Surface.—Three-fourths of A. is mountainous or hilly, being traversed by three great mountain chains—the Alps, Carpathians, and Sudetes (q. v.), whose chief ridges are of primitive rock. The Rhaetian and Noric Alps stretch from Switzerland to the Danube, and contain the highest points of the Austrian territories, the Orler Spitze rising to 12,779 English feet. Their height declines gradually towards the east, where the Leitha Hills (3000 feet), overlooking the plain of Vienna, form the transition to the Carpathians. This chain rises on the left bank of the Danube, near Presburg, and sweeping in a curve, first east, and then southward through Transylvania, again meets the Danube. The highest point is Butschetje in Transylvania, where a height of 9525 feet is reached. The central part, or Tatra Mountains, are vast granitic masses, resembling the Alps in character; the highest of these is the Lomnitz, in the longitude of Cracow, 8133 feet. The Alps are accompanied, north and south, by parallel ranges of calcareous mountains, covering whole provinces with their ramifications. The Carpathians are lapt on their northern side by sandstone formations; mountains of the same character also occupy Transylvania. Springing from the north-west bend of the Carpathians, the Sudetes run through the north-east of Moravia and Bohemia, in which last the range is known as the Riesengebirge, or Giant Mountains. The boundary between Bohemia and Prussian Silesia passes over the Schneekoppe, the highest peak of these mountains, which is 5275 feet in height. Continuous with this range, and beginning on the left bank of the Elbe, are the Erzgebirge, or Ore Mountains, on the confines of Saxony; and veering round to nearly south-east, the range is further prolonged in the Bohemian-Forest Mountains, between Bohemia and Bavaria.—The chief plains of the Austrian empire are the great plains of Hungary (the smaller of these is in the west, between the offsets of the Alps and Carpathians, and is about 4200 square miles in extent; the other, which is in the east, and traversed by the Danube and the Theiss, has an area of 21,000 square miles), and the plain of Galicia.

From the Gulf of Triest to the south point of Dalmatia, A. has a sea-line of about 1000 miles, not counting the coasts of the numerous islands, the largest of which is Veglia, 23 miles by 12. The chief lakes are the Platten See (about 400 square miles), and the Neusiedler See (about 100 miles), both in Hungary. The first is navigable by steamers, and both are rich in fish, and have fruitful vineyards around them. The Alps and Carpathians enclose numerous mountain lakes. The Long Lake in the Tatra Mountains lies at an elevation of 6000 feet. The most remarkable of all is the Zirknitz Lake (q. v.) in Illyria. There are extensive swamps or morasses in Hungary. One connected with the Neusiedler See covers some 80 square miles. A good deal has been done in draining morasses.

The leading rivers that have navigable tributaries are: the Danube (q. v.), which has a course of 849 miles within the Austrian dominions, from Passau, at the mouth of the Inn, to Orsova, on the frontier of Walachia, and receives, on the right, the Inn, Traun, Ens, Leitha, Raab, Drau, and Save; and, on the left, the March, Waag, Neutra, Gran, Theiss, Bega, and Temes: the Vistula (q. v.), with its tributary the Bug: the Elbe (q. v.), with the Moldau and Eger: the Dniester and Adige (q. v.) have no navigable tributaries; this last, which rises in the Rhaetian Alps, and flows past the famous city of

AUSTRIA.

Trent, enters Lombardy above Verona, and confers on that country the benefits of what commercial importance it possesses—being navigable only up to a point below Legnago. The Rhine only bounds the empire for about fourteen miles above Lake Constance. The Isonzo, Zermagna, Kerka, and Narenta flow into the Adriatic.

The canal system of Austria is in general not extensive. Canal construction is recent. The Vienna and Neustadt Canal, in Lower Austria, has a length of 40 miles; the Bacsor or Franz Canal, between the Danube and Theiss in Hungary, 69 miles; and the Bega Canal, constructed by the Romans, between the Bega and Temes, 53 miles. Extensive lines are still capable of being opened up, affording the only possible communication with many places now inaccessible, and, at the same time, the means of rescuing tracts of arable land from inundations.

The climate of A. is on the whole very favourable; but from the extent and diversity of surface, it presents great varieties. In the warmest southern region between 42°—46° lat., rice, olives, oranges, and lemons ripen in the better localities; and wine and maize are produced everywhere. In the middle, temperate region from 46°—49°, which has the greatest extent and diversity of surface, wine and maize still thrive in perfection. In the northern region, beyond 49°, except in favoured spots, neither wine nor maize succeeds; but grain, fruit, flax, and hemp thrive excellently. The mean temperature of the year is, at Trieste, 55° F.; at Vienna, 51°; at Lemberg, in Galicia, 44°.

The raw products of A. are abundant and various; and in this respect it is one of the most favoured countries in Europe. What one province lacks, another supplies. Its mineral wealth is not surpassed in any European country; it is only lately that Russia has exceeded it in the production of gold and silver. Mining has been a favourite pursuit in A. for centuries, and has been encouraged and promoted by the government. Bohemia, Hungary, Styria, Carinthia, Salzburg, and Tyrol take the first place in respect of mineral produce. Except platina, none of the useful metals is wanting. The mines are partly state property, and partly owned by private individuals. The value of their yearly produce was stated in 1851 at 119,664,781 florins (£11,966,478). Of this, salt yields 53 million florins; stones and earths, 40 millions; and metals, coal, and other products, 26½ millions. (In 1855, the value of metals and coal had increased to 37½ million florins.) Gold is found chiefly in Hungary and Transylvania, and in smaller quantity in Salzburg and Tyrol. The same countries, along with Bohemia, yield silver. The discovery of quicksilver at Idria (q. v.) first brought this branch of mining industry into importance. This metal is now also found in Hungary, Transylvania, Styria, and Carinthia. Copper is found in many districts—tin, in Bohemia alone. Zinc is got chiefly in Cracow and Carinthia. The most productive lead-mines are in Carinthia. Iron is found in almost every province of the monarchy, though Styria, Carinthia, and Carniola are chief seats. The production, though great, is not yet equal to the consumption. Antimony is confined to Hungary; arsenic is found in Salzburg and Bohemia; cobalt in Hungary, Styria, and Bohemia; sulphur in Galicia, Bohemia, Hungary, Salzburg, &c., though not enough to supply home consumption. Graphite is found abundantly in Bohemia, Moravia, Carinthia, &c.

The useful earths and building-stones are to be had in great profusion; all sorts of clay up to the finest porcelain earth (in Moravia, Bohemia, and Hungary), and likewise marble, gypsum, chalk,

&c. Of precious and semi-precious stones are the Hungarian opal (which passes in commerce as oriental), Bohemian garnets (the finest in Europe), cornelians, agates, beryl, amethyst, jasper, ruby, sapphire, topaz, &c.

The following table shows the principal metals and minerals produced in Austria in 1867, and their average value in florins at the place of production:

	Weight.	Value in Florins.
Gold, (Austrian pound)	3,562	2,406,041
Silver, "	81,378	3,655,644
Quicksilver, (Austrian hundredweight)	5944	723,958
Tin, "	591	31,812
Zinc, "	40,296	495,956
Copper, "	47,930	2,377,840
Lead and Litharge, "	136,668	1,770,884
Iron, raw and cast, "	5,705,761	16,709,639
Graphite, "	279,355	271,123
Mineral coal, "	103,438,330	17,332,253

A. is peculiarly rich in salt. Rock-salt exists in immense beds on both sides of the Carpathians, chiefly at Wieliczka (q. v.) and Bochnia in Galicia, and in the county of Marmaros in Hungary, and in Transylvania. The annual produce of rock-salt is greatly above 3 million cwt. Salt is also made at state salt-works by evaporating the water of salt-springs. The chief works are those at Hallstätt, Ischl, Hallein, and Hall in Tyrol. From two to three million cwt. are thus produced annually. A considerable quantity is also made from sea-water on the coasts of the Adriatic. Of other salts, alum, sulphate of iron, and sulphate of copper are the chief. There are inexhaustible deposits of coal in the monarchy; but they have not yet been rightly explored, nor are nearly all that are known yet worked. They are spread over all the provinces; but the richest are in the mountain-systems of Moravia and Bohemia. Of recent years, however, a great deal has been done to develop this particular branch of mining. A. has abundance of mineral springs, frequented for their salubrity; 1600 are enumerated, some of them of European reputation, as the sulphurous baths of Baden in Lower A., the saline waters of Karlsbad, Marienbad, and Ofen, &c.

The vegetable productions, as might be expected from the vast variety in the soil and position of the different provinces, are extremely various. Although three-fourths of the surface is mountainous, more than five-sixths is productive, being used either for tillage, meadows, pasture, or forest. Grain of all kinds is cultivated, most abundantly in Hungary and the districts south of it on the Danube; in Bohemia, Moravia, Silesia, and Galicia. Agriculture is not yet far advanced; the prevailing system is still what is called the three-field system, introduced into Germany by Charlemagne, in which a crop of winter wheat is followed by one of summer grain, and that by fallow. In Hungary, the Magyar adheres to his primitive husbandry, the German and Slave are adopting rational methods. Rice is cultivated in the Banat, but not enough for the consumption. Potatoes are raised everywhere; and in elevated districts are often the sole subsistence of the inhabitants. Horticulture is carried to great perfection; and the orchards of Bohemia, A. proper, Tyrol, and many parts of Hungary, produce a profusion of fruit. Great quantities of cider are made in Upper A. and Carinthia, and of plum-brandy in Slavonia. In Dalmatia, oranges and lemons are produced, but not sufficient for the requirements of the country; twice as much olive-oil is imported as is raised in the monarchy.

In the production of wine, A. is second only to France. With the exception of Galicia, Silesia, and Upper Austria, the vine is cultivated in all the provinces; but Hungary stands first, yielding not

The Atlas drawn by M. Pichler & A. Mayer 1848

only the finest quality of wine, but four-fifths the amount of the whole produce of the empire. The average produce of the whole empire is estimated at about 680 million gallons, which is mostly consumed by the inhabitants themselves.

Of plants used in manufactures and commerce, the first place is held by flax and hemp. Flax is cultivated almost universally; white hemp in Galicia, Moravia, and Hungary. Tobacco is raised in great quantities, especially in Hungary, which also is first in the cultivation of rape-seed. Bohemia raises hops of the first quality, which are partly exported; though other provinces require to import from abroad. The indigo plant has been lately successfully acclimated in Dalmatia. More than a third of the productive surface is covered with wood (75,000 square miles), which, besides timber, yields a number of secondary products, as tar, potash, charcoal, bark, cork, &c.

As to *animals*, bears are found in the Carpathians, Alps, and Dalmatia; wolves, jackals, and lynxes in these same districts, and also in the Banat, Croatia, Slavonia, and the Military Frontiers. The marmot, otter, and beaver are also found in Dalmatia. Game has of late sensibly diminished. The wild goat lives in the highest, the chamois and white Alpine hare in the middle regions of the Alps and Carpathians. More productive than the chase are the fisheries of the Danube, Theiss, and numerous streams, lakes, and ponds. The chief sea-fishing is in Dalmatia. Leeches, procured chiefly in Hungary and Moravia, form an article of considerable trade. For foreign commerce the most important branch of rural industry is the rearing of silk. A. produces about a quarter of a million of silk cocoons annually. The silk trade is very extensive in the Tyrol—the yearly supply of cocoons in that country being 32,000.

The breeding of *domestic animals* has not yet advanced to what the home wants require. In some districts it is excellent, in others quite neglected. Horse-breeding is promoted by what are called 'military studs.' Besides a number of imperial studs, there are a great many private establishments, especially in Hungary, for the same purpose. The supply of black-cattle is not equal to the demand; great numbers are furnished by Hungary and Galicia. The breeding of sheep, like that of horses, has been a special object of care to the government. The finer wools are furnished by Moravia, Bohemia, Silesia, Lower Austria, and great part of Hungary and Galicia. The great mass is, however, composed of what is known as middling and inferior sorts. Goats are reared chiefly in Dalmatia, and swine in Hungary. In 1851, the number of horses in the monarchy was stated at 3,220,884 (not including 75,000 belonging to the army); cattle, 10,410,484; sheep, 16,801,515; goats, 2,275,900; and swine, 7,401,300. Nearly three-fourths of the population are engaged in husbandry, so that A. is decidedly an agricultural state, though its capabilities in this respect have by no means been fully developed.

The *population* is very unequally distributed. The most populous districts are those of the south-west and of the north-west. The Alpine regions and those of the Carpathians are the sparsest; and generally the density diminishes towards the east. The Austrian empire, at the commencement of 1870, enumerated 27 cities which had a population above 20,000 inhabitants; and three with more than 100,000—Vienna at that date counting 834,251 inhabitants. The population of Austria embraces a greater number of races, distinct in origin and language, than that of any other European country except Russia. The proportions in this respect are here given from the official statements of 1870.

The Slaves are the most numerous race, amounting to 16,219,000, nearly 50 per cent. of the whole population in 1870. They form the bulk of the population of Bohemia, Moravia, Carniola, Dalmatia, Croatia, Slavonia, the Military Frontiers, the Woiwodina, the north of Hungary, and Galicia. They are, however, split up into a number of peoples or tribes, differing greatly in language, religion, culture, and manners; so that their seeming preponderance in the empire is thus lost. The chief branches of the Slavic stem are the northern Czechs (the most numerous of all), Ruthenes, and Poles, and the southern Slowens, Croats, Serbs, and Bulgarians. The Germans numbered 9,010,000, or about 25 per cent. They are dispersed over the empire, but predominate most in the duchy of A., Salzburg, Tyrol, Styria, Carinthia, the west of Hungary, &c. The Romanic peoples (speaking languages derived from that of ancient Rome) amounted to 3,456,000, or fully 9½ per cent., and are divided into western and eastern. To the first, the Germans give the general name of *Welsch*. They consist of Italians, inhabiting the south of Tyrol, Istria, and Dalmatia; the Ladins (Latins), occupying some valleys in Tyrol; and the Friauls about Görz, north of Trieste. The eastern Romans are the Valaks or Walachians, styled by themselves *Rumuni*, who are found in Transylvania, Hungary, the Woiwodina, Bukowina, and Military Frontiers. The Magyars, or Hungarians proper, numbered 5,431,000 (over 15 per cent.): they are located chiefly in Hungary and Transylvania; also in the Woiwodina, and a few in Croatia and Slavonia. The small remaining portion are composed chiefly of Jews, Armenians, and Bohemians or gipsies; and collectively they number 1,354,000, which is pretty nearly 3¼ per cent.

As to *religion*, the great bulk of the nation is Roman Catholic. At the beginning of 1870 there were 23,954,233 Roman Catholics; of Greeks in union with the Church of Rome there were 3,941,796; not in union, 3,050,830. The Protestants of all denominations numbered 3,570,989; and the Jewish persuasion claimed 1,375,861. The Church of Rome has 11 archbishoprics and 57 bishoprics, and an army of secular priests. At the accession of Joseph II., there were 2024 convents; but at the end of the French war (1816), they had been reduced to 800. There are at present nearly 300 abbeys, and above 500 convents in the empire.

Education, since 1849, is under the care of a minister of Public Worship and Instruction. As compared with other German states, the education of A. presents some peculiarities. There is a greater prevalence of establishments where the pupils both live and receive instruction; also of schools for special callings. Instruction, again, whether high or low, is mostly gratuitous, or of trifling cost, being provided from general or local public funds. The government has recently made liberal allowance for elementary education. Another peculiarity is the sway of the clergy, both in schools and universities. The primary schools are entirely in their hands. The Jesuits, banished in 1848, have been allowed to return, and have had their schools restored. The number of elementary schools has increased greatly in recent times. In German Austria the law enforces compulsory attendance at the 'Volks-schulen,' or national schools, of all children between the ages of six and twelve; and parents are liable to be punished for neglecting to send them. Hungary is still backward in elementary education. There are seven universities in the empire. They are at Vienna, Prague, Gratz, Innsbrück, Pesth, Cracow, and Lemberg. The first four of these are classed among German universities, and were attended as follows, in the summer term of 1872:

AUSTRIA.

	Vienna.	Prague.	Gratz.	Innsbruck.
Professors and Teachers—				
Ordinary Professors, . . .	68	43	40	41
Extraordinary Professors, . . .	38	22	19	7
Assistant Professors, . . .	86	21	17	9
Teachers of Languages, &c., . . .	8	6	3	1

Faculty of Theology, . . .	198	207	103	197
“ Jurisprudence, . . .	1304	640	312	104
“ Philosophy, . . .	697	265	143	148
“ Medicine, . . .	1383	500	292	79
Total Matriculated Students,	3564	1612	850	523
Non-Matriculated Students,	317	97	76	81
Total,	3881	1709	926	612

The university of Pesth had in the same year 53 professors and 1700 students; Cracow and Lemberg, the universities of Galicia, and the other Slavonian provinces, numbered 70 professors and 1800 students. There are also a large number of establishments where the pupils are received young, and educated and trained for special professions, for the army and navy, for the counting-house, for the mine and the farm, as accoucheurs, &c. There are besides a large number of institutes for the promotion of science and art. The fruits of this extensive educational system are not what might be expected, in consequence of the priestly and monarchical restrictions which hedge it round. The chief libraries are the Imperial and University libraries of Vienna. There are in the whole monarchy 362 newspapers and other periodical prints; of which only 134 are political. Fully the half are in German; but the whole are fettered by conditions which render them quite worthless as organs of public opinion.

The *manufacturing industry* of A. is not yet adequately developed. The annual value of its manufactures—not including small trades—is estimated at 1000—1200 million florins, while that of its husbandry may reach 3000 millions. Bohemia takes the lead in this industry, then follow Austria proper, Moravia and Silesia, and Hungary. Vienna is the chief seat of manufacture for articles of luxury; Moravia, Silesia, and Bohemia for linen, woollen, and glass wares; Styria and Carinthia for iron and steel wares. The chief manufactured articles of export are those of silk and wool; the only others of consequence are linen twist, glass wares, and cotton goods. The yearly value of manufactured iron is about 54 million florins. The glass wares of Bohemia are of special excellence. The hemp and flax industry is one of the oldest and still most important. No branch of industry has risen more rapidly than that of cotton. The annual value of the silk industry is estimated at 60 million florins. The manufacture of tobacco is a state monopoly, and brings a revenue of nearly sixty million florins. The salt monopoly secures 18 millions.

In respect of *commerce*, A. is most unfavourably situated. High mountains oppose great obstacles on all hands to communication, and separate the producing districts from the only sea that touches the empire; while the chief navigable rivers have their mouths in other countries. Much has been done to remedy these obstacles. Since 1809, a length of 19,000 miles of highways has been made. The great Alpine roads over the Stelvio Pass, the Splügen, and the Semering (q. v.), are among the most remarkable constructions of our times. The first railway opened in A. extends from Linz on the Danube north to Budweis on the Moldau, and south to Wells and Gmunden. It is worked by horse-power. The state, in 1841, resolved to undertake the construction of railways, and since then a great extent has been laid down. The principal lines are from Vienna to Grätz, from Grätz to Cilly, thence

to Triest; from Vienna to Stockerau, and thence to Bruck; and from Vienna to Brunn, thence to Olmütz and Prague. In Hungary, the chief lines are from Pesth to Szolnok, and from Pesth to Presburg, *vid* Waitzen, thence to Tyrnau. The total length of railways in the empire open for traffic at the beginning of 1870 was 4517 English miles. The length of lines under construction was 1696, and the length for which concessions had been granted at that date was 1719 English miles.

The length of the telegraph lines in the empire in 1870 was about 44,197 English miles.

River-communication received a great impulse from the introduction of steam. By means of the Danube Steam-company, formed in 1850, and a second company (1852) confined to tug-navigation, passengers and goods are now conveyed on the Danube between Ulm and Galatz, and on to Constantinople. The Austrian Danube Steam-company has a fleet of steamers plying on the Danube, the annual receipts from conveyance of goods being more than 7 million florins. This traffic would be vastly greater were the Lower Danube freed from the influence of Russia.

A great number of the political impediments to commerce have been removed or diminished. The customs-boundary that separated Hungary and the adjoining provinces from the rest of the empire, was done away in 1851, so that the whole is included in one customs-district, with the exception of Dalmatia, which still forms a small district by itself. The tolls that obstructed the navigation of the Elbe and the Danube have also been removed by means of conventions with the states through which they pass. By the new tariff, which came into partial operation in 1852, A. has passed from a prohibitive to a protective system. No article is admitted duty-free; but absolute prohibition is confined to articles of state monopoly (salt, powder, and tobacco). Goods for mere transit or transhipment pay no duty. But the foreign commerce of A. is nothing compared with that between the different provinces. The great centre of this internal commerce is Vienna; other important markets are Linz, Prague, Lemberg, Brody, Pesth, Gratz. The imports and exports of merchandise and bullion for the whole of the empire, except the province of Dalmatia, which, as has been mentioned, is not within the imperial line of customs, were tabulated as follows for 1870 and 1871:

	Merchandise, Florins.	Bullion and Coin, Florins.
IMPORTS—		
1870,	421,588,651	41,056,447
1871,	525,737,301	59,803,052
EXPORTS—		
1870,	391,477,615	34,061,026
1871,	498,560,123	63,107,832

The principal article of import is raw cotton, which amounted to the value of 38,506,920 florins in 1870. Next in importance is the import of iron, which was received by the empire to the amount of 27,401,833 florins. The silk manufactures imported the same year were estimated at 20,172,400 florins' worth. The most important articles of export are corn, flour, instruments, and machines. The last two were exported in 1871 to the value of 6,373,063.

The chief harbours of A. are those of Istria—Triest, Rovigno, Pirano, Citta Nuova, &c.; of Croatia—Fiume, Buccari, Novi; of Dalmatia—Zara, Spalato, Ragusa, Cattaro, Curzola, &c.

As to *form of government*, A. is a monarchy hereditary in the House of Hapsburg-Lothringen. In the case of the reigning family dying out, the states of Bohemia and of Hungary have the right of choosing a new king; but for the other crown-lands,

the last sovereign appoints his own successor. The reigning House must profess the Roman Catholic faith.

Till 1848, Hungary and Transylvania had a constitution limiting the monarchy, which was absolute for the rest of the empire; though the several provinces had each its consultative council composed of clergy, nobles, and burghers. After the Revolution of 1848, and the subsequent reaction, all marks of independence of the separate provinces disappeared. The imperial constitution granted (*octroyirtz*) March 4, 1849, as well as the provincial constitutions that followed, were abolished, and government was organised in the most absolute form by the imperial 'patent' or charter of December 31, 1851. The patent guaranteed to every religious body recognised by law protection in the observance of public ordinances, in the management of its own affairs, and in the possession of buildings and funds for the purpose of worship and instruction. The relation of the Roman Catholic Church to the state was put upon a new footing. It was no longer under the oversight of the secular authority, the *placetum regium* and church-patronage were abolished, ecclesiastical jurisdiction for discipline, and the independent administration of church-property, were conceded, and the intercourse of bishops and of all Catholics with Rome left free. The clergy had no longer to submit to examination or tests on the part of the state; they were nominated by the state, but only with the concurrence of the bishops, and without that concurrence they could not be deprived of their office. Along with all this, they obtained an overwhelming influence over education, even in the universities; and by the concordat signed in the early part of 1856, this influence was very greatly increased. The patent further guaranteed the equality in the eye of the law of all citizens, irrespective of nation, rank, or religion, and the liberation of the land from all serfdom. Subsequent patents (e. g. for Hungary, Croatia, &c. in 1853) regulated the claims between existing proprietors and their vassals, and determined the indemnities due to the former for their seigniorial rights.

But since the year 1867, Austria has been reconstructed as a twofold empire, consisting of a German or 'Cisleithan' monarchy, and a Magyar or 'Transleithan' kingdom. The former is generally known as Austria proper, and the latter as Hungary. Each of the two countries has its own laws, parliament, ministers, and government; and the formal tie between them is a body known as the Delegations. These form a parliament of 120 members: the one-half is chosen by the legislature of German Austria, which is represented by it, and the other half represents Hungary. The person of the sovereign is another knot in the tie between the two members of the empire. The Magyars claim, under certain conditions, the right of freely electing their monarch. The Delegations have jurisdiction over all matters affecting the common interests of the two countries, especially foreign affairs, war, and finance; the ministries of which three departments are responsible for the discharge of their official functions to the Delegations, a committee of whom sits permanently. The acts of the Delegations require to be confirmed by the representative assemblies of their respective countries; and in this manner it is attempted to leave the self-government of both Austria proper and Hungary free.

The administration of Austria proper is divided at present among nine ministries—Foreign Affairs, Police, Public Education, Agriculture and Public Works, Finance, Interior, War and Navy, Commerce, and Justice. Formerly the ministry was merely the collective organ of the emperor, and was

responsible to him alone. But a bill passed by the Reichsrath in 1867, and sanctioned by the emperor, renders it responsible to that parliament of the western empire.

The Reichsrath consists of an upper and a lower house. The upper house is constituted by princes, nobles, archbishops, bishops, and life members nominated by the emperor. The lower house numbers 203 members, elected by the 14 provincial diets of the empire in the following proportions: Bohemia, 54; Dalmatia, 5; Galicia, 38; Higher Austria, 10; Lower Austria, 18; Salzburg, 3; Styria, 13; Carinthia, 5; Carniola, 6; Buckowina, 5; Moravia, 22; Silesia, 6; Tyrol and Vorarlberg, 12; Istria and Trieste, 6. The members of the Reichsrath are elected in the Provincial Diets, and no one who is not a member of one of these is eligible to the wider sphere of legislation. The emperor nominates the Presidents and Vice-presidents of both houses. The rights claimed by the Reichsrath are: 1. *Consent* to all military laws; 2. *Co-operation* in legislature affecting trade and commerce, customs, banking, posting, telegraphs, and railways. 3. Examination of the estimates, and general control of the public debt. To give validity to bills passed by the Reichsrath, the consent of both chambers is required, as well as the sanction of the emperor.

The executive of Hungary is carried on in the name of 'the king' by a responsible ministry.

Finance.—The protracted wars of the first 15 years of the 19th c. had so exhausted the resources of A., and shattered her credit, that paper-money, after being already twice reduced, had again sunk to 25 per cent. of its nominal value; and even 5 per cent. loans could only be obtained at a sacrifice of sometimes more than 50 per cent. During the 30 years that followed the war, much was done to restore the state credit, and 4 per cent. state paper was bought at par. The revolution of 1848 brought new difficulties, from which the finances had not recovered, when the Crimean war increased the expenditure; the Italian war must have added to it enormously; and the war with Prussia in 1866 threatened ruin to the empire.

The estimated revenue for 1871 was 17,607,859 florins; and the estimated expenditure, 122,501,173; shewing a deficit of 104,833,314 florins. The Budget estimates for the common affairs of the empire, for 1872, were—revenue, 17,208,833; expenditure, 110,647,498 florins; leaving a deficit of 93,438,615. To cover this latter deficit, the Austrian monarchy contributed 65,407,315; and the kingdom of Hungary, 28,031,584 florins. On the 1st July 1871, the national debt of the Austrian empire was 3,065,269,072 florins, or £306,526,906 sterling.

History.—The nucleus around which this great empire has grown was that part of the Archduchy of A. that lies below the Ens. In the age of Charlemagne, about 800, the defence of the south-eastern frontier of Germany against Asiatic hordes gave rise here to a Margraviate, called the Eastern Mark or boundary of the empire, or Ostreich (Austria), the eastern government; which, being united in 1156 to the country above the Ens, was raised to a duchy. After coming, in 1282, into the possession of the House of Hapsburg (q.v.), it rapidly rose to a powerful state. The princes of that House extended their dominion by marriage, purchase, and otherwise, over a number of other states, and from 1438 held almost uninterruptedly the throne of the German empire. By the acquisition (1526 and 1527) of the crowns of Bohemia and Hungary, the House of A. rose to the rank of a European monarchy. In 1801, Francis

* As the history of A. and its rulers involves, for many centuries, the main strand of the thread of European history, it is given at somewhat more than the usual length.

declared himself hereditary Emperor of A., and, two years afterwards, laid down the title of Emperor of Germany and King of the Romans.

In the earliest times, what is now the Duchy of A. was inhabited by the Taurisci, a Celtic people; but their name subsequently disappeared before that of the Norici. After the conquest of the Norici by the Romans (14 B.C.), the country to the north of the Danube belonged to the kingdom of the Marcomanni (q. v.); on the south of the river lay the Roman provinces of Noricum and Pannonia, in which last was the municipal city of Vindobona (Vienna). Tyrol formed part of Rhetia. All these boundaries were swept away by the irruption of the northern peoples; and the regions in question were occupied in succession, during the 5th and 6th centuries, by Boii, Vandals, Goths, Huns, Lombards, and Avari. After the Lombards had settled in Italy, the Enns came, about 568, to be the boundary between a tribe of German origin and the Avari, a people who had penetrated thither from the east. The Avari having, in 788, crossed the Enns, and fallen upon Bavaria, then part of the Frankish empire, Charlemagne drove them back (796) as far as the Raab, and united the district from the Enns to that river with Germany, under the name of the East Mark, *Marchia Orientalis*, or Austria. He sent colonists, mostly Bavarians, into the new province, and appointed over it a margrave. It came into the possession of the Hungarians in 900, but was reconquered by Otto I. in 955, and reunited with Germany.

As margrave of the reconquered province, the emperor, in 983, appointed Leopold of Babenberg (q. v.), whose dynasty ruled A. for 260 years. Under Henry Jasomirgott (1141—1177), the Mark above the Enns was annexed to the Lower Mark, the united province raised to a duchy, and important privileges conferred on the newly named duke and his heirs. This Henry Jasomirgott took part in the second crusade; he also removed the ducal residence from Leopoldsdorf to Vienna, now first called a city, and began the building of the cathedral of St Stephen. Under his successors, numerous additions (Styria, Carniola) were made to the possessions of the House. Leopold VI. undertook numerous expeditions against the Hungarians and the infidels, and is reckoned the best of the Babenberg princes. The line became extinct with his successor, Frederic, who fell in battle with the Magyars (1246).

Then followed an interregnum from 1246 to 1282. The Emperor Frederic II. at first treated the duchy as a lapsed fief of the empire; shortly, claims were set up by Count Hermann of Bavaria, who was married to a niece of the deceased margrave, Frederic; and when Hermann died, and the empire was distracted by the contests between rival emperors, the 'States' of A. and Styria chose Ottokar, son of the Bohemian king, as duke, who made good his nomination about 1260. Ottokar, refusing to acknowledge Rudolf of Hapsburg as emperor, was defeated, and lost his life and possessions, in the battle of Marchfeld (1278); and the emperor shortly afterwards (1282) conferred the duchies of A., Styria, and Carinthia on his son Albrecht.

The accession of the Hapsburg dynasty with Albrecht I. (q. v.) was the foundation of A.'s subsequent greatness. The despotic Albrecht contended successfully with Hungarians and Bavarians, but while attempting to subdue the Swiss, he was murdered near Rheinfelden (1308) by his nephew, John of Swabia, whom he had deprived of his hereditary possessions. Of his five sons, Frederic was chosen (1314) by a party to the imperial throne, but was defeated (1322) by his rival, Ludwig of Bavaria. Duke Leopold was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons that had thrown

off their allegiance to Albrecht I. At last, by the death of all his brothers, Albrecht II. reunited the Austrian possessions, increased by various additions. After his death (1358), two sons, Rudolf and Albrecht III., successively followed in the Duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach, in seeking to regain the Hapsburg possessions in Switzerland. The posterity of Albert and Leopold formed the two lines of A. and Styria. During Albrecht III.'s reign, Tyrol and other districts were ceded to Austria. After his death (1395), the dukedom was held by his son, Albrecht IV. Albrecht V., who succeeded his father in 1404, by marrying the daughter of the Emperor Sigismund, succeeded (1438) to the thrones of Hungary and Bohemia, and was at the same time raised to the dignity of German Emperor, as Albrecht II. With his death, in 1439, Bohemia and Hungary were for a time lost to the House of A., as were also, after a bloody struggle, the last of the family possessions in Switzerland. But the imperial dignity was henceforth uninterruptedly held by them. With Ladislaw, Albrecht's son, the Austrian line of the House closed (1457), and their possessions went to the Styrian line. Of this line was the Emperor Frederic III., who raised the dignity of his House by making A. an archduchy. After the death of Ladislaw and of his own brother, Albrecht, Frederic came into the undivided possession of the archduchy (1464).

His son, Maximilian I., by marrying Maria, daughter of Charles the Bold, acquired (1477) the Netherlands. Becoming emperor on the death of his father (1493), he ceded the government of the Netherlands to his son Philip. Under Maximilian, Tyrol fell again to the chief branch of the House of A., several districts were acquired from Bavaria, and fresh claims were established on Hungary and Bohemia. The court of Vienna began to be the seat of German art and science. The marriage of the emperor's son Philip with Johanna of Spain set the House of Hapsburg on the throne of Spain and the Indies. Philip died in 1506; and on the death of Maximilian I., in 1519, Philip's son, Charles I. of Spain, was elected German emperor as Charles V. (q. v.). Charles resigned by treaty all the German possessions, except the Netherlands, to his brother, Ferdinand I. (q. v.).

Ferdinand I. had married the sister of Lewis II. of Hungary; and on the death of the latter in the battle of Mohacz (1526), he claimed the kingdoms of Hungary and Bohemia, along with Moravia, Silesia, and Lausatia. His claim was contested by John Zapolya, who secured the aid of Sultan Soliman II.; and Ferdinand, after contests extending over twenty years, had finally to pay an annual tribute of 30,000 ducats to Soliman for possession of Lower Hungary. Ferdinand was also fain to surrender Würtemberg to Duke Ulrich (1534), on condition of its reverting to A. on the death of the male line. Nevertheless, the possessions of the House of A. (in the German line) were at this time already of the extent of 110,000 square miles. On the abdication of Charles V. (1556), Ferdinand succeeded to the imperial dignity; he died 1564, with the reputation of a good ruler, though he was strongly conservative of everything established, and introduced the Jesuits.

In the partition of the inheritance that took place among his three sons, the eldest, Maximilian II., received the imperial crown along with A., Hungary, and Bohemia; the second, Ferdinand, Tyrol and Upper A.; the third, Karl, Styria, Carinthia, &c. Maximilian was more fortunate in Hungary than his father. The death of Soliman before Szigeth (1566) led to a truce; he got his eldest son, Rudolf, crowned king of Hungary in 1572, and shortly after, of

Bohemia, and also chosen king of Rome. But his attempt to bring the crown of Poland into his House failed. Maximilian II. was fond of peace, tolerant in religion, and a just ruler. He died 1576; and of his five sons, the eldest, Rudolf II., became emperor. Under him, the possessions of the Archduke Ferdinand of Tyrol, who had married Philippine Welsper (q. v.), the beautiful daughter of an Augsburg burgher, reverted to the other two lines, Ferdinand's children not being considered noble. Rudolf II. adhered to the old feudal usages, and was a negligent sovereign, leaving everything to his ministers and the Jesuits. His war with the Porte and Transylvania brought him little credit; and the Protestants of Bohemia, oppressed by the Jesuits, extorted from him a charter of religious liberty. At last he was obliged, in 1608, to cede Hungary, and, in 1611, Bohemia and A., to his brother Matthias (q. v.). Matthias, who became emperor in 1612, concluded a 20 years' peace with the Turks, and ceded (1617 and 1618) Bohemia and Hungary to his cousin Ferdinand, son of the Archduke Karl of Styria, third son of Maximilian II. Matthias lived to see the outbreak of the Thirty Years' War (q. v.), and died March 20, 1619.

Bohemia refused to acknowledge his successor, Ferdinand II. (q. v.), to whom all the Austrian possessions had again reverted, and chose the Elector Palatine, Frederic V., the head of the Protestant union, as king. The States of A. and the Hungarians were also refractory. But the battle of Prague (1620) subjected Bohemia to Ferdinand; who formally set about rooting out Protestantism in that country and in Moravia, annulled their right of electing their king, and the patent of religious freedom granted them by Rudolf II., and set up a Catholic reformation tribunal which drove thousands into exile. The emperor also succeeded in extorting acknowledgment of his sovereignty from the States of A., among which Protestantism predominated; after which Protestantism was rigorously prohibited. Hungary also was at last compelled to yield, which had revolted under the Prince of Transylvania. But this religious war and persecution cost the House of A. the life-blood of its possessions. Of 732 cities in Bohemia, only 130 were left; of 30,700 villages, only 6000; of 3 million inhabitants, only 780,000. Under Ferdinand's successor, the Emperor Ferdinand III. (1637—1657), A. continued to be a theatre of war; and at the peace of Westphalia (1648), had to cede Alsace to France. Ferdinand III.'s son and successor, Leopold I., provoked the Hungarians to rebellion by his severity. Tekeli (q. v.) received aid from the Porte, and Kara Mustapha besieged Vienna (1683); which was rescued only by an army of Poles and Germans under John Sobieski hastening to its assistance. The emperor's generals now reduced the whole of Hungary, which was declared a hereditary kingdom in the male line (1687). Prince Eugene compelled the Porte (1699) to restore the country between the Danube and Theiss, and, in 1718, to cede other important provinces to Hungary. The struggle between Leopold and Louis XIV. of France for the heirship to the king of Spain, led to the war of the Spanish Succession (q. v.), during which Leopold died, May 5, 1705. He was of sluggish phlegmatic character, and wholly under the influence of the Jesuits.

His eldest son and successor, the enlightened Joseph I. (q. v.), continued the war. He died childless, April 17, 1711, and was succeeded by his brother, Karl VI. The peace of Utrecht concluded under his reign (1713) secured to A. the Netherlands, Milan, Mantua, Naples, and Sicily. The monarchy now embraced 190,000 square miles, with 29 million

inhabitants, and had a revenue of 14 million florins, with an army of 130,000 men. Its strength, however, was soon much exhausted by fresh wars with France and Spain. At the peace of Vienna (1737), Karl VI. had to give up Naples and Sicily to Don Carlos of Spain, and part of Milan to the king of Sardinia; receiving only Parma and Piacenza instead. He also lost at the peace of Belgrade (1739) nearly all the fruits of Eugene's conquests, giving back to the Porte Belgrade, Servia, and the parts of Wallachia and Bosnia that had belonged to Austria. The emperor conceded all these points with the view of securing adhesion to the Pragmatic Sanction (q. v.), which conferred the succession on his daughter, Maria Theresa.

With his death (October 20, 1740), the male line of the Hapsburgs was extinct, and Maria Theresa, who was married to Franz Stephan, Duke of Lorraine, assumed the government. But counter-claims were raised on all sides, and a violent war arose, in which England alone sided with Maria. Frederic II. of Prussia conquered Silesia. The Elector of Bavaria took the title of Archduke of A., was crowned king of Bohemia at Linz and Prague, and elected emperor as Karl VII. (1742). The Hungarians alone stood by their heroic queen; who, at the peace of Breslau (1742) was forced to yield Silesia to Prussia. Frederic renewed the war by coming to the assistance of the emperor; but Karl dying (1745), Maria Theresa's husband was elected German emperor as Franz I. A second treaty of peace (1745) secured Silesia anew to Prussia; and at the peace of Aix-la-chapelle (1748), A. had to cede Parma, Piacenza, and Guastalla to Don Philip of Spain, and several districts of Milan to Sardinia. These sacrifices secured the existence of the Austrian monarchy; but Maria Theresa wished to recover Silesia, and with this view, entered into alliance with France, Russia, Saxony, and Sweden; but after a bloody Seven Years' War (q. v.), Prussia retained Silesia, and A. had spent her blood and treasure in vain. At this time, paper-money first appeared in A., under the name of state-bonds. At Franz's death (1765), his son, Joseph II., became German emperor, and joint-regent with his mother of the hereditary states. Collateral branches of the House of A. were planted by the younger sons of Maria Theresa, the Archduke Leopold in Tuscany, and the Archduke Ferdinand, who married the heiress of Este (see *MODENA*). In the first partition of Poland (1772), A. acquired Galicia and Lodomeria, and the Bukovina was ceded by the Porte in 1777. At the death of the empress in 1780, the monarchy had an extent of 234,000 square miles, with a pop. of 24 millions, and a debt of 160 million florins. The administration of Maria Theresa was distinguished by unwonted unity and vigour, both in home and foreign relations.

Her successor, Joseph II., was an active reformer in the spirit of the enlightened despotism of the times; though often rash and violent in his mode of proceeding. He introduced economy into every department, remodelled the censorship of the press, granted liberties and rights to Protestants, abolished 900 convents, and revised the school-system. His protective system of duties, though exhibiting his narrowness as a statesman, gave a start to native manufactures. But his reforming zeal and passion for uniformity excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the government by his brother, the Grand Duke of Tuscany—as German emperor, Leopold II.—who succeeded in pacifying the Netherlands and Hungary. Peace was concluded with Prussia and Turkey (1790). The fate of his sister, Marie

Antoinette, and her husband, Louis XVI., led Leopold to an alliance with Prussia; but he died (March 1, 1792) before the war with France broke out. The war was declared by France on his son Franz II., the same year (see FRANCE). By the treaty of Campo Formio (q. v.), 1797, A. lost Lombardy and the Netherlands, receiving in lieu the Venetian territory; two years later, at the second partition of Poland, it was augmented by West Galicia. Franz, in alliance with Russia, renewed the war with France in 1799, which was ended by the peace of Luneville. It is needless to follow all the alterations of boundary that the Austrian dominions underwent during these wars. The most serious was at the peace of Vienna (1809), which cost A. 42,000 square miles of territory, and 11 million florins of her revenue. It was in 1804, when Napoleon had been proclaimed Emperor of France, that Franz declared himself hereditary Emperor of Austria, uniting all his dominions in one empire. On the establishment of the Confederation of the Rhine, he laid down the dignity of German emperor, which his family had held for nearly five hundred years, and now took the title of Franz I., Emperor of Austria.

