping room for about twenty-five men. When the camp was inaugurated, in April of the year last named, by a review at which the Queen was present, there were 18,000 troops, regulars and militia, temporarily stationed there. The huts for each regiment were grouped apart, for the better maintenance of regimental discipline. Each hut had a range of iron bedsteads on either side, capable of being doubled up; and a long table through the middle, in a line with two doors at the ends of the huts. The officers' huts, though of course superior in construction and convenience, were as simple as they could well be. The cooking was performed in huts especially set apart for that purpose, provided with efficient cooking apparatus. The wooden huts have gradually been superseded by brick barracks, at a cost of more than a quarter of a million sterling. These will be briefly described in a future article (BARRACKS), as examples of the finest barracks hitherto constructed in this country. The Basingstoke Canal, running directly across the Heath, has occasioned a division into North Camp and South Camp; but each of these is susceptible

of a good deal of extension. On various occasions between the spring of 1855 and that of 1859, the Queen has been present at grand 'field-days' and reviews at the camp; but the more important operations are those which are carried on daily, and are known to very few besides those immediately concerned. There are many square miles of plain, heath, shrub, morass, valley, and hill surrounding the camp, on which soldiers, and especially the militia regiments, are exercised in the various evolutions and strategic movements connected with the battle-field and siege-works. It is no child's play; the men are often severely worked, and gain a foretaste of some of the fatigues of military life. On other days, they are exercised in various quiet duties of tents and huts, barracks and kitchens, intended to teach them many of the useful knacks in which French soldiers are acknowledged to be more skilled than the English. Different regiments, regulars as well as militia, artillery as well as cavalry and infantry, take it in turn, to experience camp-life at A. At the time when this article is being written (May 1859), there are about 15,000 troops at the camp, comprising infantry, cavalry, artillery, and militia. The war authorities have recently purchased or leased a portion of forest-land between A. and Winchester; camping arrangements of a temporary kind will be made, and the troops will be occasionally exercised with a tough march of a dozen miles. One unfortunate circumstance connected with the camp is, that the barracks have been built at the very edge of the ground belonging to the government; as a consequence, private speculators built beer-houses and haunts of dissipation, almost close to the barracks, greatly to the demoralisation of the soldiers; and it is not easy to buy up these people, owing to the enormous rise in the value of the land near the camp.

ALDINE EDITIONS, the name given to the works that issued from the press of Aldo Manuzio (q.v.) (Lat. Aldus Manutius) and his family in Venice (1490-1597). Recommended by their intrinsic value, as well as by their handsome exterior, they have been highly prized by the learned and by book-collectors. Many of them are the first editions (*editiones principes*) of Greek and Roman classics; others contain corrected texts of modern classic writers, as of Petrarch, Dante, Boccaccio, &c., carefully collated with the MSS. All of them are distinguished for the remarkable correctness of the typography; the Greek works, however, being in this respect somewhat inferior to the Latin and Italian. The editions published by Aldus, the father, form an epoch in the annals of printing, as they contributed in no ordinary measure to the perfecting of types. No one had ever before used such beautiful Greek types, of which he got nine different kinds made, and of Latin as many as fourteen. It is to him, or rather to the engraver, Francesco di Bologna, that we owe the types called by the Italians *Corvini*, and known to us as Italics, which he used for the first time in the Svo edition of ancient and modern classics, commencing with Virgil (1501). Manuzio's impressions on parchment are exceedingly beautiful; he was the first printer who introduced the custom of taking some impressions on better paper—that is, finer or stronger than the rest of the edition. The first example of this is afforded in the *Epistolæ Græcæ* (1499). It would be difficult to name another who has brought so much zeal, disinterestedness, taste, and knowledge to the furtherance of literature, especially classical literature. After his death, in 1515, his business was superintended by his father-in-law, Andreas Asulanus. Paul, the son of Aldus, possessed the same enthusiasm for Latin classics that his father had for

Greek. He died at Rome in 1597. The printing establishment founded by Aldo continued in active operation for 100 years, and during this time printed 908 different works. The distinguishing mark is an anchor, entwined by a dolphin, generally with the motto, *Sudarvit et alsit*. Under the direction of the grandson of the founder, it lost the superiority which it had formerly maintained over all the other printing-presses in Italy. The demand which arose for editions from this office, and especially for the earlier ones, induced the printers of Lyon and Florence, about 1502, to begin the system of issuing counterfeit Aldines. The Aldo-mania has considerably diminished in later times. Among the A. works which have now become very rare may be mentioned the *Horæ Beate Mariæ Virginis* of 1497; the *Virgil* of 1501; and the *Rhetores Græci*; not to mention the editions from 1494 to 1497, which are now extremely rare. The most complete collections known are those of the Grand Duke of Tuscany, and of Renouard, the bookseller of Paris. In 1834 appeared a third edition of the monograph published by Renouard, *Annales de l'Imprimerie des Aldes, ou Histoire des Trois Manuces, et de leur Editions: par A. Renouard* (Paris, 1834). Ebert has published a catalogue of all the authentic A. E. in the supplement to the first volume of his *Bibliographical Dictionary*.

ALE would seem to have been the current name in England for malt liquor in general before the introduction of hops. This took place, according to Johnston (*Chemistry of Common Life*), as late as the reign of Henry VIII., about the year 1524. As the use of hops was derived from Germany, the German name for malt liquor (*bier*), beer, was used at first to distinguish the hopped liquor from ale, the unhopped. The word ale had in all likelihood been introduced by the Danes and other Scandinavian settlers—for *öl* (allied probably to oil) is still the name for malt liquor in the Scandinavian tongues—and must have driven out the beer of the Anglo-Saxons, which that people had in common with the other Teutonic nations. As now used, ale signifies a kind of beer (q. v. and FERMENTATION), distinguished chiefly by its strength and the quantity of sugar remaining undecomposed. Strong ale is made from the best pale malt; and the fermentation is allowed to proceed slowly, and the ferment to be exhausted and separated. This, together with the large quantity of sugar still left undecomposed, enables the liquor to keep long without requiring a large amount of hops. The Scotch ales are distinguished for the smallness of the quantity of hops they contain, and for their vinous flavour. They are fermented at an unusually low temperature. The ales of Edinburgh and Prestonpans have a high reputation. Burton ale is the strongest made, containing as much as 8 per cent. of alcohol; while the best brown stout has about 6 per cent., and common beer only 1 per cent. India pale ale differs chiefly in having a larger quantity of hops.

A-LEE, expressed by the French *sous le vent*, or 'under the wind,' is a maritime term applied to the position of the helm when so worked, as to bring the head of the ship to windward.

ALEMAN, MATEO, a famous Spanish novelist, was born about the middle of the 16th c., at Seville, and died in Mexico during the reign of Philip III. In 1604, he published a poetical biography of St Antonius of Padua; and in 1608, while in the New World, an *Ortografia Castellana*, written during his voyage; but his great work is *Guzman de Alfarache*, a novel with a rogue for the hero, like some of the more recent English fictions. It was first published at Madrid in 1599, became immensely popular, and in half-a-dozen years had gone through twenty-six

editions, consisting of not less than 50,000 copies, in Spain and other countries. Both as regards the delineation of manners and the purity of style, this masterly creation of A. ranks next to that most celebrated of all the Spanish novels of the same character—the *Lazarillo de Tormes* of Mendoza. It displays keen powers of observation; and is readily recognised as the work of a ripe and cultivated mind. Mendoza's hero has the advantage in originality, freshness, and vivacity; but Guzman exhibits a richer variety of gifts in the various characters he is compelled by circumstances to assume, such as stable-boy, beggar, thief, coxcomb, mercenary, valet, pander, merchant, &c. The manners of the author's own age are lit off with great skill and effect, a wide knowledge of human nature is manifested, and the whole narrative is interspersed with shrewd and solid reflections and moralisings. A. is considered to rank with Mendoza, Cervantes, &c., as one of the masters of the Castilian style.

ALEMANNI (that is, *all-men*), the name of a military confederacy of several German tribes which began to appear on the Lower and Middle Maine about the beginning of the 3d c. Caracalla fought with them first on the Maine in 211 A.D., but without conquering them; Alexander Severus was equally unsuccessful; but Maximian at length succeeded against them, and drove them beyond the Rhine. After his death, they again invaded Gaul, but were defeated by Posthumian, who pursued them into Germany, and fortified with ramparts and ditches the boundary of the Roman territory, called the *Agri Decumates*. The mounds near Pforung, on the Danube, the rampart extending through the principality of Hohenlohe to Jaxthausen, and the ditch with palisades on the north side of the Maine, are remains of these works. The A., however, did not desist from their incursions, although they were repeatedly driven back. After 282, being pressed upon from the north-east by the Burgundians, they took up permanent settlements within the Roman boundary from Maintz to Lake Constance. At last, Julian came (357) to the relief of Gaul, which had been suffering from the incursions of the A., and soon compelled eight of their chiefs to sue for peace. Their united force, in their principal battle with Julian, amounted to 35,000 men. After the 5th c., the confederated nation is spoken of as A. and Suavi or Suevi. In the course of the 4th c., they had crossed the Rhine, and extended as far west as the Vosges, and south to the Helvetic Alps. At length, Clovis, king of the Franks, broke their power in 496, and made them subject to the Frankish dominion. The south part of their territory was formed into a duchy, called Alemannia. The name of Swabia came afterwards to be applied to the part of the duchy lying east of the Rhine. From the A., the French have given the name of *Allemands* and *Allemagne* to Germans and Germany in general, though the inhabitants of the north of Switzerland, with those of Alsace and part of Swabia, are the proper descendants of the Alemanni.

ALEMBERT, JEAN LE ROND D', one of the most distinguished mathematicians and writers of the 18th c., was born in Paris, November 16, 1717. He was the illegitimate son of Madame de Tencin, a lady of considerable notoriety in the time of the Regency, and of a M. Destonches. He was exposed by his mother on the steps of the church of St Jean-le-Rond, and the policeman who found him committed the seemingly dying infant to the care of the wife of a poor glazier, thinking it too weak to be taken to the dépôt. The father, without publicly avowing the child, secured to him an allowance of

1200 francs a year. At the age of twelve, he entered the College Mazarin, where he soon gave indication of that inclination, or rather passion for mathematical studies which distinguished him through life. On leaving college, he returned to the humble home of his kind foster-mother, where he continued to live and pursue his favourite studies for nearly forty years, sharing with her household his small revenue. Although the good woman loved him as a son, so little did she encourage his exclusive devotion to science, that when he spoke of his discoveries or writings, she replied with a sort of pity: 'You will never be anything but a philosopher; and what is a philosopher, but a fool who torments himself during his life, that people may talk about him when he is dead.' At first, his friends urged him to qualify himself for some profitable career; but after trying for a time the study of law, and then of medicine, he gave up the attempt as hopeless, and abandoned himself without reserve to his passion for science. In 1741, at the age of 23, he was admitted a member of the Academy of Sciences, having already attracted attention by several physico-mathematical tracts. Two years later appeared his *Treatise on Dynamics*, founded on a new and fertile principle which makes an epoch in mechanical philosophy. 'This principle consists,' says Condorcet, 'in establishing the equality, at every instant, between the changes which the motion of the body has undergone, and the forces which have been employed to produce them;' in other words, it reduces all the laws of motion to the consideration of Equilibrium. Among the more important of his other scientific works are: his *Theory of the Winds*, which gained the prize of the Academy of Berlin, 1746, and which contains the first conception and use of the Calculus of Partial Differences; a treatise on the *Precession of the Equinoxes*, 1749, giving for the first time an analytical solution of that phenomenon, as well as of the nutation of the earth's axis; *Essay on the Resistance of Fluids*, 1752; *Researches on some Important Points in the System of the Universe*, 1754 and 1756. His *Mathematical Opuscles* contain an immense number of memoirs, some on new subjects, some containing developments of his previous works.

But A. did not confine himself to physical science. Diderot (q. v.) having conceived the idea of the famous *Encyclopédie*, enlisted the services of A., who wrote the *Preliminary Discourse*, which is allowed by all to be a noble tribute to literature and philosophy—a model of lucid and eloquent exposition, and displaying an immense extent of knowledge combined with rare judgment. Besides numerous articles in the *Encyclopédie*, he published *Elements of Philosophy*, 1759; *Mélanges of Literature and Philosophy*; *The Destruction of the Jesuits*, &c. He also wrote a great many *éloges* of members of the Academy of Sciences, of which he was elected secretary in 1772. His literary works have been published in a collected form, new edition, by Bossange (Paris, 1821, 5 vols. 8vo). This edition contains the correspondence of A. with Voltaire and the king of Prussia. His scientific works have never been collected.

A. gave striking proof of how little he regarded riches and distinctions, or the flatteries of the great, and how genuine was his love of independence. Frederick II. of Prussia offered him the presidency of the Academy of Berlin, 1752, but he declined to leave France, and only accepted a subsequent offer of a pension of 1200 francs. The king of France granted him a similar sum. In 1762, Catharine II. of Russia invited him, through her ambassador, to undertake the education of her son, with a salary of 100,000 francs; and when he declined, she wrote him a letter with her own hand, urging that to

refuse to contribute to the education of a whole nation was inconsistent with his own principles; and inviting him, if he could not reconeile himself to the breaking-off of his pursuits and friendships, to bring all his friends with him, and she would provide both for them and for him everything they could desire. But A. remained steadfast. When the Grand Duke afterwards visited Paris, he good-humouredly reproached A. with his refusal; and to the excuse of the rigour of the climate and feeble health, the prince replied, with the compliment: 'In truth, monsieur, it is the only false calculation you have made in your life.' A. was never married. He was tenderly attached for many years to a Mademoiselle Espinasse, although their intimacy, it is believed, never went beyond a warm friendship. The death of the lady was a severe blow to A. His own health began to give way; for he was suffering from the stone, and would not consent to an operation. He died, October 29, 1783.

A. was truthful, frank, and extremely benevolent. He held it as a principle of morals that a man has no right to dispose at will of his own superfluous means while there are others in want of the necessaries of life. A stigma has attached to the name of A. from his intimate association with Voltaire and other assailants of Christianity; but A. never attacked religion in his published writings, which might be read without knowing what his opinions regarding revelation were. It is only from his private correspondence that it appears that he thought the probabilities were in favour of theism.

ALEMBIC (formed by the Arabs from their article *al* and Gr. *ambix*, a goblet), is a form of still introduced into chemistry by the alchemists, and used by the more ancient experimenters in manipulative chemistry for the distillation and sublimation of substances, such as alcohol, or formic acid obtained by heating a decoction of red ants in water. The vessel consisted of a *body*, *cucurbit* or *matrass* (A), in which the material to be volatilised was placed; a *head* or *capital* (B) into which the vapours rose, were cooled, and then trickled down to the lower part (C), from whence by a *pipe* (D) the distilled product passed into the *receiver* (E). Where very volatile liquids were being distilled, it was customary to introduce the receiver (E) into a vessel with cold water, so as to increase the perfectness

Alembic.

of the condensing part of the arrangement. The A. has now been entirely superseded by the retort and receiver, or by the flask attached to a Liebig's condenser. See RETORT.

ALEMTEJO, a large province of Portugal, containing about 300,000 inhabitants, is the second most southerly province of the country. It is partly washed by the Atlantic on the west, and stretches to the Spanish frontier on the east. It is traversed by a number of mountain-chains, and is watered by the Tagus, Guadiana, and Saado or Sado. In the south

and west, the climate is hot and dry; the plains are covered with brown heath, unrelieved by a tree or a shrub, and only broken at intervals by marshy wastes, while the vegetation is extremely scanty. In the east, on the contrary, the valleys are fertile, and the mountains adorned with forests. The productions are singularly abundant. They consist of wheat, barley, rice, maize, the vine, and a variety of choice fruits—such as the citron, the lemon, the fig, the pomegranate. In the valleys, the principal trees are the oak with edible fruits, the evergreen-oak, the cork-oak, the chestnut, and the pine; in the plains, we find lavender, rosemary, juniper, the myrtle. The pasturage, also, is extraordinarily fine. Great attention is paid to the rearing of swine, goats, and sheep, and in a less degree, of horned cattle, asses, and mules. As the population is sparse, more grain is produced than is consumed; but manufactures are in a backward condition. Even mining, which might be very profitably carried on, is neglected. The chief towns are Evora (the capital), Elvas, Portalegre, Beja, Estremoz, and Mertola.

ALENCON, chief town of the department of Orne, in France, is situated on the Sarthe, in lat. 48° 25' N., and long. 0° 5½' E. The town-church—a structure of the 16th c., containing the remains of the tombs of the A. family, which were almost completely destroyed at the Revolution—is built in the Gothic style. It has a fine porch and exquisitely painted windows. A. is a clean and handsome town, with good streets and a delightful public walk. The inhabitants produce excellent woollen and linen stuffs, embroidered fabrics, straw-hats, lace-work, artificial flowers, hosiery, &c. The manufacture of A. point-lace (*points d'A.*), although still important, is not carried on to the same extent as formerly. The cutting of the so-called A. diamonds (quartz-crystals), found in the vicinity of the town, is a branch of industry which has also greatly declined.

The old **DUKES OF A.** were a branch of the royal family of Valois, and were descended from Charles of Valois, who perished at the battle of Crecy in 1346. His grandson, John I., fell at Agincourt in 1415. His successor, John II., allying himself with the enemies of the court, was twice condemned to death, but pardoned both times. René, son of John II., also excited, not without cause, the suspicion of the French monarch, Louis XI., who confined him for three months in an iron cage at Chinon; but as the parliament had never condemned him, he was released at the death of Louis, and restored by Charles VIII. to his title and estate. René's son, who had married the sister of Francis I., was general of the advance-guard of the French army in the Netherlands. He commanded the left wing at the battle of Pavia, where, instead of supporting the king at a critical moment, he fled with his troops; and to him, therefore, has been attributed both the disastrous defeat sustained by the French, and his sovereign's falling into the hands of the enemy. With him expired the old House of A. The duchy was then given to the Duke of Anjou. Louis XIV. conferred it upon the Duke of Berri, and Louis XVI. on the Count of Provence.

ALEPPO, a town in the north of Syria, between the Orontes and the Euphrates, on the banks of the little desert stream, Nahr-el-Haleb, at the north-west entrance of the great Syro-Arabian waste. It stands in a large hollow, surrounded by rocky hills of limestone. The fruitful gardens, celebrated for their excellent plantations of pistachios, are the sole contrast to the desolation which environs the city, whose numberless cupolas and minarets, clean, well-paved streets, and stately houses, make it even yet one of

the most beautiful in the east. It contains about 80,000 inhabitants, of whom 17,000 are Christians, and 4700 Jews, with a small number of Europeans. Sixty years ago, it had above 200,000, and supplied a great part of the east with fabrics of silk, cotton and wool, and gold and silver stuffs; but in 1822 an earthquake swallowed up two-thirds of the inhabitants, and transformed the citadel into a heap of ruins. The plague of 1827, the cholera of 1832, and the oppression of the Egyptian government, all but completed its destruction. During the sway of the last, however, a new citadel and some other edifices were erected; but scarcely half of the mosques and baths have been rebuilt. The aqueduct is the oldest monument of the town. A. is one of the principal emporiums of the inland commerce of Asia. Its port is Iskanderon (q. v.), situated 60 miles to the N.E., on the bay of the same name. A. has a large trade in cotton and silk goods, skins, tobacco, wine, oil, &c. It was once the centre of Saracenic power, still retains much of the Arabic character, and its citizens are famed throughout the east for their elegant manners.

ALE'SIA, a town of ancient Gaul, the siege and capture of which form one of Cæsar's greatest exploits. The Gauls were making a last effort to shake off the Roman yoke; and Veringetorix, their bravest leader, after several defeats, had shut himself up with 80,000 men in A., there to await the reinforcements which he expected from a general insurrection of the country. The town was situated on a lofty hill, and well calculated for defence. Cæsar, with his army of 60,000 men, completely surrounded the place, with the view of starving it into a surrender. He fortified his position by two lines of rampart of prodigious extent and strength; one towards the town, for defence against the sallies of the besieged; the other towards the plain, against the expected armies of relief. Before they could assemble, 250,000 strong, he was ready for them; and all their assaults, combined with the desperate efforts of the besieged, were of no avail. A. was obliged to surrender, and Veringetorix was made prisoner. A. was afterwards a place of some note under the empire, but was destroyed by the Normans in 864. Near the site of the ancient A., west from Dijon, stands the modern village of Alise or Sainte-Reine.

ALESSANDRIA, the principal fortress and town of the province of the same name in the kingdom of Sardinia, is situated in a marshy country near the confluence of the Bormida and Tanaro. It was built in 1168 by the inhabitants of Cremona, Milan, and Placentia, as a bulwark against the emperor Frederick I. Its original name was Cæsarea, but it was afterwards called A. in honour of Pope Alexander III., who established a bishopric in it. Designed at first as a fortress to guard the passage of the Bormida and Tanaro, and being the central point of intercourse between Genoa, Milan, and Turin, the town has frequently been the object of sanguinary strife. It was taken and plundered in 1522 by Duke Sforza; besieged, but without success, by the French, under the Prince of Conti, in 1637; and again taken, in spite of an obstinate resistance, by Prince Eugene in 1707. After the prostration of Austria at the battle of Marengo in 1800, Bonaparte concluded an armistice at A. with his enemies, according to which, Upper Italy, as far as the Mineio, was ceded to the French, with twelve fortresses. It was the principal armory of the Piedmontese during the insurrection of the Lombardo-Venetian states in 1848—9, when many new fortifications were added to it. At present, the citadel is one of the strongest fortresses in Europe:

of enormous size, larger, it is said, than many a town, and in the event of a war in Italy, will probably be once more the scene of many a desperate and bloody struggle. A. contains, exclusive of the garrison, about 40,000 inhabitants, who carry on a considerable trade in linens, woollens, silk fabrics, stockings, hats, &c. The culture of flowers is also much attended to. Two fairs are held in A. annually, which are largely frequented.

ALEUTIAN ISLANDS, or the **CATHERINE ARCHIPELAGO**, is the name of a group of islands, numbering above 150, and consisting of several clusters. They belong to Russian America, and form an insular continuation of the North American peninsula of Alaska, in the shape of an arch or bridge between the former continent and Asia. They lie in 55° N. lat., separating the Sea of Kamtchatka from the Pacific, and naturally subdivide themselves into five groups: 1. Behring's Islands (where Behring died in 1741); 2. the Sasignan, or 'Nearest' Islands, so called because nearest to the coast of Kamtchatka; 3. the Rat Islands; 4. the Andreianowsky, which are very small and little frequented; 5. the Fox Islands, among which is Unimak, the largest in the archipelago. The islands are all craggy, and have a desolate appearance from the sea. They exhibit traces of violent internal commotion. Several volcanoes are still periodically active; and warm volcanic springs are numerous. The whole chain or group forms a connecting-link between the volcanic range of the west coast of America and Kamtchatka. On account of the numerous rocks which lie off their shores, they are not very accessible to ships. Under a climate which exchanges only for a short time the monotonous rigour of winter for a cloudy spring and a hot summer, little can be expected of so niggardly a soil. There are plenty of low scrubby bushes, grasses, moss, and lichens, but no strong and stately growth of trees. An experiment tried at Unalaska of planting pines had very little success. Here and there, however, European kitchen-gardens have been attempted with better results; and the cultivation of the potato has likewise succeeded. The islands abound in springs, and are overrun with foxes, dogs, and reindeer, while the coasts swarm with fish, seals, and otters. The inhabitants, who are extremely rude, and of Kamtchatkan origin, were converted to Christianity by Russian priests. They are reckoned about 9000. Their occupation is hunting and fishing. Their trade is chiefly in furs and fish, of which the principal *entrepôt* is Alexandria, in the island of Rojak. (See UNITED STATES in Supp.)

ALEXANDER THE GREAT, son of Philip of Macedon and Olympias, daughter of Neoptolemus of Epirus, was born at Pella, 356 B.C. Endowed by nature with a happy genius, he early announced his great character. Philip's triumphs saddened him. On one occasion he exclaimed: 'My father will leave nothing for me to do.' His education was committed first to Leonidas, a maternal relation, then to Lysimachus, and afterwards to Aristotle. This great philosopher withdrew him to a distance from the court, and instructed him in every branch of human learning, especially in what relates to the art of government, while at the same time he disciplined and invigorated his body by gymnastic exercises. As Macedon was surrounded by dangerous neighbours, Aristotle was anxious to inspire his pupil with military ardour, and with this view recommended him to study the *Iliad*, a revision of which he himself undertook for his use. A. was 16 years of age when his father marched against Byzantium, and left the government in his hands during his absence. Two years afterwards, he displayed singular courage at the battle of Charonea

(338 B.C.), where he overthrew the Sacred Band of the Thebans. 'My son,' said Philip, as he embraced him after the conflict, 'seek for thyself another kingdom, for that which I leave is too small for thee.' The father and son quarrelled, however, when the former repudiated Olympias. A. took part with his mother, and fled, to escape his father's vengeance, to Epirus; but receiving his pardon soon afterwards, he returned, and accompanied him in an expedition against the Triballi, when he saved his life on the field. Philip being appointed generalissimo of the Greeks, was preparing for a war with Persia, when he was assassinated (336 B.C.), and A., not yet twenty years of age, ascended the throne. After punishing his father's murderers, he went into the Peloponnesus, and in a general assembly of the Greeks he caused himself to be appointed to the command of the forces against Persia. On his return to Macedon, he found the Illyrians and Triballi up in arms, whereupon he marched against them, forced his way through Thrace, and was everywhere victorious. But now the Thebans had been induced, by a report of his death, to take up arms, and the Athenians, stimulated by the eloquence of Demosthenes, were preparing to join them. To prevent this coalition, A. rapidly marched against Thebes, which, refusing to surrender, was conquered, and razed to the ground; 6000 of the inhabitants were slain, and 30,000 sold into slavery; the house and family of the poet Pindar alone being spared. This severity struck terror into all Greece. The Athenians were treated with more leniency, A. only requiring of them the banishment of Charidemus, who had been most bitter in his invectives against him.

A., having appointed Antipater his deputy in Europe, now prepared to prosecute the war with Persia. He crossed the Hellespont in the spring of 334 B.C. with 30,000 foot and 5000 horse, attacked the Persian satraps at the river Granicus, and gained a complete victory, overthrowing the son-in-law of Darius with his own lance. The only real resistance the Macedonians met with was from the Greek auxiliaries of the Persians, who were marshalled in phalanxes, under the command of Memnon of Rhodes, but finally they were all slain except 2000, who were taken prisoners. A. celebrated the obsequies of his fallen warriors in a splendid manner, and bestowed many privileges on their relations. Most of the cities of Asia Minor, Sardis not excepted, opened their gates to the conqueror, nor did Miletus or Halicarnassus offer longer resistance. A. restored democracy in all the Greek cities, cut the Gordian-knot (q. v.) with his sword as he passed through Gordium, and proceeded to the conquest of Lycia, Ionia, Caria, Pamphylia, and Cappadocia. His career was checked for a time by a dangerous illness, brought on by bathing in the Cydnus. On this occasion he displayed his magnanimity in the following circumstances. He received a letter from Parmenio, insinuating that Philip, his physician, intended to poison him, having been bribed by Darius. A. handed the letter to Philip, and at the same time swallowed the draught which had been prepared for him. As soon as he recovered, he advanced towards the defiles of Cilicia, in which Darius had stationed himself, with an army of above 500,000 men. He arrived in November 333 B.C. in the neighbourhood of Issus, where a battle took place, between the mountains and the sea. The disorderly masses of the Persians were thrown into confusion by the charge of the Macedonians, and fled in terror. On the left wing, 30,000 Greeks, in the pay of the Persian king, held out longer, but they, too, were at length compelled to yield. All the treasures as well as the family of Darius fell into the hands of the conqueror, who treated the latter with the greatest

magnanimity. The king, who fled towards the Euphrates, twice made overtures of peace, which A. haughtily refused, saying that Darius must regard him as the ruler of Asia, and the lord of all his people. One of the conditions of the second overture was that A. should possess all Asia to the Euphrates. On hearing which his general, Parmenio, exclaimed: 'I would do it, if I were A.' 'So would I,' replied the monarch, 'if I were Parmenio.' The victory at Issus opened the whole country to the Macedonians. A. now turned towards Syria and Phœnicia, to cut off Darius's escape by sea. He occupied Damascus, where he found princely treasures, and secured to himself all the cities along the shores of the Mediterranean. Tyre, confident in its strong position, resisted him, but was conquered and destroyed, after seven months of incredible exertion (332 B.C.). Thence he marched victoriously through Palestine, where all the cities submitted to him except Gaza, which shared the same fate as Tyre. Egypt, weary of the Persian yoke, welcomed him as a deliverer; and in order to strengthen his dominion here, he restored all the old customs and religious institutions of the country, and founded Alexandria in the beginning of 331 B.C., which became one of the first cities of ancient times. Thence he marched through the Libyan Desert, in order to consult the oracle of Jupiter Ammon, whose priest saluted him as a son of Jove; and at the return of spring went against Darius, who had assembled an army in Assyria. A battle ensued, in October 331 B.C., on the plains of Arbela, or rather Guagamela, for Arbela, the point to which A. pursued the Persians, is 50 miles from the scene of the fight. See ARBELA. Notwithstanding the immense superiority of his adversary, who had collected a new army of 500,000 men, A. was not for a moment doubtful of victory. Heading the cavalry himself, he rushed on the Persians, and put them to flight; but as soon as he had entirely dispersed them, he hastened to the assistance of his left wing, which, in the meanwhile, had been sorely pressed. He was anxious to make a prisoner of the Persian king himself, but the latter escaped by flight on horseback, leaving his baggage and all his treasures a prey to the conqueror. Babylon and Susa, the storehouses of the treasures of the east, opened their gates to the conqueror, who next marched towards Persepolis, the capital of Persia, which he entered in triumph.

The marvellous successes of A. now began to dazzle his own judgment, and to inflame his passions. He became a slave to debauchery, and his caprices were as cruel as they were ungrateful. In a fit of drunkenness, and at the instigation of Thais, an Athenian courtesan, he set fire to Persepolis, the wonder of the world, and reduced it to a heap of ashes; then, ashamed of the deed, he set out with his cavalry to pursue Darius. Learning that Bessus, the satrap of Bactriana, held the king a prisoner, he hastened his march, in the hope of saving him, but he found him mortally wounded on the frontiers of that country (330 B.C.). He mourned over his unfortunate enemy, and caused his body to be buried with all the usual rites observed in Persia; but he pursued Bessus, who himself aspired to the throne, through Hyrcania, Iran, Bactriana, over the Oxus to Sogdiana (now Bokhara), whose satrap, Spitamenes, surrendered Bessus to him. Having discovered a conspiracy in which the son of Parmenio was implicated, he put both father and son to death, though Parmenio himself was innocent of all knowledge of the affair. This cruel injustice excited universal displeasure. In 329 he penetrated to the furthest known limits of Northern Asia, and overthrew the Scythians on the banks of the Jaxartes. In the following year, he subdued the whole of Sogdiana, and married Roxana, whom he had

taken prisoner. She was the daughter of Oxyartes, one of the enemy's captains, and was said to be the handsomest of the virgins of Asia. A new conspiracy broke out against A., at the head of which were Hermolaus and Callisthenes, a pupil of Aristotle, which occasioned the death of many of the culprits; while Callisthenes himself was mutilated, and carried about in an iron cage through the army, till some one put an end to his sufferings by poison.

In the year 327 B.C., A. proceeded to the conquest of India, then known only by name. He crossed the Indus near to the modern Attock, and pursued his way under the guidance of a native prince to the Hydaspes (modern Jehum), where he was opposed by Porus, another native prince, whom he overthrew after a bloody contest. Thence he marched as lord of the country through that part of India which is now called the Punjab, establishing Greek colonies. He then wished to advance to the Ganges, but the general murmuring of his troops obliged him, at the Hyphasis (modern Sutledge), to commence his retreat, which was accomplished under circumstances of extreme danger. When he had again reached the Hydaspes, he built a fleet, and sent one division of his army in it down the river, while the other followed along the banks, fighting its way through successive Indian armies. At length, having reached the ocean, he ordered Nearchus, the commander of the fleet, to sail thence to the Persian Gulf, while he himself struck inland with one division of his army, in order to return home through Gedrosia (now Beloochistan). Here he had to traverse immense deserts, where a great part of his army perished for want of food and water, and were buried in the sand. The other division marched through Arachosia and Drangiana (Afghanistan) under Craterus, but they united again in Carmania. Of all the troops, however, which had set out with A., only about a fourth part arrived with him in Persia (325 B.C.). At Susa he married Stateira, the daughter of Darius, and he bestowed presents on those Macedonians (about 10,000 in number) who had married Persian women, his design being to unite the two nations as closely as possible. He also distributed liberal rewards among his soldiers. At Opis on the Tigris he declared it to be his intention to send home the invalids richly rewarded; and this he accomplished, but not till he had with some difficulty repressed the mutiny which broke out on the occasion. Soon afterwards he was deprived, by death, of his favourite Hephestion, on which occasion his grief was unbounded, and he interred the deceased with kingly honours. As he was returning from Ecbatana to Babylon, it is said that the Magi foretold that the latter city would prove fatal to him; but A. despised their warnings, and, in spite of the advice of his friends, marched to Babylon, before reaching which, however, he was met by ambassadors from all parts of the world—Libya, Italy, Carthage, Greece, the Scythians, Celts, and Iberians. Here he again occupied himself with gigantic plans for the future, both of conquest and civilisation, when he was suddenly taken ill after a banquet, and died eleven days afterwards, on the 11th or 13th of May or June, 323 B.C., in the 32d year of his age, having reigned twelve years and eight months. His body was deposited in a golden coffin at Alexandria, by Ptolemaus, and divine honours were paid to him, not only in Egypt, but in other countries. A. had appointed no heir to his immense dominions; but to the question of his friends: 'Who should inherit them?' he replied: 'The most worthy.' After many disturbances, his generals recognised as kings the weak-minded Aridæus—a son of Philip by Philinna, the dancer—and A.'s posthumous son by Roxana, while they

shared the provinces among themselves, under the name of satraps. Perdiccas, to whom A. had, on his death-bed, delivered his ring, became guardian of the kings during their minority.

It is but right to observe that A. did something more than shed blood during his life. He diffused the language and civilisation of Greece wherever victory led him, and planted Greek kingdoms in Asia, which continued to exist for some centuries. At the very time of his death, he was engaged in devising plans for the drainage of the unhealthy marshes around Babylon, and a better irrigation of the extensive plains. It is even supposed that the fever which he caught there, rather than his famous drinking-bout, was the real cause of his death. To A., the ancient world owed a vast increase of its knowledge in geography, natural history, &c. He taught Europeans the road to India, and gave them the first glimpses of that magnificence and splendour which has dazzled and captivated their imagination for two thousand years.

ALEXANDER SEVERUS, a Roman emperor (222—235 A.D.), was the cousin, adopted son, and successor of Heliogabalus. The excellent education which he received from his mother, Julia Mamaea, rendered him one of the best princes in an age when virtue was reckoned more dangerous than vice in a monarch. He sought the society of the learned; Paulus and Ulpian were his counsellors, Plato and Cicero were, next to Horace and Virgil, his favourite authors. Although a pagan, he revered the doctrines of Christianity, and often quoted that saying: 'Whatsoever ye would that men should do to you, do ye so also to them.' Beloved as he was by the citizens on account of his equity, he soon became an object of hatred to the unruly pretorian guards. His first expedition, against Artaxerxes, king of Persia, was happily terminated by a speedy overthrow of the enemy. But during one which he undertook against the Germans on the Rhine, to defend the frontiers of the empire from their incursions, an insurrection broke out among his troops, headed by Maximin, in which Alexander was murdered, along with his mother, not far from Mentz. The grateful people, however, placed him among the gods. After his death, military despotism obtained the ascendancy, and the Roman power rapidly declined.

ALEXANDER NEWSKI, or NEVSKI, a Russian hero and saint, born at Vladimir in 1219 A.D., was the son of the Grand Duke Jaroslav, of Novgorod. In order to defend the empire, which was attacked on all sides, but especially by the Mongols, his father quitted Novgorod, leaving the cares of the government to his sons, Fedor and Alexander, the former of whom died soon afterwards. The latter vigorously resisted the enemy; yet Russia was forced to submit to the Mongol dominion in 1238 A.D. A. now fought to defend the western frontier against the Danes, the Swedes, and the Teutonic knights. He received the surname of Newski, on account of the splendid victory over the Swedes, which he achieved in 1240, on the Neva (Neva), in the province where St Petersburg now stands. In 1243 A.D., on the ice of Lake Peïpus, he defeated the Livonian Knights of the Sword, who had been stimulated by the pope to attack the Russian heretics. At the death of his father in 1247, he became Grand Duke of Vladimir. Pope Innocent IV. now made a diplomatic attempt to reunite the Greek and Roman churches, since his military scheme had failed, and with this view, sent an embassy to A., which, however, proved as ineffectual as the former. To the end of his life, however, he remained a vassal of the Tatars or Mongols.

Thrice had he to renew his oath of fealty to the Asiatic barbarians, making in each instance a journey to their camp. He died in 1263 A.D., at Kassinecow, on his return from the last of these journeys; and the gratitude of the nation perpetuated his memory in popular songs, and even canonised him. Peter the Great honoured his memory by building a magnificent convent on the spot where A. had fought his great battle, and by founding the knightly order of A. N.

ALEXANDER VI. (BORGIA), 1492—1503, the most celebrated of the eight popes (see POPES) of this name, but at the same time the most infamous one that ever lived, as well as the most vicious prince of his age. His most conspicuous qualities were a cunning and insidious cruelty, united with great fearlessness in danger, an unwearied perseverance and vigilance in all his undertakings, a soft and plausible manner towards his inferiors, a harsh and grasping spirit towards the rich. In spite of his talents and his love of art and science, he disdained, throughout his dissolute career, no means of gratifying his lust—not even perjury, murder, and poisoning. He was born at Valencia, in Spain, 1430. His own name was Rodrigo Lenzuoli, but he assumed the ancient and famous one of his mother's family, Borgia. He had five children by Rosa Vanozza, a woman celebrated for her beauty, two of whom equalled himself in criminality, Cesar and Lucretia (see BORGIA). A. was made a cardinal by his uncle Calixtus III., and on the death of Innocent VIII., was elevated to the papal chair, which he had previously secured by flagrant bribery. The long absence of the popes from Italy had weakened their authority and curtailed their revenues. To compensate for this loss, A. endeavoured to break the power of the Italian princes, and to appropriate their possessions for the benefit of his own family. To gain this end, he employed the most execrable means. He died in 1503, from having partaken, by accident, as is commonly believed, of poisoned wine, intended for his guests. Under his pontificate, the censorship of books was introduced, and Savonarola, the earnest and eloquent Florentine priest, who had advocated his deposition, was condemned to be burned as a heretic.

ALEXANDER I., PAULOWITSCH, Emperor and Autocrat of All the Russias (1801—1825), was born December 23, 1777. His education, in which his father, Paul I., had no hand, was conducted by his grandmother, Catharine II., and Colonel Laharpe and other tutors. He always shewed great affection for his mother, Maria, daughter of Eugene, Duke of Wurtemberg. With a humane and benevolent disposition, the 'northern Telemaque' was imbued by Laharpe with the enlightened principles of the age. Professor Kraft instructed him in experimental physics, and Pallas in botany. It was thought better not to devote his attention to poetry and music, as it would have required too much time to make any great acquirements. In 1793 he married Elizabeth, daughter of Karl Ludwig, Crown Prince of Baden, and, on the assassination of his father Paul (q. v.), on the 24th of March 1801, succeeded him upon the throne. Although A. doubtless knew of the conspiracy to dethrone his father, there is no reason to believe that he contemplated the crime of murder. His accession was celebrated by Klopstock in an ode. *To Humanity*, indicative of the high expectations formed of him. The young ruler seemed deeply penetrated with a sense of his obligation to make his people happy and to promote their civilisation and prosperity. He was the first to lay the foundation of the national culture and popular instruction on a regular plan, to introduce

organisation into the internal administration, unshackle the industry of the nation, raise the foreign commerce of Russia, and awaken in the people a feeling of unity, and a spirit of patriotism.

Of specific internal improvements effected by A., his exertions on behalf of the language, literature, and general culture of the Slavonic nations deserve special notice. Seven universities, at Dorpat, Kasan, Charkow, Moscow, Wilna, Warsaw, and St Petersburg, were either instituted or remodelled by him; 204 gymnasiums and normal schools, and above 2000 district elementary schools, were erected; and fresh life and activity given to the higher scientific institutions in St Petersburg and Moscow. He did more than any other sovereign in Europe for the spread of the Bible, by supporting the Bible Society (which was suppressed, however, in 1826); and in 1820, he had a bishop instituted for the evangelical Lutheran church, and a general consistory in St Petersburg for the whole empire. He devoted large sums to the printing of important works, such as Krusenstern's *Travels*, and Karamsin's *History of Russia*, and prized and rewarded scientific merit both at home and abroad. Several scientific collections were purchased by him, and in 1818 he invited two orientahsts, Demange and Char moy, from Paris to St Petersburg, to promote the study of the Arabic, Armenian, Persian, and Turkish languages. Young men of talent were sent to travel at his expense. By the ukase of 1816 he prepared the way for the abolition of slavery in the Baltic provinces; he also declared that no more gifts of peasants would be made on the crown-lands. As early as 1801 he had abolished the secret tribunal which is said to have extorted confession from political offenders by means of hunger and thirst. The practice of slitting the nose and branding, which had been customary in connection with knouting, was also done away with. Laws were enacted to prevent the abuses of power by governors. The privilege of the nobles, that their inherited property could not be confiscated as a punishment, was raised by him to a common right for all subjects; and much was done in composing a code of civil law. He promoted the manufactures and trade of the empire by amending the laws regarding debt and mortgages; and by the institution of an imperial bank, the construction of roads and canals, making Odessa a free port, and, above all, by the ukase of 1818, permitting all peasants in the empire to carry on manufactures, which was before only allowed to nobles and to merchants of the first and second guilds.

A.'s far-sighted policy with regard to the foreign commerce of Russia is shewn in various expeditions round the world sent out by him; in the embassy to Persia in 1817, in which was the Frenchman Gradanne, who was acquainted with all the plans of Napoleon respecting India and Persia; in the missions to Cochin China and to Khiva; in the treaties with the United States, Brazil, and Spain; in the naval and commercial treaties with the Porte; and in the settlement on the north-west coast of America.

A.'s foreign policy was characterised at the outset by a desire for peace; in 1801 he concluded a convention, putting an end to hostilities with England, and made peace with France and Spain. He next entered, along with France, into negotiations respecting the indemnification of the minor states in Germany and Italy, but soon discovered how little the French ruler intended any real compensation. As Bonaparte encroached more and more, took possession of Hanover, and annihilated Holland, A. broke with France, and joined the coalition of 1805. He was present at the battle of Austerlitz, when the allied armies of Austria and Russia were

defeated, and retired with the remains of his forces into Russia, declining to enter into the treaty that followed. Next year, he came forward as the ally of Prussia; but after the disastrous battles of Eylau and Friedland, in 1807, he was obliged to conclude the peace of Tilsit, in which he managed to prevent the restoration of the kingdom of Poland, and to mitigate the hard fate of the king of Prussia. During the war with France, A. had also had to carry on hostilities with Persia and with Turkey.

Dazzled by the fortune and genius of Napoleon, A., in pursuance of the stipulations of Tilsit, acceded with his huge empire to the French continental system, thus altering entirely the foreign policy of Russia. He began by declaring war on England in 1808, and attacking her ally Sweden, wrested from that country, by the peace of Friedrichshamm (1809), the province of Finland. On the other hand, the Russian fleet sent to the aid of the French at Lisbon, fell into the hands of the British. In the autumn of 1808, the two great potentates held a meeting at Erfurt, attended with great splendour, at which A. represented, as it were, the empire of the east of Europe, while Napoleon assumed the dominion of the west. In the war of France against Austria in 1809, A. took only a lukewarm part, although at the peace of Vienna he received the circle of Tarnopol as his share of the spoil of Galicia. Against the Porte, which had not observed the armistice of Slobosta, he renewed the war, which was continued till the peace of Bucharest in 1812.

The alliance, however, of A. with the Corsican conqueror involved such an inconsistency, and was so contrary to the real interests of Russia, that a rupture and a complete change of the Russian policy were inevitable. The pressure of the continental system on the material resources of Russia, the despotic changes made by Napoleon, the augmentation of the duchy of Warsaw, the proffers of alliance by England and Sweden, awoke in A. first discontent and aversion, and soon the thought of a decisive contest against the subjugator of Europe and the disturber of the peace of the world. When this gigantic struggle at last began (1812), Russia brought into the field an army of nearly 900,000 men. During this war (see RUSSO-GERMAN WAR), A. repeatedly exposed himself to personal danger, in order to fire the courage and patriotism of his troops. His magnanimity towards France after the taking of Paris facilitated the negotiations for peace, and won for him great personal regard, amounting to a kind of enthusiasm. He was received with the same feeling in London, which he visited after the treaty of Paris in June 1814. When he returned to St Petersburg, his first care was to provide for the wounded, and for the families of the soldiers that had fallen. The senate wished to give him the title of 'Blessed,' which, from Christian humility, he declined. After a short residence in his own capital, he repaired to the Congress of Vienna. Here he laid claim to Poland as essential to the interests of Russia, but promised to confer on it a constitution, and, on the whole, appeared to act for the good of humanity and the freedom of nations.

In the return of Napoleon, A. saw the confusion of Europe began again, and therefore urged the fulfilment of the treaty of Chaumont and the outlawry of the common enemy. His appearance in the French capital after the battle of Waterloo raised less enthusiasm than previously; yet on this occasion, too, France owed much to his generosity. It was about this time that the tendency of A. to pietism, fostered by intercourse with Madame Krüdener (q. v.), was most strongly manifested, and exercised decided influence on his political views. It was under the influence of this religiosity

that he founded the Holy Alliance (q. v.), the ostensible object of which was to make the principles of Christianity be recognised in the political arrangements of the world, but which became, in fact, a mere handle for political reaction.

In the end of October 1815, A. returned to his own dominions. His policy, and the march of events, had completely changed the internal condition of Russia and her foreign relations. Her weight in European politics had become powerful; the limits of the empire had extended in all directions; and notwithstanding the war, the earlier legislative reforms had begun to act favourably on the industry and well-being of the nation. After 1805, A. had remodelled the army after the fashion of the western powers, and raised it to a condition that menaced Europe. When peace was attained, he not only sought to heal the wounds inflicted by the war, but to carry forward the work of reform formerly begun. Numerous administrative abuses were done away with, and the condition of the peasants was more and more alleviated. In 1816, the Jesuits, who were causing a great deal of disturbance, were made to leave St Petersburg and Moscow, and in 1820 were sent out of the empire. On the other hand, proselytism was rigidly prohibited, and the Duchoborzes, a sect of the Russo-Greek church, were allowed the free exercise of worship.

But however good A.'s intentions might be, his internal policy met with obstructions, partly arising from his personal views and character, partly from the nature of his position. Affected with a morbid religiosity, worn out and shaken perhaps in body and mind by the vast events in the vortex of which he had moved for the last ten years, the emperor became possessed by the dread of another European revolution; and the political struggles against reaction in Germany, and the outbreaks against despotism in Italy and Spain, appeared to him as the beginning of a new and terrible catastrophe. The attention now bestowed by A. on foreign relations threw internal improvements into the background; and the liberal reformer and pupil of Laharpe found himself involved in hopeless inconsistency, when he fully concurred in the policy of the Austrian cabinet, and, at the congresses of Troppan, Laybach, and Verona, helped to crush, along with the insurrections, the just requirements and political progress of the nations.

This complete reversal of policy could not fail to produce fruits, especially as Russia peculiarly abounded in fermentable materials. Poland saw itself completely disappointed in its national expectations, and required the actual carrying out of the promised constitution. The contact into which the Russians had come during the war with the civilisation and institutions of the western nations, had excited in different classes of Russian society wishes and views by no means compatible with their condition at home. On the other hand, there had long existed in the most influential circles an Old-Russian party, who either found their interests hurt by the enlightened measures of the emperor, or saw in them the downfall of the national church, and of the nation itself. Besides, the army was kept up on the war-footing, and in 1821 numbered about 830,000 regular troops; and this pressed severely on the people, and produced discontent, along with exhaustion and disorder of the finances. To meet this evil, A. began the planting of military colonies, which, however, met with insuperable obstacles in the execution, and did not attain the end in view. But to exorcise the spirit of political discontent and the phantom of a Russian revolution, the emperor adopted the same measures that were very generally

applied over the rest of Europe with similar views. The censorship of the press, and a rigid guard over the importation of books, were again introduced; restrictions were put on science, literature, and education; inquiries instituted into all democratic movements; mason-lodges and missionary societies suppressed; and gradually all plans for reform and progress given up. Over all the provinces of the empire, a net of police, open and secret, was spread, which interfered with the ordinary intercourse of society.

The experience that, in spite of this system of repression, public opinion could not be stifled, and that parties and individuals only expressed themselves more bitterly; the variance with his former self in which A. found himself involved; and the difficulties of governing the huge empire, which were now becoming more manifest and startling—all this tormented and embittered his morbid mind, and led him to complain of ingratitude and of a want of recognition of his good intentions. Sometimes he sought to forget his position in the dissipations of a splendid court, in which luxury and piety were strangely blended; at other times, he plunged into the darkness of religious mysticism. The progress of the revolt in Greece brought the policy of the emperor into complete opposition to public opinion and the most sacred sympathies of the nation. The Russian people, restrained from all participation in political movements, were profoundly affected by the religious element of the Greek struggle; but the emperor condemned the rising as insurrection, disclaimed the favour he had formerly shewn to the Greek cause, and confined himself to exhortations to the Porte to act with humanity. The death of his only and much-loved natural daughter, the terrible inundation suffered by St Petersburg in 1824, in which he exposed himself to personal danger, and the alarm caused by a Russo-Polish conspiracy against all the members of the House of Romanow, contributed not a little to break the heart of the emperor, and completely destroy the composure of his mind. Sick in body, weary of life, and possessed by thoughts of death, he commenced, in September 1825, a journey to the Crimea, with a view to benefit the health of the empress, who was ailing, and that he himself might enjoy retirement. Leaving the empress at Taganrog, he continued his journey, but was suddenly seized by a fever peculiar to the country, and obliged to return to Taganrog. Here, in spite of all care, he became worse, and died, December 1, 1825. The rumour that he had been poisoned is altogether groundless. He is said to have learned, shortly before his death, the details of the conspiracy which his brother and successor, Nicholas I. (q. v.), had to begin his reign by putting down. Interesting notices of the life and character of A. are given in Choiseul-Gouffier's *Mémoires Historiques sur l'Empereur Alexandre et la Cour de Russie* (Par. 1829).

ALEXANDER II., Emperor of Russia, was born April 29, 1818. He was carefully educated by his father, Nicholas, who professed himself delighted with the manifestations of 'true Russian spirit' in his son. At sixteen, he was declared of age, made commandant of the Lancers of the Guard, Hetman of the Cossacks, first aide-de-camp of the emperor, and subjected daily to a life of manoeuvring, reviewing, and military parade, which at last seriously injured his health. He then travelled through Germany to recruit his energies, and while there, concluded a marriage with the Princess Maria, daughter of the Grand Duke of Darmstadt, in 1841. He now vigorously applied himself to his duties as chancellor of the university of Finland. By his dexterous and subtle manners, he insinuated himself into the affections of the Finns, and weakened

their love of independence. He founded a chair of the Finnish language and literature, patronised the academy for the culture of Finnish literature, and defrayed the expenses of remote explorations undertaken by their *savans*, such as Cygnous, Wallin, and Castren. In 1850, he visited Southern Russia, Nicolaïeff, Sebastopol, Tiflis, Erivan, &c. It is said that he witnessed with regret the attitude which his father assumed towards Europe, and that he altogether disapproved of the Crimean war. On his accession to the throne, March 2, 1855, he found himself in a very critical position. He had two parties to conciliate at home—the old Muscovite party, blindly zealous for war, and the more peaceable and intelligent portion of the nation, who possessed his personal sympathies. He pursued a course calculated to encourage both; spoke of adhering to the policy of his ‘illustrious ancestors,’ and at the same time concluded peace. Since then, he has shewn a strong desire to purge the internal administration of its impurities; he has sharply rebuked the corruption of functionaries, and severely punished some, as a warning to the rest. An honourable recognition has been given to public instruction, which he has placed under his own superintendence. His moderation has even raised the hopes of the Poles. By a ukase of May 27, 1856, he granted to all Polish exiles who were willing to express repentance for the past, permission to return home; but though desirous of preserving the nationality of Poland, he will not have it separated from the ‘great Russian family.’ The grand achievement of his reign, however, as yet, is the emancipation of the serfs—23,000,000 souls—by a ukase of March 3, 1861. This marks an epoch in the national history. In 1865, A. established elective representative assemblies in the provinces. He carried on a war against the Ameer of Bokhara in 1866; and during the year 1873, a war against the khan of Khiva.

ALEXANDER I., king of Scotland, a younger son of Malcolm Ceannmor (big-head), succeeded his brother, Edgar, in 1107, and amidst incessant disturbances, governed Scotland for seventeen years with great ability. In addition to good natural powers, he had enjoyed, through his mother, Margaret of England, the advantages of a higher mental cultivation than any of his predecessors. One of the most formidable insurrections which his prompt energy enabled him to quell, was that excited in 1120 by Angus, great grandson of the wife of Macbeth; in allusion to which, old Wynton says:

Fra that day forth his lieges all
Used him Alexander the Fierce to call.

His determined resistance to the pretensions of the English hierarchy secured the independence of the Scottish church, while his liberal patronage of the monasteries promoted her strength at home. In 1123 he founded the Abbey of Inchcolm. He died at Stirling in 1124.

ALEXANDER II. was born in 1198; succeeded his father, William the Lion, in 1214. He early displayed that wisdom and strength of character, in virtue of which he holds so high a place in history among Scottish kings. The first act of his reign was to enter into a league with the English barons who had combined to resist the tyranny of King John. This drew down upon him and his kingdom the papal excommunication; but two years subsequently (1218), the ban was removed, and the liberties of the Scottish church were even confirmed. On the accession of Henry III. to the English throne, A. brought the feuds of the two nations to a temporary close by a treaty of peace (1217), in accordance with which he married Henry’s eldest sister, the Princess Joan

(1221). The alliance thus established was broken after the death, without issue, of Queen Joan (1238), and the second marriage of A. with the daughter of a nobleman of France. In 1244, Henry marched against Scotland, to compel A.’s homage. In this emergency, the Scottish king received the steady support of the barons, whose ordinary policy was opposition to the crown, and is said, in a short time, to have found himself at the head of 100,000 foot, and 1000 horse. A peace was concluded without an appeal to arms. While engaged in one of those warlike expeditions which the turbulence of his subjects so frequently rendered necessary, A. died of fever at Kerrera, a small island opposite Oban, on the west coast of Argyleshire, in the thirty-fifth year of his reign.

ALEXANDER III. succeeded his father, A. II., on the Scottish throne at the age of eight, and, two years later, in 1251, he married the Princess Margaret, eldest daughter of Henry III. of England. The tender age of the sovereign enabled Henry to prosecute successfully for some time his schemes for obtaining entire control over the Scottish kingdom; but long before he reached manhood, A. displayed so much energy and wisdom as to give assurance that when the administration of affairs should come under his personal direction, it would be vain to think of reducing him to submission. Very shortly after he had come of age, his energies were summoned to the defence of his kingdom against the formidable invasion of Haco, king of Norway (1263), who claimed the sovereignty of the Western Isles. In attempting a landing at Largs, on the coast of Ayr, the Norwegian prince sustained a total defeat; and A., as the result of this important victory, secured the allegiance both of the Hebrides and of the Isle of Man. The alliance between Scotland and Norway was strengthened in 1282 by the marriage of A.’s only daughter, Margaret, to Eric, king of Norway. This princess died in the following year, leaving an infant daughter, Margaret, commonly designated the Maiden of Norway, whose untimely death, on her way to take possession of her throne, was the occasion of so many calamities to Scotland. During the concluding years of A.’s reign, the kingdom enjoyed a peace and prosperity which it did not taste again for many generations. The justice, liberality, and wisdom of the king, endeared his memory to his subjects, while the misfortunes that followed his death, heightened the national sense of his loss. His only son, A., who had married the daughter of Guy, Count of Flanders, died without issue in 1284. A. contracted a second marriage in 1285 with Joleta, daughter of the Count de Dreux. The hopes of the nation were soon after clouded by his untimely death. Riding on a dark night between Burntisland and Kinghorn, he fell with his horse over a precipice, and was killed on the spot.

ALEXANDER OF HALES (in Latin, Alexander Halensis), a famous theologian, known as the ‘Irrefragable Doctor’ (d. 1245). He was originally an ecclesiastic in Gloucestershire, but had attended the schools of Paris, got the degree of doctor, and had become a noted professor of philosophy and theology there, when (1222) he suddenly entered the order of the Minorite Friars. From that time, he lived the life of a studious recluse. His chief and only authentic work is the *Summa Universa Theologie* (best ed., Venice, 1576, 4 vols.), written at the command of Pope Innocent IV., and enjoined by his successor, Alexander IV., to be used by all professors and students of theology in Christendom. A. gave the doctrines of the church a more rigorously syllogistic form than they had previously had, and may thus be considered as the author of the scholastic

theology. Instead of appealing to tradition and authority, he deduces with great subtlety, from assumed premises, the most startling doctrines of Catholicism, especially in favour of the prerogatives of the papacy. He refuses any toleration to heretics, and would have them deprived of all property; he absolves subjects from all obligation to obey a prince that is not obedient to the church. The spiritual power, which blesses and consecrates kings, is, by that very fact, above all temporal powers, to say nothing of the essential dignity of its nature. It has the right to appoint and to judge these powers, while the pope has no judge but God. In ecclesiastical affairs, also, he maintains the pope's authority to be full, absolute, and superior to all laws and customs. The points on which A. exercises his dialectics are sometimes simply ludicrous; as when he discusses the question, whether a mouse that should nibble a consecrated wafer would thereby eat the body of Christ. He arrives at the conclusion that it would.

ALEXANDERS (*Smyrniolum olusatrum*), a biennial plant of the natural order *Umbellifere* (q. v.), found in waste ground, near ruins, &c., in Britain and the south of Europe. The stem is 3—4 feet high, very stout and furrowed; the leaves twice or thrice ternate, stalked, serrate, of a bright yellowish-green colour; the leaflets very large. The flowers are yellowish-green, in very dense, numerous rounded umbels, destitute of involucre; the fruit almost black. The plant has an aromatic taste, strong and pungent, but becomes rather pleasant when blanched, and was formerly much cultivated and used in the same way as celery, although at present it is little regarded. The frequency of its occurrence near ruins in Britain, may probably be referred to its former cultivation. The fruit is carminative.—*S. perfoliatum*, a native of Italy, with the upper stem-leaves embracing the stem, is used in the same way.—The genus *Smyrniolum* contains only a few known species, chiefly natives of the temperate parts of the northern hemisphere. It has compound umbels; is variable in the involucre; the calyx is obsolete; the petals inflexed at the point; the fruit consists of two nearly globose carpels, each with three prominent sharp dorsal ribs; the lateral ones distant and obsolete; several vittæ in the interstices; the albumen involute.

ALEXANDRIA (called Skanderi'eh by the Turks and Arabs) was founded by Alexander the Great in the autumn of the year 332 B.C. It was situated originally on the low tract of land which separates the lake Mareotis from the Mediterranean, about 14 miles west of the Canopic mouth of the Nile. Before the city, in the Mediterranean, lay the island of Pharos, upon the north-east point of which stood the famous light-house (Pharos), and which was connected with the mainland by a mole, called, from its length, the Heptastadium, or 'Seven Furlong' mole, thus forming the two harbours. The plan of A. was designed by the architect Dinocrates, and its original extent is said to have been about 4 miles in length, with a circumference of 15 miles. It was intersected by two straight main streets, crossing each other at right angles in the middle of the city. Colonnades adorned the whole length of these streets, which were in general very regularly built. The most magnificent quarter of the city was that called the Brucheium, which was situated on the eastern harbour. This quarter of the city contained the palaces of the Ptolemies, with the Museum and the old library; the Soma or mausoleum of Alexander the Great and of the Ptolemies, the Poseidonum, and the great theatre. Further west was the emporium or exchange. The Serapeion, or temple of Serapis, stood in the western division of

the city, which formed the Egyptian quarter, and was called Rhacotis; a small town of that name had occupied the site before the foundation of A. To the west of the city lay the great Necropolis, and to the east the race-course, beyond which was the suburb of Nicopolis. The greater part of the space under the houses was occupied by vaulted subterranean cisterns, which were capable of containing a sufficient quantity of water to supply the whole population of the city for a year. From the time of its foundation, A. was the Greek capital of Egypt. Its population, in the time of its prosperity, is said by Diodorus to have amounted to about 300,000 free citizens, and if we take into account the slaves and strangers, that number must be more than doubled. This population consisted mostly of Greeks, Jews, and Egyptians, together with settlers from all nations of the known world. After the death of Alexander the Great, A. became the residence of the Ptolemies. They made it, next to Rome and Antioch, the most magnificent city of antiquity, as well as the chief seat of Grecian learning and literature, which spread hence over the greater part of the ancient world. The situation of the city, at the point of junction between the east and west, rendered it the centre of the commerce of the world, and raised it to the highest degree of prosperity.

A. had reached its greatest splendour, when it came into the possession of the Romans, about 30 B.C. From this moment its prosperity began to decline—at first almost imperceptibly, but afterwards more rapidly, in consequence of the removal of the works of art to Rome, the massacres of Caracalla, the laying waste of the Brucheium by Aurelianus, the siege and pillage of the city by Diocletian, and, lastly, the rising prosperity of the rival city of Constantinople. All these causes combined to destroy A. so speedily, that, in the 4th c. no building of any importance was left in it except the temple of Serapis. The strife between Christianity and heathenism gave rise to bloody contests in A. The Serapeion, the last seat of heathen theology and learning, was stormed by the Christians in 389 A.D., and converted into a Christian church. This put an end to heathenism, and A. became henceforward a chief seat of Christian theology, and continued to be so till it was taken by the Arabs, under Amr, in June 638 A.D. This siege, and, still more, its conquest by the Turks in 868 A.D., completed the destruction of the city. It revived, indeed, in some degree under the Egyptian califs, and continued during the middle ages to be the most important emporium of trade between the east and west; but the discovery of America, and of the passage to India by the Cape of Good Hope, very much diminished the trade of A.; and the dominion of the Mamalukes, and the conquest of the Osmani, annihilated even the little which the Arabs had restored. The result was, that in 1778 A.D. A. contained no more than 6000 inhabitants. After the conquest of Egypt by the French in the end of the 18th c., A. once more began to revive, and under Mehemet Ali, who resided in it a part of every year, it prospered to such a degree, that it may now be reckoned one of the most important commercial places on the Mediterranean. As steam-navigation has increased, the city has assumed more and more a European aspect.

The present city is not situated exactly on the site of the old one, but is built on the mole called the Heptastadium, which has been increased by alluvial deposits till it has become a broad neck of land between the two harbours, of which the eastern is called the New Port, and the western the Old Port. A. is connected with Cairo by rail and by the canal of Mahmoudieh. Although originally,

like other oriental cities, dirty and ill-built, it is in this respect rapidly improving. In 1859, 2934 vessels, of 1,263,144 tons, entered and cleared. In 1870, the population was 238,888—Arabians, Turks, Jews, Copts, Greeks, and Franks. Of the few remains of antiquity still to be seen in A., the most prominent is Pompey's Pillar, as it is erroneously called, the shaft of which, of red granite, is 73 feet long. According to the Greek inscription on the base, which is still legible, this Pillar was erected by the Egyptian prefect, Publius, in honour of the Emperor Diocletian. There are also the so-called Cleopatra's Needles, two obelisks of the time of King Thothmes III., who lived in the 16th c. before the Christian era. One of the Needles lies prostrate on the ground, half covered with sand; the other, a monolith, of about 72 feet in height, is still standing. The other antiquities of A. are, some catacombs of the ancient city of the dead, and some of the cisterns below the city, which are almost entirely filled up.

ALEXANDRIA, a port of entry on the right or Virginian bank of the Potomac, U. S., about 7 miles below Washington, on the opposite side of the river, lat. 38° 49' N., long. 77° 4' W. Though A. is fully 100 miles from the entrance of the Potomac into Chesapeake Bay, yet the stream in front of it, which forms its harbour, is still a mile wide. The place is accessible, all the way from the sea, to the largest vessels. In this commanding position with respect to the coast, A. has, since 1852, facilitated its communications with the interior, being connected by a branch-canal with the Chesapeake and Ohio, and by a branch-railway with the Virginia Central. A canal also connects A. with Georgetown, and railways have been opened to Gordonsville, on the Central Railroad, and to Washington. Owing to these combined advantages, the trade of the city is steadily increasing, while cotton manufactures also have been introduced on an extensive scale. Pop. in 1870, 13,570.

ALEXANDRIAN CODEX, an important manuscript of the sacred Scriptures in Greek, now in the British Museum. It is written on parchment, in finely formed uncial letters, and is without accents, marks of aspiration, or spaces between the words. Its probable date is the latter half of the 6th c. With the exception of a few gaps, it contains the whole Bible in Greek (the Old Testament being in the translation of the Septuagint), along with the epistles of Clemens Romanus. For purposes of biblical criticism, the text of the Epistles of the New Testament is the most valuable part; for with respect to the Gospels, it is clear that the original text which the copyist had before him must have been far inferior. This celebrated manuscript belonged, as early as 1098, to the library of the patriarch of Alexandria. In 1628 it was sent as a present to Charles I. of England by Cyrillus Lucaris, patriarch of Constantinople, who declared that he had got it from Egypt; and that it was written there appears from internal and external evidence. Grabe made this manuscript the foundation of his edition of the Septuagint (4 vols., Oxf. 1717—1720). Fac-similes have been published, of the New Testament, by Woide (Lond. 1786, fol.); of the Old Testament, by Baber (Lond. 1816, fol.).

ALEXANDRIAN LIBRARY. This remarkable collection of books, the largest of the ancient world, was founded by Ptolemy Soter, in the city of Alexandria, in Egypt. Even in the time of its first manager, Demetrius Phalereus, a banished Athenian, the number of volumes or rolls already amounted to 50,000; and during its most flourishing period, under the direction of Zenodotus, Aristarchus of Byzantium, Apollonius Rhodius, and

others, is said to have contained 400,000, or, according to another authority, 700,000. The greater part of this Library, which embraced the collected literature of Rome, Greece, India, and Egypt, was contained in the Museum, in the quarter of Alexandria called Bruchium. During the siege of Alexandria by Julius Caesar, this part of the Library was destroyed by fire; but it was afterwards replaced by the collection of Pergamos, which was presented to Queen Cleopatra by Mark Antony, to the great annoyance of the educated Romans. The other part of the Library was kept in the Serapeion, the temple of Jupiter Serapis, where it remained till the time of Theodosius the Great. When this emperor permitted all the heathen temples in the Roman empire to be destroyed, the magnificent temple of Jupiter Serapis was not spared. A mob of fanatic Christians, led on by the Archbishop Theophilus, stormed and destroyed the temple, together, it is most likely, with the greater part of its literary treasures, in 391 A.D. It was at this time that the destruction of the Library was begun, and not at the taking of Alexandria by the Arabians, under the Calif Omar. The story, at least, is ridiculously exaggerated which relates that the Arabs found a sufficient number of books remaining to heat the baths of the city for six months. The historian Orosius, who visited the place after the destruction of the temple by the Christians, relates that he then saw only the empty shelves of the Library. See Petit-Radel, *Recherches sur les Bibliothèques Anciennes et Modernes* (Paris, 1819); and Ritschl, *Die Alexandrinischen Bibliotheken* (Berlin, 1838).

ALEXANDRINE AGE. After liberty and intellectual cultivation had declined in Greece, Alexandria in Egypt became the home and centre of science and literature. The time in which it held this position is styled the A. A., and may be divided into two periods: the first including the reigns of the Ptolemies, from 323 to 30 B.C.; the second, from 30 B.C. to 640 A.D., or from the fall of the Ptolemaean dynasty to the irruption of the Arabs.

Ptolemæus Soter, the first ruler who introduced and patronised Greek science and literature in Alexandria, was followed by that yet more munificent patron, Ptolemæus Philadelphus, who regularly established the celebrated Alexandrian Library and Museum, which had been probably begun by his father. This Museum contained porticos, a lecture-room, and a large hall, in which the learned men—the professors and fellows, as they might be called—dined together. The A. school consisted of Egyptians, Greeks, Jews, and latterly, Romans. The grammarians and poets made the greatest figure. The grammarians were both philologists and *littérateurs*, who explained things as well as words, and were thus a kind of encyclopædists. Among these rank Zeuodotus of Ephesus, Eratosthenes of Cyrene, Aristophanes of Byzantium, Aristarchus of Samothrace, Crates of Mallus, Dionysius the Thracian, Apollonius the Sophist, and Zoilus. Their chief service consists in having collected the writings then existing, prepared corrected texts, and preserved them for future generations. The most noted of the poets of the A. school were Apollonius Rhodius, Lycophron, Aratus, Nicander, Euphorion, Callimachus, Theocritus, Dionysius, and the seven tragedians called the A. Pleiades.

The A. school has a spirit and character altogether different from the previous intellectual life of Greece. From the attention paid to the study of language, it was natural that correctness, purity, and elegance of expression should become especially cultivated; and in these respects many of the A. writers are distinguished. But what no study and no efforts could give—the spirit, namely, that animated the earlier

Greek poetry, was, in most of these works, wanting. In place of it, there was displayed greater art in composition; what had formerly been done by genius, was now to be done by the rules furnished by criticism. Only a few display real genius; the works of the rest, faultless according to rule, are destitute of life and soul. In a school, where imitation and rule thus took the place of inspiration, each generation of disciples became more artificial and lifeless than their masters. Criticism degenerated into frivolous fault-finding, and both prose and poetry became labour'd affectation.

The ALEXANDRINE PHILOSOPHY is characterised by a blending of the philosophies of the East and of the West, and by a general tendency to *eclecticism*, as it is called, or an endeavour to reconcile conflicting systems of speculation, by bringing together what seemed true in each. Not that the A. philosophers were without their sects; the most famous of which were the Neoplatonists (q. v.). Uniting the religious notions of the East with Greek dialectics, they represent the struggle of ancient civilisation with Christianity; and thus their system was not without influence on the form that Christian dogmas took in Egypt. The amalgamation of eastern ideas with Christian, gave rise to the system of the Gnostics (q. v.), which was elaborated chiefly in Alexandria.—The A. school was no less distinguished for the culture of the mathematical and physical sciences, which here reached a greater height than anywhere else in ancient times. As early as the 3d c. B. C., Euclid had here written his great work on geometry. The astronomers of the A. school were distinguished from all their predecessors by their setting aside all metaphysical speculation, and devoting themselves to strict observation. Among the distinguished physicists and mathematicians of the A. school, were Archimedes, Eratosthenes, Aristarchus of Samos, Ptolemaeus, &c. For about four centuries, the A. school was the centre of learning and science in the ancient world. Counting from its origin to its complete extinction, it lasted 1000 years.

ALEXANDRINES are rhyming verses consisting each of twelve syllables or six measures. The name is most probably derived from an old French poem on Alexander the Great, belonging to the 12th or 13th c., in which this measure was first used; according to others, it was so called from the name of one of the authors of that poem being Alexander. The Alexandrine has become the regular epic or heroic verse of the French, among whom each line is divided in the middle into two hemistichs, the sixth syllable always ending a word. In English, this rule is not always observed, as in the following verse from Spenser:

That all the woods shall answer, and their echo ring.

The only considerable English poem wholly written in A. is Drayton's *Polyolbion*; but the Spenserian stanza regularly ends in an Alexandrine, and the measure occurs occasionally in our common heroic verse, as the last line of a couplet:

When both are full, they feed our blest abode,
Like those that watered once the paradise of God.—*Dryden*.

ALEXANDROVSK, a town in the south of Russia, capital of the district of the same name, situated on the left bank of the Dnieper, below the cataracts. It is 48 miles south of Ekaterinoslav, is fortified, and has considerable trade. Inland productions are shipped here for the Black Sea. Pop. 4601.—There are various other towns and districts of the same name in Russia; the most important of which is that in the government of Vladimir, in the centre of the empire. It was a favourite summer

residence of the Czar Ivan Vasiliewitch, who introduced there the first printing-press known in Russia. It has also a magnificent imperial *stud*, commenced by the Empress Elizabeth in 1761, and completed about twenty years after. Pop. (1867) 5810.

ALEXEI MICHAÏLOWITCH, the second Russian czar of the House of Romanow (b. March 10, 1629—d. January 29, 1676), succeeded his father, Michael Fedorowitch, in 1645. The young Czar A. yielding himself to the control of his chancellor, Plessow, and his tutor, Morosow, the avarice of these bad advisers caused an insurrection in 1648, in which Plessow lost his life. Popular discontent favoured the plans of two pretenders to the throne—Demetrius III. (q. v.) and Ankudinow. The latter, professing to be a son of the Czar Wasili Shuiskoi, was executed at Moscow in 1653. A. possessed good qualities, which appeared when he came to riper years. In his two campaigns against the Poles (1654—1656, and 1660—1667), he took Smolensko, conquered and devastated almost the whole of Lithuania, and even secured for himself the possession of several provinces. He also gained a part of the Ukraine; and though his war with Sweden (1656—1658) was unfortunate, he lost nothing by the following peace. A. conferred great benefits on his countrymen, by the introduction of various important reforms into the Russian laws; he ordered translations of numerous scientific works, chiefly of a military nature, into Russian; and even ventured on some ecclesiastical changes. In his private character, he was amiable, temperate, and pious. His second wife, the beautiful Natalia Narischkin, was the mother of Peter the Great.

ALEXEI, PETRO'WITCH. The eldest son of Peter the Great of Russia, was born at Moscow, February 18, 1690. Having shewn himself opposed to the reforms and innovations made by the emperor, he was excluded by Peter from the line of succession to the throne. With this decision, he appeared to be satisfied, and declared his intention of spending the remainder of his days in a monastery. But when Peter the Great undertook his second tour in Northern Europe, A., under the pretence of following the czar, escaped in 1717 to Vienna, and thence went to Naples. He was induced to return to Russia, where, by the ukase of February 2, 1718, he was disinherited, and an investigation was ordered to detect all parties concerned in his recent flight from Russia. His mother, Eudoxia, with Marie Alexiewna, step-sister to the czar, and several other eminent persons, were made prisoners, and either executed or otherwise punished. A. was condemned to death, but soon afterwards received a pardon. However, the terror and agitation of the trial so affected his health, that he died June 26, 1718. The czar, to avoid scandal, ordered the trial to be published. Other accounts assert that A. was beheaded in prison. By his wife, Charlotte Christine Sophie, Princess of Brunswick-Wolfenbüttel, A. left a son, who, as Peter II., was elevated to the throne.

ALEXIUS COMNENUS, one of the ablest rulers of the Byzantine empire, was born at Constantinople in 1048. He was the third son of Johannes Comnenus, the brother of the emperor, Isaac Comnenus. The family came originally from Italy, and settled in Asia Minor. His father having refused the purple on the abdication of Isaac, it was given to one Ducaes, the son of a distinguished general. A. in his youth gave brilliant promise of the vigorous military genius which he afterwards manifested; and at length, after a series of anarchic reigns of brief duration, his soldiers succeeded in elevating him to the throne, while the old and feeble Nicephorus Botaniates, his predecessor, was obliged

to retire to a monastery. Gibbon graphically paints the position and achievements of A. in the 48th chapter of his *Decline and Fall of the Roman Empire*. Everywhere he was encompassed with foes. The Scythians and Turks were pouring down from the north and north-east; the fierce Normans, who had violently effected a lodgment in Sicily and Italy, were menacing his western provinces; and, finally, the myriad warriors of the first crusade had burst into his empire on their way to Palestine, and had encamped around the gates of his capital. Yet he contrived to avoid all perils and disgraces by the wisdom of his policy, the mingled patience and promptitude of his character, his discipline in the camp, and his humanity on the throne. He reigned for 37 years; and if it had been possible to preserve the weak and corrupt Byzantine empire in its integrity, a ruler like A. might have done it. He could only delay its inevitable destruction. Undoubtedly, the great interest which attaches to A. arises from his relation to the crusaders. Historians differ as to the purity and sincerity of his conduct towards them. His daughter Anna, who wrote his life, defends his 'policy' with filial piety; but it seems clear that he entertained a profound dread and suspicion of the half-civilised Franks, and, knowing the weakness of his own empire, was compelled to dissimulate. He certainly promised them help, and persuaded them to go off into Asia; it is equally certain that he did not fulfil his promises, and that he simply used them as instruments to reconquer from the Turks the islands and coasts of Asia Minor. Perhaps, however, little apology is needed for a monarch who 'subdued the envy of his equals, restored the laws of public and private order, caused the arts of wealth and science to be cultivated, and transmitted the sceptre to his children of the third and fourth generation.' He died in 1118.

ALFIERI, VITTORIO, COUNT, a modern Italian dramatic poet, was born at Asti, in Piedmont, on the 17th January 1749. He received a very defective education in his father's house, and was then sent to the academy of Turin, which he quitted, as ignorant and uninformed as he had entered it, to join a provincial regiment. After a hurried tour through the greater part of Europe, he returned to Turin in 1772. He then left the military service, and renouncing idleness and unworthy amours, devoted himself to literary occupation. The applause which his first attempts received, encouraged him in his determination to win fame as a dramatic author. But as he clearly saw the deficiencies of his education, he began at a mature age to learn Latin, and also to study the Tuscan dialect, for which purpose he went to Tuscany. On his journey thither, A. made the acquaintance of the Countess of Albany (q. v.), to whom he became deeply attached. To render himself worthy of her esteem, he strove with unremitting earnestness after poetic excellence; and in order to be perfectly free and independent of all other cares, he transferred his whole property to his sister, in exchange for an annuity. A. now lived alternately in Florence and in Rome. Afterwards, when his friend the Countess was released from other ties by the death of her husband, they lived together in the closest intimacy in Alsace or in Paris, where A. was necessarily occupied in writing, revising, and publishing his works. There appears to have been a marriage, although it was never made public. On the first outburst of the French Revolution, A. went to England, but soon returned to Paris. In 1792 he was again forced to flee from France, and he then settled with his inseparable companion in Florence. Here he died, on the 8th October 1803. The ashes of A. and

those of his friend repose in the church of Santa Croce, in Florence, under a beautiful monument by Canova, between the tombs of Michael Angelo and Macchiavelli. As a dramatic author, A. has attempted three different departments of his art. He published 21 tragedies, 6 comedies, and 1 'tramelogedia,' a name invented by himself. His dramatic works shew a want of fresh imaginative vigour, and betray the laborious perseverance with which he did violence both to himself and to art. A. was inspired more by politics than by poetry. He wished to breathe a spirit of freedom into the dormant minds of his countrymen, and considered the theatre as a school in which the people might learn to be 'free, strong, and noble.' In order to preserve the purity of his muse, A. had resolved to read no other poet. He wished to produce an effect by the very simplest means, and, renouncing the aid of ornament, to please by manly strength and earnestness alone. His works are on this account cold and stiff, his plots simple even to poverty, his verse hard and unpleasing, and his language destitute of that magic splendour of colouring which stirs the inmost soul. Notwithstanding this, A. did good service to Italian tragedy. He corrected the effeminate taste which had before prevailed, as well as the pedantry of an affected imitation of Attic models. Succeeding writers endeavoured to imitate his strength and simplicity. A. was more unsuccessful in his comedies than in his tragedies. They manifest the same serious political tendency; the invention is poor, the development of the plot uninteresting, and the characters are only general sketches, without individuality. The most successful of his dramatic works is *Abel*, a mixture of tragedy and opera, invented by himself, which he designated by the singular name of 'tramelogedia.' Besides the dramatic works of A., we possess an epic poem, in four cantos, written by him, also many lyrical poems, 16 satires, and poetical translations of Terence, Virgil, and portions of Æschylus, Sophocles, Euripides, and Aristophanes. After his death, appeared his *Misogallo*, a memorial of his hatred to the French. The Countess of Albany had a collected edition of his works published (35 vols. 4to, Pisa, 1805—1815) containing his autobiography; Centofanti published *Tragedie e Vita d'Alfieri* (Florence, 1842).

ALFONSO I., earliest king of Portugal, was the son of Henry of Burgundy, conqueror and Count of Portugal. He was born in 1110 A.D., and being only two years of age at his father's death, the management of affairs fell into the hands of his ambitious and dissolute mother, Theresa of Castile, from whom he was compelled forcibly to seize it, on attaining his majority. He then entered on a war with Castile, whose supremacy he did not recognise, and leaguely himself with Navarre, made several conquests in Galicia, after which he proceeded to attack the Moors, whose invasions he had already begun to check by building the fortress of Leiria. A battle was fought in the plains of Ourique, July 25, 1139, when victory declared for the Portuguese, after a bloody struggle, in which, it is said, not less than 200,000 Moors perished. From that day, A. assumed the title of king, which the pope confirmed. On the 25th October 1147, he took Lisbon, by the help of the English fleet of crusaders; and in 1158, after a siege of two months, made himself master of Alcazar-de-Sal and Evora. In 1171, he took by assault the fortress of Santarem from the Saracens, and annihilated the garrison; and at the same place he defeated the Almohadian ruler, Jusuf-ben-Jakub, in 1184. He invited to his land the Knights-Templars and Knights of St John, and established the orders of Avis, and of St Michael. The Portuguese style him *El Conquistador* (the Conqueror). But he was also a

legislator, establishing the Cortes of Lamego, and promulgating a code of laws relating to the order of succession, the privileges of the nobility, the administration of justice, &c. He died at Coimbra, December 6, 1185.

ALFONSO VI., king of Portugal, second son of John IV., was at first destined for the church, but the death of his elder brother in 1656 altogether changed his circumstances. Being then a minor, the government of the kingdom was intrusted to his mother, Louisa de Guzman, a woman of great wisdom and prudence, who felt it her duty to retain the power in her own hands, even after A. had reached his majority; for the sickly and disolute prince displayed little aptitude for business. But the court minions, who had their own reasons for wishing him to rule, urged him to remove his mother from her office. This was accomplished in 1662. The minister, Count Castel-Melhor, a mere trifler, possessed supreme authority. Nevertheless, Portugal was victorious in the war which she undertook against Spain, although for this she had to thank her English and French allies. In 1666, A. married Maria-Francisca-Elizabeth of Savoy, who, however, soon conspired with his brother Pedro against him. The plot succeeded. A. was seized and imprisoned at Cintra, where he died on the 12th of September 1683. Pedro then obtained the throne, and married the widow of his deceased brother.

ALFONSO III., surnamed THE GREAT, king of Leon, Asturias, and Galicia, born 848 A. D. He succeeded his father, Ordoño I., in 866, but had to maintain his rights by force of arms against Count Froila, who had usurped the throne. Having caused the latter to be murdered, he proceeded sternly to reduce to obedience the powerful nobility of the kingdom, who looked with a jealous eye on the monarchy remaining in one family; and then, carrying his arms against other enemies, he fought through more than 30 campaigns, and gained numerous victories over the Moors. He crossed the Douro, broke down the walls of Coimbra, penetrated to the Tagus and Estremadura, enlarged his territories by a portion of Portugal and Old Castile, and re-peopled the conquered and desolated Burgos. But these wars entailed great expense and misery on the nation. In 888, A. had to endure the pain of beholding, at the head of a rebel army, his own son Garcias, who wished to seize the crown, although pretending a simple desire for the prosperity of the commonwealth. A. collected his forces, conquered his son, and threw him into prison. But Garcias' mother, by the help of several of the grandees, excited a new conspiracy, which resulted in the abdication of the monarch in favour of his imprisoned son. In order, however, to be still useful to his country, A. became commander of Garcias' forces in an expedition against the Moors. After returning in triumph, he died at Zamora, 910.

ALFONSO V., king of Aragon, Naples, and Sicily (1416—1458 A. D.), received the surname of 'the Magnanimous,' because on his accession to the throne he destroyed a document containing the names of all the grandees who were hostile to him. His historical importance arises from his having brought Southern Italy under the dominion of Aragon. In 1420, he attacked Corsica, but speedily basted to Naples, at the request of Queen Joanna II., who besought his assistance against Louis of Anjou. For some time he enjoyed the highest favour; but, in 1423, having thrown into prison her minion Caraccioli, who was his enemy, the queen declared for his rival, Louis. At her death, in 1435, A. resolved to claim the kingdom, but René of Anjou, whom Joanna had appointed her successor after the death of Louis,

opposed him. Rome and Genoa sided with René, and the Genoese fleet attacked and defeated that of A., the monarch himself being taken prisoner. He was sent to Duke Philip of Milan, who, charmed by his manner and talent, set him at liberty, and even formed an alliance with him. After several battles, and a long mountain-war in the Abruzzi, A. overthrew his adversary, and entered Naples in triumph. Having once firmly established his power, he proceeded to suppress the disorders which had sprung up during the worthless reign of Joanna, and honourably distinguished himself by his patronage of letters. He died at Naples while his troops were besieging Genoa, June 27, 1458.

ALFONSO X., surnamed 'the Astronomer,' 'the Philosopher,' or 'the Wise' (*El Sabio*), king of Leon and Castile, born 1221, succeeded his father, Ferdinand III., in 1252. As early as the storming of Seville in 1248, he had given indications of his courageous spirit. But, instead of wisely attempting to expel the Moors and subdue the nobility, he lavished the resources of his kingdom in fruitless efforts to secure his election to the imperial throne of Germany. Rudolf of Hapsburg was chosen in opposition to him. Nor would Pope Gregory X. recognise his claims even to the Duchy of Swabia. Soon after, his throne was threatened by the turbulence of the nobility, and his wars with the Moors. The latter, however, he defeated in 1263, in a bloody battle, and took from them Xeres, Medina-Sidonia, San-Lucar, and a part of Algarve, uniting at the same time Murcia with Castile. In 1271, an insurrection broke out in his dominions, at the head of which was his son Philip. Three years elapsed before it was finally quelled. In the mildness with which he treated the rebels, men saw only indications of his weakness. But afterwards determining to employ more stringent measures, his son Sancho also rebelled, and in 1282 deprived him of his throne. He now sought the help of the Moors; but after fruitless efforts to recover his power, he died at Seville, April 4, 1284. He was the most learned prince of his time, and has acquired lasting fame through the completion of the code of laws commenced (though this is disputed) by his father, and called *leyes de las Partidas*, which in 1501 became the universal law of the land. There are still extant several long poems of his, besides a work on chemistry, and another on philosophy. He is also credited with a history of the church and of the crusades, and is said to have ordered a translation of the Bible into Spanish. He laboured much to revive knowledge, increasing both the privileges and professorships of the university of Salamanca. He sought to improve the Ptolemaic planetary tables, whose anomalies had struck observers even at that early time. For this purpose, in 1240, he assembled at Toledo upwards of fifty of the most celebrated astronomers of that age. His improved tables, still known under the name of the Alfonsine Tables, were completed in 1252 at the cost of 40,000 ducats—an unprecedented sum to be expended on such a work in those days. The results obtained by means of the Alfonsine Tables were no more accurate than those of the older ones, for both were based on the same erroneous hypothesis of Epicycles (q. v.). The *Opusculos Legales* of A. were published by the Royal Historical Society of Madrid in 1836.

ALFORD, REV. HENRY, D.D., a biblical critic of the highest reputation, and also a poet of considerable genius, was born in London in 1810, but was educated first at Ilminster grammar-school in Somersetshire, and finally at Trinity College, Cambridge, where he took his degree, and entered the church. His first volume, published at Cambridge in 1831, was

entitled *Poems and Poetical Fragments*. Three years afterwards, the young author was elected a Fellow of Trinity, and in the following year (1835), appeared his most popular work, *The School of the Heart, and other Poems*, which has been frequently re-issued, especially in America. About the same time, A. was appointed vicar of Wymeswold, Leicestershire, where he remained till 1853, gradually enlarging the circle of his studies, and obtaining fresh honours. In 1841, he published *Chapters on the Greek Poets*, which exhibit both purity of taste and breadth of scholarship. In 1844 appeared the first volume of his *magnum opus*, the Greek Testament with notes and various readings; the second was not published till 1852. In 1853, he was removed to Quebec Street Chapel, London, where he continued to maintain his high reputation as a sound and eloquent preacher, until, in 1857, he was appointed Dean of Canterbury by Lord Palmerston. A.'s poetry is characterised, not so much by depth or originality, as by freedom from affectation, obscurity, or bombast. His Greek Testament, which was completed in 1861, occupies the first rank among English editions. Among his latest writings was *A Plea for the Queen's English*, contributed to *Good Words*, which excited considerable discussion. He also published several volumes of sermons. He died January 12, 1871.

ALFRED, surnamed THE GREAT, was born at Wantage, in Berkshire, in 849. His father was Ethelwolf, son of Egbert, king of the West Saxons; and though the youngest of four sons, he succeeded to the crown, on the death of his brother Ethelred, at the age of 23. He had already given decisive proofs of high ability as a general in repelling the incessant incursions of the Danes, at that time the most terrible warriors in Europe. After he succeeded to the throne, he redoubled his exertions to restore the independence of his country. At first he strove without success, whilst the Danes continued to pour fresh bands upon the coast, and the Anglo-Saxons either bent to the yoke or forsook their homes. In 878, the invaders had completely overrun the whole kingdom of the West Saxons. A., no longer able to collect an effective army, was obliged to seek security in the hills and forests, and for some time found refuge in a cowherd's hut. He still, however, kept up some communication with his friends; and as soon as the people began once more to arm against the Danes, he built a stronghold on an elevation or island (still known as Athelney, i. e., the 'island of the nobles,' or the 'royal island') amid the marshes of Somersetshire, to which he summoned his faithful followers. From this fortress he made frequent successful sallies against the enemy, and after a comparatively short time, he found himself at the head of a considerable army, with which he totally routed them (878) near Edington, in Wiltshire. After holding out for some time in a stronghold to which they had retreated, the invaders capitulated. A. accepted hostages, and their solemn oath to quit his territory of Wessex, and receive baptism. Their king, Godrun or Guthrun, was baptised, with thirty of his followers, and ever after proved faithful in his allegiance to A.

After this decisive victory, the power of A. steadily increased, both by land and sea—for already he had built England's first fleet—he beat the Danes in numerous battles, and gradually their possessions were confined to the northern and eastern coasts. In 886, A., without any formal installation, became recognised as the sovereign of all England, a title to which he had proved his right by the most indisputable of arguments. During the ensuing years of peace, he rebuilt the cities that had suffered most during the war, particularly London; erected new fortresses, and trained the people to the use of arms;

while at the same time he encouraged husbandry and other useful arts, and founded those wise laws and institutions which contributed so much to the future greatness and welfare of England. The grateful reverence of posterity has, as is usual with mankind, become prodigal in its awards, ascribing to A. the entire credit of having established many beneficial institutions, some of which had already existed among the Anglo-Saxons, but were by him revived, remodelled, and improved. Of his political institutions, little is known beyond the fact that he compiled a code of laws, divided England into counties, hundreds, and tithings, and thoroughly reformed the administration of justice by making these tithings, hundreds, &c., so far as was practically possible, responsible for the offences committed within their jurisdiction. William of Malmesbury, with enthusiastic exaggeration, declared that 'a purse of money, or a pair of golden bracelets,' might in A.'s day be exposed for weeks in complete safety on the common highways. A. is also said—though erroneously, as is now believed—to have been the author of 'trial by jury.' In an age of ignorance and barbarism, A. was an accomplished scholar and a zealous patron of learning. No prince of his age did so much for the diffusion of knowledge, and few monarchs at any time have shewn an equal zeal for the instruction of their people. He caused many manuscripts to be translated into Anglo-Saxon from Latin, and himself translated several works, such as Boëthius on the *Consolation of Philosophy*, the *History of Orosius*, Bede's *Ecclesiastical History*, and *Selections from the Soliloquies of St Augustine*. Among his original works in the Anglo-Saxon language, are *Laws of the West Saxons*, *Institutes*, *Chronicles*, *Meditations*, &c. All his works strikingly indicate the serious, elevated, and yet practical character of the man. In his translations, A. is frequently more than a translator. He adds his own reflections to those of his author; and expands the geographical outline of Orosius, by a chart of Germany, an account of the Baltic, and the icy regions towards the north pole, which are pretty accurate, considering the means which then existed for acquiring a knowledge of these places. Several works attributed to A. are believed not to be genuine.

The peaceful labours of A. were, in 893, interrupted by a fresh invasion of Northmen under Hæsten or Hastings, more formidable than any that had yet been attempted in his reign. The defection of the East Anglians and Northumbrians added to the difficulties with which he had to contend. A., however, was fully prepared, and though, during their protracted stay in his dominions, the invaders overran a large extent of country, and committed considerable depredations, they were beaten in almost every encounter with the English, and finally quelled. A. died on the 27th of October 901, aged 52, leaving his country in the enjoyment of comparative peace and prosperity, the fruit of that wise and energetic rule which has made his memory dear to all generations of Englishmen, as that of their best and greatest king. We cannot perhaps realise the resolute patience of A., in his political and military capacity, for we have but a very imperfect knowledge of the obstacles which stood in his way; but it must excite both our highest wonder and reverence to behold a man pursuing solitarily, in the midst of ferocity, barbarism, and ignorance, and in spite of the perpetual pains with which his body was racked, so many various and noble schemes for the civilisation and true glory of his country.—The most authentic and interesting of the original sources of information on the history of A., is the life by Asser, bishop of Sherborne, a

book distinguished by extreme simplicity and affection. The best edition is that of Wise (Oxford, 1782). Of the recent Lives, the most complete and careful is that of Dr Pauli, edited by T. Wright; published by Bentley.

ALGA MARINA. See GRASS WRACK.

ALGÆ, a natural order of plants, belonging to the class *Cryptogamia* of Linnæus, and to the *Acotyledones* of the natural system. It contains a great number of species, about 2000 being known and described, and among these there is a great variety of forms. They grow for the most part in water, some in fresh, and some in salt water, but some also on moist rocks or ground; whilst others are frequently found covering the glass and pots of hot-houses. Some species occur even upon diseased animal tissue, as *Achlya prolifera* upon the gills of fish, whilst *Sarcinula ventriculi* (q. v.) appears to be formed in the human stomach. They are most numerous in still or stagnant water and in warm climates. Their structure is very various; they are

Algae.

- | | |
|-------------------------------|---------------------------------|
| 1. <i>Alaria esculenta.</i> | 3. <i>Himanthalia lorea.</i> |
| 2. <i>Dictyota dichotoma.</i> | 4. <i>Rytiphloea thuyoides.</i> |

found of all grades, from the little microscopic vesicle, to great sea-weeds, which ramify like trees. The diversity in size is as great as in form; some species being visible only through the microscope, and resembling mould or rust; some a few inches, others several feet in length; whilst the *Laminaria*, which float in the South American seas, measure more than 100 feet; and *Macrocystis pyrifera* of the Pacific Ocean reaches the length of 1500 feet. Yet they are seldom to be found as thick as the finger, or as broad as the hand, although some far exceed these dimensions, the trunk of *Lessonia fuscescens* attaining the thickness of a man's thigh. Some species are firmly fixed at the bottom of the water, some adhere to rocks and stones left dry by the retiring tide; some frequently break loose, and float about upon and beneath the surface. They have in no case proper roots, but merely processes for their attachment to the surfaces on which they are fixed; they seem to derive their nourishment by all parts of their surface from the water or moist air in which they grow. The Guliweed (*Sargassum*) floats in long pieces in the Atlantic Ocean and all the great seas; a large portion of the sea between the West Indies and the Canary Islands, is specially called the *Mer de Sargasse*. The weed is carried in such quantities by the current into the Gulf of Mexico, that it covers the sea in tracts of many miles in breadth, and gives it the appearance of a meadow. Many fabulous stories were related of this Guliweed by the mariners of the 15th c. Ships were said to have been stopped in their course, and the crews obliged to cut their way through with hatchets.

The discoveries of Columbus put an end to these exaggerated reports.

A. are entirely cellular in their structure, however elongated may be their fronds, having no proper vessels, but consisting of an irregular tissue of utricular cells. The fronds of many are articulated. Some of the simplest or lowest organisation are propagated by spontaneous separation; in others, the reproductive organs consist of spores (see ACOTYLEDONOUS PLANTS) enclosed in *perispores*, and variously disposed in receptacles of different kinds; sometimes in the interior of the cells. *Anthridia* (q. v.) also occur in some; and *zoospores*, or spores with moving *cilia*, which exhibit phenomena of motion resembling those of animal life. The *Diatomacea*, in which the ordinary mode of reproduction is by spontaneous separation, have by some been referred to the animal kingdom. They are entirely microscopic, resemble the animalcules called *Infusoria*, and are generally found in still waters and moist places, but occur in prodigious numbers in some parts of the Antarctic Ocean, where they give a colour to the water.

A. differ from Fungi (q. v.) in deriving their nourishment exclusively, as it would seem, from the medium by which they are surrounded, and not from the substance upon which they grow. The substance of which they are composed is also very different. Yet it has been felt not a little difficult to determine to which order some of the lowest forms of vegetable life should be referred.

As to their substance, A. consist chiefly of vegetable gelatine, which dissolves in water when they are boiled in it. The harder parts of their fronds are sometimes coriaceous, or horny, or cartilaginous, but never really ligneous. Their colour is not always green, but mostly brown or yellow, sometimes purple or violet, or rose-colour; and many of them present a very beautiful appearance when examined through a microscope. Many contain an abundance of iodine. Different species of WRACK (*Fucus*), (q. v.), which are cast on shore in vast confused masses by the waves, are gathered and burned in the Orkney Islands, in Normandy, and other parts of the world, the ashes forming an article of commerce under the name of KELP (q. v.), and containing much of the iodide of sodium. Sea-weeds of all kinds are an excellent manure. None of the species are poisonous, and some of them are used for food, as CARRAGEEN (q. v.) or Irish-moss, DULSE (q. v.), LAYER (q. v.), &c. The edible swallows' nests of the Indian Archipelago are composed of a species of sea-weed. Several kinds are eaten as articles of luxury by the Chinese. *Plocaria tenax*, one of the species so used, furnishes them also with an admirable glue, of which great quantities are prepared and brought to the market. *Plocaria helminthocorton*, Corsican moss, a native of the Mediterranean, and found principally around the shores of Corsica, is used as a vermifuge. See PLOCARIA.

This natural order is divided into five sub-orders, regarded by some as distinct orders—namely,

Fucus vesiculosus :

showing the receptacles of the fructification *a, a*, at the ends of the branching frond; *b, b*, large air-cells which help to float the plant.

CHARACEE (q. v.), FUCACEE (q. v.), CERAMIACEE (q. v.), CONFERVACEE (see CONFERVA), and DIATOMACEE (q. v.). The Characeae are sometimes separated as a distinct order of higher organisation, whilst the rest are united under the name *Algae*. See Kützing's *Phycologia Generalis* (Leip. 1843), and his *Species Algarum* (Leip. 1849); Greville's *A. Britannicæ* (Lond. 1830); and Harvey's *Manual of British A.* (Lond. 1841).

ALGARDI, ALESSANDRO, an Italian sculptor (b. at Bologna 1602—d. 1654), ranked next to Lor. Bernini among Italian sculptors of the 17th c., and especially excelled in the representation of nude figures. His works, however, suffered from the faults prevalent in his time, especially from a striving after pathos and picturesque effects, opposed to the true character of sculpture. His most important work is a colossal relief of Attila in St. Peter's, Rome. His statue of the God of Sleep in the Villa Borghese has frequently been mistaken for an antique.

ALGARÔ'BA. See CAROB.

ALGAROTTI, FRANCESCO, COUNT, an Italian author, was born at Venice in 1712, studied in Rome and Bologna, and when 21 years old, published in Paris (1733) a work, entitled *Newtonianismo per le Dame* (The Newtonian Philosophy adapted to the Ladies), which was the basis of his subsequent reputation. Until 1739, he lived in France. On his return from a journey to Russia, A. became acquainted with Frederick II. of Prussia, who elevated him to the rank of count, and made him, in 1747, lord chamberlain. He was also patronised by Augustus III. of Poland, and lived alternately in Berlin and Dresden until 1754, when he returned to Italy. He died March 3, 1764, at Pisa, where, in the Campo Santo, Frederick the Great raised a monument to his memory. In his own time he was recognised as a good judge of painting and architecture, and his reputation is confirmed by his work *Saggi sopra le Belle Arti* (Essays on the Fine Arts), and by the paintings he selected for the Dresden Gallery. His poetry displays no great genius; but his other works shew that he was an accomplished man; and his letters rank with the best in the Italian language.

ALGARVÉ, the smallest and most southerly of the provinces of Portugal, lies between Andalusia and the Atlantic Ocean. In ancient times, it was much more extensive. It received its name from the Arabs, in whose language *A.* signifies 'a land lying to the west.' It was a Moorish province till 1253, when Alphonso III. united it to the crown of Portugal as a separate kingdom. Its area is estimated at 2730 square miles, and its population is 177,000. The northern part of the province is occupied by a range of mountains of an average height of 4000 feet, which form the continuation of the Sierra Morena of Spain, and terminate in Cape St. Vincent, the south-western extremity of Europe. The highest ridges are entirely destitute of vegetation; and the mountainous tract in general admits of but little cultivation. From the main ridge, the country slopes southward in jagged terraces and low hills, leaving a level tract of a few miles along the coast. The soil of this plain is but indifferently suited for the production of grain, or even of pasturage; but it produces abundance of the finest fruits of the south, even plantains and dates. The wine is also of excellent quality. The African heat of the climate is mitigated by the cool sea-breeze. The only river of importance is the Guadiana, on the frontiers of Spain. The inhabitants employ themselves chiefly in fishing, in manufacturing salt, and in cultivating fruit. They are considered the

best sailors and the truest friends in Portugal. The chief town is Faro (pop. 5500).

ALGEBRA is a branch of pure mathematics. The name is derived from the Arabs, who call the science *Al gebr wal mokibala*—i. e., supplementing and equalising—in reference to the transposition and reduction of the terms of an equation. Among the Italians in early times it was called *Arte Maygiore*, as having to do with the higher kinds of calculation, and still oftener *Regola de la Cosa*, because the unknown quantity was denominated *cosa*, the 'thing;' hence the name of *Cosike Art*, given to it by early English writers.

The term Algebraical is generally used somewhat vaguely, to denote any expression or calculation in which signs are used to denote the operations, and letters or other symbols are put instead of numbers. But it is perhaps better to restrict the name *A.* to the doctrine of Equations (q. v.). Literal arithmetic, then, or multiplying, dividing, &c., with letters instead of Arabic ciphers, is properly only a preparation for *A.*; while Analysis (q. v.), in the widest sense, would embrace *A.* as its first part. *A.* itself is divided into two chief branches. The first treats of equations involving unknown quantities having a determinate value; in the other, called the Diophantine or Indeterminate Analysis, the unknown quantities have no exactly fixed values, but depend in some degree upon assumption.

The oldest work in the West on *A.* is that of Diophantus of Alexandria, in the 4th c. after Christ. It consisted originally of 13 books, and contained arithmetical problems; only six books are now extant. They are written in Greek, and evince no little acuteness. The modern Europeans got their first acquaintance with *A.*, not directly from the Greeks, but, like most other knowledge, through the Arabs, who derived it, again, from the Hindus. The chief European source was the work of Mohammed Ben Musa, who lived in the time of Calif Al Mamun (813—833); it has been translated into English by Dr. Rosen (Lond. 1831). An Italian merchant, Leonardo Bonaccio, of Pisa, travelling in the east about 1200, acquired a knowledge of the science, and introduced it among his countrymen on his return; he has left a work on *A.*, not yet printed. The first work on *A.* after the revival of learning is that of the Minorite friar Paciolo or Luca Borgo (Ven. 1494). Scipio Ferreo in Bologna, discovered, in 1505, the solution of one case of cubic equations. Tartaglia of Brescia (died 1557) carried cubic equations still further, and imparted his discoveries to Cardan of Milan, as a secret. Cardan extended the discovery himself, and published, in 1545, the solution known as 'Cardan's Rule.' Ludovico Ferrari and Bombelli (1579) gave the solution of biquadratic equations. *A.* was first cultivated in Germany by Christian Rudolff, in a work printed in 1524; Stifel followed with his *Arithmetica Integra* (Nürnb. 1544). Robert Recorde, in England, and Pelletier, in France, wrote about 1550. Vieta, a Frenchman (died 1603), first made the grand step of using letters to denote the known quantities as well as the unknown. Harriot, in England (1631), and Girard, in Holland (1633), still further improved on the advances made by Vieta. The *Géométrie* (1637) of Descartes makes an epoch in *A.*; it is rich in new investigations. Descartes applied *A.* to Geometry, and was the first to represent the nature of curves by means of equations. Fermat also contributed much to the science; and so did the *Arithmetica Universalis* of Newton. To these names may be added Maclaurin, Moivre, Taylor, and Fontaine. Among the chief promoters of *A.*, in more recent times, are Euler, Lagrange, Gauss, Abel, Fourier, Peacock, De Morgan, &c.

ALGECIRAS, or ALGEZIRAS, a town in Spain, in the province of Cadiz, on the Gulf of Gibraltar. Its harbour is bad, but it possesses a good dock, and the inhabitants are supplied with fine aqueducts. The citadel is in a very dilapidated condition, and the trade in corn and brandy is no longer important. The place, however, which is pleasantly situated, has a picturesque appearance. It was the first town in Spain taken by the Moors (713), in whose possession it remained for 7 centuries; but in 1344, after a siege of 20 months, it was retaken by the brave Alfonso XI., king of Castile. It is said that crusaders from all parts of Europe were present at this siege, which was the siege of the age, and is spoken of as such. Edward III. of England purposed coming in person to the assistance of the Spanish monarch, whom he greatly admired. Alfonso destroyed the old Moorish town; the modern one was built by Charles III. in 1760. On the 6th of June 1801, between Algeciras and Tarifa, the English admiral Saunarez attacked the combined French and Spanish fleets under Rear-admiral Luinois. He was defeated, but renewed the engagement a few days after, and gained a complete victory. A. is 5 miles from Gibraltar, across the bay or gulf, and 10 round by land. Pop. 11,500.

ALGERIA (in French, ALGÉRIE), a country on the north coast of Africa, which was a subordinate part of the Turkish Empire till 1830, and is now a French colony. It lies between 2° S' W. long. and 8° 32' E. long. It is bounded on the north by the Mediterranean, on the east by Tunis, on the south by Sahara, and on the west by Morocco. The French have extended their dominions more than 200 miles into the interior, but those of the deys—the former rulers of A.—comprehended territories lying nearly twice as far south. The area of A., now that the southern limit is defined, is about 173,000 sq. miles; and the pop. 2,904,014, including 217,990 Europeans. The chief towns are Algiers, Bona, Constantine, and Tlemzen. Upwards of 5,000,000 acres are under cultivation. Physically, A. forms a part of the northern border of the great plateau of North Africa, which here rises from the sea in three terraces. The Atlas Mountains run parallel to the coast-line. Behind these, a vast tract of heathy plains, called the *Sekhas*, interspersed with salt-lakes, stretches southwards, until bounded by a second chain of mountains of various heights; beyond which, again, lies the great desert of Sahara, extending to the banks of the Niger. The plains and valleys which open out towards the sea in the north of A., such as those round Bona, Algiers, Oran, &c., are extremely fertile, abound in wood and water, consist mostly of a calcareous soil, and are well adapted for agriculture. They form the *Tell*, which was once one of the granaries of Italy. In strong contrast to these are the *Sekhas* or lesser deserts, covered with herbs and brushwood, but almost destitute of fresh water, except where here and there they are interrupted by an oasis. The most southern part of the country beyond the Atlas partakes of the nature of the Sahara, but contains oases covered with palm-trees, and well peopled. This is a part of the 'date-country,' or 'Blad-el-Djerid.' There are no rivers of any importance in the entire colony, nothing beyond mere coast-streams, which rise in the neighbouring Atlas. The largest is the Shelif, about 230 miles in length. With respect to the climate, the heat in the *Tell* is sometimes very great. On the coast it is mitigated by the sea-breeze; and among the high mountains of the interior, the winters are even cold. The average temperature of Algiers is about 63° F. A. is not unfrequently visited by the *simoom*, or hot wind, called by the Italians *sirocco*, and by the Spaniards

solano. Its mineral wealth is considerable; iron, lead, copper, and manganese are found. The marble of Numidia was in requisition in ancient times. Extensive forests of oaks, cedars, pines, and pistachio-nut trees cover large portions of the country, and furnish an abundant supply of timber and resin. The cereals and the olive are cultivated in the *Tell*; and the oases of Sahara are famed for their dates. The domestic animals of A. are the ox, the sheep, the goat, and the camel; but the once noble race of Numidian horses is degenerated. The population is composed of various elements. Besides Europeans, there are Kabyles and Arabs, who compose the bulk of the people; also Moors, Negroes, and Jews.

Language.—Four languages are spoken in A. The Berber, the Arabic, the Turkish, and the Negro dialects. The Berber, which is the most ancient of all, has a variety of dialects, and is spoken by all the Kabyle tribes. It possesses no literature written in its own alphabet, Arabic characters alone being used. The Arabic is of course an importation from the East, and has borrowed expressions and idioms from the various native languages with which it came into contact; but its differences are comparatively slight. The Koran is the great bond of union. The Turkish, since the French conquest, has become almost extinct. The Negro dialects are of little consequence.

History.—In the most ancient times we find the Numidians settled in the eastern part of the regency, and the Moors (or Mauri) in the west. Under the Romans, the former was included in the province of Africa, while the latter was called Mauritania Cesariensis. Like the rest of North Africa, it had then reached its highest prosperity. It had numerous cities, which were principally Roman colonies. But its conquest by the Vandals, under the famous Genseric about 440, threw it back into a state of barbarism, from which it only partially recovered after the Mohammedan immigrants had established their dominion. About the year 935, the city, Al-Jezira, i. e., the island, and later Al-Gazie, i. e., the warlike, now called Algiers, was built by an Arabian prince, Zeiri, whose successors ruled the land till 1148, after which it was governed by the Almohades (q. v.) till 1269. It was then split up into many small territories. In 1492, the Moors and Jews who had been driven out of Spain, settled in A., and began to revenge themselves on their persecutors by piracy. Ferdinand, the Spanish monarch, attacked them on this account, took the city of Algiers in 1509, and erected fortifications on the island which forms its harbour. One of the Algerine princes, the Emir of Metidja, whose territories were threatened by the Spaniards, now invited to his assistance the Greek renegade, Horuk or Harude Barbarossa, who had made himself famous as a Turkish pirate chief. This laid the foundation of the Turkish dominion; for when Barbarossa arrived in 1516, he treacherously turned his corsair bands against the emir, whom he murdered, and then made himself Sultan of Algiers. His subsequent successes alarmed the Spaniards, who marched an army against him from Oran. Barbarossa was defeated in many encounters, and, at last, being taken prisoner, was beheaded in 1518. His brother was then chosen sultan. He put himself under the protection of the Ottoman court, by the help of a Turkish army drove the Spaniards out of the country, and established that system of military despotism and piracy which lasted till 1830, and which sunk A. into a state of ruinous degradation. In 1541, the Emperor Charles V. made a bold attempt to crush this nation of corsairs. He landed in A. with a fleet of 370 ships, and 30,000 men; but a fearful storm, accompanied by earthquakes and water-spouts, destroyed the greater portion of the

ALGERIA.

former, and rendered the latter destitute of victuals, &c.; so that the expedition proved a failure, and Charles was glad to re-embark, which he managed to do with extreme difficulty.

The history of A., under the Moslems, offers few episodes worthy of notice. The Algerines continued to carry on their piratical war against the powers of

Christendom, venturing even to land on the Italian and Spanish coasts. Inland, too, they were constantly fighting to extend their territories. Before the end of the 16th c., they had subdued the whole country to the verge of Marocco, with the exception of Oran, which belonged to Spain. The Spaniards were invariably unsuccessful in their attempts at

reprisals. Emboldened by success, the Algerines pushed their piratical expeditions even beyond the Straits of Gibraltar. In the year 1600, the Turkish janissaries of Algiers obtained from the Constantinopolitan court the right to choose a dey from among themselves, who should share the power with the pacha appointed by the Sultan, and be their commander-in-chief. The result of this divided authority was internal strife and confusion. Nevertheless, the insolence of the Algerines at sea increased. They attacked even the coasts of Provence, compelling Louis XIV. to chastise them thrice; which he did, however, with very little effect. An incident occurred during the first bombardment of Algiers by the French fleet in 1682, which illustrates the reckless ferocity of these corsairs. By way of answer to the cannonading of his enemies, the dey caused the French consul, Vacher, to be shot off from the mouth of a mortar! After the third bombardment in 1687, the dey scornfully inquired of the French how much money the burning of Algiers had cost their master, and on being told, coolly replied that 'he would have done it himself for half the sum, and spared their king the trouble.' No more decisive result followed the attack of Admiral Blake in 1655, nor of the English and Dutch fleets in 1669 and 1670; yet the English were the first to form treaties with the Algerines. In 1708, the dey, Ibrahim, made himself master of Oran; and his successor, Baba-Ali, succeeded in effecting the virtual emancipation of the country from the dominion of the Porte. He banished the Turkish pacha; craftily persuaded the Sultan of Turkey to leave the power solely in his hands; carried on war, and concluded peace at his own pleasure, and paid no more tribute.

A. was now ruled by a military oligarchy, at the head of which stood the dey, and after him the powerful Turkish militia, recruited from Constantinople and Smyrna, because their children by native mothers could not enjoy the same privileges as themselves. Besides these, there was a divan, or

council of state, chosen from the sixty principal civil functionaries. The internal history of the country henceforth presents nothing but a bloody series of seraglio revolutions, caused by the lawless janissaries, who permitted few of the deys to die a natural death. In the year 1775, Spain undertook her last great expedition against A., with 44 ships of war, 340 transports, and 25,000 soldiers. This, however, was as singularly unfortunate as all her previous ones. Everything went wrong, and the Spaniards had to re-embark as speedily as possible, leaving behind them 1800 wounded, and all their artillery. Thus A. continued to defy the greater Christian powers, and to enforce tribute from the lesser. During the French Revolution, and the time of the Empire, its piracies were much diminished in consequence of the presence of powerful fleets in the Mediterranean Sea; but at the close of the war, they were recommenced as vigorously as ever. This brought down upon 'the nation of corsairs' the vengeance of the Christian powers. The Americans took the lead, attacked the Algerine fleet off Carthage, on the 20th June 1815; defeated it, and compelled the dey to acknowledge the inviolability of the American flag. About the same time, the English admiral, Lord Exmouth, extorted from the other states of Barbary the recognition of an international law respecting the treatment of prisoners. A. alone refused to consent to it; and after a delay of six weeks, the English and Dutch fleets, under the command of Lord Exmouth, fiercely bombarded the capital. The batteries of the pirates were soon silenced; and in a few hours the half of the city lay in ruins; its naval force and its magazines being all destroyed. The dey, an ignorant and obstinate barbarian, still wished to protract the fight, but his soldiery forced him to yield, and a treaty was concluded (1816), by which all Christian slaves were released without ransom (the number was 1211), and a promise was given that both piracy and Christian slavery should cease for ever. But nothing

could keep these wretches from piracy. As early as 1817, they ventured as far as the North Sea, and seized all ships in their course not belonging to any of the powers who sent them tribute or presents, as was done by Sweden, Denmark, Portugal, Spain, Naples, Tuscany, and Sardinia. Nor did even treaties avail to protect European vessels at all times. The Spanish, the Papal, and, in particular, the German shipping, suffered severely; while the dey mocked by his insolent replies the remonstrances addressed to him.