The humiliating peace of Vienna was followed (1809) by the marriage of Napoleon with the Archduchess Maria Louisa; and in March 1812, Napoleon and Franz entered into alliance against Russia. But when the Russian campaign of 1812 had broken the power of the French emperor, his father-in-law declared war on him (August 1813), and joined the alliance of England, Russia, Prussia, and Sweden. The active part which the Emperor Franz now took in the downfall of Napoleon, his consenting to the banishment of his son-in-law to Elba, and the firmness with which he signed the declaration of outlawry against him on his return to France, and contributed to his final overthrow, thus deciding the fortunes of his own daughter and her son—all furnished grounds of claim to that full indemnity for her losses which A. obtained at the close of the war. In the remodelling of the map of Europe that took place at the Congress of Vienna (1815), 32,000 square miles were added to the 253,000 possessed by A. after the last partition of Poland, besides the advantages she gained in point of compactness, and facilities for trade, especially by the acquisition of Venice and Dalmatia. Ferdinand, the emperor's uncle, was also restored to the grand duchy of Tuscany, of which he had been dispossessed by Napoleon.

After that time, A. exerted a powerful influence in European politics generally, and more especially in the German Confederation; and that influence was uniformly hostile to constitutionalism (see METTERNICH). When the Polish revolution broke out, a strict neutrality was assumed; but a Polish corps that was driven into the Austrian territories was disbanded, and sent into Hungary, while a Russian division that had taken refuge on Austrian soil was let go, and equipped with the Polish weapons.

The death of Franz I. (March 2, 1832) made little alteration in the policy of A.; Ferdinand I. trod in his father's footsteps. The political alliance with Russia and Prussia was drawn closer by a personal conference of the emperor with Nicolas I. and Frederic William III. at Teplitz, October 1833. The wonted calm was interrupted in 1840 by the war against Ibrahim Pacha in Syria, in which A. took part in union with England. An attempt at insurrection in Italy in 1844 was a complete failure.

But under this long-continued peace and superficial calm, the internal condition of the empire was coming to a crisis. The stifling bureaucratic system of government and police supervision, had produced

only irritation and discontent, and was powerless to compress the fermentation. The opposition in the several nationalities became stronger and stronger, and the tactics of playing these nationalities off against one another, no longer succeeded. The Polish insurrection, which led to the incorporation of Cracow with the monarchy (November 1846), had turned into a frightful rising of the peasantry in Galicia against the nobles. This enabled the government to overpower the political rising; but the success only increased the danger of the crisis, by encouraging it to proceed in the old reckless way. In the meantime the opposition to Austrian rule in Italy, Hungary, and Bohemia, was becoming uncontrollable, and even the states of Lower Austria insisted on some control in the management of the state. The revolutionary movement was already in full swing in Italy, when the fall of Louis-Philippe (February 24, 1848) shook Europe to its foundations. A host of petitions and addresses was followed, March 13, by a popular movement in Vienna, to which the government and military, after a feeble resistance, succumbed. Metternich resigned, the arming of the citizens and freedom of the press were granted, and the emperor promised to convoke a consultative assembly from all parts of the empire. At the same time, the opposition in Hungary had carried their demand for an independent ministry responsible to the national diet, and the emperor was not in a position to withstand it. The 22d of March saw the insurrection break out at Milan, and Radetzky, the military commander, forced to retire on Verona. Venice rose at the same time, and drove out the Austrians.

While the revolution was thus victorious in the provinces, the central authority was in a state of dissolution. The authority passed into the hands of the national guards and the students' legion (the *Aula*). A rising of the people (May 15), in support of the Central Committee, formed from the national guards, which the government had attempted to dissolve, compelled its continuance, and also a revision of the electoral law, so as to convert the new diet into a constituent assembly. These proceedings led to the flight of the court to Innsbruck (May 17). An unsuccessful attempt of the government to break the power of the 'Aula,' resulted in the appointment of a Committee of Safety, to whose influence the government had to submit. A Slavic insurrection broke out in Prague after Easter, which was repressed with bloody severity by Prince Windischgrätz. While the emperor was thus lingering at Innsbruck, leaving Vienna in the power of the populace, and the Hungarians were pursuing an independent course, it was in Italy that the power of A. began to recover itself.

Radetzky had at first been reduced to the maintaining of a defensive position at Verona, against Charles Albert of Sardinia, who had declared war on A. at the outbreak of the revolution, and the forces that came to his aid from Tuscany, Rome, and Naples; and the foreign policy of A. was in such a state of discouragement, that negotiations were entered into under the mediation of Great Britain, offering the Lombards independence on moderate conditions. But in June, Radetzky took up the offensive, reduced in succession Vicenza, Padua, and other cities, and then turning against the chief Sardinian force, defeated it at Custoza (25th July), and drove it from the field. The fruits of the victory were the dissolution of Charles Albert's army, and a truce which again delivered Lombardy to Austria.

In the meantime, the government at Vienna was more powerless than ever. The emperor remained at Innsbruck, and the constituent diet was opened,

July 22, by the Archduke John, as his representative. But a new crisis was ripening in Hungary. The Croats, under their Ban, Jellachich (q. v.), opposed the predominance of the Magyars, and refused obedience to the Hungarian government, which, under the Batthyanyi-Kossuth ministry, was pursuing a policy almost independent of Austria. Jellachich's resistance was officially condemned by the emperor, and he was threatened with deposition; but, as subsequently appeared, his conduct was secretly approved by the court. The Archduke Palatine, Stephen, now left Hungary, after a last attempt at conciliation; and the emperor, who had returned to Vienna after repeated invitations, named Count Lamberg commissioner, with the supreme command in Hungary. Lamberg, however, was murdered on the bridge of Pesth (September 25). The Hungarian parliament was now dissolved, and the command given to Jellachich. But the parliament continued its sittings, and appointed Kossuth president of the committee of defence. When the imperial troops now began to march against Hungary, a frightful insurrection broke out in Vienna (October 6), which was attributed to Hungarian instigation. The arsenal was stormed, and the war-minister, Latour, murdered; the court fled to Olmütz, a committee of safety was appointed, the armed populace organised, and the Polish general, Bem, put at the head of military affairs; while the diet wavered between loyalty and revolution. In the meantime, the military forces had withdrawn, and joined Jellachich, in order to prevent the Hungarians coming to the aid of the Viennese. Windischgrätz now approached with an army, and declared Vienna in a state of siege. The attack began on the 23d of October, and after a resistance of 8 days, Vienna surrendered.

Severe measures were then taken; and a number of leaders, among others, Robert Blum (q. v.), were condemned and shot. The diet now met at Kremsir, and a new ministry was formed, into which Prince Schwarzenberg, Count Stadion, Bach, Bruck, and others entered. But the vigorous policy thought to be necessary for the restoration, and advocated by the Archduchess Sophia, was not responded to by the easy nature of Ferdinand I. Accordingly, the emperor abdicated, December 2, as did also the Archduke Franz Karl, and the latter's son, Franz Joseph (q. v.), was declared emperor.

In winter, Windischgrätz entered Hungary, and began the Hungarian war. After the encounters at Raab and Babelna, Ofen was besieged (January 1849), and the Hungarians retired beyond the Theiss, and had time to organise themselves under such able leaders as Görgei and Klapka, and to prepare for the struggle of the following summer.

In the meantime, important events took place elsewhere. In March (21—23), Radetzky made his rapid and decisive campaign, which, by the victory of Novara, led to the abdication of Charles Albert, and an indemnification for war expenses from Sardinia of 15 million lire. With the surrender of Venice, which took place in August, the subjugation of Italy was complete.

At Kremsir, the diet proving intractable, was dissolved, March 4, 1849; and a constitution was granted (*octroyirt*), with two elective chambers, responsible ministers, and other constitutional provisions. In the National Assembly at Frankfurt, A. opposed the project of a confederated state under the leadership of Prussia, and managed to thwart the conferring of the empire of Germany on the Prussian king (March 1849).

In Hungary, the Magyars, though the Germans and Slaves within the country itself were hostile to them, began the campaign with decided success.

Bem conquered Transylvania in spite of Russian aid; and the rest of the Hungarian army advancing westward in spring, were successful against the imperial forces at Szolnok and Waitzen. Windischgrätz was replaced in the command by Welden, but the imperial cause was not improved. Kossuth's hopes rising, he proclaimed the deposition of the House of Hapsburg, and virtually made Hungary a republic. By May, Pesth and Ofen were again in the hands of the Magyars; and although General Welden was recalled, and the command given to Haynau, there was little prospect of success against the Magyars, if a treaty with the czar had not brought the aid of a Russian army under Paskevitch. The Austrians still suffered several reverses, and the Hungarians performed splendid feats of arms, such as Görgei's victory at Waitzen, and Klapka's sally from Komorn; but from June, the war on the whole began to be more favourable to A., whose forces were well managed by Haynau and Jellachich; and the intervention of the Russians brought an irresistible weight of numbers against the Magyars. After the affairs of Szegedin and Debreczin, Haynau's engagements on the Theiss, and the raising of the siege of Temeswar, it was in vain that Kossuth transferred the dictatorship to Görgei. Görgei, whether from treachery, as the other Magyar leaders maintain, or from necessity, as he himself avers, laid down his arms to the Russians at Vilagos (August 13). The surrender of Komorn, in September, completed the subjugation of Hungary, which was treated as a conquered country, and the officers taken in Arad were dealt with by Haynau with a blood-thirsty rigour.

A. was now free to attend to politics, internal and external, and the spirit of the restoration soon shewed itself. One important fruit of the revolution was retained—the liberation of the soil from the burdens and trammels of feudalism. All other liberal concessions very soon disappeared. For a time, the forms of the constitution of March 1849 were retained; but the rigorous military government and the surveillance exercised over the press, shewed the tendency of things. The fundamental principles of the constitution turned out to the profit only of the Catholic Church, which got rid of the placetum regium. In the beginning of 1851, Schmerling and Bruck, the liberal element of the ministry, retired; and in August appeared a number of imperial decrees rendering the ministers accountable to the emperor alone. At last, January 1, 1852, it was announced that the constitution and the fundamental rights were abolished, trial by jury set aside, the old press law revived, &c. This was followed by still greater concessions of influence to the clergy. The emperor did not conceal his predilection for absolute military government. All this was not effected without manifestations of discontent. The fires of revolution were still smouldering in Hungary and Italy; and in Lombardy, though still under strict military law, a tumult broke out, February 1853, in which a number of officers and soldiers were stabbed. The finances, too, notwithstanding vigorous measures for improving the material resources of the country, continued in a bad state, so that incessant loans were required to cover the current deficit.

On the confused arena of German politics, the struggle for ascendancy was kept up between A. and Prussia. In October 1850, the two powers were armed and ready to come to blows; but the bold and determined policy of Schwarzenberg prevailed, and Prussia gave way. The points in dispute it might be difficult for any but a German to understand, even if it were worth trying. See GERMANY, HESSE-CASSEL. The result was that Prussia's

scheme of a union was given up, and also A.'s admission with all her territories into the German Confederation; and in 1851, the old diet was restored. After the death of Schwartzberg, the foreign policy of A. was more conciliatory, and her interference in German affairs less dictatorial. Prussia and A., after December 1852, were more friendly, on the whole, though the war in Italy gave rise to considerable ill-feeling between the two powers. In February 1853, a commercial treaty was concluded, which was of the utmost consequence to the prosperity of A., as removing a great part of the obstructions to her commerce with the rest of Germany.

In 1853, a difference took place between A. and Turkey, which formed, as it were, a prelude to the war in the Crimea. In the quarrel between the Montenegrines and the Porte, A. took the part of the Montenegrines; she had also complaints as to the infringement of rights possessed by her on the Adriatic coast, and regarding the treatment of Christians in Turkey. The threatening mission of Count Leiningen, February 1853, procured redress of these grievances. As if following up this movement, Russia came forward as the special protector of the Greek Christians of the Ottoman empire, and made demands on the Porte which were held inconsistent with his sovereign rights. It was the interest of A., as well as of the rest of Europe, to maintain the integrity of the Ottoman empire; but although she united with England and France in endeavouring to settle the question by negotiation, when the war broke out, her peculiar relations to Russia led her to remain neutral during the contest.

The conduct of A. in Italy, especially after 1849, was such as to make that country a 'standing menace to Europe.' The government of A. in that portion of Italy of which she obtained possession by the treaty of 1815, was far from satisfactory; but what was chiefly complained of by the other powers was her interference in the affairs of the independent states of the peninsula. By means of secret treaties (copies of which were laid before the British Houses of Parliament this year, 1859), A. obtained a most undue influence in Parma, Tuscany, Modena, the States of the Church, and in the kingdom of the Two Sicilies. That influence was of course exercised in the interests of despotism, and in opposition to the welfare of the people, whose wishes their rulers, backed by Austrian troops, were enabled to set at defiance. The position of A. in Italy was canvassed at the meetings which followed the signing of the treaty of peace at Paris in 1856, but nothing resulted from the discussions. Sardinia seeing herself gradually envied by, and afraid to fall a victim to the prevailing Austrianism, after all remonstrances of a peaceful kind had failed, began to arm. A. demanded her immediate disarmament, on pain of war; but Sardinia, whose army was swelled with volunteers from every part of the peninsula, and who had previously entered into a treaty, offensive and defensive, with France, refused. A. accordingly commenced hostilities by crossing the Ticino on the 29th of April 1859. On the 3d May, France, as the ally of Sardinia, formally declared war against A.; but in anticipation of what was to follow, she had several days before despatched troops into Piedmont. The Austrian troops were beaten in every engagement that followed, and so effectually, that on the 6th July, the emperor, who latterly had taken the chief command of his army, was fain to conclude an armistice with the Emperor Napoleon, who also commanded in person. On the 12th of the same month, the two potentates met at Villafranca, and agreed to come to terms of peace, the chief conditions of which were to be the cession of

Lombardy to Sardinia, while Venetia was still retained by Austria. The formal treaty was concluded at Zurich in October. See ITALY, LOMBARDY. In 1866, a short and bloody war occurred between A. on the one hand, and Italy and Prussia on the other, which resulted in the cession of Venice to Italy, for details of which see GERMANY in SUPP. (Vol. X.).

AUTEUIL, a village with 5734 inhabitants, at the entrance of the Bois de Boulogne, about three miles from Paris, but enclosed within the fortifications of the city, is known as the residence of famous literary men. Here lived Boileau, Molière—whom Andrieux introduced in his *Molière avec ses Amis, ou le Souper à Auteuil*—and the gilded widow of Helvetius, whose parties even Bonaparte often frequented in 1798 and 1799. This lady was buried in her own garden at Auteuil.

AUTHENTIC (Gr.) is a term applied to any writing or document, the contents of which may be depended upon for their truth or accuracy. It is frequently employed as synonymous with *genuine*, though a distinction has been drawn, especially by biblical critics, between the two words. *Authenticity*, it is said, refers to the statements made by an author; *genuineness*, to the authorship itself. Thus, we speak of a *History of England as A.*, when the narrative is admitted to be correct; and we say of such and such a gospel or epistle that it is *genuine*, when we are convinced that it is the composition of the writer to whom it is attributed. See Bishop Watson's *Apology for the Bible*, and Dean Trench's *Study of Words*. This distinction, however, appears to be artificial rather than real; that is to say, it does not inhere in the original signification of the words.

AUTO, entering into many compound scientific terms of Greek extraction, is the Greek pronoun *self*. In some compounds, it denotes the agent or subject, as in *autocrat*, *automaton*, *autonomy*; in others, the object, as in *autobiography*, *autocritic*, *autodidactic*; in others, again, a mere reference to the subject, as in *autochthonous*. This variation in the grammatical relation of A. sometimes occasions ambiguity in the meaning of the compound. Thus, *autograph* means both a machine that writes of itself, and also a writing done with the person's own hand; *autocracy*, both the mastery over one's self, and the sole rule or absolute authority over a people or state.

AUTO'CRACY (Gr. *self-mastery*, or *sole mastery*) signifies that form of government in which the sovereign unites in himself the legislative and the executive powers of the state, and thus rules uncontrolled. Such a sovereign is therefore called an autocrat. Nearly all eastern governments are of this form. Among European rulers, the Emperor of Russia alone bears the title of Autocrat, thus signifying his constitutional absoluteness.—Kant used the word A., in philosophy, to denote the mastery of the reason over the rebellious propensities.

AUTO DA FÉ (Port. Act of Faith) was the name given to the procession or ceremony that used to take place in Spain and Portugal at the execution of heretics condemned to death by the inquisition. It was generally held on a Sunday between Whitsunday and Advent, very often on All-saints Day. At dawn, the dismal tolling of the great bell of the high church gave the signal to begin the drama of the day; for as such it was looked upon by the people, who thronged to it in troops, believing that they did a good work in merely looking on. Men of the highest rank reckoned it prudent to give their countenance to the 'holy' tribunal at these processions, and even grandees of Castile did not disdain to make themselves familiars of the inquisition. The procession

was led by the Dominicans, carrying the flag of the inquisition; next followed the penitents, on whom only penance had been laid; behind them, and separated by a great cross which was borne before, came those condemned to death—barefoot, clad in the sanbenito, and with a pointed cap on the head; then, effigies of the fugitives; and lastly, the bones of dead culprits, in black coffins painted with flames and hellish symbols. The frightful train was closed by the army of priests and monks. The procession went through the principal streets to the church, where, after a sermon on the true faith, the sentence was announced. In the meantime, the accused stood before a crucifix with extinguished torches in their hands. After the sentence had been read to them, an officer of the inquisition gave each of the condemned a blow on the breast with his hand, as a sign that they were given over by that tribunal to the secular power; on which a secular officer took them in charge, had them fettered, and taken to prison. A few hours afterwards, they were brought to the place of execution. If they yet, at the last, made profession of the Catholic faith, they were so far favoured as to be first strangled; otherwise, they were burned alive, and with them the effigies and bones of the fugitive and dead culprits. As a rule, the king, along with his whole court, had to exalt by his presence the solemnity of the horrid transaction. The most splendid Auto da Fé took place at Madrid, under Charles II., in 1680; the last was held as recently as towards the middle of last century.

AUTOGRAPH (Gr.) is a term applied to what is written with the person's own hand, and not by an amanuensis. In relation to manuscripts, it is used in opposition to a copy. The collection of autographs has, especially in recent times, become an object of eager pursuit, and consequently they form a branch of literary trade. Their value is determined by the interest felt in the writer, the scarcity of such relics of him, and the contents of the writing. Besides portraits of famous persons, we wish, particularly in the case of distinguished contemporaries, to possess a specimen of their handwriting, or at least their signature, as the peculiarity of the style—the physiognomy of the handwriting—completes our knowledge of their personality. Lithography is particularly serviceable in this matter, not only by supplying fac-similes for biographical and historical works and for portraits, but also by multiplying impressions of collected autographs, such as have appeared in England by Smith, in Holland by Nathan, and in Germany by Dorow. But deserving mention here all others are the *Isographie des Hommes Célèbres* (3 vols. Par. 1828—1830), to which

Signature of Richard III. (Ricardus Rex).
From the Paston Letters.

a supplement appeared in 1839; and the *Autographen-Prachtalbum zur 200 jährigen Gedächtnissfeier des Westfälischen Friedensschlusses* (fol. Leip. 1818). We possess an uninterrupted succession of the royal autographs of England from King Richard II. downwards. Fac-similes are to be found in *Autographs of Royal, Noble, Learned, and Remarkable Personages, Conspicuous in English History, from the Reign of Richard II. to that of Charles II.*, by John Gough Nichols (fol. Lond. 1829). The preface to the work contains some interesting notices.

AUTO'LYCUS, a Greek astronomer and mathematician of Pitane in Æolia, about 330 B.C., wrote on the Revolving Sphere, and on the Rising and Setting of the Fixed Stars. Both works, printed in Dasypodius's *Propositiones Doctrinæ Sphæricæ* (Strasb. 1572), contain, for the most part, only such propositions of spherical astronomy as can be solved by means of a globe; and, instead of presupposing the knowledge of spherical trigonometry, they seem rather to prove that A. himself was unacquainted with it.

AUTO'MATON is derived from two Greek words signifying self-movement, and is usually applied to machinery constructed to represent human or animal actions. The construction of automata has occupied the attention of mankind from very early ages. Archytas of Tarentum is reported, so long ago as 400 B.C., to have made a pigeon that could fly. Albertus Magnus and Roger Bacon, in the 13th c., are said—but there is some dubiety about the matter—to have made respectively a porter to open the door, and a speaking head; while Regiomontanus, in the 15th c., is declared to have been successful in imparting life-like motion to a fly. In France, in the beginning of the 18th c., many persons busied themselves in the construction of automata; and among other things, a pantomime, in five acts, was represented by actors moved by machinery. An automatic carriage group, made by M. Camus for the amusement of Louis XIV., is stated to have been very perfect; but it is doubtful whether it was so complete as it is represented to have been. The most perfect A. about which there is absolute certainty, was one constructed by M. Vaucanson, and exhibited in Paris in 1738. It represented a flute-player, which placed its lips against the instrument, and produced the notes with its fingers in precisely the same manner as a human being does. In 1741, M. Vaucanson made a flageolet-player, who with one hand beat a tambourine; and in the same year he produced a duck. This was a most ingenious contrivance, the mechanical duck being made to conduct itself in every respect like its animated pattern. It swam, dived, ate, drank, dressed its wings, &c., as naturally as its live companions; and, most wonderful of all, by means of a solution in the stomach, it was actually made to digest its food! Maelzel made a trumpeter, which, about 1809, was exhibited in Vienna, and played the Austrian and French cavalry marches with much skill. An A., produced by M. Droz, drew likenesses of public characters; and, some years ago, Mr Faber contrived a figure, exhibited in various places, Edinburgh among others, which, by means of certain keys, was made to articulate simple words and sentences very intelligibly, but the effect was not pleasant. The inventor first mentally divided the word or sentence into its distinct sounds—as a phonographer would do in writing—and having determined the sounds, pressed one after the other the keys which admitted the air into the various compartments containing the mechanism constructed to imitate them. The chess-player of Kempelen was long regarded as the most wonderful of automata. It represented a Turk of the natural size, dressed in the national costume, and seated behind a box resembling a chest of drawers in shape. Before the game commenced, the artist opened several doors in the chest, which revealed a large number of pulleys, wheels, cylinders, springs, &c. The chessmen were produced from a long drawer, as was also a cushion for the figure to rest its arm upon. The A. not being able to speak, signified when the queen of his antagonist was in danger by two nods, and when the king was in check by three. The A. succeeded in beating most of the players with whom it engaged; but it turned out afterwards that a crippled Russian

officer—a very celebrated chess-player—was concealed in the interior of the figure. The figure is said to have been constructed for the purpose of effecting the officer's escape out of Russia, where his life was forfeited. So far as the mental process was concerned, the chess-player was not, therefore, an A.; but great ingenuity was evinced in its movement of the pieces (see *Chambers's Journal*, vol. xii., p. 66). In 1815, Mr John Clark of Bridgewater exhibited an A. *Latin Versifier*, which he himself described as a practical illustration of the law of evolution. 'The machine,' he said, 'contains letters in alphabetical arrangement; out of these, through the medium of numbers, rendered tangible by being expressed by indentures on wheel-work, the instrument selects such as are requisite to form the verse conceived; the components of words suited to form hexameters being alone previously calculated, the harmonious combination of which will be found to be practically interminable.' An automatic group, consisting of a child, monkey, hare, and goat, was exhibited in this country in 1856, the motions of the animals being very perfect. M. Houdin, the celebrated conjuror, is the inventor of some striking automata. Automata have also been constructed to play on the piano, and to set up type. The latter are very ingenious machines, but hitherto they have not been successful enough to warrant their general introduction. They are, however, in use in some printing-offices in London. One practical difficulty they have not yet overcome, is the spacing out of the lines; that has to be done by the human hand. See Hutton's *Mathematical Recreations; Memoirs of Robert Houdin*. Lond. 1859. Chapman and Hall.

AUTO'NOMY (Gr. *self-legislation*) is the arrangement by which the citizens of a state manage their own legislation and government; and this evidently may, with certain restrictions, be the case also within limited bodies of the same people, such as parishes, corporations, religious sects. The term A. is used to designate the characteristic of the political condition of ancient Greece, where every city or town community claimed the right of independent sovereign action. The idea of two or more town communities sinking their individual independence, and forming the larger aggregate unity which we understand by a state, seems to have been intolerable to the Greek mind.

AUTUN (Bibracte, Augustodunum), a town in France, department of the Saône-et-Loire, in the Burgundian district of Antunois. Pop. 9348. It is situated on the river Arroux, is the seat of a bishop, and has a fine cathedral. Cloth, carpets, leather, stockings, and paper are manufactured in the place.—The ancient Bibracte was the chief city of the Ædui, and had a much frequented Druid school; and at a later period, under the Romans, when it got the name of Augustodunum, it was no less famous for its school of rhetoric. A. was pillaged by the Saracens in 725, and nearly destroyed by the Normans in 888. There still exist at A. many ruins of Roman temples, gates, triumphal arches, and other antiquities. At the Council of A. (1094), King Philip I. was excommunicated for divorcing his queen, Bertha.

AUVERGNE, a southern central district of France, was before the revolution a separate province, composing almost exclusively the modern departments of Cantal and Puy-de-Dôme. Between the Allier and the upper course of the Dordogne and the Lot, A. rises into a highland region, having Bourbonnais, Limousin, and Rouergue, as terraces of descent into the western plains, while on the east it joins the Cevennes and the southern highlands. Not only do the cone and dome-like shapes of the

summits betray a volcanic formation, but also the great masses of basalt and trachyte that break through the crust of granite and gneiss, render it probable that this was a chief focus of plutonic action. Among the summits that have apparently been at one time volcanoes, the most remarkable are Cantal (6093), Mont-d'Or (6188), Puy-de-Dôme (4806), and Pariou; the latter, adjoining Puy-de-Dôme, is basin-shaped on the top, and one of the finest specimens of an ancient and extinct volcano: all are now covered with verdure. A. falls naturally into two divisions—Upper A., to the south, and Lower A., to the north; in which last the valley of Limagne, on the left bank of the Allier, is distinguished for extraordinary fertility. The climate is colder in the mountainous districts than the southern position, with a less elevation, would lead us to expect, and is remarkable for furious winds and violent thunder-storms; but in the deep valleys the heat of summer is often oppressive. The lava-covered plateaus are desert, but the pulverised volcanic earths that cover the slopes and valleys form a rich and fruitful soil, as is shewn by the crops of grain, garden produce, fine fruits, wine, abundance of chestnuts in the south, and of walnuts in the north, as well as by extensive thriving forests, along with flax and hemp fields and meadow-lands, in the poorer districts. Agriculture is in a rather neglected condition; but the breeding of cattle, especially of mules, is well managed. A. produces iron, lead, copper, antimony, and coal, and is rich in mineral springs.

The Auvergnese are a highland people, rude in their manners, poor, ignorant, at the same time honest and kind, though not free from the propensity to revenge. They live by cattle-keeping and agriculture, and by going to Paris as labourers. Domestic manufactures, therefore, remain confined to weaving, tanning, and paper-making. A. has, however, produced distinguished men. It was the native place of statesmen and warriors of the 15th and 16th centuries; and also of the Arnauld (q. v.) family, so distinguished in the history of Port Royal and of Jansenism. In more recent times, Lafayette and Polignac may be named. Chief towns, Clermont and Aurillac (q. v.). The country derived its name from the Averni, who long defended their fastnesses against Caesar, as later against the Goths, Burgundians, and Franks, with whom they at last coalesced.

AUXILIARY VERES. See VERES, CONJUGATION.

AVA, a ruined city of Burmah, of which it has repeatedly been the capital, the honour having been transferred again and again between it and Monchobo, Sagaing, and Amarapura, which is the present capital. It stands in lat. 21° 51' N., long. 95° 58' E., on the south-east bank of the Iravaddy, here about 4000 feet broad. The river at this point receives two affluents, and these being joined by a canal, the city is rendered circumnavigable. The name is a Hindu and Malay corruption of Aengwa or Aaen-ua, meaning *fish-pond*, given it from being built where there were formerly fish-ponds, of which some still remain; but in official documents it is designated as Ratnapura, i. e., City of Pearls. The city, which is, or was, eight or ten miles in circumference, is surrounded by walls and ditches. A. is now almost a desert, having been reduced to ruins by an earthquake in 1839.—On the opposite bank stands the city of Sagaing, which has twice been the seat of government. The united population of the three cities of Ava, Sagaing, and Amarapura, was at one time estimated at 400,000.

AVA, ARVA, YAVA, or KAVA (*Macropiper methysticum*), a plant of the natural order *Piperaceæ* (q. v.), possessing narcotic properties. Until recently, it was ranked in the genus *Piper* (Pepper). It is a shrubby plant, with heart-shaped, acuminate leaves, and very short, solitary, axillary spikes of flowers. It is a native of many of the South-sea islands, where the inhabitants intoxicate themselves with a fermented liquor prepared from its root or (more accurately) rhizome. The rhizome is thick, woody, rugged, and aromatic. A tincture of it is useful in chronic rheumatisms. The intoxicating liquor is prepared by macerating it in water. The savage Tahitians were accustomed to prepare it in a very odious manner; much as the Indians of the Andes prepare *Chica* or Maize beer—chewing the root, depositing it in a bowl, straining through cocoa-nut husk, and mixing with water or cocoa-nut milk, after which fermentation speedily ensues. The taste is unpleasant to those unaccustomed to it, and has been likened to that of rhubarb and magnesia. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of ava causes a whitish scurf on the skin, which, among the heathen Tahitians, was reckoned a badge of nobility, the common people not having the means of indulgence requisite to produce it.—The leaf of the ava plant is in some places used with the betel-nut, instead of that of the betel-pepper.

AVALANCHES are masses of snow or ice that slide or roll down the declivities of high mountains, and often occasion great devastation. They have various names, according to their nature. Drift or powder avalanches (*Staub Lavinen*) consist of snow, which, loose and dry from strong frost, once set in motion by the wind, accumulates in its descent, and comes suddenly into the valley in an overwhelming dust-cloud. A. of this kind occur chiefly in winter, and are dangerous on account of their suddenness, suffocating men and animals, and overturning houses by the compression of the air which they cause. Another kind of avalanche resembles a landslide. When the snow begins to melt in spring, the soil beneath becomes loose and slippery; and the snow slides down the declivity by its own weight, carrying with it soil, trees, and rocks. The greatest danger is where elevated tracts of moderate declivity are separated from the valleys by precipitous walls of rock; the softened snow of spring beginning to roll or slide on these slopes, is hurled over the precipices with fearful force into the valleys. The very wind caused prostrates forests and houses. Ice A. are those that are seen and heard in summer thundering down the steeps, e. g., of the Jungfrau. They consist of masses of ice that detach themselves from the glaciers in the upper regions. They are most common in July, August, and September.

AVANTURINE, a variety of quartz, remarkable for the brilliancy with which it reflects light, which is supposed to result from small particles of mica enclosed in it. It is of a yellow, red, or brown colour. It is used in jewellery, but is not so much valued as amethyst or Cairngorm stone. It is found in India, Spain, and Scotland.

AVARI, a tribe of eastern origin, made their appearance 100 years later than the Bulgarians, in the countries about the Don, the Caspian Sea, and the Volga. One part of them remained at the Caucasus, another part pressed forward (about 555 A. D.) to the Danube, and settled in Dacia. Here they served in Justinian's army, and assisted the Lombards to overturn the kingdom of the Gepidæ; and, about the end of the

6th c., under the mighty Khan Bajan, they conquered Pannonia. Later, they made themselves masters of Dalmatia; made devastating incursions into Germany, as far as Thuringia; and into Italy, where they warred with the Franks and Lombards, and extended their dominion over the Slaves living on, and northwards from, the Danube, as well as over the Bulgarians as far as the Black Sea. These nations at last rose against them, and, in 640 A. D., drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne, and well-nigh extirpated by the Moravians, so that, after 827, they disappear from history. They usually surrounded their settlements with fortifications of stakes driven into the ground, and earth, of which traces, under the name of Avarian Rings, are yet found in the countries formerly occupied by them. The results of the most recent criticism shew that, in all probability, the A. belonged to the same great Turanian stock as the Huns, and that their original residence was the land lying east of the Tobol, in Siberia.

AVA'ST, one of the peculiar terms employed on shipboard. It is a command to stop or cease in any operation going forward—such as, 'avast heaving.'

AVATAR primarily signifies, in Sanscrit, a descent, but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent or for retributive ends. It is thus almost synonymous in its signification with the Christian term *Incarnation*. The word is sometimes rhetorically employed in English literature. The avatars of Vishnu (q. v.) are the most famous in Hindu mythology.

AVAT'CHA, a mountain and bay of Kamtschatka. The bay is on the east coast, being by far the best harbour of the whole peninsula, and containing the capital city of Petropaulowsk (q. v.). The mountain, 9055 feet in height, is about 20 miles to the north, and not far from the sea, in lat. 52° 15' N., and long. 158° 50' E. It is a volcano with two craters—one at the summit, and the other rather more than half-way up, on the seaward side.

AVEBURY, A'BURY, or A'BIRY, a small village of Wiltshire, situated in N. lat. 51° 25', and W. long. 1° 59', 25 miles north of Salisbury, and 6 west-by-north of Marlborough. It is a place of no importance in itself, having a population of 751; but is remarkable as the site of the largest so-called Druidical temple in Europe—in fact, occupying the most of the sacred enclosure itself—and as having in its neighbourhood several remarkable barrows and cromlechs of remote antiquity.

What is called the temple occupies a flat area of ground on the south of the Keenet, a diminutive tributary of the Thames. It consists, or rather consisted, of a hundred large blocks of stone, placed on end in a circular form, around a level area of about 470 yards in diameter, bounded by a deep ditch and a high embankment forming the enclosure. There are also the remains of two small circles of stones within the enclosure, supposed to be inner temples. Of these, one consisted of two concentric circles of 43 upright stones, having a single stone near the centre; the other, a similar double circle of 45 stones, to the north-west of the former, with three large and high blocks in the centre. The stones that remain of this ancient work are not of uniform size; they measure from 5 to 20 feet in height above the ground, and from 3 to 12 in breadth and thickness.

The embankment, which is broken down in several places, had originally two entrances to the temple, eastward and westward, from which issue two long walks, bending round to the southward, each

furnished with a range of blocks on either side similar to those of the temple itself. These avenues are each upwards of a mile in length, the width varying from 56 to 35 feet. That which issues to the east, or rather south-east, after turning southward, bends near its extremity to the south-east again, and closes on a knoll called Overton Hill in two concentric oval ranges of blocks. That which issues to the west, also bends to the south, and then to south-west, ending in a point with a single block.

Of the surrounding antiquities, that which appears most closely connected with the temple is a large barrow, or lofty conical mound, called Silbury Hill, lying due south of it, at a distance of three-quarters of a mile. It is situated nearly midway between the two avenues, in the line of the ancient Roman road between London and Bath. Close to the base, it measures 2027 feet in circumference; the sloping height is 316 feet; the perpendicular height, 170 feet; the diameter of the level area at the top, 120 feet; the space covered by the whole work, over 5 acres. What proves the structure to have been more ancient than the time of the Romans, if such proof were necessary, is, that the Roman road, as it comes from the west, is straight for several miles till it reaches Silbury, when it bends round it to the south, and again proceeds in a direct line to Marlborough.

About a mile north of A. there are remains of a large cromlech, the stones of which have been overturned; and about 3 miles east there is another, which has two upright blocks standing apart, with a larger one surmounting them. In the neighbourhood, all round the Marlborough Downs, there are remains of earthworks and upright stones, and the sites of other antiquities now nearly obliterated.

Very little was known of A. temple and the antiquities in its vicinity till the year 1749, when Dr Stukeley, a somewhat fanciful antiquary, published his work, *Stonehenge and Abury, Two Temples Restored to the British Druids*; although Aubrey, an ardent student of antiquarian lore, had written an account of them in 1663, by command of Charles II., the manuscript of which still exists. None of the earlier topographers or antiquaries appear to have left any description of them. When Sir Richard Hoare, in collecting materials for his *Ancient Wiltshire*, made his examination of them in 1812, 72 years after the appearance of Stukeley's work, and 164 after the first survey by Aubrey, a great number of the stones had disappeared, and in many places it was difficult to trace out even the plan of the works. In 1849, in order to satisfy the curiosity of the lovers of antiquity as to the nature and intention of the great barrow, Silbury Hill, a tunnel was cut to its centre, but nothing was discovered to throw light on the subject. Some modern archaeologists altogether reject the conclusions of Stukeley and his followers, and call for proof of any connection between the Druids and the stone-circles which it has been the fashion for the last century to call Druidical.

AVEIRO, a maritime town of Portugal, in the province of Beira, between Oporto and Coimbra, situated in an unhealthy locality at the mouth of the Vouga, which forms a wide but shallow harbour, is the see of a bishop, has 5000 inhabitants, and trade in oil, wine, oysters, sardines, and other fish, oranges, and sea-salt.

AVELLINO (anciently, *Abellinum*), chief town of the province of Principato-Ultra, Naples. It is on the high road from Naples to Bari, at the foot of Monte Vergine, on which is the famous monastery founded by S. Guglielmo da Vercelli, on the ruins of a temple of Cybele, in 1119. Pop. 23,000. A.

suffered greatly from earthquakes in 1694, 1731, and 1805. It has manufactures of woollens, paper, macaroni, and considerable trade in corn and hazelnuts. The *aves Avellane* were famous even in Pliny's time. Between A. and Benevento is the Val de Gargano, where the Samnites defeated the Romans in 433 A.D.

AVE MARIA, also ANGELICA SALUTATIO, or the Angelic Salutation, are names given by the Roman Catholics to a very common form of address to the Virgin Mary. *Ave Maria* are the first two words of the prayer, in Latin, which is taken from the angel Gabriel's salutation (Luke i. 28): 'Hail, Mary, highly favoured, the Lord is with thee; blessed art thou among women, and blessed is the fruit of thy womb.' In this form, according to an ordinance of Gregory I., the invocation was at first said by the priests during mass, on the fourth Sunday after Advent. With the extended worship of the Virgin since the 11th c., the A. M. appears as a lay-prayer of nearly equal use with the Pater Noster, and was sanctioned as such at the end of the 12th c. Accordingly, not only did Urban IV. (1261) add the concluding words, *Jesus Christus, Amen*, but since the first half of the 16th c., the prayer began to receive, more and more commonly, as an addition to the old formula, what constitutes the conclusion of the modern form: 'Holy Mary, mother of God, pray for us sinners, now and at the hour of our death, Amen.' An edict of John XXII. (1326) ordains that every Catholic shall, morning, noon, and evening, at the warning of the bells, repeat three aves. This ringing of bells as a summons to morning, mid-day, and evening prayers, is retained in some Protestant countries, and is still called the Ave Maria, or Angelus Domini. The aves are reckoned by the small beads of the rosary, which are hence called Ave Marias, while the large beads are devoted to the Pater Noster. 150 Ave Marias form—after the 150 Psalms—a *Psalterian Mariæ*, and are thought to possess high propitiatory power.

AVENTINUS, JOHANNES THURMAYR, a scholar and historian, born at Abensberg, Bavaria, where his father was a publican, in 1476. Having studied at Ingolstadt, he went to Paris, where he took the degree of M.A. He afterwards taught Greek and mathematics at Cracow, and poetry and eloquence at Vienna. In 1512, the Duke of Bavaria called him to Munich, and trusted him with the education of his sons. Here A. wrote his esteemed *History of Bavaria* (*Annales Boiorum*), a work which occupied him sixteen years. This work was not published until twenty years after his death, which took place in 1531, and then only with large portions, more true than pleasant, about the Romish Church, excised. These, however, were all restored in Ciser's edition of 1580. A. wrote several other learned works.