Meanwhile, the internal condition of A. continued to present the spectacle of a cruel pratorian despotism. In the year 1817, the power of the janissaries was greatly weakened by the skilful tactics of the dey, Ali. Upon his death, which was occasioned by the plague in the following year, Hussein was chosen in his stead, under whom the Moslem dominion was terminated by a conflict with France. The causes of this conflict were various. A French trading-brig was plundered in Bona in 1818; the dwelling of the French consul was attacked in 1823; Roman ships sailing under the protection of the French flag were seized; and even French ships were detained and plundered. But the chief cause of the quarrel was a dispute about the payment of a debt incurred by the French government to two Jewish merchants of Algiers at the time of the expedition to Egypt. This debt was fixed at seven millions of francs; four and a half millions were immediately paid; the rest was reserved until the counter-claims of certain French creditors should be decided in the French law-courts. For three years the lawsuit dragged its slow length along, till the dey became impatient—being himself a principal creditor of the Jewish-Algerine house—and angrily demanded payment from the King of France. To his letter no answer was returned. The feast of Beiram occurring soon after, when it was customary for the dey to receive all the consuls publicly, he asked the French consul why his master had remained silent. The latter haughtily replied that 'a king of France could not condescend to correspond with a dey of Algiers.' Upon this, the dey struck him on the face, and fiercely abused his sovereign. In consequence of this insult, a French squadron was sent to Algiers, which received the consul on board, and blockaded the city (12th June 1827). Six days after, the dey caused the French coral-fisheries at Bona to be destroyed. For three years the blockade was listlessly carried on; but in April 1830, during the ministry of Polignac, a warlike manifesto appeared; and a month later, a fleet sailed for the African coast, consisting of 100 ships of war, and 357 transports, having on board an army of 37,000 infantry, 4000 cavalry, and a proportionate number of artillery, under the command of Lieutenant-general Bourmont. The landing was effected under trifling opposition. A perpetual skirmishing then took place previous to the bombardment of Algiers, which commenced on the 4th July. Next day, a capitulation was agreed to. The Turkish soldiers marched out—for such were the conditions—with their families and private possessions, and the French took possession of the place. Fifteen hundred guns, 17 ships of war, and 50,000,000 francs fell into their hands as spoil. The dey retired to Port Mahon, with his private property and a train of 118 persons, while the greater number of the Turkish janissaries were conveyed to Asia Minor. The conduct of the French soldiery, however, it must be confessed, tarnished the glory of their conquest. They went about plundering remorselessly the beautiful villas and gardens in the neighbourhood of Algiers, as well as the ancient valuables and works of art; thus exciting a universal spirit of hostility in the natives, who kept up an incessant guerilla warfare outside the capital.

After the revolution of July, Marshal Bourmont resigned, and General Clausel was appointed his successor. The latter, who was a prompt and vigorous man, set about subduing the country, and giving it a regular government. His predecessor had committed a great mistake in driving out the Turks, who might have been usefully employed in subordinate functions of authority. After their banishment, the Kabyles and Bedouins, believing themselves emancipated from all subjection, and stimulated by intense fanaticism against the new conquerors, rose in rebellion, or rather commenced a series of petty struggles, which obstructed the colonisation of A. for many years, and which cannot be said to have altogether ceased even yet. The imposition of French laws and institutions was made not in the wisest spirit, most of the old Turkish regulations being summarily abrogated. Besides this, the natives were wounded in their most susceptible point. Their mosques and burying-grounds were frequently desecrated and destroyed; and Clausel, whose vigour was more remarkable than his justice or prudence, confiscated—in direct contradiction to the very words of the capitulation—all the immovable property of the deys, and other exiled Turks, and of the townships, besides various religious institutions. The effect of these political crimes was instant. The entire provinces determined obstinately to resist; some even of the provincial rulers who had previously submitted, now appeared in arms again. Clausel was compelled to undertake a military expedition against the refractory beys; but his uncertain successes only inflamed the hatred and patriotism of the Kabyles and Arabs, who opposed him energetically. A young emir at last appeared on the scene, Abd-el-Kader (q. v.), who soon became the rallying-point of the *Jad* ('holy war'), which the Marabouts had begun to preach. Under these circumstances, it became impossible for Clausel to carry out his scheme of colonisation, and only a reckless speculation in land took place, which was in every way injurious. To strengthen his position, the French general, whose army was now greatly reduced, made a treaty with the Bey of Tunis; but the home-government disapproving of it, he was recalled in consequence. His successor, General Berthezème, having achieved nothing but defeat and disgrace in spite of his cruelties, was also speedily recalled, and Lieutenant-general the Duke of Rovigo appointed to the command. He arrived in Algiers on the 25th of December 1831, and established a most severe and relentless system. He scrupled not to perpetrate the most arbitrary acts, cruelties, and treacheries. His two most remarkable actions were, first, the complete annihilation of the whole Arab tribe El-Uflia, when even old men, women, and children were massacred during the night, on account of a robbery committed by some of the members of the tribe; second, the execution of two Arab chiefs who were hostile to him, and whom he had treacherously allured into the city by the written promise of a safe-conduct. Such monstrous proceedings fired the entire nation. The most peaceful tribes flew to arms, and the French were attacked on all sides. The Emperor of Morocco, who secretly fomented the strife, and even meditated the conquest of Oran, assisted the fierce and impetuous Abd-el-Kader in his designs. The health of the duke now declined. He returned to France in March 1833, and the administration of affairs was provisionally intrusted to General Avizard, who gained some credit by establishing the *Bureau Arabe*. After the death of the duke, General Voirol, a man exactly the reverse of his predecessor, was made interim commander-in-chief. His

efforts were more directed to promote the material interests of the colony, than to extend the power of France. He met with little opposition in the province of Algiers, and in the eastern districts; but, on the other hand, the war raged fiercely in the west, where Abd-el-Kader had either gained over or subdued all the tribes between Mascara and the sea. At length a treaty was effected with him, in which he pledged himself to make peace, and to deliver up all his prisoners. In return, he received a monopoly of the corn-trade, and the right to buy arms and ammunition in the French ports. Towards the end of 1834, the French government, having resolved to retain permanent possession of the colony, organised its administration anew, placing the supreme power, both civil and military, in the hands of a governor-general, who received his orders from the minister of war. General Drouot d'Erlon was the first appointed to this high dignity. Under him there were a commander of the troops, a commander of the naval force, a military intendant, a civil intendant, and a director of finance. The administration of justice was also regulated by the erection of many tribunals. Frenchmen and foreigners were to be subject to French laws, but the natives to their own. Moreover, the old Algerine courts of justice were still to be kept up. D'Erlon apparently desired, at first, to occupy himself with the internal administration of the regency, and, in truth, deserved much credit for the introduction of French municipal institutions, and the French system of education and police arrangements; but a disgraceful defeat suffered by the French army at Makta, on an expedition against Abd-el-Kader, who had secretly broken the treaty, caused the recall both of the officer in command and of D'Erlon himself. Clausel was now sent back to A. with the title of marshal. He arrived on the 10th of August 1835, his first anxiety being to wipe away the disgrace of the defeat at Makta. About three months after, he marched out at the head of 11,000 men, to attack Mascara, the centre of Abd-el-Kader's power: he had to fight many petty battles on his way, but was always successful. On reaching Mascara, he resolved to set it on fire, which he did on the 8th December, and then commenced his retreat, in which his army suffered severely from bad weather, and from perpetual harassments by the enemy. Abd-el-Kader was soon more powerful than ever, and General Bugeaud had to be sent out from France with reinforcements; but nothing came of this save a few fruitless victories over Abd-el-Kader, which did the latter no real harm. Bugeaud was at length compelled to make peace on the 30th May 1837. Abd-el-Kader recognised the sovereignty of France over the regency: he received, in return, the government of the provinces of Oran, Titeri, and Algiers, with the exception of the cities of Oran, Arzen, Masagran, Mostaganem, Algiers, Blidah and Koleah, Sahel (or the 'seacoast'), and the plain of Metidja. In exchange for the city of Tlenzen, he delivered to the French army 60,000 sacks of corn, and 5000 oxen: he was likewise permitted to buy arms and ammunition in France. In February 1837, Marshal Clausel was recalled, and Lieutenant-general Damrémont succeeded him. The condition of the colony was at this moment desperate, for the disgraces which followed the rash and even reckless measures of Clausel had everywhere lowered the *prestige* of the French army. The duty of the new governor-general was clear, but difficult: he had to wipe out the stain which attached to the honour of his soldiery, and to re-create the conviction of their superiority. He first attacked the Kabyles of the province of Algiers, and chastised them with

considerable severity, and then commenced his great work of taking Constantine, from which his predecessor had been compelled ignominiously to retire. In the month of May, with an army of 12,000 disciplined troops, besides *Zuawi* (originally light infantry raised among the natives), *Bataillons d'Afrique* (convict-battalions at first), the *Tirailleurs d'Afrique*, and the *Chasseurs d'Afrique*, as well as the Spahis (a cavalry corps composed of native soldiers commanded by French officers), Damrémont marched to the attack of Constantine, and in spite of fearful weather, succeeded in storming the city on the 13th. This victory laid the foundation for the entire subjugation of the province of Constantine, which was completed in the course of the two following years without any great effort.

On December 1, 1837, General Valée was appointed governor-general in the stead of Damrémont, who had fallen at the storming of Constantine. He, like the others, misunderstood the character of Abd-el-Kader when he considered it possible for him to remain quiet. New treaties were made, which only delayed hostilities. Meanwhile, the work of colonisation went on in spite of numerous obstacles. The province of Constantine was much improved by the building of towns and the making of roads; but suddenly, in October 1839, Abd-el-Kader, whose power had now become formidable to an unprecedented extent, violated the treaty on an insignificant pretext, and fell upon the unprepared French with an overwhelming force. The European settlements in the open plain were attacked and laid waste, bodies of French troops were surprised on their march and cut to pieces, small outposts and encampments were taken in a moment, and by the 24th of November, the dominion of the French was confined to the fortified cities and camps. Even the settlements in the plain of Metidja were lost. Forty thousand Arabs swept over it, and threatened Algiers itself. This state of things demanded energetic measures. The spring campaign was vigorously opened on both sides: everywhere the French gained splendid successes; while the heroic defence of the fort of Masagran, near Mostaganem (garrisoned by only 123 men), against from 12,000 to 15,000 Arabs, who stormed it incessantly, and with the utmost fury, for three days, raised the *prestige* of the invaders higher than ever. Still, however, nothing was really accomplished. After repeated bloody defeats, the native tribes again rushed to arms, swept the plains, and rendered life insecure at the very gates of Algiers. The only thing of any practical importance which took place during the whole year, was the beginning of the circumvallation by which the fertile plain of Metidja was to be secured against the hostile incursions of the Arabs. Marshal Valée was now recalled, and Lieutenant-general Bugeaud appointed his successor. The latter arrived at Algiers on February 22, 1841, and adopted a new system, which was completely successful. A brave, inexorable, and unscrupulous man, he resolved to employ any and every means for the attainment of his purpose. He wearied out the enemy by incessant *razzas* (predatory excursions) against individual tribes, corrupted them (not a difficult thing to do) by all the arts of bribery, and on special occasions undertook great expeditions to annihilate the regular power of Abd-el-Kader, whose strong defensive positions he destroyed, and whose authority he spared no pains to undermine. The French army was raised to 80,000 or 100,000 men. Its operations were carried on from three principal points. Victory followed Bugeaud wherever he went. He relieved and victualled hard-pressed garrisons; intimidated the

surrounding country; penetrated to Tekedempt—the very stronghold of Abd-el-Kader himself—which he laid in ashes; marched thence to Mascara, which was also taken; and on all sides received the submission of the terrified Arabs. Even the hottest period of the summer was made use of. Bugeaud bribed and seduced from their allegiance those Arabs who were under the sway of Abd-el-Kader. The autumn campaign was for the time decisive. Saida, the last fortress belonging to the gallant emir, was utterly destroyed, and now almost the entire country was subdued. Abd-el-Kader retired into Morocco, where he raised a new army, for his old one had been completely annihilated. He was, however, defeated by General Bedeau, and again compelled to retreat into Morocco, from which, however, he issued a second time, in the summer of 1842, and contrived to maintain a fierce but desultory warfare, for two or three years, aided by the Sultan of Morocco. At last, however, deserted by most of his followers, pursued by his late ally, and, in fact, hemmed in on all sides, he was forced to surrender to General Lamoricière, at the close of December 1847. See ABD-EL-KADER.

The revolution of February 1848, somewhat disturbed the progress of conquest and subjugation in A. That superb race of mountaineers, the Kabyles, descendants of the ancient Numidians, and possessed of the same fiery and dauntless spirit, broke out into a new insurrection, which, however, was speedily quelled. The National Assembly now offered to the European population of A. to incorporate the country with the republic of France, and to grant it all the accompanying political privileges of a French province; but intelligent men of all parties acknowledged the uselessness and danger of this step. It was, therefore, simply declared to be a permanent possession of the republic. Four deputies from the colony were permitted to take a part in all discussions in the National Assembly on Algerian affairs. Meanwhile, the work of conquest, colonisation, and, in some respects, civilisation went on. The French troops penetrated into the far south, almost to the borders of Sahara, sternly reducing to obedience the desert tribes, who manifested a not unnatural antipathy to these inroads, and in some cases fiercely resisted the invaders. Various tribes of the Kabyles, too, opposed every attempt at organised taxation, and the imposition of civilised discipline; the result of which patriotic obstinacy was, a new campaign against them by the French general, Bugia. Fortune again declared for the invaders; but the most alarming insurrection was that excited by the Cherif Bou-zian, who fled for freedom to Zaatcha in the oases. The French pursued him thither; but were beaten, and had to retreat. Some months after, they returned, largely reinforced, and in spite of the broad belt of palm-trees which hindered their operations, and the wild and strenuous heroism of the besieged, the place was stormed and destroyed. The defenders all perished.

In 1853—1854, and again in 1856—1857, expeditions were organised against the Kabyles; though not altogether with the will of the colonists, who could not but recognise the great intelligence and industry displayed by that highland race. The struggle was sanguinary and barbarous on both sides, but the French at last subdued their enemies. For two years (1858—1860) the military government of A. was superseded by the institution of a special ministerial department for A. and the colonies, which was first of all intrusted to Prince Napoleon. In December 1860, however, a military government was re-instituted, and Marshal Pélissier made Governor-general, with a Vice-governor under him, a Director-general for Civil Affairs, and a Council

of thirty members. In 1863, the Emperor Napoleon announced that he was willing to give the colony a new constitution, with a Chamber of Representatives for provincial affairs: he also addressed a letter to the governor-general, in which he explained that A. was no colony in the strict sense of the word, but an Arabian kingdom; and that the natives had the same right to protection as the colonists. In 1864, however, strife again arose between the colonists and the Arabs; and it was only after several engagements, during the months of April and May, that peace was restored by the submission of the conquered tribes. Pélissier having died in May 1864, Marshal MacMahon was appointed to succeed him. In the following year the emperor himself made a journey to A., and, on March 5, issued a proclamation, in which, although explaining to the Arabs that A. must continue to be united to France, he promised to maintain their nationality; and at the same time gave them assurance that they should always remain in undisturbed possession of their territories. Yet these and other measures for conciliating the Arabs were all in vain; for, shortly after the emperor's return to France, insurrections broke out in the province of Oran and elsewhere. Si-Hamed, a native chief, with 12,000 horsemen at his command, began to harass those tribes which remained in submission, until he was routed by Colonel Colomb of Geryville, and forced to escape into Sahara; after which, in the beginning of 1867, two expeditions, led by Colomb and Souis, succeeded in reducing to submission the other tribes which had revolted. In 1867 and 1868, a severe and general famine checked the military enterprises of the Arabs; and there was peace till 1870, when, the Franco-Prussian war having begun, the emperor found it necessary to withdraw to Europe the greater part of the forces in Africa. MacMahon's place was then taken by General Durieu, as interim governor-general; and the natives began to entertain hopes of freeing themselves from the yoke of France. Movements were begun in the provinces of Constantine and Oran, which it required all General Durieu's vigilance and activity to hold in check. After this, again, some disorder arose among the colonists themselves, who strongly desired the abolition of the military government—a change which the new republican government at Paris soon gratified them by effecting. To Durieu's place was appointed a civil governor, and under him prefects for each of the three provinces. A council was formed—composed of the prefects, archbishop, commander of the army, and other members appointed by the French government—with which, in all important cases, the governor has to take counsel. The present (1873) governor is Vice-admiral J. de Gueydon, appointed August 1871.

The French troops still stationed in A. consist of one 'corps d'armée,' numbering 60,000. It is said that the possession of A. has cost France the lives of 150,000 men, besides £120,000,000 in money. The revenue of A. is derived chiefly from indirect taxes, licenses, and customs duties on imports. In 1870, it amounted to 45,360,859 francs, and the expenditure to 51,762,316 francs. The cost of maintaining the army, however, the outlay for public works, and other large sums disbursed—amounting in 1873 to 24,496,109 francs—are not included in the expenditure, being provided out of the French budget.

* Since the subjugation of A., the French have conferred various benefits on the colonists and native tribes, not the least important of which has been the digging of Artesian wells (q. v.). In May 1856, a 'boring' was commenced in an oasis of the Sahara or desert of the province of Constantine. A civil engineer, a sergeant of Spahis, and a detachment of

soldiers of the Foreign Legion, succeeded in bringing to light a splendid fountain or river, yielding not less than 4010 quarts of water per minute. The work was considered a miracle. From all quarters the Arabs flocked to behold and enjoy it. The native priests blessed it, naming it the 'Fountain of Peace.' Another well was termed the 'Fountain of Benediction.' In the oasis of Sidi-Rached, unproductive for want of water, a well was dug, and at a depth of 54 mètres, yielded 4300 quarts per minute. It is known as the 'Fountain of Gratitude,' and the enthusiasm excited at its opening was boundless. The idea of providing such wells has rightly been considered 'a stroke of strong political wisdom.'

The government has done service to the colonists by encouraging the formation of banking-companies, &c. In July 1860, arrangements were made with the state, and a great company formed, to construct railways throughout the colony: difficulties occurred, however, and, of all the projected lines, that from the sea to Constantine was the only one approaching completion by the beginning of 1870. A telegraph cable was laid in 1870 between Bona and Marseille.

It would be too much to affirm that the colonisation of A. has advanced rapidly. The French government has acted neither very promptly nor very liberally towards settlers; and the number of formalities which require to be gone through before one can properly secure the land which he has purchased, often disgusts the poor farmer. However, great efforts have been made for the improvement of agriculture: altogether, 5,139,136 acres are stated as being under cultivation; 413,112 acres being cultivated by Europeans. The total exports of A. amounted in 1870 to £4,978,250; the imports to £6,907,628. Large quantities of 'esparto' for making paper are exported to Great Britain. A number of Mohammedan schools for instruction in French and Arabic have been established, and are regularly attended by pupils of both sexes, who learn to read and write fluently in the French language, and to keep accounts. In Algiers itself there are several of these schools where the female children are taught the art of sewing. Thus, although progress is slower than might have been anticipated, it is real, and its pace accelerating. When fierce memories have been softened by time, and such atrocities as those of Dahra (q. v.) have been forgotten in the substantial blessings which an enlightened civilisation cannot fail to bestow, the presence of the French in A. will cease to be deplored by the natives.

ALGHERO, or ALGHERI, a seaport on the west coast of the island of Sardinia, 15 miles S.W. from Sassari. It is well defended towards the sea, being built on a rocky point, and surrounded by thick walls, but is commanded by some hills which overhang the town. A. has a cathedral, several convents, a college, and public schools. It exports wine, tobacco, anchovies, skins, coral, bones, &c. It was a favourite residence of Charles V., in whose time it belonged to Spain. Pop., 8000.

ALGIERS (Arabic, Al-jezira, the island), the capital of Algeria, was built about 935 A. D. by an Arab chief. It rises from the sea-shore up the sides of a precipitous hill in the form of an equilateral triangle. The apex is formed by the Casbah, the ancient fortress of the deys, which is 500 feet above the sea-level, and commands the whole town. The base is a mile in length. The present city may be regarded as divided into two parts: the old, or high town; and the new, or low town. With the exception of some mosques, the latter consists of wharfs, warehouses, government houses, squares, and streets, principally built and inhabited by the French;

while the former is almost wholly Moorish both in its edifices and inhabitants. The great centre of bustle and activity in A. is the Place Royale—a large oblong space in the centre of the town, planted with orange and lime trees, and surrounded by houses in the European style. Here may be found as motley a crowd as anywhere in the world, denizens of all nations—Arabs, Moors, Jews, French, Spaniards, Maltese, Germans, Italians, &c. The city is intersected by two large parallel streets, Bab-el-Ouad and Bab-azoun, running north and south for more than half a mile. They are flanked by colonnades, but are very narrow, and therefore inconvenient for traffic; as promenades, however, nothing could be more agreeable. In 1833, A. had upwards of 100 mosques and marabouts. The mosques are divided into two classes—the djamas, or principal mosques, and the mesjids, or inferior mosques. The marabouts are the tombs and sanctuaries of saints. Everywhere A. wears the aspect of a rising colonial city. Other towns in the province still retain their oriental character, with the exception of a few military buildings; but the new town of A. might deceive the traveller into the belief that he is still in Europe, were it not for the throng of swarthy faces he meets. The streets are regular, spacious, and elegant; some of them as handsome as the Parisian Boulevards, and adorned with arcades. The shops, too, are occasionally very good. The houses are in some instances five stories high, which, though it gives a massive and imposing appearance to the city, is yet a very perilous innovation in a place which has suffered dreadfully from earthquakes.

But perhaps greater interest attaches to the old Moorish town, which is connected with the new by a steep, narrow, jagged-looking street called the Casbah, leading down from the fortress of the deys. The houses are square, substantial, flat-roofed; rise irregularly one over the other; and have no windows, but only peep-holes, which are intended to exclude impertinent eyes, and are therefore fortified with iron gratings instead of glass, so that the houses have a very prison-like appearance. Although the streets at first contrast unfavourably with those of Europe, on account of their narrowness, the coolness which this secures soon reconciles the traveller to other inconveniences. The inhabitants have recourse to their flat roofs or terraces in the evening, to enjoy the delicious sea-breeze. The French have introduced many useful reforms. There are conduits in every part of the city, public baths, coffee-houses, hotels, omnibuses, &c. The markets are held in the Squares de Chartres, Mahon, and d'Isly. Horse-racing is the great amusement. The Arabs are passionately fond of it. The French have also improved, at great expense and labour, the port, which was in a precarious condition. The town has supreme courts of justice, a chamber and tribunal of commerce, a college and schools, a Catholic cathedral and several churches, a French Protestant church, a synagogue, a bazaar for the exhibition of native industry, theatres, and banks.

A., which had been wretchedly misgoverned by a long succession of Turkish deys, fell into the hands of the French in 1830 (see ALGERIA), who swept away every trace of the ferocious despotism that had prevailed. The Turks withdrew in great numbers to Tunis and Alexandria; a small remnant, however, is still left. Pop. in 1866, 52,614, of whom about 34,000 were Europeans.

ALGOA BAY, an extensive inlet at the east extremity of the south coast of Africa, being intersected by the parallel of Cape Town, from which it is distant about 8 degrees of longitude. Its anchorage is sheltered, excepting on the south-east, the holding-ground being excellent. It receives two rivers, the

Sunday and the Baasher. At the mouth of the latter is Port Elizabeth. A. B. is the harbour of the eastern province, by far the most flourishing section of the colony; and it will ever be locally memorable as the landing-place of about 4000 souls in 1820, the first British emigration to this once Dutch possession. Since then, the trade of the bay has steadily and rapidly increased. See further, CAPE OF GOOD HOPE.

ALGO'NQUINS. The A. formed the most prominent of the three aboriginal races that the French found in the great basin of the St Lawrence. They were then the lords not merely of the best part of Canada, but of much adjacent territory to the north and west. At the present day, the A., as well as the Hurons and the Iroquois, exist, at least within the pale of settlement, only as the shadow of a mighty name, being chiefly confined to several miserable villages, with hardly anything of civilisation but its individual helplessness. This deplorable result, from whatever causes it may have arisen, is certainly not to be imputed either to oppression or to indifference on the part of the French, who, politically, religiously, and socially, have always treated the red man with consideration and humanity. On this interesting subject, see further under the general head of AMERICA.

ALGUACIL, or ALGUAZIL (derived from the Arabic *Wasil*, i. e., the 'power' derived from the king), is the general name in Spain of the officers intrusted with the execution of justice. There are 'Alguaciles mayores,' who either inherit the office of executing justice in a town as a hereditary right belonging to their families, or are chosen to the office by the municipality; formerly, the name was also given to the officers that executed the sentences or orders of tribunals, such as the tribunal of the Inquisition, and of the various orders of knights. But usually, under the name of A., is understood the 'Alguaciles menores,' or 'ordinarios,' that is to say, the attendants or officers of the courts of justice, gens d'armes, bailiffs—in short, all the inferior officers of justice and police.

ALHA'GI. See MANNA.

ALHA'MBRA is the name given to the fortress which forms a sort of acropolis or citadel to the city

Entrance to the Court of the Lions—Alhambra.

of Granada, and in which stood the palace of the ancient Moorish kings of Granada. The name is a corruption of the Arabic *Kal'at al hamra*, 'the

red castle.' It is surrounded by a strong wall, more than a mile in circuit, and studded with towers. The towers on the north wall, which is defended by nature, were used as residences connected with the palace. One of them contains the famous *Hall of the Ambassadors*. The remains of the Moorish palace are called by the Spaniards the Casa Real. It was begun by Ibnu-l-ahmar, and continued by his successors (1248—1348). The portions still standing are ranged round two oblong courts, one called the *Court of the Fish-pond*, the other the *Court of the Lions*. They consist of porticos, pillared halls, cool chambers, small gardens, fountains, mosaic pavements, &c. The lightness and elegance of the columns and arches, and the richness of the ornamentation, are unsurpassed. The colouring is but little altered by time. The most characteristic parts of the Casa Real have been reproduced in the 'Alhambra Court' of the Crystal Palace at Sydenham. A great part of the ancient palace was removed to make way for the palace begun by Charles V., but never finished. It is long since any part of the Moorish palace was inhabited; but it is kept in a state of preservation as a work of art, and as a memorial of the tragic legend of the Abencerrages (q. v.).

ALI PASHA, one of the most ferocious and unscrupulous men that even the east has produced, was descended from an Albanian pasha, who perished at the siege of Corfu in 1716. He was born at Tepelen, a small place at the foot of the Klissoura Mountains, in Albania, in 1741. His mother was a vindictive and merciless woman, who never hesitated to employ the most revolting means of accomplishing her purposes. Having lost his father, a comparatively quiet and enlightened man, his education necessarily devolved upon her; and she did not fail to inspire him with the same remorseless sentiments that animated herself. His youth was passed in extreme peril and hardship, for the neighbouring pashas combining, had robbed his father of nearly all his possessions, in the effort to recover which, young Ali was repeatedly defeated, and at last had to betake himself to the mountains, and even to pledge his sword to save himself from dying of hunger. These calamities were not calculated to soften the native ferocity of his disposition; they only nurtured a mingled boldness and cunning, which afterwards developed itself in a variety of qualities, such as subtlety, dissimulation, foresight, treachery, vigour, and diabolical cruelty. It is said that the change in his fortune arose from his having accidentally discovered a chest of gold, with which he raised an army of 2000 men, gained his first victory, and entered Tepelen in triumph. On the very day of his return, he murdered his brother, and then imprisoned his mother in the harem on the charge of poisoning him, where she soon after died. He next reconciled himself to the Porte by helping to subdue the rebellious Vizier of Scutari; and thus acquired not only the lands that had been wrested from his father, but likewise several Greek cities. He also attacked and slew (with the permission of the sultan) Selim, Pasha of Delvino, and, as a reward, was appointed lieutenant to the new Pasha of Derwend; but instead of attending to the security of the high roads (which was his office), he rendered them more insecure than ever, by participating in the plunder which the *klephtis* (robbers) were allowed to make. The result was, his deposition by the Porte; but he speedily purchased back its favour, for he was a master-hand at bribery. Shortly after this, he acquired a high reputation as a soldier, and did such good service to the Turks in their Austro-Russian war of 1787, that he was named Pasha of Trikala in Thessaly; at the same time he seized Janina or Joannina, of which he

got himself appointed pasha by the instrumentality of terror, a forged firman, and bribery. It must be admitted that, as a ruler, he now displayed many excellent qualities. He swept his old friends, the robbers, from the mountain-roads, incorporated them into military troops, quelled the wretched factions that prevailed, and everywhere introduced order in the place of anarchy, by the vigour and vigilance of his administration.

A short time after this, he entered into an alliance with Napoleon Bonaparte, who sent him engineers. When Bonaparte was defeated in Egypt, Ali, in 1798, took the places in Albania possessed by the French. After a three years' war, he subdued the Suliotes, for which the Porte promoted him to be governor of Romania. About this time, he revenged upon the inhabitants of Gardiki an injury done to his mother forty years before, by the murder of 739 male descendants of the original offenders, who themselves were all dead.

In the interior of his dominions, Ali maintained the strictest order and justice. Security and peace reigned, high roads were constructed, and industry flourished, so that the European travellers, with whom he willingly held intercourse, considered him an active and intelligent governor. From the year 1807, when he once more entered into an alliance with Napoleon, the dependence of Ali on the Porte was merely nominal. Having failed, however, in his principal object, which was to obtain, at the peace of Tilsit, through the influence of Napoleon, Parga, on the coast of Albania, and the Ionian Islands, he now entered into an alliance with the English, to whom he made many concessions. In return for these, they granted Parga, nominally to the sultan, but really to Ali. As he now considered his power to be securely established, he caused the commanders of the Greek Armatoles (or Greek militia), who had hitherto given him assistance, to be privately assassinated one by one, while at the same time he put to death the assassins, to save himself from the suspicion of having been their instigator. The Porte at length determined to put an end to the power of this daring rebel; and in 1820, Sultan Mahmoud sentenced him to be deposed. Ali resisted for a time several pashas that were sent against him; but at last surrendered, on the security of an oath that his life and property would be granted him. Regardless of this, he was put to death, February 5, 1822. Ali possessed, indisputably, great natural gifts; but along with them, a character of the worst description. He never scrupled to use any means, provided it speedily secured his end. Yet we can hardly help admiring the singular talent which he invariably displayed. Like many other half-civilised monarchs and chiefs who have lived within the sphere of European influence, he was keenly alive to whatever transpired among the powers of Christendom. Though utterly illiterate himself, he had all the foreign journals translated and read to him. He watched every political change, as if conscious that the interests of his little region depended for their future prosperity on the west, and not on the east; and made friendly advances to both the French and the English, recognising, with a sagacity remarkable in a barbarian, that the practical dominion of the world had passed from the Crescent to the Cross.

ALIBAUD, LOUIS, notorious for his attempt to murder King Louis-Philippe, was, at the Revolution of July, quarter-master in the 15th regiment of the line. Having been degraded subsequently to an accidental brawl in the streets of Strasbourg, he demanded his discharge in 1834, and went to live at Perpignan, and then at Barcelona, where, having become a fanatical republican, he returned to Paris, with the determination to murder the king. A

weariness of life had also seized him, so great, that he thought of suicide. It was on the 25th of June 1836, at the moment that the king, when driving through the gate of the Tuileries, bowed to the national guard as they presented arms, that A. fired the well-aimed ball, which passed close by the king's head. Being immediately seized, he regretted nothing but the failure of his attempt. After a short trial, he was sentenced to death, and was guillotined on the 11th of July.

ALI-BEN-ABI-TALEB, the first convert to Mohammedanism, and fourth calif, was the bravest and most faithful follower of the Prophet, whose daughter, Fatima, he married. Being roade calif in the place of the murdered Othman, he was victorious over the rebels in ninety engagements. He took prisoner Aysha, the young widow of Mohammed, and his greatest enemy, in the battle of the Camel—so called because Aysha appeared in the field riding on a camel. Ali was murdered by a fanatic in the year 660. He was buried near Kufa, where a monument was afterwards erected to him, to which his votaries still go on pilgrimage, and which caused the building of the city Medjed Ali. The religious sect formed by the followers of Ali, called Shiites (q. v.), has spread extensively under that name in Persia and Tatar. The descendants of Ali and Fatima, called the Fatimites (q. v.), although much persecuted by the Ommaiades, have nevertheless ruled on the banks of the Nile and of the Tagus, in West Africa and in Syria. The best edition of the Proverbs or Maxims ascribed to Ali has been published by Fleischer (Ali's *Hundred Proverbs, Arabian and Persian*, Leip. 1837); Ali's *Divan*, the most complete collection of his lyrical poems, mostly on religious subjects, appeared lately at Bulck, near Cairo.

ALIBI, Lat., signifying 'elsewhere.' This is a defence resorted to in criminal prosecutions, when the party accused, in order to prove that he could not have committed the crime with which he is charged, tenders evidence to the effect that he was in a different place at the time the offence was committed. When true, there can be no better proof of innocence; but as offering the readiest and most obvious opportunity for false evidence, it is always regarded with suspicion. In the case of crimes the place of committing which is immaterial—as, for example, the act of fabricating the plates, or of throwing off the spurious notes, in a case of forgery—a proof of *A.* is of no avail.

ALICANTE, chief town of a province of the same name in Spain. The province, formed of parts of the old kingdoms of Valencia and Murcia, contains (1867) 426,656 inhabitants. The town, one of the most considerable seaports of Spain, has 31,500 inhabitants, and is the staple place for the products of Valencia, especially soda, cotton and linen fabrics, ropes, corn, oil, silk, and the wine of the neighbouring district, known as *A.* or *vino tinto*, on account of its dark colour. A good deal of this rough, and at the same time sweet, wine is used to doctor thin clarets for the British market. In 1331 the town was besieged by the Moors; and again by the French under Asfeld in 1709, when the English commandant of the citadel, Colonel Richards, with all his staff, perished by the explosion of a mine.

ALIEN (Lat. *alienus*, belonging to another, foreign). The citizen of one state, when resident in another, unless naturalised (see NATURALISATION), is an alien. The condition of an alien does not necessarily result from foreign birth, for the son of a natural-born or naturalised Englishman is not an alien, wherever he may be born (4 Geo. II. c. 21, s. 1). This privilege even extends to the second

generation on the father's side; and thus a man whose paternal grandfather was an Englishman, is an Englishman himself, unless either his father or grandfather be liable to the penalties of felony, have been attainted of treason, or be serving in the army of a prince at war with England at the period of his birth (13 Geo. III. c. 21, s. 1). Neither is this privilege affected by the fact that the mothers of such persons were foreigners. The children of aliens born in England, except in the case of a hostile invasion, are natural-born subjects; but the children of English women by aliens are aliens, unless born within the British dominions. By 7 and 8 Vict. c. 66, s. 16, alien women married to natural-born subjects are naturalised. The allegiance due by an alien or stranger to the prince in whose dominions he resides, is usually called *local* or *temporary allegiance*. It differs from natural allegiance chiefly in this, that whereas natural allegiance is perpetual, and unaffected by change of residence, local allegiance ceases when the stranger transfers himself to another kingdom. See ALLEGIANCE. In 1792 and 1793, in consequence of the influx of foreigners caused by the French Revolution, several acts of parliament were passed, which are known by the name of the Alien Acts. The object of these acts was expressly to confer on the crown the power of banishing aliens from the realm; a power which there is reason to think was included in the general prerogative which the crown possesses of declaring war against the whole or any portion of the inhabitants of a foreign state. They were superseded by the Peace Alien Act (6 Will. IV. c. 11, 1836).

Changes extending the power of aliens to hold property, were introduced by 7 and 8 Vict. c. 66, and 10 and 11 Vict. c. 83; and the whole legislation regarding aliens was revised and placed on its present footing by the Naturalisation Act of 12th May 1870 (33 Vict. c. 14). By this act both real and personal property of every description may now be acquired, held, and disposed of, by an alien, in the same manner, in all respects, as by a natural-born British subject; and a title to real and personal property of every description may be derived from an alien, in the same manner, in all respects, as from a British subject. An alien is not qualified for any office or municipal, parliamentary, or other franchise, unless naturalised in accordance with the provisions of the act. The act does not affect any interest arising in pursuance of any disposition made before the passing of the act, or in pursuance of any devolution by law on the death of any person dying before the passing of the act. Where a convention has been entered into with a foreign state to the effect that the subjects, or citizens, of that state, who have been naturalised as British subjects, may divest themselves of such status, any person, originally a citizen of the state with which the convention exists, may make a declaration of alienage, and on so doing he shall be regarded as an alien and subject of the state to which he originally belonged. Even a British-born subject may now cease to be such, provided that, at the time of his birth, he was, and still continues to be, the subject of another state, by making a declaration of alienage. The privilege of aliens of being tried by a jury *de medietate lingue* is abolished, and it is provided that henceforth they shall be tried in the same manner as natural-born subjects. On the subject of expatriation, it is enacted, that any British subject who has at any time before, or may at any time after the passing of this act, when in a foreign state and not under any disability, voluntarily become naturalised in such state, shall thenceforth cease to be a British subject. In the case of a British subject who, before the passing of the act,

has been naturalised in a foreign state, desiring to retain his British nationality, he may do so by making a declaration and taking the oath of allegiance. Whilst resident within the limits of the foreign state, however, he shall not be deemed a British subject unless he has ceased to be a subject of that state. On naturalisation and the resumption of British nationality, see NATURALISATION.

By the above provisions it will be seen, that in so far as Great Britain is concerned, the injustice has been obviated of a man who had been naturalised in one state being still held to his citizenship in another, and thus exposed, in the event of war, to the guilt of treason if he took part on either side. The right of merchants to reside in England, and to possess goods, money, and other personal effects, is recognised by Magna Charta (Art. 45). See CONSPIRACY BILL.

ALIGNMENT, a term used in military tactics, equivalent to 'in line.' Thus, the A. of a battalion is effected when the men are drawn up in line; the A. of a camp is a rectilinear arrangement of the tents, according to some prearranged plan.

ALIMENT (Lat. *alimentum*), that which feeds or nourishes. A. is not known as a technical term in the law of England. In the law of France and in that of Scotland, it has retained the meaning which it possessed in the Roman law (*Dig. 34, 1, 6*), and signifies the food, dwelling, clothing, and other things necessary to the support of life, or such money as may be judicially demanded in lieu of them. In this sense, it is applied in Scotland to the allowance granted to a wife deserted by her husband, or whilst an action of divorce is in dependence, whether it be at his instance or at hers, to a pauper by his parish, to a prisoner for debt by his creditors, and the like. Alimentary allowances, being generally barely sufficient for the support of the recipient, and made to him in consequence of his being in want of such support, are not attachable by Arrestment (q. v.).

ALIMENTARY CANAL, in Mammalia, is that portion of the digestive apparatus through which the food passes after mastication. It is lined by a mucous membrane, which extends from the lips to the anus, being modified in each region. See MUCOUS MEMBRANE. The A. C. really begins at the back of the mouth, in the lower part of the bag called the pharynx, which communicates with the nostrils above, and the gullet or œsophagus below, and also with the mouth and the larynx. The pharynx is surrounded by three muscles, the constrictors, which grasp the food, and force it into the next portion of the A. C., the œsophagus. This is a tube composed of an outer layer of longitudinal muscular fibres, and an inner of circular, which extend down to, and spread out upon the stomach. These fibres, by a series of peristaltic contractions, carry the morsel of food along into the stomach. In vomiting, there is a reversal of these actions, which ruminating animals can accomplish at will. The œsophagus passes through an opening in the diaphragm, and joins the stomach, which is a pouch curved with the concavity upwards, expanded into a *cul de sac* on the left side (the cardiac extremity), and gradually narrowed to the right or pyloric end. It consists of muscular fibres continuous with those of the œsophagus, which become thicker towards the pylorus. Its external surfaces are covered by peritoneum, and it is lined by a thick soft mucous membrane, which, when the stomach is empty, lies in folds. Between the muscular and mucous layers is a fibrous layer, in which the blood-vessels lie before they pass into the mucous layer. See STOMACH. At its pyloric or left extremity the

stomach communicates with the small intestine, which is about 20 feet in length, becoming gradually narrower towards its lower end, and arranged in numerous convolutions, which occupy the middle of the abdominal cavity, and are kept in position by the peritoneum, which attaches them to the back of the abdomen.

The small intestine is subdivided into three parts. The first 10 inches from the stomach is the duodenum, into which open the duct of the pancreas and the common bile duct; of the remainder, the *jejunum* includes about two-fifths, and the *ileum*, three-fifths. The differences between these last two are not visible externally, but consist in modifications of their internal structure. The tube consists of peritoneum, longitudinal and circular muscular fibres, a fibrous layer, and the mucous membrane. See **INTESTINES, SMALL**.

The ileum ends at the right iliac region in the large intestine, which is from 5 to 6 feet in length. It begins at the pouch called the blind gut (caecum coli) or cul de sac (see **CÆCUM**) which has a small worm-like appendage (appendix vermiformis); a double valve guards the opening of the small into the large intestine. The colon passes upwards on the right side to below the liver (ascending colon), then crosses from the right hypochondrium across the upper umbilical region to the left hypochondrium (transverse colon), then descends to the left iliac fossa (descending colon), when it bends twice like an S (sigmoid flexure), and then joins the *rectum* at the left margin of the true pelvis. The colon is distinguished by its puffed or sacculated appearance, the sacs being separated by three flat bands of longitudinal muscular fibres. The peritoneum only covers it in parts. See **COLON**. The rectum is not sacculated, but its muscular coat becomes much thicker; at its lower end the longitudinal fibres stop, but the muscular become more numerous, forming the internal sphincter muscle. The rectum is not straight, but takes a curved course.

The *A. C.* thus consists of a continuous passage lined by mucous membrane, which rests on a fibrous and muscular basement. Its length is generally about five or six times the length of the body, or, in other words, about thirty feet. It begins below the base of the skull, and passes through the thorax, abdomen, and pelvis, and consists shortly of the mouth, pharynx, œsophagus, stomach, small intestine, and large intestine. The above is the description of the *A. C.* in human anatomy; its parts are variously modified in different animals, as will be found in the articles on its several subdivisions.

ALIMONY signifies, in English law, the allowance which a married woman is entitled to receive out of her husband's estate, on separation or divorce *a mensâ et thoro*. It is generally proportioned to the rank and quality of the parties. Where the wife elopes and lives with an adulterer, the law allows her no *A.* By Scotch legal writers, the term is sometimes used as synonymous with *Aliment* (q. v.).

ALiquot PART. One quantity or number is said to be an *A. P.* of another, when it is contained in this other an exact number of times without remainder. Thus 2, 2½, 4, and 5 are *A. parts* of 20, being contained in it 10, 8, 5, and 4 times. The consideration of *A. parts* occurs chiefly in the rule of *Practice*. Suppose we have to find the price of a number of articles at 6½*d.*: since ¾*d.* is the 5th part of 6*d.*, to the price at 6*d.* (which is found at once in shillings, by taking half the number of articles), add ⅕ of that price.

ALISMA'CEÆ, a natural order of monocotyle-

donous plants, consisting of herbaceous plants either floating in water or growing in swamps. The leaves have parallel veins, even if expanded into a broad blade. The flowers are in umbels, racemes, or panicles; the sepals 3, the petals 3, the number of stamens definite or indefinite. The ovaries are several, superior, one-celled, distinct or united; the styles and stigmas equal to them in number. The fruit is dry, with one or two seeds in each carpel; the seeds exalbuminous.—There are about fifty

Water Plantain (*Alisma plantago*).

known species, excluding the natural order JUNCA-GINEÆ, which is very nearly allied, and is included in this by some botanists. The species of both orders are chiefly natives of the northern parts of the world. **WATER PLANTAIN** (*Alisma plantago*) is a very common plant in stagnant waters in Britain, and is not destitute of beauty. Its leaves, which have long footstalks, shoot up above the water and amongst them, but far above them rises the erect scape or leafless stem, dividing into slender whorled branches and branchlets, among which the little flowers appear to lie thinly scattered. The fleshy rhizome, or root-stock, is eaten by the Calmucks, after it has been deprived of its acridity by drying. The corms of the **ARROWHEAD** (*Sagittaria*) possess somewhat similar properties. See **ARROWHEAD**.

ALISON, REV. ARCHIBALD, was born in Edinburgh in 1757. He studied at the university of Glasgow, and afterwards at Oxford. He took orders in the church of England in 1784, and subsequently held several preferments, among others, a prebendal stall in Salisbury, and the perpetual curacy of Kenley, in Shropshire. From 1800, Mr A. ceased to reside in England, and officiated in a chapel in his native city, where he died in 1839. A. is principally known by his *Essays on the Nature and Principles of Taste*, first published in 1790. The second edition, in 1811, gave occasion to an article by Jeffrey, in the *Edinburgh Review*, which brought the book more before the public. It has since gone through several editions, and been translated into German and French. The *Essays* advocate what is called the 'association' theory of the sublime and beautiful, and are distinguished for their pleasing and elegant style, and the fine feeling that pervades them. See **ÆSTHETICS**.

ALISON, SIR ARCHIBALD, Bart., born at Kenley, Shropshire, in 1792, was the younger son of the Rev. Archibald A., author of the *Essays on the Nature*

and Principles of Taste. His mother was Dorothea Gregory, daughter of Dr John Gregory of Edinburgh. In 1800, his father removed to the Scottish metropolis, where he had accepted the senior charge in the Episcopal chapel in the Cowgate, and thus A. had the advantage of studying in a city then, as now, distinguished for its politeness and learning. At Edinburgh University he obtained the highest honours in Greek and mathematics. After he had finished his curriculum, he became a member of the Scottish bar in 1814, but spent a considerable number of years on the continent, before devoting himself to legal avocations. In 1822, he was named advocate-depute, which office he held till 1830. He now began to appear as a writer on law, politics, and literature. His *Principles of the Criminal Law of Scotland*, published at Edinburgh in 1832, is considered a standard authority on the subject. In the following year he published a sequel to the work, entitled *The Practice of the Criminal Law*. In 1834, he was appointed sheriff of Lanarkshire, by Sir Robert Peel; in 1845, the students of Aberdeen elected him 'Lord Rector' of Marischal College; in 1851, he received the same honour from the students of Glasgow University, and subsequently, the title of D.C.L. from the university of Oxford. His great work is undoubtedly *The History of Europe during the French Revolution* (10 vols. 8vo, 1839—42), which narrates the events that occurred from 1789 to 1815; a continuation, under the title of *The History of Europe from the Fall of Napoleon to the Accession of Louis Napoleon* (9 vols.), was finished in 1859. He also published a *Life of the Duke of Marlborough*, *The Principles of Population*, &c., *Free Trade and Protection, England* in 1815 and 1845, besides contributing for many years to *Blackwood's Magazine* a series of tedious articles on Tory politics. It is very difficult to characterize Sir Archibald's *magnum opus*, *The History of Europe*. Although a work of immense industry, of very respectable accuracy, written with great animation and tolerable candour, it has failed to impress critics with a high idea of Sir Archibald A.'s abilities. The style is at times excessively wordy, and even when animated, it is never picturesque. Neither has he much insight into events or characters. Nevertheless, as his work supplied a felt want, and is sufficiently entertaining for a large class of readers, it met with an excessive popularity. It has gone through numerous editions, and has been translated into German, French, Arabic, and other languages. A. died May 1867.

ALISON, WILLIAM PULTENEY, M.D., political economist, physician, and professor of the practice of medicine, in the university of Edinburgh, from which last office, however, he retired in 1855, was an elder brother of the historian. He was extremely popular with all classes of the community, from the amiable and humane disposition which he invariably shewed in his efforts to alleviate the sufferings of the poor. A pamphlet published by Dr A. in 1840, to show how the inadequate provision for the poor in Scotland led to desolating epidemics, was the principal means of bringing about an improved poor-law for that country. His other writings are—*Outlines of Physiology*, and *Outlines of Pathology and Practice of Medicine*. In a work published at Edinburgh in 1850, entitled a *Dissertation on the Reclamation of Waste Lands*, he fully examines the subject, and recommends the colonisation of these by paupers and criminals. He died September 1859.

ALJWA'L, a village near the southern bank of the Sutlej, and not far from the town of Loodianah, in lat. 30° 57' N., long. 75° 36' E. It was the scene of a fierce conflict between the British and Sikh

forces on the 28th of January 1846. The latter having crossed the river for the purpose of foraging, or otherwise obtaining supplies, had threatened Loodianah, when they were attacked by Sir Harry Smith, defeated, and driven back with great slaughter. The victory of A. is said by good judges to have been 'without a fault.'

ALKAHEST, or ALCAHEST, the universal solvent of the alchemists. See ALCHEMY.

ALKALIES. The word *alkali* is of Arabic origin, *kali* being the name of the plant from the ashes of which an alkaline substance was first procured. The name now denotes a class of substances having similar properties. The alkalis proper are four in number—potash, soda, lithia, and ammonia. The first three are oxides of metals; the last is a compound of nitrogen, hydrogen, and oxygen, and, being in the form of a gas, is called the volatile alkali. Potash, being largely present in the ashes of plants, is called the vegetable alkali; and soda, predominating in the mineral kingdom, is designated the mineral alkali. The *alkaline earths*, as they are called—lime, magnesia, baryta, and strontia—are distinguished from the former by their carbonates not being soluble in water. The distinguishing property of alkalis is that of turning vegetable blues green, and vegetable yellows reddish brown. Blues reddened by an acid are restored by an alkali. The alkalis have great affinity for acids, and combine with them, forming salts, in which the peculiar qualities of both alkali and acid are generally destroyed; hence they are said to neutralise one another. In a pure state, alkalis are extremely caustic, and act as corrosive poisons. Combined with carbonic acid, especially as bi-carbonates, they are used to correct acidity in the stomach; but the injudicious and continued use of them is attended with great evil.

ALKALIMETER. Commercial potash and soda always contain greater or less quantities of foreign substances, such as sulphate of potash, common salt, silicates, oxide of iron, water, &c., which diminish the percentage of real alkali in a given weight. It is important, then, for the manufacturer to have some simple and ready means of determining the proportion of pure carbonate of potash or soda contained in any sample, that he may be able to judge of its value. Ordinary chemical analysis takes too much time. The A. serves this purpose. It consists of a graduated glass tube, filled with diluted sulphuric acid, and containing as much absolute sulphuric acid as would neutralise a given weight, say 100 grains, of carbonate of potash. 100 grains of the article to be judged of is then dissolved in water, and as much acid is gradually added to it from the tube as to neutralise the solution, that is, take up all the alkali. The application of coloured tests determines when the neutralisation is complete. The purer the article, the more of the acid will be required; and if the tube, which is divided into 100 degrees, has been emptied to the 80°, the impure article contains 80 per cent. of pure carbonate of potash.

This method of determining the strength of alkalis is called the *alkalimetry process*; but the instrument is not confined in its use to the estimation of the strength of alkaline substances. It is likewise employed in the determination of the strength of acids, such as sulphuric acid, hydrochloric acid, nitric acid, and acetic acid (vinegar). For this end, the graduated instrument is charged with a solution of an alkali of known strength, such as a given weight of crystallised carbonate of soda (washing soda), dissolved in water, and according to the number of divisions of the liquid poured from the A., the strength of the acid into which the alkaline liquid has been decanted, is calculated. The latter application

of this instrument is called *acidimetry*. Again, the same graduated glass tube has been recently employed in many other ways, such as the determination of the strength of a solution of silver, by charging the instrument with a known or standard solution of common salt; and for this purpose it is used largely by the assayers to the Royal Mint, and other metallurgic chemists. This mode of analysis is every day becoming of more and more importance, and, in fact, has given rise to a new department of analytical chemistry, which has been designated *volumetric analysis*.

ALKALOIDS form an important class of substances discovered by modern chemistry. They are divided into two classes—namely, *natural* and *artificial*. The natural A. are found in plants and animals, and are often designated *organic bases*. Those obtained from plants are likewise called *vegeto-alkalies*. They are composed essentially of carbon, hydrogen, and nitrogen; besides which, the greater number contain oxygen. The A. have generally an energetic action on the animal system, and hence are every day employed in small doses as medicine; whilst in comparatively large doses they are powerful poisons. They have, although in a low degree, the characteristic alkaline properties on vegetable colours, &c.; have generally a bitter, acrid taste; and form the active principles of the plants in which they are found. Such are morphia, codeine, and narcotine, found in opium; quinine and chinconine, in chincona bark; strychnine, in nux-vomica; hyoscyamine, in henbane; nicotine, in tobacco; piperine, in black pepper; caffeine or theine, in coffee and tea, &c.

The animal A. are few in number, the more important being urea, found in the urine of the mammalia; and kreatine and kreatinine, two of the constituents of the juice of flesh. The artificial A. are those organic bases which are not found in any known plant or animal, but of which the later researches of chemists have contrived to form a large number. As the artificial A. do not differ essentially from the natural A. in composition, structure, or properties, it is confidently believed that the day is not far distant when all of the A. will be prepared artificially; indeed, recently several of the natural A. have been manufactured on the small scale without the intervention of the living plant or animal. For instance, urea can be formed from the simplest form of dead organic nitrogenous matter.

ALKANET (*Anchusa*), a genus of plants belonging to the natural order *Boraginæ*, and having a 5-partite calyx, a funnel-shaped or salver-shaped corolla, with five seales closing its mouth, five stamens, an obtuse stigma, and ovate achenia, which are surrounded at the base by a plaited tumid ring. The species are herbaceous plants, rough with stiff hairs, and having lanceolate or elongato-ovate leaves, and spike-like, bracteated, lateral and terminal racemes of flowers, which very much resemble those of the species of *Myosotis*, or Forget-me-not.—The COMMON A. (*A. officinalis*) grows in dry and sandy places, and by waysides, in the middle and north of Europe. It is rare and a very doubtful native in Britain. The flowers are of a deep purple colour. The roots, leaves, and flowers were formerly used in medicine as an emollient, cooling, and soothing application.—The EVERGREEN A. (*A. sempervirens*) is also a native of Europe, and a doubtful native of Britain, although not uncommon in situations to which it may have escaped from gardens, being often cultivated for the sake of its beautiful blue flowers, which appear early in the season, and for its leaves,

which retain a pleasing verdure all winter. It is a plant of humble growth, rising only a few inches above the ground.—A number of other species are occasionally seen in our flower-borders.—*A. tinctoria*, to which the name A. or ALKANNA (Arab. *Al-chenneh*) more strictly belongs, is a native of the Levant and of the south of Europe, extending as far north as Hungary. The root is sold under the name of A. or Alkannaroot; it is sometimes cultivated in England; but the greater part is imported from the Levant or the south of France. It appears in commerce in pieces of the thickness of a quill or of the finger, the rind blackish externally, but internally of a beautiful dark-red colour, and adhering rather loosely to the whitish heart. It contains chiefly a resinous red colouring-matter, called *Alkanna Red*, *Anchusic Acid*, or *Anchusine*. The colour which it yields is very beautiful, although not very durable. It is readily soluble in oils, and is therefore in very general use amongst perfumers for colouring oils, soaps, pomades, hip-salves, &c. It is extensively used for colouring spurious port-wine. It also enters into compositions for rubbing and giving colour to furniture. Its solutions in oils and alcohol have almost a carmine red colour, although to water it gives only a brownish hue. It combines with alkalis, forming blue solutions; with chloride of tin, it becomes of a carmine red; with acetate of lead, blue; with sulphate of iron, dark violet; with alum, purple; and with acetate of alumina, violet.—VIRGINIAN A. (*A. Virginia*) yields a similar colouring-matter, and is used in the same way.

Alkanet (*Anchusa officinalis*).

ALKANNA (*Al-henna*) is also a name given to a colouring-matter prepared from the leaves of *Lawsomia inermis*, and used by oriental ladies to give a red colour to their nails. See HENNA.

ALKMAAR, an old town in the province of North Holland, in the Netherlands, situated on the Helder Canal, 20 miles N.N.W. of Amsterdam, in lat. 52° 38' N., long. 4° 43' E. Pop. 10,500. It is well built, has very clean streets, and is intersected by broad canals. It possesses a town-house, ornamented with curious Gothic carving. The inhabitants support themselves by important manufactures of sail-cloth, sea-salt, &c., as well as by trade in grain, butter, and cheese. A. is said to export more of the last-mentioned commodity than any other town in the world; 9,000,000 lbs. annually is the quantity specified. It is the birthplace of Henry of A. See REINEKE FROES. Here, on October 18, 1799, the Duke of York signed a not very honourable capitulation, after his Russo-British army had been twice defeated by the French general Brune.

ALLA BREVE. In old music, the breve $\text{C} \parallel$, as the longest note, was equivalent to our semi-breve, C , the longest note commonly used in modern music. Consequently, the minims anciently used were equivalent to our crotchets. Music written with four minims in a bar is signed *Alla Breve*, which implies that the four minims must be sung as four crotchets. The difference between the two styles of writing is merely formal. Other signs for A. B. time are— C , 2 , or C , or *Alla Capella*.

ALLAH (compounded of the article, *al* and *ilah*—i. e., 'the worthy to be adored') is the

Arabic name of the one God, to whose worship Mohammed pledged his followers; and the word has passed into all languages wherever the name of Islam has been heard. The notions of the character of this God given by Mohammed in the Koran bear manifest traces of Jewish and Christian influence, and are much superior to the national superstitions and impassioned fancies of the orientals in general. Above all other things, Mohammed inculcated the unity of God in the strictest sense, in opposition not only to idolatry, but also in some points to the belief of the Jews and Christians, as is seen in the following formula or creed: 'There is no God but the God (Allah). This only true, great, and highest God has his existence of himself, is eternal, *not begotten, and begets not*, suffices for himself, fills the universe with his infinity, is the centre in whom all things unite, manifest and concealed, Lord of the corporeal and spiritual worlds, creator and ruler, almighty, all-wise, all-good, merciful, and his decrees are irrevocable.' Mohammed has ventured on very bold illustrations of these attributes for popular representation, as in the passage of the Koran where he says: 'If all the trees on earth were pens, and if there were seven oceans full of ink, they would not suffice to describe the wonders of the Almighty.' The different attributes of God, divided under his ninety-nine names, and connected together in a certain order in a litany, form the rosary of the Mohammedans, which concludes with the name A., as the hundredth, including in itself all the former epithets.

ALLAHABAD, a British district in the North-west Provinces of India, between lat. 24° 49', 25° 44'; long. 81° 14', 82° 26'. It is 85 miles in length by 50 in breadth—area, 2801 square miles. The surface of the country is in general level, with a slope towards the S.E. The principal rivers are the Ganges (flowing partly within it, and partly dividing it from Oude and Mirzapore), and its great affluent the Jumna, which joins it at the city of A. The district is well watered, and vegetation is luxuriant. The native agriculture at the end of the last century was singularly rude and deficient, but the efforts of British residents have done much for its improvement. The principal products of the district are cotton and salt; and there is a brisk transit-trade by the Jumna in cotton, indigo, and sugar. The population, in 1872, was 1,382,826, chiefly agricultural, about 100,000 being Mohammedans and others not Hindus. The four principal towns are Allahabad, Shahzadpore, Bhugaisur, and Adampore.—The Province or Division of A. comprehends the districts of Cawnpore, Futtchepur, Humeerpore, and Calpee, Banda, and A. It is bounded N. by Oude and Agra, E. by Behar, S. by Gundwana, and W. by Malwa. Its length is about 270 miles; breadth, 120; area, 11,839 square miles; population, 4,527,000. It comprises one of the most populous and productive territories in India.

ALLAHABAD. This 'city of God'—for that is the meaning of its variously pronounced name—occupies the fork of the Ganges and Jumna, lat. 25° 26' N., long. 81° 83' E., thus forming the lowest extremity of the extensive region which, as lying between those natural boundaries, is distinguished as the *Doab*, or the country of *Two Rivers*—an analogous term to the *Punjab*, or the country of *Five Rivers*. The situation of A., at the confluence of the holy streams of India, besides giving the city its sacred appellation, has rendered it a much-frequented place of pilgrimage for the purposes of ablution, some of the devotees sinking themselves with weights to rise no more. In point of appearance, A. was scarcely worthy of its character and

renown. With the exception of a few ancient monuments of costly, elaborate, and tasteful workmanship, the native part of the city consists of mean houses and narrow streets. As in the towns generally of India, the European quarter, on the whole, is vastly superior. Its nucleus appears to have been the native fort, which, on the east and south, rises directly from the banks of both rivers, while towards the land its artificial defences, of great strength in themselves, are not commanded from the neighbourhood by any higher ground. This citadel, described by Heber as having been at one time 'a very noble castle,' has lost much of its romance by having had its lofty towers pruned down to bastions and cavaliers. The Europeans of the garrison occupy well-constructed barracks. Beyond the fort are the cantonments for the native troops. In connection with these are numerous villas and bungalows, few other spots in India boasting such handsome buildings of this kind; and these showy retreats are rendered still more attractive and agreeable by avenues of trees, which wind between them, and connect them with the fort, the city, and several of the circumjacent localities.

The summer of 1857 brought disaster to A. On the 6th of June of that year, the insurrection, which had begun at Meerut on 10th May, extended itself to A. Though the Europeans continued to hold the fort, yet the mutineers were, for some days, undisputed masters of all beyond; and between the ravages of the marauders and the fire of the garrison, the city soon became little better than a heap of blackened ruins. In the history of this fearful outbreak, A. must be 'a magic word' to every English ear, as the spot where the fiery Neill entered on his brief career of glory. It was here also that Lord Canning, after the close of the mutiny, distributed three millions sterling in presents to the chiefs who had remained loyal. But although situated thus in the heart of the outbreak, and feeling its disastrous effects, the city possesses natural advantages that have allowed it to recover. Its position at the confluence of the holy rivers, which has so long made it a centre of superstitious reverence and worship, now renders it naturally a centre of commerce and civilisation, and has been fully appreciated by government. It commands the navigation both of the Ganges and of the Jumna. It is on the direct water-route between Calcutta and the Upper Provinces; and is a main station, not only on the Grand Trunk Road, but also on the East Indian Railway. New buildings, many of them possessing great architectural merits, have accordingly sprung up with rapidity since 1857; the most noteworthy buildings being still, however, the Great Mosque and the Sultan Khosor's Caravanserai—a fine cloistered quadrangle. The Fort is of red stone, and is approached by a very handsome gate: it contains the palace or Residency, and the Gada pillar or Club of Bhin Sen, in the Chalce Satoom Temple, which is said to communicate with Benares by a subterranean passage, through which flows a third holy river, the Sereswati, visible only to the eye of faith. A. possesses a college, an hospital, theatres, bazaars, &c. The inhabitants number 75,000. So many poor pilgrims throng the city, especially at the time of the Great Fair, which is held once every twelve years, that instead of Allahabad, the natives call it 'Fakirabad,' or the City of Beggars. The cotton, sugar, and indigo produce of the fertile district of A. is brought in large quantities into the city, to be transported thence to Calcutta and elsewhere. Steamers sail to Calcutta, and barges to Delhi. A. is distant from Calcutta, by land, 496 miles; by water, 808 miles in the rainy season;

by water, 965 miles in the dry season. From Delhi it is distant 386 miles; and from Bombay, by the Jubbulpore branch of the East Indian Railway, 840 miles.

ALLAMANDA, a genus of plants of the natural order *Apocynaceæ* (q. v.), distinguished by a 5-parted calyx without glands, a funnel-shaped corolla with its limb campanulate, and the fruit a prickly capsule. *A. cathartica*, a native of the West Indies, is a shrub with whorled or opposite oblong leaves, and large yellow flowers on many-flowered footstalks. It has violently emetic and purgative properties; but in small doses, an infusion of the leaves is esteemed a valuable cathartic medicine, especially in the cure of painter's colic. All the species are natives of the tropical parts of America.

ALLAN, BRIDGE OF, a beautiful village, consisting chiefly of lodging-houses, lying within the shelter of a spur of the Ochils, on the road from Stirling to Perth, from the former of which towns it is only three miles distant. It is situated on the banks of the Allan, which, like the heights behind the place, are richly wooded. It owes its prosperity partly to its mineral (saline) wells, and partly to its sheltered situation and mild climate, which render it a favourite resort of invalids, especially in spring and autumn. There are excellent hotels, and abundance of good lodgings. Pop. (1871) 3055.

ALLAN, DAVID, a distinguished Scottish painter of domestic subjects, in which he was the forerunner of Wilkie, was born at Alloa in 1744. In 1755, he entered the academy for drawing, painting, and engraving, established in Glasgow by the celebrated printer Foulis, where he studied for seven years. The liberality of friends enabled him, in 1764, to go to Rome, where he resided for sixteen years. In 1773, he gained the gold medal given by the Academy of St Luke for the best historical composition. The subject was the 'Origin of Painting,' the old legend of the Corinthian maid who drew her lover's profile from the shadow. This picture, the highest effort of Allan's powers, was engraved by Cunego. Of his other pictures executed at Rome, the best known are four humorous pieces illustrating the Carnival, which were engraved by Paul Sandby. In 1777, A. came to London, where he painted portraits; after a year or two, he removed to Edinburgh; and in 1786, succeeded Runciman at the head of the art academy established there by the Board of Manufactures. His works subsequent to this date were chiefly of a humorous description, and illustrative of Scottish domestic life. His illustrations of Allan Ramsay's *Gentle Shepherd* became very popular, but are of no great merit. A. died at Edinburgh in 1796. 'His merits,' says Allan Cunningham, 'are of a limited nature; he neither excelled in fine drawing nor in harmonious colouring; and grace and grandeur were beyond his reach. His genius lay in expression, especially in grave humour and open drollery.'

ALLAN, SIR WILLIAM, a distinguished Scottish historical painter, was born at Edinburgh in 1782. He was educated at the High School; and having early displayed a taste for drawing, was entered as a pupil in the School of Design connected with the Royal Institution, with the intention of becoming a coach-painter. Among his fellow-students and friends were David Wilkie, John Burnet, and others who afterwards rose to eminence. He subsequently studied for some time at the Royal Academy of London. Finding difficulties in the way of professional advancement in the metropolis, he determined to go abroad; and in 1805, set out for St Petersburg, where the friendly interest of his countryman, Sir Alexander

Crichton, the imperial family physician, soon procured him employment. In the Russian capital, he spent several years, diligently pursuing his professional labours, and making occasional tours to the south of Russia, the Crimea, Turkey, and Circassia, where he made numerous sketches, some of which supplied the materials of his best known works. In 1814, he returned to Edinburgh, and soon after exhibited his 'Circassian Captives,' a large picture, distinguished by the picturesqueness of the subject and the elaborate fidelity and spirit of its treatment. He had exhibited several pictures before this, but not till now was his reputation as an artist fairly established. The remuneration of his labours, however, was not so ready as the public acknowledgment of their worth. The purchase of two of his pictures by the Grand Duke Nicholas, afterwards emperor, when on a visit to Edinburgh, contributed in no small degree to promote the sale of his works. A severe attack of ophthalmia obliged him for a time to suspend his exertions. He employed his leisure in visiting Italy, Turkey, Greece, and Asia Minor. On returning home, he resumed his brush, and for many years laboured with great assiduity. In 1826, he was elected an Associate of the London Academy; in 1835, an Academician. In 1838, on the death of Mr George Watson, the Royal Scottish Academy elected him as its president, and on the death of Sir David Wilkie in 1841, he was appointed Limner to Her Majesty for Scotland. He was at the same time knighted. At intervals, he made excursions into the continent, visiting Spain and Marocco in 1834, St Petersburg in 1841, and Germany and Belgium in 1847. At St Petersburg, he received a commission from the emperor to paint a large picture of 'Peter the Great teaching Shipbuilding to his Subjects;' it was exhibited at London in 1845, and is now in the imperial Winter Palace. For some time before his death, he had been diligently working at a great picture of 'Bruce at Bannockburn.' He died in his painting-room, to which his bed had been removed, on the 22d of February 1850. The great merits of Sir W. A. as a painter consist in his conscientious fidelity, his skill in composition, and the dramatic force of his representations. The impulse contributed by him to historical painting, especially of national subjects, entitles him to a very high place in the history of Scottish art. Among his chief works, many of which are well known through engravings, are—'John Knox admonishing Queen Mary,' 1823; 'Queen Mary signing her abdication,' 1824; 'Death of the Regent Moray,' 1825; 'Polish Exiles,' 1834; 'The Slave-market at Constantinople,' 1837; 'Battle of Prestonpans,' 1842; 'Waterloo,' two pictures, from the French and English positions, the first of which was bought by the Duke of Wellington.

ALLANTOIS, a delicate membranous bag, which makes its appearance in the eggs of birds during incubation, and is a provision chiefly for the aëration of the blood of the embryo or chick. It sprouts from the lower part of the intestine of the chick, and rapidly enlarges, so as almost completely to enclose it, lining nearly the whole extent of the *membrana putaminis*—the double membrane which is immediately within the egg-shell. It is covered with a net-work of arteries and veins, corresponding to the umbilical artery and vein of Mammalia; and the aëration of the blood is accomplished by the air which enters through the pores of the shell; but as the lungs become capable of their function, the circulation in the A. diminishes, and its footstalk contracts, and at last divides, leaving only a ligamentous remnant. The A. is never developed in the eggs of Fishes and Amphibians; hence these are called Anallantoid Vertebrates;

while Reptiles, Birds, and Mammalia, in which it is present, are called Allantoid. In the Mammalia, it is superseded at an early period of fetal life by other contrivances, but continues to exist in the lower animals for receiving the urinary secretion through the urachus, a purpose which it serves in birds and reptiles likewise. In the human species, it disappears very early, only a minute vesicle remaining.

ALLARD, generalissimo of the army of Lahore, and previously adjutant to Marshal Brune under Napoleon, was born in 1783. After the murder of Marshal Brune (q. v.), A. left France (1815), intending to emigrate to America; but changed his plan, entered into the service of Abbas-Mirza of Persia, and afterwards went to Lahore (1820), where he engaged in the service of Runjeet Singh (q. v.), by whom he was made generalissimo, and whose forces he organised and trained in the European modes of warfare. Having married a native of Lahore, he identified himself with the interests of his adopted country, but could not entirely forget France. The July revolution brought him back to Paris, where he was received with distinction, and was made French *chargé d'affaires* in Lahore. He presented to the Royal Library of Paris a valuable collection of coins, and returned to Lahore (1836), leaving his wife and children in Paris. In the subsequent battles of Runjeet Singh with the Afghans, A. repeatedly distinguished himself, and died at Peshawur, January 23, 1839. His remains were, according to his own wish, buried with military honours at Lahore.

ALLEGHANIES, a name perhaps originally limited to the mountain-eradle of the river next mentioned, but often popularly extended to the whole chain, otherwise called the Appalachians (q. v.).

ALLEGHANY, a river, which, rising in the north part of Pennsylvania, unites with the Monongahela at Pittsburg to form the Ohio. Though it flows through a hilly country, yet it is navigable for nearly 200 miles above Pittsburg, whence again, with a trifling impediment near Louisville, which has been overcome by a short canal, the navigation embraces, down to the Gulf of Mexico, 950 miles on the Ohio, and 1216 on the Mississippi. What a suggestive fact is a steam-boat channel of 2366 miles in one section of a continent, equal in length to the longest line that can be drawn in Europe, whether from Brest to Astrakhan, or from Cape Matapan to North Cape!

ALLEGIANCE (Fr. *allégeance*, from Lat. *aligo* or *ad-ligo*, to bind to, or attach). 'A,' says Blackstone, 'is the tie or *ligamen* which binds the subject to the sovereign, in return for that protection which the sovereign affords the subject. A. is the highest legal duty of a subject, and consequently its violation, *Treason* (q. v.), is the highest legal offence. A. is of three kinds: 1. *Natural or implied A.*, which every native or naturalised citizen owes to the community to which he belongs. Independently of any express promise, every man, by availing himself of the benefits which society affords, comes under an implied obligation to defend it, and this equally whether the attack be from without or from within. In time of war, this obligation involves the duty either of bearing arms in defence of the state, or of contributing to the additional taxes and other impositions which the support of a standing army may render necessary. In peaceful times, it will be adequately fulfilled by an efficient performance of ordinary citizen duties. 2. *Express A.* is that obligation which arises from an expressed promise, or *oath of A.* The old English oath of A. corresponded in the case of the sovereign, as absolute superior of all the lands in

England, to the oath of fealty which, by the feudal law, all vassals were required to take to subject superiors: 'As administered for upwards of six hundred years, it contained a promise to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom.'—Blackstone, Kerr's edition, vol. i. 368. This oath being thought to favour too much the notion of non-resistance, another form was introduced by the Convention Parliament. That in use since the passing of the new Naturalisation Act in 1870 (33 Vict. c. 14), is as follows: 'I do swear that I will be faithful and bear true A. to Her Majesty Queen Victoria, her heirs and successors, according to law. So help me God.' From the reign of Queen Elizabeth down to the present time, the oath of A. has been required from all public functionaries, before entering on their offices, and by all professional persons before being permitted to practise. 3. *Local or temporary A.* is that obedience and temporary aid due by an *Alien* (q. v.) to the state or community in which he resides. Local differs from the higher kinds of A. in this, that it endures only so long as the alien resides within the Queen's dominions, whereas natural A., whether implied or expressed, is perpetual, following not only the individual himself, but his children and grandchildren. By the provisions of the act above referred to, A. may now be renounced, even by natural-born subjects, and this whether born within the realm or not, by a declaration of alienage (sect. 4), and it is forfeited by the acceptance of the allegiance of a foreign state (sect. 6). But the allegiance thus forfeited may be resumed. A natural-born British subject who has become an alien in pursuance of this act, may, on performing the same conditions as are required of an alien applying for a Certificate of Nationality (see NATURALISATION), apply to one of Her Majesty's principal Secretaries of State for a certificate of re-admission to British nationality (sect. 8). In a colony, the like powers are conferred on the Governor.

By the law of England, and agreeably to the spirit of the constitution, a usurper in undisputed possession of the crown, or king *de facto*, is entitled to A., because he then represents, not the sovereign whom he has dispossessed, but the general will in which the ultimate sovereignty of England resides. This doctrine was applied when Edward IV. recovered the crown from the House of Lancaster, and treasons committed against Henry VI. were capitally punished. The sovereign may by proclamation summon his subjects to return and take part in the defence of the kingdom, when menaced or endangered. Of this, an instance occurred in 1807, when all seamen and seafaring men who were natural-born subjects were recalled from foreign service. The option of accepting the foreign A. would now be given them, and the same legal outlet is furnished from the provisions of the otherwise unenforceable Foreign Enlistment Act (q. v.).

ALLEGORY, as a figure of rhetoric, signifies properly, the embodiment of a train of thought in a visible form, by means of sensible images, having some resemblance or analogy to the thoughts. A., therefore, is one of the Tropes (q. v.), for it involves a transfer of meaning. It differs from metaphor chiefly in extent; metaphor is confined to a single expression, or at most to a sentence, A. is carried through the whole representation. It is not abstract ideas alone that are adapted to allegorical treatment; not only may virtue and vice, for instance, be personified and treated allegorically, but real persons may be represented by allegorical persons.

We find A. in use from the earliest ages. Oriental

people are specially fond of it. As examples from antiquity may be cited, the comparison of Israel to a vine in the 80th Psalm; the beautiful passage in Plato's *Phaedrus*, where the soul is compared to a charioteer drawn by two horses, one white and one black; the description of Fame in the 4th Book of the *Iliad*. Bunyan's *Pilgrim's Progress* is perhaps the most fully carried out A. of modern times.—A. is not confined to language, but is carried into painting and sculpture, and also into scenic representation—as in the ballet and pantomime; the consideration of it is, therefore, of importance in the fine arts generally.

ALLEGORICAL INTERPRETATION is that kind of interpretation by which the literal significance of a passage is either transcended or set aside, and a more spiritual and profound meaning elicited than is contained in the form or letter. The common idea is that it originated with the Alexandrine school, but this is by no means the case, as we find it employed by the older Hindus. From the scholars of Alexandria, however, it was adopted by the Jews of Palestine, a sect of whom in particular, namely, the Essenes, made abundant use of it. The apostle Paul himself allegorises, or at least spiritually interprets the history of the free-born Isaac and the slave-born Ishmael (Gal. iv. 24). Allegorical interpretation, however, with reference to the Old Testament, was most extensively employed by Philo Judæus, a philosophical Jew of Alexandria, and a contemporary of Jesus Christ. His writings stimulated the allegorising tendencies of the Alexandrine school of Christian theologians, the most famous of whom are Clemens Alexandrinus and Origen. The latter went so far as to say that 'the Scriptures are of little use to those who understand them as they are written.' As a specimen of his method of biblical interpretation, we may adduce the following: He maintained that the Mosaic account of the Garden of Eden was allegorical; that Paradise only symbolised a high primeval spirituality; that the fall consisted in the loss of such through spiritual and not material temptation; and that the expulsion from the Garden lay in the soul's being driven out of its region of original purity. The Neo-platonists were at first averse to allegorising, but gradually acquired a relish for it from the Jews and Christians, and applied it to the ancient myths.

ALLEGRO, the fourth of the five principal degrees of movement in music, implying that the piece is to be performed in a quick or lively style. A., like all the other degrees of movement, is often modified by other terms, such as *A. non tanto*, *A. ma non troppo*, *A. moderato*, *maestoso*, *giusto*, *commodo*, *vivace*, *assiu*, *di molto*, *con brio*, &c. As a substantive, A. is used as the name of a whole piece of music, or a movement of a symphony, sonata, or quartet.

ALLEMANDE, the name of a dance invented by the French in the time of Louis XIV., and which again became popular at the Parisian theatres during the reign of the first emperor. It has a slow waltz kind of tempo, and consists of three steps (*pas marchés*) made in a sliding manner, backwards and forwards, but seldom waltzing or turning round. The whole charm of the dance lies in the graceful manner of outwining and detaching the arms in the different steps. Both the dance and the music are said to have originated in Alsace; and thus the introduction of the A. at the court of Versailles was a sort of artistic way of symbolising the incorporation of the newly acquired German provinces.

ALLEN, Bog OF, a general name applied to a congeries of morasses east of the Shannon, in King's

County and Kildare, Ireland, comprising in all about 238,500 Eng. acres. The strips of arable land which intersect this bog are occasionally watered by rivers which have their sources in the contiguous fens, such as the Barrow, Boyne, and Brosna; the Grand Canal also passes through it. The average elevation of the morasses is 250 feet above the sea-level. They approach to within 17 miles of Dublin on the east, and almost to the Shannon on the west. The depth of the peat found in them is about 25 feet.

ALLEN, JOHN, M.D., a *littérateur* of considerable talent, was born at Redford, in the parish of Colinton, near Edinburgh, in 1770. He was educated at the university of Edinburgh, where he took his degree at the age of twenty-one. Four years later, he entered the lists against Dr Gregory in defence of Hume's speculations on liberty and necessity. In 1801, he published *An Introduction to the Study of the Animal Economy*, translated from Cuvier. About a year after, along with his friends, Lord and Lady Holland, he set out on a tour through France and Spain, where he resided till 1805. On his return, he devoted himself to the discussion of political questions in the pages of the *Edinburgh Review*. He was a keen reformer, and brought to bear upon constitutional questions a wealth of research, a closeness of reasoning, and a vigour of understanding that rendered him a formidable adversary. He is said to have contributed upwards of forty articles to the *Edinburgh Review*, chiefly on British, French, Spanish, and South American politics. His most valuable work is considered to be his *Inquiry into the Rise and Growth of the Royal Prærogative in England* (1830). On one or two occasions, he held temporary political offices, and was, in addition, for some time Master of Dulwich College. He died in 1843.

ALLENTOWN, a thriving borough of Pennsylvania, U. S., 85 miles to the east of Harrisburg, and 50 to the north of Philadelphia. It is situated on an affluent of the Lehigh, with a canal and a railway passing through it. It is within easy reach of slate, limestone, coal, and iron. Pop. in 1870, 13,884.

ALLEYN, EDWARD, a distinguished actor, the contemporary and friend of Shakspeare, was born in 1566, and died in 1626. His connection with the English stage during the period of its highest prosperity, invests his life with interest to the student of literary history; but it is as the magnificent and pious founder of Dulwich College (q. v.) that he principally claims the remembrance of posterity. The building of the college was begun in 1613, and in 1619 the institution obtained the royal charter, after some obstruction on the part of Lord Bacon, who wished the king to apply part of the grant to the foundation of two lectureships at Oxford and Cambridge. A. himself took up his quarters in the college as master, living, with his wife as a pensioner, on equal terms with the sharers of his bounty. He also founded numerous almshouses in London.

ALLIA, a small stream which fell into the Tiber, eleven miles north of Rome. It is celebrated as the scene of the defeat of the Roman army by the Gauls under Brennus in 387, or, according to others, 390 B.C. Immediately afterwards, Rome was taken, plundered, and burnt. It is difficult to identify the A. with any of the modern streams; but the evidence seems in favour of the *Scolo del Casale*.

ALLIACEOUS PLANTS are those of the genus *Allium* (q. v.), or others nearly allied to it. The term is generally employed to denote not only the possession of certain botanical characters, but also of a certain smell and taste, well known by the term *alliaceous*, and of which examples are readily found

in the onion, leek, garlic, and other familiar species of *Allium*, much employed for culinary purposes. These plants contain free phosphoric acid, and a sulphuretted oil, which is partly dissipated in boiling or roasting. The *A. flavum* is, however, found also, although in comparatively rare instances, in plants of entirely different botanical affinities—for example, in *Alliaria officinalis*, of the natural order *Cruciferae* (see **ALLIARIA**), in the young shoots of *Cedrela angustifolia*, a tropical American tree of the natural order *Cedrelaceae*, allied to mahogany; and in certain species of *Dysoxylum* and *Hartighsea*, of the kindred order *Meliaceae*, the fruit of which is used instead of garlic by the mountaineers of Java.

ALLIANCE, a compact between independent families or nations. See **TREATY**, **HOLY ALLIANCE**, **TRIPLE ALLIANCE**.

ALLIARIA, a genus of plants of the natural order *Cruciferae* (q. v.), closely allied to *Sisymbrium* and *Erysimum*, but differing from both in having the stalks of the seeds flat and winged. The best known species is *A. officinalis* (*Erysimum A.* of Linnæus, and ranked by some botanists in the genus *Sisymbrium*), known by the popular names of Saucel-alone and Jack-by-the-Hedge. It is a native of Britain, not unfrequently found on hedge-banks and in waste places in dry rich soils, and is common in most parts of Europe. It is a biennial, with a stem 2—3 feet high; large, stalked, heart-shaped leaves;

Alliaria officinalis.

a, upper part of stem, with leaves and flowers; *b*, extremity of a branch, in fruit.

white flowers, and pods much longer than their stalks, which are somewhat spreading. It is remarkable for its strong alliaceous odour, is occasionally used as a pot-herb in Britain, and very generally, at least by the poorer classes, in some continental countries. It seems more deserving of cultivation than many other plants which have long received the constant care of the gardener, being wholesome, nutritious, and, to most persons, pleasant. The powdered seeds were formerly employed as a sterutatory.

ALLICE, or **ALLIS**. See **SHAD**.

A'LLIER, a river in France, a tributary of the Loire, has its source in the water-shed of the east of the department of Lozère; flows with a northerly course through Haute-Loire, Puy-de-Dôme, and Allier; and after a course of more than 200 miles, falls into the Loire below the town of Nevers. It is navigable for a considerable portion of its length.

ALLIER, a department in the centre of France, has an area of 2830 square miles, and a pop. of 390,812. It is a hilly district, especially in the south, sloping down towards the river Loire in the north, and is partly woody, but generally well cultivated, producing the usual kinds of grain with wine and oil. It is also rich in minerals, especially iron, coal, antimony, manganese, and marble. There is some manufacturing industry in cotton, wool, linen, carpets, pottery, and glass; but the majority of the population is engaged in agriculture. Mineral springs are found at Viehy, Neris, and Bourbon-l'Archambault. The chief town is Montlison. Other important places are Montluçon, La Palisse, Gannat. At Chantelle-le-Château are the extensive ruins of King Pepin's Castle.

ALLIGATION, from a Latin word signifying 'to bind together,' is a rule in arithmetic which teaches to solve such questions as the following: 3 lbs. of sugar at 6*d.* are mixed with 5 lbs. at 10*d.*; what is the price of a pound of the mixture? or: In what proportion must sugar at 6*d.* be mixed with sugar at 10*d.*, to produce a mixture at 8½*d.*? The solution of the first is $\frac{3 \times 6 + 5 \times 10}{3 + 5} = 8\frac{1}{2}$.

In the second, the proportional number for one ingredient is the difference between the price of the other and that of the mixture; the number for the cheap sugar is therefore 1½, and for the dear, 2½, which are as 3:5, so that there must be 3 lbs. at 6*d.* for every 5 lbs. at 10*d.* If there are more than two ingredients, the problem becomes indeterminate; that is, it admits of a variety of answers. Thus: Of three metals, whose specific gravities are 10, 15, and 16, it is required to compose an alloy, whose specific gravity shall be 14. The conditions will be answered by mixing them in any of the following proportions: 1, 2, 1; 2, 2, 3; 6, 2, 11, &c.

ALLIGATOR, a genus of saurian reptiles, of the family of the *Crocodylidae*, and still regarded by some naturalists as a mere sub-genus of *Crocodylus*; although it has recently been proposed to constitute a family or sub-family of *Alligatoridae*, and to divide it into the genera *Jacare*, *Alligator*, and *Caiman*. The alligators differ from the true crocodiles in the shorter and flatter head, the existence of cavities or pits in the upper jaw, into which (and not into mere notches between the teeth, as in the crocodiles) the long fourth teeth of the under jaw are received, and the much less webbed feet. In consequence of the different manner in which provision is made in the upper jaw for the reception of the longest teeth of the lower, the head of the alligators is broader and the snout more obtuse than in the crocodiles.

Alligator.

Their habits are less perfectly aquatic; they frequent swamps and marshes, and may be seen basking on the dry ground during the day, in the heat of the sun. They are most active during the night, and then make a loud bellowing. They have great strength in their tails, with which the larger ones can easily upset a light canoe. They feed chiefly on fish, but do not object to other animal food. The females lay their eggs, 20—60 in number, in the mud, and leave them to be hatched by the heat of the sun, but keep watch over the spot, and shew much affection for their young

ones, many of which, however, fall a prey to the old males, and to vultures and fishes. There are several species, varying from two to twenty feet and upwards in length. Perhaps the most fierce and dangerous is that found in the southern parts of the United States, as far up the Mississippi as the Red River, *A. Lucius*. The snout is a little turned up; and its resemblance to that of a pike has led to the specific name *Lucius*. In cold weather, these animals bury themselves in the mud, and become so torpid, that they may be cut to pieces without shewing signs of sensibility; but a few hours of bright sunshine are enough to revive them. Like the other species, they are so protected by their mailed plates, that they are not easily killed, except by a shot or blow over the eyes. A very strong kind of leather is prepared from the skin, which is used for making saddles. It is said that a considerable quantity of oil can be extracted from an A., which is transparent and burns well. The alligators of South America are there very often called *Caymans*, probably an Indian name, and some of them bear the name of *Yacaré*, particularly *A. sclerops*, also distinguished as the Spectacled Cayman, on account of a prominent bony rim surrounding the orbit of each eye. This species appears to be widely distributed over tropical America, and attains a great size. Alligators are not known to exist in any quarter of the world except America, in which, however, true crocodiles are also found. But among the fossils of the south of England are remains of a true A. (*A. Hantonensis*) in the Hordle beds. The flesh of alligators is eaten by Indians and negroes. It has a musky flavour.—The origin of the name is uncertain, but it is supposed to be a corruption of the Portuguese *lagarto*, a lizard. Cuvier adopted it as a scientific name.

ALLIGATOR APPLE. See CUSTARD APPLE.

ALLIGATOR PEAR. See AVOCADO PEAR.

ALLITERATION is the frequent occurrence in a composition of words beginning with the same letter. In Old German, Anglo-Saxon, and Scandinavian poetry, A. took the place of rhyme. This kind of verse, in its strict form, required that in the two short lines forming a couplet, three words should begin with the same letter, two in the first line or hemistich, and one in the second; as in the following couplet of Anglo-Saxon poetry:

*Firum foldan
Frea simbitig.—Cædmon.*

A. has not quite disappeared from Icelandic poetry to this day. Alliterative poems continued to be written in English after it had assumed its modern form; the most remarkable is *Pierce Plowman*, a poem of the 14th c., of which the following is a specimen, the two hemistichs being written in one line:

*Merey hight that maid, | a meek thing withal,
A full benign burd, | and duxon of spech.*

Even after the introduction of rhyme, A. continued to be largely used as an embellishment of poetry, and is so, though to a less extent, to this day:

*The fair breeze blew, the white foam flew,
The furrow followed free.—Coleridge.*

Besides the Gothic, there are other nations widely separated from each other, among whom the essential distinction of verse is A.; the Finns, for instance, and the Tamuls in the south of India.

But A. is not confined to verse; the charm that lies in it exercises great influence on human speech generally, as may be seen in many current phrases and proverbs in all languages: Ex., 'life and limb,' 'house and home,' 'wide wears, tight tears,' &c. It often constitutes part of the point and piquancy

of witty writing. Among modern writers this application of A. is perhaps most felicitously exemplified by Sidney Smith, as, when in contrasting the conditions of a dignitary of the English Church and of a poor curate, he speaks of them as 'the Right Reverend Dives in the palace, and Lazarus-in-orders at the gate, doctored by dogs and comforted with crumbs.'

In the early part of the 17th c., the fashion of hunting after alliterations was carried to an absurd excess; even from the pulpit, the chosen people of God were addressed as 'the chickens of the church, the sparrows of the spirit, and the sweet swallows of salvation.' *Ane New-year Gift*, or address, presented to Mary Queen of Scots by the poet, Alexander Scott, concludes with a stanza running thus:

*Fresh, fulgent, flourist, fragrant flower formose,
Lantern to love, of ladies lamp and lot,
Cherry maist chaste, chief earhuncle and chose, &c.*

In the following piece of elaborate trilling, given (but without naming the author) in H. Southgate's *Many Thoughts on Many Things*, Alliteration is combined with Acrosticism:

*A*n Austrian army, awfully arrayed,
*B*oldly by battery besieged Belgrade;
*C*ossack commanders cannonading come,
*D*ealing destruction's devastating doom;
*E*very endeavour engineers essay
*F*or fame, for fortune, forming furious fray.
*G*iant runners grapple, giving gashes good;
*H*eaves high his head heroic hardihood;
*I*brahim, Islam, Ismael, imps in ill,
*J*ostle John Jarovitz, Jem, Joe, Jack, Jill;
*K*ick kindling Kutusoff, kings' kinsmen kill
*L*abour low levels loftiest, longest lines;
*M*en march 'mid moles, 'mid mounds, 'mid murd'rous mines.
*N*ow nightfall's near, now needful nature nods,
*O*pposed, opposing, overcoming odds.
*P*oor peasants, partly purchased, partly pressed,
*Q*uite quaking, 'Quarter! quarter!' quickly quest.
*R*eason returns, recalls redundant rage,
*S*aves sinking soldiers, softens signiors sage.
*T*ruee, Turkey, truee! tuene, treach'rous Tartar train!
*U*nwise, unjust, unmerciful Ukraine,
*V*anish, vile vengeance! vanish, victory vain!
*W*isdom walls war—walls warring words. What were
*X*erxes, Xantippe, Ximenes, Xavier?
*Y*et Yassy's youth, ye yield your youthful yest.
*Z*ealously, zanies, zealously, zeal's zest.

ALLIUM, a genus of plants of the natural order *Liliaceæ* (q. v.), containing a large number of species, perennial—more rarely biennial—herbaceous plants, more or less decidedly bulbous-rooted, natives chiefly of the temperate and colder regions of the northern hemisphere. The flowers are umbellate, enclosed in a spathe, and the umbel often bears also small bulbs along with its flowers. The perianth is of six spreading pieces, resembling petals, having the stamens inserted in their base. The fruit is a triangular capsule, and the seeds are angular. The leaves are generally narrow, although in some species, as *A. ursinum*, they are rather broad, and in a considerable number they are rounded and fistulose. GARLIC (q. v.), ONION (q. v.), LEEK (q. v.), SHALLOT (q. v.), CHIVE (q. v.), and ROCAMBOLE (q. v.), are species of this genus in common cultivation. The first four are cultivated in the gardens of India as well as of Europe, along with *A. tuberosum*; and the hill-people of India eat the bulbs of *A. leptophyllum*, and dry the leaves, and preserve them as a condiment. A number of other species are occasionally used in different countries.—Eight or nine species are natives of Britain, of which the most common is RAMSONS (*A. ursinum*), a species with much broader leaves than most of its congeners. It is most frequently found in moist woods and hedge-banks; but occasionally in pastures, in which it proves a troublesome weed, communicating its powerful odour of garlic to the whole dairy produce. Crow Garlic

(*A. vineale*), another British species, is sometimes very troublesome in the same way, in drier pastures. Both are perennial, and to get rid of them, their bulbs must be perseveringly rooted out, when the leaves begin to appear in spring.

ALLOA, a seaport town in Clackmannanshire, Scotland, is situated on the left bank of the Forth, where the river widens into its estuary, 7 miles (by road) below Stirling. Population in 1871, 9362. It is a town of considerable antiquity, and is an active centre of trade and manufactures. The principal articles manufactured are whisky and ale, the latter of which is highly esteemed. There are extensive glass, iron, and brick works, and ship-building yards. Copper utensils, shawls, and blankets, leather, tobaeco, and snuff are manufactured to a considerable extent; and a large quantity of coal is regularly exported from the pits in the immediate neighbourhood of the town. The latter forms one of the chief items in the coasting trade, besides which there is a considerable foreign trade, chiefly outwards. The total tonnage registered at the port amounts to about 8400 tons. The harbour is good, with 16 feet of water at neap, and 22 at spring tides; it is furnished with a dry-dock. There is a steam-boat ferry across the Forth, connecting the town by a short junction line with the Scottish Central Railway. It is also connected with that line, and with the Edinburgh and Northern Railway, by the Stirling and Dunfermline branch. There is regular steam-communication by the river with Edinburgh and Stirling. In the neighbourhood is Alloa Tower, 89 feet high, supposed to have been built in the 13th c., once the residence of the Erskines, and at different times of Scottish princes.

ALLOCU'TION, which simply means an 'address,' is applied, in the language of the Vatican, to denote specially the address delivered by the pope at the College of Cardinals on any ecclesiastical or political circumstance. It may be considered as corresponding in some measure to the official explanations which constitutional ministers give when questions are asked in parliament, or to the political messages of the French emperor. The court of Rome makes abundant use of this method of address, when it desires to guard a principle which it is compelled to give up in a particular case, or to reserve a claim for the future which has no chance of recognition in the present.

ALLO'DIUM, or ALLODIAL TENURE (in Law), is the free and absolute right of property in land, independent of any burden of homage or fidelity to a superior. When the principal landholders of England submitted to the yoke of military tenure, and surrendered their lands into the hands of the Conqueror at the council of Sarum, feudality, the previous existence or non-existence of which has been a subject of much discussion, was formally recognised, and it henceforth became a fundamental maxim in the law of real property, that 'the king is the universal lord and original proprietor of all the lands in his kingdom, and that no man doth or can possess any part of it, but what has mediately or immediately been derived as a gift from him, to be held upon feudal services' (Blackstone, vol. ii. p. 51, Kerr's edition). This maxim, though, as Blackstone remarks, it was even at first little more than a fiction, was not peculiar to England, but prevailed wherever the feudal system obtained, and still forms what may be called the starting-point in all feudal tenures of land. Even where subinfeudations have prevailed to the greatest extent, every title is traceable, in the last instance, to the paramount and universal superiority of the crown. See FEUDAL SYSTEM. The surrender of

lands in England being the result of political measures, was one universal national act, and, consequently, allodial tenures at once ceased to exist; but in many other countries it was accomplished by private arrangements between the allodial proprietors and the prince, the former being anxious to exchange their nominal independence for the greater security enjoyed by the vassals of the sovereign, the latter being willing to receive them as dependents, for the sake either of their personal services in war, or latterly, for the equivalents of these services in money or the produce of the lands. In such countries, feudality, though general, was not universal; and allodial tenures consequently continued to subsist alongside of those originating with the crown. In this position was Denmark, and it is curious that the only examples of allodial tenures to be met with in Great Britain are the Udal rights in the islands of Orkney and Shetland, which formerly belonged to that country. 'When these islands,' says Mr Erskine, 'were first transferred from the crown of Denmark to that of Scotland, the right of their lands was held by natural possession, and might be proved by witnesses, without any title in writing, which had probably been their law formerly while they were subject to Denmark; and to this day, the lands, the proprietors of which have never applied to the sovereign, or those deriving right from him, for charters, are enjoyed in this manner.' By the law of Scotland, all property and superiorities belonging to the crown itself, and all churches, churelyards, manses and glebes, the right to which does not flow from the crown, are regarded as allodial; and the term in a wider sense, as opposed to *feudal* generally, is sometimes used with reference to movable property.

The etymology of the word *A.* has been much discussed, and both Celtic and Teutonic origins have been assigned to it. The latter seem the more probable conjectures, as the word, in senses closely resembling that which we attach to it, is to be found in all Scandinavian and Germanic languages. On this supposition, its derivation from *all* (all, or wholly) and *od* (property), seems probable. Another conjecture assigns it to *all* and *ocde* (waste). That adopted by Mr Erskine, of its having been composed of a privative, and *leude* or *leute*, people (taken from the people), seems wholly inadmissible, as being inconsistent with the forms of Teutonic speech.

ALLO'PATHY. See HOMEOPATHY.

ALLOTMENT OF LAND, although not a technical, is a well-understood expression in the law of England; and under the General Enclosure Act (41 Geo. III. c. 109), is used to denote the kind of conveyance or distribution directed to be made to the person or persons who at the time of the division and enclosure shall have the actual possession of the lands, tenements, or hereditaments, in lieu of, or in right of which the allotment is made, but without prejudice to any question of title. By the ancient Statute of Merton (20 Henry III. c. 4), the lord of the manor, or any other owner of a common, may enclose so much of the waste as he pleases for tillage or wood-ground, provided sufficient is left for other parties entitled to the use of the same. This right to enclose common fields and waste lands has in modern times been very generally extended throughout England by means of local acts of parliament, a number of the regulations of which have been consolidated by the act above referred to, by section 7 of which commissioners are appointed to make the allotment.

Generally speaking, this term, as a legal word, may be considered as signifying the grant or

allowance of a portion of land too inconsiderable to be made the subject of a formal conveyance; and in this sense it has been used to denote the system or species of agricultural holding which prevailed to some extent in England towards the close of the last century, but which was not in common use throughout the country till 1830, when the agricultural labourers in many counties—owing to the use of thrashing-machines and other improvements, which they dreaded would lower their wages—rose in insurrection against their employers. To meet this danger, the A. system was resorted to, and different societies were established for its promotion; and by the comparative contentment and comfort it produced, it may be considered to have been successful in its object. It has been stated to have diminished crime among the peasantry, and generally to have improved and elevated their character. By the form of agreement usually signed by A. tenants, the use of the spade in the cultivation of land is insisted upon, and the plough prohibited, and there are other conditions of the occupancy more or less capricious. The A. may be forfeited for non-payment of the rent, the tenant's misconduct or crime, or wilful neglect of his land; but it has been thought unadvisable to exclude any one from enjoying an A. on account of his previous bad character, as, from the nature of the industrious occupation which the A. necessitates, there is the chance of his reclaiming his character. See SPADE HUSBANDRY.

ALLOTROPY is the term applied in chemistry to the existence of the same element in various forms, each of which, though containing no extraneous substance, possesses different properties from the others. The various conditions in which a single element can be obtained are known as its allotropic modifications, and though as yet only a few elementary substances have been observed to exhibit such modifications, yet it is generally believed that every element is capable of existing in several allotropic forms. Phosphorus affords an excellent illustration of this doctrine. In ordinary circumstances, and when freshly prepared, phosphorus is a pale, yellow solid, of the consistence and aspect of wax, and to some extent flexible and translucent. It requires to be placed in a vessel with water to keep it from taking fire spontaneously. At any ordinary natural temperature it appears luminous, and evolves an alliaceous odour when exposed to air; owing to a slow process of combustion taking place; and when warmed to 140° F., it bursts into flame, and burns vividly. Common phosphorus is soluble in alcohol, ether, the fixed and volatile oils, and especially in bisulphuret of carbon, 100 parts of which, when warm, dissolve 20 parts of phosphorus. But the same element, when dried and kept for some days, with little or no access of air, at a temperature ranging from 446° to 482° F., passes, weight for weight—without addition or subtraction of matter—into a reddish substance, which is known to chemists as *amorphous* phosphorus. The colour of this new variety is scarlet, brownish red, or even blackish red; and it exists as a powder or cake, which does not evolve any odour, or readily take fire, and therefore needs not to be preserved under water. When heated to 140°, and even to a temperature a little short of 482°, it refuses to burn; and, in fact, it is questionable if phosphorus in this condition will take fire at all; though at 482°, and above, the red variety passes back again to the ordinary or yellow phosphorus, and then bursts into flame. Moreover, amorphous phosphorus is insoluble in alcohol, ether, the fixed and volatile oils, and even in bisulphuret of carbon. Probably the most striking difference between these two forms of the same substance is,

that ordinary phosphorus is a deadly poison, as is too often evidenced in the death of children from sucking the ends of lucifer-matches; whilst the red or amorphous phosphorus is not known to be poisonous at all. Besides the two varieties already mentioned, and which are best known, there are *black phosphorus*, *white phosphorus*, and *scaly phosphorus*. The only manner of accounting for the difference of properties evinced by ordinary and red phosphorus, is to refer the change to an absorption of heat during the passage of the ordinary into the red variety. It is an observed fact that such absorption or disappearance of heat does then take place; whilst, when the red phosphorus is heated till it passes back to the ordinary kind, a very rapid disengagement of heat occurs.

Sulphur furnishes another example of A. In the ordinary condition of roll-sulphur, it is a pale yellow, brittle, crystalline solid; insipid to taste, odourless when cold, and evolving a peculiar odour when heated or rubbed. It dissolves in small quantity in turpentine and the fixed oils, and to the extent of 35 per cent. in bisulphuret of carbon. When common sulphur is heated to 232°, it fuses, and forms a thin, yellow, limpid liquid like olive-oil; at 480°, it passes into a thick, dark-brown, viscid liquid, resembling in consistence ordinary treacle; and if, at this stage, it be poured into water, the sulphur forms itself into a thread-like mass or network, possessing great elasticity, like india-rubber, not at all brittle, and so soft, that it can be moulded by the fingers into casts and seals. Again, this elastic form of sulphur is not soluble in turpentine and the fixed oils, or even in bisulphuret of carbon. There are also other allotropic forms of sulphur.

Oxygen may be taken as a third illustration of the same doctrine. In the ordinary form in which oxygen exists in the atmosphere and elsewhere, it is a gas with no odour, no bleaching properties, and no disinfectant powers. To a certain extent, it oxidises metals, &c.; but comparatively, it may be regarded as a feeble oxidising agent. By several processes—namely, the introduction of a heated glass rod into a jar containing ordinary air and a little ether; or the presence of clean-scraped sticks of phosphorus in a glass vessel with a confined portion of air; or the passage of electric discharges through or round a glass tube or bottle with air—the oxygen of the atmospheric air is transformed into an allotropic form called *ozone*. In the latter condition, oxygen possesses a very strong and peculiar odour, long known as the electrical odour; has great bleaching powers, and is regarded as the agent in the air which bleaches clothes on the household bleaching-green; and possesses such powerful disinfecting properties, that tainted meat introduced into ozonised air, has the disagreeable odour destroyed, and smells fresh when taken out. Ozone is doubtless the great natural agent which removes many deleterious gases and vapours, and destroys infectious matter floating in or diffused through the air. See OZONE.

ALLOWANCES, OFFICERS'. In the British army—and to various degrees in the armies of other countries—military officers, besides their recognised pay, receive certain A. for special duties, or when placed under exceptional circumstances. Without detailing the actual amount of these A., it may be well to enumerate the principal modes in which they arise. An officer commanding and paying a troop or company, receives a contingent allowance as an indemnification for the expense of repairing arms, swords, and scabbards; for burials; and for the debts of soldiers who become non-effective. A kind of general average is struck for the probable amount of these charges. An officer on duty in the United Kingdom, in a situation

and 1 tin; bell-metal, 3 copper and 1 tin; speculum metal, 2 copper and 1 tin; pot-metal or cock-metal, 2 copper and 1 lead; gilding-metal, 16 copper and 1 to 1½ zinc; Mannheim gold—pinchbeck or bath-metal, 16 copper and 4 zinc; Bristol brass, for soldering, 16 copper and 6 zinc; ordinary brass, for casting, 16 copper and 8 zinc; Muntz sheathing-metal, 16 copper and 10½ zinc; spelter solder, for copper and iron, 16 copper and 12 zinc; spelter solder, for brass-work, 16 copper and 16 zinc; Mosaic gold, 16 copper and 16½ zinc; hardest silver solder, 4 silver and 1 copper; hard silver solder, 3 silver and 1 copper; soft silver solder, 2 silver and 1 copper; German silver, 100 copper, 60 zinc, and 40 nickel; type-metal, ordinary, 15 lead, 4 antimony, and 1 tin, or 14 lead, 5 antimony, and 1 tin—small types, 4 lead and 1 antimony—large types, 6 lead and 1 antimony; stereotype metal, 48 lead, 6 antimony, and 1 tin; Britannia metal, 50 tin, 4 antimony, 4 bismuth, and 1 copper.

ALLOY, or **ALLAY** (in Law), the term used to denote the base metal mixed with gold and silver in the coinage of the realm. The gold and silver to be converted into sovereigns, half-sovereigns, shillings, and the other current silver coins, must be of the true standard, or of *sterling* quality, as it is called; and by the statute 25 Edward III. c. 13, all the coin of the kingdom must be made of such sterling metal. By the 56 Geo. III. c. 68, gold coin—with certain exceptions recited in the act—is declared to be the only legal tender for payments, and that such gold coin shall be of the weight and fineness prescribed by the indenture with the Master of the Mint; and according to the standard thus indicated, the pound troy of gold, consisting of twenty-two carats—or twenty-fourth parts—fine, and two of A., is divided into forty-four guineas and a half, of the present value of twenty-one shillings each. In the case of silver, the pound troy is declared by the same act—extended by a recent statute, the 12 and 13 Vict. c. 41—to consist of eleven ounces two pennyweights of fine silver, and eighteen pennyweights of A., and in weight to be divided into sixty-six shillings. The regulation of the coinage forms part of the prerogative of the crown, although parliament also exercises a control over it; indeed, since the Revolution, the coinage has been chiefly regulated by the authority of parliament. See **COINAGE** and **MINT**.

ALL-SAINTS' BAY, in the province of Bahia, Brazil, in 12°–13° S. lat., and 38°–39° W. long. It forms a superb natural harbour, in which the navies of the whole world might anchor. Its length from N. to S. is 37 miles; its breadth from E. to W. 27. It contains several islands, the largest of which, Itaparica, is 18 miles long, and 3 broad. The entrance to the bay is easy. The town of Bahia (q. v.) lies just within it, on the right hand.

ALL-SAINTS'-DAY, in old English, All-Hallows, All-Hallowmas, or simply Hallowmas, a festival of the Roman Catholic Church, introduced because of the impossibility of keeping a separate day for every saint. As early as the 4th c., on the cessation of the persecution of the Christians, the Sunday after Easter was appointed by the Greek Church for commemorating the martyrs generally; and in the Church of Rome a similar festival was introduced about 610 A. D., when the old heathen Pantheon (the present Rotonda, or Santa Maria dei Martiri) was consecrated, on the 13th of March, to Mary and all the Martyrs. But the real festival of All Saints was first regularly instituted by Gregory IV., in 835, and appointed to be celebrated on the 1st November. It was admitted into England about 870. The choice of the day was doubtless determined by the fact,

that November 1, or rather the *eve* or night preceding it, was one of the four great festivals (1st February, 1st May, 1st August, and 1st November) of the heathen nations of the north; for it was the policy of the church to supplant heathen by Christian observances. See **BELFANE** and **HALLOW-EVE**.

ALL-SOULS'-DAY, a festival of the Roman Catholic Church, which falls on the 2d of November. The object of it is, by prayers and almsgiving to alleviate the sufferings of the souls in purgatory. It was first instituted in the monastery of Clugny, 993, and the following is the account given of the circumstance in which it originated: A pilgrim returning from the Holy Land, was compelled by a storm to land on a rocky island somewhere between Sicily and Thessalonica. Here he found a hermit, who told him that among the cliffs of the island was situated the opening into the under world, through which huge flames ascended, and the groans and cries of souls tormented by evil angels were audible. The hermit had also frequently heard the complaints and imprecations of the devils, at the number of souls that were torn from them by the prayers and alms of the pious; they were especially enraged, he said, against the Abbot and monks of Clugny. The pilgrim on his arrival acquainted Odilo, Abbot of Clugny, with what had come to his knowledge, and the abbot thereupon appointed the day after All Saints to be kept in his monastery as an annual festival for 'All Souls.' The observance was quickly adopted by the whole Catholic world. By another account, the scene of the incident is transferred to Sicily, and the institution to the year 998.

In some parts of the west of England it is still the custom for the village children to go round to all their neighbours *souling*, as they call it—collecting small contributions, and singing the following verses, taken down from two of the children themselves:

Soul! soul! for a soul-cake;
Pray, good mistress, for a soul-cake.
One for Peter, two for Paul,
Three for Them who made us all.

Soul! soul! for an apple or two;
If you've got no apples, pears will do.
Up with your kettle, and down with your pan;
Give me a good big one, and I'll be gone.

The soul-cake referred to in the verses is a sort of bun, which, until lately, it was an almost general custom for people to make, and to give to one another on the 2d of November.—*Notes and Queries*, First Series, vol. 4.

ALLSPICE, a name frequently given to the kind of spice called **PIMENTA** (q. v.) or Jamaica pepper, the fruit of *Eugenia pimenta* and *E. acris*. The name originated in its being supposed to combine the flavour of different spices, particularly cinnamon, nutmeg, and cloves.—The name **CAROLINA A.**, or **AMERICAN A.**, is given to the aromatic bark of *Calycanthus floridus* (see **CALYCANTHUS**), which is employed in the United States as a substitute for cinnamon.—The berries of *Benzoin odoriferum*, of the natural order *Lauraceæ*, are said to have been used for A. in the same country during the war with Great Britain.

ALLSTON, **WASHINGTON**, one of the best known of the painters and poets of America, was born at George Town, South Carolina, in 1779. He at first prosecuted the study of medicine, but was afterwards induced, by his acquaintance with the painter Malbone, to devote himself to art. When he had completed his studies in America, he went to London, where he became a friend of his countryman West, who was at that time president of the Academy. In the year 1804, he proceeded to Rome, where he

lived for some years in the closest intimacy with J. Vanderlyn, Thorwaldsen, and Coleridge. After a short stay in America, to which he returned in 1809, he once more visited England in 1811, when he gained the 200-guinea prize of the British Institution. In 1817 he went to Paris with Leslie, and the year after returned to America. In 1819, he was elected an Associate of the Royal Academy of London. He now permanently fixed his residence at Cambridge Port, near Boston, where he lived, cultivating his art, and the muses, till his death on the 8th of July 1843. His pictures are very numerous. The subjects of them are mostly taken from Scripture, such as, Jacob's Dream, Elijah in the Wilderness, Saul and the Witch of Endor, the Deliverance of Peter out of Prison, &c. The style of A. is noble, his ideas are imaginative, and many of his paintings evince a true poetic spirit. In colouring, he comes nearer the old masters than most modern painters do. Among his printed works, the most remarkable and best known is the poem, *The Sylphs of the Seasons* (published first in London, 1813), and the art-novel, *Monaldi* (Boston, 1842).

ALLUVION. This is a legal term, signifying land gained from the sea by the washing up of sand and earth so as to make it *terra firma*. The right of property thus arising is regulated as follows in the laws of England and Scotland: By the law of England, if the addition to the soil thus made be by little and little, by small and imperceptible degrees, it goes to the owner of the land immediately behind; but if the A. be a sudden and considerable acquisition from the shore, the ground acquired shall belong to the crown. Where, however, the crown may have made a grant to a subject *cum litore maris*—that is, the space between the high and low water marks—it would seem that a sudden or considerable increase of lands by A. within these limits must belong to the grantee. In the Scotch law, again, if the A. is made insensibly, it is said to 'acresce' to, or become the property of the owner of the ground to which the addition is made; but if it be caused by a violent flood, or by any convulsion of nature, the ground so added to the soil does not belong to the owner of the latter, but remains the property of the person of whose land it originally formed part. The Scotch law does not recognise such right of the crown on this subject as is allowed by the law of England. In Scotland, the shore is not considered to be the property of the sovereign; but it is presumed to be granted as a part and pertinent of the adjacent land, under the burden of the crown's right as trustee for the public uses, of which navigation and fishing are the chief.

ALLUVIUM, a term originally applied to those deposits which were supposed to have been formed subsequently to the Flood, while Diluvium (q. v.) included its products. In modern geological classification, these two terms, in this sense, have been abolished, as their connection with the Deluge is denied. The diluvial and alluvial deposits are included under the Pleistocene formation (q. v.). The name is now given to those deposits of mud, soil, sand, gravel, &c., which are brought down by streams and rivers and spread over lower lands. See DELTA; DENUDATION.

ALLYGURH, a fort in the district of the same name in India. Lat. 27° 56' N., long. 78° 8' E. It lies on the route between Agra and Delhi, being 55 miles from the former, and 74 from the latter. Partly to this commanding situation, and partly to the strength derived from its surrounding marshes, it owes any importance that it possesses. It was stormed by the British in 1803, being then the principal dépot of the French party in the Doab—

an exploit of sufficient consequence to be commemorated by a medal in 1851. But within six years after 1851, A. became the arena of a still more desperate struggle. Ten days after the outbreak at Meerut, the native troops in garrison mutinied. Fortunately, the Europeans escaped with comparatively little sacrifice of life. But the temporary loss of the place was severely felt far beyond the immediate neighbourhood, as almost cutting off the communications between the south-east and the north-west.

ALMA, a river in the Crimea, rising at the foot of the Tehadir Dagh, and flowing westward into the Bay of Kalamita, about half-way between Eupatoria and Sebastopol. On the steep banks of this stream, through the channel of which the British troops waded amidst a shower of bullets, a brilliant victory was won on the 20th of September 1854, by the allied armies of Britain and France, under Lord Raglan and Marshal St Arnaud, over the Russian army commanded by Prince Menschikoff.

ALMACK'S. A suite of assembly-rooms in King Street, St James's. They were built in 1765 by Almack, a tavern-keeper, and were hence called Almack's Rooms;* they are now generally called Willis's Rooms, from the name of the present proprietor. The name of A. is chiefly associated with the balls that have, since the opening of the rooms, been held there under the management of a committee of ladies of high rank; and has become synonymous with aristocratic exclusiveness. See *Chamber's Journal*, First Series, vol. vi. p. 125.

ALMADEN or **ALMADEN DEL AZOGUE** (Arabic, 'the mine of quicksilver'), a town in Spain, 50 miles S.W. of Ciudad Real, is the *Cisapona Cebobric* of the Romans, and is situated between two mountains in the chain of the Sierra Morena. Pop. 9000. It is famous for its quicksilver mines, the richest in the world, producing annually about 2,000,000 lbs. These mines were worked by the ancient Iberians; afterwards by the Romans. They were rented by the Fuggers of Augsburg in the 16th c., but were taken under the care of the Spanish government in 1615. Some years since, the firm of Rothschild undertook the working of these mines. There is a school of mines in the place.

ALMAGEST, the name given by the Arabs to the great work of Ptolemy the astronomer (q. v.).

ALMAGRO, DIEGO D', a Spanish *conquistador*—i. e., adventurer—in the conquest of South America, was born in 1464. He was a foundling, and derived his name from the town in the vicinity of which he was found. Along with many other adventurers, he went, as was common in those days, to seek his fortune in the new world which Columbus had opened up. There he amassed considerable wealth by plunder, and became one of the most influential persons in the new colony of Darien, when he was persuaded to join Pizarro in his attack on Peru. The undertaking was crowned with astonishing success. He was now appointed, in the absence of Pizarro, who had returned to Spain with rich presents, governor of the conquered country, and received permission from the Spanish court to conquer for himself a special province south of the territory subdued by Pizarro. In 1534, therefore, he marched on Chili, penetrated deeply into the land, and returned in 1536, just when the Peruvians had flown to arms under their young Inca, Mungo Capac, and shut up the Spaniards in Cuzco and Lima. As these towns lay south of Pizarro's district, they were

* Almack, it is said, was originally a poor Scottish Highlander, named M'Call. As a preparatory step to rising into importance in London, he inverted the syllables of his name.

claimed by A. He dispersed the Peruvian army before Cuzco, and advanced with his forces against Lima, hoping to make himself sole master of the country. But the crafty Pizarro contrived, by means of a truce, to gain time for collecting his forces. On the 6th of April 1538, a desperate engagement took place near Cuzco, in which A. was defeated and taken prisoner. He was condemned to death; and on the 26th of the same month, he was strangled in prison, and his corpse beheaded in the market-place of Cuzco. His son, Diego d'A., gathering together several hundreds of his father's followers, stormed the palace of Pizarro, whom he assassinated (1541); he then proclaimed himself captain-general of Peru; but, the friends of the murdered governor resisting his claims, Baca de Castro was sent out from Spain, as supreme arbiter, to quell all disturbances. Diego was now requested to submit; and on his refusing, was attacked by the troops of Baca, when the bloodiest battle took place that had ever been known in America (1542). Diego, having been defeated and taken prisoner, was executed along with forty of his companions.

ALMALEE', or ALMALU', a large town of Asiatic Turkey, in the pashalik of Anatolia. It is situated on the river Myra, about 25 miles from the sea, and is much frequented by European merchants from Smyrna, &c., who purchase the various products of the place. A. has numerous mills propelled by water, tan-yards, dye-works, and factories. The inhabitants are very industrious, and everywhere may be seen indications of their prosperity—in the clean and comfortable houses, neat apparel, excellent roads, fences, bridges, &c. A. is built in a picturesque valley at the edge of a large plateau, 5000 feet above the sea, and is embosomed in gardens, which, together with the minarets and lofty poplars interspersed through the town, give it a striking appearance. Pop. 20,000.

ALMA MATER (Lat. nourishing mother) is a name given to a university in relation to those who have studied at it, to distinguish it from inferior schools of learning. The word *Alma* (nourishing, sustaining, or kind) was applied by the Latin authors to such of the deities as were friendly to men—Ceres, Venus, &c. and also to the earth, the light, the day, wine, and the soil.

ALMANAC, from the Arabic article *al*, and *manah*, to count, a word received by the European nations from the east, denoting a book or table containing a calendar of the civil divisions of the year, the times of the various astronomical phenomena, and other useful or entertaining information. Till a comparatively modern date, this additional matter consisted of astrological predictions and other analogous absurdities; it now embraces, in the best almanacs, a wide variety of useful notes and information, chronological, statistical, political, agricultural, &c.—The Alexandrian Greeks had almanacs. The time at which they first appeared in Europe is not precisely known. The oldest of which copies (in manuscript) still exist, are of the 14th c.; there are specimens in the libraries of the British Museum and of Corpus Christi College, Cambridge. The earliest European A. worthy of notice was compiled by the celebrated astronomer Purbach, and appeared between the years 1450 and 1461; but the first printed A. was that composed by his pupil, Regiomontanus, for the thirty years from 1475 to 1506, for which he received a munificent donation from Mathias Corvinus, king of Hungary. Bernard de Granolaes of Barcelona commenced the publication of an A. in 1487; the printer Engel of Vienna, in 1491; and Stöfler of Tübingen, in 1524. Copies of these are now very rare. In 1533 Rabelais published,

at Lyon, his A. for that year, and renewed the publication in 1535, 1548, and 1550. The fame and popularity of the celebrated astrologer, Nostradamus, who prophesied minutely the death of Henry II. of France, the execution of Charles I. of England, the great fire of London, the Restoration, &c., gave such an impulse to the publication of predictions, that, in 1579, Henry III. of France prohibited the insertion of any political prophecies in almanacs—a prohibition renewed by Louis XIII. in 1628. Before this, in the reign of Charles IX., a royal ordinance required every A. to be stamped with the approval of the diocesan bishop.

Prophetic almanacs still circulate to an incredible extent in France in the rural districts, and among the uneducated. The most popular of all these is the *Almanach Liégeois*, a venerable remnant of superstition. It was first published at Liège—according to the invariable title-page which takes no note of time—in 1636, by one Matthieu Laensbergh, whose existence, however, at any time seems very problematical. The *Almanach Liégeois* is a most convenient one for those who are unable to read, for by certain symbols attached to certain dates, the most unlettered persons can follow its instructions: thus the rude representation of a phial announces the proper phase of the moon under which a draught of medicine should be taken; a pill-box designates the planet most propitious for pills; a pair of scissors points out the proper period for cutting hair, a lancet for letting blood. Of course, amidst innumerable predictions, some may naturally be expected to come to pass. So in 1774, this A. predicted that in the April of that year a royal favourite would play her last part. Madame Dnbarry took the prediction to herself, and repeatedly exclaimed: 'I wish this villainous month of April were over.' In May Louis XV. died, and Madame Dubarry's last part was really played. The credit of old Matthieu was established more firmly than ever. In 1852 a number of commissioners, appointed by M. Maupas, minister of police, having examined between 7000 and 8000 of the national chapbooks, which included a great number of almanacs, pronounced them so deleterious, that it became necessary forcibly to check their circulation. Although still in vogue amongst the ignorant peasantry, it is gratifying to learn that their popularity is greatly on the wane, and that various periodicals on a better plan have started up in France of late years.

In England, so far was any restraint from being put upon the publication of prophetic almanacs, or 'Prognostications,' as they were usually called, that the royal letters-patent gave a monopoly of the trade to the two Universities and the Stationers' Company, under whose patronage, and with the *imprimatur* of the Archbishop of Canterbury, such productions as *Moore's A.* and *Poor Robin's A.* flourished vigorously; although 'it would be difficult to find, in so small a compass, an equal quantity of ignorance, profligacy, and imposture, as was condensed in these publications.' The memory of Partridge, long employed as the prophet of the Stationers' Company, is preserved in the lively diatribe of Swift, writing under the name of Bickerstaff. In 1775, a decision of the Court of Common Pleas, in favour of a bookseller named Carnan, abolished the monopoly of the Stationers' Company. In 1779, Lord North brought in a bill renewing their privileges. After a powerful speech against the measure by Erskine, who exposed the pernicious influence of the productions published under the monopoly, it was rejected. The Stationers' Company, however, still maintained their ground by buying up all rival almanacs; and it was not until the publication, in 1828, of the *British A.* by the

Society for the Diffusion of Useful Knowledge, that the eyes of the English public became opened to the irrational and deleterious nature of the commodity which their own indifference or folly, as much as the selfishness of their purveyors, had hitherto maintained in existence. The success of this admirable publication—which still continues to appear annually—stimulated the Stationers' Company to improvement, and they accordingly published the *Englishman's A.*, which is entirely free from the superstitious absurdities of its predecessors.

In Scotland the earliest almanacs seem to have been produced about the beginning of the 16th c. Shortly after the beginning of the 17th c., the Almanacs or 'Prognostications' published at Aberdeen had begun to establish that celebrity which is hardly yet extinct. About the year 1677, they were sold for a *plack* each; and the annual circulation amounted, on an average, to 50,000 copies. In 1683 appeared a rival publication, under the title of *Edinburgh's True Almanack, or a New Prognostication*. For a long time the Scottish almanacs continued, like all others of that age, to contain little besides a calendar, with a list of fairs, and—what constituted the great attraction—predictions of the weather. But something more instructive and comprehensive became requisite, and the *Edinburgh A.* seems to have been among the first to respond to this requirement of advancing civilisation; for, by various additions, such as a list of Scottish members of parliament, it had, in 1745, been extended from the original 16 pages to 36. In twelve years from that date, it had swelled to 72 pages; in 1779 it had reached 252 pages. Since 1837, it has been published under the title of *Oliver and Boyd's New Edinburgh A.*, and now (1859) extends to 800 pages. It contains an amount of information on all public matters, especially on those connected with North Britain, which, in its completeness, leaves little to be desired.

What *Oliver and Boyd's Edinburgh A.* is to Scotland, is *Thom's Irish A.* to Ireland—a work not less excellent, and even more extensive.

Almanacs, containing astrological and other predictions, are still published in Great Britain, but their influence is extremely limited, even among the most ignorant portion of the community, and their contents are fitted to excite amusement rather than any stronger emotion.

Of important national almanacs are the French *Almanach Impérial*, begun in 1679, a bulky octavo volume, full of useful information; the Belgian Royal A., very similar in character; the Prussian Royal A.; and the American A., a very meritorious publication. The *Almanach de Gotha*, begun in 1763, has a European, or rather a cosmopolitan character. See *GOTHA, A. DE.*

The most important astronomical A. published in Britain is the *Nautical A.*, projected by the astronomer-royal, Dr Maskelyne, and first published, with the authority of government, in 1767. After his death it gradually lost its character, and in 1830, in consequence of the numerous complaints made against it, the government requested the Astronomical Society to pronounce upon the subject. The suggestions of the Society were adopted, and, in 1834, the first number of the new series appeared, with such additions and improvements as the advanced state of astronomical science rendered necessary. Still older than this A. is the French *Connaissance des Temps*, commenced in 1679 by L'icard, and now published under the authority of the *Bureau des Longitudes*. Its plan is similar to that of the *Nautical A.*, but it contains a larger amount of original memoirs, many of them of great value. Equally celebrated is the Berlin *Epheméris*, published

under the superintendence of Professor Encke, being an improvement on the *Astronomisches Jahrbuch*, so long conducted by his predecessor Bode.

Another kind of A., which has especially flourished in Germany and France, belongs rather to the class of publications known in Britain as *Annals*. Such are the *Almanach des Muses, des Dames, Populaire, Jearien, Napoléonien*, &c., the latter of which are specially devoted to the interests of particular parties, political or religious. Of this kind, the examples in Britain are innumerable, and, in fact, the publication of an A. has now become a favourite medium of advertising and puffery.

The heavy stamp-duty of fifteenpence per copy, to which almanacs were long liable in the United Kingdom, was abolished in 1834, since which time, the character, number, and circulation of this class of publications have strikingly advanced. There is now a very large sale of almanacs in Great Britain for popular use, at not more than one penny each.

ALMANAC is also the term applied by antiquaries to calendars found carved, usually on staves, but also on tablets of wood, scabbards of swords, handles of hatchets, &c. The inscribed characters are sometimes the Runic—hence the name of *runstaf*, *Scipiones Runici*—and sometimes the Gothic. The saints' days are denoted by symbols, as a pair of shoes for St Crispin's Day. These primitive almanacs were in use among the Scandinavian nations, and the examples of them found in Britain are thought to have been introduced by the Norsemen.

ALMANSOR, or, with his full name, Abu-Jafer Abdallah-ben-Mohammed-al-Mansor (al-mansor, 'helped by God'), the second calif of the house of the Abbasides (q. v.), reigned from 754 to 775. Warfare, treachery, and murder were his steps to the throne, and his whole rule was as cruel as its beginning. He especially persecuted the Christians in Syria and Egypt. In war against external foes, he had but little success. He removed the seat of the califate from Kufa to Bagdad, which he built at immense cost, raising the money by oppressive taxation. He introduced the pernicious custom of making his freed slaves, mostly foreigners, rulers of provinces. The best feature in his character was his patronage of learning. He caused the *Elements* of Euclid to be translated from the Syriac, and the famous fables of Bidpai (q. v.) from the Persian language. A. died during a pilgrimage to Mecca, in the sixty-third year of his age.

ALMEIDA, one of the strongest fortified places in Portugal, is situated on the river Coa, on the Spanish frontier, in the province of Beira. Pop. 6000. In 1762, it was captured by the Spaniards, who soon afterwards surrendered it. Here, in 1810, when the French, under Marshal Ney, attempted to cross the Coa into Portugal, the English colonel, Cox, defended the town against Marshal Massena; but the explosion of a powder-magazine compelled him to capitulate. In their retreat from Portugal, 1811, the French, under General Brenier, destroyed a great portion of the fortifications of A.; which, however, were speedily repaired by the English.

ALMEIDA, DON FRANCESCO D', a famous Portuguese warrior, who flourished in the latter part of the 15th and the beginning of the 16th c. He was the seventh son of the Count of Abrantes, and at an early period distinguished himself in the wars with the Moors, but especially at the conquest of Granada, in 1492. In 1505 his sovereign, Emanuel I., in consideration of his great abilities, appointed him viceroy of the Portuguese possessions in the East Indies. On the 25th of March, he set sail from Lisbon with a fleet of 36 vessels, containing 1500 men, many of whom were noblemen, and all

of good family. On the 22d of July, he reached Quiloa, on the Mozambique coast, where he was soon involved in a quarrel with the king of that city, the result of which was that A. deprived him of his crown, built a fortress to overawe the inhabitants, and proceeding to Zanzibar, destroyed the town of Mombaza. He then sailed for the Indies, asserting everywhere the superiority of the Portuguese flag. At Cananor, Cochin, Conlan, Ceylon, and Sunatra, he either built fortresses, to protect the factories and commercial interests of his nation, or established new factories. With the king of Malacca, a commercial treaty was formed about the same time. His son, Lorenzo, carried on several expeditions as his father's lieutenant, visited Ceylon, and discovered the Maldive Islands and Madagascar. The chief design of A. was to make the Portuguese sole masters of the Indian seas, and by blockading the Persian and Arabian gulfs, to exclude the Egyptians and Venetians from commerce with the east. To frustrate his endeavours, the Egyptian sultan fitted out, by the help of the Venetians, a large fleet, which, under the command of the Persian, Mir-Hakim (or Hossein, according to others), was sent to the assistance of the king of Calicut. In the port of Chaul, young Lorenzo was attacked in very disadvantageous circumstances by Mir-Hakim. He fought with astonishing bravery; his ships had all but made their escape out to the open sea, when his own was separated from the others, and struck upon a rock; one chance shot carried off one of his legs, and another, tearing away a part of his side, killed him. His father speedily took measures to revenge the death of his son upon the hated Mussulmans, when Alfonso d'Albuquerque appeared on the scene (1507), having been sent out by the Portuguese government to supersede A., whom it had begun to distrust, on account of his brilliant successes. The latter refused to recognise Albuquerque as viceroy, and for some months kept him prisoner at Cochin. He now sailed along the coasts, burning and plundering various seaports, amongst others Goa, and at length utterly destroyed the Egyptian fleet at Din. From this fierce and avenging expedition, he returned to Cochin, resigned his office into the hands of his successor, and set out on his homeward voyage, November 13, 1508. But he was not destined to see his native land again, for he was slain in an obscure affray with the savages at Capo Saldanha, in the south of Africa, where his men had landed. He was a man of stern, vigorous, and yet impulsive character, capable of severe retaliation of injuries, but not destitute of clemency and generosity.

ALMERIA (Arab. Al-Meryah, 'the conspicuous'), anciently Murgis, or *Portus Magnus*, the chief town in the Spanish province of the same name, at the mouth of the river Almeria. It has a well-defended harbour, a cathedral, besides 26 churches and monasteries, and a grammar-school. In the time of the Moors, it was, next to Granada, the richest and most important town in the kingdom, and flourished alike in arts, industry, and commerce, being the 'great port' of traffic with Italy and the east. At one time, it was as terrible a nest of pirates as Algiers itself, under the Moorish chief Ibn Mayman, when even Granada, according to the proverb, was merely its 'farm.' Now, it has only a few trifling manufactures, although it still keeps up considerable trade in cochineal, red silk, lead, grapes, and especially wine. The cotton-tree has been planted in the environs of A. by English merchants. Pop. 20,000.

ALMOHADES, the name of a dynasty that ruled in Africa and Spain during the 12th and 13th

centuries. The word is Arabic, and signifies Unitarians. It was taken as a term of distinction; for the A. considered themselves the only Mohammedans who worshipped God properly. The founder of this sect, which at first was religious rather than political, was called Mohammed Ibn-Toumert, a native of the Atlas region. He was a man of a bold and subtle intellect, and extremely ambitious. He had travelled much, and acquired a manifold knowledge and experience. His first measures were extremely prudent. He commenced preaching with great zeal the reformation of all abuses, affecting himself an austere and unselfish life. He went about covered with rags, prohibiting wine, music, and all pleasures. At first, his denunciations were generally held in contempt; but at length his partisans became so numerous, that Ali, king of Morocco, was compelled to take measures against him. It was, however, too late. The Arabs and Berbers flocked to his standard; and at the end of a few years, he was master of the provinces of Fez, Morocco, Tlemzen, Oran, and Tunis. Mohammed imposed on his disciples new ceremonies, and composed for their benefit a special treatise, entitled *On the Unity of God*. The A. extended their conquests into Spain, subjugating Andalusia, Granada, Valencia, and a part of Aragon, and Portugal as far as the Ebro and Tagus. Mohammed was succeeded in his authority by Abdelmoumen, who had formerly been his lieutenant. Under him and his descendants, Jussuf and Jacob, the dynasty of the A. continued to flourish in great splendour. But in 1212 they were completely defeated by the Spaniards in the famous battle of Tolosa, the result of which was a general revolt of the Christian provinces under their sway. The power of the A. was destroyed in Spain in 1257, and in Africa in 1269.

ALMOND (*Amygdalus*), a genus of the natural order *Rosaceæ* (q. v.), sub-order *Amygdalææ* or *Drupeææ*, consisting of trees or shrubs, distinguished by

Almond (*Amygdalus communis*).

the coarsely furrowed and wrinkled shell (*endocarp* or *putamen*) of the drupe, and by the young leaves being conduplicate, or having their sides folded together. According to the greater number of botanists, it includes the PEACH (q. v.), constituted by some into a distinct genus, *Persica*, in

which the drupe has a fleshy covering (*sarcocarp*), whereas, in the species to which the name *A.* is commonly given, this part is a dry fibrous husk, which shrivels as the fruit ripens, and finally opens of its own accord. The *A.*-tree (*Amygdalus communis*) is very similar to the peach-tree, and is distinguished from it principally, besides the difference of the fruit, by the fine glandulous serratures of the leaves, the stalk of which equals, or even exceeds, in length the breadth of the blade. It is a tree about 20–30 feet high, a native of the East and of Africa, but has now become completely wild in the whole south of Europe. Even in the more northern parts of Germany and of Britain it is planted for the sake of its beautiful flowers, which are produced in great abundance, and resemble those of the peach in form and often in colour, although generally paler and sometimes white. The blossoms appear before the leaves, and are very ornamental in shrubberies in March and April; and even when frosts destroy the germ of the fruit, the brilliancy of the flower is not impaired. The wood of the *A.*-tree is hard, and of a reddish colour, and is used by cabinet-makers, &c. But it is chiefly valued on account of the kernel of its fruit, well known by the

Almond.

name of ALMONDS, and forming an important article of commerce, for the sake of which it is extensively cultivated in the south of Europe and other countries of similar climate. It is mentioned in the Old Testament, and appears to have been cultivated from a very early period. It was introduced into Britain as a fruit-tree before the middle of the 16th c.; but it is only in the most favoured situations in the south of England that it ever produces good fruit.—Almonds are either sweet or bitter. The bitter appear to be the original kind, and the sweet to be an accidental variety, perpetuated and improved by cultivation. SWEET ALMONDS contain a large quantity of a very bland, fixed oil, emulsion, gum, and mucilage sugar, are of a very agreeable taste, and very nutritious, and are used in the dessert, in confectionary, and medicinally in an emulsion, which forms a pleasant, cooling, diluent drink. BITTER ALMONDS contain the same substances, and, in addition, a substance called *amygdalin*, from which is obtained a peculiar volatile oil. (For the oils derived from almonds, see the following articles.)—The muddy water of the Nile is clarified by rubbing bitter almonds on the sides of the water-vessels, in the same way in which the nuts of the *Strychnos potatorum* (see CLEARING NUT) are used in India. The principal varieties of *A.* in cultivation are—the common *sweet A.*, with thick hard shell; the *brittle-shelled*, with a very thin, almost leathery brittle shell, and sweet kernels; the *bitter A.*, with thick hard shell (sometimes also with a brittle shell), and bitter kernels; the *large-fruited*, with large flowers of a whitish rose-colour, and very large sweet fruit; the *small-fruited*, with very small sweet fruit; and the *peach A.*, with a slightly succulent blackish *sarcocarp* (see above), yellow shell, and sweet kernels. The *sarcocarp* is, in the different varieties, more or less dry, or somewhat fleshy and juicy, so that some authors have disputed even the

specific distinction between the *A.* and the peach. In commerce, the long almonds of Malaga, known as Jordan almonds, and the broad almonds of Valencia, are most valued. Large quantities of almonds are annually imported into Britain and America from France, Spain, Italy, and the Levant. Bitter almonds are brought to Britain chiefly from Mogadore.—The DWARF *A.* (*A. nana*) is very similar to the common *A.*, except that it is a low shrub, seldom more than 2 or 3 feet in height. Its fruit is also similar, but much smaller. It is common in the plains of the south of Russia, and is frequently planted as an ornamental shrub in Britain, flowering freely in March and April, but not producing fruit. It is very beautiful when covered with its pink flowers in spring, and deserves to be more frequently planted than it is. A sheltered but sunny situation is favourable to it.—Other species, little known, but very similar to these, are found in the east, and one on arid hills in Mexico.

ALMONDS, FIXED OIL OF. When almonds are subjected to pressure, a fixed greasy oil exudes. Either bitter or sweet almonds may be employed; but the former are generally used, as they are cheaper than the sweet almonds, and the expressed cake is valuable in the preparation of the *essential oil*. 1 cwt. of the almonds generally yields 48 to 52 lbs. of the fixed oil. When first obtained, it possesses a turbid or milky appearance; but when allowed to stand at rest, the impurities settle, and a clear, light, yellow oil remains above. It has the specific gravity of 918, and solidifies when reduced to -13° F. It has no odour, and to the taste is truly oleaginous and bland. The fixed oil of *A.* is used in medicine, and possesses a mild laxative property, when administered in large doses. It is often given to newly born infants, mixed with sirup of violets or sirup of roses. It is beneficial, also, in allaying troublesome coughs, when administered with confectio of roses and sirup of poppies.

ALMONDS, VOLATILE OIL OF ESSENTIAL OIL OF. The cake which is left after the expression of the fixed oil from bitter *A.*, contains, among other matters, a portion of two substances, called, respectively, amygdalin, and emulsin or synaptase. When the cake is bruised and made into a paste with water, the synaptase acts as a ferment upon the amygdalin, and 1 atom of the latter resolves itself into 2 atoms of volatile oil of bitter *A.*, 1 atom hydrocyanic (prussic) acid, 1 atom of grape-sugar, 2 atoms formic acid, and 7 atoms of water. This paste is placed in a retort, and allowed to stand for 24 hours, when heat is cautiously applied, and distillation carried on. The volatile oil rises in vapour, and passes over into the receiver, accompanied by much water, and contaminated with a considerable amount of prussic acid. The oil is not originally present in the bitter *A.*; in fact, the latter do not contain a trace of the oil ready formed, so that the oil is purely the product of the fermentation of amygdalin, 100 parts of which yield 47 of crude oil. Commercial oil of bitter *A.* has a golden yellow colour, but may be purified so as to be almost colourless. The crude oil is very poisonous, owing to the prussic acid dissolved therein, and many fatal cases have occurred from the wilful, accidental, and careless use of the oil. It is unfortunate that the manufacturers of the volatile oil should not subject the crude oil to the action of lime and an iron salt, and then re-distil, when the prussic acid would be left fixed by the lime and iron, and the pure volatile oil be alone obtained in the receiver. As so procured, the pure oil is not a dangerous poison. The oil has an agreeable odour, an acrid, bitter taste, and burns with a smoky white

flame. It is heavier than water, being of the density of 1083; is soluble in water to the extent of 1 part in 30 parts of water, and is very soluble in alcohol and ether. Heated to 356° F., it boils, and distils over unaltered; and, exposed to the air, it is gradually oxidised into benzoic acid. The oil is called by the chemist the hydride of benzoyle. In medicine, the volatile oil is used in place of prussic acid, but is very variable in strength, being sometimes four times the strength of medicinal prussic acid. The dose is a quarter of a drop to a drop and a half in an emulsion. The cook and confectioner employ the oil for flavouring custards, &c., and the perfumer uses it for scenting toilet-soap, &c.

ALMONER is the name given originally to that member of a religious order who had the distribution of the money and other things set apart for alms, which, by canonical law, was to amount to at least a tenth of the revenues of the establishment. Afterwards, those ecclesiastics also received this name who were appointed by princes to the same office in their households. The Grand A. of France was one of the principal officers of the court and of the kingdom, usually a cardinal, and, in right of his office, commander of all the orders, and also chief director of the great hospital for the blind. Queens, princes, and princesses had also their almoners, and bishops were usually appointed to this office. In England, the office of *Hereditary Grand Almoner* is now a sinecure, his only duty being to distribute the coronation medals among the assembled spectators. The *Lord High Almoner*, who is usually a bishop, distributes twice a year the Queen's bounty, which consists in giving a silver-penny each to as many poor persons as the Queen is years of age.

ALMUG TREE, or ALGUM TREE. This name, occurring in the Old Testament, was formerly supposed to denote a species of *Acacia*, or a coniferous tree like the cypress; but it is now thought more probable that it was one of the kinds of *Santalum* (q. v.), the *Santalum album*, a native of India.

ALNUS. See ALDER.

ALNWICK (town upon the Alne), the county town of Northumberland, is situated in lat. 55° 25' N., long. 1° 42' W., and is distant about 34 miles from Newcastle. The streets are broad, well paved, and well lighted, the houses modern, built of stone, and in some instances handsome. A large market-place occupies the centre of the town. The town-hall is a spacious building crowned with a tower. A. was at an early period a fortified town, and some fragments of the ancient walls even yet remain. An ancient gate, built by Hotspur, still forms one of the entrances to the city. A. Castle, the residence of the Dukes of Northumberland, stands at the north entrance of the town. It was repaired some years ago, and is considered one of the most magnificent baronial structures in England. During the middle ages, it was a bulwark against the invasions of the Scots, who thrice besieged it. A. is the election town for the north division of the county. It has various charity schools, a mechanics' institute, a theatre, &c., but the trade is insignificant. Pop. 6300.

A'LOE (*Aloë*), a genus of plants belonging to the natural order *Liliaceæ* (q. v.) sub-order *Aloineæ*, distinguished by a regular cylindrical perianth in six pieces, expanded at the mouth, and nectariferous at the base, the stamens hypogynous, or springing from beneath the germen, the ovules indefinite in number, the fruit a membranous three-celled capsule. The species are numerous, natives of warm countries, especially of the southern parts of Africa. About fifty miles from Cape Town is a mountainous

tract completely covered with aloes, and the hills on the west side of Socotra exhibit them in similar profusion. The species all have stems, but vary in height from a few inches to thirty feet. They have permanent succulent leaves. The negroes of the west coast of Africa make cords and nets of the fibres of their leaves, and stockings are woven from the fibres of a species found in Jamaica. But aloes are chiefly valuable for their medicinal properties. The well-known drug called ALOES (q. v.) is the inspissated juice of the leaves of several almost tree-like species, and particularly of *A. Socotrina*, a native of the island of Socotra; *A. purpurascens*; *A. spicata*, and *A. fruticosa*, which principally yield the Cape aloes; *A. Indica*; *A. rubescens*; *A. Arabica*; *A. linguiformis*; *A. Commelini*; and *A. vulgaris*, which is found in the East and West Indies, in Italy, and in some of the islands of the Mediterranean, being the only species which can be reckoned European, although it also is probably an introduced plant. The extract prepared from its leaves is known as Hepatic aloes, or as Barbadoes aloes. The bitter principle of aloes has been called Aloesin. It forms several compounds with oxygen, which possess the properties of acids.—The juice of aloes was anciently used in embalming, to preserve dead bodies from putrefaction. In the East Indies, it is employed as a varnish to prevent the attacks of insects; and has even been applied to bottoms of ships to protect them from marine worms. A beautiful violet colour is obtained from the leaves of the Socotrine A., which does not require any mordant to fix it. It also affords a fine transparent colour for miniature painting.—Mohammedan pilgrims suspend an A. over their doors on their return from Mecca, to signify that they have performed the pilgrimage.

The AMERICAN A. is a totally different plant. See AGAVE.

A'LOES is a drug of great antiquity, for we find Dioscorides (50 A.D.) making mention of *Aloë* as a substance obtained from a plant, and possessing cathartic properties. The great demand for A. in Britain has led to its importation from numerous sources, including Bombay, Arabia, Socotra, Madagascar, the Cape of Good Hope, the Levant, and the West Indies. The drug is the inspissated juice of various species of *Aloe* (q. v.). All these are characterised more or less by producing large, thick, fleshy leaves, stiff and brittle, pointed, and generally terminating in a strong spine, filled with a mucilaginous pulp internally, and containing in the proper vessels of their exterior portion an intensely bitter juice, which yields the medicinal substance A. It is obtained, sometimes in the form of tears, by incision, spontaneous exudation, and inspissation upon the plant; sometimes by spontaneous evaporation of the juice which drops or exudes by pressure from the leaves when cut away near the base; sometimes by evaporating the same juice with the aid of heat; and lastly, by evaporating together the juice and a decoction of the leaves.

Aloë fruticosa:
b, the flower.

Owing to the great difficulty of determining the true botanical source of any given sample, the following names are made use of in commerce to denote the various kinds of A. found in the market—namely, Socotrine, Clear, Cape, East Indian, Barbadoes, and Caballine A. The most important are:

1. Socotrine A. (*Aloë Socotrina*), so called from its supposed source, the island of Socotra, near the mouth of the Arabian Gulf. This is the most esteemed of all the varieties used in medical practice. Many hold that this is only a fine variety of East Indian A., but the characters given in the *Edinburgh Pharmacopœia*—a garnet-red translucency in thin pieces, and almost complete solubility in spirit of the strength of sherry—define a particular species, which is the true Socotrine A. of pharmacologists.

2. East Indian A. (*Aloë Indica*), also called Hepatic A., from its liver-brown colour, is imported into Bombay from Arabia and Africa, and is known in India by the name of Bombay A. A considerable portion is probably obtained from the same sources as the Socotrine A., which it resembles in colour; and according to Dr Pereira, 'the two are sometimes brought over intermixed, the Socotrine occasionally forming a vein in a cask of Hepatic A.'

3. Barbadoes A. (*Aloë Barbadosensis*) is prepared in the West Indies from *A. Socotrina*, and from a variety of *A. vulgaris*. We learn from Browne's *Natural History of Jamaica* that the largest and most succulent leaves are placed upright in tubs, that the juice may dribble out. This evaporated, forms what is sold as Socotrine A.; but the common A. is obtained by expressing the juice out of the leaves, holding it with water, evaporating and pouring it into gourds; whence this kind is often called gourd A. It is much used for veterinary medicine, and thus brings a high price in the market.

Caballine A. (*Aloë caballina*) is a very coarse kind, and is so called because it is considered fit only for horses. It contains many impurities, such as wood, sand, and charcoal, and evidently constitutes the lowest stratum in the vessels in which the better sorts are allowed to cool. It is now in a great measure superseded in veterinary practice by Barbadoes A.

All kinds of A. are remarkable for their disagreeable taste. The odour is peculiar, and is more perceptible when the drug is breathed upon. A. is in a great measure soluble in water, and more so in hot than cold water. A. was formerly considered to be a gum-resin; but the portion which was thought to be of the nature of gum is now regarded as a variety of *extractive*, and to it the name of Aloesin has been given.

Action.—When employed in small doses, A. exerts a tonic, and in larger doses, a cathartic action. It is considered by some authorities to stimulate the liver, and also to supply the place of deficient bile in torpidity of the intestinal canal, and more especially towards its lower part. Both taken singly, and also in combination with other cathartics, A. is perhaps the most important and the most extensively used of vegetable remedies of its class; and there is no end to the variety of cases in which it may be employed with advantage.

ALOES WOOD (called also Agila Wood, Eagle Wood, or Agallochum) is the inner part of the trunk of *Aquilaria ovata* and *A. Agallochum*, trees of the natural order *Aquilariaceæ* (q. v.), natives of the tropical parts of Asia, and supposed to be the aloes or lign aloes of the Bible. They are large spreading trees with simple alternate leaves. Aloes-wood contains a dark-coloured, fragrant, resinous substance, and is much prized in the east as a medicine, and for the pleasant odour which it diffuses in burning. It has been prescribed in Europe in cases of gout

and rheumatism. The resinous substance is found only in the inner part of the trunk and branches; the younger wood is white, and almost scentless. A similar substance, still more esteemed, is obtained in the south-eastern parts of Asia and the adjacent islands, from the central part of the trunk of *Aloeylon Agallochum*, an upright-growing tree with simple alternate leaves, and terminal panicles of small flowers, of the natural order *Leguminosæ*, sub-order *Casalpinieæ*. This tree abounds particularly on the highest mountains of Cochinchina and the Moluccas; a character of sacredness is attached to it, and it is ent with religious ceremonies. The A. W. which it yields is not only much prized in the east as a perfume, but many medicinal virtues are ascribed to it. The ancients ascribed to it similar virtues, and so valued it for these and its fragrance, that Herodotus says it once sold for more than its weight in gold. It was regarded almost as a universal medicine. Its very fragrance was supposed to have a beneficial influence, and it was therefore worn about the person. As it admits of a high polish and exhibits a beautiful graining, precious gems were set in it; and it was cut into fantastic forms and worn in head-dresses, &c. There seems to be allusion to a similar use of it in Psalm xlv. 8, 'All thy garments smell of myrrh and aloes and cassia.' Or perhaps this merely refers to its being employed to perfume clothing. It was also from a very early period much used to perfume the apartments of the great. The fragrance continues undiminished for years. *Lign Aloes* is a corruption of *Lignum Aloes* (Aloes Wood).

ALONG-SHORE, a phrase applied in navigating near a coast, to denote a passage near to, and parallel with, the shore. 'Along-shore-men,' or 'long-shore-men,' is a peculiar designation given to some of the humbler and rougher men employed about docks and shipping, in the Thames and other rivers.

ALOOFF, at sea, is simply 'at a distance.' To 'keep the loof,' or 'keep the luff,' is a command given to the man at the helm.

ALOPECURUS. See FONTAIL.

ALO'SA. See CLUPEIDÆ and SHAD.

ALOST (the name signifies 'to the east,' and was probably given to the town because it lay near the eastern frontier of the province), a town in Belgium, the old capital of the province of East Flanders, is situated on a tributary of the Scheldt, called the Dender, which is here converted into a canal. It is a walled city with five gates, has considerable trade in hops, corn, &c., and large manufactures, besides numerous breweries, distilleries, bleach-fields, print-works, copper and iron foundries, flax and cotton mills, &c. The finest building in A. is the church of St Martin, an unfinished edifice, but one of the grandest in Belgium, and containing a famous painting by Rubens—'St Roch beseeching our Saviour to stay the Plague of A.,' and also the mausoleum of Thierry Martens, who was born here, and who introduced the art of printing into Belgium, 1475 A.D. A. has a town-hall (founded in 1200 A.D.), a college, a hospital, chamber of commerce, academy of design, &c. Pop. 15,000.

ALOYSIA, a genus of plants of the natural order *Verbenaceæ* (q. v.), to which belongs a shrub, *A. citriodora*, much cultivated in greenhouses and apartments in Britain for the grateful fragrance which its leaves emit when slightly bruised. It is frequently to be seen in the windows of cottagers, and is by them generally named *Verbena*. It was formerly known to botanists as *Verbena triphylla*, and has also been referred to the allied genus *Lippia*. The leaves are in whorls of three. It is a native of Chili. In the Channel Islands and the south of

Ireland, it becomes a luxuriant shrub in the open air, reaching a height of 10—25 feet, with osier-like shoots.

ALP, ALB, also called the Rauhe or Swabian Alp, is a chain of mountains above 60 miles in length, and from 12 to 15 in breadth, situated between the Neckar and the Danube. It forms the water-shed between these two rivers and the basin of the Rhine, and lies almost entirely within the kingdom of Würtemberg. It is also in the vicinity of the Black Forest, but presents a totally different appearance, on account of its being clothed with forests of hard wood instead of pine. It forms a table-land intersected by a few narrow deep valleys. The average height of the system is rather more than 2000 feet. On the north, it descends to the Neckar in ridges of rocky cliffs, and abrupt pointed headlands; but on the south, it gradually slopes away to the level of the valley of the Danube. The scenery is often very picturesque, for the sharp, precipitous crags are frequently crowned with the ruined castles and strongholds of the famous old German families, such as the Hohenzollerns, Hohenstaufens, &c. The geological formation of the Alp is calcareous, and presents a regular stratification. Caverns of a very remarkable character abound among the rocks. The valleys at the base of the hills are fertile, and produce abundance of wine and fruit, but the high table-land has an extremely poor and barren soil.

ALPACA, or PACO (*Auchenia Paco*; see *AUCHENIA*), an animal of the same genus with the Lama (q. v.), and so closely allied to it, that many naturalists regard it as a variety rather than a distinct species. It is remarkable for the length and fineness of the wool, which is of a silken texture, and of an uncommonly lustrous, almost metallic appearance. The A. is smaller than the lama; the legs and breast are destitute of callosities. In form, it somewhat resembles the sheep, but with a longer neck and more elegant head. It carries its long neck erect; its motions are free and active, its ordinary pace a rapid bounding canter. The eyes are very large and beautiful. The wool, if regularly shorn, is supposed to grow about six or eight inches in a year; but if allowed to remain upon the animal for several years, attains a much greater length, sometimes even thirty inches, and is not unfrequently twenty. Its colour varies; it is often yellowish brown; sometimes gray, or approaching to white; sometimes almost black.

The A. is a native of the Andes, from the equator to Tierra del Fuego, but is most frequent on the

one or two hundred. In a wild state, it is very shy and vigilant; a sentinel on some elevated station gives notice of the approach of danger by snorting to alarm the flock. Alpacas seem instinctively to know when a storm is coming on, and seek the most sheltered situation within their reach. Flocks, the property of the Peruvian Indians, are allowed to graze throughout the whole year on the elevated pastures, and are driven to the huts only at shearing-time. When one is separated from the rest, it throws itself on the ground, and neither kindness nor severity will induce it to rise and advance alone. It is only when brought to the Indian huts very young, that they can be domesticated so as to live without the companionship of the flock; but then they become very bold and familiar. Their habits are remarkably clean.

The Indians have from time immemorial made blankets and ponchos or cloaks of A. wool. It is not quite thirty years since it became an article of commerce, but its use for the manufacture of shawls, coat-linings, cloth for warm climates, umbrellas, &c., has gradually increased, and more than 2,000,000 lbs. are now annually imported into Britain. The credit of introducing and raising to its present magnitude the Alpaca wool-manufacture in Britain, is due to Mr Titus Salt.

Attempts have been made to introduce the A. into Europe; but not yet with very satisfactory results. The only considerable flock known to exist is in the Pyrenees. There seems no reason, however, to doubt that the mountains of Wales and Scotland are suitable for this branch of husbandry; and it is to be hoped that enterprise such as has been directed to the manufacture of A. wool in Britain, will soon, and with equal success, be directed to the production of it. There are probably not yet more than two or three hundred alpacas in Britain, and these mostly in parks connected with the residences of noblemen and gentlemen, not in the situations for which they seem to be peculiarly adapted. An attempt is now being made to introduce the A. into Australia. The animals intended for this purpose were brought from South America to Glasgow, and again shipped for a second long voyage.

A. wool is straighter than that of the sheep, very strong in proportion to its thickness, and breaks little in combing. The fibre is small, and it is very soft, pliable, and elastic.—The flesh of the animal is said to be very wholesome and pleasant.

ALP-ARSLAN, a Persian sultan, the second of the Seljukide dynasty, born in Turkestan in 1028 or 1030. In 1053, he ascended the throne of Khorassan, after the death of his father Daoud, and in 1063 he also succeeded his uncle. His first act was to unite the whole of his dominions in one vast monarchy. He next embraced Islamism, and it was on this occasion that he took the surname of Alp-Arslan (the Lion-heart), his real name being Mohammed-Lhaz-ed-Dyn-Abou-Choudja. The Calif of Bagdad gave him the title of Adhad-eddin (Defender of the Faith), with this extreme honour—namely, that prayer should be made in his name. He had an excellent vizier, Nisam-al-Mulk, one of those lettered ornaments of early Mohammedanism. This vizier was the founder of all the colleges and academies in the kingdom. While he directed the internal administration of affairs, A. made war successfully. He suppressed revolts, and extended the northern boundaries of his dominions. In 1067 and 1068 he pursued the course of his conquests, carrying off the gates of the church of St Basil at Casarea, which were enriched with gold and pearls, and overthrowing the Greeks under Nicephorus Botoniates. In 1069, he invaded

Alpaca.

highest mountains of Peru and Chili, almost on the borders of perpetual snow, congregating in flocks of

Armenia and Georgia, at that time Christian kingdoms. The most remarkable incident in this expedition was the blockade of the convent of Marian-Nishin, situated on an island in the middle of a lake, and considered impregnable. An earthquake overthrew the walls during the siege, when it immediately surrendered. He next proceeded against the Greeks who, under their brave emperor, Romanus IV., had thrice driven back the Turks beyond the Euphrates. In August 1071, a bloody battle was fought near the fortress of Malaskerd, between the towns of Van and Erzeroum. A. gained the victory. The Greek emperor was taken prisoner, and only obtained his liberty by a ransom of £1,000,000, and an annual tribute of £160,000. Rather more than a year after this (December 15, 1072), A. perished at Berzem in Turkestan by the poniard of Jussuf Cothul, whom he had insulted. He was buried at Mervé, in the tomb of his ancestors.

ALPES is the name of two departments in France, the *Basses-Alpes* (or Lower Alps), and the *Hautes-Alpes* (or Upper Alps). The department of the *BASSES-ALPES* occupies the N.E. part of Provence, and includes an area of 2680 square miles. It is, for the most part, mountainous, consisting of spurs or offshoots from the Maritime Alps, which run in numerous chains towards the Rhone. In the north, the climate is cold, the soil poor, and the cultivation bad; in the south, the climate is much better—almonds, apricots, peaches, and various other choice fruits are grown, amongst which the plums of Bignolles form a well-known article of commerce. The wines of this region are reckoned excellent. On the sides of the Alps, oxen and sheep find admirable pasturage. The mines produce lead, green marble, &c. At Digne and Gréoulx there are hot mineral springs. Pop. 150,000; the trade carried on is insignificant. The department is watered by the Durance. The chief town is Digne; pop. 3720.

The *HAUTES-ALPES*, lying north of the *Basses-A.*, and forming a part of the old province of Dauphiné, is traversed by the chief range of the Cottian Alps, which here rise, in Mount Pelvoux, to the height of 14,000 feet, and Mount Olan to 13,120 feet. The scenery, especially along the course of the impetuous Durance, is singularly picturesque. The *Hautes-A.* is the highest department in France; the fierce north wind and the perpetual snow on the lofty peaks, make the climate severe and the winter long, so that the barren soil will yield little else than potatoes, a little rye, oats, and barley. Here and there, in the most southerly valleys, nut-trees, chestnuts, vines, and other choice fruits, thrive. Only horned cattle, asses, and mules are bred profitably. The most important roads through this department are: 1st, The road from Grenoble to Briançon; 2d, The road from Briançon to Susa, in Piedmont, over the Col-de-Genèvre (which has recently been used to transport masses of French soldiery into Italy); 3d, The road from Gap to Marseille. The area is 2136 square miles; pop. 130,000. The inhabitants are employed in the manufacture of leather, linen, and woollens. A number are likewise engaged in the mines, which produce lead, copper, iron, and anthraeite. About 4000 leave the department annually to seek employment. Chief town, Gap; pop. 5450.

ALPHABET. The A. of any language is the series of letters, arranged in a fixed order, with which that language is written. Picture-writing was doubtless the earliest method invented of conveying thought through the eye. The idea of an ox was readily expressed by a sketch of the animal, or, for shortness, by an outline of his head and horns.

Or the picture was used symbolically; as the figure of an eye, to express the action of seeing, or the attribute of wisdom. In process of time, some of those pictures came to be used phonetically—i.e., to represent, not ideas, but sounds. But the sounds so represented would at first be whole words, or, at all events, syllables; and the important step was yet to be taken of analysing syllables into their elementary sounds, and of agreeing upon some one unvarying picture or sign (a letter) to represent each. This constituted the invention of the A. By what steps alphabetic writing most probably rose out of picture-writing, will be seen under the head of *HEROGLYPHICS*. See also *CHINESE LANGUAGE* and *CUNEIFORM CHARACTERS*.

The Phœnician A. is the oldest of which we have any account; and from it have originated, directly or indirectly, all the modes of writing now in use in the world. It is the foundation of the Greek, the Latin, and the Arabic alphabets; and the great influence of the nations speaking these tongues accounts for the wide-spread similarity. Taking both ancient and modern times into account, as many as 400 alphabets have been enumerated; but of those now in use, if we set aside slight variations of form, the number does not exceed 50. Auer's *Sprachhalle* (Vienna, 1849) contains a rich collection of alphabets. We must confine ourselves here to those more immediately connected with the history of the English A.

A point of considerable importance is the *order* of the letters. In modern alphabets, this appears at first sight to be quite arbitrary; but traces of a principle of arrangement, or natural system according to which the series grew, have recently been brought to light.* The evidences of such a natural order are best seen in the Hebrew A., which was almost identical with the Phœnician. The following table exhibits the Hebrew letters, with their names, and sounds or powers; and also the names of the letters composing the early Greek A., as borrowed from the Phœnician:

HEBREW.		GREEK.
Name.	Sound or Power.	
1	א Aleph, a vowel or breathing.	Alpha.
	ב Beth, B.	Beta.
	ג Gimel, G (gun).	Gamma.
	ד Daleth, D.	Delta.
2	ה He, a vowel or breathing.	E (epsilon).
	ו Vau, V or F.	F = V (digamma).
	ז Zayn, Z.]	Zeta.
	ח Kheth, KH or CH.	Eta.
3	ט Theth, TH.	Theta.
	י Yod, J.	Iota.
	כ Kaph, K, variety of.]	Kappa.
	ל Lamed, L.	Lambda.
4	מ Mem, M.	Mu.
	נ Nun, N.	Nu.
	ס Samekh, S, variety of.]	Sigma.
	פ Peh, P.	Pi.
5	צ Tsadi, TS.]	
	ק Koph, K or Q.	Koppa.
	ר Resh, R.]	Rho.
	ש Sin, S.]	San.
	ת Tau, T.	Tau.

Leaving out of account the letters enclosed in brackets, which are not easily accounted for, and

* The theory was first propounded in 1833, by Professor Key, of University College, London, in the *Penny Cyclopaedia*, art. 'Alphabet.'

ALPHABET.

are possibly later interpolations, the whole fall into four groups, the law of which will best appear in the following scheme:

Vowels.	Labials.	Palatals.	Dentals.	
a	b	g	d	Flats or medials.
e	v	ch	th	Aspirates.
o	p	k	t	Sharps.
i	l	m	n	Liquids.

Without entering at present into the nature of the relation between the letters in the several rows, horizontal and vertical, of the scheme (for which see LETTERS), it will be seen that group (1) in the Hebrew A. consists of a vowel followed by three mute letters, all having one character (flats or medials); that group (2) consists of a vowel followed by three mutes, also having one character (aspirates); and that group (4) consists in like manner of a vowel followed by three mutes, all of the same character (sharps). The order, moreover, according to the organ of utterance, in which the mutes follow in each group, is invariable: the labial (lip-sound) coming first; the palatal (palate-sound), second; and the dental (tooth-sound), last. This principle of arrangement is characterised by Dr Latham as a *circulating order*. Group (3) likewise consists of a vowel and four consonants of one character (liquids); but in this case the order of the vocal organs is not observed—at least in the form in which the Hebrew A. is known to us; in order to be symmetrical with the other groups, the sequence would require to be m, l, n.

The nucleus of the original A. would thus seem to have consisted of sixteen letters, grouped in four tetrads or quaternions, on an organic principle of arrangement. This principle is obscured in English and other modern alphabets, by some of the letters having gradually come to represent quite other sounds than their original. There is sufficient evidence, for example, that in the earliest Latin alphabet, from which the English is derived, the third letter, C, had the power of G (in *gun*). There was a subsequent period in the development of that language when the distinction between the sharp and flat palatal sounds seems to have been lost, and when two syllables like *kam* and *gam* would have been both pronounced alike (*kam*). C thus acquired the power of K, and the letter K itself went almost out of use. But about the time of the First Punic War (264—241 B.C.), the distinction between the sharp and the flat sounds revived; and while the original C continued ever after to have the power of K (*Cicero*, for instance, was pronounced *Kikero*), a new character (G) was formed from it, by a very slight alteration, to express the flat sound. Again, the modern H, which has in most cases become a mere evanescent breathing, can be traced back until it becomes a strong guttural, like CH in the Scotch word *loch*. The place of the third consonant in the cycle of aspirates is a complete blank in the alphabets derived from the Latin; because that language being originally destitute of the sound, dropped the sign of it, from the first. The Latins were, in fact, completely destitute of the genuine aspirate sounds; for even the letter F had not the sound we give it. Therefore, when they had to represent the aspirate consonants of the Greek language, φ, χ, θ, they had recourse to the combinations *ph, ch, th*—a clumsy expedient still followed in modern alphabets derived from the Roman, and constituting one of their most serious defects.—The

cycle of the sharps is pretty perfect in the English alphabet, for Q is only a variety of K.

It is easy to conceive a language represented by sixteen characters of the nature above described. The most serious deficiency would seem to be the want of *r* and *s*. But the sound of *th* is very nearly allied to that of *s* (witness 'loves or loveth;') also the pronunciation of a person who *li(h)p(h)*, and one character might be made to stand for both, as easily as in English *c* is made to represent two sounds so different as those exemplified in *cat* and *city*. Some nations, again, are said to make no distinction between *r* and *l*, so that one character might stand for both these sounds.

But whether or not the Phœnician A. had originally only sixteen letters, it is evident that when transplanted into Greece, it had twenty-one letters, if not twenty-two. In accommodating itself to the necessities of the Greek tongue, it gradually underwent a series of changes. Some of the letters were modified: *He* became *e*; *Ceth*, *ce*; *Sigma* became *z*, and the name *Sigma* was transferred to *San*. Other letters were altogether dropped, as *Digamma* (= *v*) and *Koppa*. On the other hand, for such simple sounds as had no representatives in the Phœnician, new characters were invented, and annexed to the end (*v, φ, χ, ψ, ω*).

Another important change was in the *direction* of the writing. In the Phœnician and other Semitic languages, the writing proceeded from right to left. The Greeks, on borrowing the Phœnician A., also wrote for some time from right to left. The mode called *bustrophedon* (turning like an ox in ploughing), of writing alternately from right to left and from left to right, was then introduced; and finally the direction from left to right prevailed throughout the West, to the exclusion of the other modes.

In the classical period of the Greek language, the A. had come to consist of twenty-four letters, as in columns 2, 3, 4 of the following table. Column 1 (copied from Ballhorn's *Alphabet*) gives some of the earlier forms of the Greek letters, found on coins and other inscriptions, of the period when writing still proceeded from right to left; column 2 is from the Alexandrian Codex (q. v.), as given in Key's *Alphabet*; and Nos. 3 and 4 are the modern printed forms of capitals and small letters. The small characters are merely cursive forms or variations of the capitals; and it would not be difficult to shew how, in each case, the endeavour to trace the capital on soft material rapidly and without lifting the hand, would give rise to the form now used as the small letter.

GREEK ALPHABET.

Ω	Ω	Ω	ω	Omëga	o (long)

With regard to the *figures* or shapes of the letters, it is believed that they all arose out of pictures or hieroglyphic characters. The names of the Hebrew letters are also the names of material objects; and the letters themselves were at first, in all probability, rude outlines of the objects. Aleph, for example, means an 'ox,' and the letter was in its origin an outline of an ox's head. The history of Gimel, which means 'camel,' is probably similar. The Hebrew characters known to us are believed to be comparatively modern, and much corrupted from their original forms, and the likenesses are more difficult to trace in them than in the Samaritan and the early Greek, or even in the Latin. Mem, again, is the Hebrew word for 'water,' and some of the earliest forms of the letter M are zigzag lines, similar to the sign of *Aquarius* (♊) in the zodiac, intended no doubt to represent the undulations of water. Ayn, the name of the Hebrew letter equivalent to O, also means an 'eye,' and the picture of an eye would naturally degenerate into a circle, first with a dot in the centre (which some ancient O's actually have), and then without a dot.

The A. came into Italy not directly from Phœnicia, but from Greece, and that at a time when the Greek A. had undergone some of the changes described above, although not all of them; *υ*, *φ*, and *χ* had been added, but not *ψ* and *ω*. Moreover, there must have been distinct and independent importations into more than one part of Italy, and that, probably, from different parts of Greece, or, at all events, at different periods. The Etrurian A. is evidently an earlier importation than the more southerly Latin, as it departs less from the Phœnician. There are even differences in different parts of Etruria itself. The alphabets of Etruria north of the Apennines (for numerous inscriptions recently discovered shew that this remarkable race must have extended at one time as far north as the Alpine valleys of Provence, Tyrol, Graubünden, and Styria) differ slightly from the alphabets of the inscriptions in Etruria proper, which are demonstrably taken from the A. of the Greek colony of Cære.

The Latin A., which became that of Rome, and thus of the whole western world, was borrowed from a newer form of the Greek—namely, that imported

by the Dorian Greeks of Cumæ and Sicily. The writing in the oldest Latin inscriptions is never from right to left, as is mostly the case in Etrurian. On the other hand, the Kaph and the Koph (K and Q) of the Phœnician, which disappear in Etrurian, are retained in Latin. The Greek A. of Cumæ had not yet received the addition of *ψ* and *ω*; but it still retained the representative of the Phœnician *ʾau*, the Digamma, and also *Κορρα*, and thus consisted of twenty-four letters. The Latin tongue, being destitute of aspirate sounds, dropped the three letters *λ*, *φ*, *χ*, so that the original Latin A. consisted of twenty-one letters, the forms of which, as seen on the oldest inscriptions, were as in the following table. See Corssen's *Aussprache, Vocalismus und Betonung der Lateinischen Sprache* (Leip. 1858).

| 9. i I. | 20. v (u), V. |
| 10. k K, (C) | 21. x X. |
| 11. l L, Λ, L. | |

Z was early dropped, and the new letter G (see above) substituted for it; and thus the Latin A. continued to the last to consist of twenty-one letters, until it was applied to the modern tongues of Western Europe. The distinction made between *u* and *v*, and between *i* and *j*, in printing Latin books, is a modern innovation; and no Latin word contains either *y* or *z*. The five additional letters that make up the twenty-six of the English A., arose from the addition of *z*, and the development of *i* into *j*, and of *u* into *w*, *v*, and *y*.

The Anglo-Saxon A. had two useful letters, which have disappeared from modern English—namely, one for the sound of *th* in *thin*, and one (or rather two) for that of *th* in *thine*. These were derived, in all probability, from the *Mæso-Gothic* A., which (as well as the Russian and other Slavonic alphabets) was founded on the Greek rather than the Latin. The loss of these letters is owing to the influence of the Norman-French, the alphabet of which is exclusively Latin. The forms of the Anglo-Saxon letters are as under:

A a (A)		N u
Æ æ (Æ)		O o
B b		P p
C c (C)		R r (P)
D d (D)		S s (P)
E e (e)		T t (C)
F f (F)		U u
G g (G Z)		W w (P PP)
H h (H P)		X x
I i		Y y
L l		Þ þ th (<i>thin</i>)
M m (M)		Ð ð th (<i>thine</i>)

'The characters between brackets were written by the Anglo-Saxons, but, being for the most part mere corruptions of the Roman forms, are now seldom printed.'—Vernon's *Anglo-Saxon Grammar*.

The peculiarities of the several letters will be noticed in their proper places. For their classification, and the defects and redundancies of the English A., see LETTERS AND ARTICULATE SOUNDS. Other points connected with this subject will be found under BLACK-LETTER, ORTHOGRAPHY, and PHONETIC WRITING.

ALPHEIUS (now Ruféa, Rufá, or Rofíá) is the chief river of Peloponnesus (Morea), rising in the south-east of Arcadia, and flowing west through Elis, and past the famous Olympia, into the Ionic Sea. This river is one of the most celebrated in ancient song, and is connected with a beautiful and characteristic Greek legend. The nature of the upper course of the A. was calculated to affect strongly the imagination of the Greeks. In its passage through Arcadia, a country consisting of cavernous limestone, and abounding in shut-in basins and valleys, it repeatedly disappears under ground and rises again. After these feats, it was capable of anything—even of flowing under the sea—and the Greek colonists of Sicily thought they recognised it in their new country. Close on the margin of the sea in the island of Ortygia (the site of Syracuse), there was a beautiful and copious fountain; and just where the water of this fountain joined the sea, another strong spring bubbled up under the salt water. This could only be another freak of the A.; and it was popularly believed that the sweepings of the temple of Olympia, after the great festival, when thrown into the river, reappeared in the springs at Ortygia. Strabo asserts as a fact that a cup did so.

This wonderful phenomenon found its explanation, as usual, in a myth, connecting it with the history of the gods. The river-god Alpheus became enamoured of the nymph Arethusa while bathing in his stream. To escape him, she prayed to Diana, who changed her into a fountain, and opened up an underground passage for her to Ortygia. The river still pursued the object of his love, passing from Greece to Sicily below the sea, without mingling his waters with it, and appearing in the spring that bubbles up by the shore.

ALPINE HUSBANDRY. The characteristic feature of A. farming is, that the preparation of fodder is the chief object, and the cultivation of grain only secondary. In the less elevated regions bordering on the flat country, it is the practice to break up the grass from time to time, and take a succession of grain crops. In more elevated districts, the moisture of the climate and the shortness of the season of vegetation, prevent crops requiring tillage from coming to perfection, and there the whole attention is devoted to pasturage and the preparation of meadow-hay. The top-dressing of the plots devoted to hay-growing, with the solid and liquid manure of the cattle, the cutting and making of the hay, and transporting it to the farm-offices, occupy a great part of the labour of the population of the Alps. They turn to account for hay-making those shelves and crevices among the mountains which are inaccessible to cattle, and even goats; the herbage, which often grows luxuriantly in such situations, is cut, bound up in cloths or nets, and carried down difficult paths on the head, or is flung over the precipices.

The grass-lands in the lower regions near the dwellings being mostly reserved for hay, the cattle are pastured in summer in those regions that lie too high or too remote to be inhabited in winter. These pastures consist of plateaus and slopes, which imme-

diately on the disappearance of the snow, become clothed with a rich carpet of herbage and flowers. Each separate locality or pasture is called an *Alp*. Some of these 'alps' belong to individuals; others to the commune or parish. The more rocky and steep places are pastured by sheep and goats. There are three zones or stages in the A. pastures. The cattle are driven to the first and lowest stage about the end of May; about a month later, they ascend to the 'middle Alps'; and by the end of July, they reach the Upper Alps. As the days shorten, they descend in the same gradual way, so that the whole 'Alp-time' lasts about 20 weeks. The pastures are provided with huts for those who have charge of the cattle, who also convert the milk into cheese. Little butter is made. The departure for the 'Alps' in spring, and the return in autumn, are made the occasion of popular festivals.

ALPINE PLANTS. This appellation is given not only to those plants which are found at elevations approaching the limit of perpetual snow in the Alps of Central Europe, but also to plants belonging to other mountainous regions in any part of the world, whose natural place of growth is near snows that are never melted even by the beams of the summer's sun. As the elevation of the snow-line, however, varies very much in different countries, according to the latitude, and also from peculiar local circumstances, the term A. P. is not so much significant of the actual elevation of the habitat, as of the average temperature which prevails there. On the Andes, near the equator, at an elevation of 12,000—15,000 feet above the level of the sea, many kinds of plants are found, of humble growth, resembling in their general appearance those which occur in Germany and Switzerland at an elevation of 6000 feet; and these, again, either resemble, or are even identical with, the species which in Lapland grow upon hills of very little elevation, or which, in the northern parts of Siberia, are found at the level of the sea. Similar plants occur also in the Himalaya Mountains, at elevations varying remarkably within very narrow geographical limits from local causes, which also create great differences in the general dryness or humidity of the atmosphere. The laws of this natural distribution of plants have been in our own day for the first time investigated and elucidated by Humboldt, Wahlenberg, Schouw, DeCandolle, and others, and form the most essential part of a branch of science still in its infancy, and much requiring further study, phytogeography, or the science of the geographic distribution of plants. When the A. P. of Central Europe are spoken of, those are meant which grow at an average height of 6000 feet, marking what, in the language of phytogeographic science, is called a *zone*. This, on its northern limit, the Riesengebirge, or Giants' Mountains, falls as low as 4000 feet, and rises, in the southern Alps and Pyrenees, to an elevation of 9000 feet, and sometimes even above it. Although very rich in forms peculiarly its own, this zone contains many plants which are likewise found on much lower hills, and even in the plains. The number of these, however, diminishes as the elevation increases. Hence the small spaces clear of snow in the highest regions possess a very characteristic flora, the plants of which are distinguished by a very low diminutive habit, and an inclination to form a thick turf, frequently, also, by a covering of woolly hairs, whilst their stems are very often either partly or altogether woody, and their flowers are in proportion remarkably large, of brilliant colours, and in many instances very odiferous, upon which accounts, they remarkably attract and please the occasional visitors from the plains. In the Alps of Central Europe, the eye is at once caught by gentians, saxifrages, rhododendrons, and

various species of primrose. With these and other phanerogamous plants, are associated a number of delicate ferns and exceedingly beautiful mosses. The highest mountains in Scotland exhibit a somewhat similar flora, and beautiful plants, both phanerogamous and cryptogamous, are found on them, which never appear in lower situations, as the Alpine Speedwell (*Veronica Alpina*), the small Alpine Gentian (*Gentiana nivalis*), the Rock Scorpion Grass, or Alpine Forget-me-not (*Myosotis Alpestris*), *Azalea procumbens*, *Woodсия Illeensis* and *hyperborea*, &c. Many A. P. are limited to a very small district. Thus, the flora of Switzerland differs considerably from that of Germany, the latter being now known to contain 3400 phanerogamous plants, of which the former contains 2200, and along with them also 126 species which have hitherto been found only in the Swiss Alps.—There are, moreover, particular species of plants which are found only in single localities, as *Hypericum coris*, upon the mountain of Wiggis in the canton of Glarus; *Wulfenia Carinthiaca*, upon the Kiiweger Alp, in Upper Carinthia, and many others. There are, however, many species which, occurring on the mountains of Central Europe, appear also in those of Britain and of Scandinavia at lower altitudes, but are not found in the intervening plains. See SPECIES, DISTRIBUTION OF.—Cryptogamic plants are generally found in Alpine regions in much greater abundance than elsewhere. The transplanting of A. P. into gardens is attended with great difficulties, and is rarely successful. Their great beauty, even when dried, makes them favourites with those plant-collectors who have amusement more in view than the mere interests of science. Small herbaria of them are offered for sale everywhere in Switzerland; and in some places, large collections have been prepared and thrown open to the public.

ALPYNIA. See GALANGALE.

ALPNACH, or ALPNACHT, a Swiss village, in the canton of Untervalden, at the foot of Mount Pilatus, $1\frac{1}{2}$ miles from that part of Lake Lucerne called Lake A. It is known principally on account of its celebrated 'slide.' This was a sort of wooden trough by which the felled timber of Mount Pilatus was conveyed with amazing velocity from a height of 2500 feet down to the lake. In order to prevent friction, the trough was perpetually lubricated by a slender rill of water. It is no longer used, the wood being now drawn down by horses and oxen. Population of A., 1500.

ALPS, the most extensive system of lofty mountains in Europe, raise their giant masses on a basis of 90,000 square miles, between $6^{\circ} 40'$ and 18° E. long., and extending in some places from the 44th to the 48th parallel of latitude. The word *Alp* or *Alb*, signifying in the Celtic language 'white,' was the name given to these mountains on account of their tops being perpetually covered with snow. The Alpine system is bounded on the N. by the hilly ground of Switzerland and the upper plain of the Danube; on the E., by the low plains of Hungary; on the S., by the Adriatic Sea, the plains of Lombardy, and the Gulf of Genoa; and on the W., by the plains of Provence and the valley of the Rhone. A string of lakes encircles both the northern and southern bases of these mountains, the former at an elevation of 1200—2000 feet; the latter, 600—700 feet. The varied natural scenery of France, Italy, Germany, and Hungary has a common centre of union in this lofty region. Valleys open out in all directions, sending their melted snows on one side into the North Sea, on another into the Black Sea, and on another into the Mediterranean.

The water-system of the A. may be thus briefly sketched: 1. In the basin of the Rhine, there is

the Rhine itself, which partly forms the Lake of Constance, at the north-eastern extremity of Switzerland, and receives on the left the important tributaries of the Thur and the Aar; the latter of which flows through Lakes Brienz and Thun, and is itself augmented by various affluents, the largest of which are the Reuss and the Limmat. 2. In the basin of the Danube there flow from the south the Iller, Lech, Isar, and the Inn. Still further east, the Danube has for its tributaries the Traun, the Ens, the Raab, the Drave, and the Save, the last three of which have their sources in the extreme Eastern A. 3. In the basin of the Po, there are numerous streams, which rise in the Southern A.; the principal of these are the Dora Baltea, the Sesia, the Ticino from Lake Maggiore, the Mincio from Lake Garda, and the Adige. 4. In the basin of the Rhone, there are the Rhone (flowing through the Lake of Geneva), and various Alpine tributaries, the most important of which are the Arve, the Isère, and the Durance. 5. The Var is the principal Ligurian coast-stream; the Piave, and the Tagliamento, the largest of those which fall into the Adriatic from the Southern A.

Divisions.—In order to give a clear view of the manifold ranges of this mountain-land, a distinction is generally made between the East, the West, and the Middle A.; the last of which is again divided into a northern, central, and southern chain; while a natural separation by river-valleys into groups is also made. I. WEST A.—The principal ranges of these are: 1. The Maritime A., extending from the middle Durance southwards to the Mediterranean, and rising in the Col Roburent to the height of 9400 feet. 2. The Cottian A., north of these, whose highest summit, Monte Viso, is 13,599 feet. 3. The Graian A., forming the boundary between Savoy and Piedmont, and attaining in Mont Iséran an elevation of 13,272 feet, and in Mont Cenis, an elevation of 11,457 feet. II. MIDDLE A. *Central Chain.*—1. The Pennine A., between the plains of Lombardy and the valley of the Rhone. Highest summits: Mont Blanc, 15,744 feet; Monte Rosa, 15,151 feet; Mont Cervin, 14,836 feet. 2. The Lepontian or Helvetic A., from the depression of the Simplon, along the plateau and masses of St Gothard (12,900 feet), to the pass of Mont Spligen. 3. The Rhaetian A., between the Inn, the Adda, and the Upper Adige. *Northern Chain.*—1. The Bernese A., between the Rhone and the Aar; highest summits: Finsteraarhorn, 14,026 feet; Jungfrau, 13,716 feet; Schreckhorn, 13,397 feet. 2. The A. of the Four 'Forest Cantons,' the Schwytz A., &c. *The Southern Chain.*—1. The Oertler A., between the Adda and the Adige; highest summit, Oertlerspitz, 12,822 feet. 2. The Trientine A., between the Adige and the Piave; highest summit, La Marmolata, 9802 feet. III. EAST A.—The principal chains of these are: 1. The Noric A., between the plains of the Drave and the Danube; highest summit, Gross-Glockner, 12,431 feet. 2. The Carnic A., between the Drave and the Save. 3. The Judian A., between the Save and the Adriatic Sea; highest summit, Mont Tergh, 9366 feet.

Elevation.—With respect to height, it is a general rule that the A. are lowest where the system is broadest, that is, in the E., and highest where the system is narrowest, that is, towards the W. Making a threefold distinction of crests, summits, and passes, the principal ranges may be characterised as follows. The crest-line (1) of West A., 6000—11,000 feet; (2) of Middle A., 9000—13,000 feet; (3) of East A., 3600—9000 feet. The summits: (1) of West A., 9000—14,000 feet; (2) of Middle A., 9000—15,800 feet; (3) of East A., 6000—12,000 feet. Height of the passes: (1) of West A., 4000—8000

feet; (2) of Middle A., 6500—11,000 feet; (3) of East A., 3500—6000 feet.

A comprehensive classification leads to a division of the elevations into three regions: 1. The lower range forming the buttresses of the main masses, and reaching a height of 2500—6000 feet; that is, to the extreme limit of the growth of wood. 2. The middle zone lying between the former limit and the snow-line, at the elevation of 8000—9000 feet. 3. The high A., rising to 15,744 feet. The middle zone forms the region of mountain-pasturages, where the characteristic Alpine dairy-farming is carried on. These pastures consist of a rich carpet of grass and flowers. This threefold division of heights, however, does not everywhere coincide with the same phenomena of vegetation: the line of perpetual snow descends lower on the north side, and the boundaries of the zones above described vary accordingly. 1. The line of demarcation between the region of mosses and Alpine plants and that of perpetual snow, is from 8000—9000 feet on the northern declivities; but on the southern, it approaches 10,000 feet. 2. The highest limit to which wood attains on the north is about 6000 feet, while on the south it is nearly 7000 feet. 3. Grain, beech, and oak, on the north, disappear at the elevation of 4000 feet; on the south, they contrive to exist, some hundreds of feet higher. 4. The region of the vine, as well as of maize and chestnuts, extends to an elevation of 1900 feet on the northern declivity; and on the southern declivity, to 2500 feet. The ranges of outlying lower mountains which flank the high central Alps on the N., E., and W., are mostly wanting on the S., especially where the Middle A. descend into the plains of Lombardy. Thus the A. rise in steep rocky precipices from the level of the flat plains of the Po, whilst they sink more gradually into the plains on the north; hence their mighty masses closely piled together present an aspect from the south more grand and awful; from the north, more extended and various.

Valleys.—The variety in the valleys as to form and arrangement is not less striking than in the elevations. Most worthy of notice is the characteristic form of the wide longitudinal valleys that lie at the foot of the high central chains. On the E. side, they open directly into the plain; on the N., they are connected with the plain through transverse valleys which often end in lakes. The transverse valleys on the S. side are mostly in the shape of steep rocky ravines, forming in some parts long-stretching lakes. Besides the deep-sunk principal valleys, there are extensive series of basin-shaped secondary valleys, which are the scenes of Alpine life, properly so called. Many of the Alpine valleys have names distinct from the rivers flowing through them. Thus, the valley of the Rhone is styled the Upper and Lower Vallais; that of the Adda, the Valteline; of the Arve, Chamounix.

Communications—Passes.—The valleys of the high A. form the natural means of communication. Some are more accessible than others. The entrance into a longitudinal valley is almost always smooth and easy; art has often had to force an entrance into a transverse valley. On many of the high roads which link the principal with the secondary valleys, it has been found necessary to blow up long ridges of rock, to build terraces, to make stone-bridges and long galleries of rock as a protection against avalanches, as well as to erect places of shelter (*hospices*) from storms. The construction of these roads may be reckoned among the boldest and most skillful works of man. In crossing the A., several defiles (usually seven) have to be traversed; for in addition to the pass of the main crest, there are other defiles on both sides, at the entrances of the

different valleys. In the E., the number of these narrow passes or defiles is considerably increased. The names applied to the Alpine passes vary according to their natural features or the local dialect; as Pass, Sattel (Saddle), Joch (Yoke) Scheideck, Klaus, Col, Chiusa. The traveller on these beautiful mountain-roads passes in a short time through the phenomena of the various seasons. In the course of a day's journey, he experiences a succession of climatic changes, which is accompanied with an equal variety in the manners of the people.

No lofty mountains in the world can boast of being so easily crossed as the European A. Hence we can understand how the plains of Upper Italy, accessible from the French, German, and Hungarian sides, have been the theatre of bloody strife for ages. The passage of the WEST A. is made by five principal roads. 1. The military road, La Corniche, a coast-road at the foot of the A. from Nice to Genoa. 2. The causeway over the Col-di-Tenda, between Nice and Coni, made in 1778; highest point, 5890 feet. 3. The high road so much used in ancient times over Mount Genève, connecting Provence and Dauphiné with Turin; highest point, 6550 feet. 4. The carriage-road made by Napoleon in 1805, over Mount Cenis, connecting Savoy with Piedmont; highest point, 6770 feet. 5. The pass of the Little St Bernard, connecting Geneva, Savoy, and Piedmont; highest point, 7190 feet. By this pass, Hannibal crossed into Italy. It is not much used now. Besides these great roads, there are many smaller ones branching off from them, which form a pretty close network of communication. The passage of the MIDDLE A. is made by eight principal roads. 1. That of the Great St Bernard, connecting the valley of the Rhone with Piedmont; highest point, 8170 feet. It was crossed by Napoleon in 1800. 2. The magnificent road over the Simplon, constructed by Napoleon, 1801—1806, and connecting the Vallais with the confines of Piedmont and Lombardy; highest point, 6570 feet. 3. Between the Great St Bernard and Monte Rosa is the Col of Mont Cervin, the loftiest pass in Europe, being nearly 11,200 feet, connecting Piedmont with the Vallais. 4. The pass of St Gothard, connecting Lucerne with Lago Maggiore; highest point, 6800 feet. This road passes through scenery of exquisite beauty. 5. The Bernardin Pass, made 1819—1823, by the Swiss Grisons and Sardinia; highest point, 6800 feet. 6. The Splügen Pass, repaired in 1822, connecting the sources of the Rhine with the Adda. This pass was the one used by the Romans in their intercourse with the countries bordering on the Danube and the Rhine, and also by the German armies on their marches into Italy in the middle ages. 7. The Wormser Joch, also called the Orteles Pass, or road, opened by Austria in 1824. It is the loftiest carriage-road in Europe, and connects the Tyrol with Lombardy. 8. The Brenner Pass, known to the Romans. It also connects the Tyrol with Lombardy; highest point, 4650 feet. Besides these great roads, leading south into Italy, there are two which lead north from the valley of the Rhone, and cross the Bernese A., over the Grimsel Pass, 6500 feet high, and the Gemmi Pass, 7400 feet high. The roads over the EAST A. are much lower, and also much more numerous than those in the MIDDLE or WEST A. The principal are—1. The road from Venice to Salzburg, crossing the Noric A. at an elevation of rather more than 5100 feet. 2. The road over the Carnic A., which divides into three branches—the first leading to Laybach; the second, to the valley of the Isonzo; and the third to the valley of the Tagliamento. 3. The roads from the Danube at Linz to Laybach.

Geology.—The A. offer a rich field for geological

investigations, the results of which hitherto may be thus summed up: The highest central mass—the Primary A., as they are called—that rises from the plain to the S.W. of Turin, and stretches in a mighty curve to the Neusiedlersee, in Hungary, consists chiefly of the crystalline rocks Gneiss and Mica-slate, with a much smaller proportion of Granite. Enclosed among the Central A. appear representatives of the Carboniferous and Jurassic formations; but so altered and become so crystalline that their age can only be guessed from a few remaining petrefactions, which are accompanied here and there by garnets. In the Graian, Pennine, and Rhaetian A. occur great masses of serpentine; in the N. of Piedmont, and in the upper valley of the Adige, quartz-porphry. In the E. there are, on the N. and S. sides of the chief range, vast deposits of clay-slate and grauwacke mixed with transition limestone.

Beginning on the Mediterranean coast, and following in general the direction of the central chains, a belt of sedimentary rocks runs along the W. and N. sides to the neighbourhood of Vienna. On the south side, a similar belt runs from Lake Maggiore to Agram. The undulating curves and colossal dislocations presented by these regions, shew that the form of their mountains must have been the result of a mighty force acting northwards and southwards from the Central A. In respect of age, these sedimentary or calcareous A. include all the members of the series of formations from magnesian limestone up to the lowest strata of the tertiary group. The south-eastern portion of these calcareous mountains, forming the Julian A., mostly consist of cavernous rocks of the Jurassic and chalk groups; and are continued with this character into Dalmatia.

Minerals.—Precious stones are found in abundance in the trap and primary mountains, especially in the region of the St Gothard. The rock-crystal of St Gothard has a world-wide reputation. Mining and smelting become more and more productive as we advance eastward. Switzerland itself is poor in useful ores. Gold and silver are found in Tyrol, Salzburg, and Carinthia; there are also silver-mines in Styria and Illyria, and one near Grenoble, in France. Copper is found in the French A., in Tyrol, and Styria. The lead-mines near Villach, in Carinthia, yield yearly about 35,000 cwt. The yield of iron in Switzerland, Savoy, and Salzburg is trifling; Carinthia, on the other hand, produces 260,000 cwt., and Styria 450,000 cwt. Quicksilver is extracted at Idria, in Carniola, to the amount of 1000—1500 cwt. The Alpine region is rich in salt, especially at Hall in Tyrol, and Hallein in Salzburg. Coal is found in Switzerland, in Savoy, and in the French A., but in no great quantity; the Austrian A. are, again, richer in this important mineral. The mineral springs, hot and cold, that occur in the region of the A. are innumerable. See AIX, ISCHL, LEUK, BADEN, &c.

Animals.—The Alpine mountains present many peculiarities worthy of notice in the animal as well as in the vegetable kingdom (see ALPINE PLANTS). On the sunny heights, the number of insects is very great; the butterflies are especially numerous. There are few fishes, although trouts are sometimes caught in ponds even 6000 feet above the level of the sea. Although the lofty mountains are inhabited by eagles, hawks, and various species of owls; yet the birds are few in comparison with the numbers in the plains, and those few are mostly confined to the larger valleys. Among the quadrupeds, the wild goat is sometimes, though rarely, to be met with; the chamois is more frequently seen, chiefly in the eastern districts. The marmot inhabits the upper Alpine regions. Wolves

are seen more frequently in the west than in the east; in the latter, on the other hand, bears, lynxes, and wild-cats are found, although constantly diminishing in number. Of the domestic animals, goats and oxen are scattered everywhere in large herds. There are fewer sheep and horses, and these are not of good breeds. Mules and asses are used more frequently in the south than in the north, especially as beasts of burden. Swine and dogs are not common; the latter are used almost solely by the herdsmen, or are kept in the hospices, to assist in searching for the unfortunate wanderers who may be lost in the snow.

The Alpine mountains are rich in singularly beautiful natural scenery, of which the inhabitants of flat countries can scarcely form an idea. Nature in the A. has an infinite variety of aspects. Here the hardened masses of the icy glacier cover the naked rock, avalanches are hurled into immeasurable abysses, the fall of rocks or mountain-slips overwhelm the dwellings, and cover the fields in the valleys; and in the east, the *boras*, with its hurricane strength, hurls before it the upraised masses of snow. There the sun glances upon the scattered silver threads of a water-fall, or mirrors himself in the peaceful waters of a glassy lake, while his rising and his setting are announced to the expectant traveller by the ruddy glow on the snowy mountain-tops. The inhabitant of the A., surrounded on every side by mountains, is unconsciously subdued by their presence, and receives from them a peculiar stamp of character; their dangers fascinate him as well as their charms. The most ceaseless variety of occupation demands all his time and his thoughts; in the mountains he acknowledges his only despots, who seize his soul, and lead it unresistingly. In his constant struggle with the elements, the Alpine dweller strengthens both his mind and body; he opens his heart to the impressions of nature; he gives utterance to his childlike gladness in simple songs, and at the same time defends with self-sacrificing devotion his mountain-fortresses against foreign aggression. But the manners and spirit of the neighbouring plains have penetrated into the larger valleys along with the dust of the highway. There the true Alpine life has more and more passed away. The simplicity and characteristic industry of the Alpine farms are now preserved only in the higher secondary valleys.

Six states share the A. The western portion is shared by France and Sardinia. Switzerland claims the Middle A. almost exclusively for her own. Bavaria has only a small share. Austria has the largest share of the A.—in Lombardy, the Tyrol, Illyria, Styria, and the archduchy. The wide valleys opening to the east allow the civilisation of the plains to enter easily among the mountains. The value of the minerals, and the fertility of the soil, have permitted mining, manufactures, and agriculture to take firm root, and a flourishing trade has caused large towns to usurp the place of mere Alpine villages. In the Tyrol, the pastoral life of the mountains has long been mixed up with the working of mines of salt or other minerals. The inhabitants of whole valleys are occupied in various branches of industry to a greater extent than in any other district of the A., and their sons travel far and near as artisans. See H. and A. Schlagintweit, *Researches into the Physical Geography of the A. (Untersuchungen über die Physikalische Geographie der Alpen)*, Leip. 1850.

ALPUJARRAS (a corruption of an Arabic word which signifies 'grass'—an allusion to the splendid pasturage on the north side), a range of mountains parallel to the Sierra Nevada, and approaching the coast of the Mediterranean Sea. Their southern side

is precipitous, but the northern slopes away into broad valleys, beyond which rises the Sierra Nevada. They commence in the west at Motril, where they are separated by the Guadalfeo, from the lower Sierra de Holnear, and the adjacent vine-covered hills of Malaga, and stretch as far east as the river Almeria. The range is divided into two parts by the Adra, each of which bears a particular name. The highest peaks reach an elevation of 7000 feet. On the north side, owing to the copious rains, there is the richest pasturage, both in the deep valleys and on the uplands. The southern slope, however, is almost destitute of trees or shrubs, with the exception of the fertile valleys near the sea, which are abundantly watered by numerous little streams. Here flourish, under an almost tropical climate, all the products of the south, even the date-palm and the sugar-cane. The inhabitants are chiefly employed in rearing sheep, and in cultivating the vine and other fruits. A little mining also goes on. Lead, antimony, and silver are got. The Moorish element is still quite discernible in the population of this mountain region.

ALSACE, a province of France, now forming the depts. of RHIN, BAS-, and RHIN, HAUT- (q. v.). It lies between the Rhine on the east, and the Vosges mountains on the west, extending south to Switzerland, and north to Rhenish Bavaria, and occupying 3360 English square miles. It is one of the most fertile parts of France; rich also in mines and manufactures, and contains the important cities of Strasburg, Colmar, and Mülhausen. In Cæsar's time, A. was occupied by Celtic tribes; but during the decline of the empire, the Alemanni and other tribes from beyond the Rhine occupied and completely Germanised it. It afterwards formed part of the German empire, under various sovereign dukes and princes, latterly, of the House of Hapsburg; till a part of it was ceded to France, at the peace of Westphalia, and the rest fell a prey to the aggressions of Louis XIV., who seized Strasburg (1681) by surprise in time of peace. By the peace of Ryswick (1697), the cession of the whole was ratified. Thus—as the Germans complain—was this fine land, and one of the noblest branches of the race, alienated from the German people, and the command of the German Rhine disgracefully surrendered to the enemy in the time of misfortune, and more disgraceful still, not demanded back when fortune favoured. German is still the language of the people, and all newspapers are printed in both languages. [A., with a part of Lorraine, was re-annexed to Germany at the peace of 1871.]

ALSSEN (Dan. Als), an island in the Baltic belonging to the Duchy of Schleswig, and extending from the Apenrade to the Flensborg Fiord, is separated from the mainland by the Sound of A., in part very narrow but deep. Its greatest length is nearly 20 miles; its greatest breadth about 12; pop. 24,000; lat. 54° 46' N., long. 9° 52' E. The island, one of the finest in the Baltic, has a picturesque appearance, is very fertile, with rich woods, and numerous lakes abounding in fish. Its fruit-trees are celebrated over all Schleswig. The Gravenstein apple, in particular, forms an important article of commerce. The chief towns are Sonderborg or Südborg (South Town), and Norborg or Nordborg (North Town). The former has an excellent harbour, with a population of 3300, and possesses more than 80 vessels. Close to the harbour are the ruins of an old and famous castle, belonging to the Augustenborg family, which even yet owns a large portion of the island. Here Christian II. of Denmark and Norway was confined from 1532 to 1549. During the Schleswig-Holstein war, A. was a place of considerable military importance.

ALSTER, a river in Holstein, is formed by the confluence of three streams, and, in the neighbourhood of Hamburg, spreads itself out, and forms a lake, called the Great or Outer A., and, within the town, the Inner A. It flows by several canals into the Elbe.

ALSTRÆMERIA, or ALSTRÆMER'S LILY, a genus of plants of the natural order *Amaryllidææ* (q. v.), and, according to Lindley, of the tribe *Alstræmeriææ*, which is distinguished by fibrous—not bulbous—roots, and by having the outer segments of the perianth different in form from the inner. In this genus, the two lower segments are somewhat tubular at the base, the capsules do not gape when ripe, are 3-valved or pulpy within, and the seeds globose. The leaves are twisted, so that what should be the upper surface, becomes the lower. The species are numerous, natives of the warmer parts of America. Many of them have tuberous roots. Some are sufficiently hardy to endure the open air in Britain, and are admired ornaments of our flower-gardens. Some have climbing or twining stems; amongst these is the *salsilla* (*A. salsilla*), a plant of great beauty, with lanceolate leaves, a native of Peru, which is cultivated in the West Indies, and its tubers eaten like those of the potato. In Britain, it requires the stove or a hot-bed. *A. ovata*, also a beautiful plant, with a slender twining stem, and ovate leaves, is cultivated in Chili for its tubers, which are used as food. It has been introduced into Britain, but its cultivation has made little progress. The tubers weigh from 3 to 6 ounces. A kind of arrow-root is also prepared in Chili from the succulent roots of *A. pallida* and other species.

ALTAÏ (i. e., gold mountain) is the term vaguely applied to the high range in the east of Asia, forming the northern border of that vast table-land known by the name of Chinese Tatory, and extending from 80° to 142° E. long. The A. mountains constitute the boundary between the Russian and Chinese empires, or between the long icy lowlands of Siberia, stretching away to the Arctic Sea, and the variegated central plateau that lies south of them. Their general direction is from east to west. They are divided into many ranges and groups, each having a distinctive name. From the Sea of Okhotsk, in the extreme east of Asia, they extend in a broad and winding mass to the plains of Turkestan, a little to the west of Lake Zaisan, or Zaizang, a distance of more than 3000 miles. The breadth of the system is, in some places, not less than 800—900 miles. From Okhotsk to the Lena, it is called the Aldan Chain; it is next separated into three groups by the valleys of the Amur, Yemisei, and Irtysh, the last of which is called the Little A., to distinguish it from the spir that strikes off into Chinese Tatory in a south-easterly direction, and which is called the Great A., a range that in some places towers into the region of perpetual snow, and whose most easterly cliffs abruptly disappear in the dark clouds which overhang the sandy steppes of Gobi. The Russian A., between Semipalatinsk and the sources of the Obi, have been colonised by the Russians, and as they rival the Ural Mountains in their mineral wealth, they have already become one of the most important districts of the Russian empire. This chain consists of a broad Alpine range on the north-western edge of Chinese Tatory, and is called the Altai-Bjelki, or Snowy Mountains. It reaches in its highest peaks an elevation of nearly 11,000 feet. Little is known of the geology of the Altaian system. Jasper is found in considerable abundance near the summits, red porphyry lower down, and granite still lower. Around Lake Baikal there are numerous granitic masses,

interspersed with newer igneous formations, but active volcanoes do not appear until the range reaches Kamtchatka. The mines are rich in gold, silver, copper, and lead. The botany of the mountains is as imperfectly known as the geology, but it seems to be worthy of closer attention. North of the A. Ijelki, lies the broad zone of the A. mineral districts, the inhabitants of which are employed as miners and agricultural labourers, over whom a strict watch is kept. The south-east is peopled by the Calmucks of the mountains, a Mongolian race. They are heathens, and their government is a patriarchal one. They lead a nomadic life, encamping in summer among the rich pastures on the mountain-terraces, and in winter within the sheltered recesses of the woolly glens. See ALTAR in SUPPLEMENT.

ALTAR (Lat. *altare*, from *altus*, high), the place whereon offerings were laid both by Jews and heathens. The first on record is that which Noah built on leaving the ark. The Israelites, after the giving of the Law, were commanded to make one. We find, from the Old Testament (1 Kings, iii. 3; 1 Kings, xi. 7; and 2 Kings, xxiii. 15), that altars were often erected on high places—sometimes, also, on the roofs of houses. Both in the Jewish tabernacle and temple there were two altars, one for sacrifices, and another for incense. For a minute description of these, see Exodus, Leviticus, and Numbers. The Jewish and oriental altars were generally either square, oblong, or approximating to such; those of Greece and Rome, on the other hand, were often round. Sacrifices were offered to the infernal gods, not on altars, but in cavities dug in the ground.

Roman Altars.

The word has been transferred into the Christian system. For upwards of five centuries, altars in the Christian churches were, for the most part, made of wood; but in 509 A.D., it was decreed by a council held at Epone, in France, that none should be consecrated with chrism except those built of stone. In the first ages of Christianity, there was only one A. in a church; but, from a very early time, the Latins have used more than one. In the 12th c., the adorning of churches with images and numerous altars was carried to a great extent, and they were embellished with gold, silver, and precious stones. The Greek Church use but one A. Altars were frequently placed at the west end of the ancient churches, instead of the east, but in England almost uniformly in the east. The only perfect A. of the old times in England is the high A. of Arundel Church, Sussex. The slab is 12 feet 6 inches long, by 4 feet wide, and 2½ inches thick. The support is of solid stone, quite plain, and plastered over. For 300 years after the time of Christ, the word A. was constantly used to describe the table of the Lord; subsequently, 'table' and 'altar' were used indifferently. In the first Prayer-book of King Edward, 1549, the word A. was used in the Rubric, and the Lord's Supper was still called the Mass; but in 1550, an order was issued for the setting up of tables instead of altars, and in the second Prayer-book of 1552, the word *altar* was everywhere replaced by *table*. The table was further

ordered to be of wood, and movable. In Mary's reign the altars were re-erected; but in Queen Elizabeth's, some were riotously pulled down, and injunctions were then issued directing that this should not be done, except under the oversight of the curate and at least one churchwarden. It was charged against Archbishop Laud that he had converted communion-tables into altars. What he really did was to remove the tables out of the body of the church, and place them 'altarwise,' i.e., north and south, at the upper end of the chancels, where the altars formerly stood; and a dog having on one occasion run away with a piece of the consecrated bread, he directed that rails should be erected to prevent such desecrations in future. The old stone altars used frequently to be made in the shape of tombs, and they enclosed relics; this was from the early Christians having often celebrated the eucharist at the tombs of the martyrs, or, as others say, they were thus made with the design of representing Christ's humanity as having been real, and vouched for by the fact of his body lying in the tomb. The Credence Table and Piscina are adjuncts of an A. By the judgment in the Arches Court, 1845, in the case of Faulkner v. Litchfield, it was decided that altars may not be erected in churches. This case arose out of the erection, by the Cambridge Camden Society, of a stone A. in the Church of the Holy Sepulchre in that town.

The old English divines, and, indeed, all Protestant ecclesiastical writers of any importance, are unanimous in the opinion, that among Christians the word cannot mean what the Jews and heathens expressed by it. The later fathers used various phrases to denote the solemnity which should attach to the communion-table, such as 'the Mystical and Tremendous Table,' 'the Mystical Table,' 'the Holy Table,' &c. And they termed it an A., because, *first*, the holy eucharist was regarded as a kind of commemorative sacrifice, or, more properly, a consecrated memorial before God of the great sacrifice on Calvary; and, *second*, the prayers of the communicants were held to be in themselves sacrifices or oblations—sacrifices of thanksgiving, as it were. This is the view of those who hold High Church opinions, but does not exclude the other view. Again, they termed it a *table* when the eucharist was considered exclusively in the light of a sacrament, to be partaken of by believers as spiritual food. In the former case, the sacrifice was commemorated; in the latter, it was applied: in the former, it expressed more directly the gratitude; in the latter, more directly the faith of the Christian.

ALTDORFER, ALBRECHT, painter and engraver, was born at Altdorf, in Bavaria, 1488, and died at Ratisbon, 1538. He is said to have been a pupil of Albert Dürer; but this is not certain. He belongs, however, to that religious school of artists of which Dürer was the head. His pictures are also animated by a glowing and romantic spirit of poetry, which is delightful to any one who appreciates the conditions of old German life. The landscape is delineated with the same truth and tenderness as the figures; a rich manifold life pervades the scenes, and everything is handled with the utmost delicacy. His master-piece, now in Munich, is 'The Victory of Alexander over Darius,' a painting which it is said, affects the beholder like a heroic poem. As an engraver, A. is reckoned among the lesser masters.

ALTEN, KARL AUGUST, COUNT of, one of the chief Hanoverian generals in the French and German war, was born October 20, 1764; entered the army in 1781, and gained distinction at the siege of Valenciennes, and in the decisive engagement at

Hondschooten. He was first lieutenant in 1800, but on account of the unhappy capitulation at Lauenburg, found it advisable to leave Hanover, and came to England. Here he was made commander of the first light battalion in the German Legion (1803). In 1808 he assisted, as general of brigade, in covering the retreat of General Moore to Corunna, and in the following year commanded the troops stationed in Sussex. In 1811, he took part, under General Beresford, in the siege of Badajoz and the battle of Albuera, and in the following year was promoted by the Duke of Wellington. In almost all the engagements of the Spanish war of liberation—at Salamanca, Vittoria, the Pyrenees, Nivelles, Nive, Orthez, Toulouse, &c., A. took a prominent part, and had the command of a corps of 30,000 men, stationed near Madrid, in 1812. He fought with great distinction at Quatre-Bras and at Waterloo, where he was severely wounded; his efforts greatly contributed to the decision of the battle. After his return to Hanover, he was made minister of war, and in this capacity died, April 20, 1840.

ALTENBURG, the capital of the duchy of Saxe-Altenburg, is situated in a fertile country about 24 miles from Leipsic, and contains 16,000 inhabitants. Standing on an almost perpendicular rock of porphyry, the old castle of A. forms a striking feature in the landscape. Its foundations are probably as old as the 11th c. It is remarkable as the scene of the historical incident known as the Prinzenraub (q. v.). Brushes, gloves, and cigars are among the chief manufactures carried on in A., and the book-trade is considerable. A railway connects it with Leipsic and Bavaria.

ALTENGAARD, or **ALTEN**, a seaport town in the province of Finmarken, Norway, situated at the mouth of the river Alten, in lat. 69° 55' N., and long. 23° 4' E. Beyond this point, no cultivation is attempted; and even here, potatoes and barley alone are produced. A. has a harbour and considerable trade. It is visited principally by Russian and Norwegian vessels.

ALTEN-ÖTTING, or **ALTÖTTING**, a place of pilgrimage not far from the Inn, is situated in one of the most beautiful and fertile plains of Upper Bavaria. It is frequented by thousands of Roman Catholics from Austria, Bavaria, and Swabia, on account of a famous image of the Virgin Mary (the 'Black Virgin') which it possesses, and may be called the Loretto of Germany. The Redemptorist fathers, who were invited hither in 1838, have built an educational institution, which may be held as a virtual revival of the old Jesuit college erected in 1773. A. was originally a *villa regia*. Several German emperors, such as Henry III. and Henry IV., held their court here. The emperor Leopold I. and other princes of the House of Hapsburg, made pilgrimages to it. It also contains the tomb of Count Tilly, who was buried here, at his own request. This tomb is called Tilly's Chapel, and is held in such high veneration, that Maximilian I., and numerous other princes and princesses of the Bavarian family, have had their hearts interred in it.

ALTERATIVES, in Medicine, a term applied to remedies that have the power of changing the state of the living solids of the body, and consequently altering the functions which they perform. It is generally applied, however, to medicines which are irritant in full doses, but which almost imperceptibly alter disordered actions or secretions; acting specially on certain glands, or upon absorption in general, when they are given in comparatively small doses, the treatment being continued for a considerable

length of time. For example, mercury is an irritant in some of its preparations; but when small doses of blue pill, Plummer's pill, or corrosive sublimate are given at intervals for some length of time, they 'produce alteration in disordered actions, so as to cause an improvement in the nutrient and digestive functions, the disappearance of eruptions, and the removal of thickening of the skin or of other tissues' (Royle); and they will effect these changes without otherwise affecting the constitution or inducing salivation. So iodine, also an irritant in concentrated doses, and poisonous in some forms, is most useful, when given in small doses, in effecting the removal of enlarged glandular organs, and need not cause iodism, if carefully given.

The preparations of gold are likewise stimulants of the absorbents, and are used in cases of scrofula. Some preparations of arsenic are powerful A. in cases of skin-disease. So also are the decoctions of the woods and their substitutes, such as decoction of sarsaparilla, and the like, which, when taken in large quantities of water, must operate partly by their diluting and solvent properties, and partly by the stimulant effect of the active principles of the several ingredients in these diet-drinks, conveyed into the capillaries.

It will be seen, therefore, that the term A. rather implies the method in which some drugs are administered, than any special alterative action possessed by them. The most useful, it may be added, are also the most dangerous in unskilled hands.

ALTERNATE, in Botany. See LEAVES.

ALTHÆA. See MARSII MALLOWs and HOLLY-HOCK.

ALTITUDE, in Astronomy, is the height of a heavenly body above the horizon. It is measured, not by linear distance, but by the angle which a line drawn from the eye to the heavenly body makes with the horizontal line, or by the arc of a vertical circle intercepted between the body and the horizon. Altitudes are taken in observatories by means of a telescope attached to a graduated circle (see CIRCLE), which is fixed vertically. The telescope being directed towards the body to be observed, the angle which it makes with the horizon is read off the graduated circle. The A. thus observed must receive various corrections—the chief being for parallax (q. v.) and refraction (q. v.)—in order to get the true A. At sea, the A. is taken by means of a sextant (q. v.), and then it has further to be corrected for the dip of the visible horizon below the true horizon (see HORIZON). The correct determination of altitudes is of great importance in most of the problems of astronomy and navigation. See LONGITUDE.—An ALTITUDE and AZIMUTH INSTRUMENT consists essentially of a vertical circle with its telescope so arranged as to be capable of being turned round horizontally to any point of the compass. It thus differs from a Transit Circle (q. v.), which is fixed in the meridian. See AZIMUTH.

ALTO (*contralto deciso*) is the deepest or lowest species of musical voice in boys, in eunuchs, and best of all in females, where its beauty of tone gives it the preference. This quality of the human voice has been too much neglected by modern composers and singing-masters. The powers of expression which it possesses are quite peculiar, and cannot be supplied by any other kind of voice. Its tone-character (timbre) is serious, spiritual, tender, and romantic. The low A. in particular has a fulness of tone combined with power in the lower range. No other voice expresses so decidedly dignity, greatness, and religious resignation: it can also represent youthful manly power as well as romantic heroism. The high A. has generally the same range of

compass as the mezzo soprano, but differs from it in the position of the cantabile and in its character of tone. A. voices generally consist of two registers, the lowest beginning at F or G below middle C, and reaching as high as the A or B above the octave C. The higher notes up to the next F or G partake more of the character of the soprano. See VOICE.

ALTON, JOS. WILHELM EDUARD D', Professor of Archaeology and the History of Art at Bonn, was born, 1772, at Aquileia, and died in 1840. In early years, his attention was directed to natural history, especially that of the horse, on which he published a splendid illustrated work (*Naturgeschichte des Pferdes*, Bonn, 1810), which was completed in 1817. In concert with his friend Pander, he projected an extensive work on comparative oology, of which the first division was published at Bonn 1821—1828. His etchings of animals, &c. are esteemed as valuable. Albert, Prince Consort of Queen Victoria, was a pupil of A. in the History of Art.

ALTONA, the largest and richest city in the duchy of Holstein in Denmark, is situated on the Elbe, so near Hamburg, that the two cities are only divided by the state-boundaries. It contains 32,200 inhabitants. A. lies higher than Hamburg, and is much healthier; but, on the other hand, it is destitute of the numerous canals so necessary for the transport of goods, with which Hamburg is so abundantly provided. In a commercial point of view, it forms one city with Hamburg. Its trade extends to England, France, the Mediterranean Sea, and the West Indies. There are many important industrial establishments in A.; among others, the manufacture of tobacco is largely carried on, one factory working up 600,000 lbs. yearly. A. is a free port, and enjoys many privileges in respect of trade, and also of civil freedom; all sects are allowed the free exercise of their religion. The city is connected by a railway with Kiel, Rendsburg, and Glückstadt. The observatory is a private institution, which has gained a great reputation under the direction of Schumacher, who died in 1851. The rise of A. to its present importance has been recent and rapid, for a continental town.

ALTORF, the chief town in the Swiss canton Uri, is situated in a sheltered spot at the base of the Grunberg, about two miles from the head of the Lake of the Four Cantons, and contains about 2000 inhabitants. It is a well-built town, having several open places, a church, a nunnery, and the oldest Capuchin monastery in Switzerland. The little tower on which the exploits of William Tell are painted in rude frescoes, is known to be older than the legend of Tell. The lime-tree under which the scene of the shooting of the apple was laid, was removed in 1657, and a stone-fountain erected in its stead. Situated on the St Gothard road, A. has some transit trade, but little or no industry of its own.

ALTO-RILIEVO (Ital.), high-relief, the term used in sculpture to designate that mode of representing objects by which they are made to project strongly and boldly from the background, without being entirely detached. In Alto-Rilievo, some portions of the figures usually stand quite free, and in this respect it differs not only from *basso-rilievo*, or low-relief, but from the intermediate kind of relief known as *mezzo-rilievo*, in which the figures are fully rounded, but where there are no detached portions. In order to be in high-relief, objects ought actually to project somewhat more than half their thickness, no conventional means being employed in this style to give them apparent prominence. In bass-relief, on the other hand, the figures are usually flattened;

but means are adopted to prevent the projection from appearing to the eye to be less than half; because if an object projects less than half, or, to state it otherwise, be more than half buried in the background, it is obvious that its true outline or profile cannot be represented. This rule, that in all reliefs there shall be either a real or an apparent projection of at least half the thickness of round objects, was strictly observed in the best period of Greek art, but it has been often neglected in the execution of reliefs in later times, and hence attempts have been made at foreshortening and perspective, which have necessarily resulted in partial failure.

Relief forms a kind of intermediate stage between plastic art and painting, the mode of representation being borrowed from the former, whilst the mode of arrangement, to a certain extent, is in accordance with the latter. The plastic principle occupies the most prominent place in the simple and tranquil reliefs of the earlier art of Greece, whereas the pictorial principle preponderates in the crowded and often excited scenes represented in the later Roman reliefs. In such reliefs as have been produced in modern times, the one element or the other has prevailed, according as the one model or the other has been followed. The works which have been recovered from the ruins of Persepolis, Nineveh, and Babylon, still attest the extensive employment of relief in Persian and Assyrian art. Of the latter, which usually belongs to the class of *mezzo-rilievo*, some of the finest specimens in existence are now to

Winged Bull.

be seen in the British Museum. Though never exhibiting the life and freedom of classical or modern European art, the elaborately executed and majestic reliefs of these semi-oriental nations are greatly in advance not only of the whimsical distortions of nature exhibited by the Hindus, but of the inanimate and motionless representations of the Egyptians.

The earliest Greek reliefs possessed a hard and severe character, somewhat approaching to the art of those earlier nations of which we have just spoken, and were very slightly raised. Of this we have an example in the two lions over the gate at Mycenæ—probably the oldest Greek relief in existence. It was Pheidias who gave to relief its true character, and finally brought it to a degree of perfection which it has never since attained. The alt-reliefs which adorned the metopes of the Parthenon at Athens, and the Temple of Apollo at Phigalia in Arcadia, now preserved in the British Museum, are still not only unsurpassed, but unapproached as examples of the style. In none of these do we see any attempt at perspective, and even foreshortening for the most part is avoided.

Under the Romans, sculpture was employed

to an enormous extent in the decoration of tombs and sarcophagi, whole streets of such monuments being constructed, as, for example, on the Appian Way. The result of the demand thus created was, that sculpture became a manufacture rather than an art, and attempts were made to supply by technical execution and mere mass what had been lost in thought and spirit. Relief was now applied, often by Greek artists resident in Italy, to purposes

Panathenaic Frieze.—From the Parthenon.

for which the Greeks, in their own land and in their better times, had rightly conceived it to be unsuited. Behind figures standing nearly free, a second rank was introduced, and those numerous examples of a false style, still to be found in every gallery in Europe, were produced, the imitation of which afterwards led to such a lavish expenditure of artistic talent in Italy. The attempt which the Romans had made to invade the province of painting, by means of sculpture, was carried still further by the Florentine artists of the 16th and 17th c. Not only were several rows of figures represented in perspective, but even landscape was introduced with a success which, in the hands of such artists as Ghiberti, was positively marvellous. If the highest perfection in the true plastic style of relief was attained by Phidias in the metopes of the Parthenon at Athens, a corresponding merit may be claimed as regards the degenerate pictorial style by Ghiberti in the celebrated bronze doors of the Baptistery of San Giovanni at Florence. Even Canova's reliefs partook to far too great an extent of the character of paintings in stone; and to Flaxman, and above all, to Thorwaldsen, must be assigned the merit of restoring this style of art to its genuine and original principles. It is to be remembered, in studying the reliefs of classical times, that studiously as the Greeks avoided a pictorial conception of their subject, they did not eschew the use of colour where it could be employed to heighten the effect of their reliefs. There is reason to believe that in many excellent examples the background was painted blue, and that the hems of the garments of the figures, and the like, were often coloured or gilded.

ALUM, a whitish, astringent, saline substance; properly it is a double salt, being composed of sulphate of potash and sulphate of alumina, which, along with a certain proportion of water, crystallise together in octahedrons or in cubes. Its formula is $\text{KOSO}_3 + \text{Al}_2\text{O}_3 \cdot 3\text{SO}_3 + 24\text{H}_2\text{O}$. A. is soluble in eighteen times its weight of cold water, and in its own weight of hot water. The solution thus obtained has a peculiar astringent taste, and is strongly acid to coloured test papers. When heated, the crystals melt in their water of crystallisation; and when the

water is completely driven off by heat, there is left a spongy white mass, called burnt A. or anhydrous A. A. is much used as a mordant in dyeing. This property it owes to the alumina in it, which has a strong attraction for textile tissues, and also for colouring matters; the alumina thus becomes the means of fixing the colour in the cloth. The manufacture of the colours or paints called lakes depends on this property of alumina to attach to itself certain colouring matters. Thus, if a solution of A. is coloured with cochineal or madder, and ammonia or carbonate of soda is added, the alumina of the A. is precipitated with the colour attached to it, and the liquid is left colourless. Alumina, the basis of pure clay—which is a silicate of alumina—derives its name from being first extracted from A. A. is also used in the preparation of leather from skins, and, in medicine, as a powerful astringent for arresting bleeding and mucous discharges. Its use in the making of bread, to give a white appearance and more pleasing consistence to bread made from indifferent flour, is highly objectionable. A. rarely occurs in nature, except in a few springs and in some extinct volcanoes, where it appears to be formed from the action of sulphurous acid vapours upon felspathic rocks. In this country, it is prepared artificially from A.-shale, obtained from coal-mines at Hurlett and Campsie, near Glasgow; and alum-slate, which occurs at Whitby, in Yorkshire, and there forms precipitous cliffs, extending about thirty miles along the east coast of England. The alum-slate, shale, or schist, consists mainly of clay (silicate of alumina), iron pyrites (bisulphuret of iron), and coaly or bituminous matter. When the shale is exposed to the air—as it is in the old coal-wastes or mines from which the coal has been extracted—the oxygen of the air, assisted by moisture, effects a decided change upon it. The original hard stony substance begins to split up into thin leaves, and becomes studded over and interspersed with crystals. The latter are the result of the oxidation of the sulphur of the pyrites into sulphuric acid, and the iron into oxide of iron, both of which in part combine to form sulphate of iron, whilst the excess of the sulphuric acid unites with the alumina of the clay, and produces sulphate of alumina. When the alum-shale thus weathered is digested in water, there dissolve out, the sulphate of alumina ($\text{Al}_2\text{O}_3 \cdot 3\text{SO}_3$) and sulphate of iron (FeOSO_4); this solution is treated with chloride of potassium (KCl), which decomposes the sulphate of iron, forming sulphate of potash (KOSO_4) and chloride of iron (FeCl). When this liquid is evaporated to concentration, and allowed to cool, crystals of A. separate, consisting of sulphate of alumina, sulphate of potash and water, thus, $\text{KOSO}_3 + \text{Al}_2\text{O}_3 \cdot 3\text{SO}_3 + 24\text{H}_2\text{O}$, and the chloride of iron is left in the solution or *mother-liquor*. The crystals of A. obtained from the first crystallisation are not free from iron, and hence require to be redissolved in water, reconcentrated, and recrystallised. This operation is generally repeated a third time before the A. is obtained pure.—As the preliminary weathering of the shale takes some years to proceed, a more expeditious method is now largely resorted to. The shale is broken in fragments, and piled up over brushwood in long ridges, shaped like huge potato-pits, and the brushwood being set fire to, the coaly matter of the shale begins to burn, and the whole ridge undergoes the process of roasting; the results of which are the same as that of the weathering operation—namely, the oxidation of the sulphur and iron, and the formation of sulphate of alumina and sulphate of iron. This material is afterwards worked up as previously described. The roasting operation is so much more expeditious than the weathering process, that months

suffice for years. The A. made at Tolfa, near Civita Vecchia, is extracted from alum-stone, a mineral containing sulphate of potash and sulphate of alumina, but united in such a form as to render them insoluble. When the mineral is calcined, the sulphates become soluble, and are extracted by lixiviation. The A. thus manufactured is prized, as being free of iron. The potash in A. can be replaced partly or altogether by soda or ammonia; the alumina by oxide of chromium or sesquioxide of manganese; or the sulphuric acid by chromic acid, or peroxide of iron, without altering the form of the crystals. There are thus soda, ammonia, chrome, &c., alums, forming a genus of salts of which common A. is only one of the species. The more important members of the class, expressed in symbols, are:

ALUM BAGH, a fort rendered famous, during the battles and sieges arising out of the Indian mutiny in 1857, by the indomitable resolution of its defenders. The A. B. ('Garden of the Lady Alum, or Beauty of the Soul') was a domain about four miles from the city of Lucknow, near the Cawnpore road. It comprised several buildings, including a palace, a mosque, and an emanbarra or private temple, bounded by a beautiful garden, which was itself in the middle of a park, and the park enclosed by a wall with corner towers. It had belonged to some members of the royal family of Oude; but when the wars of the mutiny had been fairly begun, the A. B. was converted by the rebels into a fort. It was large enough to contain a powerful military force, and might have become a formidable stronghold, if well defended; but it proved powerless against a small British force. In September, Outram, Havelock, and Neill crossed the Ganges from Cawnpore, marched rapidly towards Lucknow, and captured the A. B. on the way. About 300 soldiers were left at the place, with four guns, a number of sick, wounded, and 4000 native camp-followers, under Colonel McIntyre; while the three generals proceeded with the main body of their force to Lucknow. It was intended that McIntyre should soon be relieved or reinforced; but Havelock and Outram, shut up for two months within the Residency at Lucknow, could scarcely send even a small note in a quill to the A. B. Not until the close of November did the British, under Sir Colin Campbell, relieve both Lucknow and the A. B. He brought away all the garrison from the former place, but left Sir James Outram, with 3500 men, to hold the A. B. It was at that time the only spot in the whole province of Oude in the hands of the British; and during the whole winter, Sir James had to defend it against the enemy. On the 12th of January 1858, he was attacked by an armed rabble of sepoys and other malcontents, amounting to 30,000 men. These, however, he completely defeated. They attacked him again with 20,000 men on the 21st of February, at a time when his small force was weakened by the absence of a detachment employed in escorting a convoy of provisions and stores from Cawnpore; he, however, met them with the same heroic resolution, and effectually repulsed them. In the next following month, Sir Colin Campbell re-conquered Lucknow; and the garrison at the A. B. was relieved from its perilous isolation. Although only a domain converted temporarily into a fort, the A. B. must ever occupy a memorable place in military history.

ALUM ROOT. This name is given in the

United States to two plants, natives of that country, very different from one another, but agreeing in the remarkable astringency of their roots, which are medicinally used. One of these plants is *Geranium maculatum* (see GERANIUM), a plant of general habit and appearance very much resembling some of the species of geranium which are common weeds in Britain. The root contains more tannin than kino (q. v.) does. The tincture is of use in sore throat and ulcerations of the mouth, and is also administered in various diseases. The property of astringency belongs, in an inferior degree, to some other species of *Geranium*, and of the kindred genera, *Erodium* and *Pelargonium*.—The other American plant to which the name A. R. is given is *Heuchera Americana*, a plant of the natural order *Saxifragaceæ* (q. v.), an order in which also astringency is a prevalent property. The genus *Heuchera* has the calyx 5-cleft, the petals undivided, five stamens, and the styles remarkably long. *H. Americana* is everywhere covered with a clammy down; the leaves are roundish, lobed, and toothed; the peduncles, dichotomous and straggling. The root is its astringent, and is used to form a wash for wounds and obstinate ulcers.

ALUMINA, the most abundant of the earths (q. v.), is the oxide of the metal Aluminium (q. v.), the formula being Al_2O_3 . It occurs in nature abundantly in combination with silica, associated with other bases. The most familiar of its native compounds is felspar, a silicate of A. and potash ($\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 + \text{K}_2\text{SiO}_3$). This is one of the constituents of granite, and of several other igneous rocks. Certain varieties of these, by exposure to the atmosphere, become completely disintegrated, passing from the state of hard, solid rock, such as we are accustomed to see in building-granite, into soft, crumbling, earthy masses. It is the felspar which undergoes the change; and it appears to be owing to the action of rain-water charged with carbonic acid, which dissolves the potash and some of the silica of the felspar, leaving the excess of silica and the A. still united. It is not known, however, why certain specimens of granite are rapidly corroded and crumbled down, whilst others have resisted for ages the same causes of decay. By such a process of disintegration as we have described, the clays of our arable soils are produced. Clay consists of silica and A. in a state of chemical combination. It never is pure A., but the quantity of silica united to the latter is variable. When it is pure, clay is quite white, as we see in the porcelain clay of Devonshire and Cornwall, which is derived from colourless felspar. More frequently, clay is red, owing to the presence of oxide of iron; or black, from the diffusion through it of vegetable matter.

From alum, A. is prepared by adding to a solution of the former, water of ammonia, as long as it occasions a precipitate. The A. appears as a voluminous, white, gelatinous substance, consisting of the oxide of the metal combined with water. When A. is precipitated from a solution containing colouring matter, such as logwood, &c., it carries down the colour chemically united to the flocculent precipitate; in this way are formed the coloured earths, called *lakes* (q. v.). A. in the state of precipitate, after being gently dried, is readily soluble in acids and in alkalis; but if heated to whiteness, it loses the associated water, contracts greatly in bulk, and forms a white, soft powder, not at all gritty, and with difficulty soluble in alkalis and acids. A., as generally prepared, whether hydrated or anhydrous, is insoluble in water, possesses no taste, and does not alter colouring matters; but recently Mr Walter Crum has obtained A. in an allotropic form, in which it is soluble in water.

It is quite different, therefore, in properties from the alkaline earths, and is a much weaker base. In the anhydrous state it absorbs water with great readiness without combining with it, so that it adheres to the tongue, and is felt to parch it. Clay retains this property; and the ends of tobacco-pipes are glazed, to prevent adhesion to the lips or tongue. A. is not fusible by a forge or furnace heat, but it melts before the oxyhydrogen blow-pipe into a clear globe, possessing great hardness. It occurs in nature in a similar state. The more coarsely crystallised specimens form the emery which is used for polishing; the transparent crystals, when of a blue colour, owing to a trace of metallic oxide, constitute the precious gem the sapphire, and, when red, the ruby. A., in common with other sesquioxides, is a feeble base. The salts it forms with the acids have almost all a sour taste, and an acid action on colouring matter.

ALUMINIUM is one of the metals present in clay, granite, and other rocky and earthy substances. It was discovered by Wöhler in 1828, and was re-examined by him in 1846, when he obtained the metal in minute globules or beads, by heating a mixture of chloride of A. and sodium. Within the last five years, however, the subject has been re-investigated by Deville and others, and it appears probable that the metal A., recently so rare and costly, will soon rank among the more common metals both in use and price. The original experiments of Deville were made at the cost of Napoleon III., who subscribed £1500, and was rewarded by the presentation of two bars of the metal. The process followed by Deville was the same as that suggested by Wöhler, and appears to have been so successful, that the metal could, in 1857, be purchased in Paris at the price of 7s. 6d. an ounce. In 1855, Rose announced to the scientific world that A. could be more readily and cheaply prepared from a mineral called cryolite, found in Greenland in large quantity, and cargoes of which are regularly imported into Germany under the name of 'Mineral Soda,' at the price of 9s. a cwt. This mineral is a double fluoride of A. and sodium, is used on the Rhine as a washing-soda, and also in the manufacture of soap, and only requires to be mixed with an excess of sodium, and heated, when the metal A. at once separates. The latter process for the preparation of the new metal is about to be carried out on the large scale at works which are now in progress of erection at Battersea, London; and it is expected that the price will not exceed 3s. 9d. per ounce. Indeed, an order for 500 ounces at that sum has already been accepted.

The properties of A. are, that it is a white metal, somewhat resembling silver, but possessing a bluish hue, which reminds one of zinc. It is very malleable and ductile, and in tenacity it approaches iron. When heated in a furnace, it fuses, and can then be cast in moulds into ingots. Exposed to dry or moist air, it is unalterable, and does not oxidise so much as lead and zinc do. Cold water has certainly no action upon it, and in the majority of experiments, hot water has not sensibly affected it. Sulphuretted hydrogen, the gas which so readily tarnishes the silver in households, forming a black film on the surface, does not act on A. When fused and cast into moulds, it is a soft metal like pure silver, and has a density of 2.56; but when hammered or rolled, it becomes as hard as iron, and its density increases to 2.67. It is therefore a very light metal, being lighter than glass, and only one-fourth as heavy as silver. This property has been taken advantage of by Napoleon III., who some time ago ordered the eagles surmounting the standards of the French army to be made of A. instead of silver; and thus

the same-sized eagle was reduced to one-fourth of its former weight. A. is very sonorous; and when a rod or small bell made of it, is struck, it gives out a very sweet clear ringing sound; hence it has been suggested that the metal would be useful in making bells, gongs, &c. A. forms, with copper, several light, very hard, white alloys, which will doubtless soon find their way into our manufactures of spoons, tea-kettles, dish-covers, &c.; and also a yellow alloy, which, though much lighter than gold, is very similar to it in colour, and in being faintly acted on by acids. With iron, the new metal yields two alloys, one of which, though containing 75 per cent. of iron, yet will not rust when exposed to a damp atmosphere, and may therefore be useful in making steam-pipes, &c. Ornaments for the mantel-piece, the arm, and the neck, have been fashioned of A., but hitherto they have proved unacceptable to the public eye, on account of its peculiar blue or zinc hue; but recently, Dr Stevenson Macadam, of Edinburgh, has suggested a process of immersing the A. in a heated solution of potash, which partially eats into the surface of the metal, and produces a fine white frosted appearance, like that of frosted silver. A number of medals of A. have been frosted in this way, and after a year's exposure, have not lost their original beauty.