AVERAGE. If any number of unequal quantities are given, another quantity may be found of a mean or intermediate magnitude, some of the given quantities being greater, and others less, than the one found, which is called the average. The exact relation is this: that the sum of the excesses of the greater above the A. is equal to the sum of the defects of the less below it. If there are, say, 7 vessels unequally filled with sand, and if we take handfuls from the greater, and add these to the less, until the sand is equally distributed, then any one of the equalised measures of sand is the A. of the 7 unequal measures. If the quantities of sand in

the several vessels are stated in numbers, as 5, 10, 12, 8, 11, 14, 3 ounces, the A. is found by adding together the numbers, and dividing by how many there are of them—viz., 7. The sum being 63, this, divided by 7, gives 9 ounces as the average. The system of averaging is a very important and time-saving one. By averages, the farmer calculates the value of his crops; the grazier, the value of his cattle; and the forester, the value of his trees. Reflection, however, requires to be exercised in striking averages; otherwise, serious errors may be committed. If a farmer, for instance, has three lots of cattle, the first of which he averages at £25 a head, the second at £15, and the third at £9, it might be thought that the A. of the whole stock made up of the three lots would be got by taking the mean of £25, £15, and £9—viz., $\frac{25+15+9}{3} = £16\frac{1}{3}$. But this would be correct only if there were an equal number of cattle in each of the lots. To get the real A. in case of the lots being unequal, he must multiply the A. of each lot by the number of cattle in it, add the three products together, and divide by the whole number of cattle in all three lots taken together. If we suppose 9 head in the first lot, 20 in the second, and 15 in the third, the A. is $\frac{25 \times 9 + 15 \times 20 + 9 \times 15}{9 + 20 + 15} = £15$.

AVERAGE (in Marit. Law). A rule was established by the Rhodian law (q. v.), and has prevailed in every maritime nation, that where a loss has been sustained, or expense incurred, for the general safety of the ship and cargo, a contribution should be made, in proportion to their respective interests, by the owners of the ship, freight, and goods on board; or, in modern times, by the insurers of these. To this contribution the name of *General A.* is given. The apparel, jewels, and other personal property of the passengers, not carried for purposes of traffic, and the seamen's wages and provisions, are not liable for any share in this contribution. Goods thrown overboard are now estimated at the price they would have yielded at the port of delivery at the time, freight, duties, &c., being deducted. See **JETTISON**. *Particular A.*, again, is the loss of an anchor, the starting of a plank, the leaking of a cask, the loss of goods washed from the deck, or the like, where the common safety was not in question, and where there is, consequently, no contribution. To losses of this description, the term A., though generally, is incorrectly applied. *Petty Averages* are the duties of anchorage, pilotage, &c. If these occur in the ordinary course of the voyage, they are not loss, but simply part of the expense necessarily incurred. But if they have been incurred in extraordinary circumstances, and for the purpose of avoiding impending danger, they are a loss which is included in the general A., and covered by the contribution. *A. Bond* is a deed which parties liable to a general A. are in the habit of executing, by which they empower an arbiter to value the property lost, and fix the proportion which shall be borne by each proprietor.

AVERDUPOIS. See **AVOIRDUPOIS**.

AVERNUS, in Gr. *Aornos*, or 'without birds,' called now Lago d'Averno, is a small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baïæ. It is about a mile and a half in circumference, and occupies the crater of an extinct volcano. It is in some places as deep as 180 feet, and is almost completely shut in by steep and wooded heights. The sulphureous and mephitic vapours arising from the lake were believed in ancient times to kill the birds that flew over it; hence, according to some, its Greek appellation. Owing to its gloomy and awful aspect, it became the centre of almost all the fables of the ancients

respecting the world of shades. Here was located Homer's *Nekyia*, or entrance to the under world; here the Cimmerians are said to have dwelt—a people who lived in deep caverns, without ever coming into the light of day, explored metals, and imparted Stygian oracles; here also were placed the grove of Hecate and the grotto of the Cumæan Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost much of its wildness; and by his orders Cocceius constructed the famous tunnel through the mountain to Cumæ, a work of comparative ease, considering that the hills round about are composed of volcanic tufa. The lake was also connected in ancient times with the Gulf of Baïæ.

AVERRHO'A. See **CARAMBOLA**.

AVERRHOËS, properly, Ibn Roshd, or more fully, Abul-Walid Mohammed-Ibn, Ahmed-Ibn, Mohammed-Ibn-Roshd, the most famous of the Arabian philosophers, was born at Cordova, in Spain, in 1149. His father, who was chief judge and mufti, instructed him in Mohammedan jurisprudence. In theology and philosophy, he had Thophail for his teacher; and in medicine, Ibn Zohr, the elder. His talents and acquirements made him be appointed successor to his father, and afterwards chief judge in the province of Mauritania. Being accused, out of envy, of a departure from the orthodox doctrines of Mohammedanism, he was dismissed from his office, and condemned by the ecclesiastical tribunal of Marocco to recant his heretical opinions, and do penance. After this, he returned to his native place, and lived in great poverty, until the Calif Almansor reinstated him in his offices, on which he went back to Marocco, where he died in 1198 or 1206. A. regarded Aristotle as the greatest of all philosophers. He translated and illustrated Aristotle's writings with great penetration; but the influence of the Alexandrine view laid down in the commentaries of Ammonius, Themistius, and others, is easily seen in his works, as in those of most of the Arabian philosophers. In opposition to the Arabian orthodox school, especially against Algazali, A. stood forth on the side of reason as the defender of philosophy. The Arabians called him, by way of eminence, the Expositor (of Aristotle), and his Syriac translation of Aristotle was held in the highest esteem among them. His writings are known to us only through Latin translations (Ven. 1489). His Commentaries on Aristotle appeared in an edition of that philosopher's works (11 vols. Ven. 1560). He also wrote a sort of medical system, which, under the name of *Colliget* (a corruption of the Arabic title *Kulliyat*—i. e., 'The Total' system), was translated into Latin, and repeatedly printed (Ven. 1482 and 1514). The philosophy of A. attained to importance in the Christian Church as early as the 13th c., although his pantheistic doctrine of the unity of the active principle in the universe was often repudiated as an error, and astrology was characterised as Averrhoism.

AVERSA, a town in the province of Terra di Lavoro (Campania), in the kingdom of Naples, is situated between Naples and Capua, in a beautiful district rich in oranges and wine. It is well built, with 18,789 inhabitants; has a cathedral, and a number of monasteries, in one of which, Andrew of Hungary, the Darnley of Neapolitan history, was murdered with the connivance of his wife, the beautiful but guilty Joanna, queen of Naples; an excellent asylum for the insane, established by Murat; and a founding hospital. A. was built in 1029 by the Normans on a territory ceded to them by Duke Sergius of Naples, to be held in fief. About two miles from A., are still to be seen a few ruins of the Oscan city of Atella, famous as the birthplace of

the satirical farces so popular on the Roman stage.

AVÈS. See BIRDS.

AVEYRON, a river and department in the south of France. The river rises near Severac-le-Château; flows, for the most part, in a westerly direction through the department of the same name; and, after a course of 90 miles, falls into the Tarn—a feeder of the Garonne—below Montauban. It touches in its course the towns of Rhodéz, Villefranche, and Negrepelisse.—The department of A. has an area of 3402 square miles, and is one of the most mountainous parts of France. Situated between the highlands of Auvergne and the Cevennes, it slopes like a terrace south-west to the Garonne, to the basin of which the department belongs. The principal rivers flow through the department from east to west; and between these, several ramified offsets from the chain of the Cevennes traverse the country. The climate is healthy, but cold and raw, especially in the north and east. North of the Lot, only rye and oats are grown; in the rest of the valleys, other kinds of grain also thrive, as well as fruit, chestnuts, potatoes, and truffles. A third part of the land is unfit for cultivation, but affords excellent pasture for the numerous herds of cattle, goats, and sheep, which, along with the breeding of swine, form the principal resources of the mountaineers. 18,000 cwt. of cheese is sold yearly under the name of Roquefort cheese. The mineral wealth of the department is considerable. Coal, iron, lead, zinc, copper, vitriol, alum, and antimony are found in abundance, the mining, preparing, and sale of which form a principal means of support to the 393,890 inhabitants. Besides these, the principal employments are paper-making, cotton-spinning, tanning, the manufacture of woollen cloth and carpets, &c. The seat of the departmental courts is Rhodéz, which is also a bishop's see.

AVIARY, a place for keeping birds. The arrangements of an A. depend upon the habits of its inmates, the climate suited to them, and other circumstances. A bird-cage is a domestic aviary. Aviaries on the largest scale are to be seen in zoological gardens.

AVICENNA, properly, Ibn Sina, or more fully, Abu Ali Al-Hossein Ibn Abdallah Ibn Sina, a famous Arabian philosopher and physician, whose authority for many centuries passed for indisputable, was born 980, at Charmatain, a village near Bokhara, where he received a very learned education. He studied with special fondness mathematics, astronomy, philosophy, and medicine. He was physician to several of the Samanide and Dilemite sovereigns, and also for some time vizir in Hamadan, but afterwards retired to Ispahan, and died during a journey of the Emir Ala-ed-Daula to Hamadan, in 1037. He left a multitude of writings, among which his system of medicine, *Kanun fi'l-Tibb*, acquired the greatest reputation. It is distinguished less by originality than by an intelligible arrangement and judicious selection from the writings of the Greek physicians, at a time when the knowledge of Greek was not widely spread. A. himself knew the Greek writers only through Arabic translations. The Arabic text of the *Kanun*, and of several of his philosophical writings, among which those on metaphysics especially attracted the attention of the schoolmen, appeared at Rome, 1593, in 2 vols. The *Kanun* was translated into Latin by Gerardus Cremonensis, and repeatedly printed (Ven. 1595, 2 vols.). His philosophical writings have also appeared several times in Latin translations (Ven. 1490, 1523, 1564).

AVICENNIA, a genus of plants of the natural order *Avicennæ* or *Myporaceæ*, an order very nearly allied to *Verbenaceæ* (q. v.), and almost exclusively

confined to the southern hemisphere. The genus *A.* consists of trees or large shrubs resembling mangroves, and, like them, growing in salt-swamps. Their creeping roots, often curving for the space of six feet above the mud before they stick into it, and the naked asparagus-like suckers which they throw up, have a singular appearance. *A. tomentosa*, the White Mangrove of Brazil, has cordate ovate leaves, downy beneath. Its bark is much used for tanning. A green resinous substance exuding from *A. resinifera* is eaten by the New Zealanders.—The genus is named in honour of the Arabian physician Avicenna.

AVICULA. See PEARL OYSTER.

AVIGNON (*Avenio Cavaram*), a city of Provence, in the south of France, capital of the department of Vaucluse, is situated on the left bank of the Rhone, which is here crossed by a long bridge. The population is about 26,312; the streets are narrow and crooked. There is a multitude of churches and religious establishments, among which the cathedral on the Rocher des Dons and the church of the Franciscans, as well as the old papal palace and the tower Glacière, are distinguished. The Dominican convent now serves as a cannon-foundry. The city is the see of an archbishop, has a museum and picture-gallery, and several other valuable institutions. The university, founded in 1303, was abolished in 1794. A. has manufactures of silk, silk-dyeing, tanning, iron-founding, &c., and is famous for its garden produce, its fruit, wine, honey, &c. The country about A. is delightful, and extremely fruitful in corn, wine, olives, oranges, and lemons.—In A., Petrarch spent several years; it was here he saw Laura, whose monument is to be found in the Franciscan church. Vaucluse, which he has immortalised, lies about three leagues from Avignon. A. was the capital of the ancient Cavare, and presents many remains of the times of the Romans. In the middle ages, it formed, with the surrounding district, a county, which the popes, who had already received the county of Venaissin as a gift from King Philip III., bought in 1348 from Joanna, queen of Naples and Countess of Provence. The pope governed both counties through a vice-legate, and continued in the possession of them till 1790, when, after several stormy and bloody scenes, the city with its district was united with France. At the peace of Tolentino (1797), the pope formally resigned A. and Venaissin. A. is celebrated in ecclesiastical history as being, for a time, the residence of the popes. By order of Philip IV. of France, Pope Clement V. and six of his successors from 1309 to 1377, were obliged to reside there. It was afterwards the residence of more than one anti-pope. Two ecclesiastical councils were also held at A. (1326 and 1337): the first took into consideration the relation of the clergy to the laity; the other, the bad training of the clergy.

AVILA, a town of Spain, capital of the province of A. in Old Castile, 53 miles north-west of Madrid; pop. 5000. The Spaniards declare that its original name was Abula, and please themselves and amuse strangers with the belief that it was built by Hercules 1660 B.C. It is the birthplace of two highly remarkable persons—the first was the learned Alfonso Tostado de Madrigal, who died in 1455, and whose doctrines (according to his biographer) were so enlightened that they caused the blind to see, though, in the opinion of Don Quixote, he was more voluminous than luminous; the second is 'Our Seraphic Mother, the Holy Teresa, Sponse of Jesus,' born March 28, 1515; she was made the lady-patroness of Spain by Philip III., and shares the honours of worship with St James. A. is the see of a bishop, with a beautiful cathedral, and was at one time one of the richest and most flourishing cities of

Spain. The university, which had been founded in 1482, and enlarged in 1638, was abolished in 1807. It was at A. that the nobles of Old Castile assembled in 1465 to depose King Henry IV., and raise his brother Alfonso to the throne of Leon and Castile. At A., also, was held the meeting of the so-called Third Estate, or of the Holy League, in 1520, under the leadership of Juan Padilla, to which nearly all the cities of Castile sent representatives.

AVILA Y ZUNIGA, DON LUIZ DE, a Spanish general, diplomatist, and historian, born at Placencia, in Estremadura, enjoyed the favour and confidence of Charles V., who intrusted him with embassies to the popes Paul IV. and Pius IV., and made him grand master of the order of Alcantara. He accompanied the emperor on his expeditions to Africa and against the princes of the league of Schmalkald, and wrote an account of the war which goes under that name, partial, indeed, but able and spirited. The *Commentarios de la Guerra de Atemanna hecha por Carlos V. en 1546 y 1547*, have been published repeatedly (first, Ven. 1548), and translated into several languages.—**AVILA**, GIL GONZALEZ DE, born at Avila, in Old Castile, in 1559, and died in 1638, was a Jesuit and canon of Salamanca; also royal historiographer for Castile and the Indies. He composed a great number of historical works, of which the following may be mentioned as containing many valuable facts: *Historia de la Vida y Hechos del Rey Don Henrique III. de Castilla* (Madr. 1638); *Historia de la Vida y Hechos del Monarca D. Felipe III.* (in Mendoza's *Monarquía de España*, 3 vols. Madr. 1770); *Historia de Salamanca* (Salam. 1606); and the *Teatro Eclesiastico de la primitiva Iglesia de las Indias Occidentales* (2 vols. Madr. 1649-1656).

Badge of Order of Aviz. **AVO'CA**, or **OVO'CA** (Celt. meeting of the waters), a small river in the south-east of Wicklow county, formed by the union of two streams, rising in the hills of the centre of the county. The A. runs through a very picturesque vale only a quarter of a mile broad, with wooded banks 300 to 500 feet high, and, after a course of nine miles, reaches the sea at Arklow. A. Vale is celebrated in Moore's *Irish Melodics*.

AVOCA'DO PEAR, or **ALLIGATOR PEAR** (*Persca gratissima*), a fruit-tree of the natural order *Lauraceæ* (q. v.), a native of the warm regions of America. It attains the height of 30-70 feet, and is a slender tree with a dome-like top. The leaves resemble those of the laurel. The flowers small, and are produced towards the extremities of the branches. The fruit is a drupe, but in size and shape resembles a large pear; is usually of a brown colour, and has a soft green or yellowish pulp, not very sweet, but of a delicate flavour, which dissolves like butter on the tongue, and is believed to consist principally of a fixed oil. It is called *vegetable butter*

in some of the French colonies. It is much esteemed in the West Indies, and often eaten with sugar and lime-juice or wine, or with spices.

AVOCET, or **AVOSET** (*Recurvirostra*), a genus of birds, which, although having the feet webbed nearly to the end of the toes, is usually ranked among the *Grallæ* or *Grallatores*, upon account of the length of the legs, the half-naked thighs, the long, slender, elastic bill, and the general agreement in habits with snipes. They are distinguished from all other birds, except a few species of humming-bird, by the strong upward curvature of the bill, which is much like a thin piece of elastic whalebone, and most probably a delicate organ of touch, adapted for seeking food in mud, as their webbed feet are for walking upon it, and their long legs for wading in the fens and marshes which they frequent. They are birds of powerful wing. They are not much addicted to swimming. They scoop through the

Avocet.

mud with the bill, first to one side, and then to the other, in quest of worms and other small animals; although Audubon has also observed the American A. taking insects which were swimming on the surface of the water, and expertly catching them in the air, running after them with partially expanded wings.—The Common A. (*R. Avocetta*), the body of which is about as large as that of a lapwing, is found in the fenny districts of England, where, however, it is much more rare than it once was, and is a native also of the continents of Europe, Asia, and Africa, occurring even at the Cape of Good Hope.—Other species are natives of North America, India, and New Holland.—The American A. (*R. Americana*) has the bill less recurved than the Common A., but its habits appear to be very similar.

AVOIDANCE, in English ecclesiastical law, the term by which the vacancy of a benefice, or the fact of its being *void* of an incumbent, is signified. A. is opposed to *plenary*, or fullness. See **BENEFICE**.

AVOIRDUPOIS, or **AVERDUPOIS**, is the name given to the system of weights and measures applied in England to all goods except the precious metals, precious stones, and medicines. The word is generally said to be derived from the French *avoir du poids*, to have weight; but the middle-age Latin word *avera* or *avera*, used for goods in general, or the middle-age Latin *avrare*, and French *avrer*, meaning to *verify*, seem to offer more probable etymologies.

The grain is the foundation of the A. system, as well as of the Troy and Apothecaries'. A cubic fuch of water weighs 252.458 grains. Of the grains so determined, 7000 make a pound A., and 5760 a pound Troy. See **WEIGHTS AND MEASURES**.—The A. pound is divided into 16 ounces, and the ounce into 16 drams. A dram, therefore, contains 27½ grains, and an ounce 437½ grains.

TABLE OF AVOIRDUPOIS WEIGHT.

27½ grains	are	1 dram,	1 dr.
16 drams or drachms	"	1 ounce,	1 oz.
16 ounces	"	1 pound,	1 lb.
28 pounds	"	1 quarter,	1 qr.
4 quarters	"	1 hundredweight,	1 cwt.
20 hundredweight	"	1 ton,	1 ton.

A cubic foot of water weighs 997·14 ounces A., or nearly 1000 ounces, which gives an easy rule for determining the weight of a cubic foot of any substance from its specific gravity. A. is the weight used in the United States of North America, where, however, in many places, the cwt. contains only 100 lb., and the ton, 2000 lb.

AVON, a word of British or Celtic origin, meaning 'river' or 'stream,' which seems allied to Aa (q. v.), the name of so many continental rivers. It is the name of several of the smaller British rivers. Of these may be noticed: 1. The Upper or Warwickshire A., which rises in north-west Northamptonshire, runs south-west through Warwickshire and Worcestershire, passing Rugby, Warwick, Stratford, and Evesham, and joining the Severn at Tewkesbury. It has a course of 100 miles, and receives several tributaries. 2. The Lower, or Bristol, or West A., which rises in north-west Wiltshire, and runs 70 or 80 miles, first south in Wiltshire, and then west and north-west between Gloucestershire and Somersetshire. It traverses an oolitic basin, passing Bradford, Bath, and Bristol, and empties itself into the Bristol Channel. It is navigable for large vessels up to Bristol. It runs generally between deep banks in a rich valley. A canal through the middle of Wiltshire connects it with the Thames. 3. The Wiltshire and Hampshire, or East A., which rises in the middle of Wiltshire, and runs south 70 miles through Wiltshire and Hampshire, passing Amesbury, Salisbury, and Ringwood, and entering the English Channel at Christchurch. It is navigable up to Salisbury. It abounds in the small delicate loach. In Wales two rivers named A.—one rising in Monmouthshire, the other in Glamorganshire—fall into Swansea Bay. In Scotland there are several of the same name, affluents of the Spey, Annan, Clyde, and Forth.

AVRANCHES, a town of France in the dep. of Manche (q. v.).

AWE, Loch, a lake in the centre of Argyleshire, extending in a direction north-east and south-west about 24 miles, with an average breadth of from half a mile to 2½ miles. It rarely freezes, and its surface is 108 feet above the sea. The country around consists of mica slate. The scenery is most striking at the north-east end of the lake, where the water is studded with numerous wooded islets, overshadowed by towering and rugged mountains, prominent among which rises the dark and rocky ridge of Ben Cruachan, 3669 feet high, and 14 miles in circuit. Of the islands, the most noted is Fraoch-eilean, containing the remains of a castle granted to Gilbert McNaughton in 1267 by Alexander III. On a peninsula, in the north end of the lake, stands Kilchurn Castle (Caesteal Chaoil-churn), once a fortress of great strength, built about 1440 by Sir Colin Campbell of Glenorchy, and garrisoned, as late as 1745, by the king's troops. The waters of the lake are carried off at its north-west end by the river Awe, which, after a course of 7 miles, enters the sea at Bunawe on Loch Etive. The magnificent 'Pass of Awe,' through which the road runs beneath the shoulder of Ben Cruachan, was the scene of a conflict, in 1308, between Robert the Bruce and the McDougalls of Lorn, in which that clan was all but exterminated. At the north-east end of the loch, it

receives the waters of the Orehy and Strac, flowing through glens of their own names. Loch A. abounds in fine fish, especially trout and salmon; and the small village of Claddich, on the east side of the loch, due north of Inverary, is the general resort of anglers.

A-WEA'THER is a term denoting the position of the helm when jammed close to the weather-side of a ship; it is the reverse of *a-lee*.

A-WEI'GH, as applied to the position of an anchor, when just loosened from the ground, and hanging vertically in the water, is nearly equivalent to *a-trip*.

AWN (*Arist'a*), in the flowers of Grasses, a solitary pointed bristle, growing either from a glume or a palea. The flowers of some grasses are entirely *awnless*; in many, the glumes alone are *awned* (or *aristate*), or only one of them; in others, the glumes are *awnless*, and the paleæ, or one palea, *awned*. The awn is often terminal, and appears as a prolongation of the midrib of the glume or palea; from which, however, it sometimes separates below the point, and is then said to be on the back of it, or *dorsal*; sometimes it is jointed at the base, and finally separates at the joint; sometimes it is knee-bent or geniculate; sometimes it is twisted, and liable to twist and untwist hygometrically; sometimes it is rough, or even serrate, at the edges, as in barley; sometimes it is feathery, as in feather-grass (*Stipa*), which also is remarkable for the great length of its awn. The characters of genera and species are often derived from it, but it is not always invariable, even in the same species, and the cultivated varieties of wheat and oats differ much in being more or less *bearded*. There appears to be a tendency to the diminution or disappearance of the awn through cultivation.

AXE, the name of two small rivers in the south-west of England. One rises in the Mendip Hills, north of Somerset, runs first south-west, and then north-east, through a carboniferous limestone, trias, and diurnal basin, past Wells and Axbridge, into the Bristol Channel. The other rises in west Dorset, and flows 21 miles south and south-west, through east Devonshire, in an oolitic and trias basin, past Axminster into the English Channel. A. is only another form of Exc. See AA.

AXEL, or A'BSALON, Archbishop of Lund, in Denmark, and also minister and general of King Waldemar I., was born in 1128, and died 1201. He was descended of a distinguished family, and, in his youth, studied at Paris. A. distinguished himself as well by wisdom and uprightness in peace, as by valour and address in war. The Wendish pirates were not only driven from the coasts of Denmark, but attacked in their own settlements, and subdued. He defeated the Pomeranian prince, Bogislav, and made him dependent on Denmark. In the wise legislation of Waldemar and of his son, he took a great part. He favoured and promoted learning and art, and to his encouragement we owe the first connected history of Denmark by Saxo Grammaticus. By building a fortified castle for defence against the pirates, he laid the foundation of the future great city of Copenhagen, which was then an insignificant village, inhabited only by fishermen. Owing to this origin, Copenhagen has sometimes got the name of Axelstadt. A. lies buried in the church of Soroe, where he had founded a monastery. The relics found when his grave was opened in 1827, the chief of which were a bishop's staff and ring, are described in the latest complete biography of A. by Estrup, translated into German by Mohnike in Illgen's *Zeitschrift für Historische Theologie* (2 vols. Leip. 1832).

AXESTONE, a mineral generally regarded as a variety of Nephrite (q. v.). It is of a greenish colour, is more or less translucent, hard, tough, and not easily broken. It occurs in primitive rocks, always massive, and is found in Saxony, in Greenland, and in New Zealand and other islands of the Southern Pacific. It derives its name from the use to which it is put by the natives of these islands for making their hatchets. They also make ear-drops of it.

AXHOLME ISLE (A. Sax. *holme*, a river-isle), a low level tract in the north of Nottinghamshire, surrounded by rivers—the Trent on the east; Don, north and west; Torne and Idle, on the west; and Vicardye, between the Trent and Idle on the south. This district, 18 miles from north to south, and 5 on an average east and west, was anciently a forest, but afterwards became a marsh. The marsh was drained into the Trent in 1634 by Vermuyden, a Dutchman, after 5 years' labour, and at the cost of £56,000. The reclaimed land became very fertile under Dutch and French Protestant settlers, and after much litigation, it was, in 1691, divided, the original inhabitants receiving 10,532 acres, and the settlers 2868. On the land are raised abundant crops of wheat, oats, rye, pease, beans, clover, flax, rape, hemp, potatoes, and onions. Peat and turf fuel abound, and valuable gypsum beds occur. The water is brackish, too hard for washing, and curdles milk when boiled with it. A. I. includes seven parishes, with a population (1851) of 13,869. There are two small towns, Crowle and Epworth.

AXIL (*axilla*), in Botany, the angle between the upper side of a leaf and the stem or branch from which it grows. Buds usually grow in the axils of leaves, although they are not always actually developed; but a bud may be made to appear in such a situation, and to form a new shoot or branch, by artificial means, which direct the strength of the plant more particularly to that quarter, as cutting over the main stem, wounding it above the place where the new branch is desired, &c. Flowers or flower-stalks (*peduncles*) growing from the axils of leaves are called *axillary*.

AXINOMANCY (Gr. *axine*, an axe, and *manteia*, divination), a mode of divination much practised by the ancient Greeks, particularly with the view of discovering the perpetrators of great crimes. An axe was poised upon a stake, and was supposed to move so as to indicate the guilty person; or the names of suspected persons being pronounced, the motion of the axe at a particular name was accepted as a sign of guilt. Another method of A. was by watching the movements of an agate placed upon a red-hot axe. This is only one of a multitude of analogous modes of divination practised in all ages and among all nations. See **DIVINATION**, and **DIVINING-ROD**.

AXIOM, a Greek word meaning a *demand* or *assumption*, is commonly used to signify a general proposition, which the understanding recognises as true, as soon as the import of the words conveying it is apprehended. Such a proposition is therefore known directly, and does not need to be deduced from any other. Of this kind, for example, are all propositions whose predicate is a property essential to our notion of the subject. Every rational science requires such fundamental propositions, from which all the truths composing it are derived; the whole of geometry, for instance, rests on, comparatively, a very few axioms. Whether there is, for the whole of human knowledge, any single, absolutely first A., from which all else that is known may be deduced, is a question that has given rise to much disputation; but the fact,

that human knowledge may have various starting-points, answers it in the negative. Mathematicians use the word A. to denote those propositions which they must assume as known from some other source than deductive reasoning, and employ in proving all the other truths of the science. The rigour of method requires that no more be assumed than are absolutely necessary. Every self-evident proposition, therefore, is not an A. in this sense, though, of course, it is desirable that every A. be self-evident; thus, Euclid rests the whole of geometry on fifteen assumptions, but he proves propositions that are at least as self-evident as some that he takes for granted. That 'any two sides of a triangle are greater than the third,' is as self-evident as that 'all right angles are equal to one another,' and much more so than his assumption about parallels, which, it has been remarked, is neither self-evident nor even easily made evident. See **PARALLELS**. Euclid's assumptions are divided into three 'postulates' or demands, and twelve 'common notions'—the term A. is of later introduction. The distinction between axioms and postulates is usually stated in this way: an A. is 'a theorem granted without demonstration;' a postulate is 'a problem granted without construction'—as, To draw a straight line between two given points.

AXIS, in Geometry.—The A. of a curved line is formed by a right line dividing the curve into two symmetrical parts, so that the part on one side exactly corresponds with that on the other; as in the parabola, the ellipse, and the hyperbola. The A. of any geometrical solid is the right line which passes through the centre of all the corresponding parallel sections of it: in this sense, we speak of the A. of a cylinder, a globe, or a spheroid. By the A. of rotation, we understand the right line around which a body revolves.—In physical science, the A. of a *lens* is the right line passing through it in such a manner as to be perpendicular to both sides of it; and the A. of a telescope is a right line which passes through the centres of all the glasses in the tube. The A. of the *eye* is the right line passing through the centres of the pupil and the crystalline lens.

AXIS, in Botany, a term applied to the central part both above and below ground, around which the whole plant is regarded as arranged. The stem is called the *ascending A.*; the root, the *descending axis*. The opposite tendencies of growth appear as soon as a seed begins to germinate, in the radicle and plumule; the former of which is the descending A., and the latter the ascending A.; the former descending deeper into the soil, the latter ascending towards the air and light. That part of the stem around which the flowers are arranged is called the *floral A.*, and, in describing some kinds of inflorescence, the terms, *primary floral A.*, *secondary floral A.*, &c., are occasionally employed.

AXIS (*Cervus Axis*), a species of deer, abundant on the banks of the Ganges, but found throughout India and in many islands of the Eastern Archipelago. It was known to the ancients by the name Axis. One of its Indian names is Chittra, and by British sportsmen in India it is generally called the Spotted Hog-deer. By some naturalists, it has been made the type of a genus of *Cervida*, called *Axis*. The A. has a great resemblance in size and colouring to the European fallow-deer; it is generally of a rich fawn colour, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns, however, differ very much from those of the fallow-deer, being slender, sharp-pointed, little branched, and not at all palmated. The female has no horns. The A. frequents thick jungles in the

vicinity of water, and feeds during the night. It is commonly found in herds of 15 or 20, of which 3 or 4 are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within shot. The males, however, sometimes exhibit great courage in defence of the young. It is very easily domesticated, is very gentle in its manners, has been frequently imported into Europe, and breeds freely in the parks in which it is kept at a few noblemen's and gentlemen's seats in Britain and France.

AXMINSTER, a small town in east Devonshire, on the side of a little hill on the left bank of the Axe. Pop. (1851) under 2000. A. was once famous for the manufacture of Turkey and Persian carpets, which were little inferior to those imported. Two celebrated geologists have been connected with A.: Dr Buckland was brought up here, and Dr Conybeare was lord of the manor, and vicar.

AXMOUTH, a village at the mouth of the Axe, east Devonshire. A mile east of A. occurred, in 1839, a landslip; an area 200 feet wide, for three-quarters of a mile parallel to the shore, having sunk 250 feet below the sea, with a great noise. The chasm thus formed became a lagoon, while the neighbouring sea-bed rose 40 feet. Rather more than a mile further east, occurred another but smaller landslip in 1840. The district around consists of greensand strata.

AXOLOTL (*Gyrinus*, or *Axolotl*, or *Axolotes edulis*), a remarkable animal, found in great abundance in some of the Mexican lakes, and particularly in the Lake of Mexico itself. It is a Batrachian (q. v.) reptile of the family of the *Proteida* or *Percenni-branchiate Batrachians*, in which the gills remain during life, and the lungs are never sufficiently developed to maintain respiration by themselves. It is in general form very like a fish; has a large

Axolotl.

and broad head; and tapers into a long compressed tail, which has a thin membranous fin both on its upper and its lower side. It has four legs, with toes not webbed; and on each side of the neck the gills form three long branched or feathered processes, which give it a very remarkable appearance. It is brown, and mottled with small black spots. When full grown, it is 8 or 9 inches in length. It is esteemed a great delicacy in Mexico, and is there constantly brought to the market.

AXUM, once the capital of the Ethiopian kingdom of the same name, is situated in the modern Abyssinian province of Tigré, west from Adowa. Lat. 14° 7' N.; long. 39° 27' E. It now lies in ruins, among which stands the principal church of Abyssinia, built in 1657. The former greatness

of the city is testified by yet remaining structures cut in granite, some of which have inscriptions. From these it appears that the Axumite empire extended over Abyssinia, and even over Yemen and Saba in Arabia, and possessed the command of the Red Sea. It acquired political importance from the circumstance, that it formed on the south a boundary to the world-embracing power of Rome, as well as to that of Parthia, which then extended as far as Arabia. The Byzantine emperors even paid an annual tribute to the sovereigns of Axum. This country was also the furthest point southward that Grecian civilisation reached; through the medium of Egypt, Greek philosophy spread into A., and the Greek language became the language of the court and of the priests. Under King Aizanes, who, in a still remaining inscription, appears as a heathen, Christianity was introduced into the country from Egypt by the two apostles Frumentius and Aedesius, who were followed by many priests from the same quarter. The new doctrine soon spread over the whole country; Frumentius was made the first Bishop of A., and Fremona was built in honour of him. The stone churches, many of them very imposing, yet scattered over the whole of Abyssinia, owe their architecture to Egyptian priests, and arose at that period, as well as the most celebrated Abyssinian convents and hermitages. The Axumite empire carried on, through Adule, an active commerce with Arabia and India; it formed the outermost bulwark of Christianity; and, as such, particularly from about the 6th c., it interfered in behalf of the Christians in Arabia, and became the natural enemy of Mohammedanism. The contests in which it soon became involved with that power caused its fall, as the kings gradually lost their possessions in Arabia, and the whole coast on the Red Sea and Gulf of Aden. The outlets for commerce were thus cut off, and the empire was at the same time so weakened by constant wars, that internal disorders brought on its complete dissolution.

AYACU'CHO, a town in a department of the same name in South Peru. Here, on the 9th December 1824, the combined forces of Peru and Colombia—the latter then comprising Ecuador, New Granada, and Venezuela—totally defeated the last Spanish army that was ever seen on the new continent.

AYALA. **PERO LOPEZ DE**, called El Viejo, to distinguish him from his son of the same name, was born at Murcia in 1332, of one of the first families of the Castilian nobility. He stood high in the regard of several kings of Castile, and filled the first offices of the state, latterly, that of high-chancellor and high-chamberlain of Castile. At the battle of Najera, in 1367, he was taken prisoner by the English, then in league with Peter the Cruel, and confined for some time in an English dungeon; and again in 1385, by the Portuguese, at the battle of Aljubarota. He died at Calahorra in 1407. A. has acquired a name, not only as a statesman, but as a writer, especially as a historian and poet. His best known work is his *Crónicas de los Reyes de Castilla D. Pedro, D. Enrique II., D. Juan I., D. Enrique III.* (2 vols. Madr. 1779-80—the older editions of 1495 and 1591 are imperfect). He was the first among the Spaniards to give up the usual simple narrative of events in the order of time, and to seek to give a more rational representation of them according to the rules of historic art. It is only in recent times that the poetical works of A. have been discovered; the most remarkable of which is the *Libro ó Rimado de Palacio*. This 'Book in Rhyme on Court-life,' as its singular title may be translated, was begun during the poet's first captivity in England, and is composed in the old national form of rhyming Alexandrine

stanzas of four lines; the contents are satirical and didactic. A. appears also in his poetical works as a representative of that transition epoch of Spanish national literature, when it was passing from a popular original literature to one of a more artificial imitative character.

AYE-AYE (*Cheiromys Madagascariensis*), a quadruped about the size of a hare, a native of Madagascar, which was at first placed by naturalists among Squirrels, and was ranked by Cuvier along with them in the order of Rodents (*Rodentia*), although Sonnerat, who discovered it, pointed out its affinity also to the Makis or Lemurs, to which family it is now pretty generally referred. The principal reason for placing the A. among the *Rodents* has been found in the conformation of its teeth; but

Aye-aye.

the other characters of the animal agree generally with those of the Lemurs, and its habits resemble theirs. The A. has large broad ears, large round eyes, long brownish gray hair, and a large bushy tail, which it does not carry over its back as squirrels do. It is very active during the night, but sleeps during the day. In confinement, it will subsist on boiled rice and fruits. It seems to be able to make as good use of its front teeth for gnawing as any of the Rodents (*Gnawers*). Mr Ellis mentions one which ate its way through a barrel, and made its escape. He thinks it probable that there are more than one species.

AYESHAH, the favourite wife of Mohammed, was born at Medina in 610 or 611 A.D. She was only nine years of age when she married the Prophet. Her father's name was Abdullah, but he was surnamed Abu-Bekr, 'father of the virgin,' in consequence, it is said, of his daughter being the only one of Mohammed's wives who was a virgin. Although A. bore no children to Mohammed, she was so tenderly beloved by him, that he was wont to say that she would be the first of his wives to whom the gates of Paradise would be opened. It is stated by Mohammedan historians, that to the charms of her beauty she added a knowledge of mathematics, rhetoric, and music. But this statement is improbable. She was accused of adultery, but Mohammed having produced a revelation from Heaven to the effect that she was innocent, punished her accusers, and made it an article of faith for all time, that whoever should not believe in her purity should endure the pains of hell for ever. In his last illness, Mohammed, by his request, was carried to her house, and expired in her arms. After the

Prophet's death, A. took an active part in the plot which deprived Kalif Othman of his power and life, and headed a force to resist the accession of Ali. After some partial success, however, the troops under her were effectually defeated by Ali, and she was taken prisoner. Ali spared her life, and allowed her to reside in any town in Arabia she chose, provided she did not interfere with state affairs. She died at Medina (677 A.D.). In spite of her political adversities, A. was highly venerated by all true Mussulmans, and named the *Prophetess*, and the *Mother of Believers*. She was consulted on divers points of the Koran, and her interpretations were held to be binding. They have been collected in the *Sunna* (q. v.).

AYLESBURY, a town in the centre of Buckinghamshire, on a rivulet which flows into the Thames, an east branch of the Thames. It lies high above the vale in which the rivulet runs, which often causes a scarcity of water in the town. Pop. (1851) 26,794. A. returns two members to parliament. It is chiefly an agricultural town, but the inhabitants also engage in straw-plait, lace, and silk manufactures. Many dnicks are reared for the London Christmas market. A. is a very ancient town, having been taken from the Britons by the Saxons in 571.

AYLESFORD, a village near the centre of Kent, on the right bank of the Medway, $3\frac{1}{2}$ miles north-east of Maidstone. Remarkable ancient remains occur here. On a hill-slope a mile and a half to the north-east, there still stands a celebrated ancient cromlech, or burying-place, called Kits Coity House—a small truncated pyramidal chamber, open in front, and formed of four large rude Kentish rag blocks, three of which are uprights, with a slight slope inwards, and the fourth laid on them. Of the side-stones, one is 7 by 7 $\frac{1}{2}$ feet, 2 feet thick, and 8 $\frac{1}{2}$ tons in weight; the second is 8 by 8 $\frac{1}{2}$ feet, weighing 8 tons; and the third is smaller and more irregular in form. The capstone is 12 by 9 $\frac{1}{2}$ feet, 2 $\frac{1}{2}$ feet thick, and weighs 10 $\frac{1}{2}$ tons. This cromlech seems to have been the centre of a group of ancient monuments connected by a long stone avenue with another group, 7 miles to the south-east. In this district also occur, on the brow of the chalk-hills on both sides of the Medway, large circular sepulchral pits, opening at bottom into one or more chambers. Some of these pits are covered with flat stones, and filled with flints. At A. the Britons defeated the Saxons in 455, and drove them from the island; but early in the 7th c. the Saxons were victorious here.

AYLOFFE, SIR JOSEPH, an English antiquary of celebrity, born about 1708 in the parish of Framfield, Sussex. In 1731 he was elected a Fellow of the Royal Society, and in the following year, a Fellow of the Society of Antiquaries. He was one of the first council of this Society, after it received its charter of incorporation in 1751; and he was made vice-president some years after. When the new State-Paper Office was established in 1763, he was made one of the commissioners for the preservation of the state papers. In 1772, he published a valuable work on the national records. He also wrote several useful papers for the publications of the Society of Antiquaries; and projected, and was engaged in the execution of the work, afterwards continued by Gough, and known as Gough's *Sepulchral Monuments*, at the time of his death in 1781.

AYMAR, JACQUES, a celebrated French professor of the art of divination. A. was the son of a peasant of Dauphiné, and was born at St Veran in September 1662. He was brought up as a mason, but he forsook that trade for the divining-rod, which he used at first to point out springs, hidden treasures, &c.

in 1692, a murder and robbery was committed at Lyon, and A. and his rod were called into requisition to detect the criminals. In some way or other, he succeeded in discovering one of the guilty parties. A.'s fame having been spread by this incident, he was called to Paris to exhibit his art before the Prince de Condé; but, unfortunately for his reputation, his power of divination utterly failed him; and being forced to confess himself an impostor, he was sent back in disgrace to his original obscurity.