ALUNNO, Niccolo, or Niccolo of Fuligno, one of the old Umbrian painters, whose works first indicated the qualities discernible in that school. His earliest known piece is a 'Madonna with Angels and Saints,' 1458 A.D. There is also a gonfalon—a banner used in religious processions—of the year 1466, in the church of Santa Maria Nuova at Perugia, which A. painted for the brotherhood, as the inscription testifies: '*Societas Annunciamenta fecit fieri hoc opus.*' It is a work of peculiar beauty, displaying deep religious feeling and exquisite sweetness. A. painted several of these gonfalons. Some of his pictures were carried off by the French, and sent to Paris; but at the restoration of artistic spoil, 'The Nativity,' 'The Resurrection,' &c., were returned, although 'The Agony in the Garden' still remains in the Louvre. There is also a 'Madonna between Two Angels,' of the year 1499, to be seen in the parish church of the village of Bastia. Fragments, too, are still in existence of an altar-piece for the cathedral of Assisi. The picture represented a Pieta, with two angels bearing torches, and, according to Vasari, weeping so naturally, that 'no one,' he thinks, 'could have painted them better.' A. is not so remarkable for the originality or fertility of his invention, as for his selection of details, warmth of feeling, purity, and devout faith. His earnestness, however, leads him at times into exaggeration.

ALURED, or ALRED, of Beverley, in Yorkshire, an old English historian of the time of Henry I. Little is known regarding him; but he is said to have been educated at Cambridge, and to have greatly distinguished himself by the variety of his learning. It is also stated that he had enriched his mind by travel, both in France and Italy, and that at Rome he became domestic chaplain to Cardinal Othoboni. His permanent office, however, appears to have been that of canon and treasurer of the church of St John in his native town of Beverley, where he wrote his *Annals*. This work commences with a fabulous period of British history, and extends down to the twenty-ninth year of Henry I. It was published at Oxford in 1716 by Thomas Hearne, and is a remarkable production, for various reasons. Its Latin is extremely good, and even elegant, while its accuracy, especially in dates, is unusual for the age in which its author lived. He is said, though it is very doubtful, to have written,

besides the *Annals*, a work on the liberties or privileges of the church of St John of Beverley. The work, whoever wrote it, is a translation of old Saxon documents, charters, &c., relative to that edifice, and is still in manuscript. A. died in 1128 or 1129.

ALVARADO, PEDRO DE, a famous companion of Cortes, was born at Balajoz in Spanish Estremadura, towards the close of the 15th c. In 1517 or 1518, he sailed for the new world, and in the same year was despatched from Cuba, by Velasquez, the governor of that island, to explore, under the command of Grijalva, the shores of the American continent. The expedition touched at Acozamil (the Isle of Swallows), and at various places in Yucatan. Ascending also the rivers Tabasco and Banderos, Grijalva was so enchanted with the beauty of the country, its fine cultivation, and the numerous traces of advanced civilisation, that he named it *New Spain*. Now, for the first time, the Spaniards heard of the riches of Montezuma, and of his vast empire. A. was ordered to return to Cuba, and inform Velasquez of the result of the expedition. The sight of the gold which A. brought with him, stimulated the covetousness and ambition of Velasquez, who became greatly incensed against Grijalva, because the latter had not penetrated further into the new region, and on his return to Cuba deprived him of his command. In February 1519, Cortes sailed from Havana, solely for the purpose of conquest, with eleven ships, containing 508 soldiers, and 109 seamen. A. commanded one of these ships; but a storm separating the fleet, he arrived at the rendezvous, Isle of Swallows, three days earlier than the others. Here the conquest of Mexico was planned by these intrepid adventurers. A. figured in every conspicuous incident; he was, indeed, hardly less distinguished than the sagacious Cortes himself, who knew his worth, and whom he served with unflinching zeal and fidelity. While he held the city of Mexico, during the absence of his chief, he massacred, in the midst of a fête, a great number of Aztec nobles, which act is said to have excited the indignation of Cortes; but, on the other hand, it is asserted that the Mexicans had plotted the destruction of the Spaniards, and that A. had become cognizant of the scheme. In the famous night-retreat of 1st July 1520, A. commanded the rear-guard. After the conquest of Mexico, he was sent, in 1523, at the head of 300 foot, 160 horse, with 4 pieces of cannon, and a troop of Mexican auxiliaries, to subdue the tribes on the coast of the Pacific in the direction of Guatemala. He was completely successful, receiving everywhere the submission of the native chiefs, while the people brought him presents, in token of the sincerity of their friendship. He now returned to Spain, where the emperor, Charles V., gave him a splendid reception, and appointed him governor of Guatemala. On departing again for the new world, he was accompanied by numerous friends and cavaliers desirous of making their fortune. His adventurous spirit soon launched him into new enterprises. Pizarro and Almagro were prosecuting a brilliant career of conquest in South America. A. resolved not to intrude upon their territories. He considered the province of Quito to be without the limits of these, and so, embarking with a force of 500 soldiers, 227 of whom were cavaliers, he landed at Bahia de los Carraques, near Cape San Francisco, whence he penetrated into the heart of the country, crossing the Andes by as bold and hazardous a march as it is possible to conceive. In the plain of Rio Bamba he was met by some of the troops of Pizarro, headed by Almagro; but instead of disputing by force of arms his right to the possession of the country in which he found

himself, he agreed to retire, on receiving an indemnity for his arduous undertaking. He therefore retired to Honduras, and aided the colonists in establishing new settlements, amongst others, Gracias-a-Dios and San Juan de Puerto de Caballos. Meanwhile, Pizarro, loaded with wealth, went back to Spain in 1534, and misrepresented the conduct of A. to the emperor; but the latter following, vindicated himself so successfully, that he received the government of Honduras in addition to Guatemala. Again he embarked for the new world, and pursued his course of discovery and conquest; but in an affray with the Indians upon the coast of Michoacan, in 1541, he was accidentally killed by his horse falling upon him and crushing him. In the same year, an inundation, accompanied by a frightful tempest, overthrew the walls of the town of San Jago, when his wife and children all perished.

ALVAREZ, DON JOSE, a Spanish sculptor, was born April 23, 1768, at Priego, in the province of Cordova. During youth he laboured with his father, a stone-mason; and when twenty years old, began to study drawing and sculpture in the academy at Granada. His early essays in sculpture secured for him the patronage of the Bishop of Cordova, and in 1794, he was received into the academy of San Fernando, where, in 1799, he gained the first prize in the first class. Subsequently, he gained the second prize for sculpture in the Institute of Paris, and in 1804, increased his celebrity by a plaster-model of Ganymede, which proved that he could rival Canova in gracefulness of style. He now attempted greater works in the more severe style, and prepared a model for a wounded Achilles, which was accidentally broken. Having removed to Rome, he was here employed by Napoleon to design bass-reliefs for the Quirinal Palace on Monte Cavallo; but, on account of political changes, his works were not allowed to occupy the places for which they had been destined. In Rome, where he lived on terms of friendship with Canova and Thorwaldsen, he executed, among other works, his *Grupo Colosal de Zaragoza*, now in the Royal Museum of Madrid, representing a scene in the defence of Saragossa. This work alone is sufficient to establish A.'s fame. Clearness of design, dignified simplicity in execution, truthness to nature, and deep sentiment, mark the sculptures of A., who, next to nature and classical antiquity, studied the works of Michael Angelo. He died, in Madrid, November 26, 1827.

AMADEUS (i. e. Love-God), a common name in the House of Savoy. The first who bore it was Count A., eldest son of Count Humbert, who lived about the commencement of the 11th c. His successors gradually enlarged their paternal dominions; but the first to make an important figure in history was A. V., who was born in 1249, succeeded his uncle Filippo in 1285, and died in 1323. He acquired the dignity of a prince of the empire. He had a brother who resided for a long period in England, and while there, built the Savoy Palace in London.—His son, A. VI, the 'Green Count,' born in 1334, succeeded his father in 1343. He was a sagacious, moderate, and vigorous ruler, won various places from the Dauphin of France, became lord-paramount of Piedmont, and through the favour of the emperor Charles IV., obtained the viceregency over a great part of Upper Italy. His influence among the Italian states was very great. He died in 1383.—A. VIII., born in 1383, was at first under the guardianship of his grandmother, a woman of superior talents; but in 1398 he assumed the reins of government himself, and displayed a spirit of moderation, and, at the same time, a love of order which augured well for his people. The zeal with which he

aided the policy of the Emperor Sigismund secured him the imperial favour, and the elevation of Savoy into a duchy (1416). On the extinction of its native dynasty, in 1418, Piedmont chose him for its ruler, as he was next of kin. But a religious melancholy taking possession of his mind, he (November 7, 1434) laid down his authority, and along with six of his knights, betook himself to a monastic hermitage which he had caused to be built on the shores of the Lake of Geneva. He was elected pope in 1439, when he assumed the name of Felix V.; but he resigned the papal chair in 1448, and died three years afterwards at Geneva.—A. IX., after governing for four years, handed over his authority to his wife Jolanthe, on account of ill health; but she used it very imprudently. While he lived, A. was a mere tool in the hands of grasping factions. He died in 1472.

AMADIS, a much-used heroic name in chivalric poetry. At the head of those heroes of romance, stands A. of Gaul, called the Lion Knight, from the device on his shield, and also Beltenebros, or the Darkly Beautiful. The other Amadisès that figure in romance are represented as descendants more or less remote of A. of Gaul. He himself was what the Germans call a love-child of the fabulous King Perion of France and of Elisena, a princess of Bretagne. The relationship of several of the other Amadisès to the princes and princesses of Colchis, Trebisond, Greece, and Cathay, that figure as their parents, is of the same un sanctioned kind. Nor do such irregularities seem at all to have shocked, in these fabulous regions, or to have derogated from the dignity of any of the personages concerned. The romance which narrates the adventures of A. of Gaul is both the most ancient and the best of all the A. romances. It even found favour in the sight of Cervantes, who won immortal honour by overthrowing the long usurped dominion of this 'evil sect.' This one, however, has maintained its reputation even to the present day, not only because it was regarded by him as a literary curiosity, but also from its own merits, as the original production of a creative fancy.

The question which was early raised, and cannot yet be demonstratively settled, as to whether this romance was originally a Portuguese, a Spanish, or a French production, proves at least the absence in it of all national peculiarities, and the entire want of all national traditions connected with it; and hence the want also of a living historical background, which, in the case of all really national legends, is discernible through the purely epic structure. It may be asserted with certainty, both from internal and external evidence, that this romance is the pure subjective creation of the fancy of a single individual; and that it was composed at a time when the genuine epic style of chivalric writing was near its decline, consequently, not earlier than the 14th c. It is also apparent that this romance must have been originally written in prose, and intended to be read, and not to be recited. Lastly, it is not to be doubted that the author was well acquainted with the earlier legendary poetry, and has imitated it in many things, but has, nevertheless, struck out for himself a perfectly new path, in an opposite direction, which naturally tended to lead his less gifted imitators into a bottomless abyss, and at last brought about the extinction of the whole class. For these chivalric romances—doubtless, unintentionally—became by degrees more and more of an ironical cast; and only a genius like Cervantes was wanting in order to complete their extinction, by making the comic element the fundamental tone, and exaggerating the incongruity inherent in such compositions.

The Spanish A. romances consist of fourteen books, of which the first four contain the history of

A. of Gaul. Yet, according to the researches of the learned Clemencin, as stated in his *Commentary on Don Quixote* (Madrid, 1833), it can scarcely be doubted that this most ancient part was originally written in the Portuguese language, by the knight Vasco de Lobeira of Oporto, who died in 1403; and that it must have been composed between 1342 and 1367. The original manuscript is said to have been first in the possession of the Infant Alfonso of Portugal, the son of John I., the founder of the House of Braganza, who died in 1461; and last, in that of the Duke of Aveiro, and to have been destroyed during the earthquake in Lisbon in 1755. At least, these first four books have only been preserved in the Spanish translation which was made by Garcia Ordoñez de Montalvo, about 1460, and was first printed between 1492 and 1505. The same Montalvo added to it the fifth book, *Las Sergas [ergas, i. e., actions or deeds] de Esplandian, Hijo de Amadis de Gáula*. He began this book in 1485, but did not complete it till 1492. The books from the 6th to the 14th contain the Exploits and Adventures of Florisando, by Paez de Ribera; of Lisuarte of Greece, and of Perion of Gaul, by Juan Diaz; of A. of Greece, of Florisel of Nicea, and of Anaxarte, by Feliciano de Silva; of Rogel of Greece, and of Silves de la Selva, by the same; of Lepolemo, and of Leandro the Fair, by Pedro de Lujan; and lastly, of Penelva, by an anonymous Portuguese. The French translators and continuators, beginning with Nicolas de Herberay, Sieur des Essarts, who published the first eight books between 1540—1548, have increased this series of romances to twenty-four books. Gilbert Saunier, Sieur de Duverdier, has written a conclusion, in seven large volumes, to all the adventures begun in the whole series of legends, which he has called *Le Roman des Romans*.

How popular and widely circulated these romances were in their day, may be proved by the many editions of single legends, by the translations of most of them into Italian, English, German, and even into Dutch, and also by the numerous chivalric romances written in imitation of them. As, nevertheless, a change came over the public taste, they almost all fell into oblivion, and indeed justly so, because of their want of intrinsic merit. They were transferred from the Temple of the Muses to the literary lumber-room, where now at best they only serve to feast the eyes of bibliomanics. A. of Gaul has been deservedly excepted from this fate, and has not only found readers in the present day, but has been in modern times translated, revised, and imitated. The Portuguese Gil Vicente, and the Spaniard Andrés Rei de Artieda, extracted from it the materials for two Spanish comedies. De Lubert and Count Tressan revived this romance in tasteful extracts; and as Bernardo Tasso formerly did in his *Amadigi*, so now Creuzé de Lesser and William Stewart Rose have extracted from it the materials for epic poems: *A. de Gaulle, Poème faisant suite aux Chevaliers de la Table ronde* (Paris, 1813), and *A. of Gaul*, a poem in three books (London, 1803). On the other hand, Wieland's *Newer A.* has nothing in common with the more ancient Amadisès, except the title, and the multitude of adventures encountered by the hero.

AMADOU, a name given to *Polyporus igniarius* and *P. fomentarius*, fungi of the tribe or division *Hymenomyces*, and formerly included in the genus *Boletus*. They grow upon old trees in Britain, and on the continent of Europe. The pileus is completely blended with the hymenium, which is pierced with thin-sided, rather angular, tubular, vertical passages—the whole fungus thus appearing as a leathery or fleshy mass; the under side of which is pierced by deep pores. *P. igniarius* is called Hard A., or

Touchwood. *P. fomentarius* is called Soft A., or German Tinder. They are used as styptics for stanching slight wounds; and when steel and flint were in general use for striking fire, were much employed as tinder, being prepared for this purpose by boiling in a solution of nitre. The Soft A. is used for making small surgical pads, for which its elasticity peculiarly fits it. *P. fomentarius*, or a very similar species, is found in India, and used there as in Europe. It is also employed by the Laplanders and others for moxa (q. v.). It is sometimes made into razor-straps, and this use is likewise made of *P. betulinus*.—*P. officinalis*, the Agaricon of Dioscorides, which grows upon larch-trees in the south of Europe, is a drastic purgative, now rarely employed. *P. suaveolens*, which grows upon the stems of willows, and is easily recognised by its anise-like smell, was

Polyporus suaveolens.

formerly employed in medicine, in cases of consumption, under the name of *Fungus salicis*. All these species are very similar in appearance. Another species of the same genus, *P. destructor*, is one of the fungi known by the name of Dry Rot (q. v.).—The remarkably light wood of *Hernandia Guianensis*, a shrub of the natural order *Thymelacaceæ* (q. v.), is readily kindled by flint and steel, and is used in Guiana as A.

AMAIN, a peculiar phrase applied by sailors to signify at once or suddenly; in such orders or directions as 'lower amain,' 'strike amain,' &c.

AMALEKITES, one of the most fierce and warlike of the Canaanitish nations. They dwelt 'in the land of the south' (Numbers, xiii. 29), that is, in the land south of Palestine, or between Idumea and Egypt. From the very first, they manifested an uncompromising hostility to the Israelites, whose rear-guard they smote after the passage through the Red Sea. In consequence of this, they received no mercy at the hands of the Israelites, when the latter had established themselves in Palestine. Saul (1 Samuel, xv. 2) nearly annihilated them. Twenty years later, David, while dwelling amongst the Philistines, penetrated into their land, and made dreadful slaughter of them. After this, they made a last desperate reprisal, but were overtaken by David in the midst of their drinking and dancing; and 'from twilight, even unto the evening of the next day,' he smote them, 'and there escaped not a man of them, save 400 young men who rode upon camels and fled.' The descendants of these were finally extirpated in the days of Hezekiah, king of Judah, by the Simeonites.

AMALFI, a seaport on the Gulf of Salerno, on the E. coast of the kingdom of Naples, contains about 3000 inhabitants; has a very ancient cathedral, and is the seat of a bishop. It is said to have been founded under Constantine the Great, and during the middle ages, was once a republic; afterwards, it was ruled by dukes of A.; and about the close of the 11th c., fell under the power of the Normans. The maritime laws of A. (*Tabula Amalphitana*) once prevailed throughout Italy. The unique manuscript of the pandects (q. v.) was discovered at A.; and Flavio Gioja, the inventor of the compass, and Masaniello, were born there.

AMALGAM is the term applied to that class of alloys (q. v.) in which one of the combining metals is mercury. On the nature of the union, it has been observed that 'on adding successive small quantities of silver to mercury, a great variety of fluid amalgams are apparently produced; but in reality, the chief, if not the sole compound, is a solid A., which is merely diffused throughout the fluid mass.' The fluidity of an A. would thus seem to depend on there being an excess of mercury above what is necessary to form a definite compound. Mercury unites readily with gold and silver at the usual temperature. It has no disposition to unite with iron even when hot. A solid A. of tin is used to silver looking-glasses.

Amalgamation is employed on a small scale in some processes of gilding, the silver or other metal being overlaid with a film of gold A., and the mercury being then driven off by heat. But its most extensive use is in separating gold, and especially silver, from certain of their ores. The mercury dissolves the particles of the metal, and leaves the earthy particles; it is then easily separated from the gold or silver. This process, discovered in Mexico in 1557 by Bartolomé de Medina, is very extensively used in Mexico at the present time, and has lately been introduced with great success into the Californian and Australian gold-fields. The mode of application is to crush the quartz rock which serves as the matrix in which the small particles of gold are embedded; place the fragments in a barrel or revolving drum with mercury, and agitate for some time. The mercury attaches all the gold particles to itself; and in the apparatus, when fully agitated, there is found a semi-fluid mass, which is the mercury, appearing half congealed, and containing all the gold. It is only necessary to place this A. in a retort and apply heat, when the mercury sublimes over—and can be re-employed for further amalgamation—and leaves the gold in the body of the retort. This process is the only known method of separating the finer particles of gold from a mass of rock, and is always used by the gold-crushing companies. Indeed, it is now believed that this truly commercial mode of gold-seeking is the only one which, in a few years, will be had recourse to.

Several amalgams may be regarded as definite chemical compounds. Thus, when gold-leaf is placed in mercury, and the A. so produced filtered by being squeezed in a chamois-leather bag, the uncombined mercury oozes through the skin, but a definite A. of 2 of gold and 1 of mercury remains behind in the leather filter. Tin A. is employed in silvering looking-glasses, and is formed by laying a sheet of tin-foil on a table, covering it with mercury, and then placing, by a sliding movement, the sheet of glass over it. This A. contains 3 of mercury and 1 of tin; glass balls are silvered with an A. of 10 mercury, 1 tin, 1 lead, and 2 bismuth. A silver A. highly crystalline—and, from the clusters of crystals somewhat resembling a tree, called *Arbor Diana*, or Tree of Diana—is prepared from 3 parts of the

strongest solution of nitrate of silver, 2 parts of solution of proto-nitrate of mercury added to an A. of 7 mercury and 1 silver. In a day or two, the arborescent appearance presents itself, and the crystals contain 65 per cent. mercury, and 35 silver. The A. used for frictional electric machines is made from 1 tin, 1 zinc, and 3 mercury, to which sand is afterwards added.

AMALIA, ANNA, Duchess of Saxe-Weimar, an amiable lady, and generous patron of literature, was born in 1739, and, during the latter part of the 18th c., was the centre of the court of Weimar. Left a widow in the second year of her marriage (1758), her judicious rule, as guardian of her infant son, enabled the country to recover from the effects of the Seven Years' War; while her efforts were no less effectual in promoting the education of the people. She appointed Wieland tutor to her son, afterwards Duke, and attracted to Weimar such men as Herder, Goethe, Knebel, Böttiger, Musæus, Schiller; forming a galaxy of genius such as no single court, perhaps, was ever graced with. How much the fine qualities of head and heart possessed by the duchess herself contributed to this success, was shewn by the fact that, when she resigned the government into the hands of her son in 1775, she continued to be surrounded by the same society. She has the high distinction of having honoured and encouraged the greatest writers that Germany has produced. The battle of Jena is said to have broken her heart; she died (1807) six months after that event.

AMALIE, MARIE, the wife of Louis Philippe, king of the French, was the daughter of King Ferdinand I. (IV.) of the Two Sicilies, and was born April 26, 1782. When she married Louis Philippe (then Duke of Orleans), he was a political exile, without a hope of ever rising to the throne of France. It was a marriage of personal choice on both sides, and was consequently happy. After Louis Philippe's elevation to the throne, the queen avoided interference in political affairs, and devoted her attention to plans of beneficence. In her domestic relations, her conduct was highly exemplary, and won the esteem of all parties; indeed, the only charge ever preferred against her, was her supposed excess of piety. She shared the fortune of her exiled husband, and was very respectfully received in England. Louis Philippe, shortly before his death (at Claremont, 1850), gave expression to the love and esteem with which he regarded his faithful wife.

AMANDE DE TERRE. See *CYPERUS*.

AMANITA, a genus of Fungi, nearly allied to *Agaricus*, but bursting from a *volva*. *A. muscaria*,

which is pretty common in woods, especially of fir and beech, in Britain, is one of the most dangerous fungi. It is sometimes called *FLY AGARIC*, being used in Sweden and other countries to kill flies and bugs, for which purpose it is steeped in milk. The pileus or cap is of an orange-red colour, with white warts, the gills white, and the stem bulbous. It grows to a considerable size. Notwithstanding its very poisonous nature, it is used by the Kamchatkades to produce intoxication, and it imparts an intoxicating property to the urine of those who swallow it, of which they or others often avail themselves, when abundance of the fungus is not at hand.

AMARANTH (*Amaranthus*), a genus of plants of the natural order *Amaranthaceæ*. This order contains nearly 300 known species, natives of tropical and temperate countries, but chiefly abounding within the tropics. They are herbs or shrubs, with simple exstipulate leaves, and flowers in heads or spikes; the perianth usually coloured, 3–5-partite, hypogynous, scarious, persistent, generally surrounded with small bractæ; the stamens hypogynous, either 5, and opposite the segments of the perianth, or some multiple of 5, distinct or united into a tube, sometimes partly abortive; the anthers either 2-celled or 1-celled; the ovary single, superior, 1-celled, with 1 or few ovules, which hang from a free central cord; style single or absent; stigma simple or compound; fruit, a small membranous bag or utricle, or a caryopsis (q.v.), rarely baccate; seeds lens-shaped, externally crustaceous, embryo curved round the circumference; albumen farinaceous.—The genus *Amaranthus* has mostly monoecious flowers (although the order is generally hermaphrodite), with two or three stigmas, and a 1-celled, 1-seeded utricle, bursting all round transversely. Some of the species are naturally of singular form, and others assume singular but monstrous forms through cultivation. *A. caudatus* (Love-lies-

Love-lies-bleeding (*Amaranthus caudatus*).

bleeding), *A. cruentus*, *A. hypochondriacus* (Prince's Feather), and other species, are common annuals in our flower-gardens. The spikes of *A. caudatus* are sometimes several feet in length. The dry red bracts which surround the flower retain their freshness for a long time after being gathered; for which reason the plant has been employed by poets as

Amanita Muscaria, in a young state.

Amanita Muscaria, full-grown, more reduced.

an emblem of immortality.—The Globe A. (*Gomphrena globosa*) and the Cockscorn (q. v.), well-known tender annuals, belong to the same natural order. The Globe A. is much cultivated in Portugal and other Roman Catholic countries for adorning churches in winter. Its flowers, which are of a shining purple, retain their beauty and freshness for several years. No species of the order can be regarded as a true native of Britain, although *Amaranthus Blitum* is now found in waste places near London and elsewhere. *A. Blitum*, *A. oleraceus* (Chusan Han-tsi), and other species, are used as pot-herbs; but rarely in Britain. Wholesome mucilaginous qualities are very generally found in the leaves throughout the order. The seeds of *Amaranthus frumentaceus* (called Kiery) and of *A. amardhana* are gathered as corn-crops in India.—Medicinal properties are ascribed to some species of the order, particularly to *Gomphrena officinalis* and *macrocephala*, which have a high and probably exaggerated reputation in Brazil as cures for many diseases.

AMARAPURA, or UMMERAPOORA, a town of Burmah, on the left bank of the Irrawaddy, 9 miles north-east from Ava, in lat. 21° 57', long. 96° 7'. It was founded in 1783, and made the capital of the empire, which, with a short interval (1822—1837), it has continued to be. It was burned to the ground in 1810. The population at that time was estimated at 170,000; in 1827, it had sunk to 30,000. In 1839, it was again almost destroyed by an earthquake. The whole city is built of bamboo, with the exception of some temples; the most celebrated of which is that containing a colossal bronze image of Gaudama.

AMARA-SINHIA, a celebrated Hindu grammarian of great antiquity, who wrote a variety of works, only one of which has come down to us, the *Amara-Kosha*, or Thesaurus of Amara; sometimes called the *Trikanda*, i. e., the Tripartite. Regarding the author's life, little is known, nor is the precise period during which he flourished definitely ascertained. He is generally supposed to have been one of the 'nine gems' who adorned the throne of King Vikramaditya I. (56 B.C.). But Mr Bentley (*Asiatic Researches*) places him as late as the 11th c. A.D., while Mr Colebrooke assigns the close of the 5th as the most probable. He is known to have been a Buddhist; and it is universally believed that his writings perished during the fierce persecution to which that sect was subjected by the orthodox Brahmans, in the 3d, 4th, and 5th centuries. This tradition harmonises with the earliest of the three ages in which he is said to have lived.

The *Amara-Kosha* is a Sanscrit vocabulary, divided into 3 books and 18 chapters, and containing in all about 10,000 words. The words are classed according to the nature of the things signified by them. Almost all the grammarians of Hindustan imitate, translate, or comment upon the work of A.

An excellent edition of the *Amara-Kosha*, with notes in English and an index, was published by H. T. Colebrooke, Serampore, 1808; reprinted in 1829: the Sanscrit text at Calcutta in 1813; and in 1839 a French translation appeared in Paris.

AMARI, MICHELE, an Italian historian and orientalist, was born at Palermo, July 7, 1806. At the age of sixteen, he entered a government office; and shortly after—his father being condemned to thirty years' imprisonment for a political crime—the duty of supporting his mother and the other members of the family devolved upon him. His straitened circumstances soured him; and he even meditated becoming a bandit, but was roused from his morbid wretchedness by falling passionately in love with an English lady. Although he did not win her hand,

he secured a knowledge of the English language, the first result of which was a translation of Sir Walter Scott's *Marmion*, published at Palermo in 1832. A. soon became a political 'suspect;' and although he had conducted himself during the tumult of 1837 with exemplary moderation, he was summarily transferred to a situation in Naples, where he remained four years, and where he pursued with the utmost diligence his historical investigations. In 1842 appeared his *La Guerra del Vespro Siciliano* (The War of the Sicilian Vespers), which has been often republished, and remains the master-piece of its author. Its great merit arises from its having successfully combated the common notion, that the terrible massacre so named was the result of a deep and ramified conspiracy on the part of the nobles. A. proves from a letter of Charles of Anjou himself, as well as from numerous other sources, that it was a popular or national outbreak, occasioned by the tyranny of the foreign rulers, that really brought about the deliverance of Sicily. The book was quickly prohibited, and, as a consequence, widely read. It was translated into German by Dr Schroöder of Hildesheim, and into English by Lord Ellesmere. A. was now ordered to Naples, but fled to France, where he gave himself up to the study of Arabic and modern Greek, and to the preparation of his *History of the Mussulmans in Sicily*. At the revolution of 1848, he returned to Palermo, where he had been appointed professor of public law, but shortly after his arrival was elected vice-president of the committee of war. He was next sent on a diplomatic mission by the provisional government to France and England. In 1849, he published at Paris a brochure, entitled *La Sicile et les Bourbons*, the aim of which was to shew the incompatibility between the rights of the Sicilians and the pretensions of the Neapolitan sovereign. After the Sicilian insurrection had been quelled, A. took up his residence in Paris, where he has since published a number of learned papers upon the language and history of the Arabs, in the *Revue Archéologique*, *Le Journal Asiatique*, &c., besides an English translation of the *Solwan* of Ibn Djafer (London, 1852).

AMARYLLIDEÆ, or AMARYLLIDACEÆ, a natural order of Monocotyledonous plants, including many species distinguished by the beauty of their flowers. They are herbaceous plants, or when, as in the genera *Agave* and *Fourcroya*, they form woody stems, they have still the character of gigantic herbaceous plants rather than of shrubs. The greater part are bulbous-rooted. The leaves are sword-shaped, with parallel veins; the flowers have spathaceous bracts. The perianth is regular, 6-cleft, sometimes with a corona. The stamens are 6, arising from the perianth, sometimes cohering by their dilated bases; the anthers bursting inwardly. The ovary is inferior, 3-celled, with 1, 2, or many anatropal ovules; the style is single; the stigma, 3-lobed. The fruit is a 3-celled, 3-valved capsule, or a 1—3-seeded berry. The seed is albuminous, with the embryo nearly straight.—There are about 400 known species of this order, natives of tropical, or sub-tropical, and more sparingly, of temperate regions—particularly abundant at the Cape of Good Hope. A few species only are European. Many of them are much prized ornaments of our gardens and hot-houses. Amongst these are different species of NARCISSUS (q. v.), AMARYLLIS (q. v.), CRINUM (q. v.), ALSTREMERIA (q. v.), NERINE, COBURGIA, BRUNSVIGIA, PANCRATIUM, FOURCROYA, &c. To this order belong the SNOWDROP (q. v.) and SNOWFLAKE (q. v.), and it includes also the AMERICAN ALOE (*Agave*, q. v.).

AMARYLLIS, a genus of bulbous-rooted plants

of the natural order *Amaryllidæ* (q. v.), having a simple 6-partite perianth, and containing a large number of species, natives of the warmer regions of the globe. Many of them have flowers of very great beauty. A species of this genus, *A. formosissima*, was brought to Europe from South America in the end of the 17th c., and has since been in common cultivation as a garden-flower. Its flowers are of a beautiful red colour, exhibiting a play of golden gleams in the sunshine. They are scentless. *A. amabilis*, *A. Josephina*, and *A. vittata* are amongst the

Amaryllis formosissima.

most admired bulbous-rooted plants. *A. Sarniensis* is one of the most hardy species, flowering freely in Guernsey, with a little protection during winter, and commonly called Guernsey Lily, although it is supposed to be a native of Japan. By artificial impregnation, a great number of hybrid forms have been produced in this genus.

AMASIS, a king of Egypt. Of humble origin, he rose to be general under Apries, the last king of the line of Psammetichus. Being sent to put down an insurrection, he joined the rebels, and was proclaimed king (569 B.C.). He cultivated the friendship of the Greeks, opened up to them the commerce of Egypt, previously confined to Naucratis, married a Greek wife, and took a body-guard of Greeks into pay. Pythagoras and Solon are said to have visited him. For his alliance with Polyocrates, and the singular reason for which Herodotus makes him break it off, see **POLYCRATES**. During his reign of 44 years, he greatly promoted the prosperity and adornment of Egypt. Immediately after his death, the country was conquered by Cambyses of Persia.

AMATITLAN, a district of Central America, near Guatemala city, embosomed in abrupt mountains of volcanic origin. It produces cochineal largely.

AMAURO'SIS (Gr. *amauros*, obscure) is a blindness or obscurity of vision caused by disease of the optic nerve, and this cause may be situated either at the origin of the nerve in the brain, in some part of its course, or at its termination in the retina; and of course the degree of blindness will be in proportion to the extent these parts are involved by the disease. See **OPTIC NERVE**. A. may also depend upon causes remote from the organ of vision; the suppression of accustomed discharges from the body may lead to congestion of the vessels of the brain, and cause A.; and it may spring from many very slight causes, if a predisposition to the disease exists. This is occasionally hereditary. Beer mentions several cases in one family; for three successive generations, all the females who had not borne children became blind in middle age; the males shewed a tendency to the disease, but did not become blind. A common cause is exposure to bright light or great heat and light, either natural or artificial, occupation upon minute objects, and employment of the eyes during the hours which ought to be devoted to sleep. In many instances, a single imprudent exposure of the eyes to the operation of some such cause, has been sufficient to extinguish the sensibility of the retina; but, in general, it is from

long-continued over-excitement of the organs of vision that they begin to fail, and at last become totally unable to continue their office. The heat of the sun, rage, continued stooping, and fevers or other causes, causing congestion, inflammation, or serous effusion in the head, cause A. Some poisonous substances cause A. suddenly, as belladonna, stramonium, and other narcotics given in large doses; and others, applied to the body every day in small quantities, have the same effect, but more slowly. Tobacco may be justly signalled as a poison of this sort, as also mercury and lead.

Exhaustion of the body and depressing mental affections also are causes of A. But we can seldom attribute its occurrence to the influence of any single remote cause, but to a number of circumstances which have been acting for a length of time upon one individual, either consecutively or together.

We recognise the presence of A. by the history of the case and the appearance of the eyes. The latter have generally a vacant, unmeaning stare, dilated pupils, and do not converge towards an object, but appear to be looking steadfastly at something in the distance. The sclerotic or white of the eye is generally altered in colour, and crossed by enlarged blood-vessels. The history of the case varies with the patient. Among the first symptoms are difficulty in calculating distances, as in threading a needle or pouring fluid into a glass; and sometimes there is occasional loss of sight in one eye (*amaurosis vaga*), confusion of vision—sometimes a part of the field of vision will be clear, and part obscured. There are also present spectra or *muscæ volitantes*, which sometimes are permanent, arising from the existence of insensible patches on the retina. Floating specks are merely coincident with the disease.

A. is treated by depletion in the robust, alteratives and tonics in the feeble, and by those remedies which act upon the nervous system, and counter-irritation by blisters or issues behind the ears, or in the neighbourhood. Except in very recent cases, the prospect of recovery is slight.

AMAXI'CHI, the capital of the Ionian island of Santa Maura or Leucadia, is built on the edge of the shallow lagoons that separate the north-east part of the island from the mainland. The harbour constructed by the Anglo-Ionian government is protected by a mole, at the end of which is a lighthouse. It is fitted only for small-craft. A. derives its name from the Greek *amaxai*, 'cars,' which the Venetian garrison employed in bringing down the oil and wine from the inland districts to the point nearest the fort of Santa Maura, where, subsequently, houses began to be erected. The town has a very mean and poor appearance; the buildings are partly of wood, on account of the frequent earthquakes. Slight shocks occur not seldom more than once a month. Behind A. there is an old olive-wood, extending to the base of the neighbouring hills, and checkered with cypresses and gardens. The town is the residence of a Greek archbishop and of a British governor. Pop. 4000.

AMAZON, **MARANON**, or **ORELLANA**, a river which, after traversing nearly the entire breadth of South America, enters the Atlantic between Brazil and Guiana, by a mouth of about 150 miles in width—a mouth which, though it admits the tide for nearly 500 miles, is yet so far from meeting our ordinary notion of an estuary that it repels, or at least overlays, the ocean to a distance of more than 50 leagues. With its various tributaries—the Napo, the Putumayo, the Yapura, and the Rio Negro from the north, and the Huallaga, the Yavari, the Jutay, the Jurua, the Coary, the Purus, the Madeira, the Tapajos,

and the Xingo from the south—the A. drains about 2,000,000 square miles, an area equal to that of Europe, and is estimated to afford an inland navigation of 50,000 miles, a line double the circumference of the globe. In every respect, then, the A. may well claim to be the largest of rivers, excepting only that, in volume of contents as distinguished from volume of discharge, the St Lawrence, with its computed mass of 11,000 cubic miles, has been estimated to be equal to all the other bodies of fresh water on the earth's surface, from the A. downwards. With this exception, which—as the St Lawrence is really a series of lakes—is rather apparent than real, the Amazon stands forth as the king of rivers, whether trunk be compared with trunk, or branches with branches, alike in essential features and in the area of basin. Viewed as one grand system, the A., from its sources, from which the Pacific may be seen within a distance of 63 miles, to its embouchure, comprises a course of about 4000 miles; while, gathering its tribute from both sides of the equator along more than 20° of latitude, it presents, perhaps, between south and north, a longer line of natural communication than even between west and east. Reckoning from the western range of the Andes, the A. is but little better than a mountain-torrent, till it has burst through the gorges of the eastern range of the chain, where it is overhung by peaks that tower thousands of feet above its bed. But, within 300 miles from the Pacific—a journey of about 200 days for loaded mules—the branch called the Huallaga is practicable for canoes, while, after a run of 325 miles, it becomes navigable for vessels drawing 5 feet, growing deeper and deeper, and more and more available as it rolls its steadily swelling flood towards the ocean. Nor is this the remotest point of clear navigation from the sea, for the Marañon itself is estimated by Herndon to carry the clear navigation about one-fifth higher up, amounting in all to 3360 miles. What an idea do these single threads afford of this matchless net-work of inland navigation! But it is not to its own basin alone, vast as that basin is, that the value of the A. is confined. The Rio Tapajos has its navigation separated only by a portage of 18 miles from that of an affluent of the Plata; the Rio Branco, the main tributary of the Rio Negro, has a water-communication which is only two hours distant from that of the Essequibo; while the Rio Negro itself is doubly connected with the Orinoco, receiving from it the navigable Cassiquiare (q. v.), and wanting only a canal over a portage of six hours to complete a still more useful bond of union, whose superior advantages will certainly one day lead to the necessary improvement. In addition to all this, the outlet of this mighty river, besides washing Cayenne, is itself, under nature's guidance, a feeder, as it were, of that highway of nations, the Gulf Stream. Thus does the A., to say nothing more of its maritime relations, bring its inland navigation, mediately or immediately, to bear, Chili alone excepted, on every country in South America—Venezuela, Ecuador, New Granada, Bolivia, Peru, Brazil, the Guianas, and the several Argentine Republics. This is not mere prospect; not only has the basin proper of the A. been more or less frequently traversed, but also the various joints that knit it to other basins have been tested by experience. The grandest and most singular of them all, besides being explored by Humboldt, has been placed beyond a doubt by the denizens of the country. The barge-builders of San Carlos, at the entrance of the Cassiquiare into the Rio Negro, have long sent vessels, not only down the Rio Negro to Para, on the Lower A., but likewise up

the Cassiquiare to Angostura, on the Lower Orinoco; thus solving, in their own way, the problem which systematic geographers were elsewhere deriding as worse than a fable—as a sheer impossibility. But still the navigation of the A. is only in its infancy, Para, its maritime emporium, having a business that amounts in both directions to only 2,000,000 dollars. But the little that exists has been achieved under most untoward circumstances. The local craft, badly built and badly rigged, have been worse manned, while the rapids above, all safe and easy for the downward trip, are often rendered more arduous to the upward voyager by a depth which forbids poling, and by banks which, if not actually submerged, are in general too thickly tangled for towing. What a noble field for steam! Brazil and Peru have themselves seen this truth. But unfortunately they seem to think more of monopolising the profits of this new agency than of developing the resources of the country. If opened to all-comers, the magnificent region of the A. might become the garden of the world, teeming as it does with game, fish, coffee, sugar, cotton, tobacco, maize, rice, sarsaparilla, cocoa, indigo, grapes, bananas, spices, dyes, drugs, india-rubber, cabinet woods, building-timber, and precious metals. Yet so feebly has Nature been seconded by man, red and white alike, that Herndon, on his long downward voyage, seldom got anything better than farinha and salt fish, and even of these doubtful delicacies not always enough. What is wanted is an infusion of new blood. The colonists, themselves sufficiently indolent, describe the aborigines as bad citizens and worse slaves. In short, whether for trade or for colonisation, this almost untrodden world is as promising as it is boundless. In the presence of industry, every difficulty would vanish. Steam must there work the same wonders that it has already worked in similar wildernesses. Nor will steam have all the burden to bear. In spite of the weight of the river, which has been already stated to drive back the sea, as such, out of sight of land, the tide, as the reader will remember, makes its influence felt for nearly 500 miles from the coast; while the easterly trades are ready to waft the adventurer to his destination; and, lastly, what is more than all, the wind on the river, apparently a continuation of that from the sea, blows almost invariably upwards, so as to be ready to help the screw or the paddle against the adverse current.

AMAZONS, AMAZONS. According to a very ancient tradition, the A. were a nation of women, who suffered no men to remain among them, but marched to battle under the command of their queen, and formed for a long time a formidable state. They held occasional intercourse with the men of the neighbouring states. If boys were born to them, they either sent them to their fathers, or killed them. But they brought up the girls for war, and burned off their right breasts, that they might not be prevented from bending the bow. From this custom, they received the name of A., that is, 'breastless.' Such is the ordinary tale; the origin of which is perhaps to be accounted for by supposing that vague reports, exaggerated and poetically embellished, had reached the Greeks of the peculiar way in which the women of various Caucasian districts lived, performing military duties which elsewhere devolved on husbands, and also of the numerous examples of female heroism which travellers inform us, still distinguish the women of that region. In later times, however, the word Amazon has been supposed to have some connection with the Circassian word 'Maza,' signifying the moon, as if the myth of the A. had taken its origin in the worship of the moon, which prevailed on the borders

of Asia. Three nations of A. have been mentioned by the ancients. 1. The Asiatic A., from whom the others branched off. These dwelt on the shores of the Black Sea, and among the mountains of the Caucasus, especially in the neighbourhood of the modern Trebisond, on the river Thermodon (now Termeh). They are said to have at one time subdued the whole of Asia, and to have built Smyrna, Ephesus, Cumæ, and other cities. Their queen, Hippolyte, or, according to others, Antiope, was killed by Hercules, as the ninth of the labours imposed on him by Eurystheus consisted in taking from her the shoulder-belt bestowed on her by Mars. On one of their expeditions, the A. came to Attica, in the time of Theseus. They also marched under the command of their queen, Penthesilea, to assist Priam against the Greeks. They even appear upon the scene in the time of Alexander the Great, when their queen, Thalestris, paid him a visit, in order to become a mother by the conqueror of Asia. 2. The Scythian A., who, in after-times, married among the neighbouring Scythians, and withdrew further into Sarmatia. 3. The African A., who, under the command of their queen, Myrina, subdued the Gorgons and Atlantes, marched through Egypt and Arabia, and founded their capital on the Lake Tritonis, but were then annihilated by Hercules. See Nagel, *Geschichte der Amazonen* (Stuttgart, 1838).

AMBASSADOR is a title by which the highest order of diplomatic ministers is distinguished, and the person holding such a high commission may be defined to be an officer sent by one sovereign power to another to treat on affairs of state. The credentials, or letters of credence, of an A. are addressed directly by his own sovereign to the sovereign to whom he is sent, and with whom he has the privilege of personal communication. In the performance of all his diplomatic duties, an A. is understood to represent, not only the affairs, but the dignity and the power of his master; and by the law of nations, he has many important rights and privileges, the chief of which is exemption from the control of the municipal laws of the nation wherein he is to exercise his functions, an exemption that is not confined to the A. himself, but is extended to all his suite, including not only the persons employed by him in diplomatic services, but his wife, chaplain, and household generally. But there is a dispute among legal writers whether this exemption extends to *all crimes*, or whether it is limited to such offences as are *mala prohibita*, as coining, and not to those that are *mala in se*, as murder. The law of England appears to have formerly allowed the exemption in the restricted sense only; and in the year 1654, during the Protectorate of Cromwell, the Portuguese A. was tried, convicted, and executed, for an atrocious murder. But now, according to the general practice of this country, as well as that of the rest of Europe, it is considered that the security of an A. in conducting the intercourse of nations, is of more importance than the punishment of a particular crime, and therefore few examples have happened in modern times where an A. has been punished for any offence. In regard to civil suits, the privilege of exemption is clear and undoubted, and has been expressly recognised by an act of parliament, the 7th Anne c. 12, the history of which, as given by Blackstone, is curious. That learned commentator cites the opinion of Sir Edward Coke, who was disposed to qualify the absolute exemption of ambassadors in civil proceedings, by maintaining, that if an A. to the English court make a contract, which is good according to the law of nations, he shall answer for it in England. Blackstone then proceeds: 'But the truth is, so few cases (if any) had arisen, wherein the privilege was either

claimed or disputed, even with regard to civil suits, that our law-books are (in general) quite silent upon it, previous to the reign of Queen Anne, when an A. from Peter the Great, Czar of Muscovy, was actually arrested, and taken out of his coach in London, for a debt of £50, which he had there contracted. Instead of applying to be discharged upon his privilege, he gave bail to the action, and the next day complained to the queen. The persons who were concerned in the arrest were examined before the privy-council (of which the Lord Chief-justice Holt was at the same time sworn a member), and seventeen were committed to prison, most of whom were prosecuted by information in the Court of Queen's Bench, at the suit of the Attorney-general; and at their trial before the Lord Chief-justice, were convicted of the facts by the jury; reserving the question of law, how far those facts were criminal, to be afterwards argued before the judges; which question was never determined. In the meantime, the Czar resented this affront very highly, and demanded that the sheriff of Middlesex, and all others concerned in the arrest, should be punished with instant death. But the queen (to the amazement of that despotic court) directed her secretary to inform him, that she could inflict no punishment upon any the meanest of her subjects, unless warranted by the law of the land; and therefore was persuaded that he would not insist upon impossibilities. To satisfy, however, the clamours of the foreign ministers, who made it a common cause, as well as to appease the wrath of Peter, a bill was brought into parliament, and afterwards passed into a law (the 7th Anne c. 12), to prevent and punish such outrageous insolence for the future; and with a copy of this act elegantly engrossed and illuminated, accompanied by a letter from the queen, an A. extraordinary was commissioned to appear at Moscow, who declared, that though her majesty could not inflict such a punishment as was required, because of the defect in that particular of the former established constitutions of her kingdom, yet, with the unanimous consent of the parliament, she had caused a new act to be passed, to serve as a law for the future. This humiliating step,' says Blackstone, 'was accepted as a full satisfaction by the Czar; and the offenders, at his request, were discharged from all further prosecution.'

But although an A. is not amenable to any tribunal of the country he resides in, he cannot misconduct himself with impunity. He must respect the laws and customs of the country in which he is officially resident; and if he violates or offends these laws and customs, he may be complained of to the court or government which he represents; or if the offence is of a very serious nature, his recall may be demanded, or the sovereign to whom he has given such offence may dismiss him peremptorily, and further require that he be brought to trial in his own country. It hardly need be added, that if an A. is guilty of an offence which threatens the safety of the state, he ceases to enjoy the privileges of the exemption in question.

There are some other and inferior privileges which are very generally allowed to ambassadors: they are, for instance, permitted the free exercise of their religion; they are, in general, exempted from direct taxation, they have special letter-bags, and they are usually allowed to import their goods without paying any custom-house duties—a privilege, however, which, being liable to abuse, has sometimes been limited.

Ambassadors are of two kinds—first, those who reside regularly at the court to which they are accredited; and, secondly, those who are sent on special occasions, when they receive the designation of AMBASSADORS EXTRAORDINARY.

There are other inferior diplomatic agents, who, according to the nature of their duties, receive the title of CHARGE D'AFFAIRES, MINISTER PLENIPOTENTIARY, or ENVOY (q. v.).

AMBER, a substance analogous to the vegetable resins, and, in all probability, derived from an extinct coniferous tree, although now appearing, like coal, in connection with beds of which it is usually found, as a product of the mineral kingdom. It is usually of a pale-yellow colour, sometimes reddish or brownish, is sometimes transparent, sometimes almost opaque. It occurs in round irregular lumps, grains, or drops; has a perfectly conchoidal fracture, is slightly brittle, emits an agreeable odour when rubbed, melts at 550° F., and burns with a bright flame and pleasant smell. It becomes negatively electric by friction, and possesses this property in a high degree—which, indeed, was first observed in it, and the term electricity is derived from *elektron*, the Greek name of A. The specific gravity of A. is 1.0—1.1. It is ultimately composed of carbon 79, hydrogen 10.5, and oxygen 10.5. An acid called succinic acid (named from the Lat. *succinum*, amber) is obtained from it. A had formerly a high reputation as a medicine, but the virtues ascribed to it were almost entirely imaginary. An antispasmodic volatile oil is obtained from it by distillation. A. is employed in the arts, for the manufacture of many ornamental articles, and for the preparation of a kind of varnish. Great quantities are consumed in Mohammedan worship at Mecca, and it is in great demand throughout the east. It was obtained by the ancients from the coasts of the

Amber, with enclosed insects.

Baltic Sea, where it is still found, especially between Königsberg and Memel, in greater abundance than anywhere else in the world. It is there partly cast up by the sea, partly obtained by means of nets, and partly dug out of a bed of bituminous wood. It is found elsewhere also in coal, and occasionally in diluvial deposits, as in the gravel near London; but it is very rare in Britain. It is obtained in small quantities from the coasts of Sicily and the Adriatic, and is found in different parts of Europe, in Siberia, Greenland, &c. It sometimes encloses insects of species which no longer exist. Leaves have also been found enclosed in it. Specimens which contain insects or leaves being much valued, fictitious ones are often manufactured and imposed upon collectors. According to an ancient fable, A. is the tears of the sisters of Phæthon, who, after his death, were changed into poplars. The ancients set an immense value upon it. Pieces of A. have occasionally been found of 12 or 13 lbs. weight, but such pieces are extremely rare.

AMBERG, the old capital of the Upper Palatinate in Bavaria, 35 miles east of Nürnberg, and 32 north of Ratisbon. It is situated on both sides of the Vils,

is well built, with double walls and five strong gates, and contains 11,000 inhabitants. It is the seat of the court of appeal for the district, possesses a library of 34,000 volumes, a lyceum, an agricultural and industrial school, a house of correction, an arsenal, &c. The principal products are firearms, earthenware, woollen cloths, ironmongery, and beer. A. has 14 breweries, a large cattle and swine market, a market for hops, and an important salt-trade. Many of the inhabitants are employed as miners in the neighbouring mountains. The suburbs are adorned with beautiful gardens and shaded alleys.

AMBERGRIS (i. e., gray amber), a fatty substance, of an ash-gray colour, with yellow or reddish striae, like those of marble, which is found in lumps of from half an ounce in weight to 100 lbs. and upwards, floating on the sea, or cast upon the seashore in different parts of the world, and is also taken by whale-fishers from the bowels of the spermæcti whale (*Physeter macrocephalus*). Much A. is obtained from the coasts of the Bahama Islands; it is also brought from different parts of the East Indies, and the coasts of Africa and Brazil. It is probable that all of it is produced by the spermæcti whale, and that it is a morbid secretion in the intestinal canal of that animal, derived from the bile. It is highly valued, upon account of its agreeable smell, and is much used in perfumery. The price is about 20s. an ounce. It has been strongly recommended for medicinal uses, but is scarcely employed in Europe; although, in some parts of Asia and Africa, it is much used as a medicine, and also in cookery as a condiment. The specific gravity of A. is scarcely more than 0.9. It almost always contains black spots, which appear to be caused by the presence of beaks of the *Sepia octopodia*, the principal food of the spermæcti whale. It consists in great part (85 per cent.) of a peculiar brilliant white crystalline substance called *Ambrein*, which is obtained from it by treating it with alcohol.

AMBO (Lat.), a kind of reading-desk or pulpit, which, in early churches, was placed in the choir. The Gospels and Epistles were read from the A., and sermons were sometimes preached from it, although the more usual practice in the primitive church was for the preacher to stand on the steps in front of

Ambo, St Clement's Church, Rome.

the altar. The A. is still to be found in oriental churches, and specimens of it may be seen in Rome. The A. had two ascents—one from the east, and the other from the west. In the Roman churches, there were two ambos, one on each side of the choir, from one of which the Gospel was read, and from the other, the Epistle. Where two such ambos were used, their construction was somewhat different. The name A. was also given to the analogium or

reading-desk used in monastic choirs, which was usually in the form of an eagle.

AMBOISE, a town on the left bank of the Loire, in the department of Indre-et-Loire, France. It is 15 miles by railway east of Tours, and lies in a region so rich in vineyards that it has been called 'the Garden of France.' Its manufactures are unimportant. A. possesses a castle, in which several of the French kings have resided. Charles VIII. was born here. It was also the scene of his death. The town is memorable as the place in which the religious wars that devastated the kingdom during the 16th c. broke out, and where the word 'Huguenot' was first applied to the Protestant party. The castle of A. was much improved by Louis Philippe, and was the residence of the gallant Arab chief, Abd-el-Kader, during his captivity in France. Pop. 4260.

AMBOISE, **GEORGE D'**, cardinal and prime-minister under Louis XII. of France, was born, 1460, at Chaumont-sur-Loire. When only fourteen years old, he was made Bishop of Montauban, and almoner to Louis XI., and, in 1493, was made Archbishop of Rouen. Initiated in early years into the intrigues of court, he soon, by his zealous services, secured the confidence of Louis of Orleans (Louis XII.), by whom he was made premier in 1498. From this time, A. became the prime mover in all the political affairs of France. By his advice, the king undertook the capture of Milan, which had such great influence on the fortunes of France. After the death of Pope Alexander VI., A. endeavoured to raise himself to the papal see, and having failed, became the dangerous enemy of the succeeding popes, Pius III.—who occupied the papal chair only 27 days—and Julius II. To secure his own election, A. encouraged a schism between the French Church and the See of Rome, and convened a separate council, held first at Pisa, afterwards at Milan and Lyon; but his plans were frustrated by the failures of the French army in Italy. He died at Lyon, May 25, 1510. The Cardinal A. was a dexterous and experienced statesman; but was accused of avarice, vanity, and ambition, and it was said that his vast fortune of 11,000,000 livres had not been accumulated by over-scrupulous means. His biography was written by Montaigne (1631) and Legendre (Rouen, 1724).

AMBOYNA, one of the Molucca or Spice Islands in the Eastern Archipelago. It is the chief of a group of which the next in importance are Ceram, Pulu-Buru, Haruco or Oma, &c., and lies in lat. 3° 26'—3° 48' S., long. 127° 50'—128° 15' E. It is about 32 miles long, with an average breadth of 10, and is irregular in shape, being nearly divided in two by the deep Bay of Binnen; it is mountainous, well watered, and thickly wooded. The climate is healthy—average temperature, 82° F.; lowest, 72°—but the monsoons bring deluges of rain. It is worthy of remark that the monsoons are quite reversed on the opposite sides of 120° long., the east monsoon bringing rain and storm in A., while in Borneo it brings fair weather; and *vice versa*, the west monsoon bringing sunshine in the Moluccas, and tempest in Java. This island produces the usual spices and fruits of these regions, but has been specially appropriated by its possessors, the Dutch, to the cultivation of the clove, to secure the monopoly of which they have stooped to the most contemptible expedients, extirpating all the trees, except in particular localities, where they are carefully numbered. The annual produce, which varies considerably, averages about 500,000 lbs., each tree yielding from 2 to 5 lbs. The cajuput tree, which yields a valuable medicinal oil, grows in A.; and the sago-palm, which affords the chief food of the inhabitants, is extensively cultivated. Fine indigo is also raised. The

principal wild animals are hogs and deer. The predominant race are the Malays. The aboriginal race, the Hlorafora, live in a wild state in the forests. The Chinese form a small but important section of the population, being the principal merchants; and still fewer are the ruling race, the Dutch.

AMBOYNA, the principal town in the island, on the south-east shore of the Bay of Binnen, is clean and well built, and contains 9000 inhabitants. It is protected by Fort Victoria, an irregular hexagon, with a horn-work towards the sea, and a ditch and covered-way on the land-side, commanded, however, by two neighbouring heights.

The population of the whole group of islands, of which A. is the chief, was, by the last official return, 282,000. A. was discovered by the Portuguese in 1511, and 16 years afterwards they formally took possession of this among the rest of the Moluccas. In 1607, their oppressive sway was succeeded by that of the Dutch. The English East India Company formed a settlement here in 1612, which was extirpated in 1622 by the Dutch, with those circumstances of diabolical cruelty which made the 'A. massacre' long memorable. For this barbarous proceeding due retribution was exacted many years after by Cromwell. The island was taken by the British in 1796, restored at the peace of Amiens, recaptured in 1810, and again given up to the Dutch in 1814, whose rule, though mitigated from its former severity, is still characterised by an intolerance and harshness unworthy of a civilised nation.

AMBROSE, **SAINTE**, one of the most celebrated of the ancient fathers of the church, was born about the year 340, probably at Treves, where his father, as Prefect of Gaul, was wont to reside. A. received a fortunate omen even in his cradle: a swarm of bees covered the slumbering boy; and the astonished nurse saw that the bees clustered round his mouth, without doing him any harm. His father, perhaps remembering a similar wonder related of Plato, foreboded from this a high destiny for A. He received an excellent education, and went with his brother Satyrus to Milan, in order to follow the legal profession. He soon distinguished himself so much, that, in 369, he was appointed, by Valentinian, Prefect of Upper Italy and Milan. In this office, his gentleness and wisdom won for him the esteem and love of the people, whose prosperity had been much injured by the troubles caused by Arianism. Accordingly, by both Arians and Catholics, he was unanimously called to be Bishop of Milan, in 374. A. long refused to accept this dignity, and even left the city; yet he soon returned, was baptised, as hitherto he had been only a catechumen, and was consecrated eight days afterwards. The anniversary of this event is still celebrated as a fête by the Catholic Church. As a bishop, A. won the universal reverence of all, by his mild and gentle, though, towards wickedness of every kind, severe and unbending character. Thus, he repulsed the Emperor Theodosius himself even from the door of the church, on account of his having caused the rebellious Thessalonians to be cruelly massacred by Rufinus, excommunicated him, and only restored him to the church after eight months of severe penance. A. died in 397. The best edition of his works, in which he followed in many things the Greek theological writers, is that published by the Ben dictines (2 vols. Paris, 1686—1690). The hymn, *Te Deum Laudamus*, is usually ascribed to A., but it is proved to have been written 100 years later. The Ambrosian ritual has also received his name, only because A. had made some changes upon it, which are retained at the present day in the Milanese Church. A commentary on the epistles of Paul, which was formerly ascribed to A., was probably composed by the Roman deacon

Vilarius, and is usually quoted as the Commentary of the Ambrosiaster. A. is the patron saint of Milan, and the Ambrosian Library received its name in honour of him.

AMBROSIA, in Greek and Roman Mythology, is the name of the food of the gods, which conferred immortal youth and beauty. It was brought by doves to Jupiter, and was occasionally bestowed upon such human beings as were the peculiar favourites of the gods. A. was also used as a fragrant salve, which the goddesses employed to heighten their beauty; with which Jupiter himself anointed his locks; and which had the property of preserving bodies from corruption. Hindu mythology has also its *amrita* (from *a*, signifying 'without' or 'not,' and the Sanserit root, allied to the Lat. *mort*, and Greek *brot*), or liquor of immortality, that resulted from the churning of the ocean by the gods; and the gods of the Scandinavian pantheon were preserved in perpetual vigour by eating the apples guarded by Idun.

AMBROSIAN CHANT, the choral music of the early Christian Church, introduced from the eastern church into the western by St Ambrose, Bishop of Milan, in the 4th c.; it was founded on the first four authentic modes of the ancient Greeks, and was sung antiphonally. It continued in use until the 6th c., when Pope Gregory the Great reformed the music of the church by introducing the Gregorian chant. There exists still another specimen of music by Ambrosius, which is now known only in the German-Lutheran Church by Luther's translation of the words, *Nun kommt der Heiden Heiland*; it is beyond a doubt 1400 years old, and remains to this day a beautiful specimen of melody, expressive of filial humility and submission. The A. C. continued to be still sung in the cathedral at Milan long after Gregory's reformation, and till this day, it is said, it may be heard there.

AMBROSIAN LIBRARY, a library in Milan, so named in honour of St Ambrose, the patron saint of that city. It was established in 1609 by the Cardinal Archbishop Federigo Borromeo, a lover of art, who employed learned men to collect books both in Europe and Asia. This Library was afterwards enriched by the acquisition of the MSS. of the Pinelli collection. Borromeo intended to establish, in connection with the Library, a college of sixteen learned men, each having charge of a particular department, whose duty should be to make known the works contained in the Library, and assist strangers in their researches. The want of funds limited this college to *two members*, who bear the title of *Doctores Bibliothecæ Ambrosianæ*. The library contains above 60,000 printed books and 15,000

MSS. Among the many rarities belonging to it, besides the Palimpsests and other as yet unedited MSS. discovered by Maio, Castiglione, and Mazzuchelli, it contains a 'Virgil,' in which Petrarch had written an account of his first meeting with Laura.

A'MBRY, AUMERY, ALMERY (supposed by some to be a corruption of Almonry), a niche in the wall of a church, shut in by a door; or a small cabinet of wood placed by the side of the altar, for the purpose of holding the vestments and utensils,

Ambry, Rushden, Northamptonshire—14th century.

such as the chalices, basins, cruets, &c., used for the service of the mass. In monastic buildings, ambries were used for various purposes, such as keeping plate, hanging towels for the monks to dry their hands with before dinner, and the like. In this sense, the term A. seems to have been applied to any kind of cupboard which was closed in and locked, and it is so used in Scotland at the present day.

AMBULA'CRA (from the Latin *ambulare*, to walk), the name given to peculiar organs of locomotion with which star-fishes and other *Echinodermata* are furnished. They are fleshy, more or less elongated, and terminated by suckers. They pass through orifices in the shell or other external integument of the animal, and are generally arranged in rows. Those of the *Echini*, or Sea-urchins, are long enough

Ambulacra of Star-fish,

As seen in a longitudinal and vertical section of one of the rays; and three of them in a separate figure on a larger scale, in which they are shown in different conditions: *a, a, a*, tubular feet; *b, b, b*, internal vesicles; *c*, the organ which supplies the fluid with which they are filled.

to extend beyond the point of the spines, and by means of them the animal is able to climb a perpendicular rock. They are tubular, and each has at its base a vesicle, filled with a fluid which, on the contraction of the vesicle, is forced into the tube, dilating it to its full extent, whilst, on the contraction of the tube, the fluid returns again into the vesicle. The fluid is not secreted by these vesicles, but provided for them by distinct secreting organs.

A'MBULANCE, a military term which is somewhat differently applied in different countries. In France, an A. is a portable hospital, one of which is attached to every division of an army in the field, and provided with all the requisites for the medical succour of sick and wounded troops. Such an A. is stationed at some spot removed from immediate danger; and soldiers are sedulously employed after a battle in seeking out those who have fallen, and conveying them to the A. Baron Larrey, during the great wars of the First Napoleon, brought this department of medical business to a high degree of efficiency, and set an example to the rest of Europe. When England engaged in war with Russia in 1854, the A. arrangements, like many others relating to the army, were in a very imperfect state. In the English army, an A. sometimes means a litter for carrying from the field of battle those who have been placed *hors de combat*; while at other times the name is applied to a four-wheeled wagon or a two-wheeled cart fitted up for the reception of wounded men. When Lord Raglan was about to be sent out with the army, Dr Guthrie, President of the College of Surgeons, devised a new form of A. cart; while Dr Andrew Smith, Director-general of the Army and Ordnance Medical Department, invented a new A. wagon. Annexed is a figure of Dr Guthrie's A. cart.

The badly wounded were laid on it at full length, while those slightly hurt sat in front and rear, and on the sides. A stretcher is slung from the top for the accommodation of the former. The

Ambulance cart.

back-board is let down for cases requiring amputation. The hospital chests are lashed underneath. Many of Smith's A. wagons and of Guthrie's A. carts were at once made and sent out to the East; but they were not at the proper place when most wanted. After the battle of the Alma, in which 1986 British officers and soldiers were killed or wounded, Lord Raglan, who was almost without A. and draught-animals, was much embarrassed for the means of dealing with his poor suffering men; the conveyance of them down to the beach for shipment to the military hospitals at Scutari, was a work of delay and misery to all concerned. The French, who had 1360 killed or wounded at the same battle, adopted excellent arrangements for conveying their invalids down to the beach; they had a large number of *caeolets*, which had been suggested to them by their experience in Algeria. Each of these consists of a sort of easy-chair—or rather two easy-chairs—slung in panniers across the back of a mule: they are comfortable to the wounded men, and are available along tracks where no wheel-carriage could pass. During the siege of Sebastopol, the English were—in the early months at least—much distressed in their A. arrangements by the want of men, draught-animals, forage, and vehicles; but the experience thence gained will doubtless be valuable in future years.

AMBULANCE CORPS. When the A. wagons and carts, noticed in the last article, were ordered for construction, the War authorities made arrangements for supplying a body of men, to drive the vehicles and to attend the sick and wounded. These men were to constitute an A. C. to which there had been nothing before analogous in the English army. The experiment was unsuccessful; and at a later period of the war, the A. C. was superseded by the Land Transport Corps; which, since the conclusion of the war, has given way to the Military Train. See **LAND TRANSPORT CORPS, MILITARY TRAIN.**

A'MEULATORY. A name occasionally given in architecture to the cloisters of a cathedral, college, or the like.

A'MBUSCADE is one of the manœuvres adopted in war. The original Italian, *imboscata* ('concealed in a wood'), denotes the general nature of the A.; but the meaning is now much more extended, seeing that it applies to any attempt to attack an enemy by lying in wait and coming upon him unexpectedly. In former days, when soldiers fought hand to hand more frequently than at present, the A. was much resorted to; but the tactics of modern times render it less available. It was by an A. on the part of the revolted sepoys that so many British soldiers were killed and wounded in that adventure which was known, during the wars of the Indian mutiny, as

the 'disaster at Arrah,' in July 1857. An A. is neither an 'attack' nor a 'surprise,' in military language; it is something more sudden and unexpected than either.—**AMBUSH** is another name for ambuscade.

AMELANCHIER, a genus of plants of the natural order *Rosaceæ* (q. v.), sub-order *Pomeæ*, distinguished by having five ovaries, each of which is divided into two cells, with one ovule in each cell, the ripe fruit including 3—5 carpels. It consists of a few species of small trees with deciduous simple leaves, abundant racemes of white flowers, and small fruit of the size of a pea, or a little larger, but soft, juicy, and agreeable. The common A. (*A. vulgaris*) is a native of the Alps, Pyrenees, &c. The other species are natives of North America. *A. botryapium* is sometimes called June-berry, from its fruit ripening in June, before that of any other tree or shrub; and *A. ovalis* produces a very pleasant fruit, which makes excellent puddings. The amelanchiers are planted in Britain merely as ornamental trees. They are very hardy.

A'MEN, a Hebrew word of asseveration, is equivalent to 'Yea,' 'Truly,' and has been commonly adopted in the forms of Christian worship. In Jewish synagogues, the A. is pronounced by the congregation at the conclusion of the benediction given at parting. Among the early Christians, the prayer offered by the presbyter was concluded by the word A., uttered by the congregation. Mention is made of the practice in the 1st Epistle to the Corinthians (xiv. 16). Justin Martyr is the earliest of the fathers who alludes to the use of the response. 'In speaking of the sacrament, he says that, at the close of the benediction and prayer, all the assembly respond "A." According to Tertullian, none but the faithful were permitted to join in the response.' A somewhat noisy and irreverent practice prevailed in the celebration of the Lord's Supper until the 6th c., after which it was discontinued. 'Upon the reception both of the bread and of the wine, each person uttered a loud "A.;" and at the close of the consecration by the priest, all joined in shouting a loud "A."' The same custom was observed at baptism, where the sponsors and witnesses responded vehemently. In the Greek Church, the A. was pronounced after the name of each person of the Trinity; and at the close of the baptismal formula, the people responded. At the conclusion of prayer, it signifies (according to the English Church Catechism) *So be it*; after the repetition of the Creed, *So is it*.

AMENDMENT is a term used both in judicial and parliamentary proceedings. In the former, it is a power of correction of any errors in actions, suits, or prosecutions, which has been greatly extended of late, and which has largely improved and simplified the administration of the law, both in England and in Scotland. In parliament, the word A. is used when it is intended to oppose, vary, or qualify a question or resolution; and in the case of bills, it is employed as a courteous method of dismissing the bill from any further consideration, by moving that instead of 'now,' it be read at the end of three months, six months, or any other term beyond the probable duration of the session. It is also competent to a member to move as an A. to the question a resolution declaratory of some principle adverse to that of the bill, provided it be strictly relevant, as was lately done successfully by Lord John Russell, when he moved and carried, as an A. to the motion for the second reading of the Reform Bill of Lord Derby's government, a resolution declaratory of a principle which the supporters of that measure considered to be subversive of it.

AMENTACEÆ, according to some botanists, a natural order of dicotyledonous or exogenous plants, consisting entirely of trees and shrubs, whose flowers are unisexual, the male flowers, and very often also the female flowers, disposed in *amenta* or CATKINS (q. v.), and the perianth either wanting or incomplete. This order, which contains many well-known and important trees, is divided into a number of sub-orders, which by many have been erected into distinct orders, forming the *Amental Alliance* of Lindley. Under A. are ranked *Salicinæ* or *Salicaceæ* (see WILLOW), *Myricæ* (see CANDLEBERRY MYRTLE), *Casuarinacæ* (see CASUARINA), *Ectulacæ* (see BIRCH), *Altingiaceæ*, called also *Balsamacæ*, but not to be confounded with *Balsaminacæ*, or *Balsaminæ* (see LIQUIDAMBAR); by some also *Corylaceæ* or *Cupulifloræ* (q. v.), and *Platanæ* (see PLANE), both of which Lindley excludes from his Amental Alliance, associating the former with *Juglandacæ* (see WALNUT), as a distinct *alliance*, and referring the latter to the *Urtical Alliance*. See URTICACEÆ. On the other hand, he unites with the Amental Alliance the order *Elæagnacæ*. See ELÆAGNUS.

AMÉNTHES, an Egyptian mythological word equivalent in meaning to the Greek word *Hades*, the unseen world. Plutarch explained it as signifying 'the giving and taking,' an interpretation generally adopted, but erroneously. A. literally means 'the hiding' (-place understood). On Egyptian monuments we find the god Anubis leading to A. the souls which, in the form of birds, are escaping from the body through the mouth. He conducts them before the throne of Osiris, who sits as judge, with a council or jury of forty-two persons. The female deity, AMENT, represented on monuments in Upper Egypt, is merely a female form of Ammon, and her name has no connection with that of A.

AMÉRICA, one of the four quarters of the globe; being smaller than Asia, but larger, perhaps, than both Europe and Africa taken together. It is the only one of the four main divisions of the land that is washed by all the four great oceans—the Northern, the Atlantic, the Southern, and the Pacific.

If Tierra del Fuego and Greenland are included—as ought to be done on geological grounds—A. occupies about 150° of long., and about 135° of lat. Speaking generally, its extreme length may be said to be on a meridian, and its extreme breadth on a parallel—facts which, in the light of analogy, look more like a law than an accident. As the map will shew, similar coincidences occur in South A. by itself; in Africa, in Europe, in Asia, and in Australia. As between Asia and A., moreover, it deserves to be noticed that the meridional semicircles, along which run their respective lengths, form, with an interval of 150°, one and the same meridional circle.

Like the old continent, A. has been divided by nature into two peninsulas—Darwin and Suez being the isthmuses, while South A. corresponds with Africa, and North A. with Asia and Europe. Even to this extent, however, the resemblance is by no means close. In the new world, the whole of the lower peninsula is to the south of the whole of the upper one, while Asia overlaps half the latitude, and more than half the magnitude, of Africa.

Of the northern half of A. the southern section, on account of essential differences in character and appearance, is in general contemplated by itself under the name of Central A.—the most convenient limit, perhaps, being a line drawn from the mouth of Rio Bravo del Norte to the lower end of peninsular California; and this line, besides its geographical propriety on both coasts, has the recommendation of marking, on the nearer coast, the international

boundary of the United States and Mexico. *Central A.*, it is to be observed, has a political signification as well as a physical one, comprising, in the former sense, the comparatively small states between Mexico and New Granada—Guatemala, Honduras, San Salvador, Costa Rica, and Nicaragua.

Physically, however, these three subdivisions of A. may be regarded as one, being knit together on the west side by a backbone, as it were, of mountains, which, under various names and various aspects, stretches from the extreme south at Cape Horn to nearly the extreme north at the mouth of the Mackenzie. To this mountain-system we shall have occasion to refer under the distinct heads of ANDES, CORDILLERAS OF CENTRAL A., and ROCKY MOUNTAINS, restricting ourselves at present, in accordance with the general aim of this article, to such features of the entire chain as may incidentally come under our notice in connection with earthquakes, volcanoes, climate, or hydrography; and with regard to this article generally, the subject being A. as a whole, we shall, as seldom and as little as possible, anticipate details, which, even if anticipated here, must still be repeated under the respective heads of their proper localities.

In this treating of A., we shall consider separately its *earthquakes and volcanoes*, its *climate*, its *hydrography*, its *history*—comprehending its *discovery* and its *colonisation*, but excluding anything like the annals of any individual state—and, lastly, its *geology*, *botany*, and *zoology*.

The *earthquakes and volcanoes* of A. are to be found chiefly in the backbone of mountains already mentioned. In South A. they may be said to be exclusively so found, being confined to the Andes proper, that skirt the Pacific, and to the Venezuelan spur or branch of the main range. The same remark may be applied to Central A. But in North A., the energy which produces both classes of phenomena appears to have followed rather the coast, than the continuous chain which diverges gradually from it—earthquakes being often felt in the maritime towns of Upper California, and volcanoes having left their traces behind them on the islands of Russian A. The agency in question seems to have travelled from north to south along the coast, having exhausted itself in its more ancient seats; and this view derives support from the obvious formation of the Sandwich Islands, which are as nearly as possible parallel with the west coast of A., between Behring's Strait and the equator. On this interesting subject we quote from Sir George Simpson's *Overland Journey*: 'The whole group appears to have been thrown up from the deep by volcanic action advancing from the north-west to the south-east, and increasing in force as it advanced; so that, while island rose after island, each grew at once in height and in breadth according to the intensity of the power that heaved it upwards from the waters. Thus Bird Island, a barren rock taking its name from its only inhabitants, must be considered as the germ of the archipelago, as the first fruits of a submarine energy that was here only kindling its fires; while the other links in the chain, Kauai, Woahoo, Mowee, and Hawaii, not only differ, as I have just mentioned, at once in extent and in elevation, but also present, as they proceed, less and less evidence of antiquity in their gradually diminishing proportions of land capable of cultivation—a proof the more conclusive, inasmuch as the soil of the whole group undeniably consists of the successive gifts of years and ages and centuries. Moreover, the visible laboratories of the subterranean fire, which are scattered over the archipelago, confirm the same view: the craters are all extinct, excepting on Hawaii; and even on Hawaii, Mouna Loa, the

most south-easterly of its three great safety-valves, alone bears living testimony to the creative impulse that has called the whole chain into existence, and bears it, too, only through its lateral volcano of Kilauea, which, besides itself looking to the east, appears, by the gradual advance of subsidiary outlets down its eastern declivities, to be rolling the hidden sources of its strength—peradventure there to forge fresh islands—under the bed of the ocean.

Climate.—In comparing A. with the older continent, we must contrast not east and west with each other, but west with west, and east with east—neither Newfoundland with England, nor British Columbia with Kamtchatka, but Kamtchatka with Newfoundland, and England with British Columbia. Such a comparison shews that the difference lies not, as is often assumed, between the two continents, but between the opposite shores of either continent within itself. For instance, at Nain, in Labrador, the mean temperature is 7° F. below freezing; while at Archangel, in Russian A., it is 12° above freezing. This difference of 19° between the east and west coasts of the New World, is only a very little less than the difference between the east coast of the New, and the west coast of the Old; for the temperature of Gottenburg, in Sweden, is only 21° higher than that of Nain. It is to be remarked, however, that this difference between the opposite coasts of the two continents diminishes as we proceed southwards. New York is only 7° colder than Naples; and Florida has the same temperature as Cairo.

In illustration of the contrast between the east and west coasts of A., we are told, by the traveller already cited, that, at the mouth of the Columbia River, the first half of December presented one deluge of rain after another from the south-east, this weather winding up on the 16th of the month with a storm of thunder and lightning; 'while, to mark the difference of climate between the two sides of the continent, the good folks of Montreal, though occupying a lower parallel than ourselves, were sleighing it merrily through the clearest and driest of atmospheres.' Nor is the difference, according to the same authority, less palpable in the old continent than in the new. 'To place in the most striking light the contrast in point of climate between the opposite shores of the old continent, Kamtchatka and the British Isles may be said, with sufficient accuracy for this purpose, to lie in the same latitudes, and to present the same area, and even to occupy the same position with respect to the proximity of water; and yet, while the British Isles, with but little foreign aid, feed at least 25,000,000 inhabitants, Kamtchatka, with the help of extraneous supplies, can barely prevent its population of 4000 souls from starving.'

But whatever influences may be common to the climates of both continents, the climate of A. is subject to two peculiar influences—that continent's prolongation southward, and its backbone of mountains. With respect to the former point, A. advances at least 20° further southward than Africa—fully more than half the interval between the latter and antarctic ice; so that the southern breezes which, in summer, bring freshness and delight to the Cape of Good Hope, waft cold and misery to Cape Horn. Two of Cook's people, on his first voyage, were frozen to death in Tierra del Fuego towards the end of January—in a month corresponding with our July, and in a latitude the same as that of Edinburgh. The backbone of mountains, again, that other point which peculiarly influences the climate of A., does its work in two ways. Throughout almost its entire course, its height arrests the passage of the clouds and rains. Within

and about the tropics, these are borne from the east by the trades; in the more temperate regions, they are brought from the west by the prevailing counter-currents of air. But in either case, the windward slope of the mountain barrier is a fertile garden, the leeward slope a barren desert. In the more central plateaus, again, of Quito and Mexico, the various terraces present as many climates, and bring together, under the same parallel, all the temperatures and energies of nature.

But there exist, more particularly in North A., peculiarities of climate which cannot, perhaps, be referred to any known cause. On the opposite sides, for instance, of the great water-shed between the Gulf of Mexico and Hudson's Bay, antagonistic results are said to shew themselves in winter. On the northern side, the climate is understood to improve as one advances westward, the Saskatchewan, though in a considerably higher latitude, opening earlier in spring than the St Lawrence; whereas, on the southern side, ice forms in New Orleans, at the mouth of the Mississippi, strong enough to bear half-grown boys, a thing wholly unprecedented on the corresponding parallel of the Atlantic shore. Even in summer, at least on the northern side of the water-shed in question, something of a similar change of climate has been observed, for maize, which, in Lower Canada, is a precarious crop, even on the international line of 45°, regularly ripens, in Red River settlement, which, besides 5° more of latitude, is at least 1000 feet higher above the level of the sea.

With respect to that portion of A. which is best known, a popular misapprehension generally prevails as to the steadiness of its climate in any given season of the year. The Canadian summer, for instance, is supposed to be an unbroken period of tropical heat; and the Canadian winter to be, in its turn, an unbroken period of hyperborean cold. Now, in both directions, this is a great mistake. The summer of British A. is often tropical, and its winter often hyperborean, the extreme ranges of the thermometer, according to the experience of credible informants in localities to the south of London, sometimes being, in one and the same year, 104° F. above zero, and 32° below it. But this difference of 156°, which is measured probably by an interval of six months, is far less remarkable than the differences which a few days may bring forth. The highest range occurred within four days after parlour-fires had been given up; and the lowest fell on a day which, a year or so before, had been marked by a powerful thaw. In the city of Montreal itself, 36 hours, or less, have sometimes exhibited a difference, up or down, of 60° F. in winter; and even in summer, whether in Lower Canada or in the north-west, one can seldom reckon on any other month than July as free from night-frosts. In this respect, the Canadian climate may be taken as a sample of the climate of North A. in general, extreme ranges of temperature, as prevailing respectively in summer and winter, being naturally attended by more or less considerable vicissitudes in each individual season.

In the tropical regions, however, of A., whether Central or Southern, a singular uniformity of temperature does exist on each of the various terraces of the mountain chain. The same parallel, as has been already mentioned, presents at once the torrid, the temperate, and the frigid zones. Such a view of the matter, however, is, to a certain extent, deceptive, for in not one of the three cases are the vicissitudes of the respective zones, properly so called, found to shew themselves. Each level is said to be so steady in its temperature as to enfeeble and enervate the inhabitants through the monotony even of that which is in itself good; and in such cases, the

salutary prescription is to ascend or to descend, for a time, from one terrace to another.

Hydrography.—With the backbone of mountains as the principal water-shed of A., the rivers on opposite sides of the continent are still more different than the climates. Excepting in Central A., the difference in question is enormous. Even in North A., where it is less than in South A., the contrast is sufficiently striking. On the west side of the Rocky Mountains, the only streams worthy of notice in such a summary as this are the Colorado, which flows into the head of the Gulf of California; the Sacramento, which enters the harbour of San Francisco; and the Columbia, which empties itself into the open ocean—three rivers which, if compared with the waters of the opposite coast, are, in practical value, inferior singly to the Hudson, and collectively to the Rio Bravo del Norte. On the east side, however, there exist rivers to which the Rio Bravo del Norte and the Hudson are but as brooks. To begin with the extreme north: the Mackenzie, besides draining a large basin on its own side of the Rocky Mountains, draws from beyond them two of its principal feeders, the Peace and the Liarde, burying itself, however, under the perennial ices of the Arctic Ocean. Passing, without further notice, the Coppermine and the Fish River, of both which the interest is purely historical in connection with arctic discovery, we come to the Nelson, which brings down to Hudson's Bay the Winnipeg and the Red River, two streams bordering respectively on the headwaters of the St Lawrence and the Mississippi, and also the two branches of the Saskatchewan, which all but touch the sources of the Columbia and the Missouri. Next in order is that long alternation of mighty river and mightier lake—that reservoir of half the life-blood of the earth—which, under the name of the St Lawrence, gradually becomes a sea. South of the St Lawrence, along the coast, we meet the Atlantic streams of New Brunswick and the United States, all of them valuable beyond their magnitude, and most of them connected, more or less closely, with the Alleghanies—the St John, the Penobscot, the Connecticut, the Hudson, the Delaware, the Susquehanna, and the Potomac. Round into the Gulf of Mexico, and we reach, besides many second-rate rivers in either direction, perchance the most important stream on the face of the globe—a stream which, after uniting the Mississippi and the Missouri under the name of the former, receives on the right the Arkansas and the Red River, and on the left the Ohio, enriched, as it is, with the tributaries of the Wabash and the Tennessee.

In South A., again, the difference between east and west is still more remarkable. On the west, the Guayaquil, the only stream worth mentioning, is not to be compared even with the rivers that flow from the subordinate ranges of Brazil or Guiana; while, on the east, the Andes send down, besides the Magdalena flowing into the Caribbean Sea, the Orinoco, the Amazon, and the Plata, into the open ocean across the almost entire breadth of the continent—three networks of inland navigation, which, under the head of the Amazon (q. v.), we have already shewn to be virtually one, and, beyond that, to be virtually linked with the Essequibo of British Guiana.

Nor will the disparity between the two coasts of the continent be less striking, if the harbours are considered as well as rivers, the external outlets as well as internal channels. On the Pacific, South A. possesses, to the north of Chili, only two ports entitled to the name, Panama and the Guayaquil already mentioned; while, on the same coast, North A., along a line of 3000 miles up to British Columbia, presents only five safe and convenient

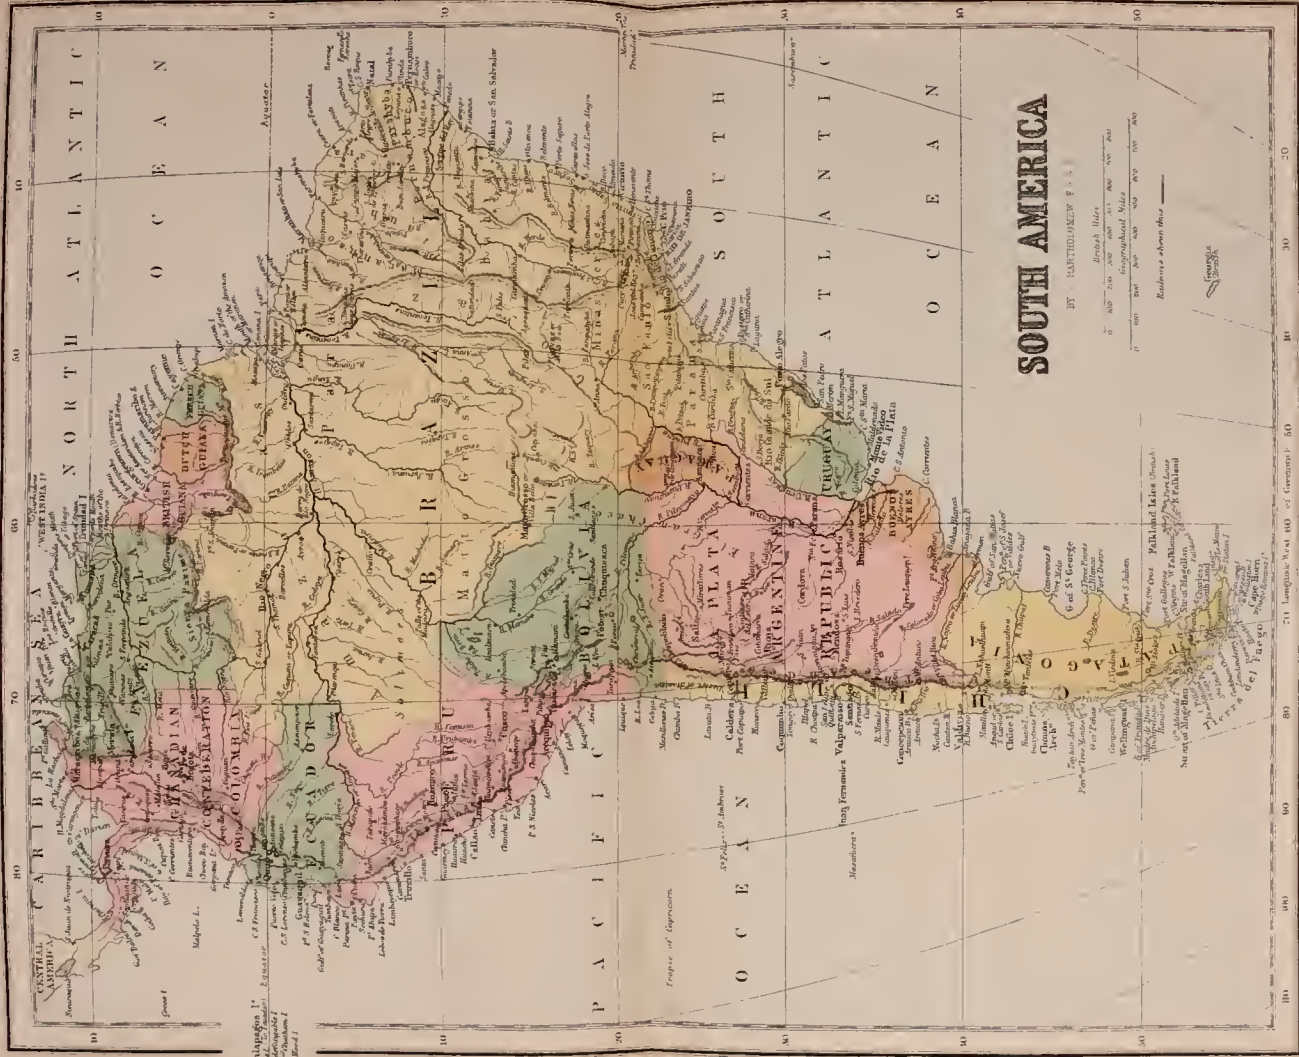

havens—Acapuleco, Mazatlan, Magdalena Bay, San Diego, and San Francisco. But the Atlantic side presents a contrast to which no language can do justice. To take the divisions as they come: Newfoundland has its St John's, Cape Breton its Louisbourg, Nova Scotia its Halifax, New Brunswick its St Andrews, Maine its Portland, New Hampshire its Portsmouth, Massachusetts its Boston, Connecticut its Newhaven, Rhode Island its Newport, and so on. Nor is this all. While fully a third part of the rivers of Europe and Asia are lost to the commerce of the world at large in the frozen seas of the north, or in such land-locked pools as the Aral and the Caspian, all the considerable rivers of A., with the Mackenzie as the only exception, are, more or less, channels of communication between the open ocean and the interior. To take the three grandest examples—The Amazon, with a basin estimated to contain 1,500,000 square miles, is navigable for steam-vessels up every one of its main branches, nearly to the eastern foot of the Andes; thus comprising several available lines of 2500 miles each, and presenting, as a whole, a network of such lines to the amount of at least ten times that length. The Mississippi, again, navigable as it is at once to the Alleghanies and to the Rocky Mountains, and between them, more to the north, as far as the Falls of St Anthony, has been computed to afford to the steam-vessel an uninterrupted career of 36,000 miles. But perhaps the St Lawrence, if less extensive, is more marvellous still. Owing to British improvements of its channel, New York and Pennsylvania have virtually a sea-board on their inland shores; while Ohio, Indiana, and Illinois, accessible to ships from the Gulf of St Lawrence by the lakes, and from the Gulf of Mexico by the Mississippi, far eclipse, in the heart of a continent, the peculiar boast of ancient Corinth as the mart of two seas.

To append a few subordinate examples: nearly all the considerable rivers along the coast between the St Lawrence and the Mississippi possess far more than an average value, in proportion to their lengths, as arteries of internal communication. The Atlantic slope of the Alleghanies, in particular, presents, as a whole, perhaps twice as many facilities in this way as any other region of equal extent on the face of the earth—facilities, too, which have been not less zealously and successfully improved than those of the St Lawrence. The Hudson has been, at vast expense, and with indomitable energy, connected with the basin of the St Lawrence at three points—on Lake Erie, on Lake Ontario, and on Lake Champlain; and the Susquehanna has been in like manner connected with the basin of the Mississippi by a canal which terminates at Pittsburg on the Ohio.

But in one part of A., still smaller streams than these last are entitled to particular attention. We allude to those streams, five in number, which promise to vie with each other in connecting together the Pacific and the Atlantic Oceans.

The five rivers in question form parts of three different routes. The Atrato of the Atlantic side co-operates with the San Juan of the opposite coast a little below the Isthmus of Darien; the San Juan of the Caribbean Sea, with the lake of Nicaragua, and with the smaller lake of Leon more to the westward; and, lastly, the Coatzacoalcos of the Gulf of Mexico, with the Tehuantepec of the bay of its own name.

To begin with the *first* route: the Atrato and the San Juan flow, in contrary directions, through the slightly undulating country into which the Andes gradually subside as they approach the Isthmus. Their head-waters are said to be near to each other, the Atrato being already navigable for small vessels, and the San Juan, manifestly a considerable stream,

H. & C. CHAMBERS, LONDON & EDINBURGH

entering the sea by several mouths, after a course of 150 miles. With such streams separated by such a country, a ship-channel between the two oceans does not by any means appear to be impracticable. Next, as to the *second* route, which, as well as the third, is already in actual use as a place of transit: the San Juan itself, about 100 miles long, has a gentle current, which, though in some places impeded by short rapids, is stated to be always navigable throughout for boats of 10 tons, and for much larger vessels to a considerable distance from the sea. Lake Nicaragua, again, said to measure 140 miles by 40, is adapted for ships of any burden, being fifteen fathoms deep. At its west end it receives the Tipitapa from Lake Leon, which, with a length of 35 miles, and a breadth of 15, is only 28 feet higher than itself, or 156 above the level of the Pacific. Two schemes seem to be agitated with respect to the more westerly portion of the route—one scheme proposing to avail itself of Lake Leon, and the other to carry the ship-canal at once from Lake Nicaragua. Lastly, as to the *third* route, where the intervening land, actually designated as an isthmus, is only 130 miles wide: the Coatzacoalcos alone is said to traverse nearly the entire breadth; while the Tehuantepec, which gives name to the isthmus, goes far to complete what the other has begun.

The practical value of the enterprise of connecting by navigation the Pacific and Atlantic Oceans is already evidenced by the fact, that, in the face of the competition of the last two routes, the Panama Railroad is perhaps the most profitable undertaking of the kind in the new world. In fact, the completion of any one of those three routes for sea-going ships, would be to realise Columbus's idea of a western passage to the East.

Of the *Lakes of A.* a brief notice will be sufficient. In North A., besides the vast reservoirs of the St Lawrence, a line drawn north-west from the centre of Lake Superior, appears, on the face of the map, to intersect a kindred series—Lake Winipeg, Lake Athabasca, Great Slave Lake, and Great Bear Lake—the first of the four being connected with the Nelson, and the remaining three with the Mackenzie. It may not be out of place to observe, that the general direction indicated is pretty nearly parallel with the Pacific coast, just as the general direction of the St Lawrence from the great bend at the head of Lake Erie is pretty nearly parallel with the Atlantic shores. As to the secondary lakes of North-west A., their name is legion, almost every stream, whether large or small, expanding itself here and there vastly beyond its average width, and being, as it were, a St Lawrence in miniature. One lake, or rather pond, is too singular to be overlooked. On the Athabasca Pass of the Rocky Mountains, where the road, little better than a succession of glaciers, runs through a region of perpetual snow, a small body of water, named by the Hudson's Bay Company's voyagers as the 'Committee's Punch-bowl,' sends its tribute from one end to the Columbia, and from the other to the Mackenzie. To proceed southwards along the continent, Central A. abounds in lakes. The Leon and the Nicaragua have been already noticed. But such bodies of water are perhaps most numerous on the table-land of Mexico, or as it is often termed, the plateau of Anahuac. The largest of these is Chapala, estimated to contain 1300 square miles—an area which, however insignificant in comparison with the great lakes of the north, is more than equivalent to a circle of 40 miles in diameter. Many of these reservoirs of the table-land have no outlet. Such is the case with the various lakes of the valley of Mexico, enclosed as they are by mountains at a height of

7471 feet above the sea-level. Of the same description, too, is the Lake of Titicaca, decidedly the largest in South A. Raised by the table-land of Peru and Bolivia to a height of 12,846 feet, it yet has no outlet to the sea; for the Desaguadero, which empties it, loses itself in the apparently land-locked Lake Uros to the southward. Of this great body of water, the magnitude is not so well ascertained as its altitude. Besides such round numbers as 16,000 and 5000 square miles, which are never meant to be accurate, one is perplexed to meet statements so minute, and yet so discordant, as 4032 and 2225 square miles. But even the lowest estimate is more than equivalent to a square of 47 miles a side—an area which, with a depth ranging up to 120 fathoms, exceeds, perhaps, anything to be found to the south of the basin of the St Lawrence.

The vast advantage in point of fluvial communication possessed by the new world over the old, has already been adverted to. There is, however, a hydrographical feature in which one of the grand divisions of the eastern continent is decidedly superior to A. The coast-line of Europe, in proportion to extent of surface, is incomparably longer than that of even the northern half of the western continent. This is at once apparent on glancing at the two maps. It is surely a suggestive fact, that the two portions of the earth which are best fitted for human intercourse, are also hydrographically so connected as to be beyond comparison the most accessible to each other. The dividing sea, besides being itself physically by far the narrower of the two intercontinental oceans, is virtually narrowed still more by its winds and its currents. Along a belt of about 30° on either side of the equator, the easterly trade with its attendant current wafts the voyager westward from Africa; while above that belt, the reaction, strengthened and accelerated by the peculiar formation of the Caribbean Sea and the Gulf of Mexico, is ready to carry him round again to Europe, under the double pressure of the Florida stream and its generally prevailing breezes from the south-west. Nor yet can the hydrographical relations of A. with Asia be denied their proportion of significance and influence, linked as the two continents are by Behring's Strait, and twice bridged as is their ocean, first by the Aleutian Isles—a continuation of the Kuriles and Japan—and then by the Polynesian clusters, that series of offshoots, as it were, from the Indian Archipelago.

History.—We propose to glance at this under the three heads of Aboriginal Ages, Discovery, and Colonisation.

As to the *Aboriginal Ages*, there arises a question, too interesting to be overlooked, and yet too doubtful to be solved, as to the origin of the native tribes and peoples of A. Without prejudicing the question (which will be considered under *INDIANS*) whether the aboriginal inhabitants of A. are to be considered, in an ethnological point of view, as substantially of one stock, it appears highly probable that they did not all spring from one and the same primeval band of adventurers; in other words, that different colonies, voluntary or involuntary, must have reached the new continent at different times. This view, to say nothing of the direct testimony of local traditions, seems to be in itself more than probable, when we consider that, through the length and breadth of the universal ocean, even the most insignificant specks of land had each received, at least, one influx of human wanderers. But, beyond such probabilities, and such traditions, the view in question is strengthened by facts, which it is difficult otherwise to explain—by diversities of language, by different degrees, or kinds, of civilisation, and, above all, by monuments, architectural or otherwise, of

defunct races of bygone days. On this supposition, whence came the successive shoals of invaders? To this question no direct answer can be given. We can only scan the various routes by which, previously to what we call the discovery of A., the old world was most likely to people the American continent. To begin with the natural routes on the side of the Pacific—Behring's Strait, the Aleutian Isles, and the Polynesian Archipelagoes—we can hardly conceive anything but barbarism having been conducted to A. by any one of them. The country which stretches back from Behring's Strait to the Kolyma, may be asserted to be, without exception, the most inhospitable portion even of Siberia; and, moreover, the strait itself has more probably been a channel of migration from America than from Asia, the Tehuktohi of the latter regarding themselves rather as a branch, than as the stem, of the Tehuktohi of the former. With respect, again, both to the Aleutian Isles and the Polynesian Archipelagoes, the successive stepping-stones in either series, instead of being presumed to have been so many halts for Asiatic Columbuses and Magellans, must rather be viewed as each a mother-country to a new colony, as each a point of departure for a fresh swarm. Thus would the ever-aggravating blight of isolation—exemplified even in the old world among the Laplanders, the Kamtchadales, and the Hottentots—prepare at each remove a deeper and deeper barbarism to land at last on the western shores of A. Further, if civilisation, as certainly appears to have been the case, ever did find its way to A., it must have come directly and immediately from the old world, and that under circumstances and conditions of by no means a favourable character. In remote times, such accidental, or, to speak more correctly, unintentional visits of Europeans and Asiatics may have occurred, as we know to have actually taken place in more modern days. Japanese junks have repeatedly been driven, by stress of weather, across the Pacific to the new world; and again, on the Atlantic, the easterly trades, within eight years after Columbus's earliest voyage, wafted the unconscious Portuguese to Brazil, during their second voyage to India—the very first, in fact, which they had attempted by steering clear of the headlands of Africa. Such incidents, however frequently they might have happened, were much more likely to civilise existing communities than to found new ones; and it is at least a curious fact, that the only aboriginal nations which could be regarded as in any sense civilised at the date of the Spanish conquest, pointed in their traditions to such events as we have endeavoured to describe. Mexico and Peru had each had its Ceerops, or semi-divine civiliser—the former referring him to the east across the Atlantic, and the latter to the west, across the Pacific. How far such hypotheses may account for the admitted facts, we are not left altogether to conjecture. Isolated individuals of our own nation have enabled us to bring the light of the present to bear on the past. When we consider what William Adams achieved in Japan, two hundred years ago, and what John Young and James Brooke have, more recently, effected in the Sandwich Islands and in Borneo, we can perhaps the more easily understand certain undeniable traces and traditions of aboriginal civilisation.

Discovery.—Whatever may have been the kind and degree of aboriginal civilisation, A. was not destined to be the perpetual inheritance of the red man. New actors were to appear on the scene, before whom the old possessors were in a great measure to pass away.

Previously to the times of Columbus, Europeans

had certainly visited A. The Scandinavians, after having colonised Iceland in 875 A.D., and Greenland in 983, had, by the year 1000, discovered A. as far down as 41° 30' N. lat., a point near to New Bedford, in the state of Massachusetts. These Scandinavians afterwards settled in the neighbourhood—the mother-country, most probably through the intervention of Iceland and Greenland, maintaining an intercourse with the colony down to the 14th c. But these enterprises do not appear to have left any special impress on the character or prospects of the new continent, being more akin, perhaps, to similar incidents of yet earlier ages, than to the long-meditated and well-matured scheme of the illustrious Genoese. Subsequently to the Scandinavian discovery, and previous to that of Columbus, A. is believed by some to have been visited by a Welsh prince. In Cardoc's *Historie of Cambria* it is stated that Madoc, son of Owen Gwynnedd, prince of Wales, set sail westward in 1170 with a small fleet, and after a voyage of several weeks, landed in a region totally different both in its inhabitants and productions from Europe. Madoc is supposed to have reached the coast of Virginia. Neither this, however, if true, nor the earlier Scandinavian expeditions, can be said even to have formed a connecting-link between the A. of the red man and the A. of his white brother. Even if the northmen had possessed resources worthy of their heroic courage, the old world was not yet ripe for the appropriation of the new.

At the end of the 15th c., however, science and politics were alike strengthening Europe for its task. The mariner's compass and the astrolabe had facilitated long voyages out of sight of land; while, in almost every country of Christendom, various causes were consolidating government, and promoting the growth of population—a position which derives, perhaps, its best illustration from the fact that the capture of Granada—the last foothold of the Moslem in Spain—preceded by only a few months the discovery of A.

Columbus (q. v) set out on his great enterprise to discover A. under the patronage of the crown of Spain, on Friday, the 3d of August 1492; at which date, properly speaking, begins the deeply interesting history of A. Had the Atlantic been broader, or had not the easterly trades wafted Columbus almost on a parallel from the Canaries to the Bahamas, he must have failed in his bold attempt; and, in fact, those same easterly trades, assisted by a still nearer approach of the two continents, speedily proved their own value in this respect by carrying the Portuguese, without their own consent, to the shores of Brazil. Nay, Columbus's discovery of A., if not so accidental, was quite as unintentional as that of the Portuguese. It was towards the East that his hopes directed his western course, hopes whose supposed fulfilment still lives in the misapplication to the new world of the terms Indian and Indies. Much of our subsequent knowledge of America has been owing to the same desire of reaching the E. Indies that led to its discovery. The gorgeous East was the aim alike of Davis, Baffin, and Hudson at the north, and of Magellan, Schouten, and Lemaire at the south, to say nothing of the earlier enterprise of Balboa on the Isthmus of Darien; while, under a similar impulse, the French of Canada were ascending lake after lake as nature's ready-made highway to the same goal. Even to more recent times may these remarks be applied. While the eastern coasts of Africa, and the upper shores of Asia, as not bearing on the grand question of oriental traffic, were comparatively neglected and forgotten, our own Cook and Vancouver, in quest of a passage

between the two oceans, surveyed every nook and cranny of A. from Columbia River to Behring's Strait. Nor yet have the aspirations of Columbus and his noble band of successors and imitators been altogether disappointed. That same continent which, in their case, barred a westward advance along nearly the whole interval between the arctic and antarctic circles, has to us already become, or is gradually becoming, more than a substitute for the ocean which it was found so extensively to displace. By means of the railway across the Isthmus of Panama, the Caribbean Sea, whether for passengers or for goods, is virtually nearer to the Pacific than an open channel could have rendered it to any sea-going vessels. Nor is it merely across the scanty span of Central A. that art is outstripping nature in the race. For, to take one instance, the Grand Trunk Railway runs a steep-chase over every obstacle, St Lawrence not excepted, for 1000 miles from the Atlantic to Lake Huron, fully one-third of the entire distance to be accomplished. Since October 11, 1492, the date of Columbus's first discovery, little more than three and a half centuries have elapsed; and if we look at the future in the light of the past, it seems not unreasonable to suppose, that, by 1892, the locomotive will, within three days, connect together oceans physically as distant from each other as are the Bahamas from the Canaries.

But Columbus found something better than what he himself or his successors and imitators looked for. He had discovered a land which, besides eclipsing India in the richness and variety of its commerce, was to confer on Europe a still more solid benefit. Colonisation, which, since the early ages of Greece, had slumbered for 2000 years, received an impetus, which, after building up empires in the West, was to build up others in an East richer far than that which was so long the loadstar of European navigators—an east where, almost without a metaphor, the grass was to be wool, and the stones to be gold.

The first-fruits of Columbus's enterprise were the Bahamas, Guanahani, or Cat Island, being the spot where he landed on the 11th of October 1492. Without attempting, in so summary a sketch as this, to distinguish the results of each of his four voyages from each other, it may be sufficient to state that this great man, besides Hispaniola, or St Domingo, Cuba, Jamaica, and others of the Antilles, discovered and explored Central A. from Honduras southward along the coast of Veragua, and South A. from the mouths of the Orinoco westward, as far as Margarita. It was on this last-mentioned scene of his operations that he was followed by Hojeda, whose pilot, Amerigo Vespucci (q. v.), has been allowed to wrest from Columbus the glory of giving his name to the new world. Within twenty years after Columbus's first discovery, Ponce de Leon discovered Florida; and, what was certainly of far more consequence, he ascertained that, through the strait which separated that peninsula from the Bahamas, there constantly ran a strong current to the north-east. In 1513, again, just one year later, Vasco Nunez de Balboa crossed the Isthmus of Darien to the Great South Sea, or, as it was afterwards named, the Pacific Ocean. About thirteen years before this last event, almost immediately after Columbus's own continental explorations, the interval left between his most southerly point from Honduras, and his most westerly point from the Orinoco, was, in a great measure, filled up by the voyage of Bastidas. To the south, again, of the Orinoco, Pinzon and Solis sailed along the continent down to 40° S. lat., between the years 1500 and 1514. The former, after anticipating, by a few months, the Portuguese on the shores of Brazil, had seen the Amazon; and the latter, sent out for

the express purpose of entering, if possible, Balboa's Great South Sea, found his way into the La Plata or Plate, being there slain by the neighbouring natives. Moreover, to return to the northward, by the year 1519, different navigators had between them completed the examination of the Gulf of Mexico. Within twenty-seven years, therefore, after Columbus's first departure from Spain, the eastern shores of South and Central A. had been almost continuously explored by the Spaniards down to within 15° of the southern extremity of the continent.

Nor had other nations been idle in the north. The Cabots, on behalf of England, had discovered Newfoundland, and portions of the adjacent continent, in 1497. In 1500, the Portuguese, under the Corteals, sailed along the coast of Labrador nearly up to Hudson's Bay, having, it is supposed, entered the Gulf of St Lawrence, long known among them as the Gulf of the Two Brothers. Thus gradually there grew up the opinion, since proved to have been the true and sound one, that any practicable passage between the two oceans must be looked for towards the south of the Plate. Accordingly, in 1519, Magellan, a Portuguese in the service of Spain, undertook the voyage in which was discovered the strait that bears his name—a voyage which furnished the first instance of the circumnavigation of the globe. Thus there remained little to be done, unless in the extreme north and the extreme south. In the extreme south, Schouten, a Dutch navigator, discovered, in 1610, the passage round Cape Horn; while, six years thereafter, Lemaire, a mariner of the same nation, passed through the strait of his own name between Staten Land and Tierra del Fuego. Towards the north, again, the French and English divided the labours and honours of the enterprise between them. Scarcely had Magellan's companions—for he had himself been killed—returned to Europe, when Vexazzano, under the auspices of Francis I. of France, sailed along what are now the Atlantic shores of the United States, thereby connecting the discoveries of the Cabots with those of Ponce de Leon; and again, about ten years later, Jacques Cartier, in the service also of the same prince, explored the gulf and river of St Lawrence, penetrating as far to the westward as the island of Montreal. In the extreme north, however, the English may be said to have been without a rival. It is unnecessary, in this summary sketch, to do more than mention names which tell their own story on every map—Davis, Baffin, Lancaster, and Hudson. (See these Heads.)

To pass now to the western coast of A. The conquerors of Mexico and Peru effected, in a few years, more perhaps than they left behind them for future ages to effect, ranging along the coast from the southern extremity of Chili to the peninsula and Gulf of California. Beyond Lower California, the only direction in which there was much to do, the English Drake, whose voyage took place in 1578, divided with the Spaniards the credit of having discovered Upper California. For nearly two centuries, excepting the half-fabulous voyages of Fonte and Fuca, the Spaniards and the English alike slumbered over their task; and it was not till towards the close of the last century, that Cook and Vancouver co-operated with Spanish and American navigators in dispelling the mystery that had so long hung over the north-west coast of A.

To advert to inland discoveries: As early as 1537, within six years after the landing of Pizarro in Peru, and within two after the founding of Buenos Ayres, the Spaniards met each other on the eastern borders of Peru, from the opposite shores of the continent; and, in 1540, within three years more, they sent forth that eastward expedition which ended

in Orellana's exploration of the Amazon, from its source to its mouth. In the northern half of the continent, similar enterprises were of a much later date. It was in 1682 that the French first descended the Mississippi; it was in 1771 that Hearne traversed the wilderness from Hudson's Bay to the mouth of the Coppermine; and it was respectively in 1789 and 1793 that Alexander Mackenzie reached the mouth of the river that bears his name, and passed through what is now British Columbia, to the shores of the Pacific Ocean.

Colonisation.—Among the European powers that colonised A., the most prominent were Spain, Portugal, France, and England.

Spain, of course, took the lead, having, with few exceptions, accomplished its task before any rival state had entered on its share of the work. In one respect, its colonies differed from all others on the new continent. Spain alone came in contact with civilisation, such as it was among the aborigines; and, accordingly, in the cases of Mexico and Peru, colonisation required to be preceded by something like regular war and formal conquest. But, notwithstanding this peculiar obstacle, the colonies of Spain grew at first with a rapidity which, perhaps, has scarcely found its parallel even in the somewhat congenial case of Australia. As an illustration of this—for the statement needs no proof—it was colonial resources that armed Cortes and Pizarro for their respective enterprises. Without the direct and immediate aid, in either instance, of the old country, Cuba, within twenty-seven years after the first discovery, equipped the conquerors of Mexico; while the town of Panama, only twelve years later, sent forth the adventurers that were to subjugate Peru. So unexampled a degree of vigour and vitality continued to advance in Spain's transatlantic possessions, precisely while they were so organised and conducted as to afford scope to individual ambition. Never, perhaps, was this scope sufficiently free and full, for, even from the beginning, government often embarrassed and blighted the fairest schemes by its jealous and suspicious interference. But, for a time, it generally found its account in tolerating the unrestricted liberty, or licence, of its instruments. It was, therefore, only after law and order were established, and the original actors had disappeared from the scene, that the authorities of the mother-country stereotyped, as it were, their despotism along the length and breadth of every colony. From that moment, vigour and vitality were succeeded by stagnation and torpor. Still, with such elements of prosperity on every side—above the earth and below it—material interests could not fail to flourish. But the soul had fled; the body alone remained behind. Under these circumstances, Spain, though continuing to claim the entire continent to the north, more especially on the Pacific, did very little to enforce its pretensions. To this remark, New Mexico and Upper California were the only exceptions. It was not before 1594 that New Mexico was at all occupied; and it was not till a century later that the province, after ten years of bush-fighting, was finally subdued; while it was only in 1767 that the Franciscans, on behalf of Spain, took possession of Upper California. But Spain never abandoned the hope of extending its dominions towards the north-west coast. As late as 1790, that power, while restoring Nootka Sound, and acknowledging England's right of planting other settlements, took the precaution, useless as it proved, of expressly reserving a similar right to itself; and it was only in 1819, nearly thirty years later, that Spain formally ceded to the United States all its claims to the coast above the parallel of 42°. See further under the separate head of AMERICA, SPANISH.

The efforts of Portugal, in the cause of American colonisation, were at first less energetic than those of Spain. In fact, Portugal, which had doubled the Cape of Good Hope in the year 1497, was so zealously engaged in the East as to allow an age to elapse before sending any colony to Brazil. The discovery of the country took place in 1500; but its colonisation only in 1531, or rather 1548. Within 32 years thereafter, in 1580, Brazil, at the same time as Portugal itself, was annexed to the Spanish monarchy, soon afterwards falling, in this its new character, partly into the hands of the revolted Hollanders. In 1640, Brazil, as well as Portugal, threw off the Spanish yoke with the help of the Dutch settlers. But the continued presence of the latter retarded the progress of the colony. It was only after their expulsion, that the Portuguese, who had lost nearly everything in India, turned their attention more largely to Brazil. It accordingly became the most flourishing colony, as such, to the south of the English settlements; and, as the refuge of the House of Braganza from French domination, it received, about fifty years ago, an impetus which has rendered it, as an independent state, the most flourishing power of Southern A.

France, as the claimant to the basins of the St Lawrence and the Mississippi, may be said rather to have pitched camps than to have planted colonies, in those vast possessions. She regarded A. chiefly as a supplementary battle-field for England and herself. Every French settlement was but an inert part of a political machine, powerful, indeed, but unwieldy, expensive, and unproductive. The government was everything, and the individual subject was nothing. Hence, neither Louisiana nor Canada at all realised our idea of a colony. In corroboration of this may be cited two authentic and official facts. As an encouragement to marriage, rewards and exemptions were held out to the parents of three children; and the erection of a dwelling on a lot of less than forty arpents (about thirty-two acres) was prohibited by a royal ordinance. In 1762, France gave up Canada to England, and, as an indirect concession also to the same power, transferred Louisiana to Spain—events which, singularly enough, did much to facilitate France's grand scheme, the separation from England of her old colonies.

England, the most energetic and successful of all in the work of colonisation, was the last in the field among the four powers already mentioned. Among her continental colonies, to say nothing of Newfoundland, Virginia, the oldest, was established in 1607, just four years after the union of the crowns; and Georgia, the youngest, as late as 1733. With these two exceptions, the remaining eleven were, one and all, founded during that period of civil and religious troubles which, in the mother-country's own history, sent one Stuart to the scaffold, and drove another into exile. In 1620, Massachusetts was occupied by the Puritan fathers; in 1623 and 1631 respectively, New Hampshire and Connecticut were first settled; in 1634, Maryland was granted to Lord Baltimore, a Roman Catholic nobleman; in 1636, Rhode Island became a refuge from the sectarian intolerance of Massachusetts; in 1653, North Carolina became an offshoot from Virginia; in 1664, New York, New Jersey, and Delaware were taken from the Dutch; in 1670, South Carolina was established; and in 1682, Pennsylvania was granted to William Penn, the Quaker, continuing to be a proprietary government down to the Revolution. In nearly all these cases, the civil and religious liberties for which chiefly the colonists expatriated themselves, were secured by liberal, nay, virtually republican charters. Subject only to the appointment of a governor on the part of the crown, every colony was

Printed and Colored by Colver & Spence, Leeds.

W & R CHAMBER: LONDON & EDINBURGH

practically a state within itself; and it is a suggestive fact that the very earliest assertion of legislative superiority on the part of the mother-country was 7 and 8 Will. III. c. 22, which, however, only operated negatively by forbidding every colony to make laws repugnant to those of England. With such aspirations and such institutions, the enterprising inhabitants of a new home could not fail to prosper; while their prosperity was rendered more solid and permanent by the comparative poverty of a region where steady industry, in agriculture or in the fisheries, was, as it were, a necessary of life. Under these circumstances, the germs of political independence were at work long before 1765; and it is not merely a probability, but a fact, that the expulsion of the dreaded power of France from Canada and Louisiana, in 1762, was closely connected with the troubles which so soon began. See AMERICA, BRITISH.

The colonisation of the West Indies, Guiana included, will be seen at a glance in the appended table of American Governments.

It may be added, in conclusion, that the whole of A. is now in the hands of European races, excepting only the aboriginal Araucania to the south of Chili, and the African republic of Hayti, otherwise known as Hispaniola or St Domingo, the oldest among the colonies of Spain.