AYMON, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud, sons of Aymon or Haimon, Count of Dordogne, who figure among the most illustrious heroes of the chivalric poetry of the middle ages; but their historic existence must be considered problematical, as the deeds attributed to them possess in so large a measure a miraculous character. What basis of fact may underlie the fanciful accretions of mythology, it is now impossible to determine. Their career belongs to the cycle of marvels, of which Charlemagne is the central point, and their adventures furnished rich material to the romantic narratives of Italy in the 15th and 16th centuries, and, in fact, were the exclusive subject of some of these. A novel, entitled *Les Quatre Fils Aymon*, by Haon de Villeneuve, a French poet of the age of Philippe Auguste, details very minutely their exploits. Finally, Ariosto conferred a poetical immortality on the family by the publication of his *Roland*, in which Renaud, the bravest of the four brothers, plays continually the most distinguished part. The traditions concerning them are not uniform or consistent. Some have a Provençal origin; but the author or authors of the popular German book which Tieck has edited and published, entitled *The Beautiful and Entertaining History of the Four Brothers Aymon, and of their Horse Bayard, with the Deeds and Heroic Feats that they accomplished against the Pagans, in the Time of Charlemagne*, seem to have drawn from a different source. The most probable hypothesis, therefore, is, that the varieties in these poetic legends are due to the fancy and national predilections of the particular authors, and that there originally existed a single tradition, out of which the whole sprang.

AYR, the county town of Ayrshire, is situated on the left bank of the river Ayr, about the middle of the coast of Ayrshire, 40 miles south-south-west of Glasgow by rail. It lies in a coal district. A. is a clean and handsome town, and its principal streets are well built. To the south, between the town and the race-course, numerous elegant villas have recently sprung up. The spire of the Assembly-rooms is 217 feet, and the Wallace Tower, 113 feet high. The river is here spanned by three bridges—the 'Auld Brig' and 'New Brig' of Burns, and one built long after, to permit the Glasgow and South-Western Railway to be carried on uninterruptedly into Carrick. These connect the town with Newton-upon-Ayr. A. harbour is formed by the estuary of the river, and is protected on each side by a pier. There is a bar at its mouth, with a depth only of sixteen feet at spring-tides, which prevents the entrance of vessels above 200 tons. The coasting-trade is considerable. The chief export is coal, 60,000 to 70,000 tons yearly being sent to Ireland from the Newton-upon-Ayr collieries. Formerly, much wine was imported from France. At an early date, A. was a commercial and military place of some importance. William the Lion made it a royal burgh about 1202. During the Scottish wars of independence, it formed a regular centre of military operations, and, while in possession of an

English garrison, it was the scene of Wallace's first exploits. The principal objects of interest near A. are connected with the memory of Robert Burns. See ALLOWAY KIRK. Pop. in 1851, municipal burgh, 9097; parliamentary burgh, including Newton-upon-Ayr, 17,624. A. unites with Campbellton, Irvine, Inverary, and Oban, in sending a member to parliament. In 1857, custom duties, £4930; value of exports, £7160; registered shipping, 35 vessels, or 3919 tons.

AYRSHIRE, an extensive maritime county in the south-west of Scotland, bounded, N., by Renfrewshire; W., by the Firth of Clyde and the North Channel; S., by Wigton and Kirkcubright; E. and N. E., by Dumfries and Lanark. Its greatest length is 78 miles; its greatest breadth, 26—average 14½; estimated area, 1016 square miles. It is the seventh in size of the Scottish counties. The general aspect of the county is undulating and hilly, the land attaining no great elevation, except a small portion in the north, and some considerable tracts in the south and south-east, which are mountainous. None of the eminences exceed 2000 feet. A. contains a great number of lakes and small streams, the latter rising near the inland boundary of the county. The chief rivers—only 20 to 35 miles long—are the Ayr, with its tributary the Lugar, and the Doon, which flow across the centre of the county; the Garnock and Irvine in the north; and the Girvan and Stinchar in the south. A. to the south of the Girvan consists of Lower Silurian rocks, and to the north of that river, of patches of Devonian, carboniferous, and trap rocks. It is rich in valuable minerals, especially coal, ironstone, limestone, and freestone. The other minerals have been long wrought, but it is only of late years that the working of ironstone has been established—and is now carried on on a large scale in the north of the county. On the banks of the Ayr, is found an excellent species of whetstone, called Water-of-Ayr Stone. The climate of A. is mild and healthy, but moist. The soil along the coast is light and sandy, interspersed with deep loam; the most fertile districts are in the centre of the county, where clay predominates. On the east side are extensive mosses and moorlands. The three ancient divisions of the county are—Carrick, south of the Doon, mostly wild and hilly; Kyle, between the Doon and the Irvine, containing much rich level land, but towards the coast the soil is light, and, though well cultivated, is less productive; and Cunningham, comprising all the country north of the Irvine, mostly fertile. The characteristics of these districts are rudely indicated in the old country rhyme:

Kyle for a man;
Carrick for a coo;
Cunningham for butter and cheese;
And Galloway for woo.

Agriculture in A., till about 1800, was very backward; but since that time, especially of late years, extraordinary progress has been made in furrow-draining, improved rotation, and road-making; while the condition of the peasants has been much improved. In 1857, 259,911 acres were in crop, held by 3300 persons, the farms being generally small. Dairy-husbandry is carried to high perfection in Ayrshire, the breed of milch cows, of which it rears a greater number than any other Scotch county, being noted as the finest in the kingdom for the quantity and quality of their milk. The Dunlop cheese, so called from the parish of that name, is almost as celebrated as Stilton. The breed of horses is also excellent. Manufactures, especially woollen and cotton, are carried on to an important extent.

The muslin manufacturers of Glasgow and Paisley employ a considerable proportion of the female population, whose needlework is celebrated. Of the minor manufactures, the most characteristic is that of snuff-boxes, which is extensively carried on at Old Cumnock and Mauchline. Kilmarnock 'cowls' or night-caps used to be famous all over Scotland, but they have now disappeared. Ironworks exist at Muirkirk. There are considerable willow-plantations for hoops and baskets. Pop. in 1851, 189,858; inhabited houses, 23,554; day-schools, 298 with 23,372 scholars; places of worship, 179 (54 of the Established, and 46 of the Free Church). A. county returns one member to parliament. The chief towns, besides Ayr, are Kilmarnock, Girvan, Maybole, Dalry, Kilwinning, Beith, Irvine, Stewarton, Ardrossan, Saltcoats, Troon, Mauchline, Galston, Newmilns, Killbirnie, and Largs. Of antiquities, the most interesting are the ruins of Crossraguel Abbey, near Kirkoswald, and of the castles of Turnberry, the family seat of Robert the Bruce, Dunure, Loch Doon, Dean, Auchinleck, Dundonald, &c.; also the ruins of Alloway Kirk. There are also relics of early times in the form of cairns and encampments.

A. was inhabited, in the time of Agricola, by the Damii, with whom were afterwards mixed the Scots from the opposite coast of Kintyre. In the 8th c., the Northumbrian Saxons seized the territory; and afterwards came the Normans, whose traces still exist in local names. During the religious persecutions of the Stuarts, A. was a stronghold of the Covenanters.

AYRER, JACOB, next to Hans Sachs the most prolific and important German dramatic writer of the 16th c. His history is involved in obscurity; but it is known that he was a citizen of Nürnberg in 1594, and a procurator in the courts of law. It was not till after his death, in 1605, that a collection of his pieces was published, consisting of 66 tragedies, comedies, and carnival plays (Nürnb. 1618). A. has the same garrulous breadth of dialogue as Hans Sachs, but is inferior to him in wit and humour.

AY'TON, SIR ROBERT, a Scottish poet and favourite courtier in the reign of James VI. He was a younger son of Andrew Ayton of Kinaldie, Fifeshire, where he was born in 1570. He was enrolled as a student in St Leonard's College, St Andrews, in 1584, and took his degree of M.A. in 1588. For purposes of study, he next visited France, from whence he addressed, in 1603, an elegant panegyric, in Latin verse, to King James, on his accession to the throne of England. This poem appears to have been the making of A.'s fortune, for we find him afterwards appointed, successively, one of the gentlemen of the bedchamber, private secretary to the queen, and master of requests. Subsequently, he held the appointment of secretary to the queen of Charles I. King James employed him to convey copies of one of his works, conjectured to be his *Apology for the Oath of Allegiance*, to the German courts. A. was on terms of familiarity with all the most eminent men of his time—poets, wits, and philosophers alike—among others, Hobbes and Ben Jonson. He was himself a poet of considerable merit; but, unfortunately, a large number of his effusions being complimentary verses to his friends, are characterised by conceit and extravagant flattery. He was one of the first Scotsmen who wrote in English with any degree of elegance and purity. His verses on general topics 'are conceived in a refined and tender strain of fancy, that reminds us more of the fairy strains of Herrick than anything else.' Burns had a great admiration of some of A.'s pieces, two or three of which he paraphrased. A. is also said to have written verses in Greek and French, as well

as in English and Latin. Several of his Latin poems are preserved in the work called *Deliciae Poëtarum Scotorum*, printed at Amsterdam in 1637. A. died in Whitehall Palace, March 1618.

AY'TOUN, WILLIAM EDMOND-STOUNE, is a native of Edinburgh, having been born there in 1813. He received his education at the metropolitan university, and was called to the Scottish bar in 1840. In 1845, he was appointed Regius Professor of Rhetoric and Belles-Lettres in the university of Edinburgh; and after the formation of the Derby administration, in 1852, he was promoted to the shrievalty of Orkney and Shetland. He married a daughter of the late Professor Wilson. During the last 20 years, Professor A. has wielded an indefatigable pen. The earliest work of his with which we are acquainted is entitled *The Life and Times of Richard I.*, published in 1840—a subject well treated, and singularly in consonance with his chivalrous and romance-loving nature. Despite his minstrel tendencies, he is a master of caricature and parody; and many of the most successful of the *Bon Gaultier Ballads* are understood to be from his pen. In 1849, he published the *Lays of the Scottish Cavaliers and other Poems*, which established his reputation as a poet of the school of Sir Walter Scott, and which has run through eleven editions. His subsequent writings are—*Firmilian, a Spasmodic Tragedy*, published in 1854; *Bothwell*, a narrative poem of considerable length, in the measure and manner of Scott, and which has, since its publication in 1856, to a considerable extent been recast and improved. His edition of the *Scottish Ballads*, in 2 vols., appeared in 1858. In the ensuing year, he, in conjunction with his friend Mr Theodore Martin, issued translations of various minor poems of Goethe, in one volume. He has for many years been one of the most frequent and brilliant contributors to *Blackwood's Magazine*. Professor A. has been successful in quite opposite departments of literature—he is distinguished as a poet and humorist. His poems exhibit a ballad-like simplicity, and a fiery flow of narration—the special merits of the poetical school in which he has graduated; while his tales—the best known and appreciated of which are *The Glenmutelkin Railway*, and *How I became a Yeoman*—possess a certain robust humour and farcical abandonment, and are related to the writings of the great masters of humour much in the degree that the 'screaming farce' is related to genteel comedy. His poetical powers appear in their greatest perfection in the *Lays of the Scottish Cavaliers*; the special merits of his humour are best exhibited in *How I became a Yeoman*. He has also acquired some reputation as a critic, and wields, with considerable dexterity and force, to the terror of a later generation, the knout of the dreaded Christopher North of the 'Noctes.'

AYUNTAMIENTO is the name given in Spain to the councils or governing bodies of towns. Sprung from the institutions of the Romans, and firmly established during the long struggles with the Moors, the ayuntamientos acquired great influence and political power, the more so that the nobility were not excluded from them. Although this importance was impaired through the insurrection of Juan de Padilla in 1521; and at a later period, under the Bourbons, the last shadow of municipal freedom was lost; the remembrance of it continued to be cherished by the people. Accordingly, the cortes of Cadiz, in 1812, took up the leading features of the former system, adapting them, by more democratic modifications, to the requirements of the time. On the return of Ferdinand VII., the ayuntamientos were abolished; they were again restored by the

cortes, in 1823; and after the invasion by France, once more set aside. During the civil war, various proposals were made regarding the ayuntamientos; but at last the arrangements of 1812 were confirmed by the constitution of 1837. According to that statute, the A., with the alcalde as president, is appointed by the free choice of the people, and is entitled to exercise the highest functions within the circle of its jurisdiction. The government can provisionally annul its acts, but must afterwards procure the ratification of the cortes, by which alone an A. can be dissolved. The ayuntamientos are empowered to make up the lists of electors and jurors, to organise the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune. In 1840, a bill was brought into the cortes, formed on the model of the French law, proposing to deprive the ayuntamientos of all political power, and restrict their functions to purely municipal matters, and also to limit the franchise to the most highly taxed. But the insurrection which this step excited, and which ended in the expulsion of the queen, Maria Christina, prevented the project from being carried out. At last, in 1844, a law, similar to that proposed in 1840, was, through the intriguing of Christina, supported by French influence, adopted by the cortes, then composed of moderados; and this law, with little alteration, continues in force to the present day.

AZALEA, a genus of plants belonging to the natural order *Ericaceæ*, and distinguished from *Rhododendron* (q. v.) chiefly by the flowers having five stamens instead of ten. Most of the species of A. also differ from the rhododendrons in having

Azalea Indica.

thin deciduous leaves. Some botanists unite the genus *A.* to *Rhododendron*. One of the species best deserving of notice is *A. Pontica*, a shrub from three to five feet high, a native of the countries around the Black Sea, with large obovate or oblong-lanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands, and are very fragrant. It may be regarded as, like many of the other *Ericaceæ* (heaths, &c.), a social plant; and its golden flowers give great

brilliance to the landscape in many parts of the Crimea, the south-east of Poland, the Caucasus, &c. It covers many mountain slopes, but does not ascend to great elevations, giving place to the more alpine *Rhododendron Ponticum*. It is common in gardens and shrubberies in Britain, and varies with orange, red, and almost white flowers. The whole plant is narcotic and poisonous, and the honey collected by bees from its flowers, which very much abound in honey, is said to cause stupefaction and delirium, as happened to Xenophon's soldiers in their famous retreat in Asia.—North America abounds in azaleas as well as in rhododendrons, and some of the species have been long cultivated in Britain, particularly *A. nudiflora* and *A. viscosa*, which, with *A. Pontica*, have become the parents of many hybrids. Both have nearly white flowers, very beautiful, and of delicious fragrance. *A. viscosa* has the flowers covered with glutinous hairs like *A. Pontica*; but the flowers of *A. nudiflora* are nearly destitute of them. Both species abound from Canada to the southern parts of the United States. They are taller shrubs than *A. Pontica*. Upon account of its sweet smell, *A. nudiflora* is called in America the Upright Honeysuckle. *A. calendulacea*, a native of the southern parts of the United States, is described as frequently clothing the mountains with a robe of living scarlet.—India and China produce several species of A., of which one of the finest is *A. Indica*, well known in Britain as a greenhouse shrub. Its flowers exhibit great brilliancy of colours. Many hybrids exist between the more hardy species and this. Another extremely beautiful species is *A. ledifolia*, an evergreen, which has been introduced into Britain from China.

A diminutive, procumbent, evergreen shrub, a native of alpine regions in Europe and North America, plentiful on high mountains in Scotland, was long known as *A. procumbens*, but is now called *Loiseleuria procumbens*. The flowers are small and rose-coloured. The whole appearance of the plant widely differs from that of the genus *Azalea*.

AZEGLIO, MARQUESS MARQUIS D', famous as an artist, a publicist, a romance-writer, and a statesman, is the descendant of an ancient and noble family of Piedmont. He was born in 1801 at Turin, where his father held a high military position. In his fifteenth year, A. followed his father to Rome, where he had been appointed ambassador, and there contracted a love for the fine arts; but his study of music and painting was cut short by his father procuring him an appointment in a Piedmontese cavalry regiment. Here A. devoted his leisure with such intensity to scientific pursuits, that he brought on an illness which forced him to quit the service. A journey to Rome, from which he returned to Turin in 1820, restored his health, but deepened his passion for painting. After some difficulty, he got his father's permission to devote himself entirely to this art. A year had hardly elapsed ere A. had made himself a name in Rome as an artist. In landscape-painting he soon attained complete artistic skill. After a residence of eight years at Rome, during which he had pursued the study of history along with painting, he returned to Turin. On the death of his father in 1830, he went to Milan, where painting was then flourishing. In Milan he made the friendship of Alexander Manzoni, whose daughter he married. A. now began to make himself favourably known also in literature, his novels, *Ettore Pieramocco* (1833), and *Niccolo di Lapi* (1841), having done much to fan the national spirit of the Italians. The political affairs of Italy soon occupied him exclusively; he traversed the provinces, cities, and villages, seeking to stir up the spirit of patriotism, and to conciliate the unhappy party divisions, and

was everywhere received with rejoicing and acclamation. A. never belonged to a secret political society, but opposed conspiracies as mischievous, and exhorted the impatient to moderation. While in Florence, he wrote his famous piece, *Degli ultimi Casi di Romagna*, in which he lashed the miserable papal government, denounced the vain attempts at insurrection, and proved to the Italian princes the necessity of a national policy. After the election of Pius IX. as pope, A. returned to Rome, and to his influence were ascribed the reforms with which Pius began his government. He was intensely active at this time, and wrote much on public questions. (The whole of his political writings, collected in one volume, appeared at Turin, 1851.) When Charles Albert, after the rising of Lombardy, crossed the Ticino, A. left Rome with the papal troops destined to support the Italian contest. In the battle of Vicenza, where he commanded a legion, he was severely wounded in the leg while fighting at the head of his troops. Scarcely was he recovered, when with his pen he courageously opposed the republican party, now intoxicated with victory. On the opening of the Sardinian parliament, he was chosen a member of the Chamber of Deputies. After the unfortunate event of the battle of Novara, the young king, Victor Emanuel II., appointed him (1849) president of the cabinet, an office which he undertook solely out of love to his king and country. His influence in this high position was most beneficial, Sardinia owing much of the prosperity and proud national position she now enjoys to his foresight and sagacity. At the close of the late war (1859), when several important towns in the States of the Church declared for Piedmont, A. was appointed (*pro tempore*) General and Commissioner Extraordinary, purely military, for the Roman States. On his retirement, he issued a proclamation to the people, which greatly tended to strengthen their resolution by its noble yet temperate advice.

AZERBIJAN', or ADERBAIJAN', the ancient *Media Atropatene*, is the most northerly province of Persia. It is situated between lat. 36° and 40° N., long. 44° and 48° 40' E.; bounded on the S. by Persian Kurdistan and Irak, E. by Ghilan, N.E. and N. by the Russian territory, and W. by Turkish Kurdistan. It has an area of about 30,000 square miles, and a population of 2,000,000. The surface of A. is very mountainous, many of the ranges rising from 7000 to 9000 feet in height. The peak of Savalan (an extinct volcano) reaches an elevation of 13,000 feet. Mount Ararat rises on the north-west border. The chief rivers of A. are the Aras or *Araxes*, the Kara Su, and the Kizil-Uzen. The salt lake Urumiyah or Urumieyeh (q. v.), the largest in Persia, is situated on the western border of the province. The climate of A. is not unhealthy, but it is subject to the extremes of heat and cold. The transition from cold to heat is very rapid. In the mountainous districts, the hail-storms are occasionally so violent as to kill cattle. The principal products of A. are rice, barley, wheat, maize, flax, hemp, cotton, tobacco, honey, and saffron; camels, horses, cattle, and sheep are also reared; velvet, silks, stuff, carpets, woollens, and leather are the most important articles of manufacture, and a little is done in hardware. Lead, iron, copper, sulphur, saltpetre, and salt are found in the province. The capital of A. is Tabriz, with a population of about 30,000. It has suffered greatly from earthquakes. The other towns of note are Urumiyah, on the lake of that name; Maragha, famous as the place where Nasir Eddin, the astronomer, fixed his observatory; Miana, Khoi, Selmas, and Ardebil.

AZINGHUR, or AZIM'S FORT, a name primarily applied to a town in India, and thence extended to its district. 1. The town is in lat. 26° N., and long. 83° 14' E. From Calcutta it is 448 miles to the north-west; from Benares, 81 to the north; from Allahabad, 109 to the north-east; and from Lucknow, 171 to the south-east. It is situated on the north-eastern Tons, a considerable offset of the Gogra, which is here crossed by a bridge of boats, and which is navigable downwards, a distance of 40 miles, to its confluence with the Surjoo. The town is estimated to contain about 14,000 inhabitants, besides the troops in garrison. During the mutiny of 1857, A. was, so far, a creditable exception to the general rule of ruthless cruelty among the insurgents. The sepoy did indeed mutiny, actuated, apparently, by a wish to appropriate a passing treasure of 7 lacs of rupees, or £70,000 sterling. But, having formed a square round their officers, and sworn to protect them, they brought carriages for them and their families, and escorted the whole ten miles towards Ghazee-pore.—2. The district stretches in N. lat. between 25° 36' and 26° 24', and in E. long. between 82° 45' and 84° 12'. Its area is said to be 2520 square miles; and its population to be 1,313,950. These two estimates can scarcely be both correct, yielding, as they do, an average of 521 inhabitants to a square mile—a very improbable average, more particularly as populous towns are unknown. The district is low and remarkably level. The soil is fertile, excepting that a few tracts are irreclaimably barren from being impregnated with soda, nitre, and other saline substances. There are tolerably extensive manufactures—the silk looms being 3122, and the cotton ones, 10,560. Connected with the latter is the curious fact, that scarcely any cotton-wool is produced on the spot.

AZIMUTH. The A. of a heavenly body is the angle measured along the horizon between the north or south point, and the point where a circle, passing through the zenith and the body, cuts the horizon. The word comes from the Arabic, and is said to be derived from a word signifying a quarter of the heavens. It is usual to measure the A. westward from the point most remote from the elevated pole, beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the north pole is elevated, the A. is measured from the south point, so that the east point, for instance, has an A. of 270°. See ARMILLARY SPHERE. A. circles are those which extend from zenith to nadir, cutting the horizon at right angles, or those in which all the points have the same azimuth.

AZINCOURT, or AGINCOURT, a village in the department of Pas-de-Calais, France, celebrated for a bloody battle between the English and French, October 25, 1415. The internal distractions of France under the imbecile Charles VI. (q. v.) had encouraged England to attempt to make good her ancient claims on France. Henry V. of England had landed at Harfleur, had taken that fortress, and wished to march through Picardie to Calais, in order to go into winter-quarters. The Dauphin advanced against him with a powerful force. A great number of the nobility accompanied him; and so great was their confidence, that the offered aid of the Duke of Burgundy and of the city of Paris was rejected. Henry hastened to the Somme, but was followed by the French, who opposed his passage; he at last managed to cross with his army at St Quentin. Greatly weakened in numbers, and suffering extremely from want of provisions, Henry offered to purchase peace by reparation of injuries. But the French would not

hear of a treaty, as they entertained the hope of completely annihilating the English army. They had, in fact, intercepted the English march to Calais, by getting possession of the high road behind the little river Ternoise, near the villages of A. and Framécourt. The invading army, therefore, still (according to French accounts) 14,000 strong, of whom 2000 were men-at-arms—though no English writer makes it more than 10,000—prepared for an engagement by posting themselves between two woods, in a single line of battle, with the archers on the wings. The French, to the number of 50,000, under the command of the Constable, D'Albret, were drawn up in two lines, the men-at-arms, of whom only 2000 were mounted, being in the first. The English were the first to begin the onset. The French cavalry rushed forward to meet them, but were received with such a storm of arrows that they took to flight, threw themselves upon the first line, and put it into disorder. On this, the light-armed English archers took to their bill-hooks and hatchets, broke into the ranks of the men-at-arms that fought on foot, whose heavy armour and close array rendered them almost incapable of resistance, and made the greatest havoc among them. This being followed by a charge of the English horsemen, the first line took to flight, the second was unable to arrest the victors, and the whole French army was soon completely dispersed. The victory was decided. For a moment, Henry believed that the rallying masses were going to renew the fight; and hearing also that a troop of armed peasants were plundering his baggage, he gave orders to slay all the prisoners taken. The order was already executed when he discovered the groundlessness of his alarm. As many as 10,000 Frenchmen were slain, among whom were the Constable and six dukes and princes, the Duke of Brabant, the Count of Nevers, the Duke of Alençon, the Duke of Bar and his two brothers. Five princes, among them the Dukes of Orleans and Bourbon, were taken prisoners. The English lost 1600 killed, including the Duke of York, the king's great-uncle, whom the Duke of Alençon slew. Alençon had even struck the crown from King Henry's head, when he was surrounded by all present, and fell with many wounds. Henry, however, was too weak to pursue his advantage, and therefore continued his march to Calais, where he embarked for England.

AZORES, a cluster of islands in the Atlantic, 800 miles due west of the southern half of Portugal, ranging in N. lat. between $36^{\circ} 55'$ and $39^{\circ} 44'$, and in W. long. between $25^{\circ} 10'$ and $31^{\circ} 16'$. In the first half of the 15th c., the A. were discovered by the Portuguese, or rather, it has been said, appropriated by them, after having been revealed to them by a Flemish navigator, Joshua Vanderberg of Bruges. They were at that time uninhabited—a fact which, so far as it goes, seems adverse to any notion that America could have been colonised from Europe in this direction. Their salient position, however, may soon be turned to account, for the A. have recently been suggested as a resting-place for an intercontinental telegraph—and that in connection with the Bermudas, which are precisely as far to the east of South Carolina as the A. themselves are to the west of Portugal. The Portuguese colonists called the whole group A., from *acor* or *azor*, a hawk; and they named two individual islands Corvo and St Jorgo, from *Corvos Marinos* and St Jorsi, which, according to the maps of the 14th c., had been previously seen in the western ocean. Without reckoning mere rocks, the islands are nine in number. Taken from east to west, they are as follow: St Mary, St Michael, Terceira, Graciosa, St Jorgo, Pico, Fayal, Flores, and Corvo.

The area of the group is estimated at 700 square miles; while its population is 343,572, yielding an average of nearly 500 to a square mile. In the order of population and importance, the islands stand thus: St Michael, Terceira, Pico, Fayal, St Jorgo, Flores, Graciosa, St Mary, and Corvo. The A. are still a dependency of Portugal. Their capital is Angra, in Terceira; but Ponta Delgada and Ribeira Grande, both in St Michael, are larger towns.

As may be presumed from the density of the population, the soil is fertile, and the climate healthy. The islands are also well watered. The exports are oranges, wine, brandy, grain, pulse, pork, beef, cheese, and coarse linens; and the imports are woollens, cottons, hardware, iron, glass, cordage, pitch, tar, staves, timber, oil, fish, rum, coffee, sugar, salt, and tea. Perhaps the greatest want of the group is a good harbour. The A. are of volcanic origin—a fact from which may probably be inferred their identity with the Isles of Brazil or of Fire in the maps above mentioned, of the 14th c. Though most of the volcanoes themselves appear to be extinct, yet the islands contain hot springs, and are subject to violent earthquakes. The coasts are generally steep and rugged, while the interior parts abound in ravines and mountains. The mountains range from 1869 feet to 7613—the latter being the height of the lava-covered *peak* which gives name to Pico.

AZOTE (Gr. α , depriver of, and $\zeta\omicron\varsigma$, life) is the name given by French chemists to Nitrogen (q. v.).

AZOTISED BODIES are those substances which contain azote or nitrogen as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during its natural decay. The principal members of the group are *albumen*, present in white of eggs, and the juices of plants and animals; *globuline*, or *crystalline*, a variety of albumen found in the lens of the eye; *vitelline*, another variety of albumen, composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrine*, which occurs largely in the seeds of cereals and in animal muscle; *caseine* (or cheese matter), present in all milk; *legumine*, a variety of caseine found in pease, beans, and leguminous seeds in general; *gelatine*, which is present in the skin, bones, and other parts of animals; *chondrine*, a variety of gelatine obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatine manufactured from the inner membrane of the floating bladder of sturgeons and other fishes; *glue* and *size*, which are secondary forms of gelatine; *uric acid*, and *hippuric acid*, which are present in the urine of the higher animals; *kreatine* and *kreatinine*, occurring in the juice of flesh; several forms of *urinary calculi*, which are found as stones in the bladder; and the very large and important class of *alkaloids*, including strychnine, morphine, quinine, &c. The principal members of the series of A. B. will be considered under their special headings; and the use of several of them as articles of diet will come into notice under Food.

AZOTUS, the *Ashdod* of the Old Testament (now Esdud), a village on the Mediterranean, 21 miles south of Jaffa. Lat. $31^{\circ} 45'$ N., long. $34^{\circ} 37'$ E. It was formerly one of the chief cities of the Philistines, strongly fortified, and the scene of numerous contests between that race and the Jews. Into this city the Ark of the Covenant was brought by the Philistines, and placed in the temple of their god Dagon, whose image fell in pieces before it. In the 8th c. b. c., the town fell into the hands of the Assyrians; and in the following century was

captured by the Egyptians, after a 29 years' blockade and siege. In the wars between Alexander Balas and Demetrius, A. was destroyed by fire. It was afterwards rebuilt by the Romans, but never regained its early importance. It has now a population of about 300, and the sea is gradually receding from its harbour.

AZOV, or **A'SOW**, a fortress and port-town in the south of Russia, situated on the Don, about 20 miles from its mouth. The sand and mud deposited by the river have choked up the port, so that the trade and shipping of the place have dwindled away, and the 3000 inhabitants now depend mostly on fishing. A. was anciently a Greek colony, under the name of Tanais, and carried on extensive commerce with the northern peoples. In number of inhabitants and in wealth it often rivalled Panticapæum (now Kerch). In the 13th c. it was taken possession of by the Genoese, who called it Tana. They were driven out of it by Timur (Tamerlane) in 1392. In 1471, it was taken by the Turks, and since then has borne the name of A., the Turks calling the town and the neighbouring sea Asak. After an obstinate struggle, at which Peter the Great, then beginning his career, was present, it was captured by the Russians about the end of the 17th c. It more than once fell again under the dominion of the Turks, but at last, in 1774, remained in the undisturbed possession of Russia. It was bombarded and destroyed by an allied English and French squadron in 1855.

AZOV, SEA OF, named after the town, is a large gulf of the Black Sea, formed by the peninsula of Crimea, or rather an inland lake connected with the Black Sea by the long narrow strait of Kaffa. The Siwash or Putrid Sea is the western portion of the Sea of A. cut off by the long narrow strip of low sandy land called the Tongue of Arabat. The entrance to the Putrid Sea is by the narrow strait of Genitschi at the north of the Tongue. The Putrid Sea is little but a succession of swamps. The ancient name of the Sea of A. was Palus Mæotis. It gets the name of Balik-Denghis, or Fish-sea, from the Turks and Tatars, from its abundance of fish. The water is almost fresh. The whole sea is shallow, and occupies an area of about 14,000 square miles. During the Crimean war, an expedition, having on board 16,500 English, French, and Turks, was sent to this sea in May 1855, which devastated the ports, and cut off supplies intended for Sebastopol.

AZTEC CHILDREN. In the year 1853, there were brought over to this country from America two diminutive children, a boy and a girl, said to be aged respectively 17 and 11, and who were represented as descendants of the ancient Aztecs. The height of each was under 3 feet. Their figure was slender and not ill-proportioned; that which was chiefly remarkable being their features. While the forehead and chin receded, the nose was so singularly prominent as to suggest the idea of the face of a bird. Yet, with dark lively eyes, an olive complexion, and glossy long black hair, and a great fund of good-nature, they were far from unpleasing. They spoke no intelligible language, but understood a few words of English, and seemed to have a taste for music. Shewn to the public as curiosities, they were usually exhibited on a large table, on which they ran about amusing themselves. Their exhibitor told a very incredible story of how they had been obtained from the ancient city of Ximaga, where they were revered as gods. A certain Señor

Velasquez, in company with a Canadian and American, penetrated into this ancient city of Central America, where they made the acquaintance of one of the guardian priests of these undersized deities, who was so charmed with the accounts of the outer world, that he resolved to steal the gods of his people, and escape with the strangers. One after the other—the Canadian, the American, and the priest—were overtaken by disaster, and Velasquez alone was left to tell the wondrous tale, with no attestation but such as the children themselves furnished. Professor Owen considered them mere dwarfs, and other authorities held a similar opinion. Belonging probably to some Indian tribe, they were doubtless monstrosities; and this becoming apparent, interest in them ceased.

AZTECS. The name of the dominant tribe in Mexico at the time of the arrival of the Spaniards. See MEXICO, ANTIQUITIES OF.

AZU'NI, DOMENICO ALBERTO, a distinguished jurist, born at Sassari, in the island of Sardinia, August 3, 1749. He early applied himself to the study of law, devoting himself particularly to the maritime relationships of nations. He became judge of the Tribunal of Commerce at Nizza or Nice; and in 1795, after that city had been taken by the French, he published a work in which he endeavoured to reduce maritime laws to fixed principles, and which, being recast, was published at Paris in 1805 under the title of *Droit Maritime de l'Europe*. The work was sufficiently anti-British in tone to secure its author the favourable consideration of Napoleon's ministry, by whom he was appointed one of the commissioners for compiling the new commercial code, the maritime portion being allotted to him. Genoa having been annexed to France, A., in 1807, was appointed president of the Court of Appeal there, where he remained until the fall of Napoleon. Among other things, A. published an *Essai sur l'Histoire Géographique Politique et Morale de la Sardaigne*, and a *Dictionary of Mercantile Jurisprudence*, and some controversial brochures. For some time after he had withdrawn from Genoa, he resided at Nice, and afterwards in his native island, where he was appointed, by King Charles Felix, judge of the consulate of Cagliari, and librarian to the university of that city. He died in January 1827.

AZURE, a French word technically used in Heraldry to signify blue. In engraving arms, it is always represented by horizontal lines.

AZURINE (*Leuciscus coruleus*), a fish of the same genus with the roach, chub, &c., and most nearly resembling the Red-eye (q. v.) or Rudd (*L. erythrophthalmus*), from which, however, it is readily distinguished by the slate-blue colour of the back, and the whiteness of the abdomen and fins. It is a fresh-water fish, and was first described by Yarrell from specimens received from Lancashire, where it is called the Blue Roach, but it is also an inhabitant of some of the lakes of Switzerland.

AZURITE, a name which has been given to the mineral more commonly called Lazulite (q. v.), and to which, along with Lapis Lazuli (q. v.) or *Azure-stone*, mineral turquoise (see TURQUOISE), &c., the generic name, *Azure Spar*, is sometimes given.—The name A. is also given by mineralogists to an ore of copper, generally known as *Blue Copper* (see COPPER), nearly allied to Malachite (q. v.), and remarkable for its beautiful azure colour.

B

THE second letter in the Hebrew or Phœnician alphabet, and in all alphabets derived from it, belongs to the order of labials, and is of the kind called medial or flat. See LETTERS, ALPHABET. Its name in Hebrew is *beth*, signifying 'house,'

probably because its original hieroglyphic or picture form was an outline of a house or tent. In the corresponding words of sister-languages, we find *b* very generally replaced by some one of the other labial letters [*p*, *f* (*ph*), *v*]; these substitutions, however, take place not by chance or caprice, but according to ascertained laws. See PHILOLOGY, COMPARATIVE, and GRIMM'S LAW. The following are some examples of the interchange of *b* with other letters: Corresponding to Eng. *bear* are Sansc. *bhri*, Lat. *ferre*, Gr. *pherein*: Eng. *be*, Sansc. *bhu*, Lat. *fo* and *fui*, Gr. *phuo*: Eng. *bore*, Lat. *forare*: Eng. *of* and *off*, Gr. *apo*, Lat. *ab*: Eng. *wife*, plural *wives*, Ger. *weib*, Old H. Ger. *wip*: Eng. *web*, *weave*, *west*: Gr. *episcopos*, Eng. *bishop*, Fr. *evêque*. In several Latin words, *b* arose out of *v* (pronounced like *v* or *w*). Thus, the original form of *bellum*, war, was *duellum* or *dwellum*; of *bonus*, *dvonus*; and the *d* being dropped (as we drop the sound of *k* in *knee*), the *v* became hardened into *b*. Similarly, *bis*, twice, is for *duis*. A remarkable interchange sometimes takes place between *b* and *m*, as in Sansc. *mri*, to die; Lat. *mort*, death; and Gr. *brotos*, mortal.

The Greeks pronounced their *b* (β) like a *v*, for they spelled *Virgilius*, e. g., *Birgilius*; and this continues to be the case in modern Greek. In Latin, during the classical ages at least, the letter was pronounced as it is in English, French, &c. But in the time of the later emperors (beginning with the 3d c. of our era), *b* was softened down, in the popular language at least, to a slovenly sound like *v*; for in inscriptions of this period, such spellings as *verva* for *verba*, *miravili* for *mirabili*, are quite common. The distinction between the two sounds being once lost sight of, the letter *b* was frequently substituted for *v*—as *boba* for *verba*, *bivus* for *vivus*. This softening of *b* into *v* in the middle-age Latin, has left traces in the modern Italian and French; as Lat. *habere*, Ital. *avere*, Fr. *avoir*; Lat. *tabula*, Ital. *tavola*. A Spaniard, on the contrary, has a tendency to use *b* instead of *v*; thus he pronounces *vivere* like *bibere*, and *Jovis* as if written *Jobis*.

B, in Music, is the seventh degree of the diatonic scale of *C*, and the twelfth degree of the diatonic-chromatic scale. In harmony, it is called the major seventh. According to the tempered system of tuning, the ratio of *B*, to the fundamental note *C*, is $\frac{15}{8}$. In the ancient diatonic scale, *B* was never used as a key-note, as its fifth, *F*, was imperfect. In the German notation, *B* is called *H*, while *B* flat is called simply *B*. *B* flat is half a tone lower than *B*, and in harmony is called the flat seventh. As a harmonic arising from *C*, *B* flat, as produced by nature, is considerably flatter than in the tempered system of tuning.

BA'AL, a Hebrew word signifying *lord*, *owner*,

or *master*, and applied as a general title of honour to many different gods. In Hosea ii. 16, it is mentioned as a name which had been given to Jehovah himself; but when used with the definite article, it specially designated the principal male deity of the Phœnicians and Carthaginians, as Baaltis or Astarte was the principal female deity. In connection with Babylon and Assyria, the same deity is spoken of under the name of Bel or Belus. Originally, *B*, was the god of the sun, the ruler and vivifier of nature, and Astarte the goddess of the moon. In the later star-worship of the western Asiatic nations, *B*, was the name of Jupiter, the planet of fate, or, as some suppose, of Saturn. The proper Phœnician name of *B*, however, was Melkart, Melkrat, or Melchrat, which is usually supposed to mean 'king of the city'—i. e., Tyre; but others consider it a contraction of two words signifying 'king of the earth;' while the learned

Fig. 1.—Baal, or Melkart.

From a copper coin of Cossyra in the British Museum. (Twice the size of the original)

Selden is of opinion that it is equivalent to 'strong king.' *B*, was perhaps the same god as the Phœnician Moloch. The Greeks confounded *B*, or Melkart with their own Heracles; and, for the purpose of distinction, termed him the Tyrian Heracles.

From the earliest foundation of Tyre, he seems to have been the tutelary god of that city, and his worship apparently extended thence until it was prevalent in all the towns of the Phœnician confederation, and was established in their remotest colonies, such as Malta, Carthage, and Cadiz. It also overspread the neighbouring countries of Assyria and Egypt. Each country or locality had its *B*, or chief god. According to Scripture, the temples of this idol (at least in Phœnicia and Assyria) were built on the tops of hills, or still more frequently in solemn groves, and sometimes altars

Fig. 2.—Baal

In a warlike aspect, with four legs, representing the pervading energy and rapidity of the sun.

were erected to him on the roofs of houses. His priests were numerous. Incense was the most frequent offering presented to him, but we also read of sacrifices of bullocks, and even of children. In 1 Kings, chap. xviii., we read that the priests of B. danced about the altar during the sacrifice, and barbarously cut and mangled themselves, if their god did not speedily answer their prayers.

The word B. enters into the composition of many Hebrew, Chaldee, Phœnician, and Carthaginian names, such as Jezebel, Hasdrubal ('Help of Baal'), Hannibal ('Grace of Baal'), Ethbaal ('With Baal'), Baal-bee ('City of Baal'). The word is also frequently found in conjunction with some epithet, and in such cases appears to have denoted a different deity, though it is not impossible that it may have been the same person regarded in another aspect, and as exercising merely a different function. Thus, we have Baal-Berith, 'the Covenant Lord,' who was specially worshipped by the people of Shechem; Baal-Peor, the Priapus of the Moabites and Midianites; and Beelzebub, or Baalzebub (the Fly-god), the idol of the Philistines at Ekron, where he had a temple.—The Celtic deity Beal is usually identified with Baal. See BELTEIN.