American Antiquities.—The architectural remains, to which we have already alluded in connection with a general estimate of aboriginal civilisation, are to be found in each of the grand divisions of the new continent. To begin from the north. That portion of the United States which lies between the Appalachians and the Rocky Mountains, presents in three groups at once the oldest and the rudest monuments of bygone times: the first group extending from the sources of the Alleghany to the waters of the Missouri; the second occupying the Mississippi Valley, vaguely so defined; and the third stretching from South Carolina to Texas. These several groups, apparently with very little difference among themselves, consist of numberless mounds, and circumvallations of earth and stone—1500 of the latter, and 10,000 of the former, being said to stud Ohio alone. The erections themselves range from 5 to 30 feet in height; while the areas enclosed—generally of some symmetrical figure, such as circle or ellipse, rectangular parallelogram or regular polygon—vary from twenty to forty acres, though among a few of greater extent, one in Arkansas is stated to embrace a square mile. The circumvallations, moreover, seem generally to contain the mounds; and sometimes a smaller circumvallation is surrounded by a larger one. Whether these colossal structures were intended for worship or for defence, it is impossible to decide; more probably, however, they were of a military character, provided, as they ordinarily were, with cisterns for water. But, whatever their origin, they derive interest from the analogous fact, that, within the same territorial limits, have been dug up vases of earthenware or copper in elegant forms, pipe-bowls decorated with human heads of the type of the existing aborigines, or with those of birds, &c., domestic utensils, personal ornaments, hatchets of stone, and, lastly, weapons of copper or mica, or shell or obsidian.—The architectural remains of Central and South A. are at once of more modern origin and more elaborate character, and may be roughly compared with the cyclopean ruins in Italy and Greece. Uniformly in the pyramidal style—a style likely enough to be indigenous in a region of earthquakes—they are composed of blocks generally huge, and sometimes enormous; those in the walls of Tiahuanaco in Bolivia being equivalent to cubes of about 16 feet each way. Between those of South A. and Central

A., however, there are diversities as well as resemblances. Those of South A., situated, as they are, within the native limits of Peru, and referred, as they must be, to its closing era under the Incas, cannot reach back beyond the Spanish conquest more than 300 or 400 years: the principal ruins are those of Tiahuanaco, already mentioned; of a temple on an island in Lake Titicaca; of another edifice of the kind at Pachacamac, not far from Lima; and of the palaces and mausoleums of the royal race. Those of Central A., again, are reckoned to be considerably more ancient, reaching five or six centuries further back, and being partly the work of the Aztecs, whom the Spaniards conquered, and partly of the Toltecs, whom the Aztecs had themselves supplanted. Nor is the fact altogether without significance, that, in the two more southerly divisions of the continent, those mysterious records of the past are generally superior in development in proportion as they are anterior in age; those of Central A., as a whole, surpassing those of South A.; and, again, within Central A. itself, the earlier specimens of Oaxaca, Guatemala, and Yucatan, eclipsing the later ones of Mexico Proper. While attempting, in the light of these remains, to appreciate aboriginal civilisation, we cannot fail to be struck rather with their magni-

Front and back of a stone idol found at Copan, in Central America.

tude than with their beauty, rather with the evidence of despotism in the ruler than with traces of skill in the subject—Stonehenge affording us infinitely more of a parallel than Windsor Castle or Westminster Hall. Nor does the sculpture, so often subsidiary to the architecture, lead to a more favourable inference, being generally rude and clumsy, and sometimes grotesque and hideous. The only safe conclusion is this, that, in the new world as in the old, there were different degrees of civilisation; some of them confessedly higher than one could have expected in the utter absence of the useful metals, and the almost utter absence of beasts of burden. Nor has even this conclusion any necessary bearing on the better organised communities at large. Stray visitors of a higher type might have produced all the phenomena—visitors precisely such as appear to have figured in the traditions both of Mexico and Peru.

Geology.—The geology of the new world presents

some remarkable contrasts to that of the districts in the old world which have supplied the types of geological classification. None of these is more striking than the enormous extent of country which one formation occupies, and that without interruption. It has long been noticed that the rock-structure of islands is more varied than that of continents; and thus it is that the inhabitants of the British Isles have been to some extent compelled to become acquainted with geology. A journey of a few hours presents to the traveller rocks which, as regards both their mineral and fossil contents, are widely different. In A., on the other hand, one may travel for days over beds belonging to a single epoch. American strata often stretch from the Atlantic west beyond the Mississippi. They have, on the whole, been subjected to few disturbing agencies; as is evidenced by the absence of any true mountain-range, except the Appalachians, east of the Rocky Mountains. The rocks of Britain, from their disposition and variety, have been, so to speak, the 'primer' and 'pocket manual' of this science, and will always continue to be the *'vade mecum'* of the geologist; but should he desire to peruse the large 'folios' that contain the stony records of our earth's history, in their order and natural vastness, he must betake himself to the new world.

It is not many years since attention was first directed to American geology, but during the short time that has intervened, its progress has been very remarkable. This has resulted from the appointment of a geological staff in connection with nearly every province of the United States, from the vigorous operations of the Canadian survey under Sir W. E. Logan, and from the observations of arctic explorers, whose frequent visits to these regions in search of the ill-fated Franklin have supplied data for the exposition of their natural history. Humboldt, though the first, is yet the most important of South American observers. The numerous facts recorded by him have been confirmed and added to by recent travellers. Data have been thus supplied to form an approximate estimate of the geological structure of this portion of the American continent.

The names of North American observers are almost past reckoning, yet the various systems may be said to have been chiefly laid open by four sets of observers—Morton for the Cretaceous, Conrad for the Tertiary, Hall and the New York geologists for the Paleozoic, and the Professors Rogers for the Carboniferous strata and the Appalachians.

In the following rapid sketch of this subject, we can do nothing more than glance at the various formations, and must refer for details to the articles under the different divisions of A.

The oldest strata are a range of CRYSTALLINE ROCKS which, in North A., occupy an area that extends from the northern shores of Lake Superior, and the banks of the St Lawrence, north-west to the Arctic Ocean, and lies between the line of minor lakes (Slave, Winnipeg, &c.) and Hudson's Bay. The average width of this area is about 200 miles, and its length from Lake Superior to its termination on the shores of the Arctic Sea is more than 1500 miles. The rocks are chiefly gneiss, with granite and trap. They form a flat plateau, very little elevated above the surrounding country, and only in the Copper Mountains rising to the altitude of hills, the highest of which is 800 feet above the sea-level. In this immense plain we have an example of the great characteristic of American geology—the tranquil operation of an upheaving force, exerted over a wide area, with limited and regulated intensity, and constancy of direction. This series of rocks stretches over nearly the whole of the eastern portion of

South A., extending from the northern shores to the mouth of the La Plata, being, however, hidden in the valley of the Amazon by its alluvial deposits. The same rocks form the western slopes of the Andes and Rocky Mountains, and the plains of Russian A. In the central district, in which we first traced them, they dip east and west under the Silurian strata. They are themselves free from superincumbent beds, shewing that even in the Silurian age they formed dry land; and ever since, although subject, like the rest of the world, to great oscillation, it has apparently held its place with wonderful stability, for it is now, as probably then, not far above the level of the sea.

On either side of this tract there exists, as we have said, a SILURIAN district. That on the eastern side, reaching to Hudson's Bay, has a low and uniformly swampy aspect; the strata are hid by superficial deposits, chiefly boulder clay or drift, large boulders from which are scattered along the shore. The Silurian rocks under which the crystalline strata dip on their western limits, cover a large extent of the North American continent. They have been traced from Canada and New England, bounding the southern limits of the azoic rocks along the line of the great lakes, and extending in a broad band of some 200 miles parallel to the more ancient formation, probably till they reach the Arctic Ocean. These rocks are only slightly developed in Southern A., on the eastern slopes of the Andes.

The Silurians have been divided into *Lower* and *Upper*, and each of these contains three periods. Beginning with the *Lower*, we have first the

Potsdam Period, comprising beds of slate and sandstone, and containing fossils representative of the three great divisions of the animal kingdom—Molluscs, Articulates, and Radiates. Next follows the

Trenton Period, a period of limestones indicating a sea of greater depth, and teeming with life, for some beds are composed entirely of shells and corals.

Another change, and rocks of a clayey and shaly structure are deposited, containing numberless zoophytes and other fossils, and forming the *Hudson Period*.

The Upper Silurian division also comprises three epochs: *The Medina and Clinton*, composed of sandstones and shales; then *The Niagara and Onondaga*, with limestones and saline rocks; and, lastly, *The Lower Helderberg Period*, a richly fossiliferous series of limestone rocks.

The Silurian beds on their southern and western borders dip under the DEVONIAN rocks, which are developed to a large extent north of lat. 72° N., where they appear to rest upon the azoic rocks. They have been divided into five periods: *Oriskany*, *Upper Helderberg*, *Hamilton*, *Chemung*, and *Catskill*.

Vast beds of conglomerate overlie the Devonian rocks, and form the basis of the CARBONIFEROUS strata. This formation covers large districts in New Jersey and Pennsylvania, and in the Ohio and Mississippi valleys, with an enormous thickness of limestone, shale, and other beds, which still continue parallel to the previous. At the close of the carboniferous epoch, the whole character of North A. was altered by the formation of its mountain systems. No hill higher than Copper Mountain seems to have existed at this time, although the land occupied much the same area, and had a similar outline as at present. The Professors Rogers, having with perfect success unravelled the contortions of the Appalachians, have shewn that the Silurian, Devonian, and Carboniferous strata, which were originally laid out in horizontal layers, were afterwards pressed on to the north-westward, and folded up till the folds were of mountain height. To similar causes do the

Rocky Mountains and the Andes owe their origin—only the directions of the forces are different.

The Appalachian fires have long been extinguished; they have, however, left traces of their former violence in the highly metamorphosed Silurian and Carboniferous rocks of New York and Pennsylvania, which were long supposed to be primary granite, &c. The igneous agency, which at first raised the western range, is still active at intervals throughout its course.

There seems to have been a rest in the deposition of sedimentary strata at this time. The only activity was that of the earthquake and the volcano. Two whole formations—the Permian and Triassic—have no place in the rock-structure of A. The first renewed signs of life are discovered in the sandstones which occupy the valleys on the eastern side of the Appalachians. In these beds, which belong to the OOLITHIC period, occur the tracks of birds and reptiles, discovered and described by Professor Hitchcock.

In the CRETACEOUS beds which follow, evidence is given that the Mexican Gulf extended far up the Missouri Valley, and sufficiently deep to cover Texas and Nebraska with the beds which belong to this formation.

The TERTIARY formation is developed as a band of about 60 miles, forming the southern extremity of North A., and stretching from North Carolina to the peninsula of Yucatan, leaving the coast-line only at the delta of the Mississippi. This formation occupies a large amount of the surface of South A. From Patagonia to Venezuela it can be traced occupying the space intervening between the base of the Andes and the azoic rocks of Brazil and Guiana. The older Silurian and Carboniferous deposits are not found in the positions they occupy in the northern continent; the gneiss, &c., dip directly under the tertiaries.—The valleys of the Amazon and the La Plata, and the mouth of the Mississippi, contain extensive Alluvial deposits.

There only remain two post-tertiary beds, which, however, are of considerable importance—viz., the *Boulder Clay*, and the *River Terraces or Loess*, containing the remains of the mastodon and of the elephant. The boulder clay occurs in the country north of lat. 40° N., and in Patagonia in South A. Its characteristics are the same as that in the old world—a stiff clay, containing boulders of all sizes, some being as much as one or two thousand tons weight. The origin of this remarkable deposit—one of the most stupendous events in geological history—is still involved in mystery.

The pampas of Southern A. are covered with a deposit of clay and sand, containing the bones of the megatherium and mylodon, genera allied to the sloths, and of the glyptodon, a huge armadillo. For details, see ANDES, APPALACHIANS, ROCKY MOUNTAINS.

Botany.—On the discovery of A., Europeans regarded with astonishment its vegetable and animal productions, so different from all that they had ever seen before. The difference between the productions of the old and new worlds is least remarkable in the most northern regions. Around the north pole, a region having a flora and fauna which may properly be designated arctic, includes portions of the three continents of Europe, Asia, and A.; and many productions are common to these three continents throughout this region, whilst those which are peculiar to one, are generally represented in the others by species nearly allied. In A., this region extends to the northern shores of Lake Superior. The polar bear haunts the arctic regions of the old and new worlds alike; and further south, in both, the beaver builds his dam, and is pursued for his skin. Pine and birch are the chief trees of all the most northern forests, and struggle

on, dwarfed and stunted, towards the regions of perpetual snow; whilst the berries of different species of *Rubus* and *Vaccinium* (bilberry, &c.) are the last fruits which the soil offers to man during the brief summer of the north—alike to the Laplander and the Esquimaux.

More to the south, the flora and fauna of A. become more decidedly different from those of the old world; yet the difference consists not so much in the appearance of new families as in new species, replacing, so to speak, those of Europe and of Asia. The forests consist chiefly, as in these continents, of pines, oaks, birches, and willows; but the pines, and oaks, and birches, and willows, are not the same as those which cover the plains and mountains eastward of the Atlantic. The same remark applies to poplars, elms, planes, maples, hazels, and other kinds of trees, and to plants of humbler growth, as roses, brambles, strawberries, bilberries, &c., the pasture grasses, and the common flowers and weeds, although umbelliferous and cruciferous plants are comparatively rare. Not unfrequently, also, forms occur more completely different from those of the other quarters of the world, and these become more numerous as we proceed southward; although the magnolias, which form so admirable a feature of the flora of the Southern Alleghanies and other southern parts of North A., have recently been found equally to characterise that of the east of Asia and of the Himalaya Mountains, where magnificent species of rhododendron have also been discovered, rivalling or excelling those which are natives of the United States, and very different from the dwarf shrubs which represent the same genus on the mountains of Europe. It is remarkable that no true species of heath is found in A., although many shrubs of the same family occur, but none of them so strongly exhibiting the *social* character, or covering great tracts, as the heaths do in Europe. Where the climate begins to assume a tropical character, however, A. is distinguished by the abundance of the *Cacti* (the prickly pear and its allies), which are found on its plains, often forming the greater part of their vegetation. The species of this order, so far as is yet known, are exclusively American, although some of them have been introduced into the warmer parts of the old world, and are now very common in the south of Europe and elsewhere. The mountains of Mexico are, to a large extent, clothed with oaks and pines, most of them, however, different not only from those of the eastern continents, but even from those of the more northern parts of A. The flora of tropical A. resembles that of Asia and Africa in its palms, although these also are with few exceptions different in species; and the species are more abundant than in any other part of the world. It appears, indeed, that palm-forests like those of South A. scarcely exist elsewhere. The forests of the hottest parts of South A. produce also many remarkable trees of other kinds, among which may be mentioned the trees of the order *Lecythidaceæ* (q. v.), one of them known as the cannon-ball tree, and all of them producing huge fruits, with thick hard shells, which are often used for domestic purposes; whilst within the shell of a particular species are packed together the well-known Brazil Nuts (q. v.) of our shops. In the waters of the same region has recently been discovered the *Victoria Regia*, the most magnificent of water-lilies, and for the growth of which, hot-houses containing ponds of water have been erected in our own country. The forests of this part of A. are so dense and full of underwood, and the trees so bound together by *lianas* or twining plants, that they are in many places impenetrable, and the animals which inhabit them either find their way among the branches, or by narrow

paths, which they keep open by constant use. The treeless plains of South A., like those of North A., have, in general, much of a grassy vegetation. Part of the elevated regions of the Cordillera, within the torrid zone, is remarkably characterised by the presence of *Cinchona*, which form its principal botanical feature, and yield the celebrated Peruvian bark. In still more elevated regions, *Escallonia* and *Calceolaria* give a novel aspect to a vegetation otherwise very similar to that of Europe in its general character, and containing saxifrages, gentians, and many other plants of genera common in the old world. The flora of Chili presents also some interesting points of resemblance to that of New Holland and New Zealand. An *Araucaria*, now not unfrequent in our pleasure-grounds, appears as a representative of the pines; and its seeds afford a large part of the food of the natives of the district in which it abounds. Towards the Strait of Magellan, vegetation again assumes forms more similar to those of Europe. The forests consist in great part of peculiar species of beech. Barberries, different from those of other parts of the world, but very nearly resembling them, are particularly abundant; and with them occur brambles, saxifrages, gentians, primroses, &c. There are also vegetable productions very different and peculiar, as the Winter's bark, which has obtained some reputation as a medicine. From this region are derived not a few of the fuchsias now so familiar an ornament of gardens, greenhouses, and cottage windows in Britain, and which are exclusively American.

Maize is one of the most important of the botanical productions of A. It is the only cultivated grain of American origin; it was in cultivation before the discovery of A. by Europeans, by whom, however, its value was soon recognised, and it has now become an important crop in climates suitable for it in all quarters of the world. The other grains have all been introduced into A. by Europeans, with the sugar-cane, the banana and plantain, coffee, cotton, flax, and many other plants now generally cultivated both in the tropical and temperate regions. The yam is regarded as amongst its native productions, common to its tropical regions with those of other quarters of the world. Tobacco is a native production of A., the cultivation and use of which extended from it to the old world, and rapidly became prevalent among a great part of mankind. (It is indeed supposed by some that there is a species of tobacco indigenous to the furthest east; but this, and the question of its use there before it was made known from A., are still involved in uncertainty.) But of all the vegetable productions of A., the potato is the most important and useful. We owe to it also the Jerusalem artichoke; and it produces several other plants, valuable for their roots and tubers, as the arracacha, the melocco, &c., the use of which has scarcely yet extended beyond their native regions. With them may be mentioned the quinoa, which is not a grain (the seed of a grass), but the seed of a species of *Chenopodium*, or goosefoot, resembling the seeds of the cereal grasses in its qualities, and extensively cultivated on the high table-lands of Chili and Peru. Tapioca, arrow-root, cocoa, vanilla, pimenta or Jamaica pepper, and Cayenne pepper, are among the native productions of the tropical parts of A. The Agave (q. v.) or American aloe, valuable both for its fibre and its juice, has now become common in the warm parts of Europe, and in similar climates in other quarters of the globe. The pine-apple is a native of tropical A., although now naturalised, or nearly so, in other tropical regions. Tropical A. and the West Indies produce also many other fine fruits, among which are the guava, different species of anona or custard-apple, and of granadilla or pas-

sion-flower.—The forests of North A. yield much valuable timber, chiefly consisting of different kinds of oak and pine. The black walnut and hickory of the United States are also much esteemed. The West Indies and neighbouring parts of the mainland yield mahogany; and from the same regions comes logwood, one of the most useful dyewoods. The tropical forests of South A. produce many valuable timber-trees, of which perhaps the most deserving of notice are the Greenheart (q. v.) or Bibiri, and the Mora. Brazil wood and Pernambuco wood are among their dyewoods. One of the most remarkable productions of this region is the Cow-tree (q. v.), the juice of which possesses many properties in common with milk, and is used instead of it. The milky juice of some other trees of tropical A. thickens into caoutchouc.—Different parts of South A. produce *Mate* (q. v.) or Paraguay Tea, a species of holly, the leaves of which possess properties similar to those of tea and coffee, and afford a beverage which is extensively used, although not yet an article of export to other parts of the world; and the Coca (q. v.), a shrub of which the leaf has been, from a remote period, employed by the Indians as a narcotic.

Zoology.—In the animal kingdom, as in the vegetable, all seemed strange and new to Europeans when they first set foot in America. Yet here also the difference from the productions of Europe is not so great as in South Africa or Australia. In North A., many of the animals, as of the plants, of Europe are represented by others of the same genera or families. A few are common to the old and the new world; and in some which are now regarded as specifically different, the difference is not so great as readily to attract the notice of unscientific observers. North A. has its elk and its deers, its oxen (the bison, called buffalo in the United States, and the musk-ox), its sheep (the Rocky Mountain sheep), its beavers, hares, squirrels (some of them much sought after for their fur), mice, rats, weasels, bats, porcupines, bears, badgers, foxes, wolves, and several species of feline animals, among which are the puma and the lynx. The jaguar, more powerful and dangerous than any other of the feline animals of the new world, and the only very formidable beast of prey which it produces, inhabits the tropical forests of South A. The warm parts of South A. produce the great tapir, peccaries, sloths, ant-eaters, armadillos, &c.; but the elephant, rhinoceros, hippopotamus, and boar of the old world, have no more nearly allied representatives. The lama and its congeners, among which is the alpaca, are peculiar to South A., inhabiting the Andes of Chili and Peru. Of the animals of the old world, the most nearly allied to them is the camel, which is entirely wanting in the new; as was also the horse (with all its congeners), until it was introduced by Europeans—a sight of wonder and of terror to the Mexicans and Peruvians who first found themselves opposed to Spanish cavalry, but now thoroughly naturalised, and roaming in vast multitudes on the South American plains. The dog existed in A. before the days of Columbus; it existed in different varieties as a domesticated animal, and the same difficulty arises concerning the origin of the domesticated varieties as when those of the old world alone are considered. The chinchilla, so valuable for its fur, is a small quadruped, peculiar to the north of Chili. The opossums of North A. were the first known of marsupial quadrupeds—i. e., those which have a pouch for their young—and are described as objects of great curiosity by the earlier writers on the new world and its productions. Monkeys are numerous in the warm parts of the new world as well as of the old, and of many species; but they are not only of different species

Printed by Colver & Co. at the Edinburgh Press.

AMERICA.

from those of Asia and Africa; they form a different section of the monkey family. There are no apes resembling the orang-outang or chimpanzee, and no baboons; but all of the American monkeys have long tails, and many of them prehensile tails, the latter peculiarity being found in none of those of the old world. The absence of cheek-pouches is another character of the American monkeys.

Among the birds of A. are eagles and others of the same family, vultures (among which is the great condor of the Andes), owls, ravens, crows, herons, thrushes of many kinds (of which the mocking-bird may be mentioned as a species particularly interesting), finches, sparrows, buntings, warblers, wrens, larks, &c. Few, however, are identical in species with those of Europe or of Asia. Few things in the natural history of North A. are more remarkable than its multitudinous flocks of pigeons. There are numerous species of grouse and partridge. Of the large gallinaceous birds, the first place in importance must be assigned to the turkey, now so common in a domesticated state in Europe, although in a wild state it has almost disappeared from great part of its native regions. Alectors and curassoes are large gallinaceous birds of Mexico, Guiana, and other warm parts of A. Parrots abound in the tropical forests, and although only one species extends northward into the United States, yet in South A., birds of this family range to the southern extremity of the continent. Humming-birds are peculiar to A., and are found not only in its tropical but in its temperate regions, of numerous species, and many of them of dazzling beauty, passing like bees from flower to flower, and often constituting a characteristic feature of the scenes in which they abound. Toucans and aracaris are among the other kinds of birds peculiar to A., and are found in South A. alone. Swans, geese, and ducks, with other waterfowl of many kinds, exist in great numbers in North A., and in the warmer parts the brilliant colours of the flamingo enliven some of the coasts.

Serpents are numerous. Among them are boas, remarkable for their great size. Rattlesnakes, the most venomous and dreaded of the serpent tribe, are peculiar to A. Alligators abound in the rivers of the tropical and sub-tropical regions. Turtles are caught in great numbers in the West Indian seas, and fresh-water turtles abound in some of the tropical rivers. The bull-frog is a native of the United States, remarkable for the loud noise which it makes, and which those who have been accustomed to it from their childhood learn to associate with all that is pleasant in nature. The lakes and rivers of A. abound in fish, of which many are of the salmon family, the common salmon itself being found as far south as 41° N. lat., and some are of the sturgeon family. The cod-fisheries of the Bank of Newfoundland and of the coasts of Nova Scotia are unequalled in productiveness; and herrings, and other species of the herring family, are taken in great numbers in the same seas.

Some parts of A. are grievously infested by mosquitoes and other insect tribes, the vast numbers of which are extremely annoying, so that some places on the banks of tropical rivers are rendered almost uninhabitable. Ants and termites, or white ants, are very abundant in some parts of South A. Many species of wild bees are found in the forests of Brazil, some of them very productive of honey; but the common hive-bee was unknown in A. till it was introduced from Europe. It has now become naturalised, and is found in the forests far beyond the settlements of white men. The cochineal insect of the opuntia is a native of Mexico and Central A., and the plant on which it feeds has long been cultivated there and in the West Indies for its sake.

Political Divisions.—The following are the chief political divisions of America, each of which will be described in its proper place. In North A., strictly so called, are Russian A., British A. as commonly understood, the United States, and part of Mexico. In Central A. are the remainder of Mexico, Central A., in its political sense, comprising Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica; and, lastly, a small portion of New Granada. In South A. are the rest of New Granada; thence along the Pacific are Ecuador, Peru, Chili, and aboriginal Araucania; while round by Patagonia and Tierra del Fuego, the Atlantic washes Buenos Ayres, Uruguay, Brazil, Guiana, and Venezuela—the interior being occupied by Bolivia, Paraguay, and the Argentine Confederation. Finally, the West Indies consist of the Bahamas, the Greater Antilles, and the Lesser Antilles.

The annexed tables, from the *American Almanac* for 1859, give the states of America, with their areas and populations.

1. Governments of North America.

Governments.	Area in Square Miles.	Population.	Capitals.
Danish America (Greenland),	380,000	3,400	Liechtenfels.
French Possessions,	118	200	St. Pierre.
Russian America,	334,000	66,000	N. Archangel.
New Britain,	1,800,000	120,000	York Factory.
Canada West,	147,832	999,847	} Toronto.
Canada East,	201,969	390,261	} Quebec.
New Brunswick,	27,700	200,000	Frederickton.
Nova Scotia, &c.,	18,746	200,000	Halifax.
Prince Edw.'s Isld.,	2,134	62,348	Charlotte Tn.
Newfoundland,	57,100	120,000	St. John's.
British Columbia,	213,500	7,500	Ft. Langley.
United S. of America,	3,306,034	23,101,876	Washington.
United S. of Mexico,	1,038,865	7,200,000	Mexico.
San Salvador,	3,500	450,000	Cajutepeque.
Nicaragua,	44,000	400,000	Granada.
Honduras,	53,000	380,000	Comasagua.
Guatemala,	59,000	1,100,000	N. Guatemala.
Costa Rica,	25,000	200,000	San José.
Mosquitia,		6,000	Blewfields.
Honduras (Brit. colony),		11,065	Belize.
Total	7,779,218	35,774,498	

2. West Indian Governments.

Governments.	Area in Square Miles.	Population.	Capitals.
Hayti, } San { Rep.	11,000	800,000	Cape Hay'tn.
Dominica, } Dingo { Rep.	18,000	200,000	San Domingo.
Cuba,	42,383	1,067,624	Havana.
Porto Rico, } Spanish, {	3,365	500,000	San Juan.
Jamaica, } British, {	5,468	379,600	Spanish Town
Trinidad,	2,000	60,319	Puerta d'Esp.

St. John's,	72	3,000	"
St. Bartholomew's (Swedish)	25	9,000	La Carenage.
Total	91,910	3,669,817	

3. Governments of South America.

Governments.	Area in Square Miles.	Population.	Capitals.
Venezuela, Republic,	416,600	1,336,000	Caracas.
Ecuador, do.	325,000	685,000	Quito.
Bolivia, do.	374,400	1,650,000	Chuquisaca.
Peru, do.	530,000	2,400,000	Lima.
Chile, do.	170,000	1,439,127	Santiago.
Granadian Confederation,	380,000	2,363,000	Sta Fe de Bog.
Argentine Confederation,	927,000	873,000	Parana.
Buenos Ayres, Republic,	60,000	350,000	Buenos Ayres.
Uruguay, The Oriental Republic of,	120,000	250,000	Montevideo.
Paraguay, Republic,	74,000	600,000	Asuncion.
Brazil, Empire of,	2,300,000	7,677,800	Rio de Janeiro.
Guiana (British),	76,000	127,600	Georgetown.
Guiana (Dutch),	38,500	64,271	Paramaribo.
Guiana (French),	21,500	30,000	Cayenne.
Patagonia,	380,000	120,000	
Falkland Islands,	16,000	500	Port Louis.
Total,	6,229,080	19,977,305	
Grand total of America,	14,130,208	59,411,700	

AMERICA, BRITISH. From the small beginnings specified in the general article above, British A. in the proper sense of the words, is now, in mere extent, at least equal to the American republic, and vastly superior to any other state in the western hemisphere—occupying, as it does, a breadth of about 90° of long., and stretching, with more or less interruption, over a length of 120°. Besides touching, actually or virtually, every considerable power on the continent, England, in the new world as in the old, commands nearly every turning-point in navigation and commerce. In co-operation with Ireland, Newfoundland is ready to link together the two continents by a submarine telegraph. Again, with the gulf and river of St Lawrence as its main artery, British A., in its ordinary acceptation, comprising Nova Scotia, New Brunswick, Prince Edward Island, and the Canadas, has received from nature an advantage in respect of the western trade, which even the energy of Pennsylvania and New York cannot counterbalance; Halifax, the Bermudas, and the Bahamas, are so many guardians of the gulf-stream, freighted, as it is, with the exports of half a continent. Jamaica forms the first link of a chain which girds the Caribbean sea; Trinidad fronts the Orinoco, which is connected by the Cassiquiare with the Amazon; Western Guiana, also, as already mentioned under another head, finds, up the Essequibo, its own communication with the 'King of Waters;' and, lastly, at least on the Atlantic side, the Falklands, with their Port Egmont, flank alike the river Plate and the Strait of Magellan. Round, again, in the Pacific, British A. exerts an influence which, if absolutely less, is perhaps relatively greater. At the upper extremity of a coast, which, in spite of some splendid exceptions, is, as a whole, singularly deficient in harbours, New Columbia, with its breast-work of islands from Vancouver's upwards, and its succession of indentations or arms of the sea, bids fair, more especially with its inexhaustible supplies of magnificent timber, to become a congenial base of operations for sustaining the maritime greatness of Britain.

AMERICA, RUSSIAN.—Russian A. is the remotest portion of the new world, being bounded, on the side of British A., above, between the two bordering oceans, by the meridian of 141° W., and below, down to the parallel of 54° 40' N., by a conventional line to be drawn at a distance of 30 miles from the continental coast. It was discovered by a Russian expedition conducted by Behring (q. v.), which sailed from Kamtchatka in 1741. It is little better than a vast hunting-ground, having, in this aspect, been long held by the Imperial Fur Company, which differs, however, but little from the imperial government itself. Its

only town, or rather village, worthy of the name, is New Archangel, on the island of Sitka. The most noticeable points in geography are Cape Prince of Wales, on Behring's Strait; Kotzebue's Sound, Norton Sound, peninsula of Alaska, Cook's Inlet, and Mount St Elias. See UNITED STATES in SUPP.

AMERICA, SPANISH.—Spanish A., shrunk, as it is, into Porto Rico and Cuba, now belongs rather to history than to geography. For many years it embraced absolutely the entire continent, having in 1580 absorbed Brazil, as Spain itself absorbed Portugal, at a date prior to the intrusion of any other European settlement. But, boundless as it was, it contained, from the beginning, the seeds of its ultimate and irremediable decay. The colonists, as hunters after the precious metals, disclaimed that steady industry, which, to their English competitors, was a necessary of life; while the mother country, by rigorously excluding all but its own actual natives from public employments, did nothing to prepare its dependencies for the rational use of that independence which was sure at last to come. At the same time, those very circumstances did tend to prolong the subjection of Spanish A.; for the colonies found their first motive for rebellion in their fidelity to their sovereign, throwing off the yoke of Spain primarily on account of Napoleon's seizure of Ferdinand VII. Similarly, Brazil, as the chosen shelter of its sovereign from French domination, remained faithful to the House of Braganza.

AMERICANISMS are words and phrases current in the United States of America, and not current in England. These peculiarities are much more prominent in conversation than in writing; indeed, in the American writers that are usually considered classical, it is difficult to detect anything of the kind. The number of absolutely new words introduced into the English language in America is remarkably small. As an instance may be mentioned *caucus*, for a secret political assembly. This is a corruption of *call-house*, a calker's shed in Boston, where the patriots before the revolution had usually held their meetings. The term *Yankee* (an Indian corruption of the French *Anglais*) is another. The great body of A. consist in giving an unusual sense to existing words: as *clever*, in the sense of amiable, and *smart* for clever; *wagon* for a very light kind of carriage; *book-store* for bookseller's shop; *wilted* for withered; *creek* for a small river, instead of a small arm of the sea.

The several divisions of the Union have their characteristic peculiarities. Thus, in the New England States—Yankeeland proper—*ugly* is used for ill-natured; *friends* for relations (so used also in Scotland); and *guess* for a great variety of things—to think, presume, suppose, &c. This use of *guess* is confined to New England; the inhabitants of New York and of the Middle States generally employ *expect* in the same way; while those of the Southern States *reckon*; and those of the Western States *calculate*. Several words current in the Middle States are of Dutch origin, as *loafer* for a vagabond, from the Dutch *loopen*, to run; and *boss* for a head workman or employer. The Southern States have fewer peculiarities than any of the other divisions. In the Western States, again, there is hardly any recognised standard of speech, and in some districts 'it would hardly be an exaggeration to say that every prominent person has his own private vocabulary.' The verb *to fix* is made to do duty for expressing every conceivable kind of action. The vague use of this word is common all over the Union, but in the West the abuse is carried to the extreme. *Help*, in the sense of servant, is common to the West and to New England, but is nearly unknown

in the Middle States. The well-known phrase *go a-head* is a coinage of the West; it is sufficiently expressive of the leading characteristic of the American people. *Posted-up* in a subject, for 'well informed,' is one of a class of metaphors indicative of the prominence of mercantile pursuits.

The tendency to the use of slang is excessive in America, especially in the Western States. 'Every state, every city has its own flash vocabulary; but it is in the political world that this tendency to cant phrases most develops itself. Every new party, every new modification of an old party, is bound to have at least one new name, either assumed by itself, or attached to it by its opponents.'

A variety of causes have been enumerated to account for the existence of those deviations from standard English, such as, the influence of the Indian languages; the various tongues spoken by settlers from Europe other than English; the original provincial peculiarities of portions of the English settlers, &c. But even supposing the language of the United States were at this moment in every respect identical with that of England, and to be henceforth unaffected by the importation of foreign elements, the complete identity could not be expected to continue long. Not only do new circumstances and wants make new terms necessary, and modify the application of old, but those changes of structure which constitute the organic growth of every living tongue, are evolved more or less rapidly according to the industrial and political activity of those that speak it. To complain, then, that the English language in America, or in any of the British colonies, should exhibit deviations from the standard of the mother country, is as unreasonable as to complain that an animal should exhibit changes in its coat or its habits when removed from one climate to another. Nothing is more desirable for the interests of humanity than that the language spoken by all the sections of the great Anglo-Saxon race should continue to be substantially one. All wanton innovations are to be reprobated; but when a great and diversified community adopt generally any new term or mode of expression, it is to be presumed that the cause lies deeper than any that can be controlled by criticism.

As the Americans of Anglo-Saxon origin do not exceed one-third of the whole population of the United States, it seems wonderful that the English language should have held its ground so well—that it should not have been completely corrupted, or even in some places extruded by other tongues. Yet there is apparently no danger of this. The original Dutch of New York has disappeared, with the exception of a very few stray words; and although French is still spoken in one-half of the city of New Orleans, it has been preserved at the expense of the speakers isolating themselves and losing their due influence. The same is the case with those islands of German-speaking population that still hold out in Pennsylvania and elsewhere; and, what is remarkable, the proximity of these Germans has no sensible effect upon the language of their English-speaking neighbours; while, on the other hand, the influence of the English is reducing the language of the Germans to a corrupt patois, swarming with English words. See *The English Language in America*, in the Cambridge Essays for 1855; also Bartlett's *Dictionary of Americanisms*, New York, new ed. 1858.

AMERIGO VESPUCCI, a naval astronomer, from whom America accidentally received its name, was born at Florence, March 9, 1451. His father was a notary. The education of A. was intrusted to his uncle, Giorgio Antonio Vespucci, a monk and apparently a man of superior enlightenment.

The youth made but indifferent progress in his Latin grammar, though he shewed great aptitude and liking for natural philosophy, astronomy, and geography—at that period, favourite objects of study, on account of their commercial importance. It is not precisely ascertained when he first went to Spain. We find him there, however, in 1486, engaged in mercantile pursuits. He was at the head of a large Florentine firm in Seville in 1496, when Columbus was making preparations for a second voyage to the new world. The success of the great discoverer inflamed A. with a passion for discovery, and having abandoned 'business,' he sailed from Cadiz on the 20th May 1499, in the expedition commanded by Admiral Hojeda, and, after a voyage of thirty-seven days, arrived at that portion of the continent of America now called Cumana, explored the Bay of Paria, lying between the isle of Trinidad and the mainland, and some hundreds of miles along the coast. He returned in the autumn of the same year, but commenced a second voyage under Admiral Pinzon in December, which resulted in the discovery of a crowd of small islands on the south of the Gulf of Mexico. He was now allured by promises into the service of Emanuel, king of Portugal, and undertook two other voyages with Portuguese ships; the first on the 10th of May 1501, and the second on the 10th of May 1503. His purpose was to sail westward, in hopes of discovering a passage to Malacca, the extreme point of discovery in the east. He lost one of his ships; and it was only after encountering great perils that the other five found refuge in All Saints' Bay, on the coast of Brazil. The monarch gave orders that some remains of the ship *Victoria*, in which A. made his last voyage, should be suspended in the cathedral of Lisbon, but fulfilled none of the promises which he had made. A. consequently returned to Spain, and in the year 1508 succeeded in obtaining the office of pilot-major. He died at Seville on the 22d of February 1512.

The character of A. V. has been covered with a great deal of unmerited obloquy. He has been accused of endeavouring to claim the honour of discoveries which he never made, and has been commonly regarded as an unprincipled adventurer. Humboldt, however, has successfully vindicated him from such aspersions. He had a very considerable knowledge of various branches of science, and it was on account of his superior attainments in these that he was selected to accompany the expeditions as naval astronomer. He was a prompt and skilful inspector of the commissariat while under his control; vigorous, practical, and severe in his demands for increased knowledge on the part of the naval functionaries under him; an earnest navigator and close friend of Columbus in the last years of the great admiral's life. How America came to receive its name from him is not quite clear; but it is certain, from Humboldt's investigation, that A. himself had nothing to do with it. The name of the new world probably came from Germany. A selection from A.'s narrative of his American voyages found its way into that country. Martin Waldseemüller of Freiburg in Baden translated it for a bookseller of St Diez in Lorraine. As the first account of the wonderful discovery, it was greedily devoured. Edition after edition was printed off, and, according to Humboldt, it was Waldseemüller who proposed that the new world should be called America in honour of the author. Afterwards, this name was generally employed by geographical writers, and even the Spaniards and Portuguese adopted it.

AMERSFOORT, an ancient town of the Netherlands, province of Utrecht. It is situated on the

Eem, which flows into the Zuiderzee. There are several tobacco-plantations in the district, and a considerable trade is carried on both in cotton and woollen goods, and in such articles as corn and dried herrings. It communicates with Amsterdam, from which it is distant 24 miles, by means of barges. A. has a Jansenist college and a court of justice. It received municipal privileges in 1259. It was captured in 1483 by the Archduke Maximilian, in 1672 by Montecuculi, and in 1785 by the French. Pop. 13,000.

AMETHYST, a variety of quartz (q. v.), differing from common quartz and rock-crystal chiefly in its beautiful violet-blue or purplish violet colour—well known as *amethystine*—which is owing to the presence of a little peroxide of iron or of manganese. It is, one of the most esteemed varieties of quartz, and is much employed for seals, rings, &c., although, being comparatively abundant, it is much inferior in price to the true gems. An amethystine tinge is frequently to be observed in specimens of quartz, which yet are not perfect A. The tinge is often very faint, and is frequently confined to the summits or edges of the crystals. The finest specimens of A. are brought from India, Ceylon, and Brazil. It is, however, a common mineral in Europe, and occurs in many parts of Scotland. It frequently occurs lining the interior of balls or geodes of agate, and in veins and cavities in greenstone and other rocks. The ancients imagined it to possess the property of preventing intoxication, and persons much addicted to drinking therefore wore it on their necks. The name is derived from a Greek word which signifies *untinticated*.—Not to be confounded with this mineral is that sometimes called the *oriental A.*, which is a variety of spinel (q. v.) having an amethystine colour, and is a very valuable gem.—False amethysts made of glass or paste are very common, and in general very coarse; but a very perfect imitation can be, and sometimes is made.

AMMIERST, a sea-port of Tenasserim, on the E. shore of the Bay of Bengal, in lat. 16° 4' N., and long. 97° 40' E., at the entrance of the Martaban or Saluen. In 1826, the province having been newly ceded by the Burmese, A. was founded, after a special survey of all the available sites, as the commercial capital, being named after the then governor-general of India, and proclaimed to be an asylum for the neighbouring Peguers, still subject to Burmah; but policy, prestige, and foresight alike have in some measure failed; for the harbour, otherwise commodious enough, labours under two serious defects—difficulty of access, and exposure to the south-west monsoon. Even in trade, A. has been distanced by Moulmein, selected at first merely to be the military station of the territory. Its exports, however, are said to be considerable, consisting chiefly of teak from the upper basin of the river, and partly of grain from Belu, an island at its mouth.

AMHERSTBURG, a town on the river Detroit, which empties Lake St Clair into Lake Erie. It is one of the oldest settlements in Upper Canada, being named from Lord Amherst, who, by the capture of Montreal in 1760, completed what General Wolfe had begun at Quebec in 1759. It occupies the south-west extremity of the province, the turning-point of climate and character to the basin of the St Lawrence, the spot where its waters, after having gained southing from the 50th to the 42d parallel, suddenly assume a direction which pretty uniformly carries them back to their original latitude above the island of Anticosti. Pop. 1300.

AMIDOGEN is a substance procured by the

action of the metal potassium on dry gaseous ammonia. The latter contains one atom of nitrogen to three atoms of hydrogen (NH₃), whilst A. contains one to two (NH₂). A. forms a very important class of organic compounds called *amides*, and gives rise to a number of substances closely allied to the alkaloids, many of which, indeed, may be regarded as natural amides.

AMIENS, an ancient city in the plain of Picardy, and capital of the department of Somme; it is the seat of a bishop and of a court of justice, and has a citadel and fortifications. It possesses a college, an academy, a theological seminary, an industrial school, a school of medicine, a public library, a picture-gallery, a botanical garden, and several literary and scientific institutions. Among its public buildings, the cathedral is a noble edifice, built in 1220, and esteemed a masterpiece of Gothic architecture. Peter the Hermit was born here. A. has considerable manufactures of velvet, silk, woollen, and cotton goods, ribbons, and carpets. But the place owes its celebrity chiefly to the 'Peace of A.' a treaty signed in this city, March 27, 1802, by Joseph Bonaparte, the Marquis of Cornwallis, Azara, and Schimmelpennink, and intended to settle the disputed points between England, France, Spain, and Holland. By this treaty, England retained possession of Ceylon and Trinidad, and an open port at the Cape of Good Hope; France received back her colonies; the republic of the Seven Islands was recognised; Malta was restored to the order of the Knights of St John; Spain and Holland regained their colonies, with the exception of Trinidad and Ceylon; the French were to quit Rome, Naples, and Elba; and Turkey was restored to its integrity as before the war. These terms were not received with any degree of satisfaction by the English, and further difficulties arising, through the ambition and obstinacy of the French, the peace was dissolved, and war declared against Bonaparte in 1803.

AMLETH, or HAMLETH, Prince of Jütland, is said to have lived in the 2d c. b. c. According to Saxo-Grammaticus, he was the son of Horvendill and Gerutha; and after the murder of his father by his uncle Fengo, who married Gerutha, he feigned himself a fool, to save his own life. Saxo relates a number of little things regarding A., which are a curious medley of sharp and lively observation, and apparent madness. We are told that, on one occasion, when he visited his mother, suspecting that he was watched, he commenced to crow like a cock and dance idiotically about the apartment, until he discovered, hidden in a heap of straw, a spy, in the person of one of Fengo's courtiers, whom he immediately stabbed; he then so terrified his mother by his reproaches, that she promised to aid him in his intended revenge on his father's murderer, and, according to the old chronicler, really did so. Scandinavian traditions confirm the existence of a prince of this name. A field is still pointed out in Jütland with a tomb bearing the name of A. In the vicinity of Elsinore is shewn the spot where the father of A. was assassinated. Saxo himself does not mention the manner or circumstances of his death; but his French translator says that he was murdered at a banquet. Most of the recent historians of Denmark consider the history of A. fabulous, but Müller thinks there is a substratum of fact in the old myth. It is the source of Shakspeare's tragedy of *Hamlet*, and thus possesses a perennial interest for all the civilised world.

AMMANATE, BARTOLEMEO, architect and sculptor, born at Florence in 1511, died in 1592. He was at first a pupil of Baccio Bandinelli, and afterwards

of Sansovino at Venice. In 1550, he married Laura Battiferri of Urbino, a lady celebrated for her poetical gifts. Pope Julius III. employed him in the decoration of the Capitol, and Cosmo de Medici appointed him his architect. His principal works are, the statues which adorn the tomb of Sannazar at Naples, the tomb of Cardinal de Monti at Rome, the bridge of the Trinity and several fountains at Florence. He also completed the Pitti Palace, commenced by Brunelleschi, and ornamented the court with three orders of columns, which were subsequently imitated by J. de Brosse in the palace of the Luxembourg at Paris. In the collection of architectural designs in the Florence Gallery, there is one by A., exhibiting the plans of different buildings, by which a city may be rendered at once magnificent and convenient. His works have all a certain grandeur of character, derived, probably, from his early admiration of Michael Angelo, but are somewhat marred by a quaint mannerism. His bronzes are executed with great delicacy.

AMMIANUS MARCELLINUS, a Roman historian of the 4th c., was present in several campaigns in Gaul, Germany, and the east, and afterwards lived at Rome, devoted to literature. Though a Greek by birth, he wrote in Latin a history of the Roman empire from 91 to 378 A.D., in 31 books, of which 13, containing the years from 91 to 352, are lost. This work, which commenced with the accession of Nerva, may be regarded as a continuation of Tacitus, and though the portions remaining have many faults of style, they are valuable on account of the author's love of truth, his careful descriptions of countries, and events from personal observation, and especially his remarks on Germany. After his time, Latin ceased to be employed by any Roman writer in the composition of secular history. The best edition of A. M. is that by Wagner and Erfurd, in 3 vols. (Leip. 1808.)

AMMON, an Egyptian deity, styled Amun on hieroglyphic monuments, was compared by the Greeks with their supreme deity Zeus. The sacred name of Thebes, A.'s city ('No-Ammon' in the Old Testament), was therefore translated into Greek by Diospolis. In the temples of this town, his peculiar residence, A. is represented as sitting on a throne, holding the symbols of life and power, and wearing a crown with a peculiar ornament of two feathers, and a band falling behind and hanging down to his feet. He was especially the god of Thebes; though his temples are found in other places, as at Meroë, and over the whole of Nubia and Libya. The name Amun signifies the hidden, unrevealed deity, and, in Egyptian mythology, he held the highest place. His undefined character may serve to explain how other deities were identified with A. After the eighteenth dynasty, we find in hieroglyphics the name Amun-Ra frequently inscribed, indicating a blending of A. with the sun-god Ra. Similarly, the representation of A. with a ram's head shews the blending of him with Kneph. The worship of A. spread at an early period to Greece, and afterwards to Rome, where he was identified with Zeus and Jupiter. Temples for his worship were erected in Thebes (Bœotia), Sparta, Megalopolis, and other places.

AMMON, CHRIS. FRED., a German theologian, born January 16, 1766, died May 21, 1850, is chiefly known by his work on the *Development of Christianity as a Universal Religion* (4 vols., Leip. 1833—1840), in which he argues in favour of such liberal development of doctrine as may keep theology in harmony with the progress of science. A. was a leader of the Rationalist school. He was a man of extensive learning, united with great industry and earnestness, and was generally respected in

Saxony, where he resided.—His second son, FREDERICK AUGUSTUS A., is well known in Germany as an able physician, and the writer of several works on practical medicine and surgery.

AMMONIA, Hartshorn, or the Volatile Alkali, was one of the few substances known to the chemistry of the ancients; being referred to by Pliny under the name of *vehement odour*, which he evolved by mixing lime with nitrum (probably sal ammoniac). It derives its name A. from its being obtained from sal ammoniac, which was first procured by heating camels' dung in Libya, near the temple of Jupiter Ammon. The atmosphere contains a minute quantity of A., amounting to 210—237 parts in the 10,000,000,000 parts of air, which is equal to 1 volume of A. in 28,000,000 of air. It is likewise present in rain-water in variable proportion. The supply of A. to the atmosphere is its evolution during the putrefaction of animal and vegetable substances, during the vinous fermentation, and the combustion of coal. It is likewise present in respired air, and is therefore a product of the daily wear and tear of the animal system. The principal source of A. at the present time is the destructive distillation of coal, as in gas-making. The materials which pass over from the retort are partly uncondensable and truly gaseous, and these are carried to our gas-jets, and burned; but in other parts they are condensable, and are received during the purification of the gas, as a mixed tarry and watery liquid. On allowing this liquid to settle, the water portion, containing A., can be separated, and hydrochloric acid being added to it, there is formed a compound of A. and hydrochloric acid, called chloride of ammonium, which can be obtained dry, by evaporating the solution down in shallow vessels. Pure A. is manufactured from this impure chloride of ammonium by mixing it with its own weight of slaked lime in a retort, and applying a gentle heat, when the A. as a gas passes over, and is received in a vessel containing water. The solubility of A. in water is very great, 1 volume of water dissolving 670 volumes of ammoniacal gas, increasing in bulk, and forming a liquid (*liquor ammonia* of the chemist, and hartshorn of the shops), which is lighter than water, its density being 575. The solution of A. is transparent, colourless, and strongly alkaline. In taste it is acrid caustic, and in odour very pungent. Applied to the skin in a concentrated form, it blisters. Exposed to the air, the A. escapes, and the solution thus gets weaker, and, reduced to -40° F., it freezes. As generally obtained, even in the gaseous condition, it is in combination with the elements of 1 atom of water, and contains 1 of nitrogen, 4 hydrogen, and 1 oxygen (NH_4O). Dry A. can be procured by passing the vapour of A., as ordinarily obtained, over fused chloride of calcium, when the water is abstracted, and true gaseous A. is left, having the composition 1 nitrogen, and 3 hydrogen (NH_3). Gaseous A. can be liquefied under pressure and cold, and then yields a colourless, clear, mobile liquid, with the characteristic odour and other properties of A. much intensified. A. combines with acids to form a class of salts which are of considerable importance. Thus, the crystallised sulphate of A. ($\text{HO}, \text{NH}_4, \text{OSO}_4$) is very extensively used as a top-dressing by farmers, and is also mixed with manures where an increase of ammoniacal matter is desirable. The chloride of ammonium is also employed in agriculture; likewise largely by the Russian peasantry, as a condiment for flavouring food in place of common salt.

In medicine, the gaseous A. has been rarely used. The solution of A. is employed as a means of rousing the respiratory and vascular systems; and of the speedy alleviation of spasm. It is also used as a local irritant and antacid. It is serviceable in dyspeptic

complaints with preternatural acidity of stomach and flatulence; to produce local irritation or destruction of certain parts, and to render comparatively harmless the bites of poisonous animals, such as serpents and insects.

AMMONIUM is a hypothetical metal, which is said to consist of 1 volume of nitrogen with 4 of hydrogen. It has never been produced in an isolated state; but a singular amalgam of A. and mercury may be formed, by subjecting a globule of mercury, surrounded by a little water of ammonia, to the action of the galvanic current: when the galvanic agency ceases, this amalgam is decomposed into mercury, ammonia, and water. A. may likewise be prepared by acting on an amalgam of sodium and mercury with a solution of chloride of A. A portion of mercury is slightly heated in a porcelain vessel, and pieces of sodium introduced, when the sodium and mercury combine, and form an amalgam of sodium and mercury, which is a semi-solid substance, and scarcely occupies mere space than the bulk of the mercury employed. If this be introduced into a vessel containing a strong or saturated solution of chloride of A. (NH_4Cl), the chlorine combines with the sodium (Na) of the amalgam, forming chloride of sodium ($NaCl$), and the A. unites with the mercury, forming the amalgam of A. and mercury. As the change referred to proceeds, the amalgam increases in size many times, and forms a spongy mass of the consistence of butter, which rises through the saline solution and floats on the surface. The amalgam of A. and mercury very readily decomposes, and hence the difficulty of determining its exact composition.

AMMONIACUM, or AMMONIAC, a gum resin, used in medicine on account of its stimulant and discutient qualities, is obtained from *Dorema A.*, a plant of the natural order *Umbelliferae*, a native of Persia—a perennial, about seven feet high, with large doubly pinnate leaves. The leaves are about two feet long. The whole plant is abundantly pervaded by a milky juice, which oozes out upon the slightest puncture, and which hardens, and becomes A. The A. exudes from punctures made by an insect, which appears in great numbers at the time when the plant has attained perfection. Much of it is sent to India, and it is generally imported into Britain from Bombay, although sometimes from the Levant. It occurs in commerce either in tears, or in masses formed of them, but mixed with impurities. It is whitish, becoming yellow by exposure to the atmosphere, is softened by the heat of the hand, and has a peculiar heavy unpleasant smell, and a nauseous taste, at first mucilaginous and bitter, afterwards acid. It is not fusible, but burns with white crepitating flame, little smoke, and strong smell.—It was for some time erroneously supposed to be the produce of a species of *Heracleum*, the seeds of which were found enclosed in it.—A similar substance is obtained from *Ferula Tingitana*, an umbelliferous plant, growing on light sandy soils in the north of Africa; and is said also to be obtained from *F. Orientalis*, a native of Asia Minor and of Greece. Both these plants have branched stems, and very compound leaves, somewhat resembling fennel. It would seem that the A. of the ancients was the gum resin of the *Ferula*, which has a more faint odour and less powerful medicinal properties than that of the *Dorema*.

AMMONITES, a Semitic race of people, living on the edge of the Syrian Desert; the descendants

of Ben-ammi, the son of Let (Gen. xix. 38). They inhabited the country lying to the north of Meab, between the rivers Arnon and Jabbek, i. e. the desert country east of Gad. Their chief city was Rabbath-Ammon, to which the Greeks afterwards gave the name of Philadelphia. The Israelites were often at war with them and their other Bedouin confederates. Jephthah defeated them with great slaughter. They were also overcome by Saul, David, Uzziah, and Jotham; but after the fall of the kingdom of Israel (720 B.C.), spread themselves in the districts of Judaea on the east of the Jordan. In 582 they were subdued by the Babylonians. After the captivity, they recommenced their feuds with the Jews, but were conquered by Judas Maccabeus. The intermarriages of Jews with the A., which had been frequent, were prohibited by Nehemiah. The chief deity worshipped by the A. was named Milcom, who in his character seems to have resembled Meloch. Justin Martyr affirms that in his time the A. were still numerous.

AMMONITES, a genus of fossil shells, nearly

Ammonites:

1. *Ammonites obtusus*; 2. Section of *Ammonites obtusus*, shewing the interior chambers and siphuncle; 3. *Ammonites nodosus*.

allied to the recent genus *Nautilus*, being, like it, chambered and spiral. The molluscous inhabitant appears to have lodged in the last and largest chamber of the shell, the spaces left behind as it increased in size being successively converted into air-chambers, and all connected by a tube (*siphuncle*), so that the animal could at pleasure ascend or descend in the sea; whilst the transverse plates dividing the chambers gave strength to the whole structure without great increase of weight. A. have long been popularly called *Cornua Ammonis*, from a fancied resemblance to the horns on sculptured heads of Jupiter Ammon. They are found throughout the entire series of fossiliferous rocks from the transition strata to the chalk. They abound in the cretaceous and eolitic groups. Particular kinds distinguish particular formations, a circumstance which renders them of particular interest and importance to the geologist. The number of species is very great, considerably above two hundred; and several genera have been constituted, as *Baculites*, *Hamites*, *Scaphites*, *Turritites*, forming with *Ammonites*, the family of *Ammonitida*. A. are of very different sizes, from a very small size, to two, or even three or four feet in diameter. The larger ones were in former times ignorantly mistaken for petrified snakes; and impositions have been practised upon collectors by adding to specimens nicely carved snakes' heads; whilst the general absence of the heads was popularly accounted for by a legend of a saint decapitating the snakes, and turning them into stone.

AMMONIUM, now known as the oasis of Siwah, in the Libyan Desert, was in ancient times celebrated on account of the oracle of Ammon, the unfortunate expedition of Cambyses, and the subsequent journeys of Alexander the Great and Cato. Besides the temple of Jupiter, placed in the centre of a grove of palms, the ruins of which still exist, and which

contained an image of the god, composed of smaragdus and other gems, A. was remarkable for the palace of its ancient kings, surrounded by a triple wall, in the very heart of the oasis, and for its 'Well of the Sun,' of which the waters were coldest at noonday, and warmest at midnight. Here the Emperor Justinian built a Christian church. The length of the oasis is 15 miles, by 12 broad; it is about 150 miles distant from the Mediterranean, and is situated in lat. 29° N., and in long. 26° E.

AMMONIUS SACCAS, a Greek philosopher, founder of the Neoplatonic School, is said to have been in his earlier days a porter in Alexandria. His parents were Christian, but he himself is said to have abandoned his early religion, in which he had been instructed by Clemens Alexandrinus, and to have devoted himself to the study of heathen philosophy under Athenageras; although both Eusebius and St Jerome deny that he ever formally apostatised from the Christian faith. His great endeavour was to harmonise, through a comprehensive eclecticism, the various philosophical theories which prevailed in the Roman world, especially those of Aristotle and Plato. He also laboured to amalgamate with these the doctrines of the Magi and Brahmins; but instead of boldly announcing the result as his own, he claimed for his system the highest antiquity. His most distinguished pupils were Longinus, Herennius, Origen, and Plotinus, the last of whom, by far the most subtle and profound of the Neoplatonists, always expressed the highest respect for his master. A. died at Alexandria, 241 A. D. He left no writings behind him.

A. is the name of several learned men in the later periods of Greek history; such as A., the master of Plutarch, who lived during the reign of the Emperor Adrian, and, like A. Saccas, taught a species of eclecticism in philosophy; A., the Christian philosopher of the 3d c., who wrote a *Harmony of the Gospels*; A., son of Hermeas, a Peripatetic philosopher of the 5th c., and disciple of Proclus; A., the famous surgeon of Alexandria, who lived in the time of Ptolemy Philadelphus; and A., the Grammarian, who was at first high-priest in an Egyptian temple, sacred to the god Apis, and afterwards (389 A. D.) became teacher at Constantinople, where he had the church historian Socrates for his pupil.

AMMO'PHILA, a genus of Grasses, closely allied to *Arundo* (see REED), and distinguished by a spike-like panicle, and by the *glumes* being nearly equal, keeled, longer than the *palaeæ* of the single floret, and surrounded at the base by a tuft of hairs.—*A. arundinacea*, formerly called *Arundo arenaria*—a grass about 2—3 feet high, with rigid bluish leaves, the edges of which are rolled in, and very creeping roots—is frequent on the sandy sea-shores of Britain and the continent of Europe. It is sometimes called SEA REED or SAND REED, and sometimes MAT GRASS, the culms being wrought into foot-mats, coverings for stairs, &c., in the manufacture of which many families residing along the coast of Ireland are employed most of the year. It is also called *Marum*, *Marrum*, or *Marram*, by which name it is designated in laws both English and Scottish, by which the destruction of it was prohibited under severe penalties, because of its great utility in fixing the shifting sand. In Holland, and in Norfolk, it is extensively employed—along with the Sea LYME GRASS (q. v.)—in preserving the banks of sand which prevent the inroads of the sea. It is of little value as food for cattle, although they eat the very young leaves. The fibre has been used instead of flax, but is too short.

AMMUNITION. Sometimes this name is given to cannon and mortars, as well as to the projectiles

and explosive substances employed with them; but more usually A. is considered to apply to the latter—such as shot, shell, gunpowder, cartridges, fuses, wads, grenades. Muskets, swords, bayonets, and other small-arms are sometimes, but improperly, included under this term. The Royal Laboratory at Woolwich is the place where A. is chiefly prepared for the British army and navy. The cannon-balls may be cast at some of the great iron-foundries in the north; the shells may be cast or forged in the shell-factory at Woolwich; the muskets may be made at Birmingham, and the rifles at Enfield; the bullets at the shot-factories; the gunpowder at Waltham-Abbey—and so on; but the 'making up' of the A. is mostly conducted at the establishment above mentioned. Bags of serge, in enormous number, are cut out and made, and filled to form the cartridges for large ordnance. Bags or tubes of paper are made and filled to constitute cartridges for small-arms. The tubes and combustibles for war-rockets and fuses are also manufactured. The cartridges for small-arms (rifles, muskets, carbines, and pistols) are made in millions; since it is on those that the main offensive operations of an army depend. It has been calculated by the Woolwich authorities, that a British army of 60,000 men, comprising a fair average of infantry, cavalry, artillery, and engineers, ought to be provided with no less than 18,000,000 ball-cartridges for small-arms, for six months' operations. These would require 1000 A. wagons, and 3600 horses, to convey them all at once. It is therefore deemed better that, under any such circumstances, there should be established *entrepôts* for supplying the troops from time to time. The wagons constructed for this kind of service will carry 20,000 rounds of small-arm A. each; the cartridges are packed in boxes, and the wagons are drawn by four horses each. Several wagons are organised into an 'equipment,' under the charge of a detachment of artillery; and there are several such equipments for an army of the magnitude above mentioned—one for each division of infantry, a small portion for the cavalry, and the rest in reserve. It has been laid down that an army of 60,000 men ought to have 2,680,000 cartridges *with them*, besides those in reserve; and that the conveyance of such a quantity, with a few forges and stores, would require 150 A. wagons, 830 men, and 704 horses. The equipment would return to the *entrepôt* for a new supply when needed. In the Peninsular War, and at Waterloo, the English used two-horse carts, carrying about 10,000 rounds of small-arm A. each; but a superior kind of wagon has been since introduced. In the field, an infantry soldier usually carries about 60 rounds, put in compartments in his pouch; the pouch having a separate receptacle for percussion-caps. When the word A. is used in connection with artillery matters, the 'fixed' A. comprises the loaded shells, cartridges, and carcasses; whereas the 'unfixed' are the unfilled case-shot, grape-shot, and shell. During peace, the Woolwich Laboratory serves out little less than a million lbs. of gunpowder annually, in A. for the army and navy, for purposes of exercising, saluting, &c.: the quantity in war is of course indeterminable.

The chief kinds of A. will be found briefly described under their proper headings.

AMNESTY signifies an act of pardon or oblivion, and the effect of it is, that the crimes and offences against the state, specified in the act, are so obliterated that they can never again be charged against the guilty parties. The A. may be either absolute, or qualified with exceptions. Instances of the latter are to be found in ancient and modern history: thus, Thrasylbulus, when he overthrew the oligarchy in Athens, caused an A. to be

proclaimed, from the operation of which the Thirty Tyrants, who had formed the oligarchy, and some few persons who had acted under them, were excluded. Again, Bonaparte, on his return from Elba in 1815, issued a decree, which was published at Lyon, declaring an A., from the benefits of which he excepted thirteen persons whom he named. And in our own country, the historical reader will be able to recall the act of indemnity passed upon the restoration of Charles II., by which the persons actually concerned in his father's execution, were, as a class, excluded from the A.

AMNION is the membrane which immediately invests the embryo, appearing very early in the development of the latter, and adhering closely to it. As gestation proceeds, this membrane secretes from its inner surface a fluid which separates it from the fœtus. This fluid, the liquor amnii, consists of water, with albumen, salt of soda, and extractive matters in solution; it has a specific gravity of 1008. It supplies nutriment to the fœtus, preserves around it an agreeable temperature, and when gestation is completed, by projecting the membrane through the os uteri, is the primary agent in opening the way for the fœtus. At this time, the A. is thin and transparent, slightly flocculent on the side next its enveloping membrane, the chorion, but smooth on the surface next the fœtus. Within it, the latter is suspended in the fluid which not only serves the purposes just mentioned, but protects it from injury. For further particulars, see EMBRYO, and for many curious superstitions connected with the subject, see CAUL.

AMOMUM, a genus of plants of the natural order *Scitamineæ* (q. v.) or *Zingiberacææ* distinguished by perennial stems; the flowers in close heads resembling cones, not upon the leafy stems, but arising by themselves from the root, and little elevated above the ground; the corolla without inner lateral lobes, and with a very large flat lip; the filament flat, extended beyond the anther, with two lateral lobes, and an emarginate middle lobe. It contains a number of species, natives of tropical countries, and almost exclusively of the eastern hemisphere, of which several yield the CARDAMOMS (q. v.) of commerce, and several the spice known by the name of GRAINS OF PARADISE (q. v.). The genus *A.* was formerly more extensive, and included species now forming the genus *Zingiber* (see GINGER), &c.

AMOO'R, or AMUR, a river formed by the junction (about lat. 53° N., and long. 120° E.) of the Shilka and the Argoun, which both come from the south-west—the former rising in Russian Siberia, near the head-waters of the Yenisei; and the latter in Chinese Tatory, not far from the sandy plateau of Kobi. From this starting-post, the A. presents, on its right, a tolerably symmetrical curve, which, after receiving, at its most southerly point, the Songari from beyond the Wall of China, besides other considerable feeders on both sides of either segment, enters, on nearly its original parallel, the Gulf of Saghalien, about a degree below the Sea of Okhotsk, properly so called. For more minute details, the reader must look forward to the steadily pursued researches of the Russians, who, according to our latest information, had, last season, fixed in position about 120 points in the various sections of the basin of the A. But they have already thrown much light on a stream which, always physically interesting, as the only bond of union between the central steppes of Asia and the world at large, is now, by a recent change of its political relations, redeemed from an isolation virtually more thorough than that of any of the tributaries of the Arctic Sea. The Russians, then, have ascertained that the A. offers great facilities

for colonisation, and still greater for navigation. To begin with the latter. They have traversed by steam, in the season, too, of low water, the entire length upwards to the grand fork of the Argoun and the Shilka, accomplishing the stretch of 3000 versts, or 2000 miles, in 30 days—and that, from want of preparation, in spite of the delay of cutting wood, and the difficulty of utilising it when green; and they have discovered that even the Chinese, near one of their motley garrisons, have a fleet of 30 or 40 sailing-craft. With respect, again, to colonisation: while the stream itself is said to be stocked like a fishpond, the Russians have found, more particularly on the Lower A., much land fitted for pasturage and cultivation, whole oceans, as they express themselves, of timber—oak, elm, ash, larch, pine, and maple; vast supplies of limestone, and decisive indications of iron ore—the climate, though severe in both its extremes, not being more so than in many thriving parts of Russia, whether European or Asiatic. But far beyond these merely local considerations, the A. has an extraneous importance, and that not merely to Russia itself. Touching, as it nearly does, the Yenisei, it forms a far more available continuation of the eastward route through Siberia than the only other possible line, which, crossing to the Lena, and following that river to its most easterly point, runs from Yakutsk to Okhotsk, by a wretched bridle-path of 18 days, through a country as rugged as it is inhospitable. Nor is the A. likely to be less valuable in connection with the south, for there, on an arena where might will be everything, its waters are ready to carry the proverbially aggressive Muscovites within easy reach of the Gulfs of Corea and Pe-che-le. But it is towards the east that the A. assumes the most serviceable aspect. Already has it been a channel of traffic between the outside world and Central Asia—carrying down to the former the salted pork of the region of the Baikal, and bringing up to the latter the productions and commodities of more genial climes. This, however, is but as a drop in the bucket to the ambition of Russia. Even now, the significant names of Nicholajesk and Petrowsk stand forth as naval stations of the empire—the background, as we have seen, being one huge arsenal of naval stores—of timber, of iron, and doubtless, at pleasure, of hemp. It was at the commencement of the reign of Peter the Great that the indefatigable Russians, with the open ocean—Russia's most special want—looming in their mind's eye, were arrested on the A. by the Chinese; and it was fortunate for the Anglo-Saxon race that that gigantic power did not find the fulcrum for putting forth its strength on the Pacific, till England and America had each established a permanent foothold on its shores. Even here, however, Russia has to face its almost universal enemy, the ice of winter. As in the White Sea, as in the Baltic, and as, to some extent, in the Euxine, the frost encumbers this, the newest and noblest outlet; for, in the last four springs, or rather summers, it has chained the A., on an average, down to the 21st of May.

AMORITES, a powerful nation of Canaan, extending on both sides of the Jordan. They were vanquished by the Hebrews under Moses, and their lands beyond Jordan were distributed among the tribes of Gad, Reuben, and Manasseh. Their two most famous kings were Sihon, king of Heshbon, and Og, king of Bashan. Og was the last of the giants, or at least of that gigantic race, the Rephaim. In Deut. iii. 11, his iron bedstead is mentioned as measuring 13½ feet in length; but the whole of this verse, with the exception of the first clause, is considered by some an interpolation. The Rabbins

hold this hedstead to have been Og's cradle, and affirm that his full-grown stature was 120 feet! Joshua subdued, but did not wholly exterminate, the Amorites in Canaan. The residue of this people became tributary under Solomon. (Gen. x. 15—20; xv. 19—21; Numb. xiii. 29; xxi. 13; Deut. xx. 16; xii. 31; Joshua, ix.)

AMORO'SO, in Music, affectionately, tenderly.

AMORPHA. See INDIGO.

AMORPHOPHALLUS. See ARUM.

AMORPHOUS (Gr., *a*, priv., *morphē*, form), shapeless. In chemistry, the term A. is used to describe the uncrystallised, in opposition to the crystallised, condition of bodies. There are substances which, in certain conditions, are capable of crystallisation, but in other conditions remain A. Thus, pure sugar contains carbon, which appears as an A. substance after the sugar has been burned in a platina crucible. The same substance, carbon, appears in its crystallised form in the diamond.

AMOS, the Hebrew prophet, was a herdsman of Tekoa, in the neighbourhood of Bethlehem, and also a dresser of sycamore trees. During the reigns of Uzziah in Judah, and Jeroboam in Israel (about 784 B. C.), he came forward to denounce the idolatry then prevalent. His prophetic writings, as given in the Old Testament, contain, in the first six chapters, denunciations of the Divine displeasure against several states, particularly that of Israel, on account of the worship of idols. As Ruckert poetically expresses it, the thunder-storm rolls over all the surrounding kingdoms, touches Judah in its progress, and at length settles upon Israel. The three remaining chapters contain his symbolical visions of the approaching overthrow of the kingdom of Israel, and lastly, a promise of restoration. The style of A., remarkable for its clearness and picturesque vigour, abounds with images taken from rural and pastoral life. The canonicity of the book of Amos is well attested both by Jewish and Christian authorities. Philo, Josephus, and the Talmud include it in the list of inspired writings. It is, moreover, twice quoted in the New Testament (Acts vii. 42, and Acts xv. 16).

AMOY, a seaport town of China, in a small island of the same name, in the province of Fo-kien, on the sea-coast, lat. 24° 10' N., long. 118° 10' E. It is one of the chief commercial emporiums of the east, and contains a population estimated at 250,000. It is divided into an outer and inner town, and has an outer and inner harbour, the entrance to the former of which, as well as the inner town itself, is strongly fortified. In 1841, it was taken by the British; by the treaty of Nan-king, a British consul and British subjects were permitted to reside there. The trade is now open to all nations. The chief imports are rice, sugar, camphor, raw cotton, cotton-twist, and British long cloths; the exports are tea, porcelain, paper, grass-cloths, &c. Smuggling is carried on extensively. Mr Fortune describes A. as one of the dirtiest towns in the world.

AMPÈRE, ANDRÉ MARIE, a distinguished mathematician and naturalist, was born at Lyon, January 20, 1775. The death of his father, who fell under the guillotine in 1793, made a deep and melancholy impression on the mind of young A., who sought for solace in the study of nature and antiquity. In 1805, after he had been engaged for some time as private mathematical tutor at Lyon, he was called to Paris, where he distinguished himself as an able teacher in the Polytechnic School, and began his career as an author by his essay on the Mathematical Theory of Chances (*Sur la Théorie Mathématique du Jeu*). In 1814, he was elected as a member of the Academy of Sciences; and in 1824,

was appointed as Professor of Experimental Physics in the Collège de France. He died June 10, 1836. Scientific progress is largely indebted to A., especially for his electro-dynamic theory and his original views of the identity of electricity and magnetism, as given in his *Recueil d'Observations Electro-dynamiques* (Paris, 1822), and his *Théorie des Phénomènes Electro-dynamiques* (Paris, 1830). These researches prepared the way for the experiments of Dr Faraday. Several of A.'s writings may be found in the *Annales de Physique et de Chimie*.

AMPÈRE, JEAN JACQUES ANTOINE, son of the above named, Professor of Modern Literature in the Collège de France, at Paris, and member of the French Academy, was born at Lyon, August 12, 1800. He acquired a brilliant reputation, on account of the keen and searching character of his manifold literary efforts. After laying the groundwork of his comprehensive studies in Paris, he proceeded to Italy, Germany, and Scandinavia. In 1829, when he returned from his travels, he saw no prospect of becoming a professor in Paris, and so consented to give a course of lectures on the history of literature at Marseille. After the July revolution, he succeeded Andrieux as professor in the Collège de France, and also took the place of Villemain in the Normal School. In both chairs he taught with great success. He was especially versed in the knowledge of German literature; while his valuable writings upon China, Persia, India, Egypt, and Nubia, as well as his Levantine voyages, proved that the far east itself was embraced within the circle of his studies. A. allowed many of his linguistic and historico-literary investigations to see the light first in reviews, especially the *Revue des Deux Mondes*. In 1833 he published an essay on the relations of French literature to that of other countries in the middle ages; in 1841, an *Essay on the Formation of the French Language*—a most valuable contribution to philology in general; and in 1850, a work entitled *Grece, Rome, and Dante*, which shews his acquaintance with classical and south-European literature. Many of his papers for periodicals have been collected under the title *Littérature et Voyages* (2 vols., Paris, 1834). Deep research and judicious criticism, expressed in a clear and classical style, distinguish his various compositions. He died April 1864.

AMPHIBIA, in the Linnæan system of zoology, a class containing Reptiles and Cartilaginous Fishes. The term *amphibious* (Gr., having a double life) had been previously employed, as it still popularly is, to denote animals capable of sustaining existence for a considerable time either on dry land or in water. Of the animals of the Linnæan class, however, some only are capable of this, whilst some are strictly limited to the one element, and some to the other, and only a very few are truly amphibious, or adapted by the possession of lungs and gills at the same time for breathing either in air or in water. The Linnæan classification was soon altered by the removal of the Cartilaginous Fishes from the class Amphibia, and the name was retained for a class consisting of Reptiles alone—the *Reptilia* of Cuvier. See REPTILES. Some recent naturalists have divided this into two classes, *Reptilia* and *Amphibia*, the former having lungs only, the latter having both lungs and gills; the former including the Chelonian, Saurian, and Ophidian Reptiles; the latter only the Batrachian Reptiles, or the former order Batrachia. But if it must be admitted that these differ from the other orders more than they do from each other, yet the propriety of separating them as a distinct class is not acknowledged by naturalists in general; and only a very few of them possess lungs and gills at the same period of their existence. See BATRACHIA.

AMPHICTYONIC COUNCIL. This central politico-religious court of several Grecian tribes, was held twice a year. In spring, the members assembled in the Temple of Apollo, at Delphi; in autumn, in the Temple of Ceres, at the village of Anthela, near Thermopylae. Their purpose was twofold: 1. To determine questions of international law; 2. To preserve the religious institutions of the Greeks. As there were many amphictyonics in the early days of Greek history—of which, however, by far the most important was that which forms the subject of our article—it has generally been supposed that they originated out of a desire for social union, and were, consequently, a result of the national instinct for civilisation. Like the Olympic games of a later period, their tendency was to develop a spirit of brotherhood where it was greatly required. The restless Greek intellect, in its application to political life, had naturally an excessive and perilous love of individualism, out of which rose the numerous strifes and animosities of the various states. These councils, on the other hand, were calculated to exert a wholesome centralising influence. They knit together, for a time, the distracted tribes in a bond of common interest and piety. Like the Olympic games, too, they became the occasion of vast gatherings of the Greek peoples, who crowded thither for every variety of purpose, sacred and secular; and thus a feeling of unity and pure national patriotism was, temporarily at least, excited in the popular mind. The special origin of the A. C. or league is unknown, though we know that it was composed of twelve tribes. The ancient writers differ in the names of these; but the list given by the orator Æschines, though containing only eleven, is perhaps the safest to adhere to: the Thessalians, Bœotians, Dorians, Ionians, Perrhæbians, Magnetes, Locrians, Ceteans, Phthiots, Malians, and Phocians. Probably the remaining tribe was the Dolopians, who are mentioned in other accounts. It has been justly concluded that the great preponderance of the northern tribes, who were of the old Pelasgic race, proves the antiquity of the Council. It must have been older than the descent of the Dorians upon the Peloponnesus, or the emigration of the Ionians to the coasts of Asia Minor. Each of the twelve tribes sent to the A. C. two members. These twenty-four representatives possessed equal authority, although some of the tribes were very small, and hardly independent. They bound themselves by an oath that 'they would destroy no city of the Amphictyons, nor cut off their streams in war or peace; and if any should do so, they would march against him and destroy his cities; and should any pillage the property of the god, or be privy to, or plan anything against what was in his temple at Delphi, they would take vengeance on him with hand, and foot, and voice, and all their might' (Æschines). It is only right to state, what indeed most people would naturally conclude for themselves, that so excellent an oath was very indifferently kept. In the primitive period of Greek history, it, in all likelihood, exerted the beneficial and civilising influence of which we have spoken; but it opposed only a feeble check to the passions and ambition of a more powerful age. The members at times connived and even took part in many political crimes, and thus violated their oath. By the time of Demosthenes, the A. C. had ceased to command respect; in the 2d c. after Christ, it still existed, but was then just wavering on the verge of extinction.

AMPHIPOLIS, a city of Macedonia, built on an island at the mouth of the river Strymon, which flowed almost round the town, whence it derived its name (Gr. *amphi*, around, and *polis*, a city). In ancient times its position must have been invaluable,

as it commanded the only safe entrance from the Strymonic Gulf into the broad Macedonian plains. It belonged originally to the Edonians, a Thracian people, and was called, on account of the roads which met here, *Ennea Hodoi* (Nine Ways). The first who attempted to colonise it, Aristagoras of Miletus, was cut off with his followers by the Edonians. The Athenians next tried to gain possession of it. Their first army, amounting to 10,000 men, was utterly cut to pieces at Drabeseus, 465 B.C., but their second, 437 B.C., under Agnon, son of Nicias, was successful. The Thracians were expelled, and a new city built, to which Agnon gave the name of A. On account of its situation as an emporium for Upper Thrace, and of its neighbouring forests of timber for ship-building, A. was an important place. In 424 B.C., it was taken from the Athenians by the Spartan Brasidas, was restored to Athens by the Antalcidean treaty of peace, and afterwards was taken by Philip of Macedon. Under the Romans, it was made the capital of East Macedonia. In the middle ages, it was called *Popolia*. Its site is now occupied by a Turkish town, but a few of its ruins are still visible.

AMPHITHEATRE, a spacious building, generally elliptical in form, used by the Romans for exhibiting gladiatorial combats, fights of wild beasts, and other spectacles. The A. differed from a theatre for dramatic performances (*theatrum*) in this, that whereas the theatre had only a semicircle of seats fronting the stage, the A. was entirely surrounded by them; and hence the name of Amphitheatre (Gr. *amphi*, 'on both sides' or 'all round'). Till a late period at Rome, these erections were of wood, and merely temporary, like a modern race-stand. They seem, however, to have been of enormous size, as Tacitus mentions one, during the reign of Tiberius, which gave way, and caused the death or injury of 50,000 spectators. Amphitheatres of stone had begun, however, to be erected at an earlier period than this, the first having been built at the desire of Augustus. The Flavian A. at Rome, known as the Colosseum, which was begun by Vespasian, and finished by

Colosseum.

Titus 80 A.D., ten years after the destruction of Jerusalem, was probably the largest structure of the kind, and is fortunately also the best preserved. It covers about five acres of ground, and was capable of containing 87,000 persons. Its greatest length is 620 feet, and its greatest breadth 513. On the occasion of its dedication by Titus, 5000 wild beasts were

slain in the arena, the games having lasted for nearly 100 days. The exterior is about 160 feet in height, and consists of three rows of columns, Doric, Ionic, and Corinthian, and, above all, a row of Corinthian pilasters. Between the columns there are arches, which form open galleries throughout the whole building; and between each alternate pilaster of the upper tier there is a window. There were four tiers or stories of seats, corresponding to the four external stories. The first of these is supposed to have contained twenty-four rows of seats; and the second, sixteen. These were separated by a lofty wall from the third story, which is supposed to have contained the populace. The *podium* was a kind of covered gallery surrounding the arena, in which the emperor, the senators, and vestal virgins had their seats. The building was covered by a temporary awning or wooden roof, called *velarium*, the mode of adjusting and fastening which has given rise to many antiquarian conjectures. The open space in the centre of the A. was called *arena*, the Latin word for sand, because it was covered with sand or saw-dust during the performances. The taste for the excitement of the A. which existed at Rome, naturally spread to the provinces, and large amphitheatres were erected not only in the provincial towns of Italy, as at Capua, Verona, Pompeii, &c., but at Arles and Nismes, in France; and even in this country, at Cirencester, Silchester, and Dorchester.

AMPHITRITE, the daughter of the sea-god Nereus and of Doris—or, according to Apollodorus, of a daughter of Oceanus—was the wife of Neptune. When the latter demanded her in marriage, she fled to Mount Atlas, but was discovered by a dolphin, which Neptune had sent after her, and borne back to him. As goddess and queen of the sea, she is represented with her husband's trident in her hand, sitting in a car of shells drawn by Tritons, or on a dolphin, before which a Cupid swims.

AMPHORA, among the Greeks and Romans, was a large vessel, usually made of clay, shaped like our pitchers, with a narrow neck and two handles (hence the name, from Gr. *amphi*, on both sides, and *phero*, to carry), and often ending in a sharp point below, for being inserted in a stand or in the ground. Several of this sort, and in an upright position, were found in the cellars at Pompeii. The A. was chiefly used for the preservation of various liquids, especially wine, the age of which was marked on tickets affixed to the vessel. There is also evidence that amphoræ were employed as cinerary urns and as coffins. The A. among the ancients was likewise a measure for liquids. In Greece, it contained about 9 English gallons. The Roman amphora was only two-thirds of the Greek A. In modern times, *Anfora* is the name of a wine-measure in Venice.

Amphora.

AMPLIFICATION, i.e., enlargement, a term in Rhetoric, meaning that an idea, an opinion, or an inference is presented to the mind, accompanied by accessory circumstances. Its aim is to produce a powerful and vivid impression through the instrumentality of epithets, particulars, or other methods of elaboration. Rhetorical A. is generally produced—1st, by similitude; 2d, by contrast; 3d, by illustrating the universal in the particular; 4th, by piling up logical arguments. *Exaggeration* is an illegitimate kind of A.; being the result of an undue enlargement of particular facts and circumstances.

AMPLITUDE, in Astronomy, is the distance of a heavenly body, at the time of its rising or setting, from the east or the west point of the horizon. When the sun is in the equator (i. e., at the time of either

equinox), he rises exactly east, and sets exactly west, and therefore has no A. Ifis A. is at its maximum at midsummer, and again at mid-winter; and that maximum depends upon the latitude of the place, being 23½° at the equator, and increasing to the Arctic Circle, where it becomes 90°. The A. of a fixed star remains constant all the year round.

AMPULLA was a kind of bottle, used by the Romans for the preservation of liquids. It was made either of earthenware or glass, and sometimes, though very rarely, of more costly materials. Great numbers of such vessels have found their way into collections of antiquities. They are generally 'bellied', i.e., approaching to globular, narrowing towards the mouth, and provided with two handles. They are frequently mentioned in connection with the baths of ancient times. The *A. olearia* was a 'bottle of oil' which the Roman took with him when he went to the bath, and with which he anointed himself after his ablutions. Sometimes the oils were perfumed.

Ampullæ.

The *A. Remensis* (the holy vessel, Fr. *la sainte ampoule*) was the name of that famous vessel in which was contained the unguent (believed to have been brought by a dove from heaven) that anointed Clovis, king of the Franks, at Rheims in 496 A.D., and with which every succeeding monarch of France, down to Louis XVI., was anointed at his coronation. The *A. Remensis* was shattered, along with a great many more valuable things, at the revolution of 1789; but a fragment of it was preserved by some devout royalist, and handed over at the Restoration to the Archbishop of Rheims. Curious to say, a little of the miraculous substance still remained, which was mixed up with oil, and used to anoint Charles X. in 1825.

AMPUTATION (Lat. *amputo*, I lop or prune) is the cutting off of a part which, by its diseased condition, endangers, or may endanger, the safety of the whole body. The A. of a limb was in ancient times attended with great danger of the patient's dying during its performance, as surgeons had no efficient means of restraining the bleeding. They rarely ventured to remove a large portion of a limb, and when they did so, they cut in the gangrened parts, where they knew the vessels would not bleed; the smaller limbs they chopped off with a mallet and chisel; and in both cases had hot irons at hand with which to sear the raw surfaces, boiling oil in which to dip the stump, and various resins, mosses, and fungi, supposed to possess the power of arresting hæmorrhage. Some tightly banded the limbs they wished to remove, so that they mortified and dropped off; and others amputated with red-hot knives, or knives made of wood or horn dipped in vitriol. The desired power of controlling the hæmorrhage was obtained by the invention of the tourniquet (q. v.) in 1674 by a French surgeon Morell. The ancient surgeons endeavoured to save a covering of skin for the stump, by having the skin drawn upwards by an assistant, previously to using the knife. In 1679, Lowdham of Exeter suggested cutting semicircular flaps on one or both sides of a limb, so as to preserve a fleshy cushion to cover the end of the bone. Both these methods are now in use, and are known as the 'circular' and the 'flap' operations: the latter is most frequently used in this country.

A 'flap' amputation is performed thus: The patient being placed in the most convenient position, an assistant compresses the main artery of the limb

with his thumb, or a tourniquet is adjusted over it. Another assistant supports the limb. The surgeon with one hand lifts the tissues from the bone, and transfixing them with a long narrow knife, cuts rapidly downwards and towards the surface of the skin, forming a flap; he then repeats this on the other side of the limb. An assistant now draws up these flaps, and the knife is carried round the bone, dividing any flesh still adhering to it. The surgeon now saws the bone. He then, with a small forceps, seizes the end of the main artery, and drawing it slightly from the tissues, an assistant ties it with a thread. All the vessels being secured, the flaps are stitched together with a needle and thread, and a piece of wet lint is laid over the wound. An expert surgeon can remove a limb thus in from 30 to 60 seconds.

AMRITSIR, a city of the Punjab, in N. lat. 31° 40', and E. long. 74° 45', containing 115,000 inhabitants. It is said to be larger than Lahore, the seat of government. It is, in fact, the religious metropolis, a distinction which, along with its name, it owes, to its 'pool of immortality,' on an islet of which stands the chief temple of the Sikh faith. A is a favourite haunt of pilgrims, to protect or to overawe whom Runjeet Singh built a formidable citadel, which the British have strengthened; and it was the place where, perhaps to bind the slippery Sikhs more firmly, was signed the treaty of 1846, for ceding to the British the territory between the Beas and the Sutlej. A. is said to be the richest and most prosperous city in Northern India, being connected with the capital, distant 36 miles to the west, by a canal, possessing considerable manufactures of cotton, silks, shawls, &c., and carrying on considerable trade at once with Hindustan to the south, and with Central Asia to the north.

AMSLER, SAMUEL, professor of the art of engraving on copper, in the Academy of Arts, Munich, was born December 17, 1791, at Schiuznaeh, in Switzerland, received his first lessons from Lips of Zurich, and afterwards studied under Hess, in Munich. His first great work was an engraving from a Magdalen by Carlo Dolce. In 1816, he went to Rome, where, in several engravings of statues by Thorwaldsen, he succeeded well in uniting the characteristics of the originals with the simple style of Marcus Antonio. Aided by Barth and Hildburghausen, he engraved a title-page for the *Lay of the Nibelungen*, from a design by Cornelius. During his second sojourn in Rome (1820—1824), he began his great work, an engraving of 'Alexander's Triumphal Procession,' by Thorwaldsen. At Munich, in 1831, he finished his large plate of the 'Burial of Christ,' by Raphael, which, with his engraving of a statue of Christ, by Dannecker, displayed the highest qualities of imitative art. These works were followed by a 'Holy Family,' from Raphael, and the 'Madonna di Casa Torni.' His last great work was an engraving from Overbeck's 'Triumph of Religion in the Arts.' A. died May 18, 1849. His style is marked by a clear and noble treatment of form, rather than by strong contrast of tones. Few engravers have equalled A. in his deep knowledge and faithful representation of the works of Raphael.

AMSTERDAM, or **AMSTELDAM** (the dam or dike of the Amstel), the chief city of the Netherlands, and capital of the province of North Holland, is situated at the confluence of the Amstel with the Ij or Y (pronounced Eye), an arm of the Zuiderzee, and is divided by the two arms of the former, and numerous canals, into 95 small islands, connected by 290 bridges. Almost the whole of the city, which extends in the shape of a crescent, is founded on

piles. At the beginning of the 13th c., it was merely a fishing-village, with a small castle, the residence of the Lords of Amstel. In 1296, on account of the murder of Count Floris of Holland, the rising town was demolished, and its inhabitants were compelled to leave it. Afterwards, with Amstelland (the district on the banks of the Amstel), it was taken under the protection of the Counts of Holland, and under them enjoyed several privileges which contributed to its subsequent prosperity. In 1482, it was walled and fortified. It soon rose to be the first commercial place in the united states of the Netherlands; in 1585 was considerably enlarged by the building of the new town on the west; and in 1622 had 100,000 inhabitants. This prosperity excited the envy of its neighbours. The English, under Leicester, in 1587, and William II., Prince of Orange, in 1650, endeavoured to gain possession of the flourishing city; but their designs were frustrated by the good management of the burgomasters of A. In the 17th c., the war with England so far reduced the commerce of A., that in the year 1653, about 4000 houses were uninhabited. Prosperity was restored during the next century, and, though commerce was again injured by the disputes with England in 1781 and 1782, it once more revived. The union of Holland with France in 1810 entirely destroyed the foreign trade of A., while the excise and other new regulations impoverished its inland resources; but the old firms proved strong enough to live through the time of difficulty, and in 1815 commerce again began to expand.

The city has a fine aspect, when seen from the harbour, or from the high bridge over the Amstel. Numerous church towers and spires rise on every side, to relieve the flatness of the prospect. The old ramparts have been pulled down, and wind-mills for grinding corn, and other purposes, have been erected on the 28 bastions. Rich grassy meadows surround the city. On the west side are a great number of saw-mills. The three principal streets in A., each of which is two miles long, are the Heeregracht, Keizergracht, and Prinsengracht. They are not surpassed by any in Europe for length, breadth, or general elegance. Along the middle of each, as of the other streets in A., flow canals, the banks of which are lined with rows of trees. The houses are built principally of brick, and some have their gables towards the streets, which gives them a very picturesque appearance. In old times, A. was strongly fortified; but now its only defence consists in the sluices, which can flood in a few hours the surrounding land. A hard frost, however, like that of 1794—5, when Pichegru entered the city, would render even this means of defence useless.

The population was numbered at 180,000 in 1820; but in 1857 it amounted to 260,000, the majority of whom are Dutch Calvinists. Of the remainder, the most numerous body are the Roman Catholics, next the Lutherans, and next the Jews. The chief industrial establishments are numerous dock-yards, manufactories of sails, ropes, tobacco, cloth, plush, silks, gold and silver plate and jewellery, colours and chemical preparations, breweries, distilleries, with export houses for corn and colonial produce. Among the public buildings, the Stadhuis, formerly used as the palace of King Louis Bonaparte, and still retained by the present reigning family, is a noble and imposing structure, raised upon 13,659 piles, and extending 262 feet in length, by 206 feet in breadth, surmounted by a round tower, rising 327 feet from the base. It is chiefly remarkable for the great hall, 111 feet long, 52 feet wide, and 90 feet high, lined with white Italian marble—an apartment of great splendour.

The *Nieuwe Kerk* (New Church), founded in 1408,

is the finest ecclesiastical structure in the city, and, as the Dutch think, in Europe. Its chancel is especially admired. It contains the tombs of Admiral de Ruyter, who sailed up the Medway and burned the English fleet at Chatham; of the famous Dutch poet Vondel, &c., and of various other notable persons. The Old Church (*Oude Kerk*), belonging to the 14th c., contains several monuments of naval heroes. Literature, science, and recreation are not forgotten in the pressure of business; for A. has its academy of arts and sciences, an excellent museum and library, several harmonic societies, a botanical and also a zoological garden, and several theatres. The hospital for aged people, the poor-house, house of correction, and orphan asylum, a navigation school, and many benevolent societies, are well supported, and said to be managed on good principles. The moist atmosphere and mephitic exhalations from the canals, are unfavourable to the health of the city, especially in summer. The New Canal (*Nieuwe Diep*), or Grand Ship-canal of North Holland, 21 feet deep and 125 feet in breadth, connecting the Buiksloot with the North Sea at the Helder, a distance of 51 miles, so that the perilous navigation of the Zuiderzee is avoided, has greatly increased the facility of commerce, as even a ship of the line can pass through its sluices; and powerful steam-tugs are employed to tow merchant-vessels with their full cargoes out to sea. It is the broadest canal in the world. Its lock-gates exceed in dimensions the largest in the docks of Liverpool, and are founded upon piles driven through the mud into sand. Amsterdam is now connected by railway with Rotterdam and the Hague, as well as with Prussia.

AMSTERDAM, a barren islet in lat. 38° 53' S., and long. 77° 37' E., the home of sea-birds, shell-fish, and seals. It is worthy, however, of notice at once for its structure and its situation. Manifestly of volcanic origin, it still possesses a burning soil and hot springs; and along with its single neighbour, St Paul, 60 miles to the north-east, it is about midway in the direct line between the Cape of Good Hope and Van Diemen's Land, being also at nearly the same distance from Cape Comorin.

AMULET, any object worn as a charm. It is often a stone, or piece of metal, with an inscription or some figures engraved on it, and is generally suspended from the neck, and worn as a preservative against sickness, witchcraft, &c. Its origin, like its name, seems to be oriental. The ancient Egyptians had their amulets, sometimes forming necklaces. Among the Greeks, such a protective

Egyptian Amulet.

charm was styled *phylacterion*; among the Romans, *amuletum*. This word is probably derived from the Arabic *hamalet* ('what is suspended'). The phylacteries of the Jews (see Matthew, xxiii. 5), slips of parchment on which passages of the Law were written, were evidently worn as badges of piety by the Pharisees; but were also regarded as wholesome preservatives from evil spirits, and from all manner of harm. From the heathen, the use of amulets passed into the Christian Church, the inscription on them being *ichthus* (the Greek word for a fish), because it contained the initials of the Greek words

for Jesus Christ, Son of God, Saviour. See ABBREVIATIONS. Among the Gnostic sects, Abraxas stones (q. v.) were much used. Amulets soon became so common among Christians that, in the 4th c., the clergy were interdicted from making and selling them on pain of deprivation of holy orders; and in 721, the wearing of amulets was solemnly condemned by the Church. Among the Turks and many other nations of Central Asia, every person considers it necessary to wear a preservative charm. With the spread of Arabian astronomy, the astrological A. or talisman (q. v.) of the Arabs found its way to Europe. Kopp, a German author, has written a work, *Palaeographica Critica*, on amulets and their inscriptions. Among amulets in repute in the middle ages were the coins attributed to St Helena, the mother of Constantine. These and other coins marked with a cross were thought specially efficacious against epilepsy, and are generally found perforated, for the purpose of being worn suspended from the neck.—The belief in the virtue of amulets is not yet extinct among the uneducated.

AMYCLÆ, an old Laconian town, was situated on the eastern bank of the Eurotas, 20 stadia south-east of Sparta, in a richly wooded and fertile region. It was a famous city in the heroic age, the abode of Tyndarus and his spouse Leda, who bore to Jupiter the twins, Castor and Pollux (called *Amyclæi Fratres*, the Amyclæan brothers), and also Helena. Long after the Dorians had subjugated and peopled the rest of the Peloponnesus, A. continued to be a free Achæan town. It was conquered by the Spartans only before the first Messenian War, and in consequence of a curious and absurd law. The inhabitants were so often agitated by false rumours of the approach of the Spartans, that, growing tired of living in a state of continual alarm, they decreed that no one should henceforth mention or even take notice of these disagreeable fictions. Unfortunately, the Spartans *did* come at length, and according to the Greek saying, 'A. perished through silence.' Hence the proverb, *Amyclis ipsis taciturnior* (More silent than A. itself). After its conquest, A. became a village, noted only for its annual festival of the Hyacinthia, and its temple of Apollo, with the colossal statue of the god himself.—A., an ancient city on the coast of Campania, Italy, said to have been built by a colony from the Greek A. It had ceased to exist in the time of Pliny.

AMYGDALÆÆ, or DRUPACEÆ, according to some botanists, a natural order of dicotyledonous plants, but more generally regarded as a sub-order of ROSACEÆ. The species are all trees or shrubs. They have the tube of the calyx lined with a disk, the pistil a solitary simple carpel with a terminal style, the fruit a drupe. For other botanical characters, see ROSACEÆ. The bark yields gum, and hydrocyanic acid is present in very notable quantity in different parts, as the leaves, kernels, &c. The A. are chiefly natives of the cold and temperate regions of the northern hemisphere. Some of them yield valuable fruits; and various products of the order are used in medicine. See ALMOND, PEACH, NECTARINE, PLUM, CHERRY, and CHERRY LAUREL. This order or sub-order contains about 110 known species.

AMYGDALOID (from *amygdalus*, an almond), a rock, consisting of a basis of some kind of trap rock, very frequently of greenstone, forming numerous roundish or oval cells, which are filled with nodules, often of calcareous spar or of zeolitic minerals. The cells are not of large size, but even those which are almost adjacent differ much in this respect. The nodules are evidently the result of a sublimation and imperfect crystallisation, under the action of the

heat which formed the cells. Empty cells often occur amongst those which are filled with minerals. The name A. is sometimes extended to rocks of the same character, although the basis be not of trap.

AMYLACEOUS (from *amylum*, starch), a term used in Chemistry and Botany, and equivalent to starchy.—A. food is food consisting at least in part of some kind of starch, as arrow-root, sago, &c.—A compound radical, called *amyle*, is formed by the decomposition of starch in a peculiar fermentation—the *amyleic fermentation*—but to it the term A. has no reference.

AMYLIC ALCOHOL. See FUSEL OIL.

AMYOT, or **AMIOT**, **JACQUES**, a French writer, well known by his excellent translations of the Greek classics, was born in 1513, and died in 1593. Racine highly esteemed the translations by A., of which the version of Plutarch is one of the best, and has passed through several editions.—**AMIOT**, **Joseph**, a celebrated Jesuit and oriental scholar, was born at Toulon in 1718, and lived as a missionary in China from 1750 to the time of his death, in 1794. His knowledge of the Chinese and Tatar languages enabled him to collect many valuable notices of antiquities, history, language, and arts, in China. Many of his writings may be found in the *Mémoires concernant l'Histoire, les Sciences et les Arts des Chinois* (15 vols. Paris, 1776—1791). His *Dictionnaire Tatar-Mantchou-Français* was edited by Langlès in 1789.

AMYRIDA'CEÆ, a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, natives of tropical countries, remarkable for the abundance of their fragrant balsamic or resinous juice. They have compound leaves, occasionally with stipules and pellucid dots. The flowers are in racemes or panicles; the calyx persistent, with 2—5 divisions; the petals are 3—5; aestivation valvate or imbricated. The stamens are twice or four times as many as the petals. The ovary is superior, sessile, 1—5-celled, inserted in a large disk; the style solitary and compound, or wanting; the stigmas as many as the cells of the ovary; the ovules in pairs, anatropal. The fruit is hard and dry, 1—5 celled, its outer rind often splitting into valves. The seeds are exalbuminous. About forty or fifty species are referred to the order; but many of them are still very imperfectly known. Some species afford valuable timber; but the principal products of the order are fragrant resins and balsams, as **MYRRH** (q. v.), and different kinds of **FRANKINCENSE** (q. v.), **OLIBANUM** (q. v.), **ELEMI** (q. v.), **BDELLIUM** (q. v.), **TACAMAHAC** (q. v.), **BALSAM OF GILEAD** (q. v.), &c. Among the more important genera of the order may be named *Amyris*, *Balsamodendron*, *Boswellia*, and *Icica*.—*Canarium commune*, a native of Java, which yields a gum similar in its properties to the **BALSAM OF COPAIVA** (q. v.), produces also triangular nuts, which are eaten both raw and dressed, and from which an oil is extracted for the table and for burning. *Balanites Egyptiaca* is cultivated in Egypt for its fruit, a drupe, which is eaten, and from the seeds of which a fat oil is expressed, called *Zachun*.

ANA, a termination added to the names of remarkable men, to designate collections of their sayings, anecdotes, &c.; as in the works entitled *Baconiana*, *Johnsoniana*. Such titles were first used in France, where they became common after the publication of *Scaligerana* by the brothers Dupuy (Hague, 1666). In English literature, there are many works of this kind. America, also, has its *Washingtoniana*. A tolerably complete catalogue of works with such titles may be found in Namur's *Bibliographie des Ouvrages publiés sous le Nom d'Ana* (Brussels, 1839).

ANABAPTISTS, a term applied generally to those Christians who reject infant baptism, and administer the rite only to adults; so that when a new member joins them, he or she is baptised a second time, the first being considered no baptism. The name (Gr. to baptise again) is thus owing to an accidental circumstance, and is disclaimed by the more recent opponents of infant baptism, both on the continent and in Great Britain.

The origin of the sect cannot be distinctly traced; but it is manifestly connected with the controversy about infant baptism carried on in the early church. Opposition to this doctrine was kept alive in the various so-called heretical sects that went by the general name of Cathari (i. e., purists), such as the Waldenses, Albigenses, &c. Shortly after the beginning of the Reformation, the opposition to infant baptism appeared anew, especially among a set of fanatical enthusiasts called the Prophets of Zwickau, in Saxony, at whose head were Thomas Münzer (q. v.) (1520) and others. Münzer went to Waldshut, on the borders of Switzerland, which soon became a chief seat of anabaptism, and a centre whence visionaries and fanatics spread over Switzerland. They pretended to new revelations, dreamed of the establishment of the kingdom of heaven on earth, and summoned princes to join them, on pain of losing their temporal power. They rejected infant baptism, and taught that those who joined them must be baptised anew with the baptism of the Spirit; they also proclaimed the community of goods, and the equality of all Christians. These doctrines naturally fell in with and supported the 'Peasant War' (q. v.) that had about that time (1525) broken out from real causes of oppression. The sect spread rapidly through Westphalia, Holstein, and the Netherlands, in spite of the severest persecutions. The battle of Frankenhausen (see **MÜNZER**) crushed their progress in Saxony and Franconia. Still, scattered adherents of the doctrines continued, and were again brought together in various places by travelling preachers. In this capacity, one Melchior Hoffmann, a furrier of Swabia, distinguished himself, who appeared as a visionary preacher in Kiel in 1527, and in Emden in 1528. In the last town he installed a baker, John Matthiesen, of Haarlem, as bishop, and then went to Strasburg, where he died in prison. Matthiesen began to send out apostles of the new doctrine. Two of these went to Münster, where they found fanatical coadjutors in the Protestant minister Rothmann, and the burghers Knipperdolling and Krechting, and were shortly joined by the tailor Bockhold of Leyden, and Gerrit Kippenbroek of Amsterdam, a bookbinder, and at last by Matthiesen himself. With their adherents, they soon made themselves masters of the city; Matthiesen set up as a prophet, and when he lost his life in a sally against the Bishop of Münster, who was besieging the town, Bockhold and Knipperdolling took his place. The churches were now destroyed, and twelve judges were appointed over the tribes, as among the Israelites; and Bockhold (1534) had himself crowned king of the 'New Sion,' under the name of John of Leyden. The anabaptist madness in Münster now went beyond all bounds. The city became the scene of the wildest licentiousness; until several Protestant princes, uniting with the bishop, took the city, and by executing the leaders, put an end to the new kingdom (1535).

But the principles disseminated by the A. were not so easily crushed. As early as 1533 the adherents of the sect had been driven from Emden, and taken refuge in the Netherlands; and in Amsterdam the doctrine took root and spread. Bockhold also had sent out apostles, some of whom had given up the wild fanaticism of their master; they let alone the

community of goods and women, and taught the other doctrines of the A., and the establishment of a new kingdom of pure Christians. They grounded their doctrines chiefly on the Apocalypse. One of the most distinguished of this class was David Joris, a glass-painter of Delft (1501—1556). Joris united liberalism with anabaptism, devoted himself to mystic theology, and sought to effect a union of parties. He acquired many adherents, who studied his Book of Miracles (*Wunderbuch*), which appeared at Deventer in 1542, and looked upon him as a sort of new Messiah. Being persecuted, he withdrew from his party, lived inoffensively at Basle, under the name of John of Bruges, and died there in the communion of the reformed church. It was only in 1559 that his heretical doctrines came to light, when the council of Basle had the bones of Joris dug up, and burned under the gallows.

The rude and fanatical period of the history of anabaptism closes with the scandal of Münster. A new era begins with Menno Simons. (See MENNO.) Surrounded by dangers, Menno succeeded, by prudent zeal, in collecting the scattered adherents of the sect, and in founding congregations in the Netherlands, and in various parts of Germany. He called the members of the community 'God's Congregation, poor, unarmed Christians, brothers;' later, they took the name of Mennonites, and at present they call themselves, in Germany, Taufgesinnte; in Holland, Doopsgezinden—corresponding very nearly to the English designation Baptists. This, besides being a more appropriate designation, avoids offensive association with the early Anabaptists. Menno expounded his principles in his *Fundament-buche von dem rechten Christlichen Glauben*, 1556 (Elements of the True Christian Faith). This book is still an authority among the body, who lay particular stress on receiving the doctrines of the Scripture with simple faith, and acting strictly up to them, and set no value on learning and the scientific elaboration of doctrines. They reject the taking of oaths, war, every kind of revenge, divorce (except for adultery), infant baptism, and the undertaking of the office of magistrate; magistracy, they hold to be an institution necessary for the present, but foreign to the kingdom of Christ; the church is the community of the saints, which must be kept pure by strict discipline. With regard to grace, they profess universalism, or hold it to be designed for all, and their views of the Lord's Supper fall in with those of Zwingli; in its celebration, the rite of feet-washing is retained. In Germany, Switzerland, and Alsace, their form of worship differs little from the Lutheran. Their bishops, elders, and teachers serve gratis. Children receive their name at birth, baptism is performed in the place of worship, and adults that join the sect are rebaptised.

But along with these general principles, there have been endless diversities and splits in the sect, occasioned by differences as to strictness of discipline. This cause divided the body, as early as 1554, into the Mild and the Strict Mennonites. The first are known by the title of Waterländers, from a place in Holland; the second split again into a multitude of subdivisions, according to minute shades of strictness, and their several designations, derived from the names of leaders, places, and even peculiarities of dress (John-Jacob Christians, Buttoners, Hook-and-eye-ers, &c.), bewilder the student of ecclesiastical history. The purity of their lives, however, commanded everywhere respect, and their industry made them prosperous; so that they gradually secured formal toleration in many places.

Almost the only split among the early continental Baptists on doctrinal grounds was that which took place in Amsterdam in 1664. Arminianism had not

been without its influence, especially among the Waterländers, originally more liberal in their views. A leading congregation accordingly divided into two parties, one (Galenists, from Galenus, their leader) advocating freer views in doctrine and discipline; the other (Apostoolists, from Samuel Apostool) adhering to absolute predestination and the discipline of Menno. The liberal party rejected creeds as of human invention, adopted much of the philosophy and theology of England, and exercised no little influence on the intellectual progress of Holland. These two parties gradually absorbed the other sections of the Baptists in the Netherlands; and about the beginning of the nineteenth century, a union took place by which all the congregations now belong to one body. In Holland, there are about 120 Baptist congregations.

In Germany, the Baptists made some attempts in more recent times to extend their church, but without any great success. In 1852 there were in Germany 52 congregations, numbering about 3000 members, more than half of whom belong to Prussia. In that country, various concessions had been made to them early in this century, such as exemption from certain oaths and from military service. They are tolerated in Bavaria, Baden, Württemberg, Mecklenburg, Russia, France, and Denmark; but were expelled from Sweden. Wherever they are settled, they are respected as quiet, industrious subjects; but several German governments have lately imposed restrictions on their exercise of public worship. The reason assigned was the tendency to visionary enthusiasm that had again shewed itself in some congregations.

As the representatives of the sect in Great Britain and North America have little or no historical connection with the earlier A. of the continent, they fall more properly to be noticed under BAPTISTS.

ANABA'SIDÆ, or LABYRINTHIBRANCHIDÆ, a family of Acanthopterygious Fishes, characterised by a remarkable structure of the upper membranes of the pharynx, which are divided into small irregular leaves, containing between them cellular reservoirs. These retain water sufficient to keep the gills moist for a considerable time, and so enable the fish to subsist out of water, and to travel some distance on dry ground; some of the species, as the Climbing Perch (q. v.) of India (*Anabas scandens*), climbing steep banks, or even trees, by means of the spines of the fins, tail, and gill-covers. *Ophicephalus marginatus* is often seen travelling among the grass in the beginning of the rainy season. The fishes of this family appear to leave the water for various reasons; but very commonly, it would appear, upon account of the drying up of pools in periodical droughts, their peculiar organisation enabling them to go in search of others. They are all fresh-water fishes, natives of the south-east of Asia, continent and islands, and of South Africa. The species are numerous, and are arranged under eleven genera. Some of them are much esteemed for their delicacy as food.

ANABASIS (Greek), literally, an ascent or a march out of a lower into a higher country—the name of two historical works: 1. The *A. of Cyrus*, written by Xenophon, which gives a narrative of the unfortunate expedition of the Younger Cyrus against his brother, the Persian king Artaxerxes, and of the retreat of his 10,000 Greek allies under the command of Xenophon; 2. The *A. of Alexander*, written by Arrian, and giving an account of the campaigns of Alexander the Great.

ANABLEPS (from the Gr. *anableps*, to look up), a genus of fishes of the order *Malacopterygii Abdominales*, family *Cyprinidæ* of Cuvier—of the family

Cyprinodontidæ (q. v.) of Agassiz—characterised by a structure of the eyes to which there is nothing similar in any other vertebrated animals. This consists in a division of the *cornea* and *iris* into two somewhat unequal elliptical parts, by transverse bands formed of the *conjunctiva* (see EYE), so that the animal appears to have four eyes, and there are really two pupils on each side, the other parts of the eye being single. This peculiarity of structure is supposed to be connected with a habit which these fishes are said to have of swimming with the eyes partly out of the water. They are elongated, scaly fishes, with flattish rounded back, and depressed head. The young are brought forth alive, and in a state of considerable advancement. The best known species, *A. tetraophthalmus*, inhabits the rivers of Guiana and Surinam.

ANACARDIACEÆ (TEREBINTACEÆ of some botanists, and part of TEREBINTACEÆ of others), a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, which abound in a resinous, sometimes acrid and poisonous juice. The leaves are alternate and without dots; the flowers inconspicuous, usually unisexual. The calyx is generally small and persistent, and has generally five divisions; the petals are perigynous, equal in number to the segments of the calyx, imbricated in aestivation, occasionally wanting. The stamens are equal in number to the petals, and alternate with them, or twice as many, or more; distinct when there is a fleshy disk, cohering at the base when the disk is wanting. The ovary is usually single, free or adhering to the calyx, 1-celled; the styles 1, 3, or 4, occasionally wanting; the ovule solitary, attached to the bottom of the cell by a cord. The fruit is usually a drupe, the seed exalbuminous. The order contains about 95 known species, chiefly but not exclusively tropical, amongst which are a considerable number valuable for the resinous juices and varnishes which they yield, as the varnish of Sylhet, varnish of Martaban, Japan lacker, &c., and others, which produce wholesome and pleasant fruits. See CASHEW NUT, PISTACIA, MASTIC, TURPENTINE TREE, MANGO, HOG PLUM.

ANACARDIUM. See CASHEW NUT.

ANA'CHARIS, a genus of plants of the natural order *Hydrocharidææ* (q. v.), of which a species, *A. alsinastrum* (*Elodea Canadensis* of some botanists),

Anacharis Alsinastrum.

linear-oblong, transparent, 3–4 lines long. The female flowers are sessile in the upper axils, and are enclosed in a small 2-lobed spathe;

the slender tube of the perianth is often two or three inches long, so as to attain the surface of the water, where it terminates in three or six small spreading segments. The male flowers are seldom observed. The plant was first found in Britain in 1842, by the late Dr Johnston of Berwick, in the lake of Dunse Castle; and again in 1847 by Miss Kirby, in the reservoirs of a canal in Leicestershire. It is now very abundant and troublesome in the Trent, Derwent, and other rivers. Its rapidity of growth is extraordinary. Immense masses disfigure the shallows of the Trent, and cover the beds of the deeps. It strikes its shoots under the mud in a lateral direction for six inches or a foot, and then rises and spreads. The stems are very brittle, and every fragment is capable of growing, so that the means usually adopted to get quit of it serve rather for its propagation. It appears, however, that water-fowl are very fond of it; and by them, probably, its seeds may be conveyed from one river to another. It has been found that swans may be fed upon it with advantage, and its excessive growth kept down more effectually in this way than in any other. It is supposed to be a great impediment to the progress of salmon ascending the rivers in which it occurs; but for some kinds of fish, it probably affords both food and shelter. The manner of its introduction into Britain is unknown, although it has been conjectured that it may have escaped from some garden-pond—a conjecture the more doubtful, from the distance between the localities in which it was first found; but its rapid increase is of great scientific interest, in connection with the important subject of the distribution of species. As being calculated to block up water-courses, the plant involves some serious economic considerations.

ANACHA'RSIS, a Scythian and brother of King Saulos, visited Athens in the time of Solon, with whom he lived on terms of intimacy, but whose abilities for framing a constitution he does not seem to have estimated highly. Incited by a love of learning, he subsequently travelled through several countries. On account of his clearness of understanding, he was numbered among the seven wise men; and many sagacious proverbs and sayings were ascribed to him. No other 'barbarian' ever received the Athenian franchise. The letters which bear his name were written long after his time. It is said that, after his return to his native land, he was put to death by order of the king, who feared the introduction of the mysteries belonging to the Greek religion, in which it was supposed that A. had been initiated.

Under the title, *Voyage du Jeune Anacharsis en Grèce* (Travels of the young Anacharsis in Greece), Jean Jacques Barthélemy, a well-known French author (q. v.), wrote a description of Greek life and manners, displaying learning and good taste, but disfigured by many anachronisms. A. is made to visit Athens only a few years before the birth of Alexander the Great, and the features of several distinct periods in Grecian history are confusedly regarded as having been contemporaneous. The book, therefore, will not bear a critical examination; but it has contributed its share towards an improved knowledge of ancient life, and has given rise to several similar works, such as the *Gallus* and *Charicles* of Becker. The A. of Barthélemy has been translated into English, and is to be found in most old libraries; it is still a deservedly esteemed work, which may be read with advantage by the young.

ANA'CHRONISM, an error in chronology. Sometimes an A. is purposely made for the sake of effect, or to bring certain events within convenient

compass for dramatic purposes. Shakspeare, in his *Julius Cæsar*, makes the 'clock' strike three; and Schiller, in his *Piccolomini*, speaks of a 'lightning-conductor' as existing about 150 years before the date of its invention. These discrepancies, however, do not seriously injure the general truth of a poetical work. The A. is more offensive when, in a work which pedantically adheres to the costumes and other external features of old times, we find a modern style of thought and language, as in the old French dramas of Corneille and Racine. In popular epic poetry, A. is a common feature. Achilles is always young; Helena, always beautiful. In their versions of old classic traditions, the writers of the middle ages converted Alexander, Æneas, and other ancient heroes, into good Christian knights of the 12th c. In the *Nibelungen-lied*, Attila and Theodoric are good friends and allies, though the latter began to reign some 40 years after the former. At the end of the poem, the heroine, who must have been nearly sixty years old, and had passed through great affliction and sorrow, is still 'the beautiful Queen Kriemhild.'—Many ludicrous examples of A. may be found in old paintings—e.g., Abraham, Isaac, and Jacob in modern costumes.

ANACREON, one of the most esteemed lyric poets of Greece, was born at Teos, a seaport of Ionia, spent part of his youth in Abdera, to which place most of his fellow-townsmen emigrated when the city was taken by the Persians in 540 B.C., and rose to fame as a poet about 530 B.C. He was patronised by Polyocrates, the ruler of Samos, who invited him to his court; and there he sang, in light and flowing strains, the praise of wine and beauty. After the death of Polyocrates, he went to Athens (521 B.C.), and was received with distinguished honour by Hipparchus. On the fall of Hipparchus, he left Athens, and probably returned to Teos, from which, during the insurrection of Ionia against Darius, he fled to Abdera, where he died, at the age of 85. According to tradition, he was choked by a dried grape. Great honours were paid to him after his death; Teos put his likeness upon its coins, and a statue was raised to him on the Acropolis of Athens, which represented him in a state of vinous hilarity.