BAA'LBEEK, the name of a ruined city in the ancient Cœle-Syria, signifies the 'City of Baal,' the Sun-god, and was by the Greeks, during the Seleucid dynasty, converted into Heliopolis. Lat. 34° 1' 39" N., long. 36° 11' E. It is situated in the plain of Buk'a'a, 'at the northern extremity of a low range of bleak hills, about one mile from the base of Antilebanon,' in a well-watered and delightful locality, rather more than 40 miles north-west of Damascus. It was once the most magnificent of Syrian cities, full of palaces, fountains, and beautiful

Ruins of Baalbek.

monuments. It is now only famous for the splendour of its ruins, of which three deserve special notice. The most imposing is that of the great Temple of the Sun, which was a rectangular building, 290 feet by 160, having its roof supported by a peristyle of 54 Corinthian columns, '19 at each side, and 10 at each end.' Of these, six are yet standing. The circumference of these columns is about 22 feet, and the length of the shaft 58; with pedestal, capital, and entablature, they measure about 89 feet in height. The approach to this temple was through two spacious courts, surrounded on all sides with porticos and other buildings. Except the columns mentioned, little of the great temple, or of the buildings in front of it, is left standing, but the ground is covered with their ruins. The vast size of the stones used in the substructions is remarkable, some of them being 60 feet long and 12 thick. South from

the great temple is a smaller one, known as the Temple of Jupiter. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 227 feet in length, by 117 feet in breadth, being thus larger than the Parthenon at Athens. Both temples, as well as the surrounding structures, are built of limestone, in a richly decorated somewhat fantastic Corinthian style. Besides these, there stands at the distance of 300 yards from the others a circular building, supported on 6 granite columns; style, mixed Ionic and Corinthian. It was once used as a Christian church.

The early history of B. is involved in darkness; but it is certain that, from the most distant times, it had been a chief seat of sun-worship, as its name implies. Julius Cæsar made it a Roman colony, and under Augustus it was occupied by a Roman garrison. B. had an oracle held in such high esteem that, in the 2d c. A. D., it was consulted by the Emperor Trajan prior to his entrance on his second Parthian campaign. To test the prescience of the oracle, Trajan sent to it a blank piece of paper, which was returned to him blank. This gave him a high opinion of its powers, and he consulted it in all seriousness a second time. The response was some dead twigs from a vine, wrapped up in cloth. Trajan's decease some two years afterwards, and the transmission of his bones to Rome, was deemed a sufficient interpretation of the symbolical utterance, and confirmed the celebrity of the oracle. Antoninus Pius (138—161 A. D.) built the great temple, which the legend current among the modern inhabitants counts a work of Solomon. This temple is said to have contained a golden statue of Apollo, or of Zeus, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity, under Constantine, became the dominant religion, the temple became a Christian church. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A. D., the temple was turned into a fortress, the battlements of which are yet visible. The city was completely pillaged by Timur Bey, or Beg, in 1400 A. D. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pachas of Damascus merely for the sake of the iron with which the stones were bound together. What the Arabs, Tatars, and Turks had spared, was destroyed by a terrible earthquake in 1759. B. is now an insignificant village, with a population of some few hundreds. See Wood and Dawkins's *Ruins of Baalbec* (Lond. 1757); Cassas, *Voyage Pittoresque de la Syrie* (1799); Murray's *Handbook for Travellers in Syria and Palestine* (1858).

BA'BA, a Turkish word signifying *father*, originating, like our word *papa*, in the first efforts of children to speak. In Persia and Turkey, it is prefixed as a title of honour to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba.

BA'BA, CAPE, a bold rocky headland near the western extremity of Anatolia—the Lectum of the Greeks—in lat. 39° 29' N., long. 26° 4' E., about 12 miles from the northern extremity of Mitylene, the ancient Lesbos. On a shelving point of the cape stands the town of Baba, with a population of about 4000, who do some trade in cutlery of a superior quality. The once large and prosperous, but now utterly ruined city of Assos, mentioned by St Paul, is in the vicinity.

BABATA'G, or BA'BA DAG, a city with 10,000

inhabitants, in the sandjak of Süstria, in the north-eastern part of European Turkey. It is situated in a marshy district; has a high school and five mosques, of which that built by Bajazet I. is the finest. It was Bajazet that founded the city, which he peopled with Tatars, and named after a saint, whose monument, on a hill near by, is resorted to as a place of pilgrimage. Through the port of Kara-Kerman, lying a short way to the south, the inhabitants of B. carry on a considerable commerce with the Black Sea.

BABBAGE, CHARLES, born in 1790, entered early at Trinity College, Cambridge, where he took his degree of B.A. in 1814. In 1828, he was elected Professor of Mathematics in his own university, an office which he filled for eleven years. B. unites, in the most happy combination, powers of invention and observation with thorough scientific culture. Among his writings, we notice first his extremely correct and well-arranged *Tables of Logarithms* (Lond. 1834). He was the first to make the method of constructing such tables the object of earnest study. The difficulty of securing accuracy in getting up tables on a large scale, led him to the idea of committing the execution of the work to a machine. Being commissioned by the government to superintend the construction of such a machine, before beginning the work, he visited a great many manufactories and machine establishments, both in Britain and on the continent, in order to become acquainted with all the resources of mechanical art, and thus be in a position to make a combined use of them in his great undertaking. This survey afforded him the necessary information for his able work, *On the Economy of Manufactures and Machinery* (Lond. 1832)—a book which has run through several editions, and been translated into several languages—in which all mechanical processes are classified from the most scientific point of view, and the most interesting examples of the more important kinds of manufacture are described. Besides his *Comparative View of the Different Life-Insurance Societies*, his *Differential and Integral Calculus*, his *Decline of Science* (1830), *A Ninth Bridgewater Treatise*, and *The Exposition of 1851* (1851), B. has contributed a number of very interesting papers to the Transactions of the Royal Societies of London and Edinburgh.—With regard to B.'s calculating machine, which, from some cause not well explained, was never completed, see CALCULATING MACHINES. (He died October 18, 1871.)

BABEL, TOWER OF. For an account of this building, and the confusion of tongues which it brought about, see the 11th chapter of Genesis. The distinction of being a remnant of the Tower of B. has been claimed for three different masses: 1st, for Nimrod's Tower at Akkerkuf; 2d, the Mujelibe, 950 yards east of the Euphrates, and five miles above the modern town of Hillah; 3d, the Birs Nimrod, to the west of that river, and about six miles to the south-west of Hillah—the whole situated in Babylonia (q. v.). The last of these has the majority of opinions in its favour. Every one, it is said, who has seen the Birs Nimrod, feels at once that, of the ruined mounds in this region, there is not one which so nearly corresponds with his previous notions of the Tower of Babel. According to Mr Rich, it is of an oblong form, the total circumference being 762 yards. At the eastern side it is cloven by a deep furrow, and is not more than 50 or 60 feet high; but on the western side it rises in a conical figure to the elevation of 198 feet; and on its summit is a solid pile of brick 37 feet high by 28 in breadth, diminishing in thickness to the top, which is broken and irregular, and rent by a large

fissure extending through a third of its height. It is perforated by small square holes, disposed in rhomboids. The fire-burnt bricks of which it is built have inscriptions on them; and so excellent is the cement, which appears to be lime-mortar, that it is nearly impossible to extract a brick whole. The other parts of the summit of this hill are occupied by immense fragments of brickwork, of no determinate figure, tumbled together, and converted into solid vitrified masses, as if they had undergone the action of the fiercest fire, or had been blown up with gunpowder, the layers of brick being perfectly discernible. These ruins stand on a prodigious mound, the whole of which is itself in ruins, channelled by the weather, and strewed with fragments of black stone, sandstone, and marble. Sir R. K. Porter has shewn that the intense vitrifying heat to which the summit has been evidently subjected, must have been the result of fire operating from above, and was probably produced by lightning. This is a curious circumstance, taken in connection with the ancient tradition that the Tower of B. was rent and overthrown by fire from heaven. Porter thinks that the works of the Babylonish kings, especially the stupendous temple of Belus, which was erected on the site of the old Tower, concealed for a while the marks of the original devastation; and that now the destructions of time and of man have reduced it to nearly the same condition in which it appeared after the confusion.

BABEL-MANDEB (i. e., 'the Gate of Tears') is the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 20 miles distant from this cape stands the wall-like coast of Africa, rising in Ras Sejan to the height of 383 feet. Within the straits, but nearer to Arabia, lies the bare rocky island of Perim (q. v.), now occupied by the English as a fort; the strait on the east side of this island is called the Little Strait, and that on the west the Great Strait. The depth of the former varies from 8 to 12 fathoms; that of the latter reaches 185 fathoms. The first is usually chosen by vessels on account of its affording good anchorage. Close to the African coast lie eight small islands, called the Eight Brothers. The currents in these straits are generally very strong, and are extremely dangerous for small vessels. The name B. is supposed to have originated in the frequent disasters occurring in the strait.

BA'BER, or BABUR (Zohir-Eddin Mohammed), the first of the Great Moguls in India, a descendant of Timur, was born in 1483. He was barely 12 years of age when he succeeded his father, Omar Sheikh Mirza, in the sovereignty of the countries lying between Samarkand and the Indus. With a view to the conquest of India, although constantly contending with revolts in his own dominions, he made himself master, by fraud and force, of the provinces of Kashgar, Kundez, Kandahar, and Cabul. Having thus opened the way to India, he made two or three rapid incursions into Hindustan; and finally taking advantage of the feeble government of Ibrahim Lodi, about the end of 1525, he crossed the Attoek (the Cabul branch of the Indus), quickly defeated some bodies of troops that opposed him in the Punjab; and at last, in April 1526, on the plain of Panipat, not far from Delhi, encountered and fought a decisive battle with his enemy, whose army was far superior in numbers. The 100,000 men and 1000 elephants of Sultan Ibrahim were dispersed; Ibrahim himself fled; and B. made his entry into

Delhi. In the following month, Agra, the second city of the empire, surrendered. B.'s enjoyment of empire in India was short; he died in 1530, having had to contend during the five years of his reign with numerous conspiracies and revolts. To the talents of a general and statesman, which he manifested in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, postal arrangements, &c., B. united a taste for science and art. He wrote, in the Tatar language, the history of his own life and conquests, which was translated into Persian by Abdul Raehim, and, more recently, from the Persian into English. B. was succeeded on the throne of Delhi by the eldest of his four sons, Humayun, and was the founder of the B. or Great Mogul dynasty.

BABEUF, FRANÇOIS NOEL, generally known by the name of 'Caius Gracchus,' which he affixed to his political articles, was born in 1764 at St Quentin, in the department of Aisne, France. On the breaking out of the Revolution in 1789, he became a fanatical advocate of the popular demands. During the Reign of Terror he took up a position of hostility to Robespierre and the Terrorists. In his journal, established at Paris in July 1794, and termed *The Tribune of the People*, he preached the sovereignty of the masses, and defended the absurd consequences flowing from that political doctrine. He was in favour of a new distribution of the land, of the abolition of every political order, and the equality of all individuals, wise and foolish. His violent language caused him to be imprisoned. On his release, he attached himself to the members of the extreme Jacobin party, which had just been overthrown. A secret conspiracy was formed, the aim of which was the destruction of the Directory, and the complete re-establishment of the democratic constitution of 1793, which had been suspended during the Reign of Terror. The plot was discovered through the treachery of one of the members. B. and other chiefs were seized, imprisoned, and ultimately brought to trial. B. defended himself with the courage of a fanatic, and overwhelmed his judges with abuse. He was of course condemned to death, and was guillotined on the following day, May 24, 1797. B. was a weak-headed enthusiast, without talent or culture; but abler men in the conspiracy made use of his furiously resolute character to secure the ends they had in view.

BABINGTON, ANTONY, an English gentleman of the county of Derby, head of a conspiracy in favour of Mary Stuart of Scotland. The rivalry between Queen Mary and Queen Elizabeth of England was at the same time a contest between Catholicism and Protestantism. Accordingly, the various plots for rescuing Mary from the power of her enemy wore the same character, and have been misrepresented and judged of according to the ecclesiastical prejudices of each historian. B., young, rich, a zealous Catholic, and on that account already an enthusiastic admirer of the unfortunate Mary, was indeed, through the agents of a determined conspirator, Morgan, who had been arrested in France at the instance of the English court, to put himself at the head of a plot that had for its object the murder of Queen Elizabeth, and the rescue of Mary. The execution of the murder was undertaken by one Savage, in which he was to be assisted by a number of the Catholic nobility, as circumstances might require. The day of action was fixed for the 24th of August 1586. B. reserved the deliverance of Mary for his own share, entered into correspondence with her, and received letters purporting to be from her in return, approving of the assassination of Elizabeth. The secretary,

Walsingham, not only had all the threads of the plot in his hand, but contributed, through his emissaries, to spur on the conspirators to the execution of their plans. When the right moment was come, B. and his accomplices were arrested, and condemned. B. made no denial, acknowledged the letters to Mary to be his, and, September 20, 1586, laid his head on the block. Savage, Barnwell, Bolland, Abington, Tichburne, and Tilnee, had a like fate. Mary Stuart herself had, four months later, to ascend the bloody scaffold; and her condemnation was justified chiefly on the ground of those letters received by Babington. Mary, however, denied to the last moment that the letters were written by her hand, or with her knowledge; and her friends constantly maintained that they were the work of Walsingham himself, in order that the unhappy queen might be got rid of with a show of justice. The rest of Walsingham's conduct in this affair, as well as the way in which he was in the habit of supporting Elizabeth's views in general, give at least a high degree of probability to the accusation.

BABOON (*Cynocephalus*), a genus of the Monkey family, or *Simiada* (see MONKEY), and distinguished from all the rest of that family by the very elongated muzzle, which terminates abruptly, and is pierced with nostrils at the end like that of a dog. The face has, indeed, a general resemblance to the face of a dog. The dentition agrees with that of the other apes or monkeys of the Old World, to which the baboons are entirely confined, being only distinguished by the remarkable strength of the canine teeth. Baboons, like almost all the Monkey family in the Old World, have callosities upon the buttocks; and, like the greater part of them, they have cheek-pouches. The tail of some of the species is of considerable length, that of others is a mere tubercle, with an erect tuft of hairs. The physiognomy of all baboons is repulsive, and indicates the fierceness which strongly characterises them, and in which they differ from monkeys in general; some of the larger ones are dreaded by the inhabitants of the countries in which they are found; the danger to be apprehended from them being increased by the numbers in which they usually herd together. Their fore and hind legs are so proportioned, that they walk easily, and run swiftly on the ground; but, like all other quadrumanous animals, they climb trees and rocks with great agility. Their hair is long, forming a sort of mane on the upper parts. All of them are very susceptible of cold, and they seldom live long when removed from their native tropical countries. They feed chiefly on fruits and roots: some of them inhabit barren and stony places where scorpions abound, which they seize, adroitly deprive of the sting, and devour. They are very cunning, mischievous, and revengeful; troops of them sometimes enter a plantation, not merely to plunder, but apparently to amuse themselves by destroying whatever they can find; they seem, however, always to have some appointed to keep watch, and they make off with great rapidity on the first signal of alarm. When plundering, they cram their cheek-pouches before they begin to eat. These cheek-pouches are very capacious: a B., kept in confinement, has been seen to put eight eggs into them at once, and then to take out the eggs one by one, to break them at the end, and deliberately to suck their contents. The larger baboons are sometimes hunted by dogs where they have not trees to take refuge in; but a single dog, however powerful, cannot safely attack them; a baboon will seize a dog by the hind legs, and whirl him round and round till he is stupefied. Baboons are not so easily domesticated as many kinds of monkey; however, they are not quite incapable of it when

taken young. 'Happy Jerry,' a mandrill or rib-nose B., which was long a great object of attraction at Exeter Change, used to sit with great gravity in an arm-chair, awaiting orders, which he obeyed with slowness and composure. He smoked tobacco, but did not seem much to relish it, and was rather induced to do it by a bribe of gin and water, for which his fondness was unquestionable.

As examples of baboons with tails of considerable length, may be mentioned the Chacma, or Pig-faced B., also called the Ursine B. (*C. porcarius*), a native of South Africa; and the Dog-faced B. (*C. Hamadryas*), a native of Arabia, Persia, and the mountains of Abyssinia. The latter species, perhaps the only one known to the ancients, is often sculptured on the ancient monuments of Egypt, and it is supposed to have been the species of monkey to which divine honours were paid. Its body was frequently embalmed, and B. mummies are still found.—The Chacma is one of the largest of the baboons, about the size of an English mastiff, and very much stronger: it is common on the mountains of the Cape Colony, and in troops would be very formidable, but that they usually scamper out of the way, instead of attacking travellers, unless they are provoked. It is of a dark-brown colour, with long shaggy hair. The tail is rather more than half the length of the body, and is terminated by a tuft of long black hair.

The short-tailed, or almost tail-less baboons, far exceed their longer-tailed congeners in ugliness. Only two species are certainly known—the Mandrill or Rib-nose B. (*C. Mormon*), and the Drill (*C. leucophaeus*), both natives of Guinea. The mandrill is

Mandrill or Rib-nose Baboon.

the largest, fiercest, and most powerful of the whole genus. The colours of its fur are very fine, of a light olive brown above, and silvery gray beneath; but besides other things unpleasant to the sight, its face is peculiarly hideous; the cheek-bones in the adult males being enormously swollen, so that the cheeks are protuberant to the size of a man's fist upon each side, and ribbed with blue, scarlet, and purple. In their native forests, mandrills generally live in large troops, and are said to put to flight every other wild beast.

BABRIUS, a Greek fabulist, who lived about the close of the Alexandrian age, or the beginning of the succeeding Roman-sophistic period, made a considerable collection of Æsopian fables (see Æsor), which he turned into verse, in a natural and popular style. Several versions and transformations of these were made during the middle ages, and have come down to us under the name of *Æsop's Fables*. Bentley, who, in his *Dissertatio de Babrio*, was the first to recognise in these fables of Æsop the original work of B., endeavoured to restore portions

of the verses, and pointed out other fragments of the genuine B. in other quarters. A few fables were added from manuscripts by Furia, Korais, and Schneider, and all that was known at the time was collected by Knoche (Halle, 1835). At last, in 1842, a Greek of the name of Minoïdes Minas, employed by the French government to explore the convents of the East, discovered a manuscript with 123 hitherto unknown fables of B., a copy of which he made and brought to Paris, where they were published in 1844. The best edition is that by Lachmann (Berl. 1845).

BABYLON, BABYLO'NIA. Babylonia was the name given in ancient times to the flat country about the lower course of the Euphrates, called in modern times Irak-Arabi. In the Old Testament, it is called Shinar, Babel, and also 'land of the Chaldees;' and by the later Greek and Roman writers, occasionally Chaldea. Its proper boundaries were: on the N., towards Mesopotamia, the Euphrates and the Median Wall, which extended from the junction of the Chabur with the Euphrates to the Tigris; on the E., towards Assyria and Susiana, the Tigris; on the S., the Gulf of Persia; and on the W., the desert of Arabia. During the wider extension of the Babylonian dominion, the name comprehended also Assyria and Mesopotamia. The country forms a perfect plain, which is a continuation of that of Assyria. The two rivers, Euphrates and Tigris, here approach each other most nearly, until their blended waters fall into the Persian Gulf. The country was once protected from flooding by numerous canals and embankments, and several artificial lakes, which are now mostly in ruin. The most important canal was that now known as Nahr-el-Melik, which is undoubtedly the ancient royal canal that joined the two great rivers. It was kept in repair by the Roman emperors, and was serviceable as late as the 7th c., till the Mohammedans took possession of the country. The soil, naturally fertile, was rendered more so by the garden-like way in which it was cultivated, and yielded abundant crops, especially of wheat, barley, and dates. The want of stone and wood was more severely felt than in Assyria. The only building material was brick, for which the soil afforded abundance of clay. The bricks were either dried in the sun or burnt, and were very durable, resisting, in the rains, the effects of the weather to this day. Mineral bitumen, springing up everywhere in abundance, served as mortar. In this favoured plain, the human race attained early a state of social and political organisation, the oldest, indeed, that antiquity gives us any account of.

The Babylonians belonged to the Aramaic branch of the Semitic stock, as Sir Henry Rawlinson, by his discoveries among the cuneiform inscriptions, has now made clear; and to them the Assyrians owe their origin. The Mosaic accounts give, as the founder of the kingdom, Nimrod, the Cushite, which, from the construction of the whole genealogy, seems to point to an immigration from the south. Later Greek writers make the god Baal or Bel the founder. Although there were regular astronomical observations, and imperial annals extending back to 1903 years before Alexander the Great, and long lists of dynasties, from Berosus, the national sacred historian of B., and the old chroniclers, have been handed down, the whole history of B. is doubtful and dark. To an ancient native dynasty of 86 kings, succeed two Median dynasties of 8 and 11 kings, which are followed by a Chaldaic dynasty of 49 kings, and an Arabian of 9; and lastly, by Queen Semiramis. This much is evident, that the kingdom of Assyria, which was at first an offshoot from B., gradually gained

the supremacy, and reduced the mother-state to subjection.

In the history of B. we find frequent mention made of the Chaldeans. This term is used in various senses; as denoting the inhabitants of Chaldea Proper, which formed the southern portion of B.; as synonymous with Babylonians or subjects of their empire; and, lastly, as the name of a priestly caste. With respect to their origin, various opinions are held by modern writers. Some maintain that they may be identified with the Kurds or Carduchian mountaineers, who are supposed to have left the mountainous region between Assyria and the Euxine, and to have invaded and conquered the plain country. By this theory, the connection with the Persian Magi is readily explained. Others, again, as Rawlinson, think that the tide of immigration set in the opposite direction, and that the Phœnicians and Chaldeans both originally came from Elam or Susiana. A third opinion is, that they were a considerable tribe originally settled in B., which gradually became the ruling race.

No legends have yet been found among the cuneiform inscriptions by which we may ascertain the date of the commencement of the early Chaldean empire, which preceded the Assyrian, but probably the traditional date (2234 B. C.) is historic. An imperfect list of 26 kings has been deciphered from various legends; but as the interval to fill up is more than seven centuries, we must wait for further discoveries before a successful attempt can be made at arranging the chronology of this remote period. Bricks have been found bearing the inscription of *Kedur-mapula*, who is conjectured to be the Chedor-laomer of Scripture, and to have lived in the early part of the 20th c. B. C. This king's expedition seems to have been one of the migratory movements, in which, as stated above, the Phœnicians and Chaldeans bore a part, for the distance from Elam to Syria is too great to allow us to believe that the incursion was merely for the sake of plunder. In these ancient Chaldean legends, Assyria is not once mentioned; and the only notice we have that Assyria was subject to B., is found on the cylinder of Tiglath-pileser I., where it is recorded that an Assyrian temple had been originally built by a son of *Ismi-dagon*, the fifth king of the early Chaldean dynasty, whose date is about 1861 B. C.

At the close of the Chaldean period (1273 B. C.), the empire was transferred from the mother-country to its offshoot Assyria; and from this date till 747, the position of the former state is very subordinate.

The history of the period between 747 and 625 is in many points uncertain. One point, however, has been clearly ascertained from the inscriptions—that B. was by no means a submissive vassal, but that, on one occasion at least, a Babylonian monarch invaded Assyria, defeated the opposing forces, and insulted the capital. The name of *Merodach-Baladan* occurs both in Scripture and in the Assyrian inscriptions. From the former, we know that this king sent a message to Hezekiah, king of Judah, ostensibly to inquire about his recovery, probably with a view to an alliance against Assyria; and from the latter, that Merodach was expelled by Sargon, king of Assyria, that he made a fresh attempt to recover his throne, and was finally dethroned by Sennacherib. An inscription of this last-named monarch, which describes the punishment inflicted on the revolted province, also records that he had recovered certain gods which had been taken from Nineveh 418 years before by a Babylonian monarch. The complete subjection of B. to Assyria at this time (650 B. C.) is proved also from the Scripture account, which states that Esarhaddon, son of Sennacherib, reigned in Babylon.

About fifty years afterwards, Nabopolassar, governor of B. for the Assyrian king, proved faithless to his trust, and entered into an alliance with the Median king, Cyaxares, for the overthrow of the ruling state. See ASSYRIA. This undertaking was successful, and B. now (625 B. C.) became, though it was but for a short time, an independent and conquering power. The son of Nabopolassar, Nebuchadnezzar II. (or, as he is called in the Persian cuneiform inscriptions, Nabuchadrathara), next defeated the Egyptian king, Necho, at Circesium (Karchemish), on the Euphrates (604 B. C.), and thus annihilated the Egyptian dominion in Asia. He then subdued Jehoiakim, king of Judah; and in consequence of repeated revolts, destroyed Jerusalem, and put an end to the kingdom of Judah under Zedekiah (583 B. C.), carrying the inhabitants captive to Babylon. The Phœnicians submitted to him voluntarily, with the exception of Tyre, which underwent an obstinate siege without yielding. After a fortunate expedition against Egypt, Nebuchadnezzar turned his attention to the adornment of his capital; and we may believe that a considerable part of those buildings, usually ascribed to a very early period, and especially to Semiramis, belong to him. The great embankment at Bagdad, usually ascribed to the califs, has been proved by Rawlinson to date from this monarch. After his death (562 B. C.), the Neo-Babylonian empire fell to pieces as suddenly as it had sprung up, and under Nabonedus (Nabunita, in the cuneiform inscriptions, and in Herodotus, Labynetos), who had entered into an alliance with Croesus of Lydia, against Persia, it came under the dominion of Cyrus (539 B. C.). The Belshazzar of Scripture is thought to be the son of Labynetos, to whom was confided the defence of B., while the elder prince held Borsippa. After the fall of B., Labynetos submitted to Cyrus, and was treated with kindness. As a Persian province, however, B. made many attempts to assert its freedom. Thus, in the great inscription of Behistun (q. v.), Darius I. relates, that after his accession to the throne at E., a certain Nuditabira gave himself out for Nabuchadrathara, the son of Nabunita, and gained over the whole people; that he (Darius) had defeated him in battle, but that it had been necessary to besiege the rebellious city, in the course of which siege the rebel had met his death. From this time B. appears on the Persian monuments as a Persian satrapy, under the name of Babirus.

With the overthrow of the Persian monarchy, B. came under the short-lived dominion of Alexander the Great, who died in that city (323 B. C.). Selencus I., to whom it had been promised at the conference of Triparadisus, contested and won the possession of it from Antigonus (312 B. C.). About 140 B. C., it was taken from the Syrian monarchs by the Parthians. It came into the hands of the Romans only temporarily, first under Trajan (114 A. D.), under Septimius Severus (199 A. D.), and again, under Julian (363 A. D.). When, in 650, the successors of Mohammed put an end to the new Persian monarchy of the Sassanides, the province of B., where Bagdad was built (762—766), became the seat of the califs till 1258. Since 1638, when the Turks, for the second time, took it from the Persians, it has been under the dominion of Turkey, divided into the pachalics of Bagdad and Basra.

The civilisation of the ancient Babylonians was of a rather high stamp, much like that of the Assyrians. The government was despotic, of a kind to suit a crowded, luxurious, and effeminate population. In the accounts of Herodotus, we see traces of administration by satraps. Justice is said to have been dispensed by three great courts of law. Arts and commerce were highly flourishing—

the last was carried on by caravans with Bactria, Persia, and Media, perhaps as far as India, and by shipping on the Persian Gulf with Arabia. The commerce has indeed remained much in the same position down to the most recent times. In the 16th c., the English carried on traffic with this country; in modern times, Bagdad holds the place of the ancient B. and Ctesiphon. B. was famous for its dyes, its cloths, and embroideries, especially for the manufacture of rich carpets with inwoven figures of strange animals and arabesques, such as we yet see on the Nineveh sculptures. Commerce gave rise to the invention of measures and weights; and the general prosperity was such, that B. and Assyria together were able to pay to Persia, in the time of Darius Hystaspes, a yearly tribute of 1000 talents (upwards of £280,000)—a sum considerably greater than that contributed by any other province. This, however, reveals also the national character of the Babylonians, who were notorious for their effeminacy, luxury, and licentiousness. Their religion was nearly allied to that of the Phœnicians. The essential part of it was the worship of the powers of nature, as they are manifested in the larger heavenly bodies and in the fertility of the earth. At the head of their system of belief stood Baal (see BAAL), revered through the whole of Mesopotamia and Canaan, who represented, in a general way, the power of nature, without having any moral significance, and was specially identified with the sun. Along with him stood, as feminine complement, the goddess Baaltis, the receptive Earth, with whose worship all manner of licentious rites were associated. She makes her appearance principally as Melyta or Mylitta—i. e., 'the cause of generation.' How nearly she is related to Ashtaroth (among the Greeks, Astarte), whose functions are so similar, it is not easy to determine. Education and religion were in the hands of the caste of the Chaldees, which was not, however, hereditary, but was drawn from the body of the people, since even the foreign prophet Daniel was taken into the number. They occupied themselves at the same time with astronomy and astrology, and kept records, from the earliest times, of their astronomical observations, associating with them the chronicles of their kings. All this they did in a strictly collegiate capacity, for we always find the collective name, 'the Chaldees,' and never the name of an individual. Their scientific acquirements must have been considerable. See Ideler *On the Astronomy of the Chaldeans* (in the Transactions of the Berlin Academy, Historico-philological class, 1814—1815). Beyond engraved cylinders and stones, we have no considerable monuments of the state of the representative arts among them, and cannot, therefore, satisfactorily judge of it. Their architecture, on the contrary, according to the testimony of the ancients, and the ruins still remaining, deserves to be ranked high.

Apart from canals, bridges, embankments, and sluices, the interest on the subject of Babylonian architecture is concentrated in the ruins of the capital, BABYLON. The accounts that we find in the ancients of the origin, the greatness, and the structure of the city, are exceedingly confused. The god Belus is named as its founder, and also Queen Semiramis; how we are to understand the two statements is not explained. Semiramis, according to the account of Diodorus, employed on it two millions of workmen, collected from all parts of her dominions. With the capital of the older kingdom, the accounts of the ancients known to us have, for the most part, nothing to do; they

are all to be referred to the resuscitated and adorned residence of Nebuchadnezzar. Herodotus gives a description of the city, apparently from his own observation. It stood on both sides of the river, in the form of a square, the length of whose sides is variously given; by Herodotus it is stated at 120 stadia, making the whole circumference 60 miles. It must be remembered, however, that the walls, like those of most oriental towns, enclosed rather populous districts than cities, so that the whole mass of the population might easily find shelter within the space enclosed. It was surrounded by a wall 200 cubits high, and 50 cubits thick, and furnished with 100 brazen gates—the last number is raised by Diodorus to 250. The city was built with extreme regularity, with broad straight streets crossing one another at right angles; and the two parts were connected by a roofed bridge built of hewn stones, fastened together with iron clamps. Of this bridge, not a trace has yet been discovered. The western part of the city is undoubtedly the older, belonging to the early and properly Babylonish dynasty. Here stood, in the middle of the city, as it is described, the famous temple of Belus or Baal, called by the Arabs, Birs Nimrud. See BABEL, Tower of. The next important point on the west side is the mass of ruins called Mujellibe, which was probably the royal citadel of the old Babylonian monarchy. On the east side of the river stood the buildings of the Neo-Babylonian period, among which the 'Hanging Gardens' of Semiramis are to be singled out as one of the wonders of the world. Of these gardens, Diodorus has left us a detailed description. Their ruins may be recognised in the mound called El-Kasr. The city suffered greatly from the Persian conquest. When it revolted under Darius I., and, after a siege of two years, was recaptured through the ingenuity of Zopyrus, the outer walls were demolished. Xerxes plundered the temple of Belus, which had been hitherto spared, and Herodotus found it empty. Although the Persian kings made B. their residence, nothing was done for the restoration of the city; and Alexander the Great, who, on his entrance, in 331 B.C., had promised the inhabitants to rebuild the ruined temple, was unable even to clear away the rubbish, although he employed 10,000 workmen for two months. After his death in the palace of Nebuchadnezzar, and the foundation of Seleucia on the Tigris by Seleucus Nicator, B. went rapidly to decay. This was partly owing to the new city's being built of the materials of the old, and partly to the want of durable materials for monumental buildings. Stones of any size had to be brought from the mountains of Armenia; their place was mostly supplied by burned brick. As early as the time of Pausanias, there was little to be seen but the ruins of the walls. The older Arabian geographers know, indeed, of a village, Bâbil, but speak more of the great masses of ruins. Since the time of Della Valle, who erroneously looked upon the ruin Mujellibe as the tower of Belus (in which he is followed by Rennel), the site of B. has been the object of many travels and researches. The greater number of the explorers, among whom Rich is the most distinguished, consider the town of Hillah, with 7000 inhabitants, as the representative of the ancient Babylon. The great masses of ruins, from which we must not, with Rennel, exclude the Birs Nimrud, embrace, indeed, an enormous extent, but agree perfectly with the accounts of the ancients in being arranged in the form of a square. Recently, Rawlinson has transferred the site of B. to Niffer; but before anything can be determined, researches must be made on the spot, which could hardly fail to lead

BABYLONISH CAPTIVITY—BACCHUS.

at the same time to valuable results, like those of Botta and Layard in Assyria, and increase the collection of cuneiform inscriptions, which are yet only fragmentary. See Rich's *Memoirs on the Ruins of Babylon* (3d ed., Lond. 1818), and his *Personal Narrative of a Journey to England by Bussorah, Bagdad, the Ruins of Babylon* (Lond. 1826); Mignan's *Travels in Chaldæa* (Lond. 1829); Fraser's *Travels in Koordistan, Mesopotamia* (Lond. 1840); Wellsted's *Travels to the City of the Califs* (Lond. 1840); Vaux's *Nineveh and Persepolis* (Lond. 1850); Rawlinson's *Herodotus* (Lond. 1858).

BABYLO'NISH CAPTIVITY. In the despotic policy of the East in ancient times, it was a rule to remove the rich and leading inhabitants of a conquered province to a distant part of the empire, where they were separated by nationality, language, customs, and religion from the great body of the population, and thus rendered politically harmless; while the people that remained behind were by this means deprived of influential leaders. The inhabitants of Judea underwent oftener than once a deportation of this kind, after they came into conflict with the powerful kingdom of Assyria. Thus, the kingdom of Israel was put an end to under King Hosea (722 n. c.), by the Assyrian monarch Salmanassar, who, after taking the capital, Samaria, carried the principal inhabitants into captivity in Assyria, and brought stranger tribes into the land of Israel in their stead; these, with the Israelites that remained, formed afterwards the mixed nation of the Samaritans. The most remarkable exile, however, befell the tribe of Judah under Nebuchadnezzar. Zedekiah, king of Judah, warred in vain by the prophet Jeremiah, allied himself with the king of Egypt against the sovereignty of Babylon. Nebuchadnezzar soon appeared with a powerful army before Jerusalem, which he took (588 b. c.). King Zedekiah had his eyes put out, and he and the principal part of the inhabitants were carried captive to Babylon. It is this Captivity, the duration of which is usually reckoned at 70 years, although, strictly speaking, it lasted only 56 years, that is called, by way of distinction, 'the Babylonish Captivity.' The situation of the exiles was in other respects tolerable. Most of them settled down, and acquired property, and even riches; many were called to court, and even raised to high offices in the state. They were allowed to retain their organisation by families, and lived by themselves essentially according to the Mosaic law. They had also their own chief, and were allowed the free exercise of their religion. Nor did they want consolation and encouragement; for Ezekiel raised among them his powerful prophetic voice, and the idea of the Messiah became more clearly developed. When Cyrus overthrew the Babylonian empire (538 b. c.), he allowed the Jews to return to their own country. Only the tribes of Judah, Benjamin, and Levi, availed themselves of this permission, the other ten tribes disappear from history after the Captivity. It is probable that they had become so mingled with the Babylonians, a people of kindred origin, that they had ceased to remember the country of their race. Vain attempts have, in recent times, been made to discover the ten lost tribes. Some learned men have sought for them in China and India, while others have declared the Afghans to be their descendants, and even the North American Indians. A more probable conjecture, perhaps, is, that they were the ancestors of the Nestorians in the mountains of Kurdistan.

BABYROUSSA (*Sus Babyroussa*), a species of Hog (q. v.) inhabiting the forests of Java and the Molucca Islands, remarkable for the extraordinary tusks of the upper jaw, which rise like horns

through the bone and integuments, are long, somewhat slender, and curved backwards; their use being

Babyrousa (Babirusa alfurus).

probably similar to that of horns. The animal is sometimes called the Horned Hog. Its limbs are much more slender than those of the common hog.

BACCHIGLIONE', a river of Northern Italy, having its source in the Alps, and its outlet in the Adriatic. It passes through the town of Vicenza, where it is crossed by a fine bridge of nine arches; flows through the plain of Padua, and enters the Adriatic about 3 miles south of Chioggia. Its whole course is about 90 miles, and it is navigable by large boats from Vicenza to the sea.

BACCHUS, the god of wine (called in Greek Bakhos, Dionysos, and also, especially in the Mysteries, Iakchos), was the son of Zeus and Semele, the daughter of Cadmus. Before his birth, Semele fell a victim to the insidious counsels of the jealous Here, who induced her to petition Zeus to visit her in his proper form and majesty—i. e., attended with thunder and lightning. The mother was of course consumed, but the six-months-old B. was saved by being enclosed for some time in the thigh of Zeus. He was first consigned to the care of Ino, the sister of Semele, and her husband Athamas; but when Ino and Athamas were driven mad by Here, Zeus caused him to be carried to Nysa, in Thrace, and given in charge to the Nymphs. It

Bacchus.

was here that B. taught the cultivation of the vine, and prepared intoxicating drink from the grapes. In order to impart his discovery to mankind, or, as some say, because Here smote him with madness, he wandered through many countries attended by the Nymphs, who were crowned with ivy and vine-leaves, and bore in their hands the *thyrsus*, a pole bound round with leaves and fruit. This expedition, according to a later form of the myth, extended to Bactria and Media, to Egypt and India, where B. is said to have erected pillars as the eastern boundary of the world. Wherever he came in his wide progress, there is a Nysa to be found. The worship of the god, which

came originally from the East, and was introduced into Greece by Melampus, was thus spread over nearly the whole of the then known earth, and at the same time the myth of B. was variously modified among the different peoples, so that it has become one of the most perplexed and difficult. B. was, besides, the protector of fruit-trees, and of fruits in general. His worship being thus extensively spread, and his festivals being held with music and song, he naturally received a great many surnames; for example, he was called Lenæos, from the wine-vat (*lenos*); Bromius, from shouting (*bromos*); Euios (in Latin, Euius), from the exclamation *Euoi*, &c. The mythical march or expedition above spoken of, was suggested to the fancy by the Bacchanalian festivals, at which Bacchantes roved about in feigned madness, and made midnight processions to the mountains by torch-light. B. met with much opposition on his expeditious, many refusing to acknowledge his divinity. Thus, Lycurgus, king of the Edones, opposed him, and also Pentheus of Thebes, who was on that account torn to pieces by his own mother and her sisters. The daughters of Mynias (q. v.), who refused to celebrate his festivals, were punished by him with madness and metamorphosis. As he was crossing to Naxos, the Tyrrhenian sailors wished to carry him off to Italy, and, with this view, bound him; but the chains fell off, vines and ivy entwined the ship, and held it fast in the middle of the sea. B. changed himself into a lion, and the sailors from terror leaped into the sea, where they were transformed into dolphins. Those, on the contrary, who received him with hospitality and reverence, were rewarded; such as Midas (q. v.). In general, the character of B. is mild. In works of art, his type is that of a youth inclining to effeminaey. His peculiar ornament is the fillet. The long blond hair is bound up in a knot behind, and only a few locks fall down on both sides over the shoulders: the hair is surrounded by a twig of vine or of ivy. His figure is neither stout nor slim. He is usually represented quite naked; sometimes with a wide robe negligently thrown over, which either covers a part of the shoulders and thighs, or, though more rarely, enwraps the greater part of the body. Frequently, a deer-skin hangs across the breast; at times, he wears shoes, more rarely, buskins. From this, the properly Grecian B., the bearded or Indian B. is completely distinct. This last appears in a more dignified, lofty, regal form; he is clad in a tunic reaching to the feet, over which he wears a wide and splendid mantle. As a warrior, he wears a short tunic girded round the waist, with buskins on the feet; a panther's skin serves him for a shield. In addition, he is to be seen at times with horns. After the institution of the Eleusinian Mysteries, the service of B. was conjoined with these; accordingly, Pindar makes him the companion of Demeter. As the followers of Orpheus held him to be also Apollo, he is associated with the Delphic oracle.

The worship of B. consisted in noisy rites. Thebes, in Bœotia, held to be the birthplace of the god, was considered the chief seat of those rites in Greece. In Athens, the worship of the Lenæan B. was the most ancient, and may be traced back to ante-historic times. The chief offerings made to him were goats and oxen; the last, because he himself was conceived and represented under the form of an ox. The Bacchic festivals deserving special notice are—1. The Attic Dionysia, of which the minor, or country Dionysia, were celebrated in the country in the month Poseideon, at the time of the grape-gathering. Among the characteristic amusements of the occasion were the *Askolia*, which consisted in smearing full wine-skins (*askoi*) with oil, on which the young peasants attempted to leap with one foot, and by

their frequent falls produced merriment. There were also dramatic entertainments. This festival was probably held at the approach of the wine-harvest, and that of the Haloa at its close. These were followed, in the month Gamelion, by the festival of the Lenæa, which was peculiar to the city of Athens. The festivities on the occasion, besides theatrical representations, consisted in a great banquet, for which the state provided the meat, and in a procession through the city, attended with the jesting and raillery usual at Bacchic ceremonies. After the Lenæa came the Anthesteria, on the 11th, 12th, and 13th of the month Anthesterion, when the new wine was first drunk. On the second day of this festival, the chief solemnity consisted in a great public dinner, at which the guests, crowned with flowers, and to the music of trumpets, entered into regular contests in drinking, and in a private sacrifice for the prosperity of the state offered by the 'king archon's' wife, who was at the same time symbolically married to the god. On the third day, a sacrifice was offered to the Chthonian Hermes and to the souls of the dead. Last came the Great Dionysia, which were celebrated in the month Elaphebolion, and at which new comedies and tragedies were represented. 2. The Triateric Dionysia, which were celebrated every third year in the middle of winter. The performers were women and girls (called in Greek, *Manades*; in Latin, *Bacche* or *Bacchantes*), and the orgies were held at night, on the mountains, with blazing torches and the wildest enthusiasm. This mystic solemnity came from Thrace, and its institution is referred to Orpheus. When it was adopted in Greece, cannot be exactly determined. It is earliest met with in Bœotia, particularly at Thebes, where the Cithæron was the scene of celebration. An important place in connection with it is also Parnassus, on the highest summit of which the women of Attica and Delphi celebrated nocturnal orgies in honour of B. and Apollo. The *Manades* or *Bacchantes* were clad on the

Bacchant.

occasion in fawn-skins, swung about the 'thyrsus,' made a great noise with clapping of hands, and danced wildly with streaming hair. In this ecstatic solemnity, the god himself was represented by the victim sacred to him, the ox, which the *Manades* in their fury tore in pieces. In the most ancient times, even human sacrifices were not uncommon. Descriptions of these wild and terrible rites are not unfrequent in the poets. 3. The Bacchanalia of later times, the foundation of which was laid in Athens, during the

Peloponnesian war, by the introduction of foreign rites. From Greece they were carried to Italy. As early as 496 B.C., the Greek worship of B. was introduced at Rome along with that of Ceres; and Ceres, Liber, and Libera were worshipped in a common temple. In honour of these deities, the Liberalia were celebrated on the 17th of March, and were of a yet simpler and ruder kind than the great Dionysia of Athens. Afterwards, however, these rites degenerated, and came to be celebrated with a licentiousness that threatened the destruction of morality and of society itself. They were made the occasion of the most unnatural excesses. At first, only women took part in these mysterious Bacchic rites, but latterly men also were admitted. When the evil had reached its greatest height, the government (186 B.C.) instituted an inquiry into it, and rooted out the Bacchanalia with the greatest severity. This was the occasion of the well-known *Senatus Consultum de Bacchanalibus*. Mention of them, however, still occurs at a later period under the emperors.—Wild, excessive revels are still called Bacchanalia.

BACCIO DELLA PORTA, better known by the name of Fra Bartolomeo di San Marco, one of the most distinguished masters of the Florentine school of painting, was born at Savignano, in Tuscany, in 1469. His first teacher was Cosimo Roselli; but he owed his higher cultivation to the study of the works of Leonardo da Vinci. His subjects are mostly religious, and by far the greater part of his pieces belong to the later years of his life. He was a warm adherent of that bold reformer of church and state, Savonarola (q.v.), after whose tragical end he, 1500, took the habit of the cloister, and for a considerable time renounced art. The visit of the young Raphael to Florence in 1504 seems to have been instrumental in stimulating him to return to it. He imparted to Raphael his knowledge of colouring, and acquired from him a more perfect knowledge of perspective. The two remained constant friends—B., on one occasion, finishing certain of Raphael's unfinished works, Raphael performing a like kindness for him at another time. B. died at Florence, 1517. The greater number of his works are to be seen at Florence, in the gallery of the Pitti Palace.

BACH, ALEXANDER, an Austrian statesman, was born January 4, 1813, at Loosdorf, in Lower Austria, where his father held a judicial office. The young B. received a careful education. At the age of 24, he was promoted to the rank of Doctor of Laws, and then entered the imperial service, in which he remained about nine years. During this period also he travelled over the greater part of Europe and some of the countries of Asia. He was on terms of friendship with the members of the opposition of Lower Austria, and belonged to that circle of young men who well understood the failings of the old system, and the inevitability of a change in the organisation of Austria. He took an active part in founding the Juridico-political Reading Club, and courageously defended it against the police. On the occurrence of the events of March 1848, B. took a distinguished place as a mediator. He formed part of the Provisional Committee of the Commons, and was also chosen in April, by the states of Lower Austria, one of their representatives in the Central Commission of the Provincial States of Austria.

In this, the outset of his political career, B. already shewed a leaning to those views which he afterwards manifested as minister. He advocated the centralisation of the Austrian monarchy, and declared himself against the independence of Hungary, as well as against the entry of the German

provinces of Austria into the German confederation. But he also desired an extension of the basis of the states, and of their parliamentary influence in the direction of public affairs. During the occurrences of the 15th of May 1848, B. kept away from Vienna. When, after these occurrences, the old liberal opposition came to the helm, B. undertook the ministry of justice. He now entered with talent and energy into the remodelling of the whole system of Austrian law. On the other hand, the part he took in the assembly brought upon him the hatred of the 'left,' and of the democratic party generally. The opposition was particularly bitter on the question of removing the burdens from peasant proprietors, on which B. maintained the principle of compensation, and wished a part of that compensation to be made good by those who had hitherto borne the burdens in question. His policy, also, with regard to Hungarian affairs met with violent opposition from the 'left.' In the events of the 6th of October 1848, B. would have fallen a victim to popular fury, like the war-minister Latour, had he not found an opportunity of withdrawing from pursuit. On the formation of the Schwartzenberg-Station ministry, he again took the portfolio of justice, and participated in the measures regarding Hungary and all the other important steps taken by that ministry. On the withdrawal of Stadion in May 1849, B. took his place at the head of the ministry of the interior, which office he continued in 1859 to retain. Among his most important labours in this department are the constitutions for the different crown-lands, as well as the organisation of their political administration. His political opponents allow him to possess cleverness, energy, and activity.

BACH, JOHANN SEBASTIAN, a celebrated musician, born at Eisenach, Upper Saxony, in March 1685. When he was ten years old, his father, who was a musician at Eisenach, died, and B. sought the protection of an elder brother, who, dying soon after, he was again left destitute, and, to earn a livelihood, entered the choir of St Michael's, Lüneburg, as a soprano singer. In 1703 he became court-musician at Weimar, and, the following year, organist to a new church at Arnstadt. His reputation in this capacity soon spread, and in 1708 he was appointed court-organist at Weimar, by the reigning duke. While holding this office, he laboured assiduously to make himself master of every branch of music. In 1717, he was made director of concerts, and six years afterwards, director of music, and cantor to St Thomas's School, Leipsic, an appointment which he held to his death. About ten years later, the honorary distinctions of Kapellmeister to the Duke of Weissenfels, and court composer to the king of Poland, were conferred upon him. B., who had a son in the service of Frederick the Great, received a pressing request to visit Potsdam on the occasion of a concert there. He went, and acquitted himself greatly to the satisfaction of that monarch, some of whose music he played at first sight. B.'s close studies affected his eyes, and an operation designed to benefit them, left him totally blind, and hastened his death, which took place in July 1750. With the exception of Handel, B. had no rival as an organist; and his compositions for the organ have a deservedly high reputation. They are too elaborate, however, ever to become very popular, though his fame as a composer is sure to advance with the progress of scientific musical culture. The highly educated musician will best appreciate the grandeur of some of his works. In 1850, a Bach Society for the study and practice of his compositions was formed in London, and since that time some of them have been publicly performed in this country. Three of his sons were also musicians of some note. One of

them, Johann Christian, held the appointment of music-preceptor to Queen Charlotte.

BACHARACH, a small town of Rhenish Prussia, romantically situated on the left bank of the Rhine, 22½ miles above Coblenz. It has a population of 1900, with a brisk trade, and a good deal of commerce by river-traffic. It is said to have derived its name from Bachelus (*Bacchi are*), and the vine is still largely cultivated in the neighbourhood—the wine produced being of a superior quality. B. is noteworthy also as the place where Blucher crossed the Rhine, on January 1, 1814.

BACHELOR (Fr. *bachelier*, Lat. *baccalaureus*, or, as it is variously written in old documents, *baccalaureus*, *bacularius*, and *bacillarius*). This word, which first makes its appearance in middle-age Latin, is of very uncertain etymology, and its primary meaning is consequently involved in obscurity. The usual derivation, from *bacca laurea*, a laurel berry, gives us little help; but the Spanish *bacillir*, which means at once a babler and a master of arts, taken in conjunction with the Portuguese *bacharel* and *bacillo*, a shoot or twig of the vine (from the Latin *baculus* or *baculum*, a stick or shoot), and the French *bachelette*, a damsel, seem to point to its original and generic meaning, which probably was a *person shooting, or protruding from one stage of his career into another more advanced*. With this general signification, all the special meanings of the word given by Ducange seem to have some analogy. 1. It was used, he says, to indicate a person who cultivated certain portions of church-lands called *baccalaria*—which he supposes to have been a corruption of *vassleria*—a feu belonging to an inferior vassal, or to one who had not attained to a full feudal recognition. 2. It indicated ecclesiastics of a lower dignity than the other members of a religious brotherhood—i. e., monks who were still in the first stages of monkhood. 3. It was used by later writers to indicate persons in the first or probationary stage of knight-hood; i. e., not esquires simply, but knights who, from poverty and the insufficient number of their retainers—from their possessing, perhaps, only the *baccalaria* above referred to—or, from nonage, had not yet raised their banner in the field (*levé bannière*). 4. It was adopted to indicate the first grade or step in the career of university life. As an academical title, it was first introduced by Pope Gregory IX. in the 13th c., into the university of Paris, to denote a candidate who had undergone his first academical trials, and was authorised to give lectures, but was not yet admitted to the rank of an independent master or doctor. At a later period, it was introduced into the other faculties as the lowest academical honour, and adopted by the other universities of Europe. See DEGREES, UNIVERSITY. 5. It came to be used in its popular meaning of an unmarried man, who was thus regarded as a candidate or probationer for matrimony.

The legislation of almost every country, at some period of its history, has imposed penalties on male celibates or bachelors, on the principle that every citizen is bound to rear up legitimate children to the state. By the Jews, the command, 'Be fruitful and multiply,' was interpreted strictly, and every Hebrew regarded marriage as a duty. In Sparta, where the interests of the individual were entirely sunk in those of the state, criminal proceedings were authorised by the laws of Lycurgus not only against those who neglected to marry, but against those who, from marrying late in life, or any other cause, formed such alliances as rendered the procreation of healthy children unlikely. By the laws of Solon, celibacy was also treated as a crime, though the practice of

interfering with the feelings of the individual in this respect early fell into desuetude at Athens. At Rome, penalties and disabilities were imposed on unmarried men from an early period, and latterly on unmarried women also. In the allotment of the Campanian lands, Julius Cæsar gave portions only to those who had three or more children; and in later times we have the *jus trium (quatuor et quinque) liberorum*. The most important provisions on this subject are contained in the law (or rather the laws, for it consisted of an act and an amended act) called *Lex Julia et Papia Poppæa*, the first portion of which belongs probably to 18 B.C., and the second portion to 9 A.D. In addition to various other provisions regarding marriage, this law imposed penalties on those who lived in a state of celibacy after a certain age. No unmarried person could take a legacy, whether of a portion or of the whole possessions of a deceased person, unless he complied with the law—i. e., got married within a hundred days from the testator's death. Widows were at first allowed a year from their husbands' death, and divorced women six months from the time of the divorce, before they came within the penalties of the law; and these periods were afterwards extended to two years, and a year and six months, respectively. The original provisions of the law did not apply to men beyond sixty, or women above fifty, but they were extended to them by subsequent enactments, and made perpetual even in case of their marrying. The *Senatus consultum* passed in the time of Claudius, however, again exempted men above sixty who married wives under fifty, as from their unions it was supposed there was a fair prospect of issue. Childless married persons, moreover, from the ages of twenty-five to sixty in males, and twenty to fifty in females, were subject to the penalties of the law, to the extent of losing one-half of any inheritance or legacy which might be bequeathed to them. The *Lex Papia* also contained a provision by which a candidate who had several children was preferred to one who had fewer; and various other premiums on fruitfulness were held out both at Rome and in the provinces.

In Britain, there are numerous instances of additional or higher taxes being imposed on bachelors and widowers, but apparently more with a view to the revenue than with any other object. Of this, 6 and 7 Will. III. c. 6, which was passed in 1695, and which granted to his majesty certain rates and duties upon marriages, births, and burials, and upon bachelors and widowers for five years, 'for carrying on the war against France with vigour,' is an instance; and another, probably, may be found in the higher charge for the servants of bachelors, first imposed by Mr Pitt in 1785, and continued to the present time. By 52 Geo. III. c. 93, unmarried daughters of persons alive are exempted from the tax upon hair-powder; and in the income-tax of 1798, deductions were made on account of children, 5 per cent. being allowed to a person who had a family, and whose income was above £60, and under £400 a year, corresponding deductions being made in other cases. Much might be said in favour of such distinctions, on the ground of expediency, as they enable the government to impose a higher taxation, by lessening the burden on those members of the community who are most likely to complain; but their recognition in practice would, no doubt, be regarded as impossible by the financiers of our day, who have hitherto failed to distinguish between income derived from realised property and from personal labour.

BACHELOR, KNIGHT, the lowest grade of knight-hood, now very frequently conferred not only on military and naval officers, but upon

civilians who have in any way merited the favour of the sovereign. The person who is to receive the honour of knighthood kneels down before the sovereign, who touches him on the shoulder with a naked sword, saying, in French: '*Sois chevalier au nom de Dieu*' (Be a knight in God's name), and then adds: 'Rise, Sir A. B.' The ceremony of degradation, in former times, was more remarkable. It was effected by ungirding the belt of the knight, taking off his sword, and breaking it, and hewing off the gilded spurs, which were the peculiar emblems of knighthood, with a hatchet. In ancient times, earls used to confer the honour of knighthood, but the privilege is now confined to the sovereign and to the lord-lieutenant of Ireland. In 1859 there were in all about 330 British knights-bachelors.

BACIO'CCHI, MARIE-ANNE-ELISA BONAPARTE, the eldest sister of Napoleon Bonaparte, was born at Ajaccio, Corsica, in 1777. When that island was occupied by the English, she, with her family, emigrated to Marseille. Here she married, at the age of 20, a countryman of her own, Captain Baciocchi. The elevation of Napoleon raised her also to rank and power; and in 1806, the principality of Massa and Carrara was intrusted to her administration, which was, on the whole, a beneficial one for the people. In 1809, she was made Grand Duchess of Tuscany, and appointed as administrator over that country in Napoleon's name. Here the arbitrary measures of her brother, which she had to carry out, and her own self-will and harshness, rendered her anything but popular. Her husband took no part in the government. When the allies entered Tuscany in 1814, she of course had to leave Florence. She died, at Bologna, of nervous fever, in 1820.

BACK, in maritime language, has many technical applications. To *back an anchor*, is to support the large anchor by a smaller one, in order to prevent it from loosening and coming home in bad ground. To *back and fill*, is a mode of tacking when the tide is with a vessel, but the wind against her. To *back the sails*, is so to arrange them as to make the ship move astern or backwards; it is done when the tide or current is with the ship, and light winds against her; and the manœuvre is useful to avoid collisions in narrow channels, to bring the ship into a particular position during naval engagements, or to keep ships well asunder when crowded in convoy. To *back the maintop-sail*, and analogous operations to other sails, is so to arrange a sail that the speed of the ship's progress may be checked.

BACK, SIR GEORGE, a well-known traveller in the polar regions, was born at Stockport in 1796. He entered early on a naval career, and accompanied Franklin and Richardson in their expedition to the north coast of America. He volunteered to the government to go in search of Captain Ross, who was supposed to have been lost in his attempt to discover the North-west Passage; and his offer having been accepted, he left London, February 17, 1833, and on the 28th of June, started from Norwayhouse, a station of the Hudson Bay Company, on his journey to the north. After passing a terrible winter with his companions at Slave Lake, he discovered, in 1834, Artilley Lake, and the Great Fish River, or Back's River, which he followed to the Frozen Ocean. Being hindered by the ice from proceeding along the coast as far as Cape Turn-again, he returned by the river; but although he had received news of the return of Captain Ross, he continued his explorations in the North Sea, and did not return to England until 1835, when he was raised to the rank of

post-captain for his services. In 1836 and 1837, he further explored the arctic shores in the interests of geography—the Geographical Society, in the latter year, bestowing its gold medal upon him. Two years afterwards, he was knighted, and he has since had a lucrative Treasury appointment. Accounts of his two expeditions, written by himself, have been published.

BACKERGUNGE, a town of Bengal, situated on Backergunge Creek, an offset from the Ganges, in lat. 22° 33' N., and long. 90° 22' E.—125 miles to the east of Calcutta. Till supplanted by Burrisol, which is 12 miles to the north, it was the capital of the district of the same name.

BACKERGUNGE, the district named from the foregoing town. It extends in N. lat. from 22° 2' to 23° 13', and in E. long. from 89° 49' to 91°, containing 3794 square miles, and 733,800 inhabitants, or about 193 inhabitants to a square mile. Like the rest of the great delta of Bengal, B. is of alluvial formation and level surface, being watered at once by the lower streams of the Ganges and the Brahmaputra, and also by the various branches or offsets which interlace together those mighty rivers. In consequence of the great number of water-courses, which at once cool the atmosphere and drain the soil, the country is fertile, and the temperature is said never to rise above 88° in the shade. From the same cause, the district is independent of regular roads for intercourse and communication. In the season of high-water, as may be expected, inundations are common. To guard against them, the houses are built on mounds; while the corresponding excavations, like the natural 'water-holes' of Australia, serve as tanks against the effects of the dry season. As is often the case in alluvial regions, land-slips are frequent, and also the opening of new channels for the streams. The productions are rice, sugar, cotton, pulse, mustard, cocoa-nut, betel-nut, mango, guava, plantains, limes, pine-apples, ginger, and turmeric. Buffaloes are said to be generally used instead of oxen, of which the domestic breed is small and poor.

BACKGAMMON is the modern name of a game of considerable antiquity in England, where it was formerly known by the appellation of 'the tables.' The words *back-gammon* have been ascribed to the Welsh tongue, in which they are said to signify *little battle*; but Strutt, with greater plausibility, traces the term to the Saxon '*bac* and *gamen*—that is, *back-game*—so denominated because the performance consists in the two players bringing their men back from their antagonist's tables into their own; or because the pieces are sometimes taken up and obliged to go back—that is, re-enter at the table they came from.' Whatever be the etymology of the term, the game has been long established in the country; and as a fireside amusement of a decorous nature, is a favourite among clergymen, squires, farmers, and retired professional persons.

B. is played with an apparatus consisting of a board or tables, men or pieces, dice, and dice-boxes. The introduction of dice into the game, and their constant use in determining moves, makes B. essentially a game of chance, and therefore brings two players of unequal talents nearer a level than other diversions in which skill is the sole or predominant element. The B. board consists of two parts or tables, generally united by a hinge in the middle, by which they can be shut up as a box. Each table possesses twelve points, six at each end. These points are coloured white and black alternately; but this variation of colour has no reference to the game, and is only done to make the points more easily counted. The game

is played by two parties, and with 30 pieces or men; each party has 15 men, one set of 15 being black, and the other white. In beginning the game, the men are placed on certain points on the tables, as shewn in the following figure. The game is played with two dice and two dice-boxes. The dice are common to both; but each party uses his own dice-box, and the throws are alternate. Each die is a perfect cube, marked on its sides with dots from 1 to 6. The 1 is called *ace*; the 2, *deuce*; the 3, *tre* or *trois*; the 4, *quatre*; the 5, *cinque*; and the 6, *six*. At every throw, the two dice are employed; consequently, a person may throw from 2 up to 12—that is, two *aces* up to two *sixes*. If a player throw *doublers*, or both dice of one number, double the number of dots is reckoned; thus, by a throw of two aces, the player does not count 2, but 4. These numbers thrown or accidentally turned up by the dice, bear a reference to the points on the tables. In order to understand this connection between the dice and the men, the learner must observe how the men are placed on the points, and the rules by which their shifting from one to another is governed.

The Backgammon Table.

The tables are here spread out as if two partners were seated, and about to begin to play. The party owning the white men is seated at W, and the party owning the black men at B. We shall call one party White, and another Black. White counts round from the ace-point of Black, and Black counts round from the ace-point of White. These ace-points are respectively seen to have two men upon them in opposite corners of the same table. The grand object of the game is for each party to get all his men played round into the table containing the aces, removing them from point to point agreeable to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by itself, or collectively, with the number on the other die. Thus, if quatre be thrown by one die, and size by the other, a man can be advanced 4 points, and another 6 points; or one man can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by two men belonging to the adversary. If covered by only one man, which is called a *blot*, then that man can be hit, and be removed from the point, and placed on the bar between the tables, his place being taken by the man who has won it. The removal of a man to the bars throws a player considerably behind

in the game, because the man must remain out of the play till the dice turn up a number corresponding to one open point on the adversary's table. Being fortunate to get an open point by this means, the man must be entered and wrought round from thence, as in the case of others in the set to which he belongs. The frequent occurrence of this hitting of a blot gives an adversary a great advantage, and allows him to win the gammon. There are two kinds of victory—winning the hit, and winning the gammon. The party who has played all his men round into his own table, and by fortunate throws of the dice has borne or played the men off the points first, wins the *hit*. The gammon may be explained as follows: When you have got all your men round to your own table, covering every point, and your adversary has a man out, then you are enabled to *bear* or lift your men away. If you can bear all away, so as to clear your table before the adversary gets his man placed by a throw on your table, you win the gammon. If the adversary has been able to bear one before you have borne all your men, it reduces the victory to a hit. Two hits are reckoned equal to one gammon in playing matches. To win two games out of three is called winning the *rub*, as at whist.

BACKHUYSEN, LUDOLPH, one of the most famous painters of the Dutch school, a master in marine painting, was born at Emden in 1631. His parents intended him for a commercial career; but he had not been long in a mercantile office in Amsterdam, to which he had been sent at the age of 18, before he resolved to devote himself to painting, and with that object received instruction from Evendingen, and attained, in a short time, extraordinary skill and readiness in execution. He was a close student of nature; so much so, that on the approach of a storm he often put to sea in a boat, in order to watch and sketch its effects, which he transferred to canvas immediately on his return home. His most famous picture is the sea-piece in the gallery at Paris, which he was commissioned to paint by the magistrates of Amsterdam, and which was, in 1665, sent as a present to Louis XIV. In all his pictures, the utmost truthfulness prevails, at the same time that they embody all the poetry of the sea. His colouring is also excellent. After he was 71 years old, he began etching on copper. He also made attempts in poetry, and gave lessons in writing, an art which he did much to promote. He died, after long illness, in 1709.

BACK-STAYS are long ropes which extend from the topmast-heads down to the sides of a ship, where they are fastened in such a way as to assist the shrouds in supporting the masts. Different kinds are distinguished as *after-B.*, *breast-B.*, and *travelling-stays*. One rope generally forms a pair of B.; being looped in the middle to pass over the mast-head.

BACON (from a root in the Teutonic languages which seems to be allied to the Lat. *vacca* [in mid. Lat. *baca*], a cow, and to have signified an animal in general; *bache*, in Ger., signifies among hunters a wild sow; *bake*, in Dutch, a swine in general) is the cured sides of a pig; while bacon-hams are the hind-legs cured. The mode of curing will be described under **HAMS**; and their properties as articles of food, under **PORK**.

BACON BEETLE. See **DERMESTES**.

BACON, SIR NICHOLAS, the father of Lord Bacon, was born in 1510, at Chiselhurst, in Kent. He received an excellent education; and being gifted by nature with sound and practical abilities, he quickly prospered in the legal profession, to which he attached himself. At the age of 27,

he was appointed solicitor to the Court of Angmentations; two years later, on the dissolution of the monasteries by Henry VIII., he had the courage to present to that irascible monarch a reasonable project for applying the wealth which had been 'rescued' from the church. It was this: that Henry should employ a portion of it in founding a college for the study of politics and diplomacy. Unfortunately, the king had already squandered it away in presents, and was unable to comply with the wise suggestion of the young lawyer; but probably he remembered his good sense, for, in 1546, Henry advanced him to the office of Attorney of the Court of Wards, which he retained during the reign of Edward VI.; but his Protestantism necessarily caused him to be deprived of all public honours and emoluments after the subsequent Catholic succession. On the death of Mary, however, he was made a member of the Protestant part of the Privy Council, by Queen Elizabeth; and in 1558, received at her hands the Great Seal. In the beginning of 1559, he opened parliament with a judicious speech on the difficult subject of a national religion. He was also president of that assembly of ecclesiastical disputants which met in Westminster two months later, to discuss the points of controversy between Protestants and Catholics. In 1564, he suffered a temporary eclipse of royal favour, on account of the too patriotic character of his religion; but through the persevering efforts of his old and constant friend, Sir William Cecil, he was at length restored to the sunshine in which he had been accustomed to bask. Elizabeth even went the length of paying him a visit in 1577, at his magnificent mansion of Gorhambury, in Hertfordshire. He died on the 20th of February 1579. Sir Nicholas was one of those solid and stately Englishmen to whose sagacity, high principle, and firm demeanour his country owed its safety in that critical period when Elizabeth mounted the throne.

BACON, FRANCIS, LORD VERULAM, VISCOUNT SR ALBANS, born in London, January 22, 1561, was the son of Sir Nicholas Bacon (q. v.). His mother was the learned Anne Cooke. In early childhood, he manifested superior powers, and an ardent love of knowledge; his intelligence was so precocious, and his sedateness so remarkable, that the queen took pleasure in calling him her 'young Lord Keeper.' At the age of thirteen, he was sent to the university of Cambridge, which he quitted, after a residence of three years, with a low opinion of the course of study pursued there, and, as well, of the Aristotelian philosophy. On leaving the university, he went to Paris, in the suite of Sir Amias Paulet, the English ambassador, and there occupied himself chiefly with statistics and diplomacy, the result of his studies and observation being a work, afterwards published, *Of the State of Europe*. The sudden death of his father, about the end of 1579, recalled him in 1580 to England, where, after failing to procure from the government a provision which would enable him to devote himself to science and literature, he betook himself for several years to the study of law. His professional progress was at first very slow, and, contrary to what might have been expected, it was long before he could obtain promotion in the public service. This want of success was chiefly owing to the hostility of his uncle, the queen's first minister, Lord Burleigh (see *CECIL*), who regarded him as a dangerous rival to his own son. To Lord Burleigh and his son, B., in the hope of advancement, had paid court till it was clear no favour was to be expected from them, when he betook himself to their rival, the Earl of Essex, whose friendship he speedily won. But the earl's influence could not

counteract the continued opposition of the Cecils, through whom he was defeated, in 1594, in an attempt to obtain for B. the then vacant office of attorney-general. What he could do for his friend, however, he did, for shortly after this disappointment he presented him with an estate at Twickenham worth £2000 a year. It is painful to relate that B. repaid the generous friendship of his patron with flagrant ingratitude. When Essex was subsequently brought to trial for a conspiracy against the queen, B. came forward as his accuser with tongue and pen; he unnecessarily appeared as counsel against the friend who had so largely obliged and confided in him, and used all his great talents and ingenuity as a pleader to magnify his crimes and secure their punishment. B. was straitened at the time in his circumstances, through his extravagant mode of life, and, moreover, was anxious to conciliate the court, whose anger he had provoked by having espoused the popular cause on his first entering parliament as member for Middlesex in 1595. But whatever the temptation was, it cannot affect our opinion of conduct so mean and immoral. It remains to be stated, that, after the earl's execution, he wrote, at the request of the queen, *A Declaration of the Practices and Treasons Attempted and Committed by Robert Earl of Essex*, which was printed by authority.

In 1590, B. obtained the post of Counsel Extraordinary to the Queen, and a few years afterwards, he entered parliament as member for Middlesex. It was not, however, till the reign of James I. that he made rapid progress. He was knighted in 1603, and in the following year was appointed salaried counsel to the crown; by 1613, he had advanced to the office of Attorney-general, in which he unconditionally subserved the purposes of the court. His conduct as attorney, in attempting to extort by the rack a confession of treason from an old clergyman of the name of Peacham, has met with universal and deserved condemnation. He did not, however, cringe to the king and the royal favourite, Villiers, except to good purpose. In 1617, he was appointed Keeper of the Great Seal, and in 1619 attained the dignity of the Lord Chancellorship, with the title of Lord Verulam. In the year following, he was created Viscount St Albans.

Having attained the highest honours of the state by truckling to the king and his favourite, B. proceeded to abuse his judicial functions to increase his revenues, which, great as they were, were unequal to his extravagance. Though his official income was great, and his means had been enlarged by a marriage with the daughter of a wealthy alderman, he could only support his style of life by contracting debt and accepting bribes from suitors. Nor was money his only motive to false judgments; he more than once polluted the stream of justice, to maintain the favour of Buckingham. By 1621, the state of the courts had become so scandalous as to call for a parliamentary inquiry, which resulted in his being convicted, on his own written confession, of twenty-three acts of corruption. In consequence, he was condemned to pay a fine of £110,000, and to be confined in the Tower during the king's pleasure; he was banished for life from the court, and declared unfit to hold any office of state, or to sit in parliament. The fine, however, was remitted; the imprisonment lasted only two days; he was allowed again to appear at court, and, indeed, was summoned to sit in the very next parliament. Age, however, failing health, and perhaps shame, prevented him from appearing. Banished from public life, he henceforth devoted himself to literature and science, enjoying from the government a pension of £1200, and an annual income, in all, of £2500. His mode of life still, however, continued

to be so prodigal and ostentatious that, at his death, in 1626, his debts amounted to upwards of £22,000. The immediate occasion of his death (as related by Aubrey, who probably got it from Hobbes, who was B.'s intimate friend) was cold caught in making an experiment to test the power of snow to preserve flesh. He died in the house of the Earl of Arundel, to which he had been removed with the fatal chill upon him which he had caught in the course of the experiment.

While, on the whole, the public life of Lord B. is marked by meanness and dishonour, his literary and scientific works are everywhere irradiated by the powerful light of an intellect which towered over those of other men. The first edition of his *Essays* appeared in 1597; his two books of the *Advancement of Learning* in 1605; his *Wisdom of the Ancients*—in Latin—in 1610; a third edition of his *Essays*, greatly extended, in 1612; his two books of the *Novum Organum*, or second part of the *Instauratio Magna*, designed to consist of six parts—also in Latin—in 1620; his *History of the Reign of Henry VII.*, in 1622; his nine books, *De Augmentis Scientiarum*—a Latin translation and extension of his *Advancement of Learning*—in 1623. Besides these, he wrote several minor works, which need not here be specially mentioned. It is enough to say that his writings embrace almost all subjects, from jurisprudence—which he treated not as a mere lawyer, but as a legislator and philosopher—to morality and medicine. The *Sermones Fideles* is a treasury of the deepest knowledge of human relations, conveyed in a gorgeous and energetic style. Almost the only science with which he was unacquainted was that of mathematics. Thus singularly gifted and accomplished, he appeared at a time when science, from a variety of causes, started on that progress which has never since been arrested. If it is now a question how far he contributed by his genius to that progress at its commencement, it is a fact that he was long vulgarly regarded by his countrymen as the father of Inductive Philosophy—as having been the inventor and first teacher of the method of interrogating nature by observation and experiment and inductive reasoning. Nor are his writings wanting in materials qualified *ex facie* to support his title to that eminence. His claim to the distinction, however, has of late been the subject of much controversy, the result of which is that it has been generally disallowed. But if it be true that he had a somewhat vague and imperfect apprehension of the philosophy of induction, overestimated the province of observation, and undervalued the use of deduction and hypothesis, and that even his classification of the sciences in the *De Augmentis*, on which his reputation long turned, has been properly superseded by the superior and better-reasoned classification of M. Comte; still it must be borne in mind that he was one of the first that was aware of the true character of the positive philosophy, and who understood its conditions, and foresaw its final supremacy; and as for his classification, that it was a marvellous effort of reason at a time when the sciences were in their infancy, and many of them were yet unborn. Also, it must be said, that if B. cannot be claimed by the physicists as the father of their science, and they must look rather to Galileo, yet he may fairly be claimed in that character by the students of man and society; for he was the first to aim at the extension of the methods of positive philosophy to moral and social conceptions. If recent criticisms have dethroned him from the position which for centuries he occupied in relation to the physical sciences, by shewing that neither his doctrines, experiments, nor writings have materially affected their course, it is

only to leave him free to be placed in a position no less dignified in relation to human and social philosophy.

As a writer, B. presents us in combination an intellect at once one of the most capacious and profound that ever appeared among men—one of the most penetrating, one of the most far-reaching—and an imagination almost equally remarkable. In no other writer is so much profound thought to be found expressed in such splendid eloquence. 'If,' says Hallam (*Literature of Europe*, iii. 218), 'we compare what may be found in the sixth, seventh, and eighth books *De Augmentis*, in the *Essays*, the *History of Henry VII.*, and the various short treatises contained in his works on moral and political wisdom and on human nature, from experience of which all such wisdom is drawn, with the Rhetoric, Ethics, and Politics of Aristotle, or with the historians most celebrated for their deep insight into civil society and human character—with Thucydides, Tacitus, Philip de Comines, Machiavel, Davila, Huanc—we shall, I think, find that one man may almost be compared with all of these together.'

The collected works and life of Lord B. were published by Mallet in 5 vols. (Lond. 1765); a good edition is that of Montague (16 vols., Lond. 1825—1834); but the best, it is generally admitted, is the last (5 vols., edited by Messrs Spedding, Ellis, and Heath, Lond. 1858). Montague's edition gave occasion to an able review of B.'s character by Lord Macaulay, to be found among his *Essays*. The *Encyclopedias Britannica* and *Metropolitana* contain valuable papers on his writings, on which also Sir John Herschel's *Preliminary Discourse in Lardner's Encyclopadia* may be consulted.

BA'CON, ROGER, an English monk, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. He was descended of a respectable family, and born at Ilchester, in the county of Somerset, 1214. He studied at Oxford, and then at Paris, where he received the degree of Doctor in theology; and soon after his return home, he entered the order of the Franciscans, and settled at Oxford. Physics seems to have been at that time the chief object of his labours; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of hellish magic. This prejudice was encouraged by the jealousy and hate with which his brother monks regarded his superiority. Besides, he loudly denounced the ignorance and immorality of the clergy, especially of the monks, and even wrote a letter to the pope, in which he represented to him the necessity of clerical reform. Out of revenge, an accusation was brought against him at the papal court, and the pope interdicted him from teaching in the university. He was shortly after imprisoned, forbidden all human intercourse, and hardly allowed sufficient food. Among the few clear-sighted men who admired Bacon's genius, and pitied his misfortunes, was the cardinal-bishop of Sabina, at that time papal legate in England. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On his ascent to the papal throne as Clement IV., B. wrote to him, expressing his readiness to furnish him with whatever he desired, and Clement in reply repeated his request to see B.'s works, in defiance of the Franciscan prohibition. B. accordingly drew up his *Opus Majus* (edited by Jebb, 1733), which he sent, along with two other works, it is said, to the

pope, by his favourite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is not very well known; but they could only have reached him about the time he was seized with his last illness. For ten years after Clement's death, B. was free from open persecution at least. But in 1278, under Nicolas III., the general of the Franciscan order, Jerome of Esculo, declared himself against B., forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by the pope. This new imprisonment lasted ten years. When Jerome of Esculo became pope, under the name of Nicolas IV., B. sent him a *Treatise on the Means of warding off the Infirmities of Old Age* (Lat. Oxf. 1590; Eng., by Brown, 1653), with a view to convince him of the harmlessness and utility of his labours, but in vain. What the pope refused to the representations of the old philosopher, was yielded to the intercession of several influential English noblemen, and B. at last recovered his freedom. He returned to Oxford, wrote a compendium of theology, and shortly after died—according to some, in 1292, to others, in 1294.

B., although an extraordinary genius, could not rid himself of all the prejudices of his times. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics; for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemicl discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal, we may imitate lightning, and produce explosions. Mathematics, applied to observation, he considered to be the only means of arriving at a knowledge of nature. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honourable mention are his discoveries of the errors that prevailed in the calendar, and his proposals and data for remedying them, in which he came very near the truth. He prepared a rectified calendar, of which a copy is preserved in the Oxford library. On account of his extensive knowledge, he received the name of 'Doctor mirabilis.' Several of his works have never been printed, and are preserved among the Cottonian manuscripts in the British Museum; some are to be found in French libraries.

BA'CON, JOHN, a distinguished statuary, was born in London, 1740, and died there August 7, 1799. He was at first a painter on porcelain, and only began to work in marble at the age of 23; yet in 1769 he received the first prize from the Royal Academy, of which he was soon after made a member. His statue of Mars first established his fame. Among his principal works are, two busts of George III., one in Christ Church College at Oxford, the other in the university library at Göttingen; the monuments of Lord Chatham in Westminster Abbey and in Guildhall; the statues of Howard and of Samuel Johnson in St Paul's, and that of Blackstone at Oxford. B. was deficient in imagination, and had no refined perception of beauty.

BACSA'NYI, JANOS (pronounced Bat-shan-yi), a Hungarian writer and poet, was born May 11, 1763, at Tapoleza, in the circle of Szalader. After studying at Vessprim, Oedenburg, and Pesth, he became tutor to the son of General Oreyz, and while thus employed, published his first work, *The Valour of the Magyars* (Pesth, 1785). He received the same year an appointment in the finance department at

Kaschau, and there, in conjunction with Baroti and Pazinezy, he began the *Magyar Museum* (Kaschau and Pesth, 1788—1792). In 1793, in consequence of a liberal poem, he was deprived of his office, and in 1794, having taken part in the conspiracy of Bishop Martinovich, he was carried to Spielberg, where he was confined till 1796. After recovering his freedom, he assisted in editing the *Magyar Minerva*, then came to Vienna, where he held an office in the bank, and married (1805) the German poetess, Gabrielle Baumgarten—an unhappy match. When the French entered Vienna in 1809, B. translated Napoleon's proclamation to the Hungarians, on which account he found himself afterwards obliged to take refuge in Paris. After the peace of Paris, he was given up, and had Linz assigned him as a compulsory residence, but was allowed to receive his French pension till his death. He died at Linz, May 12, 1845: the Hungarian Academy had in 1843 again elected the octogenarian a corresponding member. In the latter part of his life, B., besides other works, published his *Collected Poems* (Pesth, 1827; Ofen, 1835). We are also indebted to him for the collected edition of the poetical works of Anyos (Vienna, 1798) and of Faludi (Pesth, 1821).

BA'CTRIA, the ancient name of the imperfectly known land lying between the western part of the Hindu Kush mountains, and the river Oxus (Anu, or Gihon), which separated it from Sogdiana on the north and north-east. Its boundaries in early times cannot be precisely ascertained, but it is generally considered to have been identical with the modern Balkh (q. v.). B. is supposed to have been the seat of the parent-people from which the Aryan (q. v.) or Indo-European family of nations branched off. The ancient Bactrians of historic times were akin to the Medes and Persians, and used the Zend language. B. was originally the centre of a powerful kingdom, which extended itself over the east of Persia, but we have almost no record of its early greatness; we only know that Ninus, the Assyrian king, in spite of his vast army, found much difficulty in conquering it, and that when Arbaces besieged the last Assyrian king, Sardanapalus, in his metropolis, he was assisted by a large force of Bactrians. It is believed that the ancient Persian religion was first developed in Bactra or Zariaspa, the capital of B., which was the head-quarters of the Magi till the land was overrun by the Arabs, and a centre-point of the inland trade of Asia. The modern town of Balkh (q. v.) is built upon its site. Alexander, on his return from Persia, left in B. a colony of 14,000 Greeks, who here extended civilisation. After the death of Alexander, B. was annexed to the kingdom of Syria; but was raised to independence by its governor, Diodotus I., who founded the Greek kingdom of New B. about 256 B. C. The history of this kingdom was formerly little known, but has been recently elucidated by numerous Græco-Bactrian coins found in the *topes* or burial-places of Afghanistan. These coins give the names of a series of kings, and bear indications of the political circumstances of the Greek kingdom of B. On those of Eucratides, a monarch who flourished in the age of Mithridates, there are found, beside the Greek characters, others which have been proved to belong to a dialect of the Sanscrit, and have been very happily deciphered by Mr Prinsep.

BA'CTRIS, a genus of Palms, of which nearly fifty species are known, all American. The leaves of some are pinnate, those of others entire. They are generally small palms, some of them very small, and with slender stems; that of *B. tenuis* is not thicker than a goose-quill. Some are spiny, and form thickets not easily traversed. *B. acanthocarpa*

is called Tucum, near Bahia, and from it an extremely tough thread is obtained, which is used for making nets. *B. Maraja*, the MARAJA' palm, produces large clusters of fruit, resembling small grapes, with a thin pulp of an agreeable subacid flavour.

BACTRITES, a genus of fossil *Ammonitidae*, with a straight shell, and indented but not ramified septa. Five species have been described, all from Devonian strata.