Only a few of his poems have been preserved. Of five Books which once existed, only 68 lyrics now exist which bear his name; but of these, comparatively few are to be confidently regarded as genuine. They exhibit great simplicity and delicacy of expression, fertility of invention, and variety of illustration. Moore, a poet of congenial spirit, translated the *Odes* of A. into English verse.

ANACYCLUS. See PELLITORY OF SPAIN.

ANADYOMENE ('emerging'), one of the names of Venus; a painting by Apelles, representing Venus rising from the sea, and wringing her flowing wet hair. Phryne or Pancaste was supposed to have supplied the model for this master-piece of Apelles. The inhabitants of the island of Cos bought the picture, and placed it in the temple of Æsculapius. Augustus afterwards bought it for 100 talents of remitted taxes, and placed it in the temple of Venus Genetrix. It is frequently described in the Greek anthology.

ANÆMIA (from *a*, privative, and *aima*, blood) is the condition generally termed poverty of blood, and consists essentially of a diminution in the fibrine, and especially in the proportion of red corpuscles of the blood (see BLOOD), which in some cases of A. may be so low as 27 in 1000 parts. Persons in an anæmic condition have pale waxy complexions, pallid lips and tongues, and if blood be drawn from them, it forms a clot which is less red, and also smaller in

proportion to the serum, than blood from a healthy person.

They suffer from palpitations, fainting, and headaches, singing in the ears, and disturbed vision; and the symptoms may simulate organic disease within the head or of the heart. This A. condition may be induced by repeated losses of blood, or by defective nutrition, or by some cause, as in chlorosis, when the balance is disturbed between the loss and reproduction of the red corpuscles.

The curative treatment of A. consists in allowing the patient fresh air, good nourishment, and those materials which promote the formation of the deficient elements of the vital fluid. Of these, the principal is iron, of which there are several preparations. This remedy has, in some instances of chlorosis, doubled the proportion of red blood corpuscles in a very short time.

ANÆSTHESIA (*a*, privative, and *aisthēsis*, sensation) is a term used to express a loss of sensibility to external impressions, which may involve a part or the whole surface of the body. In some diseased conditions of the nervous centres, a part of the body may become totally insensible to pain, while in another part, sensation may be unnaturally acute, or be in a state of hyperæsthesia. When a nerve is divided, the parts which it supplies lose their sensation; and in some diseases, as the *elephantiasis gracorum*, a loss of sensation in patches of the skin is an early and characteristic symptom. This insensibility to external impressions may be either *peripheral*—that is, on the surface of the body—or *central*, that is, from a cause acting primarily upon the brain or spinal cord; and some means of temporarily inducing either of these has always been earnestly sought by surgical practitioners.

In ancient writers, we read of insensibility or indifference to pain being obtained by means of the Indian hemp (*Canabus Indica*), either inhaled or taken into the stomach. The Chinese, more than 1500 years ago, used a preparation of hemp, or *ma-yo*, to annul the pain attendant upon cauterisation and surgical operations. Probably, they used the hemp by inhalation. The Greeks and Romans used mandragora for a similar purpose (*poiein anaisthēsan*); and as late as the 13th c., the vapour from a sponge filled with mandragora, opium, and other sedatives was used. The mandragora, however, occasionally induced convulsions, with other alarming symptoms; and though Bulleyn, an English author (1579), mentions the possibility of putting patients who were to be cut for the stone into 'a trance or a deepe terrible dreame' by its use, it gradually became obsolete and banished from the pharmacopœia; and although it is probable that surgeons occasionally endeavoured to procure A. for their patients, there was no one means of doing so in general use. John Baptista Porta, of Naples, in his work on Natural Magic (1597), speaks of a quintessence extracted from medicines by somniferous *menstrua*, the nature of which he does not mention. This was kept in leaden vessels, perfectly closed, lest the *aura* should escape, for the medicine would vanish away. 'When it is used, the cover being removed, it is applied to the nostrils of the sleeper, who draws in the most subtle power of the vapour by smelling, and so blocks up the fortress of the senses, that he is plunged into the most profound sleep, and cannot be roused without the greatest effort. . . . These things are plain to the skilful physician, but unintelligible to the wicked.' Dr Snow suggests that the evanescent substance was sulphuric ether, which had been described more than fifty years before. In 1784, Dr Moore, of London, used compression on the nerves of a limb requiring amputation, but this method was in itself productive

of much pain. In 1800, Sir Humphry Davy, experimenting with the nitrous oxide or laughing-gas, suggested its usefulness as an anæsthetic; and in 1828, Dr Hickman suggested carbonic acid gas. As early as 1795, Dr Pearson had used the vapour of sulphuric ether for the relief of spasmodic affections of the respiration. The fact that sulphuric ether could produce insensibility was shewn by the American physicians, Gedwin (1822), Mitchell (1832), Jackson (1833), Wood and Bache (1834); but it was first used to prevent the pain of an operation in 1846, by Dr Morton, a dentist of Boston. The news of his success reached England on 17th December 1846; on the 19th, Mr Robinson, a dentist, and Mr Liston, the eminent surgeon, operated on patients rendered insensible by the inhalation of the sulphuric ether. This material was extensively used for a year, when Dr J. Y. Simpson, of Edinburgh, discovered the anæsthetic powers of *Chloroform* (see *CHLOROFORM*), and introduced the use of it into his own department, midwifery. Since that time, chloroform has been the anæsthetic in general use.

Nothing could be more desirable than the power of producing *local A.*; but as yet no efficient and satisfactory agent has been discovered. Dr Arnott has indeed shewn that the application of a freezing mixture of ice and salt can render a part insensible to the surgeon's knife; and for dentistry, Mr Morrison, of Edinburgh, has lately introduced an apparatus by which a current of air, at a very low temperature, can be applied to the gum. But the pain of the application is often found little less than that which it is intended to prevent. From various causes, and especially the well-merited confidence of the public in its safety, when skilfully employed, chloroform continues to occupy its high place as one of the greatest blessings granted to man. It is proper, however, to say that it requires to be used under certain precautions, and that in unskilful hands its application may be fatal. It should be administered only by expert practitioners.

See *On Chloroform and other Anæsthetics*, by John Snow, Lond. 1858; *The Obstetric Memoirs and Contributions* of James Y. Simpson, Edin. 1855; also an article on Anæsthesia in the *Westminster Review* for Jan. 1859.

ANAGALLIS. See PIMPERNEL.

ANAGRAM (from the Greek *ana*, backwards, and *gramma*, writing), the transposition of the letters of a word, phrase, or short sentence, so as to form a new word or sentence. It originally signified a simple reversal of the order of letters, but has long borne the sense in which it is now used. The Cabalists attached great importance to anagrams, believing in some relation of them to the character or destiny of the persons from whose names they were formed. Plato entertained a similar notion, and the later Platonists rivalled the Cabalists in ascribing to them mysterious virtues. Although now classed among follies, or at best among ingenious trifles, anagrams formerly employed the most serious minds, and some of the puritanical writers commended the use of them. Cotton Mather, in his elegy on the death of John Wilson, the first pastor of Boston, in New England, mentions

His care to guide his flock and feed his lambs
By words, works, prayers, psalms, alms, and anagrams.

The best anagrams are such as have, in the new order of letters, some signification appropriate to that from which they are formed. It was a great triumph of the mediæval anagrammatist to find in Pilate's question, '*Quid est veritas?*' (What is truth?) its own answer: '*Est vir qui adest!*' (It is the man who is here). Anagrams, in the days of their popularity, were much employed, both for complimentary

and for satirical purposes; and a little straining was often employed in the emission, addition, or alteration of letters, although, of course, the merit of an A. depended much upon its acuteness.

I. D'Israeli (*Curiosities of Literature*, vol. iii.) has a chapter on anagrams, which, as an exercise of ingenuity, he ranks far above acrostics. Among a great many considered by him worthy of record, are the following: The mistress of Charles IX. of France was named *Marie Touchet*; this became *Le charme tout* (I charm every one), 'which is historically just.' The flatterers of James I. of England proved his right to the British monarchy, as the descendant of the mythical King Arthur, from his name *Charles James Stuart*, which becomes *Claims Arthur's Seat*. An author, in dedicating a book to the same monarch, finds that in *James Stuart* he has a *just master*. 'But, perhaps, the happiest of anagrams was produced on a singular person and occasion. Lady Eleanor Davies, the wife of the celebrated Sir John Davies, the poet, was a very extraordinary character. She was the Cassandra of her age, and several of her predictions warranted her to conceive she was a prophetess. As her prophecies in the troubled times of Charles I. were usually against the government, she was at length brought by them into the Court of High Commission. The prophetess was not a little mad, and fancied the spirit of Daniel was in her, from an A. she had formed of her name,

ELEANOR DAVIES.

Reveal, O Daniel!

The A. had too much by an *l*, and too little by an *s*; yet *Daniel* and *reveal* were in it, and that was sufficient to satisfy her inspirations. The court attempted to dispossess the spirit from the lady, while the bishops were in vain reasoning the point with her out of the Scriptures, to no purpose, she poisoning text against text: one of the deans of the arches, says Heylin, shot her through and through with an arrow borrowed from her own quiver; he took a pen, and at last hit upon this excellent A.:

DAME ELEANOR DAVIES.

Never so mad a Ladie!

The happy fancy put the solemn court into laughter, and Cassandra into the utmost dejection of spirit. Foiled by her own weapons, her spirit suddenly forsook her; and either she never afterwards ventured on prophesying, or the A. perpetually reminded her hearers of her state—and we hear no more of this prophetess.

On a visit to King's Newton Hall, in Derbyshire, Charles II. is said to have left written on one of the windows, *Cras ero lux* (To-morrow I shall be light), which is the A. of *Carolus Rex*.

ANAHUAC, a Mexican term, said to signify 'near the water.' Its application is vague in the extreme. It is either a plateau or a ridge. As a ridge, again it oscillates between the continuation of the Rocky Mountains, below lat. 40° N., and that branch of the chain which runs nearly parallel to the upper course of the Rio Bravo del Norte; and as a plateau, it designates either the whole of the table-land of Mexico or certain portions thereof, more or less extensive, with the capital as a common centre. Practically, if one acceptance is more generally admitted than another, A. may be regarded as the largest of those plateaus—a definition which, with reference to the number of lakes, seems more peculiarly to suit the etymology of the word. See further, *CORDELLERAS OF CENTRAL AMERICA*—a description which, for want of a briefer and better one, may be made to embrace all that less regular section of the backbone of America which lies between the simple formations of the

Andes to the south and the Rocky Mountains to the north.

ANAKIM, a gigantic race of people, whose stronghold was Kirjath-arba, in the south of Palestine. In the opinion of some biblical critics, they were not Canaanites, as they are not included in the list of devoted nations; others, again, conclude from the fact that invariably mention is made only of three individuals or families, that the name is appellative rather than gentile, and that the A. were merely particular tribes of the wide-spread and powerful Amorites, distinguished for their unusual stature. Be that as it may, the Israelites considered them too dangerous for neighbours, and consequently subjected them to the same stern treatment as the rest. It was the A. whose appearance so terrified the Hebrew spies who entered the Land of Promise from Kadesh-barnea. Those who escaped the sword of Joshua fled to the country of the Philistines; and it has been conjectured that Goliath and the other Philistine giants were their descendants; a supposition probable enough, when we reflect that the particular places in which the fugitive A. took refuge were Gaza, Gath, and Ashdod. The word Anak means a necklace or neck-chain; and some have supposed that these giants received that name from the circumstance of their wearing such ornaments proudly round their necks; others translate the word A. by 'long-necked men,' or men with long-stretched necks, i. e., men of great height. The A., however, in all probability, immediately derived their name from Anak, the son of Arba.

ANAKOLU'THON is a term employed both in Grammar and Rhetoric, to denote the absence of strict logical sequence in the grammatical construction. Good writers sometimes sacrifice this logical sequence to emphasis, clearness, or graceful arrangement. In colloquial speech, nothing is more common than examples of A.

ANAL GLANDS. Under this name may be described a large and diversified group of glands, found in many animals, and generally characterised by the disagreeable odour of their secretion. Those to which the name most strictly belongs are of frequent occurrence among carnivora and rodents; they consist of follicles which pour their secretion into sacs with muscular walls and narrow orifices, placed one on each side of the anus. According to the most recent investigations, it appears that these sacs are to be considered as prolongations inwards of the common integument, and that two sorts of glands open into them; one of a lobulated structure, having a fatty secretion, and representing the sebaceous glands of the skin greatly hypertrophied; the other crowded more at the bottom of the sac, tubular, and elaborating the specific secretion. In the hyæna, there is a single sac, which opens by a transverse fissure above the vent. There is a gradual passage from true A. G. to others of a somewhat different character. Thus, there are glands called inguinal in the hare and rabbit—little bare places pouring out an unctuous secretion, which are held to be equivalent to A. G., only not enclosed in sacs. The civet cat has an anal sac on each side of the vent; and also two other sacs opening by a common outlet in front of the vent; and from the latter is derived the substance known as civet, which the negroes seek for on the trees where it has been left by the civet cats. The civet gland furnishes a natural link between the A. G. and those more closely connected with the genital apertures, called preputial. The most remarkable are those of the beaver, large sacs found both in the male and female, and which furnish the

castoreum of commerce. The beaver has true A. G. besides. The sac which contains the musk of the musk-deer lies in the middle line beneath the skin of the abdomen, and opens at the prepuce. The secretion peculiar to badgers, polecats, and skunks, and which they use as an instrument of defence, shielding themselves from their adversaries by an overpowering and intolerable odour, comes from a pouch situated beneath the tail. In some animals, we meet with secretions similar to some of the above, poured out on other parts of the body. Thus, in the bat, there are glands on the face opening above the mouth, which prepare a fetid oily secretion; the so-called lachrymal follicles of ruminants, and the cutaneous glands of the tail of the deer, secrete a dark unctuous humour; and the temporal gland between the eye and the ear of the elephant pours out an oily substance at rutting-time. The peccary has an odoriferous gland on its back; and the crocodile has a musk-sac under the lower jaw. Anal sacs opening immediately behind the vent are also found in the crocodile and in many serpents.

ANALOGUE, a term in Comparative Anatomy. Organs are *analogous* to one another, or are *analogues*, when they perform the same function, though they may be altogether different in structure; as the wings of a bird, and the so-called wings of the flying lizard. Organs, again, are *homologous*, or *homologues*, when they are corresponding parts in the skeleton, however different their form and function. Thus, the arms of a man, the pectoral fins of a fish, and the wings of a bird, are homologues of one another. See **HOMOLGY**.

ANA'LOGY, a term originally Greek, and which signifies an agreement or correspondence in certain respects between things in other respects different. Euclid employed it to signify proportion, or the equality of ratios, and it has retained this sense in mathematics; but it is a term little used in the exact sciences, and of very frequent use in every other department of knowledge and of human affairs. In Grammar, we speak of the A. of language, i. e., the correspondence of a word or phrase with the genius of the language, as learned from the manner in which its words and phrases are ordinarily formed. A., in fact, supposes a rule inferred from observation of instances, and upon the application of which, in other instances not precisely, but in some respects, similar, we venture, with more or less confidence, according to the degree of ascertained similarity, and according to the extent of observation from which our knowledge of the rule has been derived. The opposite to A. is *Anomaly* (Gr. irregularity); and this term is used not only in Grammar, but with reference to objects of Natural History which in any respect are exceptions to the ordinary rule of their class or kind. In the progress of science, analogies have been discovered pervading all nature, and upon which conclusions are often based with great confidence and safety. Reasoning from A. indeed warrants only probable conclusions; but the probability may become of a very high degree, and in the affairs of life we must often act upon conclusions thus attained. Reasoning from A., however, requires much caution in the reasoner. Yet even when its conclusions are very uncertain, they often serve to guide inquiry and lead to discovery. Many of the most brilliant discoveries recently made in Natural Science were the result of investigations thus directed. Where the proper evidence of truth is of another kind, arguments from A. are often of great use for the removal of objections. It is thus that they are employed by Bishop Butler in his *A. of Religion*,

Natural and Revealed, to the Constitution and Course of Nature. In Law, reasoning from A. must often, to a certain extent, be admitted in the application of statutes to particular cases. Upon similar reasoning, the practice of medicine very much depends. To discover the meaning of any composition, it is also often necessary; the sense of the author in a passage somewhat obscure being in some measure determined according to passages in which he has expressed himself more clearly. The application of this rule to the interpretation of Scripture is a point of difference between Protestants and Roman Catholics, the latter insisting upon the interpretation of difficult passages by ecclesiastical tradition and authority. The extension of it to the whole Scriptures, however, depends upon the admission of their inspiration; but this, when fully admitted, warrants a more confident use of analogical reasoning than in the case of the works, or even of a single work, of an uninspired author. Protestant theologians have very generally employed, with reference to this rule of interpretation, the phrase 'A. of Faith,' deriving it from Rom. xii. 6; but the meaning of the expression in that verse is disputed. However, the reality of an A. of faith, and the right of reasoning from it, are not affected by any criticism on that verse.

ANALYSIS (Gr.), the resolution of a whole into its component parts. In mental philosophy, this term is applied to the logical treatment of an idea so as to resolve it into other ideas which combine to form it. A judgment or proposition may thus also be analysed. The opposite of A. is *Synthesis* (q. v.); and the opposition of these terms is common in other branches of science as well as in mental philosophy. We speak of an *analytic* method in science, and of a *synthetic method*; and both are necessary, the one coming to the assistance of the other to secure against error, and promote the ascertainment of truth. The analytic method proceeds from the examination of facts to the determination of principles; whilst the synthetic method proceeds to the determination of consequences from principles known or assumed. The test of perfection in a theory is the harmony of the results obtained by the methods of A. and synthesis.

Mathematical A., in the modern sense of the term, is the method of treating all quantities as unknown numbers, and representing them for this purpose by symbols, such as letters, the relations subsisting among them being thus stated and subjected to further investigation. It is therefore the same thing with Algebra, in the widest sense of that term, although the term algebra is more strictly limited to what relates to equations, and thus denotes only the first part of A. The second part of it, or A. more strictly so called, is divided into the A. of Finite Quantities, and the A. of Infinite Quantities. To the former, also called the Theory of Functions, belong the subjects of Series, Logarithms, Curves, &c. The A. of Infinites comprehends the Differential Calculus, the Integral Calculus, and the Calculus of Variations. To the diligent prosecution of mathematical A. by minds of the greatest acuteness, is to be ascribed the great progress both of pure and applied mathematics within the last two centuries.

The A. of the ancient mathematicians was a thing entirely different from this, and consisted simply in the application of the analytic method as opposed to the synthetic, to the solution of geometrical questions. That which was to be proved being in the first place assumed, an inquiry was instituted into those things upon which it depended, and thus the investigation proceeded, as it were, back, until something was reached which was already ascertained, and from which the new proposition might be seen by

necessary consequence to flow. A reversal of the steps of the inquiry now gave the synthetical proof of the proposition. The modern mathematical A. affords a much more easy and rapid means of solving geometrical questions; but the ancient A. also afforded opportunity for the exercise of much acuteness, and was the chief instrument of the advancement of mathematical science until comparatively recent times. The invention of it is ascribed to Plato; but of the works of the ancients on geometrical A. none are extant, except some portions of those of Euclid, Apollonius of Perga, and Archimedes.

ANALYSIS, in Chemistry, is the term applied to that department of experimental science which has for its object the chemical disunion or separation of the constituents of a compound substance; thus, the resolution of water into its components hydrogen and oxygen; of common salt into chlorine and sodium; of marble into lime and carbonic acid; of rust into iron and oxygen; of sugar into carbon, hydrogen, and oxygen; and of chloroform into carbon, hydrogen, and chlorine—are all examples of chemical A. This department of chemistry, therefore, takes cognizance of the breaking down of the more complex or compound substances into their more simple and elementary constituents, and is antagonistic to *chemical synthesis*, which treats of the union of the more simple or elementary bodies to produce the more complex or compound. Chemical A. is of two kinds: *Qualitative A.*, which determines the quality or nature of the ingredients of a compound, without regard to the quantity of each which may be present; and *quantitative A.*, which calls in the aid of the balance or measure, and estimates the exact proportion, by weight or volume, in which the several constituents are united. Thus, *qualitative A.* informs us what water, marble, common salt, &c., are composed of; but it remains for *quantitative A.* to tell us that water consists of 1 part of hydrogen by weight united with 8 parts of oxygen; that marble is composed of 28 parts of lime, and 22 of carbonic acid; common salt, of 35½ parts of chlorine, and 23 of sodium; turpentine, of 30 carbon, and 4 hydrogen; chloroform, of 12 carbon, 1 hydrogen, and 106½ chlorine.

The divisions of inorganic (mineral) chemistry and organic (vegetable and animal) chemistry have led to a corresponding classification of chemical A. into *inorganic A.*, comprehending the processes followed and the results obtained in the investigation of the atmosphere, water, soils, and rocks; and *organic A.*, treating of the modes of isolation, and the nature, of the ingredients found in or derived from organised structures—viz., plants and animals. Both departments afford examples of what are called *proximate* and *ultimate A.* Proximate A. is the resolution of a compound substance into components which are themselves compound; thus, in inorganic chemistry, marble is resolved into lime (calcium united with oxygen) and carbonic acid (carbon with oxygen); whilst ultimate A. comprehends the disunion of a compound into its *elements* or the simplest forms of matter; thus, lime into calcium and oxygen; carbonic acid into carbon and oxygen; water into hydrogen and oxygen. Organic chemistry affords still better examples of each class: thus, ordinary wheat-flour, when subjected to proximate A., yields, as its proximate components, gluten (vegetable fibrin), albumen, starch, sugar, gum, oil, and saline matter; but each of these proximate ingredients is in itself compound, and when they undergo ultimate A., the gluten and albumen yield, as their ultimate elements or constituents, carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus; and the starch, sugar, gum, and oil are found built up of carbon, hydrogen, and oxygen.

Several other terms are in use in chemical treatises: thus, *Gas A.* is applied to the processes employed in the examination of the various gases, and is every day becoming of more and more importance and interest. *Metallogie A.* includes the smelting of metallic ores, the assay of alloys of gold, silver, &c., and, in general, everything that pertains to the ultimate *A.* of metallic ores and compounds. *Agricultural A.* is restricted to the examination of manures, feeding-stuffs, and soils; *Medical or Physiological A.* to the investigation of blood, urine, and other animal fluids and juices, and the examination of medicinal compounds; whilst *Commercial A.* is the term used where great accuracy or nicety of detail is not required in an *A.*, but where the commercially important constituents alone are determined, as the separation and recording of the amount of phosphates, ammonia, and alkaline salts in a sample of guano; the total amount of saline matter in a certain water; the iron in an ironstone, the lime in a limestone, &c.

ANALYTICAL CHEMISTRY is that department of chemistry which takes cognizance of analyses. The analytical chemist requires some peculiar apparatus, together with reagents, generally solutions, by the addition or reaction of which the nature and amount of the ingredients of a compound are determined.

ANAM, a feudatory dependency of China, in the east portion of Further India, comprising, from the Celestial Empire southwards, Tonquin, Cochin China, and part of Cambodia. It lies between lat. 9° and 23' N., and between long. 102° and 109° E. Its area is about 98,000 square miles—considerably more than that of Great Britain; while its population is estimated at 5,000,000, all Buddhists, excepting, what is singular enough, about 400,000 Christians. The inhabitants, however, are not noted for the earnestness of their religious feelings. Their sense of the supernatural manifests itself principally in reverence for the dead, whose obsequies are performed with great splendour. The Anamese language resembles the Chinese. It is monosyllabic and harsh, and contains no literature. Whatever of this is found in *A.* is borrowed from their 'Celestial' kinsmen in the north. They have a maritime taste, and excel in ship-building. The king himself seems to keep them busy in this way, for, besides having 800 war-craft, he monopolises, by means of larger vessels, the foreign trade of his dominions. The climate is said to be salubrious, and the soil to be productive—features which, combined as they are, with some of the best harbours in the world, recommend *A.* alike for commerce and for colonisation. These advantages France appears to appreciate, for it is at this moment making its third attempt to gain an ascendancy in the country, the first having been made as far back as the days of Louis XVI.

ANAMIRTA. See COCCULUS INDICUS.

ANANAS. See PINE APPLE.

ANARCHY (from the Gr. *a.* privative, and *arche*, government), the state of society without any regular government, when a country is torn by the strife of parties, and no law or authority remains. Complete *A.* is necessarily rare and of short duration; but conditions approaching to it often arise after revolutions and gross abuses in government; and in such cases it is apt to become, as in the South American states, a chronic or permanent evil, attended with constant national decay.

ANARRICHAS. See WOLF-FISH.

ANAS, a Linnean genus of birds, included in the order *Palmipedes* (Web-footed birds) of the system of Cuvier, and divided by recent ornithologists into a number of genera; one of which, retaining the name *A.*, contains the true Ducks, and others contain

the Swans (*Cygnus*), Geese (*Anser*), Scoters (*Oidemia*) Garrots (*Clangula*), Eiders (*Somateria*), Pochards (*Fuligula*), Shovelers (*Rhyncaspis*), Sheldrakes (*Tadorna*), Musk-ducks (*Cairina*), Teals (*Querquedula*), Widgeons (*Marca*), &c. These, with Mergansers (*Mergus*) and Flamingoes (*Phoenicopterus*), constitute the family *Anatida* of some ornithologists. Cuvier places them in a family called by him *Lamellirostres*, and distinguished by a thick bill, horny only at the nail-like extremity, and elsewhere invested with a soft skin, the edges furnished with lamina, or with small teeth particularly adapted for the purpose of separating the food from the mud which is often taken into the bill along with it. The lamina, and a large and broad bill, are the chief characteristics of the old genus *A.* Some, as the true ducks, subsist in great part on small insects; others, as geese and swans, almost exclusively on vegetable food. The species are very numerous, distributed over all parts of the world, some of them very abundant in the polar regions. Some are important for their feathers or down, others for their flesh and for their eggs. A few have been domesticated, and are commonly kept for economic uses. See DUCK, GOOSE, SWAN, EIDER, BARNACLE, TEAL, &c.

ANASTASIUS I., Patriarch of Constantinople, was born in the second half of the 7th c. He favoured the party of iconoclasts, or image-breakers. He owed his elevation to the Emperor Leon, who exacted from him a pledge that he would assist in the destruction of the images. *A.* kept his word; but having made himself obnoxious to the new emperor, Constantine Copronymus, the latter (743) seized him, put out his eyes, and marched him through the hippodrome (race-course) mounted on an ass with his head to the tail. He died in 753.

ANASTASIUS, SAINT, surnamed ASTRIC, apostle of the Hungarians, was born in 954, and died in 1044. A Frenchman by birth, he finally settled, after various changes, at the court of Stephen, Duke of Hungary, where he became very influential, and was intrusted with the ecclesiastical organisation of the land. All his energies were devoted to securing the triumph of the Christian faith.

ANASTASIUS I. was elected pope, or rather bishop of Rome, in 398 A.D. He succeeded Siricius, one year after the death of Ambrose. Under his pontificate, flourished Chrysostom, Augustine, and Jerome. The most conspicuous act of his life was the reconciliation of the church of Antioch with that of Rome, after a schism of 17 years. Among the epistles attributed to *A.*, two are obviously apocryphal; the one addressed to Nere-nianus; the other, to the German bishops. The latter commanded the faithful to remain standing while the gospel was read in the churches, that neophytes should receive holy orders only on the recommendation of five bishops, and that the Manichaeans, who had been expelled from Rome, should not be admitted into Germany. But the first of these epistles is posterior to the death of *A.*, and the second, anterior to his accession to the pontificate. *A.* was vehemently opposed to the doctrines of Origen, one of whose works (*Pari Archon*, i. e., 'Concerning Principles') he condemned as heretical. For this, he is praised by Jerome, who calls him a man of a holy life, of a 'rich poverty,' and of an apostolical earnestness. During his life, several councils were held, at Carthage, Constantinople, Ephesus, and Toledo. He died Dec. 14, 401 A.D.—There were three other popes of this name. ANASTASIUS II. (496—498), ANASTASIUS III. (911—913), and ANASTASIUS IV. (1153—1154). See POPE.

ANASTASIUS I., emperor of the East, was born in 430 A.D., at Dyrrachium, in Epirus, of an

obscure family. The early portion of his life is unknown to history. On the death of Zeno, he was proclaimed emperor by the senate, and crowned on the 11th April 491, at the age of 60. He owed his elevation to Ariadne, widow of Zeno, whom he married. No monarch was ever more notable for his heresies. One of his generals, Vitalian, taking advantage of this unpopular feature of his character, revolted, ravaged Thrace, Scythia, and Moesia, compelled Anastasius to promise to recall the orthodox bishops whom he had banished, and secured for himself the title of Governor of Thrace. Anastasius, however, had some good natural qualities, and performed certain praiseworthy actions. He suppressed the cruel and degrading spectacles where men fought with wild beasts, abolished the sale of offices, the tax on domestic animals, which had existed since the days of Vespasian, built a wall on the west side of Constantinople to defend it from the incursions of the barbarians, constructed aqueducts in the city of Hierapolis, made a harbour at Casarea, and restored the 'pharos' or light-house at Alexandria. He died 8th July 518.—ANASTASIUS II., emperor of the East, was born about the middle of the 7th c., and died in 719 A.D. His great aim was to restore peace to the church, but his measures led to his deposition.

ANASTATIC PRINTING. See PRINTING.

ANASTATICA. See ROSE OF JERICHO.

ANASTOMOSIS (Gr. the making of a mouth or opening), an anatomical term used to express the union of the vessels which carry blood or other fluids, and also, for convenience' sake, the junction of nerves. The veins and absorbents anastomose to form large single trunks, as they approach their ultimate destinations. The arteries break up into small branches, for the supply of the tissues, and each small vessel, again, communicates with others given off above and below. At each large joint there is very free A., so that the safety of the limb beyond may not be entirely dependent on the single arterial trunk passing into it, exposed as it is to all the obstructive influences of the different motions of the limb. After the main artery has been permanently obstructed, the anastomosing vessels enlarge, so as to compensate for the loss; but after a time, only those whose course most resembles the parent trunk continue enlarged, and the others gradually regain their ordinary dimensions.

An idea of the profusion of this anastomosing system may be formed from the fact, that if the innominate artery, or great vessel destined for the supply of the right upper half of the body, be tied, and those on the left side injected with size and vermilion, the injection will flow freely into the arteries of the right arm, through branches as minute as they are numerous.

Arteries anastomosing.

ANA'THEMA (Gr., a thing set or hung up or apart—i. e., as consecrated), a word originally signifying some offering or gift to Deity, generally suspended in the temple. Thus, we read in Luke xxi. 5, that the temple was adorned 'with goodly stones and gifts' (*anathemasi*). It also signifies a sacrifice to God; and, as the animals devoted to be sacrificed could not be redeemed from death, the word was ultimately used in its strongest sense, implying eternal perdition, as in Rom. ix. 3; Gal. i. 8 and 9; and other places. In the Catholic Church, from the 9th c., a distinction has been made between excommunication and anathematising; the latter

being the extreme form of denunciation against obstinate offenders. The synod of Pavia, in 850, determined that all transgressors who refused to submit to discipline, such as penance, should be not merely excommunicated, but anathematised, and deprived of every kind of Christian hope and consolation. Such a sentence could not be pronounced without the concurrence of the provincial bishops with their metropolitan. See EXCOMMUNICATION.

ANATOLIA (Gr. Anatolé, the East, i. e., from Constantinople) is the modern name for Asia Minor; Turkish, Anadolí. It may be considered as coincident with the peninsula; the boundary-line on the east between it and Armenia and Mesopotamia, not being natural, cannot be well defined. The area of the peninsula exceeds 200,000 square miles. It constitutes the western prolongation of the high table-land of Armenia, with its border mountain-ranges. The interior consists of a great plateau, or, rather series of plateaus, rising in gradation from 2400 to 5000 feet, with bare steppes, salt plains, marshes, and lakes; the structure is volcanic, and there are several conical mountains, one of which, the Agridagh (Argæus), with two craters, rises 10,000 feet above the plain of Kaisarijeh, which has itself an elevation of between 2000 and 3000 feet. The plateau is bordered on the north by a long train of parallel mountains, varying from 4000 to 6000 feet high, and cut up into groups by cross valleys. These mountains sink abruptly down on the north side to a narrow strip of coast; their slopes towards the interior are gentler and bare of wood. Similar is the character of the border ranges on the south, the ancient Taurus, only that they are more continuous and higher, being, to the north of the Bay of Skanderun or Issus, 10—12,000 feet, and further to the west, 8—9000 feet. The west border is intersected by numerous valleys, opening upon the Archipelago, through the highlands of the ancient Caria, Lydia, and Mysia, to the northern part of which Mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast-lands of the Levant. The rivers of A. are not considerable; the largest are the Yeshil Irmak (Iris), the Kisil Irmak (Halys), and the Sakkariah (Sangarius), flowing into the Black Sea; and the Sarabat (Hermus) and Minder (Maander) into the Ægean.

The climate wears on the whole a south-European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer, and a cold in winter; the south coast has mild winters and scorching summers; while on the coast of the Ægean there is the mildest of climates and a magnificent vegetation. On the north side, the climate is not so mild, nor the productions of so tropical a kind as on the west; yet the vegetation is most luxuriant, and a more delightful or richer tract than the coast from the Sea of Marmora to Trebizond, is hardly to be found. The whole peninsula, however, is liable to earthquakes.

In point of natural history, A. forms the transition from the continental character of the East to the maritime character of the West. The forest-trees and cultivated plants of Europe are seen mingled with the forms peculiar to the East. The central plateau, which is barren, except where there are means of irrigation, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; while the coasts, rich in all European products, fine fruits, olives, wine, and silk, have quite the character of the south of Europe, which on the warmer and drier south coast shades into that of Africa.

The inhabitants consist of the most various races.

The dominant race are the Osmanli Turks, who number about 1,200,000, and are spread over the whole country; next to these come the Turkomans, belonging to the same stock, and speaking a dialect of the same language. These are found chiefly on the table-land, leading a nomadic life; there also live hordes of nomadic Kurds. Among the mountains east of Trebizond are the robber tribes of the Lazes. The population of the towns, in addition to Turks, consists, in the west, chiefly of Greeks and Jews; and in the east, of Armenians; the non-Turkish population, along with Europeans in the maritime parts, have the whole commerce of the country in their hands. The whole population of the peninsula is supposed not to exceed 5,000,000; the official census of 1844 made it 10,700,000, including Armenia; but this is thought to be much over-estimated. The political and social arrangements are much as in the rest of Turkey (q. v.). One peculiarity is the old Turkish system of vassal-dynasties, the Dere-begs (valley chiefs), who, like the feudal lords of the middle ages in Europe, are hereditary rulers and military commanders of their district, under the suzerainty of the sultan. This institution is in greatest force in the north-east of the peninsula. The power of these feudal chiefs, however, was broken by Sultan Mahmud.

The whole country is divided at present into eight *eyalets* or governments, under governors-general, and each of these, again, into several *sandjaks*, or provinces, under lieutenant-governors. The *eyalets* are: 1. Khudavendkiar, in the north-west, including ancient Mysia, the west part of Bithynia, and part of Phrygia; chief town Brussa. 2. Kastamuni, occupying the middle of the north coast, including ancient Paphlagonia, the east of Bithynia, and part of Pontus; chief town, Kastamuni. 3. Tarabosan or Trabezun (Trebizond), the ancient Pontus and Colchis; capital, Trebizond. 4. Aidin, in the south-west, the ancient Lydia, Caria, and Phrygia; capital, Ismir or Smyrna. 5. Karaman (Karamania), eastward from Aidin, the ancient Lycia, Pamphylia, Pisidia, Lycaonia, and part of Cilicia; chief town, Konieh (Iconium). 6. Adana, comprehending the rest of Cilicia, Kataonia, and part of Cappadocia; chief town, Adana. 7. Bosok, the central part of the peninsula, ancient Cappadocia and Galatia, chief town, Enguri or Angora. 8. Sivas, east from Bosok, embracing parts of Pontus and Little Armenia; chief town, Sivas.

ANATOMY (Gr., a cutting up or dissecting) is the science of the form and structure of organic bodies, and is practically acquired by separation of the parts of a body, so as to shew their distinct formation, and their relations with each other. It is generally understood as applied to the human body, while the A. of animals is styled ZOOLOGY, and that of plants, PHYTOTOMY. The investigation and comparison of the structures of the different kinds of organic bodies is styled COMPARATIVE A. Theoretical A. is divided into GENERAL and SPECIAL.

GENERAL A. gives a description of the elementary tissues of which the systems and organs of the body are composed, as preliminary to an examination of them in their combined state in the various organs: it also investigates their laws of formation and combination, and the changes which they undergo in various stages of life. This branch of study may also be styled Structural or Analytical A., and has been first developed in recent times, especially by Bichat (1801) and Borden, who have been followed by J. Müller, Goodsir, Mayer, E. H. Weber, Schwann, Valentin, and many others. In our day, microscopic investigation has been successfully applied to the study of elementary textures. See HISTOLOGY.

SPECIAL A. (styled Descriptive by the French writers) treats of the several parts and organs of the body in respect to their form, structure, and systematic connection or relation with each other. The arrangement of the several parts and organs in an order deduced from their similarity in structure or use, constitutes SYSTEMATIC A. According to this mode of study, which is essential as an introduction to physiology, A. has been divided, though not with scientific precision, into six branches of study. 1. *Osteology*, which treats of the bones, including the cartilages of the joints (chondrology).—2. *Syndesmology*, which describes the ligaments, or bands, that unite the bones of various joints. The bones, with their cartilages and ligaments, form a framework, which supports the external soft parts, and within which the vital organs are suspended and protected from injury; they are also arranged in a mechanical system as instruments of motion.—3. *Myology* explains the system of the muscles, which, by their contractile power, serve to impart motion to the bones and joints; while, like the bones, they contribute to form the cavities of the body, and to protect the internal organs. Their structure also serves to produce the external shape and symmetry.—4. *Angiology* describes the vessels or ducts, with their complex net-work and ramifications, spreading over most parts of the body, and divided into two great systems: (a), the blood-vessels with the heart, a fleshy organ propelling the blood through the pulsating vessels or arteries, from which it returns to the heart, after circulation through the veins; (b), the lymphatics, by which a certain fluid (lymph) is brought into union with the blood in the organs styled lymphatic glands, and is afterwards passed into the veins.—5. *Neurology*, or the doctrine of the nerves, describes the nervous system, as divided into, *first*, the two central masses of the brain and the spinal column; *second*, the ramifications of nerves running from the brain and spinal column to almost all points of the surface; and *lastly*, the order of nerves having a peculiar structure, and styled the ganglionic system of nerves.—6. *Splanchnology* describes the viscera or organs formed by combination of the distinct systems of veins, nerves, lymphatics, &c., and mostly situated in the cavities of the body. These are divided into five groups, viz.: (a), the organs of sensation—sight, hearing, smell, taste, and touch; (b), of voice and respiration—nostrils, mouth, larynx, trachea, and lungs, with the thyroid gland, the thymus gland, and the diaphragm; (c), digestive organs—the mouth, with its salivary glands, the throat, gullet, the stomach, the intestines, with the liver, spleen, and pancreas; (d), the urinary organs—kidneys, ureter, bladder, and urethra; (e), sexual organs of both sexes.

Special A. may be treated in another mode; by an arrangement made in accordance with natural divisions, or by imaginary lines dividing the body into several regions—as the head, the trunk, and the extremities. Again, the trunk may be subdivided into neck, thorax, and abdomen; and in each of the main regions, several subdivisions may be made. This system of arrangement may be styled TOPOGRAPHICAL A., and is also known as SURGICAL A., on account of its importance as the basis of operative surgery. It was the eldest of the Monroes of Edinburgh University who first gave this branch of the study its due prominence.

The several parts and organs of the animal body will be found described under their proper heads.

History of A.—It is difficult to determine the date at which this science began to be cultivated, but it is probable that from the earliest times some persons took advantage of favourable circumstances

to acquaint themselves with it. The Druids, who were at once the priests, judges, and physicians of the people, demanded from those who came for their advice human victims as sacrifices, and were themselves the executioners; and it is not unlikely that they availed themselves of these opportunities of acquiring anatomical knowledge. It is probable, says Galen, that Æsculapius, who excelled in the treatment of wounds, dissected animals for the instruction of his pupils. His descendants, the Asclepiades, cultivated A., or rather zootomy, and founded the three famous schools of Cos, Rhodes, and Knidos. The rabbins tell us that, although among the Jews the touching of a dead body involved ceremonial uncleanness, they did not entirely neglect A., which they studied from the carefully preserved bones of their ancestors, and the necessary manipulations of embalming. They counted 248 bones, and 365 veins or ligaments, which division, according to the rabbins, has relation to the 248 precepts of the Mosaic Law that *command*, and the 365 that *forbid*.

Homer exhibits a certain amount of anatomical knowledge in his description of wounds in the *Iliad*. Pythagoras first reasoned physiologically from observations made by him when in Egypt, where he witnessed the sacrifices, and also the Egyptian methods of embalming. Alcmæon of Crotona, a disciple of Pythagoras, first dissected animals with the view of obtaining comparative knowledge of human A. Democritus, who frequented the sepulchres, probably with anatomical views, practised zootomy, and was engaged dissecting animals when visited by Hippocrates. Hippocrates II., descended in the eighteenth degree from Æsculapius, and born at Cos in 35 A.M., was the first author who treats A. as a science. He caused a skeleton of brass to be cast, which he consecrated to the Delphian Apollo, with the view of transmitting to posterity proofs of the progress he had made, and of stimulating others to the study of A. Aristotle, who lived 384 B.C., does not appear to have dissected men; and he states that the parts of man are unknown to them, or that they possess nothing certain on the subject beyond what they can draw from the probable resemblance of the corresponding parts of other animals. He first gave the name *arteria* to the great artery.

Diocles (380 B.C.) was the first who treated of the proper manner of conducting anatomical examinations for purposes of demonstration. But no real progress in A. was made, owing to the researches being confined to animals, till the time of Erasistratus, who was born at Ceos about 370 B.C., and who was the first to dissect human bodies. He obtained from Seleucus Nicanor and Antiochus Soter the bodies of criminals, and is said to have dissected some condemned to death while they were still alive. His writings are lost, but fragments are preserved in the writings of Galen. He made many discoveries, among others, of the lacteal vessels. Hierophilus, who lived about the same time, was born at Carthage, but carried on his anatomical pursuits principally at Alexandria. He also is said to have dissected living subjects. Parthenius, who lived 200 years B.C., published a book, entitled *On the Dissection of the Human Body*. In the 1st c. of the Christian era, the dissection of human subjects was forbidden, under heavy penalties. Rufus the Ephesian, who lived 112 A.D., under the empire of Trajan, taught A. in a more exact manner than had been hitherto done, and devised a more exact anatomical nomenclature. He made use of animals in his demonstrations, and mentions that 'of old they used for that purpose human bodies.'

Galen (131 A.D.) dissected apes, as being most like human subjects, though he occasionally obtained

bodies of children exposed in the fields, or of persons found murdered, which, however, he was obliged to dissect in secret. There was at this time no regularly prepared skeleton, as there was a law at Rome forbidding the use of dead bodies. Galen's writings shew a knowledge of human A. Soranus had extensive knowledge of A., derived from human subjects. Moschion had some anatomical illustrations engraved. Oribasius compiled more than 70 volumes, the 24th and 25th being on A., principally from Galen.

Nemesius, Bishop of Nemesus, a town in Phœnicia, cultivated A. at the end of the 4th c., in which also Meletius lived, who wrote a complete treatise *On the Nature and Structure of Man*. Theophilus, a monk, published in the 7th c. a good abridgment of the A. of Galen.

A. made small progress among the Arabs, which is accounted for by their religion prohibiting contact with dead bodies. When the great Arabian physician, Rhazes, was about to be operated on for cataract, he discovered that the surgeon was ignorant of the structures of the eye, and refused to submit to the operation. Avicenna (980 A.D.), born in the province of Khorasan, was a good osteologist, and described some structures not alluded to by Galen.

A. was now neglected for a long period, till Frederick II., king of Sicily (1194—1250), made a law forbidding any one to practise surgery without having first acquired some knowledge of A. He founded a chair at the solicitation of Martianus, his chief physician, where the science was demonstrated for five years; students from all parts crowded to it, and some time after, a similar school was established at Bologna—these two were largely attended, but no very material progress was made in A.

The university of Montpellier was founded by Pope Nicholas IV. in 1284, and the chair of A. was filled by Bernard Gordon with great distinction for ten years. He published a huge work, called *Liberum Medicinæ*.

Mundinus, born at Milan, 1315, professed A. there, and is considered the real restorer of A. in Italy. He publicly demonstrated it, and published a work which was the text-book in the academy of Padua two hundred years after its publication. Then came Guy de Chauliac, who first correctly described the humerus. Mathæus of Grado published several anatomical works about 1480. Gabriel de Zerbus, in 1495, published a confused and imperfect work on A. at Verona. The science continued to be studied by surgeons such as Vigo (1516), Achillinus, and Berenger (Carpi), (1518), who boasted of having dissected at Bologna more than a hundred subjects. Reports were raised that he dissected living Spaniards, and he fled or was exiled to Ferrara.

André Lacuna (1535), Charles Etienne, Gonthier (1536), Massa, Briander (1537), Sylvius (1539), Levassem; and Gesner, were celebrated for A.; but especially Andrew Vesalius, born 1514, who published a great work on A. before he was 28 years of age. He had the misfortune to open the body of a young Spanish nobleman whose heart was found still beating, and was obliged to make an expiatory pilgrimage to Jerusalem. In 1564, the Venetian senate recalled him to succeed, at Padua, the famous Fallopius, who had just died; on his return, he was shipwrecked on the island of Zante, where he was starved to death.

William Horman of Salisbury wrote, in 1530, *Anatomia Corporis Humani* (A. of Human Body); then came Ingrassias, and others of less note.

Thomas Gemini of London, in 1545, engraved upon copper the anatomical figures of Vesalius, which had appeared in Germany upon wood. Gemini suppressed

the name of Vesalius, though using his figures and descriptions. Thomas Vicary, in 1518, is said to be the first who wrote in English on A.; he published *The Englishman's Treasure, or the True A. of Man's Body*. John Liggeus, in 1555, published an anatomical treatise in Latin hexameters. Franco (1556), Valverde, Columbus, and others, wrote works of great merit on A. In 1561, Gabriel Fallopius professed it with great distinction at Padua, and made many original discoveries.

In the 17th c., progress was rapid: Hervey, in 1619, discovered the circulation of the blood, and the microscope was employed to detect the structure of minute vessels. Aselli, in 1622, discovered and demonstrated the existence of the lymph-vessels; and his conclusions were supported by the investigations of Pecquet, Bartholin, and Olaus Rudbeck. The glandular organs were investigated by Wharton, while Malpighi, Swammerdam, and (in the following c.) the illustrious Ruysch, by the use of injections and the aid of the microscope, gave a new impulse to research in the minute structures. Eminent names in the history of A. are numerous in the 18th c. In Italy, which still retained its former pre-eminence, we find Paechioni, Valsalva, Morgagni, Santorini, Mascagni, and Cotunni; in France, Winslow, D'Aubenton, Lieutaud, Vicq d'Azyr, and Bichât, the founder of General A.; in Germany, the accomplished Haller and Meckel prepared the way for greater achievements in the 19th c.; in Great Britain, Cowper, Cheselden, Hunter, Cruikshank, Monro, and Charles Bell contributed to the progress of the science; while Holland was worthily represented by Boerhaave, Albinus, Camper, Sandifort, and Bonn. On the boundaries of the two centuries, we find the names of Sömmerring, Loder, Blumenbach, Hildebrand, Reil, Tiedemann, and Seiler; nearly all connected with practical medicine, which was benefited by their studies in A.

The necessity of a union of theory and practice has led to that zealous study of PATHOLOGICAL A. (the dissection and study of structures as modified by diseases) which has recently prevailed. The origin of this branch of A. may be traced back to ancient times in Egypt, where post-mortem examinations were sometimes made to discover the seat of disease and cause of death. In the medical writings of the Greeks, some anatomico-pathological observations are found. During the general revival of science in the 16th c. many notices of pathological A. occur. In 1507, Benevieni of Florence wrote the first book on this branch of science; and Bonet, in 1679, published his compilation of numerous observations. Still, these were only fragmentary indications of a possible science, and the facts stated were often very erroneously interpreted. Morgagni (1767), who must be regarded as the true founder of Pathological A., was worthily followed by Lieutaud, Sandifort, Hunter, Baillie, and others. Meckel the Younger, in Germany, in his study of malformations, &c., paid little or no attention to practical applications of the science. The recent change of direction given to the study of Pathological A., which is now properly regarded as a means towards practical improvements in medicine, must be ascribed to Bichât and the pupils of Broussais, among whom may be mentioned the names of Laeince, Cruveilhier, Louis, Andral, Lobstein, Lebert, Virchow, Bennett, &c. In London and other large towns there are societies devoted specially to the investigation of pathology.

COMPARATIVE A. has always preceded anthropology, or dissection of the human subject, but was first treated systematically as a distinct science by Cuvier and his pupil Meckel the Younger. The system proposed by the latter was, unfortunately,

never completed. Blumenbach, Tiedemann, Home, Blainville, Geoffroy St Hilaire, Carus, Oken, Goethe, the German poet, Richard Owen, John Goodsir, and Huxley, must be named as eminent contributors to this branch of science; while, in late years, zootomy and comparative A. have been studied, with an especial reference to physiology, by Müller, Wagner, Siebold, Bowman, Todd, and Allan Thomson.

A. FOR ARTISTS is studied with reference to the effects produced by internal structure on the external form, and describes the organs, especially the muscles and tendons, not only in a state of rest, but also as modified by passion, action, and posture. Consequently, observation of the nude living form is required in this branch of study, which has been treated of by Errard and Genga (1691); and in modern times, by Lavater (1790), Camper (1792), Charles Bell (1806), Salvage (1812), Mascagni (1816), Koeck (1822), Gardy (1831), Fischer (1838), Salomon and Aulich (1841), Berger (1842), Seiler and Günther (1850), &c.

PRACTICAL A. includes *Dissection* (q. v.) and the making of *Preparations*. *Preparation* consists in dividing parts or organs, so that their respective forms and positions may be clearly shewn. Organs or parts thus treated are styled *Anatomical Preparations* of bones, muscles, vessels, nerves, &c. For example, a bone-preparation is made by clearing away all muscular and other adhesions; the whole structure of the bones, thus prepared and bleached, when connected by wires in its natural order, forms an artificial *skeleton*.

For preparations of parts containing vessels with minute ramifications, injections are employed. Some coloured fluid which has the property of gradually becoming solid, is gently injected into the arteries or other vessels by means of a syringe. Formerly, materials which required a certain degree of warmth to preserve their fluidity were used; but as these were attended with inconvenience, a great improvement was made by Shaw and Weber, who introduced the use of linseed-oil and turpentine, which, when mixed with certain metallic compounds in due proportions, form a fluid which, after a time, becomes solid in ordinary temperatures. Quick-silver and coloured lime-water are also used for injection of the finer vessels. Preparations are either dried and varnished or preserved in spirit.

A series of such specimens, arranged in proper order, forms an *Anatomical Museum*. The valuable collections made by Ruysch, Rau, Loder, Walter, John and William Hunter, Meckel, Sömmerring, and Dupuytren, are all now public property. There is also a splendid collection in the university of Edinburgh, collected and prepared for the most part by John Goodsir. The College of Surgeons of Edinburgh also possesses a very valuable museum of pathological preparations. As it is impossible to preserve thus all parts in their integrity for any great length of time, artificial copies in wood, ivory, and wax have been made with great exactitude, especially in Florence; and recently Anzou in Paris has employed *papier-mâché* for the same purpose. But, apart from dissections and preparations of the natural organs, the most general and available assistance in the study of A. is found in anatomical engravings and plates on wood and copper. This assistance was known in ancient times. Aristotle alluded to his works on A. some anatomical drawings, which have been lost. In the 16th c., the greatest artists—Leonardo da Vinci, Michael Angelo, Raphael, Titian, and Dürer—gave their aid in designing anatomical figures; but few of their works, in this department of art, have been preserved. Lately, lithography has been employed. Among the numerous illustrations of A. which we now possess, the

old works by Vasal (1543), Eustachius (1714), Bidloo (1685), Albin (1747), Haller (1743—1756), and Vieq d'Azv (1786—1790), may be mentioned. The present century has supplied works of first-rate excellence by Caldani (Venice, 1801—1814), Mascagni (Pisa, 1823), Langenbeck (Göttingen, 1826), Bourgery and Jacob (Paris, 1832), and Arnold (Zürich, 1838). For general use, we may commend the plates of Loder (Weimar, 1803), Cloquet (Paris, 1826), Oesterreicher (Munich, 1827—1830), Weber (Düsseldorf, 1830), Bock (Leipsic, 1840), and D'Alton (Leipsic, 1848): in Surgical A., the works by Rosenmüller (Weimar, 1805), Pirogoff (Dorp, 1840), and Günther (Hamburg, 1844): in Pathological A., Meckel (Leipsic, 1817—1826), Cruveilhier (Paris, 1828—1841), Froriep (Weimar, 1828), Albers (Bonn, 1832), Gluge (Jena, 1843—1850), and Vogel (Leipsic, 1843): in Comparative A., Carus (Leipsic, 1826) and Wagner (Leipsic, 1841). Among English works may be mentioned those by Lizars, Jones, and Richard Quain, in Special A.; by Morton and Maclise, in Surgical A.; and by Baillie and Bright in Pathological A.

ANATOMY (in Law). While the study and practice of A., or the art of dissecting the human body, were necessary to the pursuit of surgical knowledge, there were, until the year 1832, no sufficient legal means in Britain of procuring dead bodies for anatomical purposes; and the consequence was, the evasion, and sometimes even the open violation of the law by persons interested in supplying the surgical profession with subjects for dissection. The high prices, indeed, given for these subjects, may almost be said to have created a lucrative and tempting trade, which led to the most atrocious crimes; and murders, with no other object than the possession of the victim's body for the surgeon's knife, were frequently committed. The notorious case of Burke, tried and convicted before the High Court of Justiciary in Edinburgh, in 1828, is a horrible illustration of the state of the law at that time, and of the position in which it placed surgical practitioners. It was believed that Burke and his associate Hare had been the murderers of sixteen persons, whose bodies they sold to the anatomists. It was their practice to inveigle poor people, generally strangers, into their houses, make them drunk, and then smother them. Burke, informed against by Hare, was condemned for thus disposing of an old woman, and suffered the last penalty of the law, bequeathing a new verb, *to burke*, to the English language. To remedy this state of things, an act of parliament was passed on the 1st of August 1832, 2d and 3d William IV. c. 75, the preamble of which, sufficiently disclosing its necessity, is as follows: 'Whereas a knowledge of the causes and nature of sundry diseases which affect the body, and of the best methods of treating and curing such diseases, and of healing and repairing divers wounds and injuries to which the human frame is liable, cannot be acquired without the aid of anatomical examination: and whereas the legal supply of human bodies for such anatomical examination is insufficient fully to provide the means of such knowledge: and whereas, in order further to supply human bodies for such purposes, divers great and grievous crimes have been committed, and, lately, murder, for the single object of selling for such purposes the bodies of the persons so murdered: and whereas, therefore, it is highly expedient to give protection, under certain regulations, to the study and practice of A., and to prevent, as far as may be, such great and grievous crimes and murder as aforesaid'—It is therefore enacted, that the Secretary of State for the Home Department in Great Britain, and the Chief Secretary

in Ireland, may grant a licence to practise A. to any fellow or member of any college of physicians or surgeons, or to any graduate or licentiate in medicine, or to any person lawfully qualified to practise medicine in any part of the United Kingdom, or to any professor or teacher of A., medicine, or surgery, or to any student attending any school of A., on the application of such party for such purpose, countersigned by two justices of the peace acting for the county, city, borough, or place where such party resides, certifying that, to their knowledge or belief, such party so applying is about to carry on the practice of A. The act provides for the appointment of inspectors of schools of A., and directs them to make a quarterly return to the Secretary of State, or the Chief Secretary, as the case may be, of subjects removed for anatomical examination to every place in the inspector's district where A. is carried on, distinguishing the sex, and, as far as is known at the time, the name and age of each person whose body was so removed. The inspectors are further required to visit and inspect places within their respective districts where A. is practised; and for the performance of all these duties, the inspectors are each to have an annual salary not exceeding £100, with a further reasonable sum for their official expenses. By section 7, it is enacted that it shall be lawful for any executor or other party having lawful possession of the body of any deceased person, and not being an undertaker or other party intrusted with the body, for the purpose only of interment, to permit the body of such deceased person to undergo anatomical examination, unless, to the knowledge of such executor or other party, such person shall have expressed his desire, either in writing, at any time during his life, or verbally, in the presence of two or more witnesses, during the illness whereof he died, that his body, after death, might not undergo such examination; or unless the surviving husband or wife, or any known relative of the deceased person, shall require the body to be interred without such examination: while, by section 8, it is declared that the wishes of persons who had expressed a desire that their bodies should be subjected to anatomical examination shall be respected, unless the deceased person's surviving husband or wife, or nearest known relative, or any one or more of such person's nearest known relatives being of kin in the same degree, shall require the body to be interred without such examination. Bodies are not to be removed for examination until forty-eight hours after death, and without a certificate by the medical attendant, stating, according to the best of his knowledge or belief, the manner or cause of death. The act contains a number of provisions intended to secure its sufficient administration; but, by section 15, it is provided that it shall not extend to or prohibit any post-mortem examination of any human body required or directed to be made by any competent legal authority; and it repeals an enactment in a previous statute, 9 George IV. c. 31, which directed the bodies of murderers after execution to be dissected.

This act of parliament is understood to have met the evil it was designed to obviate; and under it the supply of bodies of persons dying friendless, in poor-houses, hospitals, and elsewhere, is stated to have proved sufficient for the wants of the profession.

ANAXAGORAS, one of the most eminent philosophers of the Ionic school, was born at Clazomenæ, in Ionia, 500 B. C. He belonged to a wealthy and distinguished family, which circumstance may have enabled him to devote himself exclusively to intellectual pursuits. Yet he does not seem to have entered into the possession of his property, but left it to his relations. When only twenty years of age, he went to Athens, where, in the course of time, he

acquired a high reputation, and had several illustrious pupils, among whom were Pericles, Euripides, Socrates, and Archelaus. But at last, being accused of impiety towards the gods, he was condemned to death. His sentence, however, was commuted into banishment for life, through the eloquence of Pericles. He withdrew to Lampsacus on the Hellespont, where he died in the 73d year of his age. The old man was accustomed to say proudly, in his exile: 'It is not I who have lost the Athenians, but the Athenians who have lost me.' When on his death-bed, the magistrates of the town asked what funeral honours he desired; 'Give the boys a holiday,' was the quaint reply of the sage; and for several centuries the day of his death was commemorated in all the schools of Lampsacus.

It is not easy to ascertain what were the opinions of A. in philosophy. Fragments merely of his works have been preserved, and even these are sometimes contradictory. Of one thing we are certain, that he had a deeper knowledge of physical laws than any of his predecessors or contemporaries. The absurdities of opinion which are attributed to him are no proof of the contrary, for, in his time, any attempt to explain even a moderate number of the phenomena of nature was sure to be attended with what everybody now sees to be extravagant fictions. He believed the heavens to be a solid vault; the stars to be stones thrown up from the earth by some violent convulsion, and set on fire by the ether which ever burns in the upper regions of the universe; the milky-way to be the shadow of the earth; that the soul had an aerial body; that the sun was a burning mass of stone, larger than the Peloponnesus. But he also arrived at some tolerably accurate conclusions regarding the cause of the moon's light, of the rainbow, of wind, and of sound. His great contribution to ancient philosophy, however, was his doctrine as to the origin of all things. He held that all matter existed originally in the condition of atoms; that these atoms, infinitely numerous, and infinitely divisible, had existed from all eternity, and that order was first produced out of this infinite chaos of minutia through the influence and operation of an eternal intelligence (*Gr. nous*). He also maintained that all bodies were simply aggregations of these atoms, and that a bar of gold, or iron, or copper, was composed of inconceivably minute particles of the same material; but he did not allow that objects had taken their shape through accident or blind fate, but through the agency of this 'shaping spirit' or *Nous*, which he described as infinite, self-potent, and unmixed with anything else. '*Nous*,' he again says, 'is the most pure and subtle of all things, and has all knowledge about all things, and infinite power.' A.'s theory is thus only one step from pure theism. He makes the work of the Eternal commence with providence, not with creation.

The fragments of A. have been collected by Schaubach (Leipsic, 1827), and by Schorn (Bonn, 1829).

ANAXIMANDER, a Greek mathematician and philosopher, the son of Praxiades, and the disciple and friend of Thales, was born at Miletus 610 B.C., and died in 546. His principal study was mathematics. He is said to have discovered the obliquity of the ecliptic, and certainly taught it. He appears to have applied the *gnomon*, or style set on a horizontal plane, to determine the solstices and equinoxes. The invention of geographical maps is also ascribed to him. As a philosopher, he speculated on the origin (*arche*) of the phenomenal world, and this principle he held to be the infinite or indeterminate (*ta apeiron*). This indeterminate principle of A. is generally supposed to have been

much the same with the chaos of other philosophers. From it he conceived all opposites, such as hot and cold, dry and moist, to proceed through a perpetual motion, and to return to it again. Of the manner in which he imagined these opposites to be formed, and of his hypothesis concerning the formation of the heavenly bodies from them, we have no accurate information. It would seem, however, that he did not believe in the generation of anything in the proper sense of the word, but supposed that the infinite atoms or units of which the *arche*, or primary matter, is composed, merely change their relative positions in obedience to a moving power residing in it. Some of his particular opinions were, that the sun is in the highest region of the heavens, is in circumference twenty-eight times greater than the earth, and resembles a cylinder from which flow continual streams of fire; that eclipses are caused by the stopping of the openings from which the fire flows; that the moon is also a cylinder, nineteen times greater than the earth; and that the moon's phases are caused by obliquity of position, and eclipses by complete turning round. He taught that the earth is of the form of a cylinder, and that it floats in the midst of the universe, that it was formed by the drying up of moisture by the sun, and that animals are produced from moisture.

ANAXIMENES, a Greek philosopher, born at Miletus, flourished about 556 B.C. He held *air* to be the first cause of all things, or the primary form of matter, from which all things are formed by compression.

AN'BURY, a disease to which turnips are liable, and which often proves of serious importance to farmers, destroying the crop of entire fields. It is sometimes called *Club-root*, because of the knobs or tubercular excrescences which form upon the root. The root, instead of swelling into one turnip of good size, generally becomes divided into a number of parts, each in some small degree swelling separately by itself; whence the popular name, *Fingers and Toes*. The growth of the plant is arrested; the root becomes woody; the excrescences rot, and emit most offensive effluvia, which, however, appear peculiarly attractive to insects of various kinds; and, accordingly, eggs and maggots in abundance are soon to be found in them. It has been very generally supposed that these insects, or some of them, are the cause of the disease; but the truth seems rather to be that they are attracted by the diseased state of the plant. A. has been erroneously confounded with the excrescences, each containing a small grub, which are frequent on the roots of turnips, as on those of cabbages, and many other cruciferous plants, although these also sometimes effect the destruction of the plant. The true nature and cause of the disease are not yet well known. Much attention has been devoted to the subject; and premiums have been offered in connection with it by the Highland and Agricultural Society of Scotland; but hitherto, without eliciting any certain or satisfactory information. It appears probable that the disease is in some measure owing to peculiarities of soil, or of manure, and to the too frequent repetition of turnip-crops upon the same field. A much greater frequency of repetition, however, can be safely practised in some districts, or in some fields, than in others. The liberal application of lime has been found advantageous as a preventive of A.; but even this often succeeds but imperfectly; and the increasing prevalence of this disease in certain districts seems not unlikely to necessitate a considerable modification in the system of husbandry, in which the turnip-crop has long occupied so important a place. See TURNIP.

ANCELOT, JACQUES - ARSÈNE - POLYCARPE-

FRANÇOIS, a French poet, born February 9, 1794, at Havre, where his father was clerk of the Chamber of Commerce. The latter being a well-informed gentleman, delighting in verse, early taught his son to recite passages from the French poets. A. was from the first intended for active life in connection with the administration of the navy; and was employed, until the revolution of July, in the government service. His reputation was first established in 1819 by his tragedy of *Louis IX.*, which was played fifty nights in succession, and procured him a pension of 2000 francs from the king. His next piece, *The Mayor of the Palace* (1823), was not so well received. In 1824, appeared his *Fiesque*, a work which exhibited the great skill of the author in adopting a master-piece of Schiller to the French stage. In 1825, he gave to the world an epic poem in six cantos, *Marie de Brabant*; and in 1827, a clever and graceful work, partly prose and partly verse, entitled *Six Months in Russia*; besides a novel in four volumes, *The Man of the World*. *Olya*, a drama, was published in 1828; and *Elizabeth of England* in 1829. Both of these works were highly successful, though neither met with the brilliant reception of *Louis IX.* In 1834 appeared *Les Empereurs aux Salons de Paris*. The revolution of July deprived him of his pension, and also of his situation as librarian of Meudon; and for the next ten years, he was compelled to support himself and family by the concoction of numberless *vaudevilles*, dramas, comedies, anecdotes, &c., sometimes of very questionable morality. In 1841, the French Academy chose him as the successor of Bonald. Shortly after appeared his *Familiar Letters* (*Épîtres Familiales*), a collection of satires as remarkable for freshness of epigram as for grace of style and richness of versification. In 1848, he published *La Rue—Quincampoix*.

A.'s *chef-d'œuvre*, *Louis IX.*, is a work of genius; the versification is correct, elegant, and harmonious; the manners and characters of the period are delineated with great fidelity and brilliancy; the plot is skilfully constructed; and some of the scenes are contrived with singular felicity.

ANCHOR, an implement for retaining a ship in a particular spot, by temporarily chaining it to the bed of a sea or river. Many forms of A. were made by the ancients; some were merely large stones; others, crooked pieces of wood, weighted to make them sink in water. The first *iron* anchors are supposed to have been used by the Greeks. As originally made, the A. had only one fluke or arm for penetrating the ground, but a second was afterwards added; it had no stock (presently to be described), and was, on that account, ill suited for insuring a firm gripe into the ground when lowered. The Greek vessels had several anchors, one of which, called the 'sacred A.,' was never let go until the ship was in dire distress; something equivalent to this was long retained in the English navy, but the designation is now dying out. Of whatever form and material the ancient anchors were made, they were lowered from the ships' sides by ropes—chain-cables being a modern invention.

The maritime nations of Europe, and the United States of America, employ anchors bearing a good deal of general resemblance one to another. A large-sized modern A., regarded irrespectively of improvements recently introduced, comprises the following parts: The vertical or supporting beam of the A. is the *shank*, B; at the upper end of it is the *ring*, r; and just below the ring is a transverse piece called the *stock*, s; the other extremity is the *crown*, c, from which branch out two *arms* or *blades*, g, in directions nearly at right angles to that of the stock; each arm spreads out into a broad *palm* or

fluke, h, the sharp extremity of which is the *peak* or *bill*, k. All these parts bear special relation to the fast-holding of the A. in the ground. When the A. is let go from the ship's side, the crown first strikes the ground; it then falls over in such a manner that one end of the stock rests upon the ground; and the subsequent movements of the ship and the cable cause one or other of the flukes (it matters not which) to dig vertically into the ground, and maintain a firm hold. On the firmness of this gripe depends the safe anchoring of the ship; and the sizes of all the different parts of the A., as well as the curve of the arms and flukes, are calculated with direct reference to this condition.

Anchor.

The number and weights of anchors in British ships-of-war are nearly as follow: Men-of-war have four anchors—the 'best bower,' the 'small bower,' the 'sheet,' and the 'spare.' For particular and special services, there are also the 'stream' and the 'kedg.' Smaller vessels have fewer and smaller anchors; and the 'stream'-A. of a large ship may conveniently serve as the 'bower' for a smaller. There was at one time a rough rule in the navy, that the chief A. should weigh as many hundred-weight as the ship carried guns; thus, an 80 cwt. A. for an 80-gun ship. In the commercial marine there was also a kind of rough formula that the chief A. should weigh one-twentieth part as many hundred-weight as the ship measured in tonnage; thus, a 300-ton ship would have an A. of 15 cwt. The weight of an A. 10 feet long used to be laid down at 11½ cwt., and that of an A. 14 feet long, at 30 cwt. It must be borne in mind, however, that these numbers and ratios are no longer strictly reliable, seeing that new forms of A., the use of chain-cables, the introduction of steam-navigation, and the building of ships of great magnitude, have rendered many old formulas inapplicable at the present day.

Many important improvements in the shape and construction of anchors have been introduced within the last few years. Lieutenant Rodgers, to increase the strength, without increasing the weight, took out a patent for *hollow-shanked* anchors; these are not strictly hollow, however, for there is a wooden core, which is bound to the iron of the shank by iron hoops. Mr P'ring introduced iron shanks made of layers of flat bars, instead of solid iron. The same inventor increased the strength of the arms, by making them in great part a curved continuation of the same pieces of iron which form the shank.

The most effective novelty, however, is that introduced under Mr Porter's patent, about twenty years ago, seeing that it is the basis which supports all

Porter's Anchor at Work.

the subsequent improvements of any note. The arms are pivoted to the stock, instead of being rigidly fixed; and there is a projecting piece, called

the *toggle*, on the convex part of each arm. These two additions or adjustments have a remarkable effect on the action of the A. The advantages of this A. over those of ordinary make are very considerable. There is less chance of 'fouling,' by the cable passing over the exposed fluke of the A., when the vessel is swinging in a tide-way; there is less danger of injury from the upper peak; the lower peak bites quickly into the most stubborn ground; the A. cannot lodge on its stock-end; it is stronger in the arm than ordinary anchors; and it is very conveniently stowed on shipboard.

Among the modifications of Porter's anchor, since introduced, are those of Trotman and Honiball. Trotman's, to which most attention is at present directed, has the following advantages: The arm has sufficient length and curve to deepen and set the palm at such an angle as to insure its biting or penetrating the hardest bottom; the area and surface of the palm are greatly increased, offering a proportionate resistance in soft ground; the *toggle* or projection at the back of the arms is rendered more effective by its form and position; and the mode in which the upper arm rests on the shank increases both the strength and the penetrating power. This A. has been the subject of a long contention between

Ship's Tonnage.	Ordinary Anchors.	Trotman's Anchors.	Size of Chain-cables.
100	7 cwt.	5 cwt.	0 $\frac{1}{2}$ inch.
200	12 "	9 "	1 "
400	22 "	17 "	1 $\frac{1}{2}$ "
700	34 "	25 "	1 $\frac{3}{4}$ "
1000	41 "	31 "	1 $\frac{7}{8}$ "
1400	48 "	37 "	2 "
2000	51 "	46 "	2 $\frac{1}{8}$ "

The manufacture of anchors furnished, until recent years, the most formidable exemplification of smith's work anywhere presented, on account of the vast dimensions and weight of the pieces of iron which had to be welded into one mass. The anchor-smiths wielded the most ponderous sledge-hammers known to our artisans; and the services of a large number were needed to weld the metal while in the heated and yielding state. At the present time, however, the operations are wonderfully aided by Mr Nasmyth's steam-hammer, which comes down upon the A. with a force greater than that of any available number of sledge-hammers wielded by men. At some of the government dockyards, anchor-making is conducted on a great scale; but the larger portion of the supply for the navy is obtained by contract by private firms.

ANCHORAGE is a due or toll levied on the owner or captain of a ship for permission to cast anchor at special anchoring-grounds. In most instances, it is payable to the state; but sometimes the right is vested in corporate bodies or in individuals. The tariff varies greatly, depending on the size of the ship, or on the value of the cargo, according to circumstances. In most cases, where a vessel is driven into port by stress of weather, and does not discharge cargo there, it is exempt from this toll. Shore-dues differ from A. chiefly in the fact, that a vessel pays duty on entering a certain port or harbour, whether she anchors or not; and, by a singular anomaly, these duties are in certain instances vested in the corporation of an inland town, many miles distant from the port in question.

A. is a term also sometimes applied to the whole suite of anchors belonging to a ship; and still more frequently it has the same sense as anchor-ground (q. v.).

ANCHOR-GROUND is a part of the bed of the sea, or of a river, suitable for anchoring. It must not be too deep, or the cable will bear too perpendicularly, and will be likely to drag the anchor out of the ground. It must not be too shallow, or the ship's bottom will be exposed to the hazard of striking at low-water, or when the sea is rough. It must not be too rocky, or the anchor will be liable to break its flukes by hooking into jagged rocks, and the cable to be severed by rubbing against rocky edges. Thus, a combination of favourable circumstances is necessary for the selection of a good anchoring-ground.

ANCHORITES, or **ANCHORETS** (Gr. *anachorētai*, literally, persons who withdraw from society), the hermits who began to appear in the Christian Church in the 3d c., living in solitude, and not, like the monks or cenobites, in communities. During the first two centuries, Christians generally thought it enough to withdraw from the world by refusing to participate in heathen festivals and amusements; but extreme views became gradually prevalent, and were connected with a belief in the merit of celibacy, of abstinence from particular kinds of food, of self-inflicted tortures, &c. The persecutions to which Christians were subjected, drove some into the solitude of deserts; afterwards, the glory of a life spent in loneliness and austerity became a substitute for

Trotman's Anchor at Work.

Mr Trotman and the Admiralty. In 1852, in compliance with a requisition from numerous ship-owners and underwriters, the Admiralty appointed a committee, consisting of eleven experienced and impartial persons, to make trial of a large number of anchors, with a view of determining the relative merits of various forms and modes of construction. The anchors were to be similar in weight, and were to be tested in a great variety of ways—on shore, and at sea, and in reference to the holding, stowage, sweeping, tripping, fouling, &c. There were several competitors, all of whom were subjected to the same conditions. Every one of the recently invented anchors tried was found to be better than the ordinary Admiralty A.; and the one which appeared to possess the greatest number of good qualities was Trotman's. The patentee naturally expected to derive some commercial advantage from the favourable report of the committee; but from 1852 to 1859, the successive Boards of Admiralty have refused to admit Trotman's A. into the royal navy, except in a few isolated instances. The grounds for this refusal have never yet been satisfactorily made known.

The weights of anchors bear, or ought to bear, some definite relation to the tonnage of a ship. Lloyd's Committee has agreed upon certain ratios to recommend, in reference to the large or 'best bower' anchors and their chain-cables; and Mr Trotman has prepared a table, shewing the diminished weight of his anchors, to render equivalent service. The anchors are here supposed to have iron stocks:

that of the martyr's death. The general corruption of society also caused many earnest and well-meaning persons to flee from it; the Ascetics (q. v.) first set the example of retiring from cities to rural districts and villages; the A. went further, and sought to withdraw themselves altogether from mankind; and if the reputation of sanctity which was connected with a life of solitude constituted its chief attraction to some, there can be no doubt that many chose it in the hope of thereby attaining to real sanctity. Many of the A. voluntarily subjected themselves to the vicissitudes of the weather, without proper habitation or clothing, restricted themselves to coarse and scanty fare, wore chains and iron rings, and even throughout many years maintained painful postures, such as standing on the top of a pillar (see *STYLITES*), thus displaying an earnestness which greater enlightenment might have directed to the good of mankind. Paul (q. v.) the Hermit, and Antony (q. v.), were among the first and most celebrated A. The A. were not able always to preserve their solitude unbroken. The fame of their sanctity drew many to visit them; their advice was often sought; and the number of their visitors was much increased by the belief that diseases, particularly mental diseases, were cured by their blessing. Sometimes, also, they returned for a short time to the midst of their fellow-men to deliver warnings, instructions, or encouragements, and were received as if they had been inspired prophets or angels from heaven. The number of A., however, gradually diminished, and the religious life of convents was preferred to that of the hermitage. The Western Church, indeed, at no time abounded in A. like the eastern, and perhaps the reason may in part be found in the difference of climate, which renders a manner of life impossible in most parts of Europe that could be pursued for many years in Egypt or Syria.

ANCHOVY (*Engraulis Enchrasicholus*), a small fish, about a span long, much esteemed for its rich and peculiar flavour. It is not much longer than the middle finger, thicker in proportion than the herring, to which it has a general resemblance; the head is sharp-pointed, and the under jaw much shorter than the upper; the scales large, silvery, and easily removed, the tail deeply forked. It is occasionally found on the British coasts, and is said to be not at all uncommon on the coast of Cornwall in the latter part of summer and beginning of autumn. It would seem to have been formerly more abundant than it now is in the British seas, as several acts of parliament, of the reign of William and Mary, regulated the A. fisheries. It occurs on the

Anchovy.

coasts of the Baltic and of Greenland, and abounds in the Mediterranean and on the Atlantic coasts of Spain, Portugal, and France, where extensive and very productive fisheries are carried on, particularly in the months of May, June, and July, when the shoals of anchovies leave the deep seas, and approach the shores for the purpose of spawning. They are fished during the night, and are attracted to the boats by fires. They are salted in small barrels, and are much used for sauces, &c. The Romans made from them a highly valued sauce called *garum*.—*Sardines* (q. v.) are often sold as

anchovies.—The genus *Engraulis* belongs to the *Clupeidae* (q. v.) or Herring family, and was formerly included in *Clupea*, from which it is distinguished by the more deeply cleft mouth, the wider gill openings, and more numerous gill rays. All the species are small, and most of them tropical. *E. Brownii* abounds in the Strait of Malacca and at the mouths of the Ganges, and is used for making a delicious condiment called *Red Fish* in India.

ANCHOVY PEAR (*Grias cauliflora*), a tree, the only known species of a genus somewhat doubtfully referred by Lindley to his order *Barringtoniaceae* (more generally regarded as a sub-order of *Myrtaceae*, q. v.). It grows in boggy places in the mountainous districts of Jamaica and other West Indian islands, attains a height of fifty feet, and has great oblong leaves two or three feet in length. The flowers are numerous, on short peduncles, large and whitish, the corolla consisting of four petals, and the calyx 4-cleft. The fruit is an ovate drupe, crowned with the persistent calyx, the stone marked with eight ridges. This fruit is pickled and eaten like the East Indian mango, which it much resembles in taste.

ANCHUSA. See *ALKANET*.

ANCHYLOSIS. See *ANKYLOSIS*.

ANCILLON, a French family who, after the revocation of the Edict of Nantes, migrated from Metz into Prussia.—**DAVID A.** studied theology at Geneva, was afterwards pastor of the French Reformed colony at Hanau, and died in Berlin in 1692.—**CHARLES**, son of the former, was born at Metz, July 28, 1659, and died in Berlin, July 5, 1715. He is known by his writings: *L'Irrévocabilité de l'Édit de Nantes* (1688), and *Histoire de l'Établissement des Français Réfugiés dans les États de Brandebourg* (1690).—**LOUIS FREDERICK**, grandson of Charles A., was born in Berlin 1740, and died there as pastor of the French congregation in 1814. His son **FREDERICK**, who rose to be a minister of state in Prussia, was born in Berlin, April 30, 1767. In 1792, he was appointed Professor of History in the Military Academy of Berlin, and afterwards Royal Historiographer, a post to which he had recommended himself by his work, *Tableau des Révolutions du Système Politique de l'Europe depuis le 15^{me} Siècle* (4 vols. Berlin, 1803—1805). In 1814, he took an administrative post under Hardenberg, and, in 1818, held a very prominent position under Count von Bernstorff. In 1830, when the July revolution occurred in France, he assisted the measures of King Frederick William III. for the preservation of peace in Europe. While, like the politicians of Austria, he argued that 'all should be done for the people, but nothing by the people;' he also contended for the necessity of progressive reforms in legislation, in order to prevent all violent collisions between government and popular opinion. His private life was simple and unostentations. Though thrice married, he left no children. A. died April 19, 1837. His various writings on politics, philosophy, and literature, are chiefly devoted to an exposition of the principles by which he was guided as a statesman.

ANCONA, the capital of a delegation of the same name in the States of the Church, lat. 43° 38' N., and long. 13° 35' E. It is situated on a promontory of the Adriatic coast, and rising in the form of an amphitheatre, presents a picturesque appearance from the sea. It is the seat of a bishop, and contains about 29,000 inhabitants, of whom about 5000 are Jews. The harbour, once famous, seems likely to be filled up with mud. The commerce is much less considerable than it once was, though, in that respect, it is still the most

important place in the States of the Church. Corn, and woollen and silk goods, oils, cordage, bacon, fruits, &c., are the chief exports. A mole of 2000 feet in length, built by the Emperor Trajan, and a triumphal arch of the same emperor, are the most notable monuments of antiquity. There are some fine public buildings. One of the most venerable of these is the cathedral of St Cyriac, built in the 10th c., and possessing the oldest *cupola* in Italy. But the houses are in general mean, and the streets narrow. A. is supposed to have been founded by Syracusans who had fled from the tyranny of Dionysius the Elder. It was destroyed by the Goths, rebuilt by Narses, and again destroyed by the Saracens in the 10th c. It afterwards became a republic; but in 1532, Pope Clement VII. annexed it to the States of the Church. In 1798, it was taken by the French; but in 1799, General Meunier was obliged to surrender it to the Russians and Austrians, after a long and gallant defence. Since 1815, the citadel has been the only fortification. When the Austrian troops in 1831 occupied the Roman frontiers, whose inhabitants were then in a state of insurrection, the French ministry determined to neutralise the influence of Austria. A French squadron appeared before the harbour, and landed 1500 men, who took possession of the town on the 22d February 1832 without any resistance, the citadel capitulating on the 25th. It remained in their hands till 1838, when both French and Austrians retired from the Papal States. In 1849, a revolutionary garrison in A. capitulated after enduring a siege by the Austrians of twenty-five days.

ANCRE, CONCINO CONCINI, BARON DE LUSSIGNY, MARSHAL D', a Florentine by birth, who came to the French court in the year 1600, with Maria de' Medici, the wife of Henry IV., and along with his wife, Eleonora Galigai, exercised an unhappy influence in promoting the disagreement between the king and queen. When, after Henry's death, the queen became regent, Concini, as her favourite, obtained possession of the reins of government; and in 1613, was made a marshal and prime minister. He purchased the marquise of Ancre in Picardy, and took his title from it. He became an object of detestation equally to the nobility and the people. A conspiracy was formed against him, to which the young king Louis XIII. was himself privy.—Luynes (q. v.), the king's worthless favourite, being one of the conspirators—and he was assassinated in the Louvre in open day, on the 24th of April 1617. His body was privately buried, but was soon disinterred by the populace, dragged through Paris, and burned before the statue of Henry IV. His wife was soon afterwards accused of witchcraft, which she sarcastically repudiated, saying that the only sorcery she had employed to influence the queen was 'the power of a strong mind over a weak one.' The sneer, however, did not save her. She was executed, and her son, deprived of rank and property, was driven from the country.

ANCUS MARCIUS, son of Pompilia, daughter of King Numa Pompilius, was the fourth king of Rome. Following the example of his grandsire, Numa, he endeavoured to restore the almost forgotten worship of the gods and the cultivation of the arts of peace among the Romans. But, despite his inclination for peace, he was engaged in several wars with the neighbouring Latin tribes, whom he subdued and reduced to order. These Latins, Niebuhr considers to have formed the original *plebs*. Against the Etruscans, he fortified the Janiculum, connected it with Rome by a wooden bridge, and gained possession of both banks of the Tiber, as far as its mouth, where he founded Ostia as the port of Rome; he

dug what was called 'the Ditch of the Quirites'—a defence for the open space between the Caelian Hill and Mount Palatine; and built the first Roman prison of which we read, a proof that civilisation had really commenced, inasmuch as offences then formally ceased to be regarded as private and personal matters, and were treated as crimes against the community. He died in 614 B.C., after reigning twenty-four years.

ANCYRA. See ANGORA.

AN'DA, a genus of plants of the natural order *Euphorbiaceæ*, the only known species of which, *A. Brasiliensis*, is a Brazilian tree, with large yellow flowers, and an angular fruit about the size of an orange, containing two roundish seeds, like small chestnuts. The seeds are called in Brazil *Purga dos Paulistas*, are much used medicinally in that country, and are more purgative than those of the castor-oil plant. This quality seems to depend upon a valuable fixed oil, of which twenty drops are a moderate dose. It is obtained by pressure. The bark of the tree, roasted in the fire, is accounted in Brazil a certain remedy for diarrhoea, brought on by cold. The fresh bark, thrown into ponds, is said to stupify fish.

ANDALU'SIA or ANDALUCIA, a large and fertile province or kingdom in the south of Spain, lying between 36° 2' and 38° 39' N. lat., and 1° 38' and 7° 20' W. long. Having been overrun by the Vandals, it is supposed by some that they gave it the name of Vandalucia or Andaluca; but the real origin of the name is probably *Andalosh*, the Land of the West. It is the *Tarshish* of the Bible, and was called Tartessus in ancient geography. The Romans named it *Bætica*, from the river Bætis (the modern Guadalquivir). The Moors founded here a splendid monarchy, which quickly attained a high degree of civilisation. Learning, art, and chivalry flourished in harmony with industry and commerce. The four great Moorish capitals were Seville, Cordova, Jaen, and Granada. During the darkness of the middle ages, Cordova was 'the Athens of the west, the seat of arts and sciences;' and later still, under the Spaniards, when 'the sun of Raphael set in Italy, painting here arose in a new form in the Velasquez, Murillo, and Cano school of Seville, the finest in the peninsula.' On the north, A. is divided from Estremadura and New Castile by the mountain-chains of Aroche, Cordova, and Morena. On the east it is bounded by Murcia, and on the west by Portugal and the Atlantic. The south coast eastward from Gibraltar is mountainous; the west, where the Guadalquivir flows into the Atlantic, is level. A. was esteemed the richest district of Hesperia, and its former wealth of produce has been indicated by such names as the 'garden,' the 'granary,' the 'wine-cellar,' and the 'gold-purse' of Spain. But, in the present day, such predicates are merited only by comparatively small portions of the hilly country on both sides of the Guadalquivir, where, even with careless cultivation, the soil is luxuriantly productive. Here wheat and maize ripen in April, and yield abundantly. Olives and oranges attain their greatest height, and vegetation generally assumes a tropical character. Cotton, sugar-cane, Indian figs, and batatas flourish in the open air, and the cactus and aloë form impenetrable hedges. Wine and oil abound. The botany and mineralogy of A. are very rich. The ranges of the Sierra Nevada are composed principally of primary and secondary formations. In the west, towards Xenil, cultivation is more sparing, as there is a natural deficiency of water, and the artificial means of irrigation formerly employed have fallen into disuse. Nearer to the

coast lie tracts of land still more barren; and the level strip extending between the mouths of the Guadalquivir and the Tinto, is covered with moving sands. On the whole, A. is still one of the most fertile districts of Spain, owing to its delicious southern climate and the abundance of water supplied by its snowy mountains. Its breed of horses has long been celebrated, and the mules are superior to those of other countries. The *Sierra Morena* mountains supply the wild cattle exhibited in the bull-fights of Madrid. The natural riches of the district have at various times invited colonists and invaders, such as the Phœnicians and the Moors. The Andalusians are regarded as among the most lively, imaginative, and active people of Spain. But they are also considered by the rest of their countrymen to be the Gaseons—the braggarts and boasters of Spain. Apparently they have never at any time been warlike, since even Livy calls them *imbelles*. They are, like all braggarts, extremely credulous, and are, besides, remarkable for their intense superstition. The worship of the Virgin prevails to such an extent that the very country is called *La Tierra de la Santísima*, 'the Land of the Most Holy Virgin.' They speak a dialect of Spanish mixed with Arabic. The chief towns of A. are named after the four ancient provinces into which it was divided—Seville, Cordova, Jaen, Cadiz, (q. v.). Area 27,217 miles. Pop. 2,800,000.

ANDAMANS, a group of thickly wooded islands towards the east side of the Bay of Bengal, between 10° and 14° of N. lat., and about 93° of E. long. The population is both barbarous and scanty, and bears no resemblance whatever either in physical features or language to the neighbouring Asiatic races. In 1793 the Great Andaman received a British colony, which was withdrawn, however, in 1796. Since 1857, the A. have been selected as a penal settlement for sepoj mutineers, though the design has not, at least on any large scale, been carried into effect. It is only physically, in short, that the A. deserve special mention, not so much from their presenting in themselves any remarkable features, as from their being a portion of the long arch, mostly volcanic, of the Indian Archipelago, which, with Timor at its bend, comprises the Moluccas, Celebes, the Philippines, and Formosa, on the one side; and on the other side the Sunda Isles, Java, Sumatra, the Nicobars, and the A.—the outline only requiring to be filled up in imagination, in order to produce a peninsula harmonising more or less with the other southern projections of the world, Hindostan, Africa, and South America.

ANDANTE (Italian), in Music, implies a movement somewhat slow and sedate, but in a gentle and soothing style. This term is often modified, both as to time and style, by the addition of other words—as *A. affettuoso*, slow, but pathetically; *A. cantabile*, slow, but in a singing style; *A. con moto*, slow, but with emotion; *A. grazioso*, slow but gracefully; *A. maestoso*, slow, with majesty; *A. non troppo*, slow, but not too much so; *A. pastorale*, slow, and with pastoral simplicity.

ANDERNACH, a little town belonging to the district of Coblenz on the Rhine, in lat. 50° 27' N., long. 7° 25' E., was once a Roman fortress styled Antunnaeum, then a residence of the Merovingian kings, and afterwards became one of the most flourishing places on the Rhine. The great tower on the north side, the fine old church—with one tower built in the Carlovingian times—and the old gates and walls, give quite a medieval aspect to the town. It now contains about 3500 people, supported by trade in leather, wine, and corn, and is especially celebrated for its millstones, exported to distant

parts of the world, and for its *tuffstein* or trass, an indurated volcanic mud, which, when pulverised and mixed with lime, makes a mortar or cement for constructions under water.

ANDERSEN, HANS CHRISTIAN, one of the most gifted poets that Denmark has recently produced, was born April 2, 1805, at Odense in Funen. His father was a poor shoemaker, who used, however, to console himself by speaking of the former prosperity and wealth of his family. After his father's death, he was for a short time employed in a manufactory. The widow of Bunkelød, a poet of some reputation, charitably adopted him. He early displayed a talent for poetry, and was known in his native place as 'the comedy-writer.' Hoping to obtain an engagement in the theatre, he went to Copenhagen, but was rejected because he was too lean. He was next encouraged to hope for success as a singer; but had hardly commenced his musical studies when his voice failed. He found generous friends, however, to help him in his distress; and application having been made by one of them to the king, he was placed at an advanced school at the public expense, and so began his academic education in 1828. Some of his poems, particularly one entitled *The Dying Child*, had already been favourably received, and he now became better known by the publication of his *Walk to Amak*, a literary satire in the form of a humorous narrative. In 1830, he published the first collected volume of his *Poems*, and in 1831 a second, under the title of *Fantasies and Sketches*. His *Travelling Sketches* (*Skjægbilleder af en Reise til Harzen, &c.*) were the fruit of a tour in the north of Germany. A pension from the king now enabled him to visit Germany, France, Switzerland, and Italy. In Switzerland he completed his *Agnes and the Mermaid*; and one of his best works, *The Improvisatore*, a series of scenes depicted in a glowing style, and full of poetic interest, was the fruit of his visit to Italy. Soon afterwards, he produced *O. T.* (1835), a novel containing vivid pictures of northern scenery and manners, which was followed (1837) by another, entitled *Only a Fiddler* (*Kun en Spillemand*). In 1840, he produced a romantic drama, entitled *The Mulatto*, which was well received; but another drama, *Raphaela*, was less successful. In the same year appeared his *Picture-book without Pictures*, a series of the finest imaginative sketches. Exhausted by his labours, he sought recreation in the end of 1840 in a somewhat lengthened tour in Italy and the East, of which he gave an account in *A Poet's Bazaar* (1842). After his return, appeared *The Flower of Fortune*, a dramatised fable, and three series of tales, some of which had previously appeared, and by which the popularity of A. was greatly extended, and particularly in Germany. His works have been translated, not only into German, but into English and other languages, although the beauties of his style, more than of many authors, are unavoidably lost in translation. His *Dying Child* has been translated into the language of Greenland. Besides the works above mentioned, he is the author of *Ahasuerus*, a mythical drama, and of *The Two Baronesses*, a tale illustrative of Danish society.

ANDERSON, JAMES, LL.D., a writer on political economy and agriculture, was born in 1739 at the village of Hermiston, near Edinburgh. He lost both his parents when very young, so that the management of a large farm, which had been in the possession of the family for a long time, devolved upon himself. Recognising the practical importance of a knowledge of chemistry to a farmer, he attended the chemistry class in the university of Edinburgh, and brought the results of his study to bear on his

profession. He invented, at an early period of life, the small two-horse plough without wheels, commonly called the Scotch plough, which is generally admitted to have been one of the most useful improvements of agricultural implements ever introduced. When only 24 years of age, he went to Aberdeenshire, where he rented a large moorland farm of 1300 acres. Here he remained for a considerable time, devoting his leisure hours to writing upon agriculture. His first attempt was a series of essays upon planting, which, under the signature of *Agricola*, he contributed to the *Edinburgh Weekly Magazine*. In 1780, the university of Aberdeen bestowed on him the degree of Doctor of Laws. In 1784, on account of his pamphlet, entitled *Encouragement of the National Fisheries*, he was engaged by government to make a survey of the western coast of Scotland, with special reference to that object. He next commenced in 1791 the publication of a periodical called *The Bee*, which was continued for three years; in 1797 he went to London, where he pursued his literary avocations with such intense assiduity, that his health gradually gave way. He died on the 15th of October 1808.

A. will deserve a place in any record which details the remarkable advances made by Scotland in agriculture and other sources of wealth in the latter half of the 18th c. And even in the history of ideas he will deserve a prominent notice, as his *Bee* was the type of many periodical miscellanies of a cheap nature, mingling instruction with entertainment, which have since been published. It is also to be observed that, in his essay called *A Comparative View of the Effects of Rent and of Tithe in Influencing the Price of Corn* (contained in one of his latest publications, *The Recreations of Agriculture*), he anticipated some important principles subsequently advocated by Malthus, Ricardo, and West, particularly the famous theory of rent.

ANDERSON, JOHN, F.R.S., Professor of Natural Philosophy in the university of Glasgow, and founder of the eminently useful institution bearing his name, was born in the parish of Roseneath, Dunbartonshire, in 1726. Having lost his father, who was a clergyman, when very young, the care of his education devolved upon an aunt who resided at Stirling. From Stirling, he went to Glasgow University, where he must have excelled in literature as well as in science, for in his 30th year he was appointed Professor of Oriental Languages. Four years later (1760), he was transferred to the chair of Natural Philosophy—an event which, considering his decided predilection for the exact sciences, must have been not less agreeable to him than fortunate for the world. He entered upon his new duties with extraordinary ardour. Besides the work of the class, he was indefatigable in studying the application of science to mechanical practice; visiting, for this purpose, the workshops of artisans in the town, and receiving, in return for the theories and principles which he had to communicate, a full equivalent of experimental knowledge. Even this, however, did not satisfy him. Inspired by a rational philanthropy, he instituted, in addition to his usual class, which was strictly mathematical, one for the working-classes and other persons whose pursuits did not enable them to conform to the prescribed routine of academical study. He continued to teach this *Anti-toja Class*, as he called it—with reference to the red toga, or college-gown, worn by the regular students in Glasgow—twice every week, during the session, to the end of his life. In 1786 appeared his valuable work, entitled *Institutes of Physics*, which went through five editions in ten years. Shortly before the French Revolution, he invented a species of gun, the recoil of which was stopped by the

condensation of common air, within the body of the carriage; but having in vain endeavoured to attract the attention of the British government to it, he proceeded to Paris in 1791, and, being himself a great friend of liberty, presented his model to the National Convention. It was hung up in their hall, with the following inscription over it: 'The gift of SCIENCE to LIBERTY.' Afterwards, when the allied monarchical forces had drawn a military cordon around the frontiers of France, to prevent the introduction of French newspapers into Germany, A. ingeniously suggested the expedient, which was adopted, and proved quite successful, of making small balloons of paper, to which newspapers and manifestoes might be tied, and letting them off, when the wind was favourable, for Germany. A. died 13th January 1796. By his will, dated 7th May 1795, he directed that the whole of his effects, of every kind, should be devoted to the establishment of an educational institution in Glasgow, to be denominated *Anderson's University*, for the use of the unacademical classes.

ANDERSON'S, or, more commonly, the ANDERSONIAN UNIVERSITY, was originally intended to consist of four colleges—for arts, medicine, law, and theology—besides an initiatory school. Each college was to have nine professors, the senior professor being the president or dean. The funds, however, were totally inadequate to such a plan, and the institution was therefore opened with only a single course of lectures on natural philosophy and chemistry, by Dr Thomas Garnett. This course was attended by nearly a thousand persons of both sexes. In 1798, a professor of mathematics and geography was appointed. The splendid apparatus and library of the founder, which were valued at £3000, added greatly to the advantages of the infant institution. In 1799, Dr Birbeck, the successor of Dr Garnett, commenced the system of giving a familiar exposition of mechanics and general science. His class was attended by 500 artisans, who received their instruction *gratis*. This was the origin of mechanics' institutes. The Andersonian Institution was placed, by the will of the founder, under the inspection and control of the lord provost, and many other honourable persons, as ordinary visitors, and under the more immediate superintendence of 81 trustees, who are elected by ballot, and remain in office for life. It has gradually enlarged its sphere of instruction, and brought it nearer to the design of the founder. In 1852, the number of professors amounted to 15. It possesses a high reputation at the present day, as a school of medicine in particular.

ANDES, the great mountain-chain of South America, extending in a direction nearly parallel with the Pacific, along almost the whole length of the continent. The chain falls short of the Isthmus of Darien, between which and the Atrato—a river falling into the Caribbean Sea—it gradually subsides into a merely undulating country. It appears, also, to fall still further short of the Strait of Magellan, so far as the mainland is concerned. But, on geological grounds, it has been traced, first along the islands that breast Patagonia to the west, and next along those that form the Fuegian Archipelago. Thus may the chain be said to stretch from the neighbourhood of the mouth of the Atrato, not merely to Cape Horn, but even to the rocks of Diego Ramirez, which lie about 60 miles to the south-west of that promontory. The extreme length, therefore, is from lat. 8° 15' N. to lat. 56° 30' S.—comprising, of course, 64° 45', or, without any allowance for windings or deviations, about 4500 English miles. But to mark the scale on which nature has moulded the new world, the A. may be regarded as merely a part of the sufficiently continuous chain

of about 9000 miles which loses itself near the mouth of the Mackenzie, towards the shores of the Arctic Ocean. In this respect, the old continent can bring nothing into comparison.

Position.—The A., besides being generally in a direction nearly parallel with the Pacific, verge closely on that ocean. From the rocks, indeed, of Diego Ramirez to about lat. 40° S., the mountains, whether they are found on islands or on the mainland, are almost literally washed by the surf; while northward from that parallel, there spreads out, between the chain itself and the sea, a belt of land not exceeding, in average breadth, 70 or 80 miles. Within the limits of Peru, the belt in question is narrowest, while above and below it is, in general, somewhat more extensive. The position of the A. with respect to the Atlantic Ocean presents a striking contrast. To illustrate this, a passage is subjoined from Herndon, the explorer of the Amazon on behalf of the United States. Crossing from Lima to the head-waters of the Amazon, by the Pass of Antaranra, he writes thus: 'Yana-coto, on the western slope of the A., at the height of 2337 feet above the sea-level, is only 23 miles from the ocean that washes the base of the slope on which it is situated; while Fort San Ramon, at nearly the same elevation on the opposite side, cannot be much less than 4000 miles from its ocean by the windings of the river, and in the river's direct course is at least 2500 miles.' Further, to compare the two areas respectively to the west and east of the dividing ridge, the former has been estimated at 180,000 square miles, and the latter at twenty times as much.

Hydrography.—This interesting feature of the A. has been already anticipated, to a considerable extent, under the heads of the AMERICAN and AMERICA. It only remains to observe that from one end of the continent to the other, the true and only water-shed, wherever there are two ranges, is the range nearer to the Pacific. Not only is the water-shed in question obviously far closer to the west than to the east, but, beyond this, it is, apparently without a single exception, pushed as far to the westward as possible; it thus affords the most conspicuous and most decisive example of an almost universal law in the hydrography of the earth. Throughout both continents, almost every leading water-shed presents a longer descent towards the east than towards the west, or, in other words, sends off larger streams in the former direction than in the latter. To cite a few instances: compare, in North America, the Missouri with the Columbia; in Europe, the Volga with the Neva; in Asia, the Hoang-ho of China with the Oxus of the Sea of Aral; and even in Africa, where, as also in Arabia, hydrographical traces have been largely overlaid by deserts of sand, the plateau of the Sahara and the chain of the Atlas gradually incline, both of them, towards the east. But, if the water-shed be invariably found as far as possible to the westward, it necessarily follows, that, wherever there are two ranges, the more easterly range cannot also be a continuous water-shed—unless, indeed, it may be regarded as such with respect to the land-locked basin of the connected lakes, Titicaca and Uroz, already mentioned under the head of AMERICA. With this exception, all the gatherings between the two ranges, whether the intermediate space be plateau or sierra, have found or formed channels of escape—narrow, deep, and dark as they often are—only to that sea which is thirty or forty times more distant than the one at their back.

Breadth and Area.—The area, on an estimate, necessarily rough and vague, has been computed to be triple that of the belt of comparatively level land

that borders on the Pacific. In other words, the average breadth of the chain is reckoned to be thrice that of the belt in question. In a rough way, the breadth may be estimated from the very shore of the Pacific, whence the west slope commences, to the lowest pongos, or cataracts, on the eastward streams. But it is more correct to measure it from the foot of the mountains, properly so called, on the one side to that on the other. The phraseology of the country, which, on such a subject, ought to be conclusive, appears to support the latter mode of computation. In Lima and its neighbourhood, where Herndon crossed the A., that officer speaks of 'coast' and 'sierra,' as distinguished from each other even to the westward of the dividing ridge. The entire distance of the Pass of Antaranra, as measured on the actual road, was 87 miles—the first 50 being *coast*, and the remaining 37 being *sierra*. Nor does the distinction seem to have been an arbitrary one. From Callao to Cocachera—a line of 44 miles—the rise above the sea-level, tolerably uniform the whole way, amounted to 4452 feet, or rather more than 101 feet to the mile; but the next 15 miles, of which about a half still belonged to what was called *coast*, yielded an increase of 2350 feet, an average probably of 200 feet for that part of the stage that fell under the definition of *sierra*. To give instances of extreme breadths of the A.—an average breadth being unattainable—the least breadth, and that in Patagonia, is believed to be 60 or 70 miles; the greatest breadth, again, pretty nearly on the parallel of Lake Titicaca, and right through the grand plateau of Bolivia, is said to be 400 miles; and to give an intermediate case, the breadth from Mendoza, in the basin of La Plata, to Santiago, in Chili, is given at 140 miles—the former city being 4486 feet above the Atlantic, and the latter 2614 above the Pacific.

In order, then, to have a definite idea of the breadth of the A., the chain must be viewed from one end to the other. In doing this, there will be adopted the ordinary nomenclature, referring each division of the A. to the particular country through which it may pass.

Patagonian Andes.—Including the A. of the Fuegian Archipelago, this part of the chain, extending from lat. 56° S. to lat. 42° S., a distance of more than 960 miles, is the narrowest of all, or is, at all events, too irregular to have its breadth accurately estimated. The Patagonian shore, strictly so called, is breasted, very much like the north-west coast between Fuc's Strait and Mount St Elias, by a number of islands. On these, as already mentioned, the true A. are to be found, or rather, of these the true A. consist—the continent itself affording no footing to the chain till fully 300 miles to the northward of Cape Horn. Even after the chain has laid hold of the mainland, it by no means can be said to abandon the islands; so that here, as further to the north, the chain may be regarded as made up of parallel ranges—the main difference being that the intervening valleys, which, to the north, are basins of fresh-water rivers, here present salt-water channels.

Chilian Andes, stretching from lat. 42° S. to lat. 24° S., a distance of nearly 1250 miles. Throughout nearly the whole of this line, the A. consist of only one range, for the parallel ridges, which run along between the great water-shed and the Pacific, cannot claim to be any exception to this remark, inasmuch as their highest points do not exceed an elevation of 2500 feet above the level of the sea. This part of the chain, however, presents several lateral ranges, if it does not present any parallel ones of importance. These spurs are to be seen on both sides, though of very different magnitudes. To

ANDES.

the west, they are akin to the comparatively insignificant parallel ranges just noticed, being, if A. at all, merely A. in miniature. But to the east, the spurs deserve more consideration. They are two in number, the one branching off between the 33d and 31st parallels, and the other between the 28th and 24th. The former, called the Sierra de Cordova, advances like a promontory into the plains of Rio de La Plata, or Pampas, as they are more generally denominated, as far as the 65th meridian; and the latter, called the Sierra de Salta, runs nearly as far to the east, and in a direction nearly parallel.

Peruvian Andes.—This part of the chain, stretching from lat. 24° S. to lat. 6° S.—a distance about the same as in the last paragraph—is perhaps the broadest of all the divisions of the A. It certainly contains the largest of the plateaus, the plateau of Bolivia. Between the 20th and 19th parallels, not far from the city of Potosi, the chain separates into two ranges, known as the East and West Cordilleras of Bolivia; and it is the reunion of these ranges, between the 15th and 14th parallels, that encloses the land-locked plateau of Titicaca, containing, as is said, 30,000 square miles, or an area equal to that of Ireland. Immediately above this table-land, the united ranges in question constitute the mountain-group of Cuzco, which, in point of superficial extent, is stated to be thrice as large as all Switzerland. About a degree further north, the chain again separates as before, reuniting also, as before, between the 11th and 10th parallels, so as to embrace the cities of Guanta and Guancavelica. Hardly have the two ranges reunited, when they mass themselves into the table-land of Pasco, not quite half the size of that of Titicaca. Further to the north, the chain divides, not into two, but into three ranges, which unite again, on the frontiers of Ecuador, in the group of Loxa, about lat. 5° S.

Andes of Ecuador.—Immediately beyond the group of Loxa, between 4° and 3° S. lat., the chain divides into two ranges, which, by again uniting in 2° 27', form the valley of Cuenca; and immediately beyond this is the group of Assuay, with its table-land. Then another plateau of no great extent, and a short stretch of the undivided chain, lead to the vast table-land of Quito, which is said to be subdivided by low hills into five smaller plateaus, two to the east, and three to the west. Towards the north, the table-land of Quito is succeeded by the group of Los Pastos, forming the extreme portion of the A. of Ecuador.

Andes of New Granada.—Beyond the city of Ahnager, the chain breaks off into two ranges, which never again join each other. The range on the west side remains undivided, till it disappears near the mouth of the Atrato, a little to the east of the Isthmus of Darien. But the range on the east, after massing itself into the group of Paramo de los Papas, breaks into two branches, which, as distinguished from the range aforesaid on the west, are styled the Central and Eastern Cordilleras of New Granada. These two contain between them the upper waters of the Magdalena, the eastern separating them from the basin of the Orinoco, and the central dividing them from that of the Cauca. Between them also they contain several considerable table-lands, the principal one being that of Santa Fé de Bogota.

Height.—Under this head must be treated separately the plateaus, the most prominent mountains, and the passes—the altitudes of the lines of perpetual snow falling more naturally under the head of Climate. Here, as in the case of breadth, the chain will be followed from south to north.

HEIGHT OF PLATEAUS.

	Feet.
Table-land of Titicaca,	12,700
Group of Cuzco,	8,300
Table-land of Pasco,	11,000
" " Assuay,	15,520
" " Quito,	9,543
" " Bogota,	8,958

The average height of these six colossal masses above the sea-level is thus 11,000 feet, or considerably more than 2 English miles.

These passes will bear a comparison with the loftiest pinnacles in Europe. The last and lowest overtops the highest summit of the Pyrenees by 332 feet; while the last but two, that of Antarangra, which Herndon traversed, soars 389 feet above Mont Blanc, the culminating peak of the Alps.

The passes across the A. present a vast variety of surfaces and levels. They appear to skirt, as often as practicable, the mountain-torrents; and, when

that is impracticable, sometimes surmount them by bridges, and sometimes avoid them by means of a path cut along the shoulder of the overhanging height.

With respect to the mountain-torrents, Herndon, after leaving Antarangra behind him, was enabled to avail himself chiefly of this resource. 'As far as the traveller,' says he, 'is concerned, there are not, on the route we have travelled, two ranges of the A.—that is, he has not to ascend and descend one range, and then ascend and descend another. From the time that he crosses at Antarangra, his progress is downward, till he reaches the plain. Really, however, there are two ranges. The streams from the first or western range have broken their way through the second, making deep gorges, at the bottom of which the road generally runs, and leaves the peaks of the second range thousands of feet above the traveller's head.'

In addition to the essential perils of such a course, Herndon encountered, on one occasion, an incidental danger, which he thus describes—the scene being a narrow path on the shoulder of an almost precipitous hill: 'Mr Gibbon was riding ahead. Just as he was about to turn a sharp bend, the head of a bull peered round it on the descent. When the bull came in full view, he stopped; and we could see the heads of other cattle clustering over his quarters, and hear the shouts of the cattle-drivers, far behind, urging on their herd. I happened to be abreast of a slight natural excavation; and dismounting, I put my shoulder against my mule's flank, and pressed her into this friendly retreat; but I saw no escape for Gibbon. The bull, with lowered crest and savage look, came slowly on, and actually got his head between the perpendicular wall and the neck of Gibbon's mule. But his sagacious beast, pressing her haunches hard against the rock, gathered her feet close under her, and turned as on a pivot. This placed the bull on the outside; and he rushed by at the gallop, followed in single file by the rest of the herd.'

In the bridging of the mountain-torrents, a good deal of rude ingenuity is displayed. Sometimes chains are suspended from side to side; and sometimes a rough flooring is laid between projecting beams from either bank, which have previously been fixed as solidly as possible. Nature also has done something in this respect to help man, having thrown two bridges of her own over a fearful chasm at Iconozzo. The torrent, which they span, falls down a beautiful cataract into a murky crevice—the noisy haunt of nocturnal birds. At a height of 400 feet above the foaming waters, the two bridges hang in mid-air, both of them, apparently, though in different ways, the work of an earthquake. The upper one is merely a fragment of the original sandstone, which must have resisted the shock that formed the rent; while the lower, probably the most singular arch in the world, consists of three detached rocks, so adjusted as to support each other.

The loftiest pinnacles of the A., when viewed from the table-lands, and, still more, when seen from the crests of the passes, lose, to the eye of the beholder, much of their real altitude. Under such circumstances, not a single mountain presents the actual dimensions of Mont Blanc, as overhanging the Vale of Chamouni. It is only from a distance—best of all, perhaps, from a good offing in the Pacific—that the A. appear in all their gigantic proportions. Standing thus on their pedestal, the most rugged and colossal in nature, they almost realise to the spectator the highest Pyrenees piled on the highest Alps; while, to enhance the grandeur of the scene, the igneous action, which has heaved the chain into existence,

is here and there adding to its stature a pillar of smoke and flame.

The geology of the A. is as yet very little known. It is more than half a century since Humboldt travelled through these mountains, and to him we are even now chiefly indebted for our knowledge regarding them. At that time, geology was in its infancy—its language had not been formed, its classification, at least as it now exists, was unknown, and its facts were mixed with absurd and now long-exploded theories; it could, in fact, scarcely be called a science. It is fortunate that as regards the materials constituting the great mass of the A. range—the igneous rocks which form its back-bone, and the metamorphic rocks which form its great bulk—our knowledge was almost as extensive and explicit 50 years ago as it is now, and therefore, in respect to them, Humboldt's observations are as good as if made but yesterday. Not so as regards the more recent sedimentary formations. The value of fossils was not then known, and the vaguest ideas prevailed as to the chronological order of the stratified rocks. Hence descriptions written at that time are almost valueless to modern science. A few scattered notes may be gleaned from the small number of intelligent travellers who have recently visited these mountains; and to them we are obliged for any of the facts we are able to give regarding the deposits referred to.

The elevation of the A. took place at an epoch anterior to the formation of the Rocky Mountains of North America, which are geographically a continuation of them. They are composed, to a very large extent, of stratified metamorphic rocks. It is remarkable that granite occurs in them not as an unstratified plutonic rock, but only intercalated with the other members of the stratified azoic series. The true igneous rocks belong either to the trappean or volcanic divisions. The grand ridge is everywhere covered with one or other of the varieties of trap (greenstone, clinkstone, basalt, or porphyry). These are often broken into columns, and appear at a distance like ruined castles, producing a very striking effect.

Bursting through the trap-rocks, there are a number of volcanoes covering their summits with more recent igneous rocks. Among the mountains specified above as to altitude, Yanteles, Corcobado, Minchinadom, Antuco, Gualtieri, Arequipa, Cotopaxi, Antesana, and Pichincha belong to this class. Fifty-one volcanoes have been described as existing throughout the whole range. The mountains of Ecuador are so extensively and continuously of volcanic origin, that they have been regarded as different safety-valves of one and the same burning vault. It is generally maintained that there is a relation between the height of a volcano and its activity and the frequency of its eruptions. Thus, Stromboli (2957 feet) has continued in a state of activity since the earliest ages, serving the purpose of a light-house to the navigators of the Tyrrhenian Sea; while Cotopaxi (18,887 feet) and Tunguragua (16,579 feet) have been active only once in a hundred years. Many of these 51 volcanoes have consequently not yet been observed by Europeans in an active state. In the Quito district there are 10 active, and 7 of doubtful activity; in Peru and Bolivia, the numbers are 9 and 3; in Chili, 17 and 5; making in all 36 active, and 15 about which there is some uncertainty as to their activity. Another characteristic of these volcanoes, resulting from their gigantic altitude, is that few of them emit streams of lava. Thus Antesana is probably the only one in the Quito range that has ejected lava. The force, however, which is repressed apparently by the immense superincumbent mass which fills the crater, is exhibited

in a terrific manner when an eruption does take place. Cotopaxi, for instance, the most regular and beautiful outlet of this the grandest of nature's laboratories, has been known to shoot its fiery torrents 3000 feet above its snow-bound crater, while its voice is said to have been heard at a distance of 550 miles. On one occasion a piece of rock, measuring 300 cubic feet, was thrown from its crater to a distance of more than eight miles.

Earthquakes are intimately connected with these volcanic phenomena. No portion of the globe is subject to such frequent and destructive earthquakes as the countries embosomed within the range of the A. and those lying between them and the Pacific. The cities and towns of Bogota, Quito, Riobamba, Callao, Copiapo, Valparaiso, and Concepcion, have all at different times been more or less devastated by their agency. During the present year (1859), an earthquake buried many of the inhabitants of Quito under the ruins of its churches and public edifices; scarcely a single building of any size escaped uninjured.

It is to the same subterranean agency that upheaved and still convulses the A. that we are to ascribe those fearful ravines which are almost peculiar to the chain. An apt instance has already been cited in the case of the deep and dismal crevice which has been spanned by the natural bridges of Leonzo. A still better specimen is the valley or den of Chota, which, with a width at top of only 2600 feet, is 4875 feet in perpendicular height. This den might overlap the loftiest hill in Scotland, with St Peter's at Rome on its summit.

The flanks of the mountains are clothed with crystalline stratified rocks, consisting of innumerable varieties of granites, gneiss, schists, hornblende, chloritic slates, porphyries, &c. These have been greatly disrupted by the underlying igneous rocks, and now occupy a vertical or nearly vertical position. They often run up into bold and rugged peaks on the summits. They alternate with each other in great meridional bands, but without any apparent order in the succession, except that the varieties of schist depend on the crystalline parent rock below; otherwise, no regular sequence can be observed; for miles, only granite and gneiss are found, then schist, quartz, gneiss, &c., interchanging. The variety and quantity of the mineral wealth of these rocks is remarkable; with the exception of lead, most of the metals are obtained in large quantities—see below. The topaz, amethyst, and other gems are abundant.

Lying unconformable with these almost vertical metamorphic rocks, there occur in the valleys and table-lands, and creeping up the base of the mountains, a variety of fossiliferous beds, which require further examination before they can be clearly understood. A better estimate of the nature of these deposits will be arrived at by describing one of the localities where they occur. Take the large plateau on which Bogota is built, which is 8958 feet above the sea. The deposits filling up this plain have been formed subsequent to the present conformation of the district, though not necessarily at the present altitude: the whole range may have been since elevated. The almost horizontal rocks, from their organic contents, consisting of Ammonites, Hamites, &c., have been referred by Edward Forbes to the cretaceous era. The basin consists of many beds of sandstones, limestones, shale, coal, gypsum, and salt. The salt occurs in large quantities, one bed being no less than 100 feet in thickness, and the coal in sufficient abundance to be wrought. All these rocks have been more or less affected by their proximity to the underlying metamorphic rocks. The molecular action going on below has in many

places been continued in them, and has induced a cleavage at right angles to their planes of stratification. The other patches—some of great extent, as the plateau of the Titicaca—cannot yet be referred to any particular geologic epoch. Coal has been found near Huanco, in Peru, at the height of 17,000 feet; fossiliferous limestones and sandstones have been noticed in Peru at Micupampa and Huancavelica.