BACULITES, a genus of the family of *Ammonitidae*, differing from the true *Ammonites* (q. v.) in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed. The species, like the other *Ammonitidae*, are all fossil. B. are characteristic of the upper chalk, and appear to have existed only towards the expiry of the period over which the existence of the *Ammonitidae* extended.

BADAGRY, a seaport town on the Gold Coast of Upper Guinea. Pop. 10,000. At one time it carried on a large trade in slaves with the Portuguese, who here established several factories. B. has a monarch, who is subject to the king of Katunga. It was from this place that Lander and Clapperton started on their expeditions to explore the African interior.

Baculite. **BADAJÓZ**, called by the Romans Pax Augusta, and by the Moors Beledaix, i. e. 'Land of Health,' is the capital of the Spanish province of Estremadura. It is situated about five miles from the borders of Portugal, in a fruitful district on the left bank of the Guadiana, which is here crossed by a stone-bridge of 28 arches. It numbers 12,000 inhabitants, is the residence of a captain-general, and the see of a bishop, has a cannon-foundry, and an old cathedral with a splendid organ, and paintings by Mateo Cerezo and Morales, who was born at B.; a brisk traffic, chiefly contraband, is carried on with Portugal. Its chief articles of manufacture are soap, coarse woollens, leather, and delft-ware. As one of the keys of Portugal, B. has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the allies, in the Spanish War of Succession, in 1705. During the French war, B. was besieged by the French in 1808 and in 1809, and again in 1811, when it surrendered, March 11, to Soult. It was thrice besieged by the English under Wellington: first on April 17, 1811, after the conquest of Olivenza, on which occasion, the approach of Soult to its relief caused the siege to be raised on the 14th of May; the second time, after the battles of Fuentes d'Onor and Albuera, the city was invested from May 27 to June 10, 1811, but still in vain. The third investment, March 17, 1812, ended in the taking of the city by storm, on the night of April 6, after a murderous contest, and a loss during the twenty days' siege, of 72 officers and 963 men killed, and 306 officers and 3483 men wounded. The garrison and their commander, General Philippon, became prisoners of war.

BADAKHSHA'N, or **BUDUKHSHA'N**, a territory of Central Asia, lying between 36° and 38° N. lat., and 69° and 73° E. long. B. occupies the western declivity of the great mountain-chain of Bolor-Tagh (q. v.), and includes several of the valleys through which the head streams of the river Oxus (q. v.) flow. The territory is subject to the ruler of Kunduz. It is bounded on the W. by Kunduz, on the S. by Chitral, on the E. by the plateau of Pamir, and on the N. by Bokhara. B. is

for the most part mountainous. The mountains are generally bare and barren; but the slopes of some of them are rendered productive by the terrace system of cultivation. Gold is found in considerable quantities in the tributaries of the Oxus, the principal of which is the Kokcha. B. has several ruby mines, and is famous for its production of lapis-lazuli. Iron is also found, which the inhabitants smelt with much more skill than most eastern peoples do. The country is marked by great variety of climate. Among the principal indigenous trees are the willow, the pistachio, and almond-trees, which grow on the lower slopes; and the archa or dwarf fir in the higher regions; but poplar and fruit trees are grown in the vicinity of villages, and the mulberry-tree, for food to the silk-worm, is largely cultivated in the valley of the Oxus. The chief domestic animals are horses, sheep, and cattle, which find rich pasture on the plains; asses, hogs, and the yak (q. v.), which in the more mountainous districts is the most important animal of all. It yields richer milk, but in less quantities than the cow; and as a beast of burden, if not so strong, it is more sagacious and sure-footed than the horse. Among the wild animals are lions, wolves, foxes, &c., white deer, hares, pheasants, and other game abound; eagles and ravens are also met with. The population of B. consists of Tadjiks and Mohammedans, who speak the Persian language. B. is little known to Europeans. About the beginning of the 16th c. it was conquered by Baber, the founder of the Mogul empire. After the fall of that empire, B. became subject to Cabul. In 1823, the Uzbecks, under Murad Beg, defeated the tribes of B. in a pitched battle; and two years after, their subjugation was completed. Their conquerors have treated them most harshly, demolishing their towns, and either selling them as slaves, or carrying them off to people the unhealthy swamps of Kunduz.

BADDERLOCKS, or **HEENWARE** (*Alaria esculenta*), a sea-weed (see **ALGÆ**, where a figure of it is given), of the sub-order *Fucaceæ*, growing on rocks in deep water on the shores of Britain, Iceland, and the northern parts of Europe. It has a stem 4—8 inches long, pinnated with a few short leaflets, which contain the seeds, and a membranous olive-green frond of 2—12 feet long, with a stout mid-rib. The frond being stripped off, the mid-rib forms an article of food to the inhabitants of the sea-coasts of Iceland, Denmark, Scotland, Ireland, &c. The thinner part of the frond is also sometimes eaten.

BADEN, THE GRAND DUCHY OF, is situated at the south-western extremity of the German Confederation. With an area of 5900 square miles, it runs in the direction of the valley of the Upper Rhine and of the Black Forest, from the southern bend of the Main at Wertheim to the Bodensee or Lake of Constance, and is bounded on the N. by Bavaria and Hesse-Darmstadt; on the E. by Hohenzollern, Würtemberg, Bavaria; and on the W. and S. by the Rhine, which separates it from Rhenish Bavaria, France, and Switzerland. It is divided politically into four circles—the circle of the 'Lake,' at the south, and the circles of the 'Upper Rhine,' of the 'Central Rhine,' and of the 'Lower Rhine;' these are again divided into 79 districts.

Surface and Hydrography.—Physically, B. falls into two divisions—the western plain, lying along the right bank of the Rhine, and the eastern highlands; the plain occupying about a fifth of the whole duchy, and the hilly part, four-fifths. Of the mountain-ranges, the Schwarzwald, or Black Forest, is the most prominent. See **BLACK FOREST**. For a distance of 96 miles, it belongs almost exclusively to

BADEN.

Baden. It terminates in abrupt declivities towards the west, and on the east descends by degrees into the plateau of the Neckar in Würtemberg. It decreases in height from south to north, its mean elevation being from about 4000 to 2700 feet, and is cut up into sections by numerous deep and wildly romantic valleys. The most remarkable summits are Feldberg and Belchen in the south. The less elevated part of the mountainous division of B., which lies to the north of the Murg, receives the general name of the Neckar highlands, as far as to its intersection by the Neckar valley, on the north side of which the Odenwald begins. Southward, in the circle of the 'Lake,' rise the extensive plateaus of the German Jura. This tableland is known by the local name of the Randen. In the plain of the 'Upper Rhine' between Altbreisach and Endingen, stands the small isolated basaltic group of the Kaiserstuhl, or Emperor's Seat, rising to the height of 1100 feet, and overlooking the Rhine.

Being drained by the Rhine and the Danube, B. belongs to the basins of two opposite seas; the sources of the Danube, however, drain only about 336 square miles in the northern part of the 'Circle of the Lake.' Beginning with the Bodensee, which projects three arms or bays on the north-west into B., the Rhine, in its tumultuous course, forms the south boundary, interrupted, however, by several encroachments of the Swiss territories upon its north bank. From Basel to below Mannheim, the stream is the only and natural boundary. The chief tributaries of the Rhine, on the B. side, are the Neckar, the Kinzig, the Murg, the Elz, the Treisam, and the Pfalz. On the north-east the Baden territories are bounded by the Main, which there receives the Tauber. Except a part of the Bodensee, B. has no lake of importance. In the Schwarzwald, however, there are the following sheets of water which go by the name of lakes: Mummelsee, Wildsee, Feldsee, Titisee, and the Nonnenmattweiher, with a floating island.

Climate.—As the difference between the highest and lowest points of B.—Feldberg, which rises to a height of 4802 feet, and Mannheim—amounts to something like 4500 feet, there is naturally a great variety of climate, especially in respect of temperature. The mean temperature of the plains may be stated at 50°, and that of the highlands at 41° Fahr., so that the Rhine valley of B. is one of the warmest and most fruitful districts, not only of Germany, but of Europe; the land yielding often, in the case of maize, a return of more than three hundredfold. Walnuts, cherries, apples, and pears grow in abundance, while the western terraces of the Schwarzwald are decked with vines. On these charming declivities, the walnut thrives at a height of 1340 feet, the grape at 1450 feet; other kinds of fruit are cultivated in the higher regions to an elevation of more than 2000 feet. The wild cherry is found even as high as 2600 feet; the cereals being profitably cultivated to at least an equal height. Oats rise as high even as 3600 feet, above which lie the exclusively pastoral districts.

About two-thirds of the population are engaged in the cultivation of the land, which, as may be inferred from the description, yields rich returns. An area of about 2100 square miles is occupied with fields and gardens, growing wheat, oats, rye, barley, maize, potatoes, pulse, and vegetables of all sorts. Tobacco, hemp, rape, opium, &c., yield a large revenue. Meadow land and pasturage occupy about a fifth of the surface. An important branch of cultivation is also the production of chestnuts, walnuts, almonds, &c. The quantity of wine produced yearly is, on an average, 14 million gallons. About

1790 square miles are under wood. The Schwarzwald is one of the most remarkable pine-forests of Germany. There whole tracts may be seen of pines of the height of from 160 to 180 feet, which are exported to the Netherlands for ship-building. The rearing of cattle is carried on to a large extent. The several kinds of stock may amount to the following numbers: horses, 73,200; asses, 700; cattle, 451,000; sheep, 189,000; goats, 22,100; swine, 480,000; making a total of 1,240,000 head of animals, and representing a large amount of wealth. Honey is also an important product, more than 14,000 bee-hives being kept in the duchy. Various societies exist for improving the breed of horses and perfecting agriculture.

Minerals.—The mineral wealth of the country does not seem to be valued yet as it deserves, if we may judge from the extent of mining operations carried on; but the activity of the Mining Society at Carlsruhe is yearly bringing this department of the national industry more and more into a fitting condition. Iron, lead, silver, copper, and salt are among the chief productions; gold is extracted from the sands of the Rhine, near Wittenweier, and cobalt, sulphur, marble, and several kinds of precious stones are found. B. is rich in mineral springs; as many as 60 are enumerated, some sulphureous, some chalybeate, and some acidulous. Hence there are a great number of much frequented watering-places, as Baden-Baden, Badenweiler, Griesbach, Petersthal, &c.

Manufactures, &c.—The increasing activity in the various branches of industrial art is testified by the existence of 300 manufacturing establishments, with more than 9000 hands, and a yearly produce of 14 million florins (£1,666,666). The industrial activity extends chiefly to the following articles: ribbons and cotton fabrics, mostly at St Blasias; toys and trinkets, and tobacco, which occupies the first place; chicory, paper, cloth, leather, beer, wooden clocks, and articles of straw; the last two are characteristic of the Schwarzwald districts, and known all over the world. The chief articles of export are wine and timber, which last is sent almost exclusively to the Netherlands, and brings in a sum of at least 3 million florins (£250,000). The principal imports are colonial goods, fruits, drugs, horses, wool, cotton, silk-goods, iron, steel, and articles of luxury. Money is reckoned in gulden or florins of 24 to the mark of silver, a florin being equal to 20*d.* sterling. Weights and measures are divided according to the decimal system.

Population, Religion, Education.—The population of B., in 1858, amounted to 1,335,952, being a decrease of above 20,000 as compared with 1852. With the exception of Jews, the inhabitants are exclusively German. The dominant church is the Roman Catholic, whose adherents, in 1858, numbered 877,311, or about two-thirds of the whole population. Protestants numbered 433,075; Dissenters and Mennonites, 2004; and Jews, 23,562. The school-system of B. is excellent; it offers the means of instruction to every individual; and a multitude of libraries, museums, and collections of all sorts, are significant indications of the higher elements of culture. (1867—pop. 1,434,970.)

Government.—The sovereignty of the grand duchy, which is strictly indivisible and inalienable, is hereditary in the eldest of the male line, and, failing that, of the female. The heir-apparent is styled Hereditary Grand Duke, and the other sons and daughters are called Margraves and Margravines. The sovereign is bound down by a parliamentary constitution. The parliament, which meets regularly every two years, consists of two chambers. The first chamber consists of the princes of the grand-

ducal house, the heads of the seignorial families (seven princes and three counts), and of the nobility—on whom, when they possess hereditary property, under feudal tenure, to the value of 300,000 florins, the king confers the rank of the high nobility—the Catholic bishop and the protestant prelate, two representatives of the universities, and eight members chosen by the grand duke, without regard to rank or birth. The second chamber consists of 63 representatives chosen for eight years, 22 for the cities, and 41 for the country districts, giving one representative for about 21,540 inhabitants. As to the franchise, less regard has been paid in B. than elsewhere to the property qualification; every settled citizen and all state officials may take part in the nomination of electors, and may become electors; only representatives must either pay tax on a capital of 10,000 florins, or be in possession of an ecclesiastical or secular office bringing in at least 1500 florins. The highest deliberative and executive body in the country is the council of state. The grand duke is its president, and it is divided into the ministries of foreign affairs, of justice, of the interior, of war, and of finance. The expenditure, according to the ordinary estimates for the united years of 1858—59, was 21,295,365 florins; the estimated net receipts for the same years being 21,640,952 florins, leaving an excess of income of 344,687 florins. The total receipts of each of these years are given at 16,327,572 florins, the expense of collection, administration, &c., being 5,507,546 florins, leaving a net balance of 10,820,026 florins. There is a particular budget dealing with the finances of the post-office, railways, and baths. 2½ millions of florins were added to the public debt of the country by the events of 1848 and 1849. The total state-debt, including that on railways, amounted in 1859 to 95,369,886 florins (£7,947,490). Military service is obligatory on all, with the exception of the high nobility; and B. furnishes to the eighth division of the army of the German Confederation a contingent of 10,400 men, with a reserve of 3333. The effective war-strength of the army in 1858 was 16,667; peace, 7691. There exist three orders of knighthood, besides a medal for military service, and other decorations of merit. The capital and residence of the sovereign, is Carlsruhe; the capitals of the four 'circles,' are Constanz, Freiburg, Carlsruhe (formerly Rastadt), and Manheim.

History.—The original inhabitants of B. were Alemanni. These fell under the dominion of the Franks, the conquerors of Gaul, and submitted at the same time to the Christian religion. Under their duke, Gottfried, they made repeated attempts to regain their independence, but in vain; and the dukedom of the Alemanni was abolished in 748 by Pepin the Little. In the 11th c., a Duke Berthold, said to have been a descendant of the Alemannian Gottfried, built the castle of Zähringen in Breisgau, and with him begins the unbroken line of the princes of the House of Zähringen. A descendant of his second son took the title of Margrave of B., and became the ancestor of the still flourishing House of Baden. He died in 1130. The history of this House presents, for long, little else but a succession of partitions of the territories among brothers, to be again and again reunited by one or other of the collateral branches becoming extinct. The prosperity of the country was thus greatly retarded. The present capital, Carlsruhe, was built in 1715 by the reigning count, Charles III. It is to his grandson, Charles Frederic, who succeeded in 1746, that B. owes considerable accessions of territory and political importance. By favouring the policy of Napoleon, and joining the Confederation of the Rhine, he doubled his possessions in extent and population,

and acquired successively the dignity of elector and the title of grand duke. In 1811 he was succeeded by his grandson, Charles Ludwig Frederic, who, five years before, had married Stephanie Louise Adrienne Napoleone, an adopted daughter of Napoleon. After the battle of Leipsic, Charles Ludwig seceded from the Confederation of the Rhine, and (1815) joined the German Confederation, in which B. holds the seventh rank.

The original constitutions or 'states' of the separate territories composing the grand duchy having mostly become extinct, the Grand Duke Charles granted (1818) the charter which forms the basis of the present constitution. Charles was succeeded in the same year by his uncle Ludwig, who was inclined to absolutism, and had to contend at first with a powerful opposition, which led him frequently to dissolve the Chambers. He succeeded, in 1825, in carrying through an alteration of the constitution, extending the duration of the parliaments; after which the government and the Chambers acted more harmoniously. Ludwig dying childless (1830), was succeeded by his brother Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional government; but the tide of reaction, become strong since the fall of Warsaw, soon seized the government, and the act establishing the freedom of the press, which in 1831 had been hailed with delight by B. and the whole of Germany, was, in 1832, declared impracticable and abrogated. A fluctuating contest between a reactionary government and a growing opposition was carried on till 1846, when the constitutional Bekk was made minister of the interior, and liberalism thus placed at the helm. The first effect was to calm the public mind, and to cause a split between the liberals and the radicals. The ninth parliament met (December 1847) under the most friendly and promising auspices; when the French revolution (February 1848), the vibrations of which were first felt by B., suddenly called the radical party into the most violent activity. Not satisfied with a multitude of liberal measures passed by the legislature, the revolutionary leaders, Hecker and Struve (q. v.), aimed at establishing a republic, and stirred up an insurrection. The troops having sided with the insurgents, the grand duke fled, and a Constituent Assembly was called (May 1849). The duke had recourse to Prussian aid, and after several battles, was reinstated on his throne (July 1849). The restoration was followed by some thirty executions, consisting chiefly of soldiers that had borne arms against the government, and of a few political leaders. Upon the whole, the reactionary tendency has been less marked in B. than in most other German states, and many valuable reforms effected in 1848 have been retained. See GERMANY, in SUPPLEMENT.

BAD'EN, a town and fashionable watering-place in the canton of Aargau, Switzerland, is situated on the left bank of the Limmat. It has a population of 2810. It is of ancient date, being known to the Romans as *Therma Helveticæ*. The temperature of the baths is as high as 117° Fahrenheit. B., from the 15th to the beginning of the 18th c., was the seat of the Swiss diet.

BAD'EN-BADEN, a town in the grand duchy of Baden, situated in a pleasant valley at the base of the Black Forest. It contains about 6500 inhabitants; but its visitors during the season, which is at its height in July and August, are often double the number of the settled population. It is chiefly celebrated for its medicinal springs, which were known in the time of the Romans. B. having been a fashionable place of resort so early as the days of Antoninus and Aurelius, numerous Roman

antiquities have been found in the neighbourhood, and are preserved in a museum here. There are several springs of a saline character, varying in temperature from 117° to 154° F. These springs are impregnated with iron, magnesia, and lime, with sulphuric and carbonic acid, and are especially recommended in chronic cutaneous diseases, gout, rheumatism, &c. The chief spring (Ursprung) discharges in twenty-four hours about 4290 cubic feet of water. The gaming-tables of B. are the most renowned in Europe.

BADEN BEI WIEN (i. e., 'Baden near Vienna'), a much-frequented watering-place of Lower Austria, about fifteen miles S.S.W. of Vienna. It was the *Aque Pannonia* or *Celtica* of the Romans, and is still famous for its warm mineral springs, which are frequented during the season by from 12,000 to 15,000 persons chiefly from the Austrian capital. The temperature varies from 90° to about 99° F. The baths are frequented by persons of both sexes, who, in the bath, promenade arm in arm. Many of the Austrian nobility have palaces here. The favourite walk in the neighbourhood is along the romantic valley, the Helenthal. Pop. about 4000.

BADENOCH, a Highland district in the south-east part of Inverness-shire, 30 miles long by 15 broad, bounded by Lochaber, Athole, Braemar, and Murray, and traversed by the Spey. It is much covered with forest, and is chiefly composed of gneiss rock, with a little granite. It was a lordship, held during the 13th c. by the eldest branch of the great House of Cumyn, on whose forfeiture Bruce bestowed it on his nephew Randolph. In 1371, King Robert II. gave it to his son, 'the Wolf of Badenoch,' on the failure of whose descendants it reverted to the crown, which, about 1456, granted it to the Earl of Huntly.

BADGE, the term by which, in general, all honorary decorations and special cognizances are known. Badges are either conferred by the state or sovereign, or assumed by the individual for purposes of distinction, the former class having very frequently had their origin in the latter. Of badges conferred by public authority, for the purpose of inciting to exertion, and gratifying honourable ambition, numerous instances are to be met with in every part of the world. The garter of the English knight, the golden fleece of the Spanish grandee, and the button of the Chinese mandarin, will occur as familiar examples. To the same class belong not only the stars and crosses with which princes and other persons of rank are adorned in this country, and to a far greater extent on the continent, but the medal of the private soldier, and even those not less honourable decorations which are now frequently conferred by private societies for acts of voluntary daring, such as the medal given by the Humane Society for saving from drowning. Amongst the ancients, one of the most usual emblems of authority was a gold ring, which was worn generally on the fourth finger. A ring of this description was the mark of senatorial and magisterial dignity, and latterly of knighthood at Rome; iron rings, during the earlier period, at all events, having been used by private citizens. The right of wearing a gold ring (*jus annuli aurei*) was gradually extended, till at length Justinian conferred it on all the citizens of the empire. In the early times of the republic, when ambassadors were sent to foreign states, they were furnished with gold rings, which they wore during their mission as badges of authority. From an early period, every freeman in Greece appears to have used a ring, though the custom, not being mentioned by Homer, can scarcely have belonged to the earliest period of the history of that people, and is

commonly supposed to have been of Asiatic origin. Rings are often mentioned in Scripture as badges of authority both amongst the Jews and other oriental nations. We read of Pharaoh taking off his ring and putting it on Joseph's hand, as a token of the power which he committed to him (Gen. xli. 42); and still earlier (Gen. xxxviii. 18). Judah left his signet with Tamar as a pledge. In the New Testament, rings are spoken of rather as marks of wealth and luxury than as badges of official rank; e. g., James ii. 2, and Luke xv. 22, where, on the return of the prodigal son, the father ordered that a ring should be put on his finger. As to the workmanship and materials of ancient rings, see RING, SIGNET, &c. Of badges assumed for the purpose of distinction, none are more famous than the white and red roses of York and Lancaster. Henry VII. combined these two emblems, first carrying a rose per pale, white and red, and afterwards placing the white rose within the red one. One of Queen Elizabeth's badges was a golden falcon perched on the stump of a tree between two growing branches of white and red roses, a B. which is said to have been given to her mother, Anne Boleyn, by Henry VIII. The *bear and ragged staff*, which still exists as a sign in London, was the B. of the great Earl of Warwick. The *white hart* and *silver swan*, which are frequently met with as signs to inns, have a similar origin, the first having been the B. of Richard II., and the second having belonged to the House of Lancaster. The *garb and sickle*, the B. of the

Garb and Sickle.

Hungerfords, is another very beautiful and less common example of the same class of badges. Different countries have also distinctive badges, generally connected with the history either of the actual ruling or of some former dynasty. Of these, the *fleur de lis* of France (represented in the accompanying engraving of the seal of Louis VII.), and the other badges, for which it from time to time makes way—viz., the cap of liberty and other emblems of republicanism, the eagles of the Empire, borrowed from Rome, and the bees and other insignia which the Bonaparte family have assumed, may all be taken as examples.

Fleur de lis of Louis VII.

B. of England.—The present B. of England is a rose white and red, ensigned with the royal crown. The initials V. R., ensigned with a crown, which are used on military accoutrements, is also a species of national badge.

B. of Scotland is a thistle ensigned with a royal crown.

B. of Ireland.—Ireland has two national badges—the golden harp and the trefoil, both of which are carried ensigned with the royal crown.

The three badges of England, Scotland, and Ireland, carried conjoined, may be seen under any representation of the royal arms.

B. of Wales is a dragon passant, wings elevated, gules, on a mount vert.

B. of Ulster is on a shield or canton, or, a sinister hand erect and apauncé, gu. This B., which is popularly known as 'the bloody hand,' is borne in the paternal coats of English baronets.

B. of Nova Scotia, which is borne by the Nova Scotia baronets, is, or, a saltire azure, thereon an eschecheon of the arms of Scotland, and ensigned with an imperial crown, the motto being, *Faciunt honesta gloria*.

One of the oldest and most celebrated badges in existence is the so-called jewel of King Alfred. For

Alfred's Jewel.

An ornament of gold, apparently intended to hang round the neck, found in Athelney, and now in the Ashmolean Museum, Oxford. The inscription on the side here represented, around the female figure holding flowers, is 'Aelfred me hæc gewercan' (Alfred had me wrought). On the other side is a flower. The workmanship is in a good style.

the badges of the different orders of knighthood, see their respective titles.

BADGER (*Meles*), a genus of quadrupeds of the Bear family or *Ursidae* (see BEAR), and included by Linnæus in the genus *Ursus* or Bear, but forming a sort of connecting-link between this family and the *Mustelidae* or Weasel and Otter family. To the Skunks (q. v.), which are ranked in that family, the badgers have a particularly strong resemblance, and their dentition and habits are almost the same. The dentition of badgers differs from that of bears chiefly in the large size of the tuberculous molar teeth at the bottom of each jaw, shewing a still greater adaptation to vegetable food. Badgers, like the rest of the family to which they belong, are plantigrade, i. e., they walk on the whole sole of the foot, and not merely on the fore part of it. The body is thus brought nearer to the ground than it otherwise would be from their length of limb. The head is long, with a pointed muzzle, the tail short, the skin very thick and tough, the hair long. The gait is slow, the habits nocturnal and solitary. There are five toes on each, both of the fore and

hind feet, and the feet are peculiarly adapted for digging and burrowing. A peculiar characteristic of the badgers, not found in any other quadrupeds of the same family, is the possession of a bag, beneath the tail, for the secretion of a peculiar substance, of a disagreeable odour, which is supposed to be of use in directing the sexes to each other in their solitary wanderings.—The common B. (*M. Taxus* or *M. vulgaris*) is the only quadruped of the Bear family now found in the British islands. It is widely diffused over Europe and the middle parts

Badger.

of Asia. It is grayish brown above, and black beneath; the head white, with a longitudinal black band on each side; the body long but robust, in size about equal to that of a small fox, the hair coarse and reaching to the ground as the animal walks. The average length is 2 feet 6 inches, and the height at the shoulder 11 inches. It haunts the gloomy recesses of woods, or thick coppices on the sides of hills, and digs for itself 'a deep and well-formed domicile, consisting of more than one apartment, the single entrance to which is by a deep, oblique, and even tortuous excavation.' The innermost chamber is circular, and lined with grass and hay. The B. makes use of its nose in digging, scrapes with the fore-paws, flinging the earth as far back by them as possible, and when the accumulation is considerable, pushes it away by means of the hind-feet. The B. is extremely cleanly in its habits. It is one of the most perfectly omnivorous of animals, in a wild state as well as in confinement; fruits, roots, beech-mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects, equally constitute its natural food. It has been known to visit a garden for strawberries. It is also fond of honey, and of the larvae of wasps and wild bees, for the sake of which it digs up their nests, its hide being impervious to their stings. It is often caught by placing a sack in the mouth of its hole, when it is out at night; dogs are then sent into the wood to alarm it, upon which it flees to its hole. Dogs sent into the hole are often foiled by earth which the B. throws back upon them, to block up their way, nor is it easy for a dog to contend with it, owing to its great strength, and particularly the strength of its jaws. A barbarous sport was formerly, and to some extent still is practised, called B.-baiting, or *drawing the badger*. A badger kept in a barrel was assailed by dogs, and at last, yielding to superior numbers, was dragged out, upon which it was released, and allowed to go back to its den, to recover itself, and be baited again, which happened several times daily, when the B. was kept as an attraction to a public-house of the lowest sort. The verb to *badger*, expressive of persevering annoyance by numerous assailants,

was originally employed with reference to the practice of B-baiting. The flesh of the B. is said to be very agreeable, particularly when cured in the form of hams. It is much used in China. The B. is easily domesticated when taken young, and becomes very familiar. In Scotland and the north of England, a B. is still called a *Brock*, its Anglo-Saxon name; and in some parts of England it is termed a *Grey*, from which some derive greyhound.—The Balysaur of India, also called the Sand Bear and Indian B. (*M. collaris*), very much resembles the common B., but is taller, and has a more hog-like muzzle, and a longer tail. Its habits and its food are similar to those of the common B., and when attacked, it defends itself with great vigour. It is chiefly found in hilly districts.—The American B. (*M. Labradorica*) was at first supposed to be a mere variety of the European B., but has proved to be very distinct, so that it has been regarded by some naturalists as worthy of a separate genus (*Taxidea*), and is sometimes called *Taxel*. Its teeth are more adapted than those of the B. for carnivorous subsistence, and it chiefly preys on small animals, such as marmots, which it pursues into their holes in the sandy plains near the Missouri and the Rocky Mountains. It is in that region that it abounds, over a considerable range of latitude, but it is not known to exist in Labrador, so that its specific name is perhaps the perpetuation of an error. In its pursuit of the smaller quadrupeds upon which it preys, it enlarges their burrows, and renders some parts of the plains dangerous to persons on horseback. Its prevailing colour is hoary gray in winter, yellowish brown in summer, the under parts generally yellowish white; a white stripe runs from the nose over the forehead to the neck. The hair becomes not only very long but woolly in winter.—The burrowing powers of this animal are extraordinary. It sometimes makes burrows six or seven feet deep, running under ground to a length of 30 feet.

BADIA-Y-LEBLICH, DOMINGO, known also by the name Ali-Bei-el-Abbassi, one of the most enterprising of modern travellers, was born at Barcelona, April 1, 1767. He studied the Arabic language, and also physical science and mathematics at Valencia. Possessed of a lively and restless spirit, he formed the project of visiting Africa and Asia, under the disguise of a Mussulman, both for the purpose of avoiding the suspicions of the natives when visiting those places forbidden to Christians, and also for giving greater *éclat* to his adventures. In pursuance of this scheme, therefore, he resigned an office under government in the year 1797, and went to Madrid, to make proposals of a scientific and mercantile tour of exploration in Africa. Having gained promises of support from Don Godoi, the Prince of Peace, he betook himself for a short time to London, to study commerce and politics. He also spared no labour to make himself familiar with the manners and customs of the people he was about to visit; and in his anxiety to escape detection, he even ventured to undergo the severe ordeal of circumcision. In 1803, he sailed for Africa, where he represented himself, under the name Ali-Bei, as a descendant from the Abbasides. His tact and talents gained for him such esteem that he was invited to the court of the Emperor of Fez and Morocco. After a two years' residence in Morocco, he set out on a pilgrimage to Mecca in 1805, and after sojourning some time in Tripoli, Cyprus, and Egypt, arrived at the holy place in 1807, being the first Christian that had visited it since the institution of Islam. Subsequently, he visited Jerusalem and the chief places in Palestine and Syria, and in the autumn of 1807

arrived at Constantinople, whence he had soon to flee, the reality of his Mohammedanism being suspected. After his return to Spain, he was made Intendant of Segovia and Prefect of Cordova; but the easy way in which he shelved his patriotism, and submitted to the French conquerors, was fatal to his prospects, for, on the expulsion of the latter, he was compelled to leave the country. He went to Paris, where, in 1814, he published an account of his travels under the title *Voyages d'Ali-Bei en Afrique et en Asie pendant les Années 1803 à 1807*. His work was translated into most of the European languages. Four years after the publication, B. set off on another journey to the East, but died suddenly at Aleppo on the 30th of August 1818. The Pacha of Damascus seized his papers, so that his second enterprise has been without results for Europe.

BAEL or BHEL. See *ÆGLE*.

BAËNA, a town in the province of Cordova, Spain, of about 12,000 inhabitants. It is situated about 24 miles south-south-east from Cordova, on the river Marbella, and carries on a considerable export and inland trade, chiefly in grain and oil. B. was a Roman town; and a Roman sepulchre was discovered here in 1533.

BAER, KARL ERNST VON, a distinguished Russian naturalist, was born February 17, 1792, in Esthonia. During 1810—1814, he studied medicine at the university of Dorpat, but convinced that Russia as it then was presented very few advantages for the acquisition of scientific knowledge, he went to Germany in 1814, where he studied comparative anatomy under Döllinger in Würzburg. He also made the acquaintance of Professor Nees of Esenbeck, who exercised a considerable influence over him. In 1817, he went to Königsberg, where, two years after, he was appointed professor of zoology, and charged with the organisation of the zoological museum. In 1834, he was called to St Petersburg, where he continues to be one of the most important members of the Academy, and has obtained several honorary distinctions. As a naturalist, he has specially occupied himself with the difficult subject of embryology; and to his laborious investigations we owe several most valuable discoveries in regard to the development of organic bodies. Beginning with his *Lytola de Ovi Mammalium et Hominis Genesi* (Leip. 1827), he still further elucidated this subject in his *History of Animal Development* (Königsberg, 1828—1837) and *History of the Development of Fishes* (Leip. 1835). After his return to St Petersburg, he made the polar regions the objects of his study. Setting out (1837), by order of the czar, from St Petersburg on his voyage of exploration, he examined carefully the northern shores of Russia from Archangel to Nova Zembla, and subsequently published a minute description of these and of their peculiar animals and plants, partly in the *Mémoires de l'Académie de St Petersburg*, and partly in the *Bulletins Scientifiques de l'Académie*. In 1856 appeared his *Reflections on the Russian Empire and the Neighbouring Countries of Asia*.

BAEZA, a handsome old town of Spain, in the province of Jaen, from the capital city of which it is about 22 miles distant in a north-east direction. Pop. about 10,000. It was here that the younger Scipio routed Asdrubal with immense loss, taking 10,000 Spaniards prisoners. It was a flourishing city under the Moors, several of whose caliphs and kings resided here, but it never fairly recovered its sack by St Ferdinand in the 15th c. Gaspar Becerra, the celebrated sculptor, was born here in 1720; but B. is chiefly proud of being the birthplace

of the 11,000 virgins, usually named of Cologne. Its principal buildings are the university, the old monastery of St Philip de Neri, and the cathedral. Cloth, leather, and soap are the chief manufactures.

BAFFA, the *Paphos* of ancient times, a seaport town on the south-west coast of the island of Cyprus. It has now fallen much into decay, and has but a small population, who trade in cotton, silk, and grain; but under the Venetian rule, it was a place of considerable importance. The present town occupies the site of New Paphos, which, under the Romans, was a beautiful city, full of fine temples and other public buildings. The Old Paphos, famous as the place where Venus landed immediately after her birth from the foam, and as her favourite residence, stood a little to the south-east. A hundred altars were here erected to her name, to which numerous worshippers, male and female, from New Paphos, trooped annually to pay their devotions. An earthquake in the time of Augustus destroyed the Roman Paphos, but it was rebuilt soon afterwards. The Roman deputy-governor, Sergius Paulus, was here converted by St Paul.

BAFFIN'S BAY, a gulf, or rather sea, on the north-east coast of North America, extending between that continent and Greenland. Lat. 68° to 78° N., and long. 51 to 80° E. It is about 800 miles long, with an average breadth of 250. Its greatest depth is 6890 feet. The tides do not rise more than 10 feet. The currents are generally towards the south, though recent investigations would seem to shew that on the east side of Davis' Strait and B. B. a current from Spitzbergen flows northwards round Cape Farewell. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. The prevailing rocks are granite and gneiss; the principal animals inhabiting the coasts are, on land, bears, black foxes, and hares; in the sea, the black whale, walrus, and seal, gulls, ducks, and other sea-fowls. The south shore of Whale Sound on the east coast in lat. 77° 20' N. was found by Captain Inglefield in 1852 to be inhabited. There are Danish settlements on Disco and Whale Islands. B. B. communicates with the Atlantic Ocean by Davis' Strait; and with the Arctic Ocean by Smith Sound on the north, and Lancaster Sound on the west. Wellington Strait, which forms the north-west outlet of Lancaster Sound, was entered in 1852 by Sir E. Belcher. B. B. was first explored in 1616 by William Baffin, after whom it was called, and who was pilot of the expedition, which was commanded by Bylot. Baffin's title to this honour seems to have been most faithfully earned; and the accuracy of his observations and descriptions has been confirmed by subsequent navigators. Whale and seal fishing are prosecuted to a large extent in B. B., which, on account of ice, is only navigable for some two months in summer.

BAGASSE, CANE-STRAW, or CANE-TRASH, is the refuse matter obtained during the expression of the saccharine juice from the sugar-cane. In the manufacture of sugar (q. v.), the sugar-canes, in lengths of 3 to 4 feet, are passed between heavy rollers, which only partly squeeze out the juice, and yield the bruised canes, or B., still retaining a large percentage (usually about 18) of sugar.—The only use to which the B. is put is as fuel in the heating of the boilers and pans in the sugar-manufactory. The improved apparatus introduced of late years has done much to save the large amount of sugar wasted in the B. and in other parts of the process, which at one time amounted to not less than one-half of the entire quantity of sugar in the sugar-cane.

BAGATELLE (Fr. signifying primarily any trifle), the name of a game somewhat resembling billiards. A bagatelle-table is usually about 7 feet long and 21 inches broad; it is lined with cloth, and a game is performed on it with balls and a cue or mace. The balls are small ivory spheres, and the sport consists in striking one or more into holes at one end of the board. To perform this and other feats, some skill and experience are required, and the sport is far from unamusing in a cheerful parlour circle. Of late years, bagatelle-tables have become very common in the houses of the middle classes of society; they possess the recommendation of being purchasable at a small expense.

BAGDAD, the name of a town and pachalic in the south-east of Asiatic Turkey. The pachalic extends from lat. 30 to 35° N., and from long. 40 to 45° E.; and is bounded on the N. by the pachalics of Diarbekir and Van; on the W. and S., by Syria and Arabia; and on the E., by Persia; while at its south-east extremity lies the Persian Gulf. Extreme length, 550 miles; breadth, 350. Pop. 1,300,000. It is watered by the rivers Euphrates and Tigris, which unite their streams at the town of Korna, in lat. 31° N., and long. 47° E. The pachalic of B. is usually divided into three parts. 1. That east of the Tigris, comprehending the districts of *Khuzistan* (anciently, *Susiana*) and *Kurdistan* (part of ancient Assyria), the former of which is rich in grain and fruit. 2. That west of the Euphrates, a sterile waste, losing itself at last in the great Syro-Arabian desert. 3. That between the two rivers, the northern portion of which is known under the name of *Algesirah*, or 'the Island' (anciently, *Mesopotamia*), and the southern under that of *Irak-Arabi* (anciently, *Babylonia* and *Chaldæa*). The last of these divisions, though now a barren wilderness, was in ancient times luxuriantly fertile, the seat of mighty empires, and inhabited by industrious populations. The barbarous misgovernment and wretched incapacity of the Turks have reduced it to its present condition. The pachalic produces, in the better-cultivated districts, crops of rice, wheat, maize, barley, with some hemp, flax, tobacco, &c., while dates are brought to great perfection. The chief wild animals are lions—not numerous—hyænas, jackals, wolves, gazelles, ostriches; the chief domestic ones are horses, asses, mules, buffaloes, camels, and dromedaries. The inhabitants are composed of Turkomans, Armenians, Turks, Jews, Arabs, and Kurds; the last two of which races are notorious for their open and audacious depredations, their mutual wars, and their utter contempt for the authority attempted to be exercised over them. Principal cities—Bagdad, Bassora, and Mosul. For a description of the cities which in ancient times adorned this region, see ASSYRIA, BABYLONIA, NINEVEH, BABYLON, CTESIPHON, SELEUCIA, &c.

BAGDAD, the capital of the pachalic of the same name, is situated on both banks of the Tigris, in lat. 33° 20' N., and long. 44° 23' E. Pop. estimated at 65,000. The city is surrounded by a brick-wall 5 miles in circumference; the two parts are connected by a bridge of boats, and the communication is guarded by a citadel. It has an extremely picturesque appearance from the outside, being encreined and interspersed with groves of date-trees, through which one may catch the gleam of domes and minarets; but it does not improve on closer inspection. The streets are narrow, crooked, unpaved, and dirty, full of ruts, and strewed with dead carcases, which, however, are for the most part removed by dogs, the only public scavengers in the east. The exterior of the

individual houses corresponds with the repulsive aspect of the streets. They have, in general, no windows towards the front, and are built of old brick; but their interior is often very gorgeously decorated. The vaulted ceilings, rich mouldings, inland mirrors, and massive gilding, bring back to the recollection of the traveller 'the golden time of good Harun Al-Raschid.' B. contains upwards of 100 mosques. These, together with the khans, bazaars, and the palace of the governor, are the only noticeable buildings in the city. The domes and minarets are said to be finer than those of Constantinople, and are beautifully painted. The bazaars exhibit the produce of both Turkish and European markets; but commerce has greatly decreased since Persia began to trade with Europe by way of Trebizonde on the north, and by the Persian Gulf on the south. Nevertheless, though no longer the chief emporium of merchandise between East and West Asia, as in the middle ages of European history, and though Kurds and Arabs lurk on all the roads that lead from the city to waylay and rob travellers and caravans, B. still carries on a considerable traffic with Aleppo and Damascus, and has manufactures of red and yellow leather, silks, and cotton stuffs. Of the 65,000 inhabitants, four-fifths are Turks and Arabs; the remainder are Jews, Armenians, Hindus, Afghans, and Egyptians. In summer, the heat is oppressive; rain does not fall on more than twenty or thirty days throughout the whole year; but when the snows melt on the Armenian hills, the Tigris becomes a majestic, and often a destructive river. In 1831, an inundation destroyed one half of the town, and several thousand lives. The plague visits it periodically—once every ten years. In 1831, 4000 people perished daily for several days from its ravages! These calamities, added to the blind stupidity of Turkish misrule, which depresses all native effort by a system of rapacious taxation, are gradually accomplishing the ruin of this once flourishing and famous city.