Metals.—The aboriginal term A. is said to have been derived from the Peruvian *anta*, which signifies metal in general, or rather, perhaps, copper in particular. Within the limits of the empire of the Incas, mining-tools, evidently not European, have been dug up in various places; and in one district the ancient Peruvians have left behind them traces of their mining operations at a height of 17,000 feet. Moreover, the term, whatever may have been its meaning, appears to have been, at all events, of Peruvian origin, for it does not seem to have been applied to the great chain of mountains by the aborigines of New Granada.

The A. are understood to yield every metal used in the arts but lead, and, according to one recent statement, they yield lead also.

Gold is found in Chili, Peru, and New Granada. In Chili, however, it is so little productive, that proverbially a gold-mine is inferior to a silver one, and that, again, to a copper one. In Peru, gold is most abundant between the 9th and 7th parallels; though further south, to the east of Lima, the mines of Carabaya have been recently wrought to great advantage; and further south still, to the east of Titicaca, very rich washings are situated on the river Tipiani. In New Granada, gold-mines are generally so inaccessible as not to bear the expense of working them. The washings, again, though perhaps remotely the product of the A., are confined chiefly to the alluvial soils that lie between the chain and either sea.

Silver also is found in Chili, Peru, and New Granada. In Chili, the most valuable, almost the only very valuable, mines are wrought on the east face of the A., not far from the city of Mendoza, already mentioned in connection with the breadth of the chain. In Peru, the most productive mines are those of Pasco and Potosi. In those of Pasco, which have now been open for more than two and a quarter centuries without even approaching to exhaustion, the ore is a mixture of silver and oxide of iron. In the mines, again, of Potosi, whose very name has become a proverb, there are said to be no fewer than 5000 excavations, while, to all appearance, only the upper crust of the inexhaustible deposits has been penetrated. In New Granada, it is with silver as it has been shewn to be with gold, the mines of the former metal, as well as of the latter, being so inaccessible as not to bear the expense of working them.

Mercury or *quicksilver* is found in Quito, near the village of Azogú, which lies to the north-west of Cuenca—taking its name, as is said, from this metal; and it is found likewise in Peru, not far from Guancavelica, a town situated, as already stated, to the north of the group of Cuzco. The mercury exists chiefly in combination with sulphur, forming what is called cinnabar.

Platinum appears to exist only in New Granada; but like the gold-washings of that country, it is found rather in the alluvial soils, that have been flooded down from the chain, than in the chain itself.

Copper is found chiefly in Chili, but also in Peru. In the latter country, it is of little account in comparison with silver; but, in the former, it may be styled the staple metal, or even the staple production.

The most valuable mines are in the northern and southern provinces; in Coquimbo and Copiapo above, and in the neighbourhood of Araucania below.

Climate.—The climate of the A. is, at every point, affected by three different considerations—position with respect to the length of the chain, position with respect to its breadth, position with respect to its height.

In connection with the *length* of the chain, the variations of climate, though less peculiar than its variations under either of the other aspects, are not merely a counterpart of similar changes in other parts of the globe. In the new world generally, temperature rises and falls more rapidly in proportion to latitude than in the old; and, again, as within the new world itself, more rapidly in the south than in the north. In connection, therefore, with the length of the A., the variations of climate may be regarded as the greatest possible—the tropical heat of the equatorial regions passing gradually into something like polar cold, even within a latitude not greater than that of Edinburgh. This may be best illustrated with reference to the limits of perpetual snow. Within the Strait of Magellan, in about the latitude of Wales, the limit in question is only about 3500 feet, nearly the precise height of the summit of Snowdon. In lat. 33° S., about the centre of Chili, the snow-line, according to Humboldt, is estimated at 12,780 feet; while, on a nearly corresponding parallel, the Himalayas present on their northern slope a snow-line of 16,620 feet. In the tropical regions of the A., the snow-line seems to range from 16,000 feet to 18,000. This result, excepting that it does not greatly surpass the height of the snow-line as above on the Himalayas, can scarcely be compared with anything in the old world, whose tropical regions do not present any chain of the requisite altitude for the purpose. The same cause which regularly lowers the snow-line in proceeding from north to south, has led, in Patagonia and Tierra del Fuego, to the formation of glaciers—a feature of the Alps which is altogether unknown in the central and northern divisions of the A. Glaciers, as the growth of an icicle renders familiar to every one, require alternations of heat and cold, or rather of thaw and frost. Now, these essential conditions do not exist in the lower latitudes of the A., where, generally speaking, every stage or terrace, as already noticed under the head of AMERICA, possesses an almost monotonous temperature. But they do exist in Patagonia and Tierra del Fuego; and accordingly, glaciers there abound on the shores of the deep indentations of the coast.

In connection, next, with the *breadth* of the chain, the variations of climate, if not peculiar to the A., have no perfect parallel elsewhere. At every point, excepting, perhaps, towards the extreme south, the chain is almost as much of a water-shed to the clouds as it is to the rivers. Rarefied as the air is at the elevation of the A., no vapour, generally speaking, can cross them—even the existence of snow at the height of several miles being a phenomenon which, *a priori*, was hardly to be expected. This fact is rendered more important by the ordinary directions of the currents of air. The prevailing winds blow against the A., not alongside of them, being generally from the east between the equator and 30°, and from the west in latitudes towards the south. Thus, generally speaking, every section of the chain has permanently a windward and a leeward side—the former intercepting nearly all the moisture, and the latter being condemned to comparative drought. Peru, Chili, and Patagonia, one and all, confirm these observations in detail. On the west, Peru, unless in the immediate vicinity of the mountain-streams, is little better than a

desert; while, on the east, the Montana, as it is called, is remarkable for its fertility. To the west, on the contrary, Patagonia has its glaciers to shew as the result of its rains from that quarter; while, to the east, its five terraces, extending 700 miles to the Atlantic, are almost uniformly arid and sterile. Between Patagonia and Peru, Chili has something in common with both, resembling the former in its southern half, and the latter in its northern. To take the Pacific side alone; in the northern parts, showers are only occasional, sometimes at an interval of three years—the deficiency being partly supplied by frequent dews; while, to the south of lat. 34°, the rains are sufficiently copious to form considerable rivers.

In connection, lastly, with the *height* of the chain, the variations of climate stand alone in the world, being approached, though at a great interval, only by the corresponding changes in Central America. The Alps, to take a familiar analogy, have, it is true, their gradations of climate. But, situated, in round numbers, on about the 45th parallel, they represent only half of the latitudes between the equator and the pole; while the A. of Quito, before reaching this level, must have seen melting into each other the temperatures of Borneo, India, Persia, Asia Minor, and Italy. Taking the snow-line of the A. of Quito at 18,000 feet, and that of the Alps at 8000, the lower and hotter 10,000 feet of the former have no counterpart at all on the latter. Now, Herndon found Tarma to lie within this height, precisely at an elevation of 9738 feet; and he there saw apples, strawberries, almonds, grapes, and maize—a state of things not far behind that at the foot of the Alps. No space remaining for details, one general observation must close this article. In an open locality, the naked eye may embrace half a zone, for, to quote a traveller's words, it may look upwards to the barley-field and the potato-patch, and downwards to the sugar-cane and the pine-apple. Perhaps the most striking instance of this more than telescopic vision is connected with the magnificent fall of Tequendama, the single outlet of the waters of the table-land of Bogota. This fall, 600 feet high, leaps down from the temperate zone to the torrid, from rich crops of wheat to a few scattered palms.

ANDIRA, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having an almost orbicular, one-celled, one-seeded pod.—*A. inermis* (formerly known as *Geoffroya inermis*) grows in low savannahs in the West Indies, and is there called *Cabbage Tree* or *Cabbage-bark Tree*. It is a tree of considerable height, having pinnate leaves, with 13–15 ovato-lanceolate leaflets, and panicles of reddish lilac flowers. Its bark, called *Cabbage Bark* or *Worm Bark*, is a powerful anthelmintic; and although it has recently been discarded from the pharmacopœias of Britain, still finds a place in those of other countries, along with *Surinam Bark*, the bark of *A. retusa* (formerly *Geoffroya Surinamensis*), a native of Surinam. Similar properties reside in the bark of several species of the allied genus *Geoffroya*. *Cabbage Bark* contains an alkaloid called *Jamaïcina*.

ANDIRON, or HANDIRON, is a term frequently to be met with in inventories of the furniture of old houses; and in some parts of the country is still used for what is more generally known as a fire-dog. Andirons were used for burning wood on an open hearth, and consisted of a horizontal bar raised on short supports, with an upright standard at one end. A pair were used, one standing at each side of the hearth, and the logs of wood rested across the horizontal bars. The upright portions of the A.

were of various forms, some of them, in later times, representing a human figure. More generally, the design was architectural, much ornamented with

Andiron.

arabesques, and not unfrequently with the monograms of their possessors. The ornamental parts of the A. were sometimes silver, but more frequently copper.

ANDORRA, a valley in the Eastern Pyrenees, between the French department of Ariège and Catalonia, in Spain. It is enclosed by mountains, through which its river, the Balira, breaks to join the Segre at Urgel; and its inaccessibility naturally fits it for being the seat of the interesting little republic which here holds a kind of semi-independent position between France and Spain. The whole territory contains only 198 square miles, with 17,800 inhabitants, and is divided into six parishes. The capital is Andorra, on the Balira, with a population of 2000. Dense forests supply abundance of timber; there is much excellent pasture; vines and fruit-trees flourish on the lower grounds, and the mountains contain rich iron-mines; but agriculture is so neglected, and the quantity of arable land so small, that the inhabitants partly depend for corn upon importation from France. A. was declared a free state by Charlemagne, in reward for services rendered to him by its inhabitants, when he was marching against the Moors. He retained certain rights which Louis le Débonnaire afterwards transferred to the Bishop of Urgel, in 819 A.D., and which the Bishop of Urgel still exercises. The republic is governed by a sovereign council of twenty-four members, chosen by the people, and the council elects one of its members to be syndic for life, who exercises the chief executive power. There are two judges called *viguier*s, of whom the first is appointed by France, which exercises a kind of protectorate, and the second by the Bishop of Urgel. The first *viguier* is a Frenchman, and the second a native of A. Under each *viguier* is an inferior judge called a *baillie*; but there is an appeal from his judgment to the *viguier*, and finally to the Court of Cassation at Paris, or to the Episcopal College at Urgel. In criminal cases, there is no appeal from the court of the republic itself, in which the first *viguier* presides. The revenue of the state is derived from lands, and from some inconsiderable taxes. A sum of 960 francs is paid annually to France, in return for which is granted the privilege of free importation of corn. An annual payment of 450 livres is made to the Bishop of Urgel. The manner of life of the Andorrans is very simple. There are schools, but education is in a low state. There is a complete military organisation. In recent wars, the Andorrans have warmly supported France.

ANDOVER, a market-town of Hampshire, lies in the north-west part of the county, lat. 51° 12' N. long. 1° 28' W. The origin of the town dates from a remote antiquity, as might indeed be suspected

from its name, which is a modification of the Saxon *Andoefaran*, i.e., ferry over the river Ande. It is said that the corporation of A. is as old as the time of King John. The inhabitants, amounting to 5200, are chiefly supported by their malt-trade, their agriculture, and their traffic in timber with Portsmouth. At Weyhill, a few miles to the west of the town, a fair is held, formerly one of the most celebrated and important in England. It lasts for six days. The church of A. is a new erection, in the early English style of architecture, and cost £30,000, the whole of which was defrayed by the late rector, the Rev. W. S. Goddard. Various relics of antiquity have been discovered in the vicinity of Andover. (Pop. 1871—5500.)

ANDOVER, a township in Massachusetts, about 21 miles to the north of Boston, reaching on the north to the Merrimac. It is intersected by several railways, while the water-power of its streams is extensively employed in the manufacturing of thread, linen, and flannels. The township was incorporated in 1646, just 26 years after the first landing of the Pilgrim Fathers. Its population, by the census of 1850, was 6945. A. is famous, even in Massachusetts, for its educational institutions. It has two of a superior description—the Theological Seminary of the Congregationalists, and the Phillips Academy, instituted within five or six years after the close of the war of independence, through the efforts of two brothers from whom it derives its name. Both these establishments are liberally constituted and well attended; and the latter in particular, with its revenue of £12,000 sterling, would be reckoned very wealthy in any part even of the old world.—Besides this A., there are eleven other places of the same name in the United States.

ANDRAL, GABRIEL, a celebrated French physician, member of the Institute and of the Academy of Medicine, was born in Paris on the 6th of November 1797. In 1823 he established his reputation by the publication of the first part of his *Clinique Médicale*; in 1828, partly through the influence of M. Royer-Collard, whose daughter he had married, he was appointed Professor of Hygiène; and in 1830 was advanced to the chair of Internal Pathology, a branch of medical science which had always possessed great attractions for him. A., in fact, commenced his investigations with pathological anatomy. He presented to the Academy, at a comparatively early period of his career, a paper *Sur l'Anatomie Pathologique du Tube Digestif* (On the Pathological Anatomy of the Alimentary Canal), which was greatly admired. Besides, he published, in 1829, a *Précis Élémentaire* of the same science, which met with striking success; and his *Clinique Médicale* treats principally of diseases of the chest, of the abdomen, and of the brain. In 1839, A. was almost unanimously elected by his colleagues to succeed Broussais in the chair of pathology and general therapeutics, the highest in the school. Here he has shewn the vast range of his medical knowledge; but in occupying himself so much with the pathological anatomy of the dead body, it is alleged that he has not paid sufficient attention to the phenomena of disease before the organs begin to exhibit traces of alteration. Though actively engaged in his general practice, he has found time to write several other works besides those already mentioned. In 1835 appeared his *Projet d'un Essai sur la Vitalité*; in 1836, he edited and considerably enlarged Laennec's *Traité de l'auscultation Médiate et du Cœur*; in 1836—1837, a *Cours de Pathologie Interne*; in 1837, his report to the Academy *Sur le Traitement de la Fièvre Typhoïde par les Purgatifs*; in 1843 he presented to

the Institute his *Traité Élémentaire de Pathologie et de Thérapeutique Générale* (published in 1840), &c.

ANDRE, JOHN, an unfortunate soldier who met his death under circumstances which have given his name a place in history, was born in London in 1751 of Genevese parents. At the age of twenty, he entered the army, and soon after joined the British forces in America, where, in a few years, through the favour of Sir Henry Clinton, he was promoted to the important post of adjutant-general, with the rank of major.

Sir Henry Clinton being in treaty with the American general Arnold, who commanded the fortress of West Point, for the betrayal to the British of the fortress with its magazines, including the whole stock of powder of the American army, confided the conduct of the correspondence on his part to Major A. The secret correspondence was conducted by Arnold and A. under assumed names, and as if it related to commercial affairs; and the treachery was so well concealed, that the Americans had no suspicion whatever of Arnold's fidelity. At last it remained only to settle the time and means of carrying the scheme into execution; and these it was determined should be settled in a personal interview between Arnold and A., either because Arnold required such an interview, or, more probably, because Clinton had some misgivings as to the identity of his correspondent. Various projects to bring about the interview having failed, A., at last, on the 20th September 1780, proceeded in a British sloop of war—the *Vulture*—up the Hudson nearly to the American lines. The original design was to have met under cover of a flag of truce, on the pretence of effecting some arrangement as to the sequestered property of a Colonel Robinson, a loyalist gentleman who accompanied A., and whose house was at the time Arnold's head-quarters; but this design had to be abandoned, and Arnold was obliged to contrive a secret interview. On the night of the 21st September he prevailed on a Mr Smith, who lived within the American lines, to go to the *Vulture* with a packet for Colonel Robinson. Smith went, and returned with A., who passed under the assumed name of Anderson. Arnold met him on the shore, where they conferred some time, after which they went within the lines to Smith's house, and there spent the rest of the night and part of the next day arranging the details of their plan for the treacherous surprisal of West Point. The attack was fixed for the day when the return of General Washington was expected; and there is reason for thinking that part of Arnold's scheme was, if possible, to betray Washington also into the hands of the enemy.

Early on the morning of the 22d September, a gun was brought to bear on the *Vulture*, and obliged her to fall down the river so far that A. could not prevail on the boatmen to take him to her, and so was forced to make his way by land to the English lines in a disguise furnished by Smith, and provided with a pass from the general. A. actually got safely within sight of the English lines, when he was stopped and taken prisoner by three American militia-men, to whom, mistaking them for British, he inadvertently revealed the fact that he was a British officer. His captors, on searching him, having discovered concealed in his stockings the plans of West Point and other papers connected with the proposed treachery, which he was bearing from Arnold to Clinton, carried him as a spy to a Colonel Jamieson, who, not suspecting anything, was for sending him on to Arnold. Here a chance of escape opened for him, but only for a moment. He was ultimately sent, with the papers found on his person, to General Washington. Jamieson, meantime, having sent word to Arnold of the capture

of A., Arnold fled to the *Vulture*, and so saved his life.

A., as a spy taken in the act, was liable, according to the rules of war, to be hanged at once. But considering the rank of the prisoner, and the circumstances, Washington resolved on referring the case to a Board of general officers, to report the facts, with their opinion of the light in which the prisoner ought to be considered, and the punishment that ought to be inflicted. The Board found that he ought to be considered as a spy from the enemy, and punished with death. Strenuous efforts were made by the British commander to save him. It was represented to Washington that A. could not be regarded as a spy, because—1. He entered the American lines under a flag of truce; 2. That all his movements within the lines were directed by the general. The first plea, on A.'s own authority, was contrary to the fact; and to the Americans it rightly appeared that the point of the offence lay in the communication with the base traitor Arnold. All the efforts of Clinton failed to move the American commander. A. was sentenced to death. On one condition only would Washington spare him—that the British should surrender Arnold. But this they could not think of doing; the sense of honour which, yielding to the spirit of war, offered no opposition to a bargain with Arnold for the blood and liberties of his compatriots, made it impossible to deliver up the runaway traitor to the death that otherwise awaited the soldier who only went too far in his zeal for his country.

A. suffered death by hanging at Tappan, in the state of New York, on the 2d October 1780, in his 29th year. His death everywhere excited the deepest sympathy. The whole British army went into mourning for him; a monument was erected to his memory in Westminster Abbey, and in 1821 his remains were disinterred at Tappan, and conveyed to a grave near his monument.

Much has been written on the subject of A.'s execution. It has often been maintained, and recently by Lord Mahon, in his *History of England* (vol. vii.), that his sentence was unjust. But a simple narrative of the circumstances, even as they are to be gathered from Lord Mahon's own pages, shews that the American general had no alternative. Indeed, the circumstances cited to shew that A. was not a spy, in the ordinary sense, all go to prove that he was a spy of the worst sort. The success of the treachery of Arnold would have been the destruction of the American cause; and it is hard to see how the agent who went secretly within the American lines, and was captured returning in disguise with the information that was to insure that success, is to be held in a better case than the common soldier who steals his way into the enemy's camp of a night, to see the extent of his preparations and forces.

A. was a handsome and amiable man, of considerable accomplishments; he was a good artist, and appears, when in England, to have been known to certain literary circles of his time. These circumstances naturally heightened the feeling with which his fate was regarded.

See *Biographical Dictionary* of the Society for the Diffusion of Useful Knowledge, vol. ii.; also, in vol. vi. of the *Memoirs of the Historical Society of Pennsylvania*, 1858, *The Case of Major A., with a Review of the Statement of it in Lord Mahon's History of England*, by Charles J. Biddle—an essay containing a full narrative of the case, with a discussion of all the questions of law and duty raised in connection with it.

ANDRE.E, JOH. VALENT, a very original thinker and writer, born at Herrenberg, near Tübingen, on

the 17th of August 1586. He studied at Tübingen, spent some time in travelling in the south of Europe, obtained ecclesiastical preferments in the Protestant Church of his native country, and died on June 27, 1651, at Stuttgart, where he was chaplain to the court. Eminently practical in his mental disposition, he was grieved to see the principles of Christianity made the subject of mere empty disputations, and all science and philosophy in like manner perverted by a frivolous scholasticism. To the correction of this prevailing tendency of his age, the efforts of his whole life were directed. His writings are remarkable for the wit and humour, as well as for the learning, acuteness, and moral power which they display. He has been long regarded as the founder, or at least the restorer of the order of the Rosicrucians (q. v.); and this opinion is plausibly supported by reference to three publications—the *Chymische Hochzeit Christiani Rosenkreuz* (1616), the *Pama Fraternitatis R. C.*, i. e., *rosææ crucis* (1614), and the *Confessio Fraternitatis R. C.* (1615), of the first of which he acknowledged himself the author, and the other two have so much resemblance to it as to be evidently from the same pen. But, however these works were misunderstood by his contemporaries, and particularly by those who were inclined to mysticism in religion, his intention in them was certainly not to originate or promote secret societies of mystics and enthusiasts, but to ridicule the follies of the age. He attacked Rosicrucianism itself in some of his later writings with great severity. Among the best of his works are his *Menippus s. Satyricorum Dialogorum Centuria* (1617). His *Mythologica Christiana* (1619) is another of the best known. He wrote an allegoric poem called *Die Christenbury* (of which an edition was published, Stuttg. 1836), and an autobiography (Winterthur, 1799). Herder has done much to extend a knowledge of A.'s works in the present age.

ANDROSSY, ANTOINE FRANÇOIS, COUNT, was born on March 6, 1761, at Castelnaudary, in Languedoc, and was the great-grandson of François A., who, along with Riquet, constructed the canal of Languedoc in the 17th c. He entered the army as a lieutenant of artillery in 1781, joined the Revolutionists, rose rapidly in military rank, served under Bonaparte in Italy and Egypt, accompanied him on his return from Egypt to France, and took part in the revolution of the 18th Brumaire. He was ambassador at London during the peace of Amiens, and afterwards at Vienna, was governor of Vienna when it was in the hands of the French after the battle of Wagram, and was for some time ambassador at Constantinople, from which he was recalled by Louis XVIII. on the Restoration. He was raised to the peerage by Napoleon after his return from Elba. After the battle of Waterloo, he advocated the recall of the Bourbons; but as deputy from the department of Aube, he generally took part with the opposition. He died at Montauban on September 10, 1828. He was a man of eminent scientific attainments, and distinguished himself as a member of the Institute founded at Cairo. One of his first works was the *Histoire Générale du Canal du Midi* (Par. 1800; new edition, 2 vols., 1805), in which he asserted the right of his great-grandfather to honours long enjoyed by Riquet. Among the most valuable of his works are his *Mémoire sur l'Irruption du Pont-Euxin dans la Méditerranée*, his *Mémoire sur le Système des Eaux qui arrouvent Constantinople*, and his *Constantinople et le Bosphore de Thrace pendant les Années 1812—1814 et pendant l'Année 1826* (Par. 1828), a work of importance in physical geography.

ANDREW, the first disciple of Christ, and

afterwards an apostle, was, like his brother Peter, a fisherman. Previous to his recognition of Christ as the Messiah, he had been numbered among the disciples of John the Baptist. (See John i. 40, 41.) The career of A., as an apostle, after the death of Christ, is unknown. Tradition tells us that, after preaching the gospel in Scythia, Northern Greece, and Epirus, he suffered martyrdom on the cross at Patra in Achaia, 62 or 70 A. D. A cross formed of beams obliquely placed is styled St A.'s Cross. In the early times of the Church, a spurious supplement to the Acts of the Apostles was circulated among certain sects under the title *Acta Andrae*. The anniversary of St A. falls on November 30. St A. is the patron saint of Scotland; he is also held in great veneration in Russia, as the apostle who, according to tradition, first preached the gospel in that country. In both countries there is an order of knighthood named in his honour.

ST ANDREW, or THE THISTLE, a Scottish order of knighthood, named after the patron saint of Scotland. Nisbet, with pardonable partiality, prefers it to all other orders, purely military, 'chiefly for the antiquity of it, which gives it a place and precedence over all other orders now in being. (*Heraldry*, Part iv. c. xi., p. 107.) He then proceeds, after Bishop Lesley, to recount the story of the St A.'s Cross having appeared in heaven to Achaïus, king of Scots, and Hungus, king of the Picts, as a sign of the victory which they should gain the following day over Athelstane, king of England; and their subsequent vow, when the prophecy was fulfilled, to bear it on their ensigns and banners. The recognised date of the order is, however, no earlier than the reign of James V. Having fallen into disrepute after the Reformation, it was revived by James II. of Great Britain in 1687, and re-established by Queen Anne December 31, 1703.

The star of the Order of the Thistle is worn on

Star of the Order of the Thistle.

the left side. It consists of a St A.'s Cross of silver embroidery, with rays emanating from between the points of the cross, in the centre of which is a thistle of gold and green upon a field of green, surrounded by a circle of green, bearing the motto of the order in golden characters.

The badge or jewel is worn pendent to the collar, or to a dark-green ribbon over the left shoulder, and tied under the arm. It consists of a figure of St A. with the cross enamelled and chased on rays of gold; the cross and feet resting upon the ground of enamelled green. The collar is of thistles, intermingled with sprigs of rue. By a statute passed in May 1827, the order is to consist of the sovereign and sixteen knights. The letters K.T. are placed after the names of knights of the order. The motto is 'Nemo me impune lacessit.' Nisbet, differing from Sir George Mackenzie, prefers 'laccesset,' as 'having more of daring and gallantry.'

ST ANDREW, THE RUSSIAN ORDER OF, is the highest in the empire, and was founded by Peter the Great in 1698. It is confined to members of the imperial family, princes, generals-in-chief, and others of like rank. The badge of the order shews on the obverse a cross enamelled in blue, bearing a figure of the saint surmounted by a crown, and in the four corners of the cross the letters S. A. P. R. (*Sanctus Andreas Patronus Russiae*). On the reverse is a spread eagle, with the legend (in Russian) *For religion and loyalty*, and the name of the saint. The collar consists of St Andrew's Crosses alternating with imperial crowns.

ANDREWS, LANCELOT, an eminent English prelate, was born in London in 1555, and educated successively at the Coopers' Free School, Ratcliffe, Merchant Taylors' School, and Pembroke Hall, Cambridge, of which college, after having greatly distinguished himself by his industry and acquirements, he was in 1576 elected a fellow. On taking orders, he accompanied the Earl of Huntingdon to the north of England. His talents attracted the notice of Walsingham, Queen Elizabeth's secretary of state, who appointed him successively to the parsonage of Alton, and the vicarage of St Giles, Cripplegate. In 1589 he was appointed a prebendary and canon residentiary of St Paul's, a prebendary of the collegiate church of Southwell, and Master of Pembroke Hall. The queen next testified her esteem for his gifts and piety by appointing him one of her chaplains in ordinary, and a prebendary and dean of Westminster. He rose still higher in favour with King James, who was well qualified to appreciate his extensive learning and peculiar style of oratory. He attended the Hampton Court conference, as one of the ecclesiastical commissioners, and took part in the translation of the Bible. The portion on which he was engaged was the first twelve books of the Old Testament. In 1605 he was consecrated Bishop of Chichester. In 1609 he was translated to the see of Ely, and appointed one of his majesty's privy-councillors, both for England and Scotland. To the latter country he accompanied the king in 1617, as one of the royal instruments for persuading the Scotch of the superiority of episcopacy over presbytery. In the following year he was translated to Winchester, where he died on the 27th March 1625. Bishop A. was, with the exception of Usher, the most learned English theologian of his time. As a preacher, he was regarded by his contemporaries as unrivalled; but the excellent qualities of his discourses are apt to suffer much depreciation in modern judgment from the extremely artificial and frigid character of the style. His principal works published during his life were two treatises in reply to Cardinal Bellarmine, in defence of the right of princes over ecclesiastical assemblies. His other works consist of sermons, lectures, and manuals of devotion. Bishop A. was the most eminent of that Anglican school in the 17th c. of which the 19th has seen a faint revival under the name of Puseyism. Its distinctive peculiarities were high views of ecclesiastical authority, and of the efficacy of sacraments, ceremonies, and apostolic succession, and extreme opposition to Puritanism. In his private life, A. was singularly pious, meek, and charitable.

ANDREWS, Sr, an ancient city of Scotland, is situated on the bay of the same name, in Fifeshire, about 10 miles from Cupar, and 44 miles from Edinburgh. Tradition dates the origin of this city as far back as the 9th c., when St Regulus or Rule is said to have taken refuge in this place, then called Mucros, and afterward Kilyrmont, bringing with him some of the bones of St Andrew, which, being enshrined here, continued to be an object of pilgrimage

for several centuries. A cave on the sea-shore still bears the name of St Rule. He would seem to have founded a Culdee monastery, of which the Scottish King Constantine, having resigned his crown, became abbot about the year 910. Probably about the same time, it became the seat of a prelate, who, as 'bishop of the Scots,' continued to enjoy a certain pre-eminence among the other bishops, until, in 1471, the see was erected into an archbishopric, when he became primate. In the reign of Alexander I., a priory of Canons Regular was founded at St A., which afterwards became one of the chief ecclesiastical establishments in Scotland. The last prior was the Regent Moray. In 1140 St A. was created a burgh by the bishop, with consent of King David I. The cathedral, commenced in 1162, and consecrated in 1318, was sacrificed in 1559 to the frenzied zeal of the mob, an outrage which it is customary to attribute to the preaching of Knox. The eastern gable, part of the western, and part of the south side wall and of the transept, are all that remain of this building. It was the second cathedral of St A., the first being what is now called St Rule's Church, but was long known as 'the old cathedral.' Of this interesting little edifice, built between 1127 and 1144, the roofless chancel, and a square tower 108 feet high, are still preserved. They are in the Romanesque style.

The university of St A., the oldest in Scotland, was founded by Bishop Warlaw in 1410. It consists of the United College of St Salvador, founded by Bishop Kennedy in 1456, and St Leonard, founded in 1512; and St Mary's College, founded by Beaton in 1537. The education in the latter is exclusively theological. The number of chairs in the colleges which constitute the university is 14, and the attendance of late years has been rather less than 200. The castle, once a very extensive and strong building, is now in ruins. It was for some time the residence of Cardinal Beaton, who was assassinated here in 1546. As the ecclesiastical metropolis of Scotland, an ancient seat of learning, and the centre of a considerable trade, St A., at the time of the Reformation, was an important and flourishing city. Since that period, it has greatly declined in importance; but its excellent educational establishments and convenience as a watering-place still make it an eligible residence for a highly respectable population. Its chief interest is still connected with the past. Here, in the centre of the papal jurisdiction in Scotland, the Reformation first made its appearance; Scotland's proto-martyr, Patrick Hamilton, suffered here in 1527, and George Wishart in 1546, and here John Knox first opened his lips as a preacher of the Reformed faith. The trade of St A. is inconsiderable. The harbour is difficult of access, and particularly exposed to the east wind. A few coasters and fishing-boats constitute all the shipping of the port. St A. is much frequented as a bathing-place, and the game of golf is more practised than anywhere else in Scotland on the Links or downs which stretch along the shore to the north of the town for about two miles. Besides its university, St A. affords singular advantages for cheap and excellent education in the Madras College, established by the well-known Dr Andrew Bell, which attracts a very large number of pupils, the annual average being about 900. The grammar school and commercial school are incorporated with it. St A. is a royal and parliamentary burgh, and unites with several smaller burghs in returning a member to parliament. The corporation includes a provost, dean of guild, and four bailies. Pop. in 1851—parish, 6740; parliamentary burgh, 5107. (1871, parliamentary burgh, 6316.)

ANDRIEUX, FRANÇOIS GUILLAUME JEAN

STANISLAUS, a French writer of comedies, was born at Melun, May 6, 1759. In 1798, he was elected deputy of the Seine department, and distinguished himself by his speeches on several points of public interest. In 1800 he was made Secretary, and soon afterwards, President of the Tribunal. From this post he was removed by Bonaparte in 1802, and afterwards devoted himself to literature. During his political career he had written a comedy, *Les Eourdis*, 1787. From 1803 to 1815 he held a professorship in the Polytechnic School, and in 1814 was appointed professor in the Collège de France. Louis XVIII. gave him a place in the Academy in 1816, of which he was made perpetual secretary in 1829. In this position he took an active part in the preparation of the *Dictionnaire de l'Académie*. His most popular dramas were *Molière avec ses Amis*, *Le Vieux Fat*, and the tragedy of *Brutus*. A collection of his aesthetic lectures was published under the title *La Philosophie des Belles Lettres* (Paris, 1828). He died May 10, 1833.

ANDROGYNOUS (i. e., male-female; from two Greek words), a term sometimes employed in botany to designate an inflorescence which consists of distinct male and female flowers; and more frequently in zoology in reference to animals which possess a distinct male and female generative system in the same individual. This is the case with very many of the lower kinds of animals, but is not inconsistent with a necessity for the co-operation of two individuals in the propagation of the species. See HERMAPHRODITE, PHYSIOLOGY and REPRODUCTION.

ANDROMACHE, the wife of Hector, was the daughter of King Eëtion of Thebes, in Cilicia, and is one of the finest female characters in Homer's *Iliad*. During her childhood, Achilles slew her father and her seven brothers. Her love of Hector is pathetically depicted in her address to the hero on his going to battle, and her lamentation over his death (*Iliad*, 6 and 24). After the fall of Troy, she was given into the hands of Pyrrhus (son of Achilles), who took her away to Epirus, but afterwards surrendered her to Helenus (Hector's brother), by whom she had a son named Cestrinus. A. is the heroine of one of the tragedies of Euripides.

ANDROMEDA, daughter of the Ethiopian king Cepheus, by Cassiopeia, was, like her mother, remarkably beautiful. When Cassiopeia, with motherly pride, boasted that her daughter was more

beautiful than the Nereids, these offended deities prayed Neptune to revenge the insult. Accordingly, the territory of King Cepheus was devastated by a flood; and a terrible sea-monster appeared, whose wrath, the oracle of Ammon declared, could only be appeased by the sacrifice of A. As A. was fastened to a rock, and left as a prey to the monster, Perseus, returning from his victorious battle with Medusa, saw the beautiful victim, and determined to rescue and win her. Having slain the sea-monster, he received A. as his reward. Minerva gave A. a place among the constellations.

Andromeda polifolia.

ANDROMEDA, a genus of plants of the natural

order *Ericaceæ* (q. v.), distinguished by a 5-valved naked capsule, which splits up through the back of the cells; anthers with two awns, and a globose corolla with the orifice contracted. The species, which are pretty numerous, have very much the general appearance of heaths. Most of them are small shrubs, but some attain a considerable size. The only British species is *A. polifolia*, occasionally found in peat-bogs in different parts of the country, and common throughout the north of Europe and of North America, a small evergreen shrub with beautiful rose-coloured drooping flowers. It has acrid narcotic properties, and sheep are sometimes killed by eating it. The shoots of *A. ovalifolia* in like manner poison goats in Nepal; and similar effects are ascribed to *A. Mariana* and other species in the United States.—*A. fastigiata* was observed by Dr Hooker abounding at great elevations in the Himalaya; a humble shrub, resembling the heather of Scotland. The leaves are used as a substitute for tea. See SORREL-TREE.

ANDRONICUS, the name of three Byzantine emperors.—A. I., the son of Isaac Comnenus, was one of the most conspicuous characters of his age, which produced no man more brave, more profligate, or more perfidious. His life was full of extraordinary vicissitudes. During part of his youth, he was a prisoner of the Turks in Asia Minor. He afterwards spent some time at the court of his cousin, the Emperor Manuel, and a niece of the emperor became his mistress. He was appointed to a military command in Cilicia; but although his courage, his noble appearance, and his gracious manners made him the favourite of the army, his imprudence and waste of time in dissolute pleasures involved him in defeat. Having engaged in a treasonable correspondence with the king of Hungary and the German emperor, he was thrown into prison by Manuel, and remained there above twelve years; but at last succeeded in making his escape, and, although not without further extraordinary adventures, reached Kiev, the residence of the Grand Duke Jaroslav. He regained the favour of his cousin by persuading the Russian prince to join him in the invasion of Hungary, and by his gallantry in that war; but incurred his displeasure again by refusing to take the oath of allegiance to the Prince of Hungary, the intended husband of Manuel's daughter, as presumptive heir to the empire. He was sent in honourable banishment to Cilicia, where he found a new mistress in a sister of the empress. The resentment of the emperor breaking out against him, he sought refuge in a pilgrimage to Jerusalem. His professions of zeal made his former conduct to be forgotten, and he was invested with the lordship of Berytus; but his profligacy became, if possible, more scandalous than ever in the seduction of Theodora, the widow of Baldwin, king of Jerusalem, who lived with him for years as his mistress. The emperor's anger made Palestine unsafe for him, and he fled with Theodora to Damascus, and finally settled among the Turks in Asia Minor, with a band of outlaws, making frequent inroads into the Roman province of Trebizond, from which he carried away spoil and slaves. Theodora and her children were at last taken and sent to Constantinople, and thither he followed, imploring, with a chain about his neck, and in a form of abject submission, the forgiveness of the emperor, which he obtained, but was sent to Oenoe in Pontus. After the death of Manuel, popular indignation was excited against the empress, who acted as regent for her son, Alexius II., and A. was recalled in 1182 to deliver the empire from her tyranny. He was appointed guardian of the young emperor, and soon after, his colleague in the empire. He caused the empress-mother to be strangled, and

ANDRONICUS—ANEMOMETER.

afterwards Alexius himself, with whose widow he contracted an indecent marriage. His reign, though short, was vigorous, and restored prosperity to the provinces; but tyranny and murder were its characteristics in the capital. He set no bounds to the gratification of his revenge against all who had ever offended him, and his jealousy of possible rivals was equally sanguinary. At last, a destined victim, Isaac Angelus, one of his relatives, having fled to the Church of St Sophia for sanctuary, a crowd gathered, and a sudden insurrection placed Isaac on the throne, whilst A., now 73 years of age, was put to death by the infuriated populace, after horrible mutilations and tortures, on September 12, 1185. He was the last of the Comneni that sat on the throne of Constantinople; but the succeeding Dukes and Emperors of Trebizond were descendants of his son Manuel.—A. II., the son of Michael Palæologus, ascended the throne in 1283; but after a weak and inglorious reign, was driven from it in 1328 by his grandson, A. III., who, after a reign equally inglorious, died in 1341. During these reigns, province after province was conquered by the Turks.

ANDRONICUS—surnamed **CYRREHÆTES** from his birthplace, Cyrrhos in Syria—is said to have erected the octagonal tower called the Tower of the Winds at Athens, a building of the 3d or 2d c. B. C. It probably received its name from figures representing the eight principal winds, and from a brazen Triton which surmounted it, and shewed the direction of the wind—the first known weather-cock.

ANDRONICUS of Rhodes, a Peripatetic philosopher, lived at Rome in Cicero's time, and employed himself in criticising and explaining the works of Aristotle, a great number of which he was probably the means of preserving to us. None of the writings of A. himself are extant; for the works ascribed to him are probably the productions of *Andronicus Callistos*, a learned Greek of the 15th c., who taught the Greek language in Italy and France.

ANDROPO'GON. See **LEMON-GRASS.**

ANEGA'DA, the most northerly of the Lesser Antilles, its lat. being about 19° N., and its long. between 64° and 65° W. It contains about 13 square miles, with a scanty population of little more than 200. It belongs to England. It is of coral formation, being, like most islands of the kind, low and beset by reefs. One reef in particular, which runs out 10 miles to the south-east, is marked, even on ordinary maps, as the scene of numerous shipwrecks.

ANEMO'METER (*Gr. anemos*, the wind, and *metron*, a measure; *Fr. anémomètre*, *Ger. Windmesser*), an instrument for measuring the strength and velocity of the wind. Among the various instruments which have been designed for this purpose, that invented by Dr Lind (1775 A.D.) is still considered to be one of the most convenient and accurate.

The accompanying figure gives a representation of it. AB and CD are two upright glass tubes about 9 inches high, and $\frac{1}{10}$ of an inch wide, connected below by a much narrower tube, E, varying from $\frac{1}{10}$ to $\frac{2}{10}$ of an inch in width. The tube AB is bent at right angles, so as to receive the wind blowing into it horizontally. A scale, graduated in inches and parts of an inch, is placed between the tubes, and the whole instrument is made to turn round the steel spindle, L, which can be screwed into a block of

wood by a screw at the bottom. When the instrument is used, water is poured into the tubes until the level in both stands at the middle of the scale. When no disturbing force acts upon either column of liquid, the level of both is accurately the same; but when the mouth of the tube AB is turned towards the wind, the column in AB is pressed downwards, and that in CD rises proportionably, and the difference of the heights of the two columns gives the column of water which the force of the wind sustains. Now, as we know that the pressure of the atmosphere at the earth's surface supports a column of water about 33 feet high, or presses with a force of about 2060 lbs. on the square foot, this instrument gives us immediately the data from which we can calculate the pressure or force of the wind. Thus, suppose the wind to blow with a force sufficient to raise the one column one inch above the other, we have $\frac{1}{33}$ of $\frac{1}{33}$ of 2060, or about $5\frac{1}{10}$ lbs. of pressure on the square foot as the force of the wind.

The following table gives approximately the relation of the height of the water in the A. to the force and velocity of the wind in winds of different characters. (See **AERODYNAMICS.**)

	Height of Water.	Pressure per Square Foot.	Velocity per Hour.
Fleebly Wind,	$\frac{1}{10}$ in.	$1\frac{1}{10}$ lbs.	$4\frac{1}{10}$
Fresh Breeze,	$\frac{1}{4}$ "	$1\frac{3}{10}$ "	$16\frac{1}{4}$
Very Strong Wind,	1 "	$5\frac{1}{10}$ "	$32\frac{1}{2}$
Tempest,	4 "	$20\frac{1}{10}$ "	65

Of other anemometers, those most in use consist of small metal vanes fixed to a horizontal axis, and made to revolve like a wind-mill. The revolutions are recorded very much in the same way as is seen in the ordinary gas-meter, and from this record, within a given time, the velocity of the wind is ascertained. In meteorological observatories, or where a complete register is kept of the direction and strength of the wind, anemometers of a much more complicated nature are employed. Of these, perhaps the most complete is that invented by Mr Osler. In his instrument, the force of the wind is ascertained in a different way from any of those to which we have referred. A brass plate one foot square is suspended by means of springs, and being attached to the vane of the instrument, is maintained at right angles to the direction of the wind. This plate, by the action of the wind, is beaten back upon the springs, and in so doing, causes a pencil to move backwards and forwards on a sheet of paper placed below it. This sheet of paper is made to pass under the pencil in a direction at right angles to its oscillation; and by means of clock-work, moves at a uniform rate, so that the force of the wind at any particular time of the day is recorded with perfect accuracy. A pencil in connection with the vane,

Dr Lind's A.

Register-sheet of an Osler's Anemometer.

and moving in the same transverse line as the former, records the changes in the direction of the

wind; and a third pencil, guided by a rain-gauge, registers the quantity of rain that has fallen. The preceding sketch, taken from the first half of a daily register-sheet, gives an idea of the kind of record made by an Osler's A. The space between two upright lines indicates an hour; that between two horizontal lines, in the rain-register $\frac{1}{16}$ of an inch of rain, in the direction of the wind two cardinal points, and in the force of the wind 1 lb. of pressure on the square foot.

Thus, on the day in which these lines were traced, there was in the rain-register, brought over from the former account, between .10 and .15 of an inch; and during the twelve hours, the pencil had only risen one space, indicating a fall of .05, or $\frac{1}{20}$ of an inch, almost entirely between the hours of 3 and 4 in the morning, and immediately before 12 in the day. If the day had been very rainy, and the pencil had risen to the top of the register, it would have fallen immediately to the bottom of it, and begun a new account; and it might have done so several times in the course of the twelve hours. This would have been effected by the mechanism connected with the rain-gauge, which enables the gauge to empty itself each time that the pencil reaches the top of the rain-register. As regards the direction of the wind, it was, during the first six hours, south, veering slightly towards the east; and for the last six hours, it was tending decidedly towards the west, being between 10 and 11 nearly west. From the line marking the force of the wind, it will be seen that the day was stormy. Between 1 and 2, and at 11, the wind was blowing a very high gale, producing a pressure of upwards of 12 pounds on the square foot; and between the hours of 4 and 5, there was a decided lull, the wind being brisk, but not stormy (2-3 lbs.).

ANEMONE, a genus of plants of the natural order *Ranunculaceae*, having an involucre of three divided leaves, more or less remote from the flower, a petaloid calyx, scarcely distinguishable from the corolla, and soft woolly achenia (see *ACHENIUM*), which in some species have tails. The name is originally Greek, and is said to be derived from the word for *wind*, because many of the species love very exposed situations. The species are numerous, and generally beautiful. Most of them flower early in spring. They are natives of temperate and cold climates, chiefly of the northern hemisphere. One species, *A. nemorosa*, the Wood A., is a common native of all parts of Britain, and its white flowers, externally tinged with purple, are an ornament of many a woodland scene and mountain pasture in April and May. Another species, *A. pulsatilla*, the PASQUE FLOWER, adorns chalky pastures in some parts of England at the same season. Its flowers are purple and externally silky. The Garden A. is a favourite florist's flower; the varieties are very numerous, and whole works have been published on them and their cultivation, which is most extensively carried on in Holland, and has prevailed from a very early period. It is generally supposed that all these varieties have originated from two species, *A. coronaria*, and *A. hortensis* or *stellata*. Both are natives of the Levant; the latter is found also in Italy and the south of France. By cultivation, the size of the flower is increased, its form and colours are modified, and many of the stamens are often changed into small petals, forming a sort of *heart* of the flower. The cultivation of the A. requires great attention. It prefers a light soil. The root, which consists of clustered tubers, is taken up after flowering. The plant is propagated by parting the roots, or by seed. In the latter way, new varieties are obtained. Seedling plants do not flower till the second or third year.—Besides the species which have been named,

others occasionally appear as ornaments of our flower-gardens. *A. japonica* and *A. pratensis* have beautiful blue flowers. They are both natives

Anemone coronaria.

of the south of Europe. *A. japonica*, a most beautiful species, has recently been introduced from Japan.—The species of this genus are characterised by the acidity prevalent in the natural order to which they belong; and the rhizomes of *A. nemorosa*, and others, have been recommended in obstinate rheumatism and in tænia.—The genus *Hepatica* was formerly included in *A. H. triloba* (*A. hepatica*), with three-lobed leaves, grows wild in most parts of Germany, and throughout the north of Europe, but is not a native of Britain. It is also found in North America. Varieties of different colours, and both single and double, are among the finest ornaments of our flower-borders in early spring. The plants are very apt to suffer from being removed or having the earth much loosened about them, and must be permitted to remain as much as possible untouched.

ANEMONE, SEA, a popular name of the species of *Actinia* (q. v.) and some other *Actiniadae*. It seems to have been first applied to them about a century ago by Ellis, one of the most celebrated investigators of the department of natural history to which they belong, who remarks that 'their tentacles, being disposed in regular circles, and tinged with a variety of bright lively colours, very nearly represent the beautiful petals of some of our most elegantly fringed and radiated flowers, such as the

Actinia Mesembryanthemum.

carnation, marigold, and anemone.' It is only, however, when in their proper element and undisturbed, that the sea-anemones expand their tentacula and exhibit their beauty. When left dry by the receding tide, they contract into a jelly-like mass, usually hemispherical or conical, with a puckered hole in

ANEMONE.

the top. The most common of all the British species of sea-A. is the *Actinia Mesembryanthemum*, which has received its specific name from another floral association. It attaches itself to rocks and stones from low-water almost to high-water mark, and when left by the tide, appears as a sub-conical liver-coloured or greenish mass, not more than 1—1½ inch in diameter, which, when touched, is found to be very smooth and slippery, but of pretty firm consistency. The tentacula, when fully extended, are in length nearly equal to the height of the body, and are nearly of the same colour. An azure line frequently encircles the base; and on the base are dark-green lines converging towards the centre, and which are formed by radiating vertical plates in the fleshy substance of the animal, analogous (although not calcareous) to the calcareous partitions in the single-starred madrepores. Around the margin of the mouth, there is a circle of azure tubercles, like turquoise beads of the greatest beauty. These are only to be seen when the mouth is pretty fully expanded. They are about twenty-five in number in full-grown specimens. Their use is not known, though they have been conjectured to be eyes.—A smaller species, *Actinia* (or *Sagartia*) *trogodytes*—olive-green, with snow-white stripes and numerous tentacula, is pretty common on the British shores, inhabiting holes in the rocks, often the deserted holes of the *Pholas*, above which its oval disc and tentacula scarcely rise, and into which it quickly withdraws, upon being disturbed. A number of species inhabit holes as this does.—*Actinia* (or *Bunodes*) *coriacea*, which attains a diameter of two inches, attaches itself to sand-covered rocks, and is often much buried in the sand. It is covered with pale perforated warts, which have the power of agglutinating to themselves sand, gravel, fragments of shell, &c.; so that, when the tide is out, the animal is readily passed over by the inexperienced eye as a mere inequality in the surface of the sand, unless some accidental pressure cause it to squirt out water through its tentacula; as, in such circumstances, many of the species are very apt to do, sometimes to the annoyance of those who incautiously meddle with them.—*Actinia* (*Bunodes*) *crassicornis* is one of the largest and most beautiful British

predominant; the surface of many is variegated with white, or with orange-green and yellow. It occurs almost totally white, cream colour, sulphur yellow, and bright scarlet with pale warts like ornamented beads.—Beauty of colour and form are still more abundantly lavished on *Actinia Dianthus*, a still

Actinia Dianthus.

larger species, with very numerous tentacula, which inhabits deep water.—*Anthea Cereus* is, on some parts of the coast, one of the most abundant sea-anemones. Its tentacula are from 120 to 200 in number, are longer than in the *Actinia* generally, and are incapable, it is said, of being retracted, as in the true *Actinia*, but remain constantly expanded, and are almost never completely at rest.

Of all the species, *Actinia Mesembryanthemum* is perhaps most easily kept in the aquarium. It not unfrequently changes its place, and its locomotion is an interesting subject of observation. It will subsist for a considerable time without supplies of food, but readily accepts morsels of beef or mutton, fish, or almost any kind of animal food. The tentacula with which the offered food first comes in contact attach themselves to it; those next to them are in motion, as if to support them, if necessary, and a sort of sympathy seems to extend even to the most remote; but except in the case of struggling prey, or of a very large morsel, only a small number of the whole tentacula are usually employed in conveying the food into the mouth, or, more properly, into the stomach, for they do not seem to part from it till they have fairly lodged it there.

Sea-anemones are extremely voracious, and almost every observer has his own anecdotes to illustrate it. Dr Johnston relates one which at the same time remarkably illustrates their power of reproducing organs of their own body. 'I had once brought to me a specimen of *Act. crassicornis*, that might have been originally two inches in diameter, and that had somehow contrived to swallow a valve of *Pecten maximus* of the size of an ordinary saucer. The shell, fixed within the stomach, was so placed as to divide it completely into two halves, so that the body, stretched tensely over, had become thin and flattened like a pancake. All communication between the inferior portion of the stomach and the mouth was of course prevented; yet, instead of emaciating and dying of an atrophy, the animal had availed itself of what undoubtedly had been a very untoward accident, to increase its enjoyments and

Actinia crassicornis.

sea-anemones, being about four inches in height, and fully more when expanded between the tips of the opposite tentacula. It exhibits great diversity of the most beautiful colours. Red is usually

its chances of double fare. A new mouth, furnished with two rows of numerous tentacula, was opened up on what had been the base, and led to the under-stomach: the individual had indeed become a sort of Siamese twin, but with greater intimacy and extent in its unions. (*British Zoophytes*, i. 235.)

As inmates of the aquarium, sea-anemones are apt to prey upon their fellow-prisoners. 'Simple contact of the tentacula,' says Sir J. G. Dalyell, 'is the prelude of destruction. Some animals, as if conscious of their inevitable fate, seem paralysed by the touch, and yield without a struggle. Others, whose size and strength should insure indemnity, are held in the relentless grasp; the tentacula crowding faster and faster around, until the victim is speedily swallowed alive.' There appears to be in other marine animals an instinctive horror of the tentacula of the sea-A. The hermit-crab will instantaneously flee out of its shell, if the shell is caught by them. It is now believed that, like the *Acalepha* (q. v.) and the *Hydras* (q. v.), the sea-anemones possess a power of benumbing their prey. Sea-worms (*Nereides*) have been observed first to writhe, and then to become paralysed. Little elliptical capsules are in some species scattered over the whole surface of the body; in others, confined to the tentacula, or even to their tips. These are furnished with spicula or minute spears, by which it is probable that not only are wounds inflicted, but poison is also conveyed into them. The sensations produced by the touch of the tentacula appear to be very different in the case of different persons, from a mere 'rasping feeling' on the withdrawal of the hand, to a slight tingling, and even to a stinging as by a nettle. The *Anthea Cereus* possesses the stinging power in a much greater degree than the ordinary *Actinia*. Probably the skin of the human hand is in general too thick or hard to be pierced by their fine spicula. Dr A. Waller of Birmingham has recently found, that, on submitting the tip of his tongue to the tentacula, a pungent pain and stinging, as by a nettle, were the constant result. He has also found that a thin India-rubber membrane grasped by the tentacula retains the microscopic 'poison-darts' sticking on its surface. Some of these are only two or three times the length of the capsule which contains them, or at most 100th part of an inch; but others are much longer, and when within the capsule, are coiled up after the manner of a watch-spring. The capsules are therefore called *filiferous* or *thread capsules*. This thread is highly elastic, and the expulsion of it, as of the shorter spicula, is effected, Mr Gosse tells us, by organs having this for their special office.

AN-END, a maritime term relating to the position of any mast or boom when perpendicular to the plane of the deck or other level from which it springs. When a top-mast is in its proper place at the head of the lower mast, it is said to be 'an-end.'

ANEROID (formed in an anomalous way from Gr. *a*, priv., and *neros*, wet), the name given to a barometer invented by M. Vidi of Paris, in which the pressure of the air is measured without the use of liquid, as in ordinary instruments. The face of the A. barometer, represented in fig. 1, has a diameter of about 5 inches, and the case behind, which contains the mechanism, a general idea of which is given in fig. 2, is about 2 inches deep. The pressure of the atmosphere acts upon a circular metal box, AA, about 3 inches in diameter, and $\frac{1}{2}$ of an inch deep, which has been nearly exhausted of air, and then soldered air-tight. The sides are corrugated in concentric rings, so as to increase their elasticity, and one of them is fixed to the back of the brass

case which contains the whole. The amount of exhaustion is such that if the sides of the box were

Aneroid Barometer.

allowed to take their natural position, they would be pressed in upon each other, and to prevent this they are kept distended, to a certain extent, by a strong spring, S, fixed to the case, which acts upon the head of the stalk, B, attached to the side next the face. When the pressure of the air increases, there being little or no air inside the box to resist it, the corrugated sides are forced inwards, and when it diminishes again, their elasticity restores them to their former place; and thus the little box becomes a spring extremely sensitive to the varying pressure of the external atmosphere. Supposing the two sides pressed inwards, the end of the spring, E, will be drawn towards the back of the case, and carry with it the rod, EG, which is firmly fixed into it. EG, by the link GHI, acts on the bent lever, HKL, which has its axis at K, so that, while the arm, KHI, is pushed to the right, LK is moved downwards. By this motion, a watch-chain, O, attached at L, is drawn off the little drum, M, and the index-hand, PP, which is fixed to it, would move from the position represented in fig. 1 to one towards the right. When the contrary motion takes place, a hair-spring moves the drum and the hand in the opposite way. By this mechanism, a very small motion of the corrugated sides produces a large deviation of the index-hand, $\frac{1}{2}$ of an inch causing it to turn through 3 inches. The A. barometer is graduated to represent the inches of the mercurial barometer, with which, when carefully adjusted, it almost accurately corresponds. Both from its small size and construction, it is extremely portable, and it can in consequence give indications in circumstances where the ordinary barometer is of no service. The 'Metallic Barometer' of M. Bourdon is a modification of the A. principle. —See *Manual of Barometers*, by J. H. Belville.

ANEURISM (Gr. *aneurysma*, a dilatation) is a pulsating tumour consisting of a sac or pouch into which blood flows through an opening in an artery. The sac of an arterial A. may be formed in the first instance by one or more of the tunics of the vessel, generally the outer one, the two inner having given way. This is called a *true A.*, in contradistinction to the *false*, in which the sac is formed of cellular tissue condensed by the blood flowing into it after a wound has been inflicted on the artery from without. Should the sac give way, and the blood escape among the tissues, the A. is said to be diffused. Varicose A. is when the sac communicates both with an artery and a vein; Aneurismal Varix, when these vessels communicate without any sac intervening; both of these are generally the results

of bleeding being performed by non-professional persons. Aneurisms prove fatal by their pressure on some important part, or by bursting and allowing a sudden escape of blood. They are cured by the deposit, within the sac, of fibrin from the blood—a result the surgeon can promote by obstructing the artery above the A. by compression or by ligature; applying the latter close to the sac, if the A. is of the 'false' variety, but at a distance, if it is the result of disease. Internal aneurisms are treated by those remedies which moderate the heart's action, as digitalis, &c.

ANGEL, an ancient English gold coin, varying in value from 6s. 8d. to 10s. It was so called from

Angel of Edward IV.

the figure of the archangel Michael piercing the dragon upon its obverse. Angels continued to be coined down to the time of the Commonwealth.

ANGEL-FISH (*Squatina Angelus*), a fish common on the southern coasts of Britain, and remarkable for its extreme ugliness. On some parts of the coast, it is called *monk-fish*. It is very nearly allied to the sharks, and was included by Linnæus in the genus *Squalus*. See SHARK. It is very voracious, preying chiefly upon fishes. It attains a length of

Angel Fish.

seven or eight feet; and the body is broad and flattened horizontally. The head is nearly round, and broader than the body, from which it is separated by a very distinct neck; the mouth is extremely large, and at the extremity of the snout; the eyes are on the upper part of the head, and are very small; behind the eyes are large spout-holes; the skin is very rough, and covered with tubercles. The upper parts are of a gray colour; the under parts, dirty white. The female is said to produce seven or eight young in spring and autumn.

ANGELICA, a genus of plants of the natural order *Umbelliferae* (q. v.), by some botanists divided into two: *A.*, and *Archangelica*. The species are mostly herbaceous and perennial, natives of the temperate and colder regions of the northern hemisphere. They have bipinnate or tripinnate leaves. WILD A. (*A. sylvestris*) is a common plant in moist meadows, by the sides of brooks, and in woods in Britain and throughout many parts of Europe and Asia. The root is perennial, short, ringed, and branched; it is white within, and contains a yellow milky juice. The stem is hollow, 1½–5 feet high, often flecked

with red; the umbel is convex. GARDEN A. (*A. Archangelica* or *Archangelica officinalis*) is a biennial plant, becoming perennial when not allowed to ripen

Angelica archangelica.

its seeds. It has greenish flowers in almost spherical umbels. The stem is as high as a man. The fruit is long and straw-coloured. The root is long and fusiform, an inch or more in thickness, with thick irregular rugose radicles. The whole plant, and especially the root, is aromatic and bitter, containing much resin and essential oil. The root is admitted into the pharmacopœia as an aromatic stimulant and tonic, and is used in nervous ailments, and in indigestion and flatulence. It is very little used in Britain. The root of *A. sylvestris* is sometimes substituted for it, but is much weaker.—The Garden A. was at one time much cultivated for the blanched stalks, which were used as celery now is; but its cultivation for this purpose has long been almost entirely discontinued. The tender stalks and midribs of the leaves, candied, are still, however, a well-known article of confectionary, and an agreeable stomachic; the roots and seeds are employed in the preparation of gin and of 'bitters.' The plant is a very doubtful native of Britain, but is common in many parts of Europe, and even in Lapland and Iceland. The Laplanders not only use it as food, but regard the stalks roasted in hot ashes as an efficacious remedy in pectoral disorders.—The powdered seeds of the Wild A. are used by the country people in some parts of Europe to kill lice. Several species of *A.* are natives of North America.

ANGELICA TREE. See ARALIA.

ANGELO, MICHAEL. See MICHAEL ANGELO.

ANGELS (Gr. messengers), in Jewish and Christian theology, a class of superior spirits, represented as the immediate instruments of Divine Providence. As Scripture contains no complete and systematic account of angels, the belief of the Church respecting them, except in a few points, has never been exactly defined. It has always been held that A. and human souls, notwithstanding the high

origia of the latter, are distinct; only Dionysius Areopagita (q. v.) and a few modern speculators have maintained the contrary. Dionysius, in his *Hierarchia Cælestis*, divides A. into nine orders. Whether there are not spirits superior both to men and A., has been a disputed point. As to the number of A. and their names, the Church in the middle ages repeatedly checked the tendency to go beyond the usually received accounts; a Romish council, in 745 A. D., mentions with reprobation the use of the unwonted names of Uriel, Raguel, Saniel, &c. The names that have all along been in most common use are Michael, Gabriel, and Raphael.

The creation of the A. was placed, by the Platonising Church-fathers, before that of the material world; others assigned it to some one of the six days. Equally various were the opinions as to the nature of the A. The second synod of Nice (787) assigned them a subtle, ethereal, or firelike body; the scholastics, on the other hand, and the Lateran Council of 1215, maintained their immateriality; while others, owing to the appearing of A., mentioned in Scripture, attributed to them the power of assuming momentarily the corporeal form. The poet Nonnus (lived in Egypt in the 5th c.) is the first to speak of angels' wings.

The belief in *guardian A.* was common both to heathens and Jews, and had been reduced to system by Philo; and the doctrine was adopted in the Christian Church, and defended by Origen and others, founding on Matthew xviii. 10, and Acts xii. 15. It has been cherished by many in all ages and of all parties, but has never been decided on by the Church. Some of the fathers also spoke of good and bad guardian-angels, the former of whom were always ready to prompt to good actions, and to avert evil, while the latter were equally quick in bringing about mischief, wickedness, and calamity. From the belief in the guardianship of A., and their participation in the government of the world, arose naturally the early practice of invoking and worshipping them. Many Christian teachers condemned it, appealing to Colos. ii. 18; and the Council of Laodicea, 300, called it disguised idolatry. But after the Council of Nice had conceded that though A. were not to receive divine worship, they might receive a reverential obeisance, the practice mentioned became more and more rooted, and continues in the Greek and Roman Catholic Churches to this day.

ANGER is displeasure or vexation accompanied by a passionate desire to break out in acts or words of violence against the cause of the displeasure; which must, of course, be a sentient being capable of feeling the infliction. Like most other emotions, it is accompanied by effects on the body, and in this case they are of a very marked kind. The arterial blood-vessels are highly excited; the pulse, during the paroxysm, is strong and hard, the face becomes red and swollen, the brow wrinkled, the eyes protrude, the whole body is put into commotion. The secretion of bile is excessive, and it seems to assume a morbid consistency. In cases of violent passion, and especially in nervous persons, this excitement of the organs soon passes to the other extreme of depression; generally, this does not take place till the A. has subsided, when there follows a period of general relaxation. The original tendency to A. differs much in individuals according to temperament; but frequent giving way to it begets a habit, and increases the natural tendency.

From the nature of A., it is easy to see that it must be—given at least—prejudicial to health. It frequently gives rise to bile-fever, inflammation of the liver, heart, or brain, or even to mania. These effects follow immediately a fit of the passion; other

evil effects come on, after a time, as the consequence of repeated paroxysms—such as paralysis, jaundice, consumption, and nervous fever. The milk of a mother or nurse in a fit of passion will cause convulsions in the child that sucks; it has been known even to occasion instant death, like a strong poison.

The controlling of A. is a part of moral discipline. In a rudimentary state of society, its active exercise would seem to be a necessity; by imposing some restraint on the selfish aggressions of one individual upon another, it renders the beginnings of social co-operation and intercourse possible. This is its *use*, or, as it is sometimes called, its final cause. Put the more social intercourse comes to be regulated by customs and laws, the less need is there for the vindictive expression of A. It seems an error, however, to suppose that the emotion ever will be—or that it ought to be—extirpated. Laws themselves lose their efficacy when they have not this feeling for a background; and it remains as a last resource for man, when society, as it does every now and then, resolves itself into its elements. Even in the most artificial and refined states of society, those minor moralities on which half the happiness of social intercourse depends, are imposed upon the selfish, in great measure, by that latent fund of A. which every man is known to carry about with him.

ANGERMANNLAND (Swedish, *Ängermanland*, pronounced *Öngermanland*), a province of Nordland, one of the four great divisions of Sweden, extends along the Gulf of Bothnia, and is watered by the river Angermanna. Next to Dalecarlia, perhaps, it exhibits the richest variety of wild and beautiful landscape—wood, mount, stream, and lake; vying with the banks of the Rhine, the Danube, or the far-famed scenery of Switzerland. In addition, it is one of the best cultivated provinces in Sweden, producing barley, rye, and peas, and abounding in excellent pasturage. The river Angermann, in its lower course, becomes navigable for the largest ships, and broadens out into a lake shortly before discharging itself into the Gulf of Bothnia. The inhabitants are reckoned among the sliest of the Swedes, and are favourably known for their sobriety and industrious habits, on account of which, prosperity is general. The chief town of the province is Hernösand, with a population of rather more than 2000, standing on the small island of Herno, and having steam-communication weekly with Stockholm. It is the see of a bishop, has a cathedral-school and literary and printing establishment with Lappish type, public baths, and building docks. It exports linen fabrics, and the Baltic products generally.

ANGERS, the ancient *Juliomagus* or *And-garum*, formerly the capital of the Duchy of Anjou, and now of the French department of Maine-et-Loire, is situated on both sides of the navigable river Mayenne, not far from its junction with the Loire, lat. 47° 28' N., long. 0° 33' W. A. is the see of a bishop, and was the seat of a university founded in 1246; instead of which it has now an academy of the highest class. Lord Chatham and the Duke of Wellington received a portion of their education at the military college which was once here, but which is now removed to Saumur. It has also given birth to two distinguished men, Bernier, the traveller, and David, the sculptor. It has also a theological seminary, an institution for the deaf and dumb, a botanical garden, a large picture-gallery, and a public library containing 25,000 volumes. The ruins of the ancient castle of A., built by St Louis, about the middle of the 13th c., are situated on a projecting rock above the river. The cathedral of St Martin is a fine building of the 9th c., in the Roman basilica

style. Sail-making, cotton-spinning, stocking-weaving, &c., are carried on to a considerable extent, and a trade in corn, wine, brandy, flax, hemp, honey, &c. The neighbouring slate-quarries employ 3000 men. Pop. 41,100.

ANGINA PECTORIS, or HEART-STROKE, is characterised by intense pain and sense of constriction, which occur in paroxysms beginning at the breast-bone, or deep in the chest, and extending towards the left shoulder. The fits recur, and the patient either dies in one of them, or from effusion of fluid within the chest.

A. P. rarely occurs before the fiftieth year, and is caused by some defect in the vascular or nervous supply of the heart itself; but the exact seat of the disease has not yet been ascertained, and, indeed, probably varies with the individual. The paroxysms are induced by any excess in diet, by exertion, as walking uphill or against a boisterous wind, or by mental emotions. As, during the paroxysm, but little can be done, 'whoever is subject to fits of the heart-stroke, should studiously shun all occasions of having his feelings roused or his passions warmly interested. If he is prone to anger, he must either endeavour to restrain his passion, or must withdraw from scenes likely to awaken it. If he feels keenly contradiction, disappointment, or insult, he had better avoid all disputes in which he may meet either one or the other. He must lead a sober, quiet, and temperate life, in which neither the emotions of the soul are to disturb the functions of the body, nor corporeal affections are allowed to disturb the serenity of the mind.'—*Craigie*.

ANGIOSPERMOUS (from the Greek *angeion*, a vessel, and *sperma*, seed), a term in Botany, applied to phanerogamous plants which have their seeds enclosed in a pericarp. This is the case with the greater part of phanerogamous plants. Those which have the seeds naked, as the *Conifera* (q. v.), are called *Gymnospermous*. In the Linnæan system, one of the two orders of the class *Didymania* is called *Angiospermia*.

ANGLE (from Lat. *angulus*, a corner) means, in Geometry, the opening or inclination of two lines that cut or meet one another. If the lines are straight, the A. is *rectilinear*. The magnitude of an A. depends, not upon the length of the lines or legs, but upon the degree of their opening.

Angle.

If the legs are supposed closed, like a pair of compasses, and then gradually opened till they come into one straight line, they form a series of gradually increasing angles; when half-way between shut and straight, they contain a *right A.* Any A. less than a right A. is called *acute*, and one greater, is called *obtuse*. Angles are measured by degrees, of which a right A. contains 90. The A. made by two curved lines (*curvilinear*) is the same as the A. made by the tangents to the two curves at the point of intersection. Angles made by planes with one another can also be reduced to rectilinear angles. When three or more planes meet at the same point, the angular space included between them is called a *solid A.*

The **FACIAL ANGLE**, on which Camper founded a scheme for estimating the degrees of intellect and sagacity bestowed by nature on the several members of the animal kingdom, was measured by him in the following way: One straight line was drawn from the ear to the base of the nose, and another from the prominent centre of the forehead to the most advancing part of the upper jawbone, the head being

viewed in profile. 'In the angle produced by these two lines,' says the physiologist, 'may be said to consist not only the distinction between the skulls of the several species of animals, but also those which are found to exist between different nations; and it might be concluded, that nature has availed herself at the same time of this angle to mark out the diversities of the animal kingdom, and to establish a sort of scale from the inferior tribes up to the most beautiful forms which are found in the human species. Thus it will be found that the heads of birds display the smallest angle, and that it always becomes of greater extent in proportion as the animal approaches most nearly to the human figure. Thus there is one species of the ape tribe in which the head has a facial angle of forty-two degrees; in another animal of the same family, which is one of those *simia* approaching most closely to the human figure, the facial angle contains exactly fifty degrees. Next to this is the head of the African negro, which, as well as that of the Kalmuc, forms an angle of seventy degrees, while the angle discovered in the heads of Europeans contains eighty degrees. On this difference of ten degrees in the facial angle, the superior beauty of the European depends; while that high character of sublime beauty which is so striking in some works of ancient statuary—as in the head of the Apollo and in the Medusa—is given by an angle which amounts to *one hundred degrees*.'

ANGLE, DEAD. In fortification, where an angle of the wall is so formed that a small plot of ground in front of it can neither be seen nor defended from the parapet, it is called a 'dead angle.' See **BASTION**, **CURTAIN**, **FORTIFICATION**.

ANGLER (*Lophius piscatorius*), a fish not uncommon on the British shores, and sometimes called the *Fishing-frog*, sometimes, from its ugliness and voracity, the *Sea-devil*. It usually attains the size of about three feet in length, sometimes five feet. The head is enormously large, depressed, and spinous; the mouth is of similar proportions (whence the Scottish name *Wide Gub*), and furnished with many

Angler.

sharp curved teeth. The lower jaw is considerably longer than the upper. The body is narrow in comparison with the great breadth of the head, and tapers rapidly to the tail. The whole fish is covered with a loose skin, almost without scales. There are two dorsal fins, which are spinous, and three anterior rays, regarded as belonging to the first dorsal, are free and articulated to the head, which are with great probability supposed to serve the animal as delicate organs of touch. The nostril tube is elongated into a membranous stalk, capable of spreading out like a cup at the upper end, and of being moved in every direction by a very numerous set of muscles, the bottom of the cup being divided into projecting leaflets, on which the olfactory nerve is finally distributed. There are also numerous worm-like appendages about the mouth, and by means of these, and still more of the filaments which rise from the upper part of the head, the creature is supposed to attract small fishes, upon which it seizes. The

wonderful stories told upon this point seem to require authentication, yet they are in themselves by no means incredible, and have been current concerning this fish and its congeners, since before the days of Aristotle, who mentions them, and says that this fish is called a *fisher* because of the means by which it procures its food. Yarrell justly remarks of the stratagem ascribed to the *Lophius*, that it is not more wonderful than that of spiders, which spin and repair their webs to catch insects, upon which they subsist.—The genus *Lophius* belongs to a family of Acanthopterygious Fishes, called *Lophiadae* or *Lophioids*, and by Cuvier, *Pectorales Pedunculati*, remarkable for the elongation of the carpal bones, so as to form a sort of wrist, to the extremity of which the pectoral fin is articulated; so that, by means of it, these fishes are able to leap suddenly up in the water to seize prey which they observe above them; and some of them can hop about upon seaweeds or mud from which the water has retired. They do not suffer so quickly as most other fishes from being out of the water, their gill-opening being very small, and an A. has been often known to devour flounders or other fish which have been caught along with it. The bones are much softer than those of Acanthopterygious Fishes in general.

ANGLES (*Angli*), a German tribe of the race of the Suevi, who seem originally to have occupied the country lying on the east of the Elbe, between the mouths of the Saale and the Ohre, and moving northwards, to have settled in Schleswig, between the Jutes and the Saxons. Along with the latter the A. passed over in great numbers to Britain, during the 5th c., and ultimately established there the Anglo-Saxon (q. v.) kingdoms of the Heptarchy. From them England derives its name (Lat. *Anglia*, Anglo-Saxon, *Engla-land*). After these migrations from Schleswig, the Danes from the north entered the deserted districts, and mingled with the A. who remained there. The German language and manners were afterwards introduced by immigrant nobles from Holstein, and prevailed among the higher classes; but to the time of Christian VI., the Danish was still generally spoken by the common people. During the present century, the German has more completely gained the ascendancy. The Anglo-Danes are of a more passive disposition than the Frieslanders and the people of the Dithmarsch, and religious sentiment is very strongly manifested among them. The district called *Angeln* extends from the Schlei on the south, to the Flensburg Hills on the north, contains about 330 square miles, and a population of about 50,000. The name has no political or administrative signification.

ANGLESEA, HENRY WILLIAM PAGET, Earl of Uxbridge and Marquis of A., born May 17, 1768, was educated in Oxford, and, as Lord Paget, entered the army at the beginning of the French Revolution. From 1793 to 1794 he commanded a volunteer corps in Flanders, and subsequently acquired a high reputation as a cavalry officer in the Peninsular War, especially during the retreat under General Moore. At the battle of Waterloo, where he commanded the British cavalry, he lost a leg. On his return to England, he received a vote of thanks from parliament, and was made Marquis of A. Afterwards, he took a part in the administration under Canning, and in 1828 was appointed lord-lieutenant of Ireland, at a period when that country was greatly agitated on the question of its religious privileges. He at first opposed the emancipation of the Catholics; but ultimately became convinced that it was essential to the peace of the country, in consequence of which he was recalled from Ireland by Wellington in 1829. He was again appointed to

the same office under Lord Grey's administration in 1831; but the perverse policy of the Tories had involved matters in such perplexity that even the decisiveness and integrity of his character could not allay the irritation. O'Connell had now commenced his ruinous career of agitation, and the marquis was compelled to resort to severe coercive measures, which destroyed the popularity he had previously acquired. His rule in Ireland was not characterised by any superior statesmanship; but it ought to be remembered, to his honour, that he founded the Irish Board of Education, which has been of immenso service to that nation. In 1833, he was succeeded by the Marquis of Normanby; but did not again take any prominent part in public proceedings till 1846, when he accepted the office of Master-general of the Ordnance in Lord John Russell's ministry. In the same year he was raised to the dignity of field-marshal. He died on the 29th April 1854.

ANGLESEY, or **ANGLESEA** (Sax. *Angles Ey*, i. e. 'the Englishmen's island'), an island and county of Wales, on the north-west coast of that principality, being separated from the mainland by the Menai Strait. Its form is that of an irregular triangle, the base facing the mainland. Its length is about 20 miles; breadth, about 17; coast-line, about 80; area, 173,440 acres. The climate is mild, but foggy, especially in autumn; the soil, generally a stiff loam, varying with sandy and peaty earth; the general aspect of the island, flat and uninteresting, there being very little wood. The prevailing rock is mica schist; limestone ranges traverse the county; granite, marble, coal, serpentine, soapstone, are also found. The island is rich in minerals; the Parys and Mona copper-mines, near Amlwch, opened in 1768, still give employment to about 1000 workmen. Lead ore, containing much silver, has also been found. Agriculture in A. is as yet somewhat backward. The chief crops are oats, barley, and potatoes. Cattle are extensively reared. The manufactures of the island are inconsiderable. The communication with the mainland is by means of the Menai Suspension Bridge, and the great Britannia Tubular Bridge, over which the Chester and Holyhead Railway passes. See **TUBULAR BRIDGES**. A. was known to the Romans under the name of *Mona*. It was one of the chief seats of the Druidical power, which in 61 A.D. was all but destroyed by the Roman general Suetonius Paulinus. The island was again subdued by Agricola 76 A.D. Egbert conquered it in the 9th c.; but the native princes afterwards recovered their dominion, establishing the seat of government at Aberffraw. It was finally subdued by Edward I. The ancient remains consist chiefly of cromlechs, two of which, side by side, are in the park of Plas Newydd, the seat of the Marquis of A. At Holyhead, are the remains of a Roman camp.

The climate of A. is milder than that of the mainland of Wales; but in the autumn the air is frequently filled with noxious mists. The county is divided into three districts, called *cantref's*, each subdivided into two *cemweds*. The market-towns are Amlwch (a flourishing little seaport, of 3169 inhabitants), Beaumaris (q. v.), Holyhead (q. v.), Llangefni (pop. 1362), and Llanerch-y-medd. The first four of these towns unite in returning one member to the imperial parliament; the county returns another. Other small towns in A. are Aberffraw (pop. 1332) and Newborough. The pop. of the county in 1851 was 57,327; the number of day-schools, 47, with 2880 pupils; of Sunday schools, 115, with 11,662 pupils; of places of worship, 160, belonging chiefly to the Church of England and to the Calvinistic Methodists.

ANGLING is the art of alluring and capturing

fish by means of a rod, line, and hook—the hook being furnished with a lure, which is either some object on which the animals naturally prey, or is a counterfeit of such an object. A. is of great antiquity, as we learn from mention being made of it by the prophet Isaiah: 'The fishers also shall mourn, and all they that cast angle into the brooks,' chap. xix. v. 8. The practice has continued through all ages, till the present time, and in almost all countries. In 1496, Wynken de Worde 'emprinted at Westmestre' a '*Treatise of Fysshinge with an Angle*, by Dame Juliana Berners or Barnes.' Izaak Walton, in 1653, gave to the world his *Complete Angler*, a work afterwards enriched with additions by his friend Charles Cotton, and till this day esteemed both for correctness of details, and the singularly happy humour of its apologues, poetical pieces, and disquisitions.

We reserve for future articles the habits and best methods of capturing the principal species of fish that haunt the streams and lochs of Great Britain, and here confine ourselves to a short notice of A. apparatus, and some general directions, &c., for the guidance of tyros, proceeding at once to describe, first:

FISHING-TACKLE.—The angler's equipment consists of *rod and reel, lines, hooks, baits, flies, tackle-book, and basket*; these should be as simple as possible in their construction, many accessories added by the fishing-tackle maker being more ornamental and cumbersome than really useful.

The *rod* must be long or short, stiff or supple, to suit the habits of different species of fish; thus, a long rod of sixteen or eighteen feet, very strong, but not very elastic, is necessary for salmon; while a rod of ten to fourteen feet, light, elastic, and finely tapering, is sufficient for trout. The rod for trout and similar kinds of fishing should be light enough to be wielded easily for several hours together by one hand. Spliced rods are easier mended than those with joints, and do not so readily get out of order. For salmon and other kinds of large fish, a large rod of several pieces, united by joints, is necessary.

The *reel* or *pin*—an apparatus fixed near the bottom of the rod, and upon which the line is wound—should be simple in its mechanism, and made so as to wind or unwind freely and quickly.

Lines should be long, smooth, and flexible, and of a material not easily injured by wet. The part of the line which is wound upon the reel, and passes along the rod, is called the *reel-line*; that which is attached to it, is called the *casting-line*. The casting-line should be made of triple gut, twisted, and between it and the gut to which the hooks are attached, there should be several threads of strong single gut. Reel-lines vary from twenty to one hundred and twenty yards in length, according to the dimensions of the water to be fished, and the habits of the species to be captured. Lines are made of various materials, such as horse-hair and oiled silk. If, in purchasing, the angler be at a loss to decide between a heavy or a light line, he should incline rather to the heavy, for the sake of its *casting* superiority, and the advantage gained in windy weather. The *casting-line* is sometimes made of horsehair, lighter and finer than the reel-line, and at the end of this is attached the *gut-line*—the finest of all. Sometimes, however, the horsehair casting-line is dispensed with. The casting and gut lines should taper in thickness from the reel-line to the end hook on the gut-line; all knots should be small, but *secure*, the only breaks discernible by a general glance throughout the entire length of casting and gut lines, being the hooks.

Hooks range in size from several inches down to a

quarter of an inch in length. Their chief places of manufacture are Kendal and Redditch.

Baits consist of any substance put upon a hook to act as a lure to the fish; and when used, the baited hook is dropped into, and allowed to sink in the water, instead of being kept near the surface, as is the case with fly. The materials, living or dead, used for bait are very numerous, the principal kinds being worms, caddis-worms, pastes, maggots, minnows, insects, and salmon-roe. The methods of using baits are extremely various, and in many cases rather complicated.

Artificial Flies, intended as they are to bear something like a resemblance to the actual live flies, are the most important lures used by the angler. The chief materials for dressing flies are cocks' hackles or other feathers, to form wings; the fur of a hare's ear, mouse, water-rat, or some other animal, to form the body; and waxed silk thread to tie the whole, in an artful, neat manner, to the shank of the hook.

The following is a list of trout-flies and spiders, with a supply of which the angler may pursue his 'meditative art' in almost any river or stream in Great Britain throughout the entire season; and it is almost needless to add, that the wood-cut below, though copied from two favourite flies and a spider, is intended as a guide to *size* rather than to pattern. Spiders are dressed, as they naturally exist, without wings.

Flies.—No. 1. Wings formed of feathers from the wing of the chaffinch, with a black hackle, tied with slate-coloured silk.

2. Wings composed of woodcock or partridge feathers, and red hackle, tied with yellow silk.

3. Wings formed of the feathers of the corn bunting, with a red hackle wound round close to the head, tied with orange-coloured silk.

4. Wings formed from the speckled feather of the teal, with a black hackle wound round close to the head, tied with brown silk. The same wing with a red hackle, tied with yellow silk, also makes a killing fly.

5. Wings from the feathers of the dotted; body and hackle same as No. 2.

6. Wings from woodcock or corn bunting wing; body of hare's ear.

Spiders.—1. From the small feather of the dotted wing, tied with yellow silk thread.

2. From the small glistening feather taken from the outside of the shoulder of the starling's wing, tied with yellow silk thread.

3. From the neck-feathers of the hill-partridge, tied with yellow silk thread.

4. From the black hen-hackle, tied with small black silk thread.

5. From the blue hen-hackle, tied with yellow silk thread.

6. From a small red cock-hackle, or the small feather of the landrail's wing, tied with yellow silk.

Of *salmon-flies*, the best two we know of are formed from the following materials:

'No. 1. Tail—crest-feather from golden pheasant; tip—gold tinsel and orange silk, with two turns of ostrich herl; body composed of claret-coloured pigs' wool and mohair mixed, with a little pigs' wool at the head, of a light-blue shade; wound with silver tinsel and dark-red hackle, with blue jay's feather for shoulders; wings—from the teal-duck or wid-geon, distinctly marked or barred; head—of black ostrich herl.

'No. 2. Tail—crest feather from golden pheasant; body composed of pigs' wool and mohair mixed, of a dark-cinnamon shade; wound with silver twist and

Salmon Flies.

dark-red hackle; shoulders composed of breast-feather of the argus pheasant; wings composed of golden pheasant tipplet or neck feathers, distinctly marked teal, four fibres of blue and red macaw tail-feathers, with pairs of wings from the brown and black barred feathers of the peacock wing surmounting the whole; a blue feather from the kingfisher or blue chatterer on each side of the wings; feelers—from blue and buff macaw tail-feathers; head—black ostrich herl.

Larger and more gaudily dressed hooks are necessary for some of the bigger rivers of Great Britain, such as the Shannon in Ireland, and the Tay in Scotland; but the two here described are the most killing varieties for general use that we know of, and have been found more or less serviceable in every salmon river of any importance. No. 1 may be varied by different shades of wing, to suit various colours and sizes of water. Both are stockflies with every tackle-maker.

The angler's equipment is completed by the addition of a *basket* or *bag* for holding his fish, and a *tackle-book*; also a flat, round tin box for holding his fly-casts. In fishing for perch, gudgeons, bream, &c., a small float is often used. Floats are made of cork, quill, reed, and other light materials; and a choice, according to circumstances, may be added to the tackle-book. Books adapted for the angler's purpose can be had of any tackle-maker.

The angler's dress should be a plain, dull-coloured suit; his shoes strong; and if he prefers wading, his boots or leggings should be waterproof.

The *gaff* and *landing-net* are each useful for securing large fish when stranded in very shallow water, or when fishing from a boat; and the *drag-hook*, which is an instrument with three bent prongs or hooks, with a long strong line attached, is frequently useful for casting into rivers or lochs to clear away any object at the bottom on which the hook has fouled.

PRACTICE OF ANGLING.—Bait-fishing—As a rule, bait-fishing is practised more on sluggish, deep rivers than on swift running streams, though it answers as well, and, under certain circumstances, even better in the latter than in the former. The fish usually sought for in the slow-running, deep rivers south of the Tweed, are gudgeon, roach, dace, bream, chub, barbel, tench, carp, perch, pike, trout, &c. All are sometimes taken with fly; but worms, gentles, roe, or paste are more generally used.

The first thing the bait-fisher has to learn, is the art of baiting his hooks. Taking the hook in his

right hand, and the bait between his fingers in the left, let him enter the hook at the head of the worm, and carry it through the animal to near the tail, covering the entire hook and its tying. The worm should be broken or mangled as little as possible; and the more lifelike it appears, the greater the probability of its proving an effectual lure. There must not, however, be too much spare worm left dangling from the hook, otherwise the fish will keep nibbling it away without biting at the bait bodily, and taking it into its mouth—the thing which the angler desires.

In throwing the line with bait, take care not to splash the water, but throw forward and upward, so as to let the bait fall gently on the surface, and sink slowly in the water to the required depth. The motion of the line down the stream must then be carefully followed and watched.

Occasionally, the angler will *feel* a nibble, but he must not be in a hurry to *strike*—that is, to fix the hook in the fish's mouth. Perhaps it is no more than a nibble, and it is well to allow the fish time to bolt the hook. If drawn too quickly, you may actually pull away the hook after it is half-gulped. Experience and dexterity are required in this ticklish part of the craft.

In May, the creeper, or stone-fly, in its embryo state, is a deadly bait; and in June, when it assumes the winged state, it is the most killing bait that can be used. The creepers are found under large stones in the water, the flies under large stones in the dry channel at the edge of the water. On Tweedside this fly is frequently but erroneously called the May-fly, and is productive of large takes of trout when other lures are comparatively useless. Minnows and parr-tail are two important baits; tackle is made on purpose for these, and consists of several hooks tied within an inch or so of each other. These are inserted in the minnow, so as to give a curving form to the bait, for the purpose of making it *spin* in the water; swivels are attached to the tackle further up, to prevent the line from twisting with the spinning of the minnow. Stoddart says: 'Fish in rapid streams, also in deep discoloured pools, and during a smart curl. Manage the minnow as you would your fly, throwing it down and across as far as you are able; bring it towards you about six inches below the surface, spinning rapidly by the aid of several swivels. When a fish rises, give him time before you strike; let him turn and gorge the bait, then strike sharply, and he is yours.' This mode of fishing requires more dexterity and practice than ordinary bait-fishing, and will be best learned by carefully watching the motions of an experienced hand.

Fly-fishing.—This is the true A., all other kinds being tame in comparison. Trout and salmon are the fly-fisher's chief objects of desire; and here we will quote some remarks of Mr Stoddart's upon the method of capturing the former of these fish with the lure in question: 'Your rod and tackle being ready, the wind in your favour down the river, draw out with your left hand a few yards of line from your reel, dip the top of your rod in the water, and with a rapid jerk you will lengthen as you wish that part you intend for throwing. A thirteen-foot wand will cast from six to seven fathoms of line. With a large double-handed rod you may manage a much greater length. Always, if you can, angle from a distance. Trout see you when you least imagine, and skulk off without your notice.

'All jerks, in casting, are apt to whip off your hooks or crack your gut. A fly-fisher may use two, three, or four flies on his casts, according to pleasure. When angling with small hooks, we adopt the medium number. Large ones ought to be fished

with in pairs, and well separated. In throwing the cast, the lowermost or trail-fly should be made to alight foremost; its fall ought to be almost imperceptible; it should come down on the water like a gossamer followed by the droppers. The moment a fly touches the surface, it is ten times more apt to raise a fish than during the act of drawing it along. At no time are we stanch advocates for the system of leading our hooks either against or across a stream; our method is rather to shake them over it for a moment, and then repeat the throw. A trout will discover your fly at the distance of several yards, if feeding, and will dart at it like lightning.

Trout will sometimes take in the most unlikely weathers, so that the angler should not despair at any time. Hunger causes them to feed at least once in the twenty-four hours, and generally much oftener. If the wind blows down the river, commence at the pool-head, and fish every inch of good water; you may pass over the very rough and very shallow parts, also those which are absolutely dead calm and clear, unless you see fish rising in them, when, should your tackle be light, there is no harm in taking a throw or two. Dead water, however, when rippled or discoloured, may be angled in with great success.

The following remarks and hints apply chiefly to trout-fishing in streams, and may be found of service to those who follow that delightful recreation. As a rule, fish up, especially when the water is clear, and the wind not directly down-stream: the advantages are, that the fish do not so readily detect the presence of the angler—their heads being directed up the water; they are more easily hooked; and when a large trout is hooked, he may be landed down-stream, thus saving the water above for further operations. The practice of angling up-stream is somewhat difficult at first, but a little practice works wonders, and is sure to bring its reward ultimately. Gut should be round, clear, strong, and fine; the finer it is, consistent with strength, the better, as it scares fewer fish than coarser material. Trout-flies for ordinary use in rivers such as Tweed, &c., should be dressed rather sparsely, and should be small; some half-dozen varieties, such as those already enumerated, will be found amply sufficient; and were we asked to choose three kinds as being more valuable than any others, our choice would incline to a red hackle, a black hackle, and a woodcock-wing dressed with hare-ear body. For turbid or dark water, however, the size may be increased, and the dressing be made rather gaudier by the addition of tinsel. Practise casting till you can throw your flies like gossamer on the water, and, above all, avoid splashing. The use of a short line will give you great advantage over your tackle. Heavy fish hook themselves in nine out of ten cases, so that striking is unnecessary; striking is performed by a motion of the wrist, not of the arm, and is only to be learned by practice; it then comes quite naturally to the angler. Cast frequently; you get over more ground, and vastly increase your chances of success. Trout generally seize the fly the instant it lights on the water, or the instant after; hence, it is necessary that the angler be on the *qui vive* in time. Cast above where fish are likely to lie, and remember that the greater part of your success lies in the art of keeping out of their sight. Dull-coloured clothes materially assist in achieving this important desideratum.

When fishing with a friend, always come to a distinct agreement, before starting, relative to the division of the water, especially if the stream be small.

The true angler returns all smolts, parr, and small trout to their native element—his maxim

being quality, not quantity. He also keeps his rod well varnished, dries his line and tackle after using, and looks into his tackle-book at least once every three months during the non-A. season; he thus saves his flies from the ravages of the moth. The tyro should always be guided in his selection of a rod and tackle by some experienced friend; and upon arriving at strange angling quarters, he should place himself in the hands of a resident fisherman, who will guide him to the best casts of the river, loch, or stream. A day spent in watching the proceedings of an expert angler, is a day well spent; and a few hours' lessons in fly-busking, knot-tying, &c., work wonders. And, lastly, let the angler practise courtesy towards all his brethren of the rod, and be ever willing to lend a killing-fly to a needy friend.

The principal works on A. are Izaak Walton, Stoddart's *Angler's Companion*, the article A. in the *Encyclopædia Britannica*, Davy's *Salmonia*, the angling section of Colquhoun's *Moor and the Loch*, and Stewart's *Practical Angler*. The last is perhaps the best work ever written upon trout-fishing as applied to clear water. The angler will also find many useful hints in the number on A. in *Chambers's Information for the People*.

ANGLO-CATHOLIC CHURCH, or ANGLICAN CHURCH, a term frequently employed to designate collectively those churches which embrace the principles of the English Reformation. The following are, in brief, the views generally entertained of those principles by the members of the churches in question: By referring the Anglo-catholic Church to the English Reformation, it is not meant that her origin dates from that event, but that her tenets, as she now exists, are those which the Reformation cleared of what she holds to be corruptions. For, as the word 'church' itself suggests—being derived, like 'kirk' in Scotland, from the Greek adjective *kuriakē*, which means 'the Lord's' (i. e. house)—the origin of the Anglican Church is to be traced not to a Roman but to an Eastern source. She claims the name of Catholic—which also is from the Greek *katholikē*, universal—because she is united, in origin, in doctrine, and in form of government, with the Universal Church as it has existed, with various differences of rites and ceremonies, in all countries and in all ages. Eusebius even asserts that some of the apostles passed over into Britain. Tertullian, who lived in the 2d c., speaks of places in Britain which, though inaccessible to the Romans, were subject to Christ: 'Britannorum inaccessa Romanis loca. Christo vero subdita.' At the Council of Arles, 314 A.D., there were three British bishops present; and St Alban suffered martyrdom, under Diocletian, about the close of the 3d c., or nearly three centuries before the landing of St Augustine (q. v.) and his missionaries, 596 A. D. Christianity, however, was driven by the heathen Saxons into the mountainous districts of Wales; and though Augustine, on his arrival, found no less than seven bishops and one archbishop in those parts, and though Bertha, queen of Ethelbert, was a Christian, yet the whole Saxon part of the country was in a state of heathenism. The British Church differed from the Roman and other Western Churches, as to the form of administering baptism, and the time of keeping the festival of Easter (see *EASTER*), following the customs of the Greek or Eastern Church; and it was not until the close of the 7th c., under Theodore, that the two churches became united. In the meantime, the conversion of Britain was as much due to the labours of St Aidan, the Scottish Bishop of Lindisfern in the north, and of St Chad, the Saxon saint, as to the missionaries of the Roman Church in the south. See *ANGLO-SAXONS*.

Nor is this glance at the history of the Anglican Church, in the earlier period of her existence, unimportant, when we come to consider what and whence are her present form and tenets. From the beginning of the 8th to the middle of the 16th c., she became gradually, and at last completely, assimilated in doctrine and practice to the Church of Rome, as well as subject to her domination; and the fact of her having at length freed herself from both, is in no small degree due to her having existed, in Saxon times, in a state of freedom and purity. It required, as we have seen, a struggle of nearly a century to make the British Church conform to the Roman in the matters of baptism and Easter; and it was the same spirit which offered a strenuous, and for some time an effectual, resistance to the peculiar doctrines of the Church of Rome and the claims of papal dominion. There were always found individuals, some of great eminence, to protest against the former, whilst large sections of the church never ceased to protest against the latter. For a hundred and fifty years previous to the Reformation, the doctrines of Wickliffe were leavening the body of the Anglican Church. The overthrow of the papal supremacy was indeed effected by Henry VIII.; but that monarch rather hindered than favoured the reformation of *doctrine*, as appeared from the rapid progress which it made when Edward VI. came to the throne. The bloody reign of Mary interposed a check to further progress; and it was not till the accession of Queen Elizabeth that the principles of the Reformation finally triumphed, and the Anglo-catholic Church assumed the form in which she has since continued to exist. During the period of more than 800 years preceding the Reformation, she became gradually, and at length completely, merged in the Roman Catholic; at the Reformation, she may be said to have emerged; when Rome, at the Council of Trent, anathematised all who would not receive her articles, the separation became final, and the positions of the two churches with respect to each other irrevocably hostile.

The doctrines of the Anglican Church are to be found in the *Book of Common Prayer* (q. v.), which is based upon the second prayer-book of Edward VI., and was settled in its present form 1662 A. D. Her tenets are more *legally* defined in the Thirty-nine Articles, which were settled 1562 A. D. (see ARTICLES, THIRTY-NINE). As distinguished from Rome, she rejects tradition as a rule of faith, though admitting it as to rites and ceremonies, and bases all her teaching upon the books of the Old and New Testaments, rejecting from them as apocryphal certain which Rome receives as canonical. She recognises only two sacraments, Baptism and the Lord's Supper, whereas Rome allows five others—namely, Confirmation, Orders, Penance, Matrimony, and Extreme Unction; she denies the doctrines of transubstantiation and the propitiatory sacrifice of the mass; she forbids what Rome practises—the adoration of the Virgin, saints, and angels, and the reverence of relics and images; she also denies the Roman doctrines of purgatory and the spiritual supremacy of the pope. It is not, however, to be forgotten that a great part of her liturgy is derived from the missals of the Roman Church. As distinguished from the Presbyterian Churches—e. g., that of Scotland—she is Episcopal, and holds the unbroken succession of her orders from the apostles, as one of her most esteemed privileges; whereas the Presbyterians, especially in Scotland, reject prelacy as a remnant of popery. These do not, however, differ from her materially in essential matters of faith, but chiefly as to the sacraments, the form of administering them, and the grace conveyed in them; as to the observance of seasons, such as Christmas, Lent, Easter; and as to the forms of public worship, the

Presbyterians using no set forms. Her differences with the Greek Catholics are less wide than with the Roman, and will be best seen by referring to the article GREEK CHURCH. From the Lutherans she differs on the doctrine of consubstantiation in the sacrament of the Lord's Supper. From the Calvinists she differs radically as to the extent of the efficacy of Christ's death, they believing only in 'particular,' she in 'universal,' redemption (meaning, of course, not that all men will actually be saved, but that Christ died for all); nevertheless, some of her articles, as the 17th, are decidedly Calvinistic. The numerous sects of Wesleyans, Baptists, and Independents do not differ from her on what they themselves consider essential articles of faith, but chiefly as to the necessity of orders, the grace conveyed in the sacraments, and the forms of public worship and of church government. But since their separation from her, endless varieties of doctrine and worship have spread among them. Unfortunately, there remains no Gallo-catholic Church with which to compare her.

The Anglo-catholic Church embraces in her communion the United Church of England and Ireland, the Episcopal Church in Scotland, all the colonial Episcopal Churches, and the American Episcopal Church. All but the latter use the *English Book of Common Prayer*; in America this has been slightly altered. The American Church is one of the most flourishing offshoots of the Anglican. It was planted in Virginia, 1607 A. D., but, for nearly two centuries, the mother church in England withheld from her offspring the necessary boon of an episcopacy of her own. It was not till the close of the 18th c. that the first three American bishops were ordained (one by the Scottish bishops in 1784, and two by the Archbishop of Canterbury and the Bishops of Bath and Peterborough in 1787); but now this branch of Anglo-catholicism has spread over the greater part of the United States.

ANGLOMANIA designates, among the French and Germans, a weak imitation of English manners, customs, &c., or an indiscriminate admiration of English institutions. In German literature, an A. was especially prevalent in the 18th c., when translations of English books became numerous, and were read with great admiration. The Germans have ascribed the sentimental and affected style of some parts of their literature to the influence of the English literature of last century. But the A. was harmless in comparison with the GALLOMANIA, or imitation of French literature and customs, which prevailed in the time of Frederick II. of Prussia, and was developed in the writings of Wieland. A remarkable A. prevailed in France for some time before the commencement of the Revolution. It arose out of political considerations and admiration of English free institutions, but extended to trifles even of fashions and manners, and often became very ridiculous.

ANGLO-SAXON LANGUAGE AND LITERATURE. The term Anglo-Saxon is of modern origin, our forefathers having called themselves and their language English or Ænglisc. The Anglo-Saxon language belongs to the Low-German family of the Germanic languages, and is most nearly related to the Old Saxon, the Old Dutch (or language of the Netherlands), and the Old Frisian. There were two principal dialects—one spoken in the north of England, which was chiefly peopled by the Angles; and the other in the south of England, which was chiefly peopled by the Saxons. After Wessex acquired the supremacy over the other states of the Heptarchy in the 8th c., the West Saxon dialect became prevalent as the language of

the court and of literature. From the 9th c., laws and poems began to be committed to writing; and Alfred the Great set the example of translating Latin works into Anglo-Saxon. After the Norman Conquest, the Anglo-Saxon language gave place to the Norman-French, as the language of the court, of courts of justice, of schools, and partly also of the church; but Saxon continued to be the language of the common people, and became the basis of the English language, which was gradually formed during the 12th, 13th, and 14th centuries. The Anglo-Saxon of the period from 1070 to 1250 has been designated by English philologists the *Semi-Saxon*, whilst the *Early English* prevailed from 1250 to 1350, and the *Middle English* from 1350 to 1550. Since the Reformation, the Anglo-Saxon has been made the subject of study by a few; and Hickes's *Thesaurus Linguarum Septentrionalium* (3 vols., 1703—1705) must be mentioned as one important work on the subject which the last century produced. In recent times, the knowledge both of the language and literature of the Anglo-Saxons has been greatly advanced by the labours of Thorpe, Kemble, Latham, Price, Guest, Sir Frederic Madden, the Conybeares, and others in England; and of J. Grimm and Leo in Germany. But even now it can scarcely be said to have received the amount of attention which may well be reckoned due to it, when we remember that it furnishes the basis, and, in point of words, contributes by far the greater proportion, of the English which we speak. The best Anglo-Saxon dictionaries are those of Lye, edited by Manning (2 vols. fol., Lond. 1772), and Bosworth (Lond. 1839); the grammar has been exhibited by Rask in his *Angelsäksisk Sproglaere* (Stockh. 1817; English translation by Thorpe, Copenh. 1830), and more perfectly by J. Grimm in his *Deutsche Grammatik* (4 vols., Gött. 1819—1837).

Like Latin, Greek, and modern German, the Anglo-Saxon language was inflected, the cases of its nouns, and the conjugations, numbers, and persons of its verbs, being marked by changes chiefly in the final syllable. These characteristics gradually disappeared as Anglo-Saxon passed into modern English, in which they are almost unknown. The nature of this process will be understood from the following extract from Professor Craik's excellent *Outlines of the History of the English Language*: 'It has been pointed out by Mr Guest, that the characteristic distinction of Old, or Early English, as compared with Saxon, or Semi-Saxon, is the employment of the one termination *e* in the declension of nouns and the conjugation of verbs, to represent indiscriminately the three Anglo-Saxon vowel-endings, *a*, *e*, and *u*. In this way the Saxon *nama*, *ende*, and *wudu*, became in Early English, name, ende, woode, or wood-de. Now the distinction of Middle English, as compared with Early English, may be defined as being the tendency to drop this final *e* as a distinct syllable, and along with that simplification, to throw off also whatever else remained of the original inflectional system of the language.'—P. 91, ed. 1855.

Of the remains of Anglo-Saxon literature which the ravages of the Danes and Normans have left us, the greater part are still unprinted. Very many of them are poetical. The verse is alliterative, as in the Norse and oldest German poetry; and only in some of the most recent Anglo-Saxon poems do we find a beginning of rhyme. The epic or narrative poems are remarkable for superabundance of often recurring epithets, bold metaphors, and a certain pomp and magnificence of style. Of the genuine heroic poetry, however, there are few remains, the principal one being the poem of *Beowulf* (q. v.), a work which must have been composed before the Anglo-Saxons quitted their original seats on the continent.

The introduction of Christianity gave a religious character to Anglo-Saxon poetry; and many narrative poems are extant on religious subjects, some of which may be seen in the *Codex Oxoniensis*, a collection edited by Thorpe (Lond. 1812). The *Song of Cadmon*, which is preserved in Alfred's translation of Bede, has been edited both by Junius and Thorpe; and a metrical paraphrase of parts of the Holy Scriptures, ascribed to the same author, has found editors both in Thorpe (Lond. 1832) and Bouterwek (vol. 1, Elberfeld, 1847). Cadmon, who was employed by the monks of Whitby, at first, it would seem, in tending their cattle, is conjectured to have died about 680, so that both of the works in question must belong to the 7th c. Two poems from the *codex* which Dr Blum discovered at Vercelli in 1852, have been edited by Jacob Grimm (Cassel, 1840), under the title of *Andreas und Elene*; a poetical calendar of the saints by Fox (Lond. 1830); and a version of the Psalms by Thorpe (Lond. 1835). The semi-Saxon paraphrase by Laymon of the *Brut of Wace*, or old French *Roman de Brut*, a work of about the year 1200, which has been edited by Madden (Lond. 1847), shews the language in its transition to English, as do also the *Proverbs of King Alfred* in the *Reliquie Antique* (vol. 1, Lond. 1843). Among the most important prose works in the Anglo-Saxon language must be mentioned the laws, civil and ecclesiastical, from the time of Ethelbert of Kent to that of Canute, of which the best edition is in Thorpe's *Ancient Laws and Institutes of England* (Lond. 1840). Of historical works may be mentioned Alfred's translations of Orosius and Bede; and the *Anglo-Saxon Chronicle*, carried on by different hands to 1154, of which the best edition, down at least to the Conquest, is Price's, in the *Monumenta Historica Britannica*, 1848, an earlier one being that of Ingram (Lond. 1823), of which latter there is a translation by Miss Gurney (Norwich, 1819). It is in the province of theology that Anglo-Saxon literature is most rich, abounding particularly in legends and homilies. A collection of homilies made by Bishop Ælfrie has been published by the Ælfrie Society (2 vols., Lond. 1847), a society instituted in 1843 for the promotion of the knowledge of the Anglo-Saxon language and times. Ælfrie did much to enrich Anglo-Saxon literature with translations, and began a translation of the Bible. He translated the first seven books, the book of Job, and the apocryphal Gospel of Nicodemus, and also a fragment of a poem on the history of Judith, of great celebrity (Oxf. 1698). The *Durham Book*, or St Cuthbert's book, a very famous manuscript, now in the British Museum, contains an interlinear gloss of the Gospels in the East-Anglian dialect, the text being probably of the 8th, and the gloss of the 10th c. Alfred translated the work of Boethius, *De Consolatione Philosophiæ*. The opinions of the Anglo-Saxons on astronomy, natural philosophy, and medicine, are exhibited from their works by Wright in his *Treatises on Sciences written during the Middle Ages* (Lond. 1841). Much additional information on this subject will be found in an accessible form in Professor Craik's *Outlines of the History of the English Language*, already referred to; and in Dr Pauli's *Alfred*, of which two translations have been published, the one by Wright (Bentley, 1852), whereof a second edition appeared in the following year; and another by Thorpe (Bohn, 1853). See ENGLISH LANGUAGE.

ANGLO-SAXONS, the collective name given by historians to the various Teutonic or German tribes which settled in England, chiefly in the 5th c., and founded the kingdoms of the Heptarchy. They consisted for the most part of Angles, Saxons, and Jutes. The generally received opinion is, that the

first of these invaders made their appearance in Britain in 449, having Hengest or Hengist, and Horsa or Hors, as their leader. But under the more searching scrutiny of later writers, these famous leaders have evaporated into mythical heroes of romance, common to most of the Germanic nations; and though the fact of a great Germanic invasion in the middle of the 5th c. is not doubted, it is believed that this was by no means the earliest period at which Germanic settlements were effected in England. Long previous to this period, a portion of the coast, extending from Portsmouth to Wells in Norfolk, was known as the *Littus Saxonicum*; but whether in reference to Saxons by whom it was settled, or to roving adventurers of that race by whom it was ravaged, is still a subject of dispute. The former view is advanced, on apparently satisfactory grounds, by Kemble (*Saxons in England*, vol. i. p. 14). But, however this point may stand, the probable truth is, that Britain, which for centuries had been ravaged and partially colonised by Germanic tribes, was finally reduced under their rule, on the departure of the Romans. Of the three tribes mentioned above, the Jutes are believed to have been the first comers. Their original settlements were in what is now the Duchy of Schleswig; and the portions of England of which they possessed themselves were Kent, the Isle of Wight, and the opposite coast of Hampshire. The Saxons, who were the next invaders, settled chiefly in the southern and central parts of England—in Sussex, Essex, Middlesex, the south of Hertford, Surrey, the part of Hampshire not possessed by the Jutes, Berks, Wilts, Dorset, Somerset, Devon, and the portion of Cornwall which did not remain in the possession of its former Celtic inhabitants. The Saxons who invaded England probably belonged chiefly to the portion of that great nation, or confederacy of nations, whose territories lay on the shores of the Baltic—occupying what are now the Duchy of Holstein, the north of Hanover, and the west of Mecklenburg. The third tribe, whose name and nationality afterwards prevailed over the others—the Angles—did not arrive till a somewhat later period. From 527 to 547, they made a succession of descents on the coasts of Suffolk and Norfolk, and latterly, on the country to the north of the Humber, and the southern part of Scotland between the Tweed and the Forth. Eventually, the Angles obtained possession of the whole of England, except the portions already mentioned; that is to say, of all the part to the north of the Avon, on the one side, and the Thames on the other—Essex, Middlesex, and part of Hertford excepted. The union of different hands of these conquerors amongst themselves, with their countrymen who had preceded them, and with the Celtic population which, though conquered, there is no reason to suppose was exterminated, gave rise to the so-called Heptarchy—the kingdoms of Northumbria (originally Bernicia and Deira), Kent, Sussex, Wessex, Essex, East Anglia, and Mercia. The Heptarchy (q. v.) becomes an octarchy, if the provinces of Bernicia and Deira be counted as separate kingdoms; but in place of increasing, it is very doubtful if we ought not to diminish the number of these divisions, it being very questionable if so many as seven states ever possessed, at one time, separate and independent governments. But the propriety of either term becomes still more doubtful if it be understood, as it generally has been, to convey the idea of all these separate kingdoms being bound together in a species of union or confederacy, under one head, called the Bretwalda. The Bretwalda is said to have been a species of war-king, or temporary and elective chief of all the Saxons, whose office it was to lead them forth in their wars against their common enemies, especially the Celts

of Wales and Scotland. Kemble has thrown serious doubts on the existence of the office, and has shewn that the evidence which is adduced in its favour, if not based entirely on 'a piece of vicious philology' (vol. ii. p. 12), is at any rate very slight. Lappenberg, however, than whom there is no higher authority on Anglo-Saxon history, follows pretty nearly the opinions to which Rapin and Sharon Turner had given currency. On the whole, there seems reason to believe that the Bretwaldship never was a permanent and acknowledged supremacy, but a mere accidental and temporary preponderance of one state over the others, and a consequent pre-eminence, for the time being, enjoyed by its sovereign.

The various independent states into which England had till then been divided, were united by Egbert, king of Wessex, in 827, into the one kingdom of England (the land of the Angles). The royal family of Wessex, which was thus raised to what, for the first time, probably, is entitled to be called the kingly dignity, never again lost its supremacy, except, indeed, during the Danish period (1017 to 1042), till the Norman Conquest; and to it Alfred the Great (q. v.) belonged.

The English constitution, the origin of which is sometimes ascribed to Alfred, was not framed by him, though he restored it and improved it after the deliverance of the country from the Danes in 1042. It was essentially the same as that of other Germanic nations, and its germs are to be traced in the account which Tacitus has given of their political institutions; but was more perfectly developed, and continued to flourish in greater purity among the Anglo-Saxons, than in those countries which were more immediately subject to influences proceeding from Rome. At the head of the government was the king (*cyning*, *cyng*, the same word as the German *König*). The kingly office, among the Germanic nations in early times, had reference solely to the tribes or peoples governed, and never to the land which they occupied. During this period, it was naturally elective; but after the idea of great territorial possessions came to be inseparable from it, it became hereditary, though a form of election, or colour of ascertaining the national will, was still retained. The life of the king, like that of every other man, was assessed at a fixed price (*wegegild*, q. v.), which was that of an *atheling*, or person of royal blood, with a sum super-added as the price of his royalty. The first of these sums went to his family, the second, to the people. The king and his dependants possessed other special privileges and protections; one being that 'the dishonour of his maiden serf involved a fine of fifty shillings; while the earl's female cup-bearer was protected only to the amount of twelve, and the earl's to that of six shillings' (Kemble, ii. 33). The king possessed the power of calling together the Witenagemôte (q. v.), and of laying before them propositions for the public weal; but he had not the power of dismissing the assembly when he had enough of its advice, so that in England, from the first, the real centre of power seems to have been in parliament. Neither was the convocation of the Witenagemôte at the option of the sovereign, for there is every reason to believe that his power was all along limited by the necessity of consulting the principal members both of the clergy and laity of the kingdom, and that though he possessed the privilege of presiding in their assemblies, he had no separate legislative function; nor, it would seem, could he impose taxes, or declare peace or war, without their consent. The sons and other near relations of the king constituted an aristocracy of birth, called *ethelings* or *athelings* (the same word with the German *Adel*, noble). Out of the great officers of

the state, or immediate servants of the king, was gradually formed a hereditary aristocracy, closely corresponding to that which subsequently existed in feudal times. Of these, the person next in rank to the king was the *caldorman* or duke (*heretoga*). 'But inasmuch as the dual functions, in the Anglo-Saxon polity, were by no means confined to service in the field, the peculiar title of heretoga is very rarely met with, being for the most part replaced by *caldorman* or *aldorman*, which denotes civil as well as military pre-eminence' (Kemble, *ut sup.* ii. 126). The word is derived from an adjective signifying age, though, in practice, no such meaning attached to it, more than to *senior*, which is the original form of the word *seigneur*. It was to the same class of officials that subsequently the Danish title of *corle* or earl came to be applied. The powers of these officers probably varied in the different kingdoms, whilst they remained separated; but we shall form, on the whole, a pretty accurate conception of the position of the *caldorman*, if we regard him as the governor of the *gā* or shire, the *scirgerifa* or sheriff being his deputy. Much difference of opinion exists as to the rank and position, social and political, of the thane; and all that can be said with confidence is, that, in Anglo-Saxon times, it was not convertible with *caldorman*, or equivalent to baron, as it came to be after the Conquest. The office seems to have implied subordinate landed tenure, similar to that by which the lands of the vassal were held of the lord in feudal times; and thus, whilst the king's thanes were frequently *caldormen*, these, in their turn, had thanes of a lower rank, who appear to have been very numerous. This view is strengthened by the derivation of the term from *thegnian* or *thenian*, to serve, which is the same word as the modern German *dienen*, and from the fact of its being frequently translated *minister* in the Latin charters in Anglo-Saxon times. The whole class of ordinary freemen or commoners, in Anglo-Saxon times, were called *eorls* (a word preserved in the German *Kerl*, and in the Scotch *carle*), and were generally associated under the protection of some person of rank and influence, who was called the *hloford* (whence lord). This, however, was in itself no recognised title, and up to a very late period, the Anglo-Saxon laws knew no other distinction than that of *eorl* and *eorle*. The Britons, who retained some degree of freedom, constituted a lower class, called *wealhans*. The number of slaves (*thow*) was not very great, nor does the character of the servitude imposed on them seem, comparatively speaking, to have been oppressive. Different rights and privileges belonged to the different ranks of the Saxon people, and, as we have already said, a different *veregild* (q. v.), or pecuniary estimation, was fixed for each rank, as the penalty for homicide. The great districts or shires were subdivided into tithings (*teohung*), each containing ten free heads of families, who were held mutually responsible for each other. Ten tithings formed a *hundred*, which had a court subordinate to the court of the shire. In important matters, the *caldorman* of the shire could not decide without the concurrence of an assembly (*Scirgemote*, Assembly of the Shire) of thanes of the shire and representatives of townships, which met half yearly, and corresponded to the *Witenagemote* (Assembly of the Wise), or *Michelgemote* (Assembly of the Great) for the whole kingdom.

Christianity was introduced among the Anglo-Saxons in the end of the 6th, or beginning of the 7th c. by St Augustine, a missionary sent by Pope Gregory I., called the Great. Augustine became the first Archbishop of Canterbury; and before the close of the 7th c., the whole of Saxon or German England

was a Christian country under one metropolitan. Ethelbert, king of Kent, was the first Anglo-Saxon sovereign who embraced the Christian doctrine. Bringing with them the traditions and feelings of the empire, the whole influence of the clergy was thrown into the scale of monarchy, and greatly tended to its consolidation. A Christian church, however, already existed in Scotland and the north of England; and the influence of the Culdees (q. v.) long prevailed against the efforts of the Anglo-Saxon prelates to establish uniformity of worship and complete conformity to Rome. Nor were the Anglo-Saxon clergy themselves in general very submissive to the authority of the popes, who did not succeed in reducing England to complete subjection till after a long struggle. St Dunstan (q. v.) gained for them their final victory in the 10th c. During the time of its comparative independence, the Anglo-Saxon Church was distinguished for the learning and laboriousness of its clergy. Bede (q. v.) is the most eminent author whom it produced. Between his time and that of Alfred, a very great degeneracy had taken place both in the learning and efficiency of the clergy, which that active and enlightened sovereign laboured to restore, not without success. His own remarks on the subject, contained in the introduction to his translation of Gregory's *Regula Pastoris*, will be found in Dr Pauli's excellent *Life and Times of Alfred the Great*, to which the reader is referred for much interesting information regarding Anglo-Saxon times. St Boniface (q. v.) and many other Anglo-Saxon and Scottish missionaries laboured with success in the propagation of Christianity in Germany.

ANGOLA, a name often applied to the whole of the West African coast from Cape Lopez de Gonsalvo in lat. 0° 44' S., to San Felipe de Benguela, in 12° 14' S.; but, in a more restricted sense, the name of a kingdom in Lower Guinea dependent upon Portugal, and extending from the river Coanza on the south, in lat. 9° 20' S., to the Danda on the north, in 8° 20' S. The natives generally call it Donga. The interior is very imperfectly known, and the boundaries uncertain; but along with Benguela, and other presidencies, A. is supposed to contain about 500,000 inhabitants. The country being well watered, is covered with a most luxuriant vegetation. The heat being moderated by the sea-breeze, the orange and other fruits of the warmer temperate climates are produced, as well as those which are strictly tropical. There is a great abundance and variety of wild animals, and the mouths of the rivers swarm with sharks and crocodiles. The principal rivers are the Coanza and Danda. Much of the country is mountainous. The mountains are covered with forests, and are rich in metals, particularly copper, iron, and silver, which, with wax and ivory, are the principal legitimate exports, although the great trade, almost to the present day, has been in slaves. Fetichism is the prevailing superstition, and circumcision is general among the natives. A. might easily be rendered very productive both of sugar and cotton, but the manner in which it has been governed by the Portuguese has not tended to develop its resources. They discovered it in 1486, and have had settlements in it since 1488; but the number of resident Portuguese is very small, and they are almost entirely confined to a few spots—forts and commercial establishments called *feiras* or fairs. The capital is Loando, or San Paulo de Loando (q. v.).

ANGON, a barbed spear used by many early nations. The Franks, in the 7th c., employed angons both for thrusting and hurling. The staves were armed with iron, so as to leave but little of

the wood uncovered; the head had two barbs. When hurled or thrust at an opponent, the head of the A. became fixed in the flesh by means of the barbs. This form of spear was much adopted by the Anglo-Saxon and other Teutonic nations.

ANGORA, the Ancyra of the ancients, a city in the eastern part of the Turkish eyalet of Bozra, in the mountainous interior of Asia Minor, and distant from Constantinople about 220 miles E.S.E. It is said to have been built by Midas, the son of the Phrygian Gordius; was a flourishing city under the Persians; became the capital of the Gallic Tectosages, who settled in Asia Minor about 277 B.C.; was a principal seat of eastern trade under the Romans; and was made the capital of the Roman province of Galatia Prima. It was the seat of one of the early churches of Galatia, and the scene of two Christian councils held respectively in 314 and 358. A decisive battle between the Turks and Tatars was fought near A. in 1402, in which Timur defeated and took prisoner the sultan Bajazet I. A temple of white marble was erected by the citizens of Ancyra to the Emperor Augustus, who had greatly beautified the city, and his deeds were recorded in inscriptions upon a number of tablets and the columns of an altar. These inscriptions, the *Monumentum Ancyranum*, discovered by Busberg in 1533, are important for the elucidation of ancient history. They were first printed in Schott's edition of Aurelius Victor (Antw. 1579), and have recently been edited with notes by Franz and Zumpt (Berl. 1845). The present A. is said to contain not more than 20,000 inhabitants, of whom one-third are Armenians. It is famous for its breed

yields an average of less than ten inches to the mile. In fact, the bottom of the river in front of the town is lower than the surface of the sea, for, even in the lowest state of the water, it is said to be 200 feet deep, with a margin for floods to the amount of fifty or sixty feet more. Under these circumstances, the bed of the stream must be about 250 feet under the level of the city, or about 60 feet under the level of the sea. When the river does rise to its highest, there are at least portions of the city inundated; and instances are believed to have occurred in which careless people were devoured by alligators in the very streets. Chiefly, as is supposed, through the free access of the trade-winds over the flat surface of the country, A. enjoys, in proportion to its latitude, a singularly temperate climate. Even in the hottest season of the year, the thermometer is said seldom to shew more than 86° F.; while, between the beginning of November and the end of April, it ranges from 77° by day to 69° by night.

The situation of A. is highly favourable, in a commercial view. The basin of the Orinoco, which lies nearly all above the town, and is estimated to contain 250,000 square miles, or more than twice the area of the British Isles, is particularly rich towards the north. On that side it reaches very nearly to the coast-line, so as to comprise some of the best parts of Venezuela. Towards the south, again, it consists, in a great measure, of boundless plains, traversed by countless herds of cattle. Over the whole of this vast basin, and that almost equally in both directions, the main stream and its affluents are, with hardly any interruptions, navigable to near the foot of the mountains. Owing to the impetuosity of the currents and the obstruction of shoals, sailing-vessels are said to take fifteen days to sail up to A.; but with steam-navigation these impediments would in great measure disappear.

With such advantages of position, A. was a flourishing mart before the commencement of the war of independence; but the civil broils materially interfered with its prosperity. As far back as 1807, A. had 8500 inhabitants; ere twenty years elapsed, the population had been reduced to little more than a third part of the number. According to later information, however, it was rapidly approaching its former amount.

ANGOSTURA BARK, or ANGUSTURA BARK, the aromatic bitter bark of certain trees of the natural order *Rubiaceæ*, and tribe *Cuspariæ*, natives of the tropical parts of South America. It derives its name from the town of Angostura, where it is a considerable article of commerce. It was first brought to England in 1788. It is used in medicine as a remedy for weakness of digestion, diarrhœa, dysentery, and fevers. It is tonic and stimulant. The most important of the trees producing it is the *Galipea officinalis*, which grows upon the mountains of Columbia and near the Orinoco. It is a tree of 12—20 feet high, and 3—5 feet in diameter, having a gray bark, trifoliate leaves, with oblong leaflets about ten inches long, which, when fresh, have the odour of tobacco, and flowers about an inch long, in racemes, white, hairy, and fragrant. The bark contains a chemical substance not yet sufficiently examined, called *Angosturin*, *Cusparin*, or *Galipein*, to which its medicinal efficacy is ascribed. It is supposed that a variety of A. B. is produced by *Galipea Cusparia* (called by some *Bonplandia trifoliata*), a majestic tree of 60—80 feet in height, with fragrant trifoliate leaves more than two feet long. A. B. is believed to be one of the most valuable of febrifuges; but its use is at present very limited, and has, indeed, in some countries of Europe, been prohibited, in consequence

Angora Goats.

of goats, with beautiful silky hair, eight inches long. Of this goat-hair, a kind of yarn is made, known as *Turkish yarn* or *camel yarn*, and of which also a manufacture of *camlets* is extensively carried on in A. itself. The name camel yarn has led to mistakes; it has no reference to the camel, but is derived from the Arabic word *chamal*, fine. Of the skin of the A. goat, the fine Oriental Morocco leather is made. Many of the animals in this region are characterised by the length and softness of their hair, especially the dogs, rabbits, cats, &c. This peculiarity seems to depend upon the climate, and soon disappears in Europe.

ANGOSTURA, a seaport town of Venezuela, in lat. 8° S' N., and long. 63° 55' W., on the right bank of the Orinoco, about 240 miles from its mouth. It takes its name, which signifies a strait, from its being built at a point where, on both sides, the river is narrowed by rocks to a width of 3134 feet, after having measured three miles across at thrice the distance from the sea. The site of A. is only 191 feet above the sea-level—an elevation which, on the intermediate distance as above,

of its frequent adulteration with the poisonous bark of the *Strychnos Nux Tomica*, or the substitution of that bark for it. This poisonous bark is sometimes called *Palse A. B.* It differs from the true *A. B.* in having no smell, in its much greater weight and compactness, in its inner surface being incapable of separation into small laminae, and in the effects which are produced upon it by acids and other tests, particularly in its outer crust being rendered dark-green, or blackish, by nitric acid, whilst that of the true *A. B.* is rendered slightly orange-red.

ANGOULEME, the capital of the department of Charente in France, and formerly of the province of Angoumois. It is situated on the Charente, and has narrow and crooked streets, a number of paper-mills, manufactures of woollen stuffs, linen, and earthenware, &c., and a population of about 20,300. It possesses a royal college, a museum of natural history, and several other useful institutions. In the centre of the town stands the remnant of the ancient castle of A., in which was born the celebrated Marguerite of Navarre, the authoress of the *Heptameron*, and other works. The railway from Paris to Bordeaux passes through it. Much saffron and wine are produced in the neighbourhood. The province of Angoumois was in early times a county; but the heir of it, in the beginning of the 14th c., being an adherent of the English, Philip the Fair took possession of it, and it became an apanage of younger branches of the royal family. It was made a duchy by Francis I., and was sometimes bestowed upon natural sons of the French kings. Charles de Valois, Duke of A., a natural son of Charles IX., was a distinguished general in the reigns of Henry IV. and Louis XIII.

ANGOULEME, LOUIS ANTOINE DE BOURBON, Duc D', the eldest son of Charles X. of France, and Dauphin during his father's reign, was born at Versailles on 6th August 1775. He retired from France along with his father at the commencement of the Revolution, and spent some time in military studies at Turin. In August 1792 he entered Germany at the head of a body of French emigrants; but the ill success of the campaign, and his own unfitness for military command, led to his seeking tranquillity along with his father at Edinburgh. Till 1814 he continued an exile from France, wandering from one place to another on the continent, and latterly resident with the other members of his family in England. On the entrance of the allies into France, he appeared at the British head-quarters at St. Jean de Luz, and thence issued a proclamation to the French army. He entered Bordeaux under protection of the British on 12th March, and made liberal promises in the name of his uncle, Louis XVIII., among which was that of complete religious liberty. He was again in the south when Napoleon returned from Elba. He was appointed lieutenant-general of the kingdom, and hastened with such forces as he could collect to oppose the emperor; but although he obtained some advantages at first, he was soon deserted by his troops, was for some days detained a prisoner, and at last sent away in a Swedish merchant-vessel to Barcelona. After the second restoration, he was sent by Louis XVIII. to the southern provinces to repress the political and religious movements there; and in 1823 he led the French army into Spain, to put an end to the constitution. A man of phlegmatic disposition and mean abilities, he was, in all political matters, a tool of the ultra-royalists and the priests. When the revolution took place in July 1830, he signed, along with his father, an abdication in favour of his nephew, the Duc de Bordeaux; and when the Chambers declared the family of Charles X. to have forfeited the throne, he

accompanied him into exile to Holyrood, to Prague, and to Görz, where he died, 3d June 1844.

ANGOULEME, MARIE-TIERESE-CHARLOTTE, Duchesse D', the daughter of Louis XVI., was born at Versailles on 19th December 1778, and early displayed much quickness of intelligence and energy of character, with the most tender sympathy in the distresses of others. Having passed through the horrors of the Revolution, and endured a long imprisonment, she was exchanged, on 25th December 1795, for some French prisoners in the hands of the Austrians, and lived at Vienna till her marriage, in 1799, with her cousin, the Duc d'Angoulême, whose subsequent fortunes she shared. She survived him seven years, and died on 19th October 1851.

ANGRA, the capital of the Azores, a seaport at the head of a deep bay on the south coast of the island of Terceira, lat. 38° 38' N., long. 27° 14' W. It is a station for ships between Portugal and Brazil and the East Indies; but the harbour is very much exposed. It is the seat of the Portuguese governor-general of the Azores and of the bishop; is well built, but dirty; strongly fortified, and protected by a citadel at the foot of the Monte de Brazil; contains a military college and arsenal, several scientific and literary societies, a cathedral and numerous churches; and from 10,000 to 15,000 inhabitants. There is a considerable export of wine, cheese, honey, and flax. This city furnished an asylum for the Portuguese regency from 1830 till the taking of Oporto, in 1833, by Don Pedro.

ANGUILLA. See EEL.

ANGUILLA, or **LITTLE SNAKE**, one of the West India islands, so called, perhaps, from its long and narrow figure. Next to Anegada, it is the most northerly of the Lesser Antilles, lying almost due east of the eastern extremity of Porto Rico, in lat. 18½° N., and in long. 63°—64° W. It belongs to England, having an area of 35 square miles, and a population of about 3000. It is low and wooded; but its cleared spots produce cotton, tobacco, and sugar. Its harbour, such as it is, is beset with reefs; but there is said to be good anchoring-ground in the channel between A. and the Isle of St Martin to the south.

ANGUIS. See BLIND-WORM.

ANHALT, one of the oldest principalities of Germany, situated on the Elbe, the Mulde, and the Saale, and consisting at present of three duchies—A.-Dessau, A.-Bernburg, and A.-Köthen, which, together, contain about 1034 square miles, and 156,700 inhabitants. It is almost entirely surrounded by the Prussian territories, which also intermix with it, and divide it into portions. Dessau, Zerbst, Bernburg, and Köthen are the principal towns. The country is mostly level and fertile, producing wheat, flax, rape-seed, hops, and tobacco. Wine is produced on the Saale. Agriculture is the chief employment of the people, who are generally Protestants. Part of the duchy of A.-Bernburg approaching the Harz Mountains possesses some mineral wealth in iron and other mines. A. began to be an independent principality in the first half of the 13th c. It has been repeatedly, in the course of its history, divided amongst branches of the reigning family. The present division dates from the beginning of the 17th c. It was divided originally into four parts, but the line of A.-Zerbst has become extinct. The three duchies are independent of each other; but a family compact connects the reigning lines, and in many things they have been accustomed to act together. Some of the princes of A. have been

eminent in the political, military, and ecclesiastical history of Germany.

ANHYDRITE, a mineral, consisting of anhydrous sulphate of lime, with some slight addition of sea-salt, appears in several varieties, as, 1. Granular; found in concretions with a foliated structure: 2. Fibrous; easily broken with a fracture in delicate parallel fibres: 3. Radiated; translucent: 4. Sparry, or Cube Spar: 5. Compact, of various shades, white, blue, gray, red. A. is converted into gypsum by combination with a certain proportion of water, and, where it is found in large masses, as on the south of the Harz Mountains near Osterode, the surface consists of gypsum. For building, A. has no great value, on account of its tendency to this change; but some of its varieties, especially the Siliceiferous or Vulpenite, found at Vulpiano, in Upper Italy, are used for sculptures, and take a fine polish. When burned and reduced to powder, it is used as a manure, resembling gypsum in its effects.

ANHYDROUS is the term applied to a chemical substance free from water. Thus, ordinary lime-shell as it comes from the kiln is simply lime (CaO) without any water, and is called *anhydrous* lime; but when water is thrown upon the lime-shell, the liquid disappears by combination with the lime, which very much increases in volume and becomes *hydrated* lime (CaO.HO). Again, ordinary stucco, before being used by the modeller, contains only lime and sulphuric acid (CaOSO₄), with no water, and is therefore anhydrous; but when water is added, and the stucco sets into its mould, it combines with two equivalents of water, and becomes hydrated stucco (2HO,CaOSO₄). Examples of A. substances are also found amongst liquids; thus, alcohol free from water is called A. Alcohol; and in like manner we speak of A. Acetic Acid, A. Nitric Acid, &c.

ANIMA, Cox, in Music; with animation, in a spirited manner.

ANIMA MUNDI literally signifies 'the soul of the world.' The doctrine contained in this phrase was a favourite one with the early philosophers, who conceived that there resided in nature a force immaterial, yet not intelligential, which was the source of all physical and sentient life. Plato held it impossible for pure spirit—the atmosphere in which alone eternal and archetypal ideas could exist—to bear any relation whatever to matter, and he therefore supposed the latter to be operated upon by an inferior agency, the *A. M.* In the system of the Stoics, the *A. M.* was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from Pantheism (q. v.). The notion does not seem to have been entertained by the schoolmen, but it reappears in the writings of Cornelius Agrippa, Paracelsus, and Van Helmont, and, in a modified form, was held by More, Cudworth, and others.

ANIMAL AND ANIMAL KINGDOM. According to a very old classification, all bodies are divided into three kingdoms—the mineral, the vegetable, and the animal. Animals and vegetables are again classed together as *organic*, in opposition to minerals, which are *inorganic*. Mineral bodies are masses of matter without internal movement, increasing by additions from without, having, with the exception of crystals, no determinate form or size, homogeneous throughout, and without relation of one part to another. Animals and plants, on the contrary, exist as individual beings, consisting of various organs. Their existence has a beginning and an end, and at their death they are replaced by other similar beings developed out of them.

The distinction between animals and plants strikes

us at once in the higher classes; but among the lower organisms there are beings which have been at times classed among animals, at times among plants. The marks of animality which, with very few exceptions, have as yet been found to exist in all animals, are spontaneous motion, the existence of a special digesting apparatus (it may be only a mouth and a stomach), and sensation by means of nerves. The prevalence of nitrogen as a chemical ingredient, is another general characteristic of animals, while carbon prevails in plants. Most animals, though not all, possess the faculty of *loco-motion* (q. v.); it is wanting in some, as the oyster and polype. This locomotion is generally effected by appropriate organs, which are very different in the different classes of animals, as legs, wings, fins, suckers, cilia, &c., sometimes merely by muscular dilatations and contractions. In the higher animals, it is connected with a special system of bones and muscles, which becomes less and less prominent as we descend in the scale, and at last disappears.

Nutrition is effected by swallowing and digesting organic matter by means of a mouth, stomach, and intestinal canal. A part of the food—the *chyle*, namely, which results from digestion—is taken up by a system of vessels into the body of the animal, and thrown into the blood, into which, under the action of the air in the lungs or gills, it is converted; the other part is excreted by a second orifice, except in some of the lowest forms where the mouth forms the exit. For keeping up a circulation of the blood, which must be brought to all parts of the body for the purpose of nourishment, there is provided a system of blood-vessels and, in the higher classes, a heart. See **HEART**. Nutrition may, to some extent, take place also by absorption from the external surface; but this is not considerable except, perhaps, among the lowest classes of animals. The substances that serve for the nutrition of an animal are either vegetable or animal, and the mouth and other organs are adapted accordingly. The number of omnivorous animals is small, and among these, man has the greatest latitude of choice.

Propagation or reproduction takes place in a great variety of ways: among the lowest forms, by division, gemmation or budding, and cell-germs; among the more perfect, by generation between two individuals of different sex. Of the two sexes, the male is generally distinguished by superior size and strength, more brilliant colouring, larger appendages, and often stronger voice. Besides male and female, there are among some animals (bees and ants) neuters. In some of the lower kinds, the individuals are hermaphrodite. See **REPRODUCTION**.

All animals develop gradually, and most of them go through one or more changes of form or metamorphoses. This is most marked among insects which go through the four stages of egg, larva, pupa, and perfect insect. The class of reptiles with naked skins also go through changes, though less striking. In the higher animals, these transitions through a series of forms take place in the ovum, or before birth. In some cases, the embryo comes to maturity after the exclusion of the ovum (birds and amphibia); in others (mammalia), within the body of the mother: animals of the last kind are called viviparous. The reproduction of some intestinal worms is peculiar; the egg of the mother-animal produces a sexless creature—a nurse—the eggs laid by which reproduce the original animal. A somewhat similar peculiarity is observed in some insects, as Aphides. See **ARHUS**.

The life of animals is dependent on many conditions. Among these rank warmth, atmospheric air, and moisture, along with sufficient nourishment.

Light also is essential to many, though most of the colourless animals of the lower classes can dispense with it. With regard to outward pressure, the limits are wide, as is seen in the condor soaring to a height of 20,000 feet, and the whale descending to a depth of 1000 feet below the surface of the sea. But individual animals are confined to much narrower limits; often to one circumscribed range of climate, one species of food, one medium. To go beyond those limits, though it does not always occasion death, yet gives rise to various degrees of degeneracy, from which even man with all his powers of adaptation is not exempt.

Most animals give more or less strong indications of mind; in those high in the scale, this mental life rises to intellect capable of cultivation, while, in the lower classes, it appears as instinct confined to a few operations. For communicating with the outer world, vertebrated animals are provided with a nervous system in connection with a central brain—a *cerebral* nervous system; the *ganglionic* nervous system of the lower animals seems to serve this purpose less and less as we descend in the scale. The impressions from without are received immediately by the organs of sense, which become more numerous and complex the higher the animal stands in the scale; among the highest, five senses are usually distinguished, which are variously developed in different species—in none so harmoniously as in man.

Nocturnal sleep, being the means of gathering strength for the activity of the waking hours, stands in intimate relation to that activity, and therefore is wanting in beings low in the scale. Winter sleep, or hibernation (q. v.), serves many animals instead of migration, to enable them to outlive the cold and hunger of winter. Analogous is the summer sleep of serpents and crocodiles, which lie buried in the dry mud during the summer droughts of the tropics.

Of the other vital manifestations of animals may be mentioned, the faculty of giving *light* (glowworm, meduse), and that of developing *electricity*, both possessed only by a few; also *voice*, belonging almost exclusively to vertebrate animals, and of them chiefly to the warm-blooded.

A very remarkable peculiarity occurs in some of the lowest kinds of animals, in what may be termed a composite life; individuals which separately manifest many of the powers of life, being united in part of their frame, many of them together into one living mass. Of this, examples are numerous among the Zoophytes (q. v.), some of which have already been noticed in the article ALEXONIUM.

Apart from the transforming and modifying influence of man, the animals and plants of a district—its *fauna* and *flora*—give it life and character. To man himself, animals stand in a variety of relations of the highest importance. Some are directly useful to him for labour, food, the chase, &c.; others hurtful, as destroyers of vegetation, as beasts of prey, as vermin, or by their poisons.—The number of known species of animals amounts at present to about 130,000. To describe and classify these on scientific principles, is the object of Zoology (q. v.).

ANIMAL CHEMISTRY. The object of researches into the chemical nature of animal substances is twofold: First, to classify the proximate or immediate component ingredients of the animal body, study their properties, their mutual relations and metamorphoses, and the ultimate elements of which they are composed; second, to investigate the processes that go on during the elaboration and assimilation of new materials, and the wearing out and excretion of old—processes that, taken together, constitute nutrition, or the vegetative side of animal life. Without a pretty complete knowledge of the first part, no successful researches can be made in

the second; and it is chiefly owing to the great progress that has been made within the last thirty years in the knowledge of the chemical properties of the animal compounds containing nitrogen, that we owe the recent advance in our knowledge of the chemical processes of life. That advance is not the less decided that we are still far from a complete understanding of them. The general laws of chemistry are now traced into the province of organic nature much further than formerly, and the abrupt partition between the two is removed. It is still acknowledged that these laws operate differently within the sphere of organic life, from what they do without; but instead of resting contented with saying, that owing to the vital force this could not be otherwise, the aim is now to trace the why and wherefore of this modified action as far as possible.

In the animal body, two classes of substances may be distinguished: those that properly compose the body, and those that are on the way either into it or out of it. The former, or actual components of the body, are, again, of two kinds: 1. Substances that compose the actual tissues of the organs, and in which the vital functions seem properly to inhere; the substances, namely, of muscle, of nerve, of brain, of membranes, sinews, and the organic part of the bones. All these agree in consisting chiefly of carbon, hydrogen, nitrogen, and oxygen, with usually minute proportions of sulphur and phosphorus. But in respect of their mode of composition, they fall into two classes—those that yield gelatine on boiling, and those that do not. To the former belong the substance of the cartilages, bones, sinews, and skin; to the latter, the fibrin of the muscles and of the blood corpuscles, the albumen of the nerves and blood, the caseine of milk, &c. These last are the so-called compounds of proteine (q. v.). In the living tissues, all these matters are combined with about 90 per cent. of water. 2. Besides the above, which are the real animalised or vital substances, the animal body contains substances which are merely deposited in the cells and interstices of the former for imparting colour, solidity, elasticity, &c. Of this kind are fat, the earthy matter of the bones, pigment, &c. Whether the minute quantities of common salt and of phosphates that are found in all parts of animals essentially belong to the constitution of the substance they are associated with, is not yet made out, but it is extremely probable they do; at all events, they play a very important part.

The substances that are on their way into and out of the body, form on the one hand the contents of the digestive organs, and on the other those of the organs of excretion. The vascular system forms the means of communication between both and the substance of the body, and the blood is the carrier of all that enters that substance or leaves it. In the digestive organs, accordingly, we find, along with the unaltered materials of the food, the various products of their digestion, and at last the useless refuse, not absorbable by the vascular system, and the various fluids—some acid, some alkaline—added to the food to effect its digestion, such as the saliva, gastric juice, and bile.

The matters prepared in the digestive organs for being taken up into the blood, either enter the venous system directly, or get there by first going through the lymphatic system. This last contains a fluid which is chemically very like the blood, but colourless—the chyle, namely. This fluid and the blood contain the so-called proteine compounds derived from the food, partly in solution, and partly solid in the blood corpuscles. Arterial blood contains, besides, all those salts and other substances that must be supplied for the nourishment of the

various organs. The venous system, again, which brings back the blood from the different parts to the central organs, is laden with all the matters that are no longer of use, and must therefore be carried to the chief excretory organs—the skin, liver, and kidneys. The dark colour of venous blood indicates that its components have undergone a change. But all blood that is on its way both to and from the parts of the body, before it can impart nourishment, must pass through the lungs, an organ in which it is brought into extensive contact with atmospheric air, and undergoes a process of oxidation, producing the following palpable results: The disappearance of a portion of the inhaled oxygen, and the substitution of water and carbonic acid in its place; the transformation of the dark venous blood and of the chyle into red arterial blood; lastly, the development of heat. Breathing, then, contributes to nutrition by making the blood fit for that purpose; it is an excretory process, inasmuch as it burns out useless matters and separates them in the form of gases; and at the same time it produces heat, without which life could not go on.

Sweat, urine, bile, and emanations from the skin and lungs, contain only products of the decomposition of effete animal substances; many of these products are highly interesting in a chemical point of view, especially urea, uric acid, and bile. It is clear, then, that comparative investigation of the blood in its different states, of the excretions and secretions, can alone give any knowledge of the condition of the vegetative side of the organism; and, accordingly, this kind of investigation has in recent times become of the highest importance for pathology and diagnosis. See Liebig's famous work on *A. C.*, translated by Gregory, and the excellent *Lehrbuch der Physiologischen Chemie* (3d ed., Leip. 1854), by Lehmann.

ANIMAL FLOWER. See ACTINIA, and ANEMONE (SEA).

ANIMAL HEAT is the warmth generated in animal bodies by certain of the changes constantly taking place within them. A certain amount of heat is necessary to the proper performance of the vital functions, and any material increase or decrease of it from the healthy standard, endangers animal life. The temperature thus necessary for the life of the animal is maintained by the action of that life itself. The air and other objects surrounding the animal body being in almost all cases colder than it, are constantly stealing part of its warmth; but within the system there are processes incessantly going on which produce fresh heat. When the heat thus generated is not dissipated fast enough, so that the body tends to become warmer than the due degree, the accumulation finds vent in perspiration, the evaporation of which carries off the excess. The power of producing heat is in relation to the climate in which the animal is accustomed to live. It is weaker in warm climates than in cold, and consequently when an animal is removed from a warm to a cold climate, it frequently pines and dies. In most fish and reptiles, commonly termed '*cold-blooded animals*,' the temperature differs but little from that of the water or air in which they live; the same is the case with hibernating animals during the latter part of their torpid condition, and with the larva and pupa of insects. There are exceptions, however; the thunny, shark, and bonito, among fishes, for instance, maintain within themselves a temperature several degrees higher than the water they live in.

Man has the power, to a greater degree than other warm blooded animals, of adapting himself to changes of surrounding temperature, especially in temperate

but changeable climates such as that of Great Britain. His average standard of heat is from 98° to 100°, varying with circumstances, being higher after exercise or a hearty meal, and at noonday than at midnight. It also varies in diseased conditions of the body, rising to 106° in a fever, and falling as low as 77° in cholera. But if the body be in a healthy condition, the standard of heat is maintained, even when the person is exposed to such intense heat as are men attending furnaces; one can for a short time be exposed to 350° of heat without materially raising the temperature of his own body, although he will lose weight by the copious perspiration necessary for the evaporation. Chabert, who exhibited under the sobriquet of 'the Fire-king,' could enter a furnace heated to 500° or 600°. Yet we know from experiment that an elevation of the temperature of his body even a few degrees, would have endangered, and perhaps destroyed his life.

Throughout the animal kingdom, the power of generating heat bears a close relation to the activity or sluggishness of the animal. Thus, birds, which are perpetually in action, have the highest temperature (100°—112°); and the swallow and quick-flighted birds, higher than the fowls which keep to the ground; and among insects, the hive-bees and butterflies—so perpetually on the wing—than those which crawl, as some of the beetles. The higher the standard of A. H., the less able is the animal to bear a reduction of its temperature; if that of a bird or mammal be reduced 30°, the vital changes become slower, more languid, and death ensues. Fish, on the other hand, may be enclosed in ice, and yet survive.

This heat is also necessary to development; eggs require warmth during incubation: the oviduct of the viper or the serpent is of a higher temperature than the rest of the body.

As before mentioned, the source of A. H. is in the vital processes going on within the body; but as to the exact mode in which it is engendered, opinions are very much divided. It is usually held to arise from chemical action; from the species of combustion that takes place in the union of the oxygen of the atmosphere with the carbon and hydrogen of the body. That heat must result from this union there is no doubt, nor is it less certain that the proportions of carbonic acid and of heat evolved at the same time are in close relation. The source of the carbon thus burned is still doubtful, though it must be partly derived from the tissues and the non-azotised portions of the food. But the amount of carbonic acid evolved by an animal in a given time is not sufficient to account for the amount of heat evolved; therefore, though the combustion of carbon may be the chief source of A. H., there are probably others, as the hydrogen uniting with the oxygen of the atmosphere, and the changes of the sulphur and phosphorus of the food into their acids. See RESPIRATION and DIGESTION.

ANIMAL MAGNETISM or MESMERISM is a supposed influence or emanation by means of which one person can act upon another, producing wonderful effects upon his body, and controlling his actions and thoughts. It was fancied to have some analogy to the magnetism of the loadstone, and hence its name. The term has been used to group together a multitude of manifestations deemed of a wonderful kind, and which have given rise to an amount of delusion and credulity hardly exemplified on any other subject. Electro-biology, Odyssim, Table-turning, Spirit-rapping, Table-talking, Spiritualism, have been classed as only modifications of the same phenomena. The art of inducing the magnetic state, as practised by its discoverer, Mesmer, involved the use of apparatus—the *baquet* or magnetic tub, iron rods, &c.; but the more common means have been

passes made by the hands of the magnetiser from the head of the 'subject' or patient downward, or simply making him fix his eyes on the operator. He then generally feels a creeping sensation stealing over the surface, and shortly falls into the mesmeric sleep—a state more or less resembling somnambulism. About one person in ten is found capable of being thus affected, to a greater or less extent. While in this state, the functions of the body are liable to be much affected; the pulsations of the heart and the respiration are quickened or retarded, and the secretions altered, and that chiefly at the will of the operator; at his direction, the limbs are made rigid, or become endowed with unnatural strength; one liquid tastes as any other, and is hot or cold, sweet or bitter, as the subject is told; in short, every thought, sensation, and movement of the subject obeys the behest of the mesmeriser. According to the mesmeric theory, the nervous energy of the operator has overpowered that of the subject, as a powerful magnet does a weak one, and the two are in *rapport*, as it is termed. In some cases, the mesmeric trance assumes the form of *clairvoyance*. See SOMNAMBULISM.

It has been clearly established, however, that the notion of a force of any kind whatever proceeding in such cases from a person or from a magnetising apparatus, is a delusion. The effects, whatever they are, must have their cause somewhere else. Where it is to be looked for was indicated, though not followed up, as early as 1785, in the report of the commissioners, one of whom was Franklin, appointed by the king of France to examine the pretensions of Mesmer. They report that 'on blindfolding those who seemed to be most susceptible to the influence (of this agent), all its ordinary effects were produced when nothing was done to them but when they imagined they were magnetised, while none of its effects were produced when they were really magnetised, but imagined nothing was done; that when brought under a magnetised tree (one of Mesmer's modes of operating), nothing happened if the subjects of the experiment thought they were at a distance from the tree, while they were immediately thrown into convulsions if they believed they were near the tree, although really at a distance from it; and that, consequently, *the effects actually produced were produced purely by the imagination.*'

But this part of the science of human nature—the reflex action of the mental upon the physical—had not then been sufficiently studied, and is not now widely enough known to render the conclusion of the reporters a satisfactory explanation of the phenomena; and the fallacies of mesmerism, though subjected since to many similar exposures (Dr Falkoner of Bath, e. g., annihilated the Patent Metallic Tractors of Perkin, by making wooden ones exactly like them, which produced exactly the same effects), have constantly revived in some shape or other. One chief cause of the inveteracy of the delusion is, that the opponents of mesmerism do not distinguish between denying the theory of the mesmerists and the facts which that theory pretends to explain; and have been too ready to ascribe the whole to delusion and fraud. It thus happens that the most sceptical often become all of a sudden the most credulous. Finding that things do actually happen which they cannot explain, and had been accustomed to denounce as impostures, they rush to the other extreme, and embrace not only the facts but the theory, and call this, too, believing the evidence of their senses. Now, the reality of the greater part of the manifestations appealed to by the mesmerist must be admitted, though we deny his explanation of them; and even where their reality must be denied, it does not follow that the mesmerist is not sincere

in believing them; there is only greater room than in any other case for suspecting that he has deceived himself.

The first to give a really scientific direction to the investigation of appearances of this class was Mr Braid, a surgeon in Manchester (see HYPNOTISM), who detaches them altogether from the semblance of power exerted by one individual over another, or by metallic discs or magnets, and traces the whole to the brain of the subject, acted on by *suggestion*, a principle long known to psychologists, though never made so prominent as it ought to be. The subject has since been ably handled in a paper in the *Quarterly Review* for September 1853 (said to be by Dr Carpenter). The reviewer traces the operation of this principle through the most ordinary actions, which no one thinks wonderful, up to the most miraculous of the so-called 'spiritual' manifestations.

Ideas become associated in our minds by habit or otherwise, and one being awakened brings on another, thus forming a train of thought; this is *internal suggestion*. But impressions from without originate and modify these trains, constituting *external suggestion*. While awake and in a normal condition, the *will* interferes with and directs these trains of thought, selecting some ideas to be dwelt upon, and comparing them with others and with present impressions. A comparative inactivity of this selecting and comparing faculty, leaving the flow of ideas to its spontaneous activity, produces the state of mind called *reverie* or *abstraction*. In dreaming and somnambulism, the will and judgment seem completely suspended; and under its internal suggestions the mind becomes a mere automaton, while external suggestions, if they act at all, act as upon a machine. These are well-known facts of the human constitution, and independent of mesmerism, though their bearing upon it is obvious.

Another fact of like bearing is, the effect of concentrated attention on any object of thought in intensifying the impression received. This may proceed so far, in morbid states of the nervous system, that an idea or revived sensation assumes the vividness of a present impression, and overpowers the evidence of the senses. Ideas thus become *dominant*, overriding the impressions of the outer world, and carrying themselves out into action independently of the will, and even *without the consciousness* of the individual. These dominant ideas play a greater part in human actions and beliefs than most are aware of. 'Expectant attention' acts powerfully on the bodily organs, and often makes the individual see and hear what he expects to see and hear, and, without his consciousness, moves his muscles to bring it about. These, too, are recognised facts in the sciences of physiology and psychology (see Carpenter's *Human Physiology* and Dr Holland's *Chapters on Mental Physiology*).

These principles enable us to bring together and explain a whole class of phenomena, reverie, dreaming, somnambulism, the inspiration of the Delphic priestess, religious ecstasies, the physical excitement attendant on 'revivals' and 'camp-meetings,' belief in witchcraft, possession, and mania, individual and epidemic. And it is now held that the manifestations of mesmerism, electro-biology, &c., belong to the same class, and are to be accounted for in the same way.

The mesmeric state is produced by a steady gaze at some fixed object. There is no peculiar virtue in the eyes of the mesmerist or in a metallic disc, for a spot on the wall will produce the effect. The thing requisite is a monotonous and sustained concentration of the subject's will, producing weariness and vacancy of mind; and this resembles the condition

that induces reverie and sleep, and leaves the mind open to any suggestion, and at the command of any idea that may be made to possess him. But that he is governed by *his own ideas*, and not by the *will* of the mesmeriser, is clear. *No wish of the mesmeriser, or of any other person, was ever known to affect the 'subject' until it was conveyed to him by voice or otherwise*; while an idea suggested by putting his body in a certain posture, or by an accidental touch, has the same effect as a command. If he seems more subject to the will of the mesmeriser than of any one else, it is because he was previously impressed with that idea, and is therefore more awake to his suggestions. It is thus that the operator is enabled to play upon him as an instrument; to make him taste, feel, think, and act, and lose and recover memory, the power over his limbs, or even his own identity, as the operator dictates. We must content ourselves with thus indicating the principle of explanation, leaving to the reader to apply it in detail.

The manifestations connected with table-turning, such of them as are genuine, are explained by the operation of *expectant attention*. A number of individuals sit round a table with their hands resting upon it, having the idea in their minds that it will or may move, the *direction* of the expected movement being also agreed upon. Accordingly, if none of the party are very sceptical, it generally does move after a time, all declaring, and in perfect good faith, that they did not press. And yet it has been proved by a contrivance of Faraday, that there always is pressure, though without the will or consciousness of the performers; and this is only what is to be looked for from the involuntary effects of a dominant idea. This explanation does not suffice for many of the wonders *related* by believers to have happened. But all such are to be received with suspicion, and that without accusing the relaters of bad faith. The very disposition to look for something out of the usual course of nature makes them incapable, for the time, of distinguishing what actually happens from what they expect to happen. The mysterious indications of the divining-rod, and of an oscillating body, such as a ring, suspended from the finger, are all to be accounted for in a similar way: they result from unintentional muscular movement.

In spirit-rapping, a 'medium' puts, somehow, the questioner into communication with any departed spirit he may wish to consult, and the answer is given by raps, supposed to be made by the spirit. The questioner runs a pencil over the letters of the alphabet, and the raps are given as the pencil comes to the successive letters forming the words of the answer. Many of the 'media' in this species of 'spiritual' manifestation have been proved to be impostors, though it is not necessary to suppose that they are so in all cases; they may be imposing upon themselves, as witches did of old. There is no doubt, however, that the wonderful revelations they sometimes made of things known only to the questioner, arose from involuntary indications made by the latter—by his pausing, without knowing it, at the letters of the expected answer. A variation on the mode of communicating with the world of spirits, consists in putting the questions to a table, which is manipulated, as in table-turning, and gives its answers by rapping with one of its feet, or by rocking, as may be agreed upon. The agency of the *expectant ideas* of the performers in these cases is apparent in their own narratives. Would it not otherwise be strange that spirits should reveal heaven to Robert Owen as organised on his own social theory, while a Protestant clergyman finds the world of spirits pervaded by a horror of the pope (Rev. E. Gillson, *Table-talking*), and to pious Scotch Presbyterians

every revelation regarding it is completely in accordance with Calvinistic theology.

Such are the views of those who, in regard to this matter, may be denominated the 'rationalist' party. But there is a large class of intelligent persons who hold the explanations above given to be insufficient. After making every allowance for deception, whether intentional or unintentional, they find many undoubted facts remaining which are quite beyond the scope of suggestion, dominant ideas, or any other of the usually received theories, physical or psychological. Phenomena of the character in question are, therefore, still the subject of earnest investigation on the part of many both in Great Britain and America.

ANIMALCULE, a term etymologically applicable to any very small animal, and limited in actual use to those which are microscopical. Animalcules exist in prodigious numbers, and of many different kinds, their size being such that multitudes of them find ample space for all the movements of an active life within a single drop of water; and they abound almost wherever there is moisture, at least wherever organic matter is present. The *Monas crepusculus* of Ehrenberg is only 1-2000th part of a line, or 1-24,000th part of an inch in diameter. 'Take any drop of water from the stagnant pools around us,' says Professor Rymer Jones, 'from our rivers, from our lakes, or from the vast ocean itself, and

Various forms of Animalcules.

place it under the microscope; you will find therein countless living beings moving in all directions with considerable swiftness, apparently gifted with sagacity, for they readily elude each other in the active dance they keep up. . . . Increase the power of your glasses, and you will soon perceive, inhabiting the same drop, other animals, compared to which the former were elephantine in their dimensions, equally vivacious and equally gifted. Exhaust the art of the optician, strain your eyes to the utmost, until the aching sense refuses to perceive the little quivering movement that indicates the presence of life, and you will find that you have not exhausted Nature in the descending scale.' Animals belonging to different classes are, however, microscopical, and the term A. is either applied to them all with reference to their mere size, or it is restricted to those which received from Müller, with whom the scientific study and classification of them may be said to have begun, the name of *Animalcula Infusoria*, and which are by Cuvier made the fifth and last class, under the name *Infusoria*, of his fourth great division of the animal kingdom, *Radiata*. See INFUSORIA. The name *Infusoria*, indeed, etymologically considered, is not more appropriate than *Animalcula*, perhaps not quite so much so, as only a small proportion of the animals of this class are actually found in infusions, but it continues to be generally employed by zoologists. Attempts have been made to classify them according to their structure, and to assign them their proper places accordingly in the

general arrangement of the animal kingdom; and one part of them have been formed into a class under the name *Rotifera* (q. v.), regarded as probably belonging to the Articulated division; another part, formed into a class called *Polygastrica* (q. v.), consisting of the simpler kinds, have been in like manner somewhat doubtfully referred to the Radiated division. Agassiz unhesitatingly describes the class *Infusoria* as 'an unnatural combination of the most heterogeneous beings.' He regards many as locomotive *Alge*; and of those which are true animals, he expresses the opinion that many are merely the chrysalis states of other animals. There still remain, however, many kinds which are perfect animals.

Among the most remarkable discoveries of modern science must be reckoned that of *fossil animalcules*, in such abundance as to form the principal part of extensive strata. This discovery was made by Ehrenberg, who found the *Polierschiefer* (Polishing-slate or *Tripoli*) of Bilin to be almost entirely composed of the silicious shields of a minute fossil A., the length of one of which is about $\frac{1}{100}$ th of a

Fossil Remains of Animalcules which form Tripoli.

line, so that about 23 millions of animalcules must have gone to form a cubic line, and 41,000 millions to form a cubic inch of the rock. Ehrenberg succeeded in detecting the formation of similar strata in deposits of mud at the bottom of lakes and marshes, the mud swarming with living animalcules, probably in their turn to be fossilised. The *Berg-mell* or Mountain Meal of Sweden and other parts of Europe, which is sometimes used as an article of food, is entirely composed of the remains of animalcules; not merely, however, of their silicious shields, for it contains a considerable percentage of dry animal matter. Some animalcules prefer waters impregnated with iron, and their death gives rise to an ochreous substance, in which iron is a principal ingredient.

ANIMALS, CRUELTY TO. England has the honour of first making this a distinct subject of public attention by the formation of societies for its prevention, and by legislative enactments making it punishable. The movement has now extended into France and Germany.

Benevolence to A. is a result and a proof of extending civilisation. It is the carrying out to its just limits the principle of sympathy, which first appears when the savage ceases to think exclusively of himself and learns to identify his tribe with himself. It is this principle of sympathy, only carried further, that, under Christianity, unites all the tribes and races of men in one family. And it only requires cultivation of the faculty of sympathy generally, and the direction of the attention to what the lower animals have in common with man—sensibility, namely, to pain—to make any one feel, that needlessly to inflict that pain, is to sin against his own nature, and therefore a crime. This ought to be a special object of attention in the training of children. Besides the cruelty to beasts of burden and domestic animals arising from cupidity, many, especially children, torture creatures from thoughtlessness

and ignorance. This, therefore, is one of the many instances where instruction of the head may be made to mend the heart. It deserves to be remarked, that the mere extinction of life does not necessarily constitute cruelty. There is often more cruelty in prolonging the life of an animal than in taking it away. It is the infliction of needless pain or restraint that is the essence of cruelty to animals.

ANIMALS, CRUELTY TO (in Law). This is an offence against the criminal law, and has frequently of late formed the subject of legislation, the last act of parliament, the 12 and 13 Vict. c. 92 (passed in 1849), being that which at present regulates the law of England on the subject. By this statute it is provided, that if any person shall cruelly beat, ill-treat, over-drive, abuse, or torture any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, hog, pig, sow, goat, dog, cat, or any other domestic animal, he shall forfeit a sum not exceeding £5 for every such offence, recoverable before a justice of the peace in a summary way; and if by any such misconduct he shall injure the animal, or any person or property, a further sum not exceeding £10 to the owner or person injured. The act also inflicts penalties in the case of conveying any such animal in such a manner or position as to subject it to unnecessary pain or suffering; and also in the case of bull-baiting, cock-fighting, and the like, and makes a variety of humane provisions for the regulation of the business of slaughtering horses and other cattle not intended for butcher's meat.

Formerly, in Scotland, this offence was punishable at common law—that is, according to the Scotch legal principle, common law as distinguished from *statute law*—and so late as the year 1826, a man was convicted there of affixing a stob, or prickle armed with iron nails, to the tail of a pony, by which the animal was wounded in the hind-legs; and punished with two months' imprisonment. But the Scotch law at that time did not view such conduct so much as an act of cruelty to the animal injured, as of 'malicious mischief,' as it was called, and, in fact, regarded such treatment of animals as simply an offence against *property*. An act of parliament, however, passed in the year 1850, puts the law on this subject in Scotland on the same footing as it is in England. The act referred to contains provisions similar to those enacted by the 12 and 13 Vict. for England; and in both acts it is declared that the word 'animal' shall be taken to mean 'any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, hog, pig, sow, goat, dog, cat, or any other domestic animal.'

ANIMALS, WORSHIP OF. The practice of worshipping animals, as well as certain plants and stones, prevailed among many of the nations of antiquity, and is still common among barbarous tribes. That animals should be held sacred and receive worship, need excite no surprise when we bear in mind the origin of polytheistic worship generally. They are manifestations of power; mysterious, too, because actuated by impulses differing from those of man; and often, by their greater acuteness of sense and more unerring instincts, seeming to possess supernatural knowledge. Besides this general ground, various animals have been associated with the gods as emblems and in other ways. But a more important source of the superstitious regard bestowed on animals, is the belief that gods, and spirits in general, often take the form of animals, either temporarily or as a permanent abode. The doctrine of the transmigration of souls is not confined to India. Kindred notions, though not perhaps reduced to system and formally enunciated, are all but universal; they seem as indigenous in

the heart of Africa as on the banks of the Ganges. It was as a manifestation of the soul of Osiris—originally, like all the other Egyptian deities, a sun-god—that the sacred bull Apis was worshipped in ancient Egypt. When the Spaniards first visited the coasts of South America, they found a ludicrous kind of animal-worship practised by the natives on the coast of Cumana (Venezuela). 'They held the toad to be, as they said, "the lord of the waters," and therefore they were very compassionate with it, and dreaded by any accident to kill a toad; though, as has been found the case with other idolaters, they were ready, in times of difficulty, to compel a favourable hearing from their pretended deities, for they were known to keep these toads with care under an earthen vessel, and to whip them with little switches when there was a scarcity of provisions and a want of rain. Another superstition worthy of note was, that when they hunted down any game, before killing it, they were wont to open its mouth and introduce some drops of maize-wine, in order that its soul, which they judged to be the same as that of men, might give notice to the rest of its species of the good entertainment which it had met with, and thus lead them to think that if they came too, they would participate in this kindly treatment.'—*Helps*.

ANIME, a resin exuding from the trunk of the *Hymenaea Courbaril*, a large tree of the natural order *Leguminosæ*, sub-order *Cæsalpinea*, a native of New Spain and Brazil. It somewhat resembles copal, but is more easily soluble in alcohol.—The name A., or Gum A., is, however, also given in Britain to a resin called in India copal, the produce of *Vateria Indica*, a tree of the natural order *Dipteraceæ*; whilst the copal of Madagascar is produced by *Hymenaea verrucosa*, and that of Brazil in great part by several species of *Hymenaea*, a tree of which genus is also regarded as the probable source of the copal of Mexico.

ANIONS. See ANODE.

ANISE (*Pimpinella Anisum*), an annual plant of the natural order *Umbelliferae*. The genus *Pimpinella* has compound umbels, usually without involucre. Two species are natives of Britain; they are commonly known by the name of Burnet Saxifrage, and have no properties of importance. A. is a native of Egypt. It is an annual plant; the stem is 1½ to 2 feet high, dividing into several slender branches; the lower leaves roundish-heart-shaped, divided into three lobes, and deeply cut; those of the stem pinnate, with wedge-shaped leaflets. The umbels are large and loose, with yellowish-white flowers. It is much cultivated in Egypt, Syria, Malta, and Spain, and even in Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced. Attempts were made, more than 200 years ago, to cultivate it in England; but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. A.-seed (*aniseed*) is used as a condiment and in the preparation of liqueurs; also in medicine as a stimulant stomachic, to relieve flatulence, &c., particularly in infants; and it has been used in pulmonary affections. It has an aromatic, agreeable smell, and a warm, sweetish taste. It contains a volatile oil, called *Oil of A.*, which is nearly colourless, has the odour and taste of the seed, and is employed for similar purposes. One hundred-weight of seed yields about two pounds of oil, which is obtained by distillation; but at Erfurt the oil is made from the stems and leaves, the whole plant being aroma-

tic. *A.-water*—water flavoured with the oil, and sugared—is much used in Italy as a cooling drink.

STAR ANISE, or CHINESE ANISE, is the fruit of *Illicium anisatum*, a small tree of the natural order *Magnoliaceæ*. See ILLICITUM. It receives its name from the star-like form of the fruit, which consists of a number (6—12) of hard, woody, one-seeded carpels. The tree has evergreen leaves, somewhat like those of the common laurel. The whole plant is carminative, and is used by the Chinese as a stomachic and as a spice in their cookery. The qualities of the fruit so much resemble those of the common anise, that it may be used instead of it, and by distillation it yields an oil which is very generally substituted for oil of anise, and is imported into Europe in considerable quantity, to be used instead of it. Star aniseed is also imported, chiefly from China and Singapore.

ANJOU, a former province in the north-west of France, of about 3080 square miles in extent, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. Its capital was Angers. The ancient inhabitants of A. were the *Audegavi*, who long and resolutely resisted the Roman arms.—The male line of the Counts of A., who took their name from it, having become extinct in 1060, their title and possessions passed by the female line to the powerful House of Gatinais; and from one of this family, Godfrey, Count of A., sprung the Plantagenets. He conquered the greater part of Normandy; assumed the title of duke; and in 1127 married Matilda, the daughter of Henry I. of England, and widow of the Emperor Henry V. Through her, his son inherited the English throne, which he ascended in 1154 as Henry II. A. now became one of the possessions of the kings of England; but in 1204, the French acquired it by fortune of war; and it was bestowed as a fief upon Philip, the son of Louis VIII., and afterwards upon his brother Charles, who became the founder of that House of A. which gave kings to Naples, Sicily, and Hungary. Charles II. of Naples gave A. to his daughter Margaret on her marriage with Charles of Valois, the son of Philip IV. Her son ascended the throne of France as Philip VI. in 1328. King John, in 1360, made A. a duchy, and gave it to his son Louis, and he succeeding to the crown of Naples, it remained a possession of the kings of Naples till the overthrow of that dynasty, when René II., the last of his family, was deprived of it by Louis XI., who permanently annexed it to the French crown in 1484. Since that time, it has merely given an honorary title to princes of the royal family. The last who bore it was the grandson of Louis XIV., who became Philip V. of Spain.

ANKARSTRÖM, JOHN JACOB, the assassin of Gustavus III., king of Sweden, born in 1761, the son of a lieutenant-colonel. He came very early to court, in the capacity of a page, and next entered the army; but having obtained the rank of captain, left it in 1783; married and settled in the country. He was a man of violent feelings and rough manners, and much opposed to the measures taken by the king for curtailing the power of the senate and of the nobles. Implicated in certain intrigues in the island of Gothland, he was accused of treason, but released for want of positive evidence. His hatred to the king was increased by the harsh usage he met with in the course of his trial. In 1790, he went to Stockholm, and, together with General Pechlin, Counts Horn and Ribbing, and others, planned the assassination of the king. A. begged that the execution of the deed might be left to him; but Horn and Ribbing disputing the point, they drew lots, and the lot fell

upon A. In 1792, the king convoked the Diet at Gelfe, and the conspirators hoped upon that occasion to carry out their purpose; but being thwarted in this, they had to wait till the 15th of March, when Gustavus was to attend a bal masqué, during which A. shot at and mortally wounded him. He was instantly apprehended, and at once confessed his crime, stoutly denying, however, that he had any accomplices. On the 29th of April, he was condemned to death, publicly flogged for three successive days, and then beheaded. He went to the scaffold with perfect composure, rejoicing to his last moment in the success of his crime.

ANKO'BAR, the capital of the kingdom of Shoa, in Abyssinia, is built 5198 feet above the sea-level, on the ascent of the table-land, in lat. 9° 34' N., long. 39° 35' E. The higher portion of the town is fortified in a very primitive way, by means of a palisade constructed of stakes, with intertwined branches of trees. The royal palace, unlike the most of the buildings, which are chiefly of wood, is built of stone and mortar, although the roof is thatched. The vegetation around the place is extremely rich, and the air is both cool and pure, so that A. is a very agreeable residence, and is consequently favoured with the presence of the court during a portion of the year. Pop. 10,000.

ANKYLOSIS (Gr. *ankulōsis*, bending or crooking; *ankulē*, stiff-joint), is a term used in surgery to imply a stiffness in any joint. It is usually the result of disease, which, having destroyed the articular cartilages, leaves two bony surfaces opposed to each other. The reparative powers of nature cause a union to take place by means of granulations between them. This bond of union may become osseous, so as to render the joint perfectly rigid, or it may continue membranous, allowing of a certain amount of motion. Some joints, especially the elbow, are very apt to become ankylosed; and in the knee or hip-joints, this osseous A. is reckoned the most favourable termination to disease, as the limb can then afford a rigid support for the trunk. Joints, stiff through a membranous A., may be forcibly bent, and the bond of union ruptured, so as to restore mobility, or allow of their being placed in a convenient position. A. of the joints between the ribs and the vertebrae is common in advanced age; and there are some cases on record of universal A. of all the joints. A case occurred in 1716 of a child only twenty-three months old with all its joints thus stiffened; and there are in various museums specimens of adult bodies in this condition.

ANN, or ANNAT, in Scotch law, signifies the half year's stipend payable for the vacant half year after the death of a clergyman, to which his family or nearest of kin have right, under an act of the Scottish parliament passed in the year 1672. It is a right that does not belong to the clergyman himself, but to his next of kin absolutely, and therefore can neither be assigned or disposed of by him nor attached for his debts. Compare ANNATES.

ANNA, Sr, according to tradition, was the daughter of Mathan, priest of Bethlehem, and the wife of St Joachim. After twenty-one years of barrenness, she is said to have given birth to the Virgin Mary, the mother of the Saviour. Nothing positive is known regarding her life; her name does not occur in the Scriptures, nor even in the writings of the Fathers during the first three centuries. The first who mentions her is St Epiphanius, in the 4th c.; but towards the 5th, she was all but universally invoked. Her body was believed to have been transferred from Palestine to Constantinople in 710 A. D.; and her head to Chartres, by Louis de Blois, about 1210 A. D. The inhabitants of Duren (Duchy

of Juliers, Germany) also pretend to have a head of St A.; and a third is believed to be in possession of the church at Ursitz, in the diocese of Würzburg, although numerous other churches claim to be equally favoured. The Roman Catholic Church has a festival in her honour on the 26th of July; the Greek, on the 9th of December. In Austria, Bavaria, and other Catholic countries, this festival is one of great importance. In honour of St A., a fraternity, called the Fraternity of St A., was instituted in the 13th c. After the Reformation, it was organised anew by the Jesuits; and in modern times, has manifested some vitality in Bavaria and Catholic Switzerland.

ANNA CARLOVNA, regent of Russia during the minority of her son Ivan, was the daughter of Charles Leopold, Duke of Mecklenburg, and of Catharine, sister of the Russian empress, Anna Ivanovna (q. v.). In 1739, she married Anthony Ulrich, Duke of Brunswick-Wolfenbüttel. Her son, Ivan, born August 20, 1740, was nominated by the Empress Anna Ivanovna as her successor. This was done at the instigation of Biron (q. v.), the empress's favourite, whose object was to secure the regency for himself; and the empress, on her death-bed, actually appointed him regent, but he continued in power only for a short time. She died on October 28, 1740, and his overthrow took place on the 18th of November in the same year. A. C. now proclaimed herself Grand-duchess and Regent of Russia; but she shewed no capacity for managing the affairs of a great country, spent her time in indolent enjoyments, and resigned herself very much to the guidance of one of the ladies of her court, Julia von Mengden. A conspiracy was formed by a party desirous of raising to the throne Elizabeth, daughter of Peter the Great and of Catharine, and this was accomplished on December 6, 1741. The infant Ivan was sent to the castle of Schlüsselburg, where he was afterwards murdered; Anna and her husband were condemned to imprisonment for life, and conveyed to Cholmogory, a town upon an island in the Dwina, near the White Sea. Here she bore two children, and died in childbed in 1745. Her husband remained a prisoner for thirty-nine years, and died in 1780.

ANNA COMNENA, a learned Byzantine princess, author of one of the most valuable works to be found in the collection of the Byzantine historians, was the daughter of the Emperor Alexius I. (Comnenus), and was born on December 1, 1083. She received the best education that Constantinople could give, and early displayed a fondness for literary pursuits; but was also habituated from her childhood to the intrigues of the court; and during the last illness of her father, she entered into a scheme, which her mother, the Empress Irene, also favoured, to induce him to disinherit his eldest surviving son, John, and to bestow the diadem on her. Failing in this, she framed a conspiracy against the life of her brother (1118); and when her husband, Nicephorus Bryennius, a Byzantine nobleman, either from timidity or virtuous principle, refused to join in it, she passionately lamented that she had not been born a man, and upbraided him as having the soul of a woman. Her brother spared her life, but punished her by confiscation of her property, which, however, he soon after generously restored. Disappointed and ashamed, she withdrew from the court, and sought enjoyment in literature. On the death of her husband (1137), she retired into a convent, where she died in 1148. Her life of her father, entitled *Anna Comnena Alexialos libri 19*, is full of professions of careful inquiry and a supreme regard for truth, but 'the perpetual strain of pane-

gyric and apology awakens our jealousy.' The style is characterised by an elaborate affectation of rhetoric. The best edition is that of Schopen (2 vols. Svo, Bonn, 1839).

ANNA IVANOVNA, Empress of Russia, was born on the 8th February 1693, and was the second daughter of Ivan, the elder brother of Peter the Great. She was married in 1710 to the Duke of Courland, the last of his race, who died in the following year; and she obtained the duchy of Courland for her favourite, Biron, a Courlander of low birth. The throne of Russia was offered to her by the Supreme Council on the death of Peter II. in 1730, on conditions which greatly limited the power of the monarchy, but which she soon broke. Her elevation to it was very much owing to the intrigues of the Chancellor Ostermann, who had had the charge of her education, but who was disappointed in finding her not grateful and tractable, as he expected. For three years, however, her rule was mild, humane, and equitable. The army was reformed, greater liberty was allowed to the landed gentry, government debts were paid up, and the poll-tax for the serfs lessened; but her paramour, Biron, having determined to govern the nation as well as the empress, a sudden and deplorable change ensued. This man, a blood-thirsty and avaricious wretch, established something like a reign of terror through the land. He is said to have banished not less than 20,000 persons to Siberia; numbers were knouted, had their tongues cut out, or were broken alive on the wheel. Eleven thousand perished in this way. Prince Basil Dolgoruki, and others of his family, suffered the ignominy of the scaffold. At length the health of the queen gave way. She died on October 28, 1740, and left the throne to her grand-nephew, Ivan, with Biron as regent. See **RUSSIA** and **BRON**.

ANNALS. These were at first books which contained a record, in chronological order, of the principal events occurring in one or more years. The name is derived from the oldest historical documents of the Romans, the *Annales Pontificum*, or *Annales Maximi*, the duty of drawing up which devolved upon the *Pontifex Maximus*; but these were all destroyed by the Gauls at the sack of Rome, some hundreds of years before the time of Christ. After the second Punic War, A. similar to the former ones were composed, not, however, by the priests, but by educated members of the Roman laity, such as Fabius Pictor, Calpurnius Piso, &c. At a still later period, the term was applied to any historical work that followed the order of time in its narrations, separating them off into single years—as, for instance, the *Annals* of Tacitus.

ANNAMABOE', a small seaport town, protected by a strong British fort, on the Gold Coast of Africa, in lat. 5° 5' N., long. 1° 5' W., 10 miles east of Cape Coast Castle. In 1807, the inhabitants took part with the Fantees against the Ashantees, in consequence of which the town was attacked by an overwhelming force of the latter, and most of the inhabitants were slain. There is little trade in anything but gold. The present population is between 4000 and 5000.

ANNAN, a seaport, and royal and parliamentary burgh, in the county of Dumfries, on the river of the same name, near its entrance into the Solway Firth. It is neat and well built, and has some cotton and leather manufactures, and a small coasting-trade. The river, which affords excellent salmon-fishing, is spanned by a bridge of three arches, and is navigable to within half a mile of the town for vessels of 300 tons. There is regular communication by steamers with Liverpool and Whitehaven,

and the Glasgow, Dumfries, and Carlisle Railway connects the town with Edinburgh, Glasgow, and Carlisle. The burgh unites with Dumfries, &c., in returning one member to parliament. Pop. in 1851, 4558. A. was the birthplace of the blind poet Dr Blacklock, and the great preacher Edward Irving.

ANNANDALE. See **DUMFRIESSHIRE**.

ANNAPOLIS, a seaport of Nova Scotia, in lat. 44° 40' N., and long. 65° 37' W. It stands on a river of the same name that runs into the Bay of Fundy. Its harbour is excellent, though somewhat difficult of access. A. is the oldest European settlement to the north of the Gulf of Mexico, having been established, in 1604, by the French as the capital of their province of Acadia, under the name of Port Royal. Acadia having been conquered by the English in 1710, and ceded by the French in 1713, Port Royal changed its name in honour of Queen Anne, continuing to be the seat of government, till, in 1750, it was superseded by the newly founded city of Halifax on the outside coast of the peninsula—the new capital, with its better position and superior haven, having diverted most of the trade of the place. Since then, A. has rather decayed than otherwise; and it would have done so more decidedly, had not its river been navigable for boats during nearly the whole of its course of 70 miles.

ANNAPOLIS, a seaport of Maryland, U.S., in lat. 38° 59' N., and long. 76° 29' W., standing on the right bank of the Severn, about two miles from its entrance into Chesapeake Bay. By the census of 1850, after A. had been the seat of government for 151 years, it contained only 3011 inhabitants, while, by the same census, Baltimore, the commercial capital, only 121 years old in all, numbered 169,054. A. contains a naval academy, established and supported by the United States. It has likewise a college, which, though erected by the Roman Catholics immediately after the War of Independence, is at present directed and maintained by Protestants.

ANN ARBOR, a city of Michigan, next in rank and importance to Detroit, the commercial capital of the state. In 1850, its population was 4868. A. A. stands on the river Huron, by means of which it communicates with Lake Erie; and it is about 40 miles to the west of Detroit, on the Michigan Central Railway, which, beyond this place, is connected by another line with Chicago, in Illinois. Besides these advantages, A. A. is the centre of a fertile district of country, while its river supplies an abundance of water-power. It has already a liberally endowed university, with more than 200 students; and it also contains manufactories of wool, iron, and flour.

ANNATES, or **FIRST-FRUILTS**, in the ecclesiastical law of England, means the value of every spiritual living for a whole year (hence the name from the Latin word *annus*, a year), which the Pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first only levied from persons appointed to bishoprics; but it was afterwards extended to the inferior clergy. The value of these A. was calculated according to a rate made under the direction of Pope Innocent IV. (1253 A.D.), but which was afterwards increased by Pope Nicholas III. (1292 A.D.). The valuation of Pope Nicholas is still preserved in the Exchequer. This papal exaction was abolished by the act 25 Henry VIII. c. 20, and by an act passed in the following year of the same reign (26 Henry VIII. c. 3), the right to A. or First Fruits was annexed to the crown. The various statutes subsequently passed on this subject have all been consolidated by an act (the 1 Vict. c. 20), regulating the collection

of the moneys so levied. See **FIRST FRUITS, QUEEN ANNE'S BOUNTY.**

ANNATTO. See **ARNOTTO.**

ANNE OF AUSTRIA, daughter of Philip II. of Spain, was born in 1602, and in 1615 became the wife of Louis XIII. of France. The marriage was so far from being a happy one, that the royal pair lived for 23 years in a state of virtual separation—a result due chiefly to the influence of Cardinal Richelieu, whose fixed determination to humble the House of Austria, led him to spare no means for alienating the affection of Louis from his queen, by representing her as ever involved in the most dangerous conspiracies against his authority. The naturally grave and phlegmatic disposition of the queen was not calculated to counteract the hostile influence of the great minister. On the death of the king in 1643, A. became queen-regent, and evinced her discernment by choosing as her minister Cardinal Mazarin, by whose able management the young king (Louis XIV.) came, on attaining his majority, into possession of a throne firmly established on the ruins of contending parties. The character of A. had much influence in moulding that of her son. She displayed the same cold and haughty temper, combined with the power to charm by a condescending grace, the same love of pomp and power, and the same skill in the choice of able instruments, thus compensating for the want of genuine personal greatness. She died in 1666. Two curious personal peculiarities of this queen are mentioned by biographers—her antipathy to roses, so strong that while passionately fond of flowers and perfumes, she could not endure even the picture of a rose; and the extraordinary delicacy of her skin, which made Mazarin remark, that 'if her majesty were condemned to the infernal regions, her hell would be to sleep in brown hollands.'

ANNE, Queen of Great Britain and Ireland, and the last British sovereign of the House of Stuart, was born at Twickenham, near London, on 6th February 1664. She was the second daughter of James II. of England, and VII. of Scotland (who at the time of her birth was Duke of York), by his first wife, Anne Hyde, the daughter of the famous Clarendon. When she was about seven years of age, her mother died; and her father soon after professed himself a member of the Church of Rome; but he permitted his daughters to be educated in the principles of the Church of England, to which A. always retained an ardent if not a very enlightened attachment—seldom manifesting, in the whole course of her life, so much resolution and independence of mind, as in her resistance to the attempts of her father, after his accession to the throne, to induce her to join the Church of Rome, accompanied, as these were, with the offer that she should be preferred in the succession to her sister Mary. To advance his own popularity, her father gave her in marriage, in 1684, to Prince George of Denmark, brother of Christian V., an indolent and good-natured man, who concerned himself little about public affairs, and was endowed with no capacity for taking part in them. A's own weakness of character and that of her husband gave opportunity to Lady Churehill, afterwards Duchess of Marlborough, her early playfellow, to acquire an influence over her, which, during many years, was almost supreme and absolute. During the reign of her father, A. lived in retirement, taking no part in politics. On the landing of the Prince of Orange, she seems at first to have hesitated, and even to have been inclined to adhere to the cause of her father, whose favourite daughter she was; but Lord Churchill had made up his mind to an opposite course, and his wife induced

the princess to adopt it. She consented to the act by which the throne was secured to the Prince of Orange in the event of his surviving her sister Mary; but quarrelled with her sister about questions of etiquette, and was afterwards drawn into intrigues in which the Churchills were engaged, for the restoration of her father, or to secure the succession of the throne to his son. She even entered into a secret correspondence with her father. She was herself childless when, on the death of William III., on 8th March 1702, she succeeded to the throne. She bore, indeed, seventeen children; but only one, the Duke of Gloucester, survived infancy, and he died in 1700, at the age of 11. The influence of Marlborough and his wife was most powerfully felt in all public affairs during the greater part of her reign. The strife of parties was extremely violent, and political complications were increased by the queen's anxiety to secure the succession for her brother. In so far as she had any political principles, they were opposed to that constitutional liberty of which her own occupancy of the throne was a sort of symbol, and favourable to absolute government and the assertion of royal prerogative according to the traditions of her family. These principles and her family attachment, tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin, were at the head of the Whig party. The duchess also offended the queen by presuming too boldly and haughtily upon the power which she had so long possessed. A. found a new favourite in Mrs Masham, a relation of the duchess, whom she herself had introduced into the royal household. To Mrs Masham's influence the change of government in 1710 was in a great measure owing, when the Whigs were cast out, and the Tories came into office, Harley (afterwards Earl of Oxford) and St John (Lord Bolingbroke) becoming the leaders of the ministry. But, although concurring more or less in the queen's design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution, and it oozed out sufficiently to alarm the nation, and to alienate many of their political supporters. A dispute between Oxford and Mrs Masham, carried on for hours in the queen's presence, and which terminated in her demanding his instant resignation, seems to have brought on the attack of apoplexy of which she died, 1st August 1714. The Elector of Hanover succeeded her as George I.—The public events of her reign belong to the history of Britain; but the union of England and Scotland, in 1707, may be mentioned in its personal relation to herself, as she was the last sovereign who reigned over these as separate kingdoms, and the first sovereign styled of Great Britain.—Queen A. was of middle size, and comely, though not beautiful. She was virtuous, conscientious, and affectionate, more worthy of esteem as a woman than of admiration as a queen. Her reign is often mentioned as a period rendered illustrious by some of the greatest names, both in literature and science, which her country has ever produced; but literature and science owed little to her active encouragement.

ANNEALING is the process of tempering resorted to in the manufacture of glass and the preparation of several of the metals, whereby these substances acquire a hardness combined with tenacity which renders them much stronger, and consequently more durable. In the making of glass vessels by the glass-blower, they are of course quickly reduced in temperature whilst the fused glass is being modelled into the desired shape.

The atoms of the glass thus rapidly compelled to assume a position, do not seem to be properly and firmly arranged together, and the vessel is very liable to be broken, either by a slight but smart blow, or a sudden increase or decrease in temperature. This brittleness is very observable in the *lacrymæ vitreæ*, or glass tears, known as *Prince Rupert's Drops*, obtained by allowing molten glass to fall into water, when the glass forms pear-shaped drops, which are so brittle, that if they be scratched with a file or the end be broken off, the whole bursts asunder and falls down into a fine powder of glass. The same brittleness is exhibited in *Bologna jars*, or *phials*, which are small and very thick in the glass; and yet, if a minute angular fragment of any hard substance be dropped into the jar, the latter flies to pieces.

In the A. of glass vessels, they are arranged in iron trays, and placed in a long oven, where they are gradually raised in temperature to near their fusing-point, by the trays being drawn along to the hottest part of the oven; and thereafter, the trays, with their contents, are very slowly drawn into a cooler and cooler part, till they become cold. The A. operation generally takes twelve hours for small articles such as wine-glasses; but days, and even a week or two, are required to anneal completely large vessels. Many articles of glass, such as tubes for steam-gauges, lamp-glasses, &c., are annealed by being immersed in cold water, which is very gradually raised to its boiling-point, and thereafter cooled.

The metals are often subjected to the process of A. When medals are repeatedly struck by the die-stamper, the gold or other metal, by the concussion, becomes brittle, and requires to be now and again heated and annealed. In wire-drawing, also, the metal becomes so hard and brittle, that it requires A. to prevent its breaking into short lengths. Boiler-plates, which have been drawn out by rolling, require to be annealed before they are riveted together. The brasier, in hammering out copper and brass vessels, must stop now and again, and anneal the metal. Articles of tin, lead, and zinc can be annealed in boiling water. The tempering of steel is just a process of A. The steel is placed in an oil-bath, or surrounded by a metallic mixture which has a low fusing-point; and according to the temperature to which it is subjected, a steel with various degrees of softness and strength is obtained. Parke's table of metallic mixtures capable of being used in the tempering or A. of instruments made from steel, is as follows:

	ALLOT.		Fusing-point ° F.
	Lead.	Tin.	
Laucets,	7 parts	4 parts	420°
Razors,	8 " "	4 " "	442 "
Penknives,	8½ " "	4 " "	450 "
" , large,	10 " "	4 " "	470 "
Scissors, shears, . . .	14 " "	4 " "	490 "
Axes, plane irons, . . .	19 " "	4 " "	500 "
Table-knives,	30 " "	4 " "	530 "
Watch-springs, swords, .	48 " "	4 " "	550 "
Large springs, augers, .	100 " "	4 " "	558 "

The theory of A. is very imperfectly understood. A certain re-arrangement of the atoms of the glass or metal no doubt takes place, and an absorption of heat occurs. It is possible that as the crystalline structure is indicative of brittleness, and the fibrous texture characteristic of strength, that the passage of glass or metal from a brittle to a non-brittle material may be due to the development of a fibrous structure, where a crystalline one was originally present.

ANNE'LIDA, or ANNELIDES (from Lat. *annulus*, a ring), a small class of Articulated Animals, mostly included by Linnæus in his class *Vermes*. They have a more or less elongated body, which is always composed of numerous rings. The first of these rings assumes, in most of them, the characters of a head, but in some there is no proper head. They have no articulated limbs, but most of them are provided with bristles and hairs, often in numerous bundles, which are of use to them in locomotion; some, which want these, are furnished with suckers at the extremities, and employ them for this purpose; some remain fixed in one place. Their bodies are always soft, and without external or internal skeleton; but some of them form for themselves a calcareous covering by exudation, others form coverings partly by exudation and partly by agglutination. Their blood is generally red, but not from red corpuscles, as in the vertebrate animals; sometimes it is greenish or yellowish. Their nervous system is simple. Many of them have eyes, and many have tentacula. Most of them live in water, and of these the greater part inhabit the sea. Those which live in water breathe by gills, which are variously formed and placed; some which are terrestrial, as earthworms, have, instead of gills, numerous small respiratory sacs. They are all hermaphrodite; most of them, however, requiring mutual fecundation, and most of them are oviparous. They feed in general upon other animals, and some of them live by sucking blood. They are now divided into four orders: 1. *Dorsibranchiata*, having gill-tufts disposed regularly along the body, and composed of animals of com-

Sandworm (*Arenicola piscatorum*).

paratively active habits; 2. *Tubicola*, having gill-tufts near the head, and provided with shelly or other coverings; 3. *Terricola*, destitute of all external appendages except minute bristles, and breathing by respiratory sacs; 4. *Sudoria*, destitute even of bristles, and provided with suckers at the extremities. Of the first order, the Sea-worms, Sea-centipedes, and Sea-mouse, are examples; of the second, the *Serpula*, so often an object of interest in the aquarium; of the third, the Earthworm; and of the fourth, the Leech.

ANNUAL, in Botany, a term employed to denote that the duration of the life of a plant is limited to a single year; within which the germination of the seed, all the functions of vegetation, the ripening of new seed, and the death of the plant, are included. The whole duration of life in the plants thus designated is indeed generally much less than a year, and in temperate and cold climates, falls within the brief period of the summer months. They, as well as the plants generally called biennial, produce flowers and fruit only once. Some species are generally A., and others generally biennial; but whether an individual plant is A. or biennial, often depends upon the accidental circumstance of the season at which the seed germinates, and may therefore be artificially determined by the time of sowing. Peculiar circumstances also sometimes convert A. into biennial, or even perennial plants; and those which are mere annuals in one climate, are perennial, or even shrubby, in another, of which the Castor-oil plant affords a notable example. Most kinds of corn are the produce of A. grasses; some of which, however, as wheat, in certain circumstances, prove of longer duration. The *annuals* cultivated in our flower-gardens are very numerous; and many species, both

native and foreign, are among our most beautiful flowers.

ANNUALS, the name given to a class of pleasant and graceful publications, which for some years enjoyed an extraordinary amount of public favour, intended for Christmas, New-year, and Birthday presents, in imitation of the Gift-books so popular among the Germans. They were illustrated by exquisitely engraved prints, from paintings by artists of the highest talent, and contained prose and poetry by most of the best writers of the day. The first of them, the *Forget-me-not*, edited by Frederick Shoberl, was begun in London in 1822. The idea, and even the title, were adopted from Germany by the Messrs Ackermann, the London publishers. The following year, two others made their appearance—*Friendship's Offering*, published by Smith and Elder, which had for successive editors, Mr T. K. Hervey, Mr Pote, Mr Thomas Pringle, Mr W. H. Ainsworth, and Mr Leitch Ritchie; and the *Graces*, containing a series of elegant poems on the Months by the Rev. Dr Croly. All three, in addition to their literary and pictorial contents, had at first the blank paper for memoranda, cash accounts, &c., which were customary in the Gift Pocket-books of previous times. The *Literary Souvenir*, commenced in 1824 by Mr Alaric A. Watts, was the first to discard these, and to exhibit a vast improvement on this class of embellished works. Thenceforth, the several publishers vied with each other in their efforts to render their respective A., every succeeding year, more and more attractive. The *Literary Souvenir* was followed by the *Amulet*, started by Mr S. C. Hall, and edited by his wife; the *Winter's Wreath*, a provincial annual; and the *Keepsake*, the latter commenced in 1827 by Mr Charles Heath, an eminent engraver. Up to this time, the price of all the A. was 12s. each: the *Keepsake*, however, was published at a guinea. Its first editor was Mr W. H. Ainsworth. The following year, the editorship was offered to Sir Walter Scott, with a salary of £800, and payment besides for his contributions to its pages, but was declined by him. It was then placed under the charge of Mr F. M. Reynolds, who continued to superintend it for many years. The *Keepsake* always maintained a high aristocratic character, the contributors preferred being those who could boast a title. In 1840, it came out under the editorship of Lady Emmeline Stuart Wortley. It was afterwards edited by the Countess of Blessington. So popular did the A. become, that in 1829 no fewer than seventeen were published. In 1840, the number had dwindled to nine. The *Book of Beauty*, long one of the best of the series, was begun in 1833 by Mr Charles Heath. The first volume was written by Miss Landon (L. E. L.), the engravings being principally after drawings by Frank Stone. The volume for 1834 was placed under the editorship of the Countess of Blessington, who conducted it to the close of her life. Mr Heath had also the *Picturesque Annual*, and the *Children of the Nobility*—the latter commenced in 1838. The *Juvenile Album*, an annual for children, was published by the Messrs Ackermann. Scientific A. also made their appearance, and the musical world had its *Musical Bijou*. Thomas Hood started the *Comic Annual*; and among other popular publications of the class were Fisher's *Drawing-room Scrap-book*, edited at first by Miss Landon, afterwards by Mrs Howitt, and latterly by the Honourable Mrs Norton; and Fisher's *Juvenile Scrap-book*, edited by Mrs Ellis; the *Oriental Annual*, the *Historical Annual*, and the *Gift and Token*, American productions. At first, the A. were all bound up in tinted paper, and enclosed in a case; but competition produced a great improvement in their external appearance, as well as in their

inside attractions. Paper gave place to silk; then followed morocco bindings, and afterwards velvet. The sums of money expended on the several departments were enormous. Mr Heath's outlay for the literary portion alone of the second volume of the *Keepsake* amounted to no less than £1600. Of this sum, Sir Walter Scott received £500 for the liberty of printing in it his juvenile drama of the *House of Aspen*, *Aunt Margaret's Mirror*, and two other little tales. To many engravers, the illustrations formed almost their sole employment. Sums varying from 20 to 150 guineas were paid to artists for the loan of pictures for engravings, of the size of 4 inches by 3; and engravers frequently received 150 guineas for the production of one plate. For several years, nearly £100,000 per annum was expended on the production of the A., and 150,000 copies of them were yearly sold. The sale of the *Forget-me-not* alone was at one time 20,000 copies. In their most flourishing period, a calculation of their expenses and profits was made, which may be here quoted. For 150,000 volumes, including the guinea-books, of which there were always two or three, the public paid about £90,000, thus distributed: Authors and editors, £6000; painters, £3000; engravers, £12,000; copperplate printers, £4000; printers, £3500; paper-makers, £5500; binders, £9000; silk manufacturers and leather-sellers, £4000; advertising, &c., £2000; incidental expenses, £1000; publishers' profits, £10,000; retail booksellers' profits, £30,000—Total, £90,000.

After 1840, the demand for the A. began to decline. At the best, there had been a sickly sentimentalism in the bulk of their articles; and at all events, this class of works had been mainly addressed to the refined and affluent. Better tastes in literature now began to prevail, and there was a feeling that A. had had their day. Deserted by public favour, the character both of their engravings and their literary contents became greatly deteriorated, and they ceased to have any attraction, either as literary productions or works of art. Publishers no longer found them safe speculations, and gradually discontinued them. They dropped out, one by one, like spent stars, from the literary firmament. The *Literary Souvenir* had been discontinued in 1834, after the publication of ten volumes. The *Forget-me-not*, the first in the field, saw its 22d year. The *Book of Beauty* and the *Keepsake* were the last of their race. The latter, on the death of the Countess of Blessington, was placed under the editorship of her niece, Miss Power. The *Keepsake* of 1836, the engravings in which were under the superintendence of Mr F. Heath, was the only relic of the past; and in that year it ceased to exist.

ANNUAL REGISTER. The first volume of the useful work which bears this name appeared in 1759. Various publications of a similar character had previously existed, such as Boyer's *Political State of Europe*, which was published in monthly numbers and yearly volumes from 1711 to 1739; and the *Historical Register*, a quarterly publication, begun in 1716, and concluded in 1738. The A. R. differed from these in being published once a year, in containing a more full and able historical narrative, and in the addition of a literary and miscellaneous department, including notices of new books. The undertaking was projected by Robert Dodsley the bookseller, assisted by Edmund Burke, who for some years wrote the historical narrative, and assisted to some extent in the preparation of the *Register* during most of the subsequent part of his life. Indexes to the work have been published at various periods, and the publication still goes on regularly. A rival work, entitled *The New A. R.*,

ANNUITY.

was started in 1781 by Dr Kippis. It was edited after his death by Dr Morgan, and came to a close in 1825. The *Edinburgh A. R.* was commenced in 1808, and terminated in 1827. The historical narrative was for some years written by Sir Walter Scott, and afterwards, for a considerable time, by Southey. A similar work was commenced at Paris in 1818 under the title of *Annuaire Historique*, and continued till 1849. The earlier volumes were compiled with much care and ability, but latterly the work fell off very greatly. Its place is now supplied by the *Annuaire des Deux Mondes*, a publication connected with the well-known review of that name, and compiled with high ability. The *American A. R.* is published at New York.

ANNUITY, from the Latin *annus*, a year, is a sum of money paid annually. The term, in its full meaning, expresses an obligation on one party to pay, and a right in another to receive the amount. The different kinds of annuities that may exist are as various as the conditions and fancies of those concerned in them; and it is impossible to define them all. An A. may be for the life of any person, however long that may be, becoming extinguished only by his death. It may be perpetual, so that as each enjoyer of it dies, his heirs may succeed to it. It may be on the life of the survivor of any number of persons—for instance, a father may leave to his five daughters an A. of £500 a year from his estate, to be enjoyed by the latest survivor, so that while the five are alive, they have £100 each; after the first death among them, the lapsed share is distributed among the survivors, giving them £125 each; and so on, the last survivor enjoying the whole £500. On the other hand, each might have a separate A. terminating at her death; and again, instead of either of these simple arrangements, there might be, and often is, a more complex adjustment, giving the survivors on each death a certain proportion only of the deceased's A. An A. may begin immediately, and stop on a contingency, such as the death of a person to whom the annuitant is heir. It may be 'deferred,' so as to begin to be payable only after the lapse of so many years; and then it may either be payable absolutely in perpetuity, or for a given number of years, or it may be payable to an annuitant only for the remaining years of his life, if he survive the contingency.

It will thus be seen that there is infinite variety in the nature of annuities, and consequently, in the calculations regarding them. The fixed elements of such calculations, independently of this variety, are in themselves double, being vital statistics, and the profit or interest of money. As to the former, they can only apply, of course, to the adjustment of annuities on a large scale. If a person should sell a single A.—that is to say, engage for a sum down to pay a certain person an A. for life—no study of vital statistics could make his bargain other than a chance; and though he went on the most approved tables, it might occur either that the annuitant dies immediately, leaving the whole purchase-money as his profit, or that the annuitant lives to extreme old age, and renders him a great loser by the bargain. But on a large, and especially on a national scale, the rate of mortality and the value of life may be so nicely rendered in statistics, that a market may be opened for the purchase and sale of annuities at their exact value—that is to say, at such a rate that the sum paid in from time to time by persons purchasing annuities, shall just serve to pay each annuitant's annual claim. Such vital statistics, however, can only be obtained through a very accurate and long-continued registration of births, deaths, and marriages (see REGISTER); and it is known that the government having adjusted the

price of annuities by the celebrated Northampton (q. v.) Tables, made a losing bargain with their annuitants as a body, and, without being conscious of it until afterwards, sacrificed a considerable amount of public money.

The second element, besides vital statistics, in the calculation of annuities, is the profit or interest of money. If this did not require to be considered, an A. of £1 a year for ten years would just cost £10. But while paying the A., the person who has engaged for it is drawing the interest of the money. If he sold an A. of £1 a year for ten years for £10, he would be drawing the interest of £10 for the first year, £9 for the second, and so on; and the annuitant's bargain would be to a like extent disadvantageous. As the interest of money may be various, so may this element of the calculation of an A.; and to calculate it with reference to future indefinite variations, is of course impossible. It will be seen at once that when the variety of kinds of A. have to be adjusted to different rates of profit, an immense field is opened for calculation. It is, in fact, a province of algebraic science in which several men have achieved reputations.

The interest, as it is termed, of the national debt is virtually a multitude of perpetual annuities. In a country where there is so much superabundant wealth, there is so vast an amount of capital for which people only want interest, that although the lenders of the money are not repaid by the government, yet when any one has invested in the funds, if he wants his money back, he is sure to find a person to take his place at something near to the price paid by him. This would not be the case were the quantity of these annuities in the market disproportioned to the number desiring to invest in them, and hence it is that when there is depression of trade, and money wanted to meet obligations, the funds fall. The government have the largest field of operation, and therefore it is natural to infer that their annuities are more closely adjusted to their actual value than those of insurance companies and other parties dealing in annuities can be. It may be mentioned, however, that, for the encouragement of the working classes to save and provide for old age and contingencies, government, through the savings' banks, grants small annuities on terms advantageous to the purchasers—that is, at less than their market value (see SAVINGS' BANKS).

Many complicated sets of tables have been prepared to facilitate the calculation of annuities. The latest known to us are the *Commutation Tables for Joint Annuities and Survivorship Assurances, based on the Carlisle Mortality at 3, 3½, 4, 5, and 6 per cent.*, by David Chisholm, 2 vols., royal 8vo, 1838. The calculations are brought out in decimals. Taking the simplest of these tables—namely, those containing the value of an A. of £1, payable at the end of the first year, and thereafter annually during life—we find the following results, commutating the decimals into fractional money through Mr Chisholm's decimal tables:

VALUE OF ANNUITY OF £1.							
Age.	£	s.	d.	Age.	£	s.	d.
5	16	11	9½	45	12	12	11½
10	16	13	4½	50	11	14	2½
15	16	4	6½	55	10	7	11½
20	15	16	4½	60	8	18	9½
25	15	6	1	65	7	17	3½
30	14	14	5	70	6	6	8½
35	14	2	6½	75	4	19	9½
40	13	7	9½	80	4	2	10½

In political economy, annuities come within the class of payments which tend rather to consumption

than to accumulation or reproduction. As the means of attaining a legitimate object, the establishment of an A. may be an advantage to the community in benefiting some individual member of it. For instance, a man is naturally extravagant—he would spend his heritage immediately, and come to want, if it were paid to him in capital. It is therefore vested in an A.; the man is kept in comfort, and society is not burdened with a needy member. Women are apt to mismanage by false investments or otherwise any capital sums left at their disposal, and therefore it is often advantageous to give them an equivalent in an A. In serving, however, these its legitimate objects, it will be seen that the money so spent is not in its character reproductive. People do save capital out of annuities, but, as a general rule, the object and effect of annuities are in the direction of consumption, as contrasted with accumulation. This is often overlooked in settlements, especially by men who have themselves been accumulators. The consumptive effect of an A. will depend much on its coming out of fixed or fluctuating property. Take, as an instance of the former, a landed estate. If the clear rent be paid on annuities, the estate will not be improved, and it will be stagnant in the proportion so paid. If, out of a thousand a year, nine hundred be thus paid, the owner, out of his remainder of a hundred, is not likely to accumulate sufficient capital to improve the estate and double its value. But fluctuating property may not only be rendered stagnant, but may be destroyed by the burden of injudicious annuities. This is frequently exemplified in disposing of the profits of a business. Different members of a family are portioned off upon it, as if it were a fixed permanent estate; and consequently, there is not a sufficient balance left to induce any one to give his time and energies to the management of the business.

ANNUITY, in the law of England, is the right to the yearly payment of a certain sum of money, which is charged upon the person or personal estate of the individual bound to pay it. If it is charged upon real estate, the burden is called a rent, or rent-charge, and not an A. An A. may be created for a term of years, or for the life or lives of any persons named, or in perpetuity; and in the last case the A. is reckoned among incorporeal hereditaments; because, although the security is personal only, yet the A. may descend in the same manner as real estate. By the 53 Geo. III. c. 141, repealing the 17 Geo. III. c. 26, and itself amended by 3 Geo. IV. c. 92, and 7 Geo. IV. c. 75, it is directed, that upon the sale of A. or rent-charge, a memorial of the date and nature of the security, the names of the parties and witnesses, the consideration money, and the manner in which it was paid, and the amount of such A. or rent-charge, shall, within thirty days after its execution, be enrolled in the Court of Chancery, otherwise the security shall be null and void. It is therefore the duty of the grantee of such A. to enrol a memorial of it, or a statement of its particulars, in order to make it available as a security over the property charged. The above statutes do not extend to Scotland or Ireland, nor to any A. or rent-charge given by will, or by marriage settlement, or for the advancement of a child, nor to any A. or rent-charge secured upon freehold, copyhold, or customary lands in Great Britain or Ireland, or in Her Majesty's possessions beyond the seas, or by actual transfer of stock in the public funds, nor to any voluntary A. or rent-charge granted without regard to pecuniary consideration or money's worth, nor to any A. or rent-charge granted by any body corporate or under any authority or trust created by act of parliament. By sec. 8 of the 53 Geo. III. c. 141,

it is declared a misdemeanour, punishable by fine and imprisonment, or other corporal punishment, to procure or solicit any person under twenty-one to grant an A. or rent-charge, or to advance or procure to be advanced money to him, on consideration of his granting an A. or rent-charge after he is of age. In a recent case in the Irish Court of Chancery, it was unsuccessfully attempted to extend the act to Ireland, by endeavouring to shew that although the lands on which the A. was charged were Irish, the contract itself for the A. was English. The Lord Chancellor (Napier), in giving judgment, observed: 'The imperial legislature might have cut the matter short if it had enacted one and the same law for Ireland as for England, which would then have governed this transaction in all its parts; but the act of the English Parliament before the Union, or the act of the Imperial Parliament, in terms confined to England, could not be extended to Ireland by judicial construction, so as to make either, or any part of either, a law of this land, and thereby to control the disposition of Irish landed estate.'

In Scotch law, an A., as such, may be charged on real estate as well as on personalty. In that system, it has been simply defined to be a right to a yearly payment in money; and it may be created either by the payment of the sum of money in the form of a purchase, or it may be secured over land, in which case the creditor, in the event of default of his A., may attach the land charged, claiming in his action for recovery a capital sum out of the land, sufficient to produce an annual interest equal to the A., which annual interest is paid until the expiration of the A., when the capital sum is restored to the debtor. The instrument by which, in Scotland, the A. is constituted in either of the above forms, is called a Bond of A.; and before the repeal of the usury laws (by a recent statute, 17 and 18 Vict. c. 90), this form of deed was frequently resorted to as a means of securing loans where a high rate of interest was charged; and the same practice prevailed in England. But the last-mentioned act renders all such expedients now unnecessary.

ANNUITY-TAX, a local impost for the payment of the salaries of the Established clergy of the city of Edinburgh. It was first established on a limited scale by an act of the year 1661; and was extended in its sphere of operation by an act of the legislature as lately as 1809. It amounted at one time to 6 per cent. on the rents of houses and shops within the royalty. It was a peculiarity of this tax that the members of 'the College of Justice,' including the lawyer class generally, enjoyed an exemption from it, as a relic of an ancient privilege by which they were induced to reside and hold the courts of law in Edinburgh. The tax was reduced in 1860; and, under an act passed in 1870, it was redeemed by payment of £56,500 by the Corporation to the Edinburgh Ecclesiastical Commissioners.

ANNULET (Lat. *annulus*, correctly *anulus*, a ring), a term in Architecture for a small fillet or band which frequently surrounds a column, &c. The A. is several times repeated in the moulding which surmounts the shaft of a Doric pillar, and is placed immediately under the ovolo of the capital.—A., a ring, a charge in heraldry of frequent occurrence.

ANNUNCIADA. 1. The religious Order of the Heavenly Annunciation, or of the Nuns of the Annunciation of Mary, was instituted by Victoria Fornare at Genoa in 1682, after the rule of St Augustine. All the convents of the order in France, Germany, and the Netherlands have disappeared since the French Revolution. Some still exist in Italy. 2. Another Order of the Annun-

ciation, or of Nuns of Mary's Announcement or the Ten Virtues, was endowed by John of Valois at Bourges in 1501, after its separation from Louis XII. In 1514, it was placed under the authority of the Franciscans. This order, which extended to fifty convents for the reception of poor gentlewomen, was broken up at the Revolution. 3. The Order of Knights of the Annunciation in Savoy

Star of the Order of the Annunciation.

(*Ordine Suprema dell' Annunciata*), known originally as the Order of the Neck-chain or Collar, was instituted in 1360 by Amadeus VI., Duke of Savoy. It received statutes from Amadeus VIII. in 1409; was renewed in 1518 under the name of the Holy Annunciation; and in 1720 was raised by Victor Amadeus to be the first order of the kingdom of Savoy. The king is always grandmaster. The knights who, since 1720, are not limited in number, must be of high rank, and already admitted to the orders of St Mauritius and St Lazarus. They compose only one class. The decoration is a gold

Decoration of the Order of the Annunciation.

medal, on which is represented the Annunciation, surrounded by love-knots. It is usually worn suspended by a simple gold chain; but the proper collar or chain of the order is composed alternately of love-knots and roses. On the roses are engraved the letters F. E. R. T., which some interpret *Fortitudo ejus Rhodum tenuit*, in allusion to the defence of Rhodes by Amadeus I., and which others hold to signify, *Frappes, entres, rompes tous*. Since 1680, the knights wear on the left breast a star embroidered in gold. The four supreme officers of the order—the chancellor (always a bishop or archbishop), the secretary (usually the Minister of Foreign Affairs), the almoner (usually the king's first almoner), and the treasurer—wear the decoration round the neck, suspended by a sky-blue ribbon, accompanied by a star on the left breast. For details of costumes, &c., see Burke's *Book of Orders of Knighthood*, p. 250, *et seq.*

ANNUS DELIBERANDI, in Scotch law, was meant to signify the period of a year allowed to an heir to deliberate whether he would accept the inheritance with the burden of his predecessor's debts. The year commenced on the death of the ancestor, unless in the case of a posthumous heir,

when the year ran from the birth of the heir himself. But by a recent act of parliament—the 21 and 22 Vict. c. 76, sec. 27—it is provided that all proceedings 'against an apparent heir on account of his ancestor's debt or obligation, for the purpose of attaching the ancestor's heritable estate, and actions of adjudication against such heir on account of his own debt or obligation, for the purpose of attaching such estate, may be insisted on at any time after the lapse of six months from the date of his becoming apparent heir, any law or practice to the contrary notwithstanding.'

ANOBIUM. See BORER and DEATH-WATCH.

A'NODE [Gr. *ana*, upward, and (*h*)*odos*, a way], a term introduced into the science of electro-chemical decomposition (electrolysis) by Dr Faraday to designate the positive pole, or that surface by which the galvanic current enters the body undergoing decomposition (electrolyte). The negative pole, or that surface by which the current leaves the electrolyte, is called in the same nomenclature the *cathode* [*kata*, downward, and (*h*)*odos*]. *Electrode* is the general term applied to either of these. The elements of electrolytes are called *ions* (*ion*, going). Such as go to the A. receive the name of *anions*, and those passing to the cathode, *cations*. Thus, in the decomposition of water by the passage into it of a galvanic current through two platinum plates, the water is the electrolyte; the platinum plate connected with the copper end of the battery is the A.; and the one connected with the zinc end, the cathode. The oxygen and hydrogen which are disengaged are the *ions*; the oxygen separating at the A. is the anion; and the hydrogen at the cathode, the cation. Anions and cations are more generally known under the name of electro-negative and electro-positive substances; but as these terms are considered by Dr Faraday to imply certain supposed attractions for the positive or negative pole, the other terms have been employed by him to describe simply the part the substances play in electrical decomposition.

A'NODYNE (Gr. *a*, privative, and *odynē*, pain), a medicine given to assuage pain. Properly, the term is applied to medicines, such as opium, which act on the nervous system, so as to decrease sensibility and induce sleep.

ANOINTING. See CHRISM, CORONATION, EXTREME UNCTION.

ANOMALISTIC YEAR is the interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth takes after leaving any point of the heavens to return to it again; but the disturbing influence of

Elliptical Orbit.

the other planets causes the perihelion to advance slowly (11" S annually) in the direction of the earth's motion; so that the A. Y. is longer (4 minutes 39

seconds) than the sidereal. This will be better understood from the accompanying diagram, in which A'B'B' represents the elliptical orbit of the earth; S, the sun; A, the perihelion; and AB, the longer axis. When the earth, after leaving A, comes back to it again, after having completed a sidereal revolution, it finds the longer axis AB, and with it the whole ellipse, advanced to A'B', and it has still to describe an arc of 11" 8 before it reaches its second perihelion A'. The length of the A. Y. is 365 days, 6 hours, 13 minutes, 49 seconds. It receives its name from the anomaly (q. v.).

ANOMALY (Gr. *anomalia*, irregularity), the angle measured at the sun between a planet in any point of its orbit and the last perihelion. In the figure in the preceding article, if P be a planet, A'B'B' its orbit, S the sun, and A the perihelion, the angle ASP' is the anomaly. It is so called because it was in it that the first irregularities of planetary motion were discovered. The anomaly was formerly measured from the aphelion, the opposite point of the ellipse; but from the fact that the aphelia of most of the comets lie beyond the range of observation, the perihelion is now taken as the point of departure for all planetary bodies.

ANONA. See CUSTARD-APPLE.

ANONACEÆ, a natural order of Dicotyledonous or Exogenous plants, of which the type is the genus *Anona*. They are trees or shrubs, with alternate, simple, generally entire leaves, destitute of stipules; flowers usually green or brown, axillary, solitary, or two or three together; the calyx of 3—4 persistent sepals; the corolla of 6 hypogynous leathery petals, in two rows. The stamens are generally numerous; the filaments short; the anthers adherent, turned outwards, and with a large 4-cornered *connective*. See STAMEN. The carpels are usually numerous, separate or cohering; the styles short; the stigmas simple; the ovules inverted. The fruit consists of distinct or united carpels, sometimes succulent; the seeds attached to the suture; their external covering brittle; the embryo minute, in the base of the hard albumen.—There are about 300 known species, mostly natives of tropical countries. They are generally aromatic and fragrant in all their parts, and some species are employed medicinally; the dry fruit of *Xylopia aromatica* is commonly used as pepper by the African negroes, and was formerly imported into Europe as ETHIOPIAN PEPPER or GUINEA PEPPER. The flowers of some species are of exquisite fragrance; others yield delicious fruits. See CUSTARD-APPLE and CHERIMOYER.

ANONYMOUS (Gr. nameless), a term applied to a book the author of which does not give his name; when an assumed name is given, the term PSEUDONYMOUS is used. Works of this class constitute one of the great difficulties of bibliography. French literature possesses an excellent *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (2d ed., 4 vols. Par. 1822—1825) by Barbier, embracing the titles of about 24,000 works, with the names of those who are known or assumed to be the authors. A similar work for English literature is understood to be in preparation by Mr Halkett, Keeper of the Advocates' Library, Edinburgh.

In Great Britain, political articles are always A., as is also most of the periodical criticism; but on the other side of the Channel, this practice, especially under the present régime, is far from being common. It is generally admitted, that anonymity secures the independence of the critic, and enables him to write with greater freedom, vigour, and power; but it is not less true that he frequently abuses his advantage, and gratifies, under the veil of the A., the worst passions of his nature. Perhaps the most intolerable

abuse of anonymity is the anonymous letter. The miseries, anxieties, and terrors which this cowardly method of assailing people has occasioned, must excite against it the indignation and abhorrence of all honourable-minded men.

ANOPLOTHERIUM (from the Greek *α*, private; *hlopion*, armour; and *therion*, a beast), a genus of extinct Pachydermatous quadrupeds (see PACHYDERMATA), established by Cuvier from bones occurring in great abundance in the gypsum strata of the Upper Eocene (q. v.) formation, near Paris. They are found also in the same formation in the Isle of Wight and elsewhere. The teeth differ from those of all other Pachydermata, extinct or recent. There are six incisors, two canines, eight pre-molars, and six molars in each jaw—the dental formula thus agreeing with that of the fossil genus *Palaotherium* (q. v.); but the teeth are arranged in a continuous series without intervening vacancies—a circumstance very remarkable, as it does not occur in any existing quadruped, but now appears in man alone. The molars of the upper jaw are quadrangular, those of the lower marked with a double or triple crescent of enamel, which forms prominent ridges. In some respects, the teeth resemble those of the *Ruminantia* (q. v.), or ruminating quadrupeds, between which and the Pachydermata the A. has been thought to form a connecting link; but in some of the species originally

Anoplotherium.

included in this genus, and which are now sometimes ranked along with it under the name *Anoplotheroids*, the teeth exhibit peculiarities which have led to the supposition that their food may not have been exclusively vegetable. The snout is not much elongated, and it is evident that there was no proboscis. The feet are terminated by two toes, as in the *Ruminantia*; but they have always separate metacarpal and metatarsal bones, not a single *canon* bone. A considerable number of species of A. and of Anoplotheroids have been determined, differing in size from that of a small ass to that of a hare, or even of a guinea-pig; so that the smallest species must have been smaller than any hoofed quadruped now existing, or any known to have ever existed. They differ also considerably in general appearance, some having had comparatively long limbs and a light and graceful form, whilst some were firmly built and heavy. Their habits may be supposed to have differed accordingly. The true Anoplotheria were probably very similar in habits to tapirs. The powerful and flattened tails of some species are supposed to indicate a peculiar adaptation for aquatic life. Some of the Anoplotheroids have smaller supplemental toes, besides the two hoofs. They form the genera *Dichodon*, *Dichobuncl*, *Xiphodon*, and *Microtherium*.

ANOPLURA, the name given by Leach to an order of insects called *Parasita* (q. v.) by Latreille, Cuvier, &c.—part of the *Aptera* of Linnaeus—and of which the type is the genus *Pediculus* or LOUSE (q. v.).

ANQUETIL-DUPERRON, ABRAHAM HYACINTHE, an oriental scholar, was born at Paris, December 7, 1731. He commenced the study of theology in his native city, and afterwards prosecuted it at Auxerre and Amersfort. But his love of oriental languages drew him back to Paris, where he was assisted by the Abbé Sallier, Overseer of the Manuscripts in the Royal Library. As he now possessed a tolerable knowledge of Hebrew, Arabic, and Persian, he enlisted as a private soldier for India in 1754, to gratify his passion for learning; but Malesherbes and the Abbé Barthélemy rescued him from this degradation, and enabled him, through the royal munificence, to proceed independently. After his arrival in India, he traversed a great part of the peninsula, but finally fixed his residence at Surat, where there was a colony of Parsees, or fire-worshippers, with whose priests he soon became so intimate, that they not only instructed him in the doctrines of Zoroaster, but also gave him some of their sage's books, written in Zend, in Pehlvi, and in Sanscrit. In 1762, he returned to Europe, having collected one hundred manuscripts, along with other curiosities. The Abbé Barthélemy now obtained for him a situation in the Bibliothèque Royale, and in 1763 he was elected a member of the Académie des Belles-Lettres. In 1771, he published his *Zend-avesta*, in 3 vols., which contained the results of his researches. It consists of a literal translation of the *Vendidad*, as well as other sacred books of the Parsees, preceded by a narrative of his travels. This work created a great sensation when it first appeared. Until then, our only knowledge of the doctrines of the ancient Persians had been obtained from Greek and Roman sources, hostile Mohammedans, and eastern nations of a later origin. But A. now presented to the investigation of Europeans the original records of these doctrines, or, at least, records of incontestable authority. Unfortunately, his zeal far surpassed his patience and sagacity. He had not a sufficient mastery over the languages from which he translated. His translations are, consequently, anything but accurate. Since A. wrote, great advances have been made in oriental scholarship, and his labours are now in a great measure superseded. Among his other works we may mention his *Legislation Orientale*, 1778; *Recherches Historiques et Géographiques sur l'Inde*, 1786; *La Dignité du Commerce et de l'état du Commerçant*, 1789; *L'Inde en Rapport avec l'Europe*, 1790; *Oupnek'hat* (a selection from the theological portion of the Vedas), 1804. He died at Paris 17th January 1805.

ANSE, a name sometimes given to the handles of a cannon. These handles, especially in some foreign cannon, are cast in the forms of dolphins or serpents.

ANSELM of Canterbury, a scholastic philosopher, was born at Aosta, in Piedmont, in 1033. He led at first a dissipated life; and, like Abelard, wandered through France, after the fashion of the scholars of those days, disputing wherever he could find an adversary. Attracted by the reputation of Lanfranc, he went, in 1060, to study at the monastery of Bec, in Normandy. Three years after, he became prior, and in 1078, abbot of this monastery, the most famous school of the 11th c. Lanfranc, who in the meantime had gone to England, and become Archbishop of Canterbury, died in 1089; and the diocese remained four years without a successor, till, in 1093, A. was appointed. He was distinguished both as a churchman and a philosopher. His numerous embroilments with William Rufus and Henry I., and the unbending spirit which he displayed in these, even when subjected to banishment,

indicate the vigour and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. In 1720, Clement XI. expressly placed him in the list of church authorities. A. was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill, and equal to the most eminent in virtue and piety. Embracing, without question, the doctrines of the church, mostly as stated by Augustine, and holding that belief must precede knowledge, and must be implicit and undoubting; he yet felt the necessity of a religious philosophy, urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologium sive Exemplum Meditandi de Ratione Fidei*. In his *Prologium*, otherwise entitled *Fides quærens Intellectum* (Faith Seeking Intellect), he strove to demonstrate the existence of God from the conception of a perfect being. This ontological proof, however, has never been held satisfactory. His writings, *Cur Deus Homo*, and *De Concordiâ Præscientiæ et Prædestinationis*, made an epoch in Christian philosophy. A. may justly be reckoned the earliest of the schoolmen, although Alexander of Hales (q. v.) was the first who completely systematised in the scholastic manner the doctrines of the Catholic Church. He died 21st April 1109, and was buried at Canterbury near his predecessor, Lanfranc. The day of his death is observed in the Roman Catholic Church.

ANSER. See ANAS and GOOSE.

ANSGAR, or ANSCHARIUS, styled the Apostle of the North, on account of his labours to introduce Christianity into Denmark, Sweden, and Northern Germany, was born in Picardy about the year 801 A. D. Under the patronage of Louis le Débonnaire, he went, with his colleague Audibert, to preach the doctrines of Christianity among the heathen Northmen of Schleswig, where he suffered many persecutions; but had nevertheless such success that, in 832, the pope established an archbishopric in Hamburg, and A. was appointed the first archbishop. Here he passed through many difficulties, having to save his life by flight in 845, when the Northmen and Danes under Eric I. plundered Hamburg. He afterwards made several missionary tours in Denmark and Sweden, and died February 3, 864, at Bremen, where a church was named after him. The Roman Catholic Church has canonised him.

ANSON, GEORGE, LORD, ADMIRAL, born on 23d April 1697, at Shugborough, in Staffordshire. From an early period he manifested a predilection for a sea-life. In 1716 he served as second lieutenant under Norris; next under Byng in 1718, against the Spaniards; and was made a captain in 1723. In 1739, when war with Spain broke out, he was recalled from the Carolina station, on which he had been placed since 1724, and received the command of the fleet in the South Sea, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and sailed from England in September 1740. The preparations for this cruise had been made in the most slovenly manner. Both vessels and stores were bad, and the sailors were old Chelsea pensioners; yet A., in spite of these disadvantages, achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. After his little fleet of seven vessels had been scattered by a storm, in doubling Cape Horn, he landed at Juan Fernandez, where he was soon joined by three of his ships, which arrived in a dismantled condition. While he remained on this island, he exhibited his native tenderness of character by the assiduity with which he cared for the

ANT.

sick, and the pains he took to increase their comforts. Under these disadvantages, he made several prizes of Spanish vessels, and especially distinguished himself by his capture of the Spanish galleon from Acapulco, with a cargo worth £400,000. After several other bold adventures, he returned to England; and, sailing undetected through the French fleet which lay in the Channel, arrived at Spithead, June 15, 1744, having circumnavigated the globe after a cruise of three years and nine months. His perilous voyage had great importance in extending the knowledge of navigation and geography. As a reward for his services, A. was made Rear-admiral of the Blue (1744); and in 1747, after he had gained a victory over the French admiral, Jonquière, at Cape Finisterre, was made Baron of Soberton; and four years later, First Lord of the Admiralty, in which capacity he distinguished himself not less than at sea. In 1761 he was made Admiral of the Fleet. He died June 6, 1762. Few works have been so popular as Lord A.'s *Voyage Round the World*. It has numerous readers in every civilised language. It was written by Mr B. Robins, from Lord A.'s own materials, and was carefully supervised by the latter.

ANT (*Formica*), a Linnæan genus of Hymenopterous insects, now divided into several genera, which form a family called *Formicidae*. The English name is contracted from *Emmet*, still also occasionally used. Another old English name, not now in frequent use, is *Pismire*. The species are numerous, and are generally distributed over temperate and tropical regions. Their habits and instincts are extremely interesting, and have attracted attention from remote ages.

Ants are small insects, but of extraordinary muscular strength. They carry loads of ten or twelve times their own weight, and display great activity. They have a triangular head; the antennæ are geniculate; the jaws strong; the ligula or lower lip small, rounded, vaulted or spoon-like; the thorax compressed at the sides; the abdomen nearly oval, the pedicel which joins it to the thorax forming in some kinds a single, and in some, a double scale or knot. They live in societies, often very large, which consist, as in bees, of *males*, *females*, and *neuters*. The neuters are females with imperfect ovaries, transformed at an early stage of their existence, and are distinguished into two classes, *workers* and *soldiers*, the former constituting the greater portion

kinds (*Formica* and *Polyergus*) have no sting, but have the power of ejecting a peculiar volatile acid, FORMIC ACID (q.v.), from a small sac in the abdomen; by this means effectually repelling many adversaries, to which the pungent fumes are intolerable. Small animals are soon killed by the vapour of an ant-hill; and a dog has been known to retire yelling from the effect upon his eyes, either of the vapour, or of a discharge of the fluid itself. It is said, that when those ants that are unprovided with a sting make use of their mandibles to inflict a bite, they curve round their abdomen, so as to be ready immediately to squirt this acid into the wound.

The winged ants mostly appear in autumn, and perish before the commencement of the cold weather; a few surviving to found new colonies and perpetuate the race. The neuters pass the winter in large numbers in a torpid state, and resume their activity on the return of spring. The nests of ants, after midsummer, are usually found to contain winged males and females mixed with the wingless neuters, which, however, restrain them, and particularly the females, from making their escape into the air, until the pairing season, when they ascend into it in immense swarms, those from many ant-hills sometimes uniting their myriads, rising with incredible velocity in distinct columns, and soaring to a great height. 'Each column looks like a kind of slender net-work, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them.' They occasionally, however, make their appearance in such prodigious numbers, that the air is obscured by them.—The pairing of ants is supposed to take place in the air. Some of the females which escape destruction by their enemies, or by the elements, found new colonies, in which at first they perform the work usually assigned to neuters. Some, however, are seized by the neuters of ant-hills near which they fall, and there is even reason to think that these go out to search for them; they are stripped of their wings, and forcibly conducted to the habitation, the number of whose inhabitants is to be increased by their multitudinous progeny. They are fed and treated with apparent respect, like the queen-bee among bees; but a society of ants, unlike one of bees, often contains numerous females, each thus treated and equally employed in the important work of laying eggs. Unlike the queen-bees, also, they are invariably denuded of their wings; nor is this always done by the neuters, to prevent their escape, but the female ant, after fecundation, has been seen to denude herself of her own wings, as now superfluous appendages.

The eggs of ants are so small as to be scarcely visible to the naked eye. The mother drops them at random in her progress through the nest; but the workers, of whom some are always in attendance on her, immediately seize them, moisten them with their tongue, and lay them in heaps in particular apartments of the nest. They continue to watch them, and to remove them from one quarter of the nest to another, apparently in order that they may always enjoy a suitable temperature, and perhaps in order to avoid any excess of moisture. In a few days, the young larvæ are produced; and these require the unremitting care of the workers, which feed them, disgorging into their mouths, for this purpose, a viscid substance, supposed to be the ordinary food of the species, prepared for their use by a sort of half digestion. They are also extremely careful to keep the young brood clean, by constant application of their tongue and mandibles; and a great amount of labour is daily expended upon them, in conveying them from the inner apartments of the

Ants.

1. Female; 2. Male; 3. Neuter (Worker).

of each society, the latter somewhat differing from them in larger size, and larger and more powerful head. The ordinary work of the society is performed by the workers: the principal part in warfare, defensive or offensive, is taken by the soldiers. The males and females constitute but a small portion of each community. They have delicate glistening wings; but the neuters have no wings, and the thorax is smaller and more compressed. The males are smaller than the females, and the workers are rather smaller than the males. The females and neuters of some kinds (genera *Ponera*, *Myrmica*, *Atta*, and *Cryptocerus*) are armed with stings; other

nest towards the surface after sunrise, when the weather is fine, and back again before sunset, or when the weather becomes cold, or there is a prospect of rain. The same care is extended to the pupæ. The larvæ and pupæ are the white objects which the workers are seen hastily seizing and carrying off to places of safety, when an ant's nest is broken open; and the resemblance of which, particularly of the pupæ, to grains of barley, is supposed to have contributed to the general belief, that ants amass stores of corn for winter food. The larvæ have no organs of locomotion. The pupæ are enveloped in delicate silken cocoons, and unlike those of other insects, require assistance to extricate themselves from them when they have attained their perfect state. This assistance also is afforded by the workers.

The whole supplies of food for the inmates of the nest are brought to it by the workers. The food of some kinds is exclusively or chiefly animal, that of others, vegetable. The provisions carried to their nests by the ants of Britain and other temperate countries, are now believed not at all to be intended for winter, when the creatures are entirely torpid, but only for present use; and it appears to be certain that no kind of grain forms any part of their food. But Colonel Sykes has discovered at Poonah a species of ants (*Atta providens*), which not only store up provisions, but of which the stores consist of the seeds of a species of millet. To habits of this kind the allusions in the book of Proverbs seem to be made. Virgil also speaks of the ant providing against the poverty of old age—

Inopi metuens formica senectæ.

(Georg. i. 136.)

The ant has long been a sort of proverbial type, not only of industry, but of provident care for the future. Some ants, however, collect and carry to their nests substances which are not intended for food, but for the construction of the nest, and particularly for closing its apertures in cold or wet weather. In this way they gather together small heaps of chips of wood, bits of straw, small pebbles, &c.

The vegetable substance which ants seem chiefly to use as food is sugar; and to this, wherever it is to be found, they seem to be guided by a very acute sense of smell. *Honey-dew*, the saccharine excretion of the *Aphides* (see APHIS), is a favourite food of many species; and with this are connected some of their most extraordinary instincts; for not only do they climb the plants on which the aphides abound, that they may obtain this food, but they have been seen to wait beside them for new drops, and even to touch them with their antennæ, in order to cause the drops to flow, patting the abdomen of the aphis on each side alternately and rapidly; the ant, after the drop has been obtained, passing on to another aphis. The whole process has been likened to the milking of cattle. Even more wonderful things are asserted on this subject, as that particular ants seem to regard particular aphides as their own property, and are ready to fight in defence of their right to them—that, to secure them for themselves, they convey them from one place to another—and that the *Aphis radicum*, which derives its nutriment from the roots of grass and other plants, is actually kept in large numbers in the nest of the Yellow Ant (*Formica flava*), in order that there may be always at hand a copious supply of food, these aphides and their eggs sharing the solicitude of the ants equally with their own eggs and young. Things so wonderful are ascertained beyond dispute in regard to the instincts of ants, that even such statements as these must not be hastily rejected as incredible, and certainly they express the beliefs of careful and scientific observers.