B. was founded by the Abbaside calif Almansur, 762—766 A.D. It was built out of the ruins of Ctesiphon and Selencia. In the 9th c., it was greatly enlarged by Harun Al-Raschid, who erected numerous edifices on the east side of the Tigris, and connected its two banks by a bridge of boats. The palace, built for himself, and the tomb of his favourite wife, Zobeide, are said to have been of extraordinary splendour. A hundred years later, B. was ravaged by the Turks. In 1253, the grandson of Genghis Khan, Hulaku, put an end to the old califate; but the descendants of this Tatar conqueror were expelled by Timur, who took the city in 1393. After several vicissitudes, it remained in the possession of a Turkoman chief, whose dynasty governed until 1470. In the beginning of the 16th c., Shah Ismael, the founder of the Sulfide dynasty in Persia, made himself master of it; since which period it has repeatedly been a bone of contention between Turks and Persians. After a memorably obstinate siege, it was conquered by the sultan, Murad IV., in 1638. Nadir Shah vainly essayed to retake it in the 18th c., and ever since it has been under the sway of the Porte.

BAGGAGE, in the marching arrangements of the British army, is placed under strict rules, in order that the accumulation of weight may not impede the movement of the troops; and rules of an analogous kind are enforced in troop-ships, when soldiers are on a voyage. The term itself is made to apply chiefly to articles of clothing, and to small personal effects. A private soldier is allowed to carry nothing except that which his knapsack and other accoutrements can hold; but those who

are married with their officers' consent—a small number in every regiment—are allowed one small chest each of definite size, which may be carried on a march, but at the men's own expense. Staff-sergeants and pay-sergeants have similar permission. The B.-wagons are not expected to receive packages weighing more than 400 lbs. each, or as much as four men can lift. Officers' B. is, of course, much more considerable in amount than that of the non-commissioned officers and privates. On board troop-ships, the weight to be carried for each person is strictly defined—from 15 cwt. for a field-officer, down to 1 cwt. for a married private soldier, with his wife and children. In encampments, whether permanent or temporary, and in armies on field-service, the utmost care is taken to preserve the B. from the enemy, by surrounding it as much as possible with defensive troops.

BAGGESEN, JENS, a well-known Danish poet, but who also has a place in German literature, was born at Korsør, in the island of Zealand, February 15, 1764. He first obtained a reputation by his *Comic Tales* (1785), the opera *Holger Danske* (1790), as well as by his odes and songs. Through the kind assistance of the Prince of Angustenburg, he was enabled, in 1789, to make a tour through Germany, Switzerland, and France. In 1811, he was appointed professor of Danish language and literature at Kiel; in 1814, he removed to Copenhagen, where he became involved in an unseemly strife with Ohlenschläger, and in 1820 he left his native country altogether. Some years later, a home-sickness seized him, and he set out on his return, but died at Hamburg, October 3, 1826. B.'s nature was a curious compound of pride and humility, love and hate, sensitiveness and reflective power, free-thinking and faith; and these conflicting qualities also appear in his poems, which possess an unfinished and inharmonious character. In 1803 appeared at Hamburg a collection of his German poems; in 1806, he published an idyllic epic, entitled *Parthenais oder Alpenreise*, in twelve cantos, and written in hexameters, which greatly increased his reputation. It contains single passages of great beauty. B. possessed no lyrical talent, in spite of his warm-hearted and enthusiastic character. Only a very few of his songs exhibit that simplicity and tenderness which are the essential requisites of song-writing; and, besides, they are almost all destitute of originality. Klopstock was the model whom he had in view in the composition of his odes; but he was far from reaching the level of his master. The sphere in which he shone most conspicuously was the serio-comic. His 'humorous epic' (as he called it) of *Adam and Eve*, published shortly after his death, is a singular mixture of humour, pathos, levity, and earnestness. He left in manuscript a poem of a similar character on the subject of Faust. His *Poetical Works in the German Language* (Leip. 1836, 5 vols.) have been published by his son, who has prefixed to them an excellent biography.

BAGLIVI, GEORGE, a celebrated Italian physician, born at Ragusa in September 1669. The incidents of his life are almost entirely confined to his professional career. Originally descended from an Armenian family, he took the name of his adoptive father, who was a wealthy physician of Lucca, and who bestowed on him an excellent education. He studied at Salerno, Padua, and Bologna, and afterwards visited the principal hospitals of Italy. In 1692 he went to Rome, where he enjoyed the anatomical prelections of his friend Malpighi. Shortly after, he was appointed professor of anatomy at the college of La Sapienza, Rome, where he died in

1706. His great discovery in medical science is the system of 'solidism,' as it is called. Previous to the time of B., physicians had held the doctrine of Hippocrates in reference to the primary seat of diseases—viz., that it is in the fluids. B. came to the conclusion that this was erroneous, and that the real seat of disease is in the solids. His reasons are, on the whole, sound, and the doctrine is now all but universally prevalent, though it is admitted that cases do occur in which the fluids appear to have been first affected. He published several treatises of great merit, in which his then novel views were explained. B. was very honest and independent in his judgment, and used to warn his profession against a blind adherence to mere dogmas on matters which were but imperfectly known.

BAGNARA, a seaport town of Naples on the Gulf of Gioja, 16 miles N.E. of Reggio. Excellent wine is produced in the neighbourhood. Pop. 5718.

BAGNÈRES, the name of two towns in the Pyrenees, France, both well known as watering-places.—**B. DE BIGORRE** on the Adour, in the department of the High Pyrenees, is situated at the base of Montalivet, and at the entrance to the romantic valley of Campan. Besides its extensive bathing-houses, it has a college, a theatre, a Pyrenean museum, a trades-hall, and contains 6659 inhabitants. By the Romans, it was known as *Ficus Aquensis*, or *Aqua Bigerronum*. It was destroyed by the Goths, but the fame of its waters survived, and is now so great that it is visited by 5000 or 6000 strangers yearly. The tepid, warm, and hot saline springs are numerous, and are recommended for cutaneous and nervous diseases. Woollens, linens, and *barèges* are manufactured here.—**B. DE LUCHON**—the *Aque Convenarum* of the Romans—is situated in the department of Upper Garonne, and in a pleasant valley watered by the Pique. Its cold, tepid, and hot sulphurous waters are recommended in rheumatism, gout, cutaneous diseases, and paralysis. It has a pop. of 2690.

BAGNES, the convict-prisons of France. In ancient times, the severest punishment, next to death, was that of the galleys (q. v.). In 1748, these were abolished, and the convicts were employed in hard labour in arsenals and other public works; and the prisons in which they were lodged were called *bagnes*, from the Italian *bagno*, literally, a bath—a name supposed to have originated in the fact, that the slave-prisons at Constantinople contained baths, or because they stood near the baths of the seraglio. The Constituent Assembly of 1791 and 1792 mitigated the sufferings of convicts, and substituted for the detested name *galères*, that of *travaux publics*, to which succeeded the *travaux forcés* of the Code Napoleon. The practice of branding criminals with a hot iron was not abolished till 1832. The existing institutions of this class are at Toulon, Brest, and Rochefort, at which the number of convicts, in 1850, was respectively 3873, 2331, and 986. In these establishments, the labour of the convicts is turned to profitable account, and the various handicrafts are taught in the prison under the direction of overseers. The industrious and clever are enabled to earn small wages, and good behaviour is rewarded with a gradual relaxation of restraint. Formerly the punishment of the galleys was inflicted for comparatively slight offences, such as removing landmarks, begging, poaching, &c., but now hard labour in the B. is reserved exclusively for such as commit crimes which seriously menace the public peace and personal safety. The number of these, however, is not less than 51. Of 7689 convicts (*forçats*) in 1850, 3070 were condemned to 5—10

years; 2239 to 11—20 years; 282 to 30—30; 41 to 30—40; 23 to 40—50; 9 to above 50; and 1965 for life. The principal crime was theft, for which 4750 had been condemned; for murder, 1027. The greater proportion of the criminals, viz. 4595, were from the rural districts; from towns, 2452; foreigners, 643; most of them were of the age between 20 and 40; and 3902 were unable to read or write. The most numerous class were husbandmen, threshers, gardeners, 1278; next, day-labourers, and *terrassiers* (navvies?) 1078. The number of pardons to convicts in 1848 was 90; in 1849, 52. In 1852 the imperial government decreed the suppression of the B., and substituted in their place deportation to Guiana. But in case any of the prisoners then in the B. might have considered deportation a greater punishment than what they were condemned to, it was resolved to give them the choice of remaining in prison or of being transported: 3000 chose transportation.

BAGNES-LE-CHABLE, a parish and village in the canton of Valais, Switzerland, on the left bank of the Dranse. The parish occupies the whole valley of the Bagne. Pop. 9000. The valley was twice inundated during the 16th c.; again in 1818, when 400 cottages were swept away, and 34 lives lost.

BA'GPIPE, a wind instrument, which, up to the 18th c., was common in almost every country in Europe, and still continues in use among the country people in Poland, Italy, Sicily, the south of France, Scotland, &c.; but being far from a sweet-toned instrument, and limited in its range of notes, it has fallen into disuse wherever there is any pretension to musical refinement. It consists of a leathern bag, which the player inflates by blowing with his mouth through a tube. The music proceeds from three or four pipes, whose mouth-pieces are inserted into the bag; the wind being forced out by pressing the bag under the arm. One of the pipes, the *chanter*, is a kind of oboe with eight holes, and is similarly handled; the others, called *drones*, sound each only one continuous low note. It is certain that the bagpipe was in use among the Hebrews and Greeks, and there are plenty of proofs that in Germany and elsewhere in Europe it was among the most favourite instruments in the 15th c.

Though fallen generally into disuse, the B. is still a popular instrument in the Highlands of Scotland, and wherever there are gatherings of Highlanders, and even of Lowland Scotch, in England and other countries. Pipers in proper costume are also attached to the Highland regiments, and in some instances pipers are retained by Scottish noblemen to play on festive occasions. Skill in playing the B. is promoted by various Highland societies, which, at periodical competitions, give prizes to the best players of *piibrochs* (q. v.), reels, and other airs.

BAGRATON, PETER, PRINCE, a distinguished Russian general, descended from the noble family of the Bagradites of Georgia and Armenia, was born in 1756. He entered the Russian service in 1783, and was trained under Suwarow. In 1788 he was engaged at the storming of Oczakow; fought in 1792 and 1794 against the Poles; in 1799, in Italy and Switzerland; and distinguished himself in the Austro-Russian war of 1805 against the French, especially in the sanguinary engagement of November 16 of that year, when, with a small body of troops, he bravely stood during six hours opposed to the superior forces under Murat, and thus enabled the Russian general, Kutusow, to reach Znaym with the main army. Subsequently, Prince B. was engaged in the battles of Austerlitz, Eylau, and

Friedland, and took a part in the Russian campaign against the Turks, especially in the battle of Silistria, 1809. In the campaign of 1812, he commanded the second Russian army of the west, and had the misfortune to fail in his attack on Davoust near Mohilew; but succeeded in forming a junction with the west army at Smolensk. He was, however, mortally wounded in the battle of Mosaïsk, and died October 7, 1812.

BAGSHOT BEDS, the lowest series of strata in the Middle Eocene formation of Britain. The name is derived from Bagshot Heath in Surrey, where they were first examined; but, as they are more fully developed and better seen in the Isle of Wight, the rocks there are now considered the typical representatives of the series. The strata are arranged into four groups: 1. The *Upper E. B.*, composed of yellow and white sands with ferruginous stains, generally unfossiliferous, though a remarkable exception exists at Whitecliff Bay, Isle of Wight, where a bed contains a large number of very friable shells. 2. The *Barton beds*, consisting of coloured clays interstratified with sand and loam. They are rich in fossils, chiefly the shells of mollusca, but contain also the remains of a fish and several reptiles. Here, too, the *Nummulite* (q. v.), so characteristic of the Tertiary formations, makes its first appearance in a descending order. This genus dies out with the *Nummulites variolaris*, the small species found in these beds. 3. The *Bracklesham beds*, so called from their extensive development at Bracklesham Bay, near Chichester in Sussex, are composed of marly clays and white sands, capped by a bed of flint-pebble conglomerate, and resting on dark carbonaceous clays. This is the most highly fossiliferous group in the series. Two species of plants have been noticed. The remains of 6 reptiles and 21 fishes have been described, besides a long list of mollusca, amongst which is the magnificent *Cerithium* (q. v.) *giganteum*, so conspicuous in the *Calcaire grossier* of Paris, where it is sometimes two feet in length. The prevalence of genera now only known as inhabitants of tropical or sub-tropical seas, such as volutes and cowries, together with their companion limulites and corals, makes it highly probable that a warm climate prevailed during the deposition of these strata. 4. The *Lower E. B.*, consisting of alternations of variously coloured sands with gray, chocolate-coloured, or white pipe-clays. The white clays contain the only fossil organisms found in this group—beautifully preserved leaves spread out in the layers of the clay.

The series rests on the true London clay. Its maximum thickness is about 1200 feet.

BAGGUL, or **BHAGUL**, a small state in North-west India, on the south or left bank of the Sutlej. It contains about 100 square miles, and 40,000 inhabitants, yielding the high average of 400 inhabitants to a square mile. Its lat. is about 31° N., and long. 77° E. The surface is generally mountainous, presenting two summits, Bahadurgarh and Bara Devi, respectively 6233 and 7003 feet above the sea-level. With a revenue of about £5000, B. has nearly 3000 men under arms.

BAHAMAS, or **LUCAYOS**, a chain of islands stretching in a north-west direction from the neighbourhood of the north coast of Hayti to that of the east coast of Florida. From Florida they are separated by the channel through which flows the Gulf Stream (q. v.); and from Cuba, by the Old Bahama Channel. These are the principal passages between the open ocean and the Gulf of Mexico. The chain extends in N. lat. from 20° 55' to 27° 31', and in W. long. from 72° 40' to 79° 5', having an entire

length from north-west to south-east of about 550 miles; and it rests mainly on two shoals—the Great Bank to the south, and the Little Bank to the north. The islands are perhaps 500 in number. To take no account of coral rocks, or of sandy shelves, the chief members of the group, if reckoned from the north-west, are these: Great Bahama; Abaco; Eleuthera; New Providence; Andros; Guanahani or Cat Island; San Salvador; Watling's Island; Exuma; Long Island; Crooked Islands; Mariouana; Inagua; Little Inagua; Caicos; Turk's Island.

The estimated area is 3521 square miles; and, in 1851, the population was officially stated to be 27,519—5199 white persons, and 22,020 coloured. The islands generally are of reef-like shape, long, narrow, and low—so much so, that in some of the smaller islands crops are frequently damaged by the spray of the sea. With very little appearance of soil, they derive considerable fertility from the tendency of the porous rock to retain moisture. Besides excellent pasturage, they yield Guinea corn, maize, cotton, pine-apples, lemons, oranges, pimento, and a species of cinnamon. In the larger islands, too, there is excellent timber, both for ship-building and for cabinet-work. Some of the more southerly links of the chain depend chiefly on their salt-pans. During the summer, the temperature ranges from 73 to 93° F.; but in the winter the climate is so delightfully temperate, as to be generally prescribed in the United States for pulmonary complaints. The annual fall of rain is from 43 to 45 inches, being heaviest in October, November, and December, but pretty equally distributed over the other months. Hurricanes are not unknown, for three severe ones have been recorded within the last sixty years.

The B. were Columbus's earliest discovery. But the precise spot of his first landing has not been ascertained. Guanahani or Cat Island has generally been believed to be the San Salvador of Columbus; but recent investigations appear to have transferred the honour to Watling's Island, situated a little further to the east. The B. having been depopulated, but not again colonised, by the Spaniards, were occupied by the English in 1629—to whom, after various vicissitudes of fortune in the wars with Spain and France, they were ultimately secured by the treaty of 1783. Nassau, in New Providence, is the seat of government. Politically, however, the group has been recently subdivided. The more southerly islands, particularly Turk's Island and the Caicos, have, at their own solicitation, been separated from the B., and erected into a dependency of Jamaica.

BAHAR, a district in the presidency of Bengal, so called from a town of the same name. It extends in N. lat. from 21° 12' to 25° 22', and in E. long. from 83° 25' to 86° 6'. It contains 5694 square miles, and 2,500,000 inhabitants, yielding an average of 439 inhabitants to a square mile. It is bounded on the N. by Patna; on the E. and N. E., by Monghir; on the S., by Ramghur and Palamow; on the W., by Mirzapore; and on the N. E., by Shahabad. Its towns are: Gayah, the chief place; Bahar, now in ruins; Shergotty, Dandnagar, Urwal, Juhannabad, Aurungabad, Rajagriha, and Holasganj. The roads, in general, are said to be worse than those of almost any country professing to be civilised; but roads and bridges can neither be well made nor thoroughly repaired, where, during nearly half the year, the surface of the country is inundated, and torn by innumerable torrents. In the dry season, the beds of the rivers present only detached pools. Among the minerals, the most important are coal and mica. The latter, nearly as pellucid as glass, is sometimes found in blocks, yielding plates of 36 inches by 18. Potatoes, cabbages, cauliflower, lentures,

turnips, &c., have been introduced from Europe, and succeed well. Of indigenous productions, the most considerable are rice, pulse, sugar, cotton, indigo, and tobacco. The district is largely engaged in the manufacturing of muslins, silks, carpets, blankets, tents, tapes, threads, ropes, paper, glass, cutlery, jewellery, leather, ink, soap, and pottery. Ardent spirits, too, are extensively distilled from the flowers of the *Bassia latifolia* (q. v.). Before the days even of Moslem domination, B. appears to have been the centre of a Hindu empire, which native accounts describe as of matchless splendour, and of fabulous duration.

BAHIA, capital of the Brazilian province of the same name. It is otherwise called San Salvador—the more usual term being taken from *Bahia de Todos-os-Santos*, or *Bay of All Saints*, on which it is situated, in lat. 13° 1' S., and long. 38° 32' W. B. contains about 125,000 inhabitants, pretty equally divided between whites, blacks, and mulattoes. The number of vessels entering the port of B. in 1858 was 1084, with a tonnage of 229,478, while the number clearing out was 999, with a tonnage of 226,158. The shipping trade for the last two or three years has been on the decline. The value of imports for home consumption into B., in 1857, was £2,325,152; and the value of exports in the same year, £1,984,819. The chief exports of B. are sugar, cotton, coffee, tobacco, rice, rum, dye-stuffs, fancy woods, cocoa-nuts, horns, hides, and bullion; and it imports manufactured goods, provisions, flour, salt, iron, glass, and wines. B. is the oldest city in Brazil, having been founded by the first captain-general of the country, and was for a long time the capital of the whole colony.

BAHIA, a province of Brazil, about the middle of the coast, taking its name from its chief city. It extends in S. lat. from 10° to 16°, and in W. long. from 37° to 44°. Its length is 480 miles; and its breadth about half as much. Its population in 1856 was 1,100,000. In addition to the usual productions of the tropical regions, it yields salt and Brazil-wood. The interior contains lofty sierras; but the maritime districts are fertile, being well watered by the Itapicuru, Contas, and other rivers. Besides the streams that flow through B., the San Francisco, a vastly larger river, forms about half of the inland boundary, dividing this province from that of Pernambuco.

BAHIA HO'NDA, a harbour on the north coast of Cuba, 60 miles west-south-west of Havana, protected by a fort, and much resorted to by privateers and slavers.

BAHNA'SA, or **BEHNE'SEH**, a town of Central Egypt, on the Bahr Yousef (Joseph's Canal). It is noteworthy as the site of the ancient *Oxyrynchus*, celebrated for its numerous monasteries, the ruins of which are still to be seen.

BAHR, an Arabic word signifying a large body of water, is applied both to lakes and rivers.—**BAHR-EL-ABIAD** (the White River), and **BAHR-EL-AZRAK** (the Blue River), are the chief branches of the Nile (q. v.).—**BAHR-ASSAL** is Lake Assal (q. v.).—**BAHR-BELA-MA** (the Sea without Water), a long, deep valley in the desert, west from Cairo. It is completely barren, but has the appearance of having been once a water-course.

BAHR, **JOH. CHRISTIAN FELIX**, an eminent German philologist and critic, was born, 1798, at Darmstadt. He was educated at the Heidelberg gymnasium and university, where he gained the favour and friendship of Creuzer, whose symbolic system of interpretation in mythological matters he himself pursued at a later period. He was elected

a professor in 1826. Previous to this, he had occupied himself chiefly with the elucidation and criticism of Pflutarch, the result of which was an annotated edition of *Alcibiades* (Heil. 1822), and of *Philopœmen*, *Flaminius*, *Pyrrhus* (Leip. 1826). At the same time, he collected and published the fragments of Ctesias. But a greater interest was excited by his *History of Roman Literature* (1828), which is noted for its clearness and comprehensiveness. Three supplements to this work have also appeared: *The Christian Poets and Historians of Rome* (1835), *The Christian-Roman Theology* (1837), and *The History of Roman Literature in the Carolingian Period* (1840). One of his most important works is his version of Herodotus (1832—1835). In 1835, he published his *De Universitate Constantinopoli Quinto Sæculo Condita*. He has likewise contributed numerous articles to Jahn's *Jahrbücher für Philologie*, and other works.

BAHRDT, **KARL FRIEDRICH**, a German theologian of the extreme sceptical school, was born, 1741, at Bischofswerda, in Saxony, and studied at Leipsic, where he soon displayed extraordinary talents, and some restlessness of disposition. His early theological writings betrayed the sceptical tendencies which were afterwards more fully developed. On account of his immoral conduct, however, he was, in 1768, compelled to leave Leipsic, where he had been a popular preacher. In Erfurt, his next residence, he was appointed professor of Philosophy and Hebrew Antiquities, and wrote *Letters on a Systematic Theology*, and *Aspirations of a Mute Patriot*, two works whose heterodoxy involved him in controversies, and made his position untenable. In 1771, he went to Giessen, where he delivered theological lectures, and preached with approbation. His translation of the New Testament was regarded as so dangerous, that the author was deprived of the privilege of teaching. His creed, in fact, was simple Deism, and one of the chief points in his theology was his rejection of miracles. Even the immortality of the soul was not positively maintained in his works. Ultimately, after attempting to establish various institutions, he was reduced to the position of a tavern-keeper; and as he still persevered in his attacks on orthodoxy, he was imprisoned for one year at Magdeburg, where he wrote an autobiography. Among his others works are—*The Religious Edict* (a satire on the Prussian religious edict of 1788), and *The German Union*. He died at Halle, April 23, 1792.

BAHREIN ISLANDS, or **AVÁL ISLANDS**, a group of islands lying in the Persian Gulf. The most important of these is Bahrein, or Avál, about 27 miles long, and 10 broad. It is hilly in the centre, but the soil generally is fertile, and produces dates, figs, and other eastern fruit, besides wheat and barley. Bahrein is badly cultivated. Spring-water is plentiful in the interior, but on the coast it can only be procured from the bottom of the sea, where it springs up quite fresh, and is brought up by divers in skins. Manama, the capital, in lat. 26° 12' N., and long. 50° 39' E., has a good harbour on the north, but a safer though smaller one on the south. The B. I. are chiefly remarkable for their pearl-fisheries, which were known in ancient times, and which employ, during the season, from 2000 to 3000 boats, each manned with from 8 to 20 men. The annual value of the pearls is estimated at from £200,000 to £300,000. Tortoise-shell, shark-fins, and dates are also articles of export. The islands, which have been subject to a good many political changes, are now inhabited by Arabs. Pop. 60,000.

BAÏE, a small town of antiquity, on the coast of Campania, 10 miles west of Naples, where the

present castle of Baja stands. When the Roman empire was in its greatest splendour, the beauty of its situation, the fineness of the surrounding scenery, and the excellence of its mineral springs, made B. such a favourite resort of the Roman nobles, that for want of space for their baths and villas they encroached on the sea. Julius Cæsar, Piso, Pompey, Marius, Julia Mammæa, and others, had country-houses at Baïæ. Horace preferred B. to all other places in the world. Seneca warned every one who desired to maintain dominion over his passions, to avoid this watering-place. Cicero thought it necessary to excuse himself for undertaking the defence of Marcus Cælius, a man who had often visited B., for B. was considered by the stricter moralists of those times as the abode of voluptuousness and luxury, and a den of vice. The ruins, still standing on the desolate coast, or rising from the sea, are now the only evidence of the former magnificence of B., whose population, dwelling in mean hovels, only amounts to 800. The ruins of three supposed temples—one of Venus, one of Mercury, and one of Diana Lucifera—as well as the remains of a few *thermæ*, or warm baths, still attract the attention of archaeologists. The harbour, one of the largest belonging to the Romans, is now much destroyed. The surrounding country is covered with the ruins of Roman villas, sepulchral monuments, and other buildings.

BAIKAL (in Turkish, Bei-kul, i. e., Rich Lake) is, after the Caspian Sea and the Sea of Aral, the largest lake of Asia. It is a fresh-water lake, and is situated in the south of Siberia, in the gov. of Irkutsk, near the great military road between Moscow, Kiachta, and the mines of Nertschinsk. Lat. 51° 20' to 55° 30' N., long. 103° to 110° E. It somewhat resembles a sickle in shape, and varies considerably in breadth. Between the mouths of the Selenga and the Buguldeicha, it is only 19 miles across. Its length is about 400 miles, and its average breadth 45 miles; the estimated area, 14,000 square miles. The Baikal Mountains, a spur of the Altai, enclose the lake, which is fed by numerous streams, the chief of which are the Selenga and Bargusin. Its outlet is by the Lower Angara, a chief tributary of the Yenisei; but the river is inconsiderable in size compared with those which flow into the lake. It has several islands, the largest of which, Olkon, has a length of 30 miles. B., which forms an important link in the chain of communication between Russia and China, has two commercial ports, and of recent years, steam-boats have given a considerable impetus to its trade. Its sturgeon and seal fisheries are valuable, and large quantities of a fish resembling a herring are also caught in it. A peculiar fish, called the golomyinka (*Callionymus Baicalensis*), which is almost one mass of fat, yielding beautiful train-oil, was at one time caught in immense numbers, but it is now much scarcer. The surface of the lake is frozen from November to April, but the traffic is carried on over the ice. Besides the Russians settled on the banks of the Selenga and Angara, the shores of Lake B. are also inhabited by tribes of the Burates and Tunguses.

BAIL is a technical term in the practice of the law both in England and Scotland, with this difference, that, in England, it is used both in civil and criminal procedure, whereas in Scotland it is applied exclusively to the latter. By B. is understood the security given by sufficient sureties for the appearance in court on a day, and at a place certain, of a person arrested or imprisoned, and who, in consequence of such security or B., is in the meantime set at liberty. Such security, however, involves

the assumption of the custody of the arrested or imprisoned party by his B., the meaning of the rule being that the party arrested or imprisoned is delivered into the hands of those who bind themselves for his forthcoming, in order that he may be protected from prison until he has to make his personal appearance; and, in this sense, it differed from the old term, *mainprize*, now obsolete, and which signified a mere security without any other or corresponding guarantee, as in the case of bail. A technical and necessary distinction is taken in law-books between what is called *common B.*, or *B. to render to prison*, and *special B.*, or *B. to the action*; but for general information, the following statement of the law may suffice.

In civil process, the sureties give their bail-bond to the sheriff himself for the appearance of the defendant, according to the exigency of the case, and for nothing else. It does not appear that any particular or limited number of sureties is to be taken; but it would seem that the sheriff cannot insist on more than two, provided they have both sufficient property within the county to answer the penalty; but if more than two be tendered, it is not necessary that each should be worth the full amount. On the other hand, the bail-bond will be good though there be only one surety; but in accepting such security it would seem that the sheriff does so at his own risk. If there is reasonable ground for believing the sureties to be sufficient, the sheriff has no discretion, but is bound to accept the B.; and if he refuses to do so, he is liable to an action.

The necessity of B., however, may be avoided by the defendant availing himself of the provisions of the 43 Geo. III. c. 46, extended by the 7 and 8 Geo. IV. c. 71, by which it is enacted that the arrested or imprisoned party may obtain his immediate discharge by depositing with the sheriff the sum demanded by the plaintiff, together with £10 towards the costs, the same to remain in court to abide the event of the suit. The 7 and 8 Geo. IV., however, contains a proviso that it shall be lawful for a defendant who has made such deposit in payment, at any time in the progress of the cause, before issue joined, or final or interlocutory judgment, to receive out of court the sum so deposited and paid, upon putting in and perfecting special B., and paying such costs as the court shall direct; and, by another enactment of the same statute, provision is made for the case where a defendant who has put in B., afterwards elects to deposit the plaintiff's demand, and to pay the costs to abide the event of the action.

As to those who may or may not be B., it would appear, from the nature of the security undertaken, that persons privileged from arrest cannot be B., because the engagement on the part of the B. being, in default of the principal party, to pay the debt or damages and costs, the plaintiff is entitled to require the security of persons who are amenable to the ordinary process of the courts. Therefore, peers, members of parliament, ambassadors, and other privileged persons, cannot become bail; nor, generally, can attorneys or those employed in executing the process. But persons who are not in such a position, but who are either housekeepers or freeholders, may be taken as bail. The possession of *leasehold* property is not enough, unless the party is also a housekeeper; but the real owner of a *freehold* estate, however small it may be, situated within the jurisdiction of the court, and provided he can otherwise make up the amount required, is qualified, though he be only a lodger, or merely an occupant by sufferance in the house of another. Again, to constitute a 'housekeeper,' within the meaning of

the rule, the house must be within the jurisdiction of the court, and such a party must be the *bond-fide* tenant of the house in his own right, enjoying its benefits, and bearing its burdens. A person, therefore, in lodgings in England, but with a house in Scotland, is not admissible as B.; and such B. must strictly in this sense be a *housekeeper*, for 'householder' seems not to be sufficient. See Lush's *Practice* by Stephen.

Besides these arrangements of the common law with regard to B., we may mention two other forms of it—namely, B. *in Error*, and B. *in Attachment*. The former is regulated by the Common Law Procedure Act (1852), 15 and 16 Vict. c. 76, by section 151 of which it is provided that proceedings in error shall not stay or delay execution on a judgment, unless the person alleging or pleading such error shall be bound, along with two sufficient sureties, in double the sum recovered by the judgment, in order to prosecute the proceedings in error with effect, and make payment of the costs, in the event of the judgment being affirmed, or the proceedings in error being discontinued. B. in attachment, again, signifies the sureties required for a party arrested upon a writ of attachment, and brought up before a judge in order to obtain his discharge from custody, the sureties undertaking that he shall appear and answer such interrogatories as may be required of him. This, however, only applies to attachment in the case of *contempt* of court; for it would appear that an attachment for the non-payment of money, or the non-performance of an award, is not bailable. In the Court of Chancery, also, there are rules for accepting B.; as, for instance, for a defendant against whom attachment has issued for his contempt in not making appearance to the plaintiff's suit; but an attachment for non-performance of a decree in Chancery is not a bailable process.

In criminal procedure, the subject of B. is at present regulated by the 11 and 12 Vict. c. 42, which provides that if the justice or justices, before whom a prisoner is brought, shall be of opinion that the evidence against the prisoner be sufficient, or even if it raise a strong or probable presumption of his guilt, they shall either commit him to prison, or admit him to B.—that is, allow him to be discharged on entering into a recognizance—with some sufficient surety or sureties—to appear and surrender himself to custody, to take his trial on such indictment as may be found against him, in respect of the charge in question, at the next assizes or sessions of the peace. The crime of treason, however, is not a bailable offence, except by order of a Secretary of State, or by the Court of Queen's Bench, or by a Judge thereof in vacation. But Justices are bound to admit to B. in all cases of misdemeanour, excepting in the case of a misdemeanour in receiving property stolen or obtained by false pretences, or in the case of any misdemeanour for the prosecution of which the costs may be allowed out of the county rate, as to all which misdemeanours, as well as in all felonies—treason excepted—justices and magistrates have a discretionary power either to admit to B. or to commit to prison. The Court of Queen's Bench exercises a paramount jurisdiction and control over this department of criminal practice; but it is not usual for that court or for justices or magistrates to admit to B. in any case of felony, except under circumstances of a special and favourable kind.

In Scotland, the term B., as we have mentioned, is only used in the proceedings in the criminal courts; and there the general distinction is taken between offences that are capital and not capital, the former not being bailable except by order of the High Court of Justiciary, who exercise a power in

this respect analogous to the jurisdiction of the Court of Queen's Bench; offences that are not capital being bailable by magistrates, sheriffs, or other competent judges. In the *civil* process of the Scotch courts, the term corresponding to B. is CAUTION (q. v.).

BAIL COURT is the name given to a new and supplementary tribunal at Westminster, called into existence by the 11 Geo. IV. and 1 Will. IV. c. 70, by which, after providing for the appointment of an additional puisne judge in each of the three courts of common law, it is made lawful for any one of the judges of either of these courts, when occasion shall so require, where the other judges of the same court are sitting in banc (see BANC), to sit apart from them for the business of adding and justifying special bail, discharging insolvent debtors, administering oaths, receiving declarations required by statute, hearing and deciding upon matters in motion, and making rules and orders in causes and business depending in the court to which such judge shall belong, in the same manner and with the same force and validity as may be done by the court sitting in banc.

This statute has been hitherto acted on only by the Court of Queen's Bench, wherein one of the judges sits from time to time in the B. C. for the purposes above specified. It may be remarked that a rule of the B. C. cannot be reopened in the full court after the term in which it is made, even though the judge who pronounced it sanctions the application; and a judge sitting apart, under the authority of the statute, has equal authority with the full court to reverse the decision of a judge sitting at chambers. See Lush's *Practice* by Stephen.

BAILEE'. See BAILMENT.

BAILEY, derived through the French *baille*, from the middle age Latin *BALLIUM*, which is a corruption of the Lat. *vallum*, a rampart. The B. was the whole space enclosed within the external walls of a castle, with the exception of that covered by the keep. This space was variously disposed of, and, of course, differed greatly in extent. Sometimes it consisted of several courts, which were divided from each other by embattled walls, so as to form a series of fortifications. When these courts were two in number, they were known as the outer and inner bailey. The entrance to the B. was generally by a drawbridge over the ditch, and through a strong machicolated and embattled gate. The B. was often of great extent, containing the barracks for the soldiers, lodgings for workmen and artificers, magazines, wells, chapels, and sometimes even a monastery. In towns, the B. had even a wider significance, and was often retained after the castle or keep had long disappeared, as in the case of the Old B. in London, and the B. in Oxford.

BAILEY, PHILIP JAMES, a distinguished living poet, was born at Basford, in the county of Nottingham, in the year 1816. His early education was conducted in his native town, and afterwards he became a student at the university of Glasgow. He was called to the English bar in 1840, but never practised. The first edition of *Festus*, the poem by which he is best known, was published in 1839, and has in subsequent editions received a large amount of new matter. It attracted considerable notice in England, and was in America assailed by a perfect tornado of applause. While the enthusiasm lasted, Mr B. was in certain quarters mentioned in the same breath with Shakspeare, Milton, and Goethe. This injudicious admiration was, however, certain to cool down, and to prove more prejudicial to the real interests of the author than unmerited

censure itself; consequently, in literary journals, *Festus* is frequently mentioned with a contempt which it is far from deserving. It is a wonderful work, when the age of the author at the period of its production is taken into account. It was commenced before the author had reached his 20th year, and completed in three years. *Festus* errs from excess of boldness. Mr B. speaks of universes as other poets speak of butter-cups. He has the *entrée* to the highest heaven and to the regions of penal fire. He is on terms of perfect familiarity with Eternity. He lays his scenes in the 'Centre,' 'Elsewhere,' 'Everywhere,' 'Nowhere.' Despite its extravagance, *Festus* is full of poetical thought and felicitous expression, and has occasional dashes of grim humour in it, not unworthy of Goethe's mocking fiend himself. The faults of the poem are as great as the beauties; there is no congruity or proportion in it, and you lay it down with a sense of admiration qualified with disgust. In 1850, Mr B. published the *Angel World*, which possesses all the faults and all the beauties of the former work on a reduced scale. If the reader's admiration is less, his disgust is less. The *Angel World* is now incorporated with the larger work. Mr B.'s subsequent writings have been the *Mystic*, and the *Age*, a colloquial satire. The first production is in the writer's early style, with all the beauties deleted. The second is an attempt in a new field. But whatever measure of success may attend Mr B. in 'Elsewhere' and 'Nowhere,' complete failure awaits him when he deals with mankind and the ordinary affairs and follies of earth.

BAILIE, a Scotch term, with several legal applications. It chiefly, however, and popularly, signifies a superior officer or magistrate of a municipal corporation in Scotland, with judicial authority within the city or burgh. In royal burghs, the office is in some respects analogous to that of Alderman in England. The chief magistrate of a Scotch corporation, called the *Provost* (q. v.), and often one or more of the bailies, are, in virtue of their office, in the commission of the peace; and by the 6 Geo. IV. c. 22, bailies are exempted from serving on juries. There are also *Bailies of Regality* and *Barony*, who are appointed by the *Superior* or *over-lord* of the manor (q. v.), with limited powers fixed by the 20 Geo. II. c. 43. There is a B. for the Sanctuary or Abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper, and having jurisdiction within the precincts. See ABBEY, SANCTUARY. The word B. was also formerly a term in the practice of Scotch conveyancing, and signified an officer who represented the seller, and who, as such, gave *seisin* or *sasine* (q. v.), or delivery of the lands sold to the buyer or his attorney; but by the changes and simplifications effected by recent legislation, the office of B. in this sense may be said to be virtually abolished; indeed, by the 21 and 22 Vict. c. 76, s. 1, called *The Titles to Land Act*, *seisin* itself, as a separate and independent documentary title, is declared to be unnecessary, and registration of the conveyance of the estate held to be sufficient.

BAILIFF in English, BAILIE in Scotch, BAILLI in French, and BALIO in Ital., are terms having a common origin—namely, the middle Latin *ballivus*, which is again connected with the older form, *bagalus*, or *bajulus*. Through all the changes of application they have undergone in the course of history, they have continued to agree in denoting an overseer of some kind—an officer exercising superintendence on behalf of some superior authority. At the Greek imperial court in Constantinople, the chief tutor of the imperial children was called *Bajulos*.

The same title seems also to have been given in Constantinople to the superintendent of the foreign merchants, who was appointed by the Venetians, and it may possibly be for this reason that the title *Balio* came at length to be applied also to the Venetian ambassadors themselves. The title *Ballivus* was introduced by the Knights of St John into the south and west of Europe, as the eight members of their chapter were called *Ballivi convenuales*, whence also the name *Ballei*, given to the circles into which the possessions of the order were divided. In France, the royal *Baillis* were at one time commanders of the troops, administrators of the royal domains, and judges each in his district. In later times, the royal *Baillis* were deprived of the two latter offices, and were consequently then called *Baillis d'Épée* only. Proprietors of estates, also, possessing supreme jurisdiction, appointed *Baillis* to superintend these courts of justice. As very little knowledge was required for these situations, and as they might be purchased, they were held in little estimation; and in later times, the *Baillis* became standing characters on the stage, held up to ridicule on account of their ignorance and their absurd pretensions, as well as for cheating and injustice. In England, the name B. was introduced in the reign of William I., to designate the superintendents of counties, which were called *Ballivæ*.

BAILIFF, in English law, is a legal officer, and may be described as the keeper, protector, or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs put in force arresting process, and they perform other duties within the county or bailiwick required of them by the sheriff, who is their immediate official superior. In this sense bailiffs are either *bailiffs of hundreds*, or *bound bailiffs*. The duty of the former is to collect fines, summon juries, attend the judges and justices at the assizes and quarter-sessions, and execute writs and processes in the several hundreds. *Bound* bailiffs, again, are officers usually joined by the sheriffs with the bailiffs of hundreds, and employed on account of their adroitness and dexterity. They are called bound bailiffs, because the sheriff, being civilly responsible for their official misdemeanours, they are annually bound in an obligation, with sureties, for the due execution of their office. There are also *special bailiffs*, who are officers appointed by the sheriff on the application of the party suing out the process to be executed; and whenever a party thus chooses his own officers, he is considered to discharge the sheriff from all responsibility for what is done by him. There is, besides, another exceptional class of bailiffs, called bailiffs of *liberties*, honours, manors, and other lordships and franchises, whose appointments, duties, and responsibilities are regulated by the 7 Vict. c. 19. The county courts likewise have bailiffs for the execution of their process, as to whom see 9 and 10 Vict. c. 95, 12 and 13 Vict. c. 101, 13 and 14 Vict. c. 61, and 19 and 20 Vict. c. 108.

The sheriff himself is the *Queen's B.*, and, as such, it is his business to preserve the rights of the Crown within his bailiwick. He must seize to the sovereign's use all lands devolved to the Crown by attainder or escheat; must levy all fines and forfeitures; and must seize and keep all waifs (q. v.), wrecks, estrays (q. v.), and the like, unless they be granted to some subject.

BAILIFF, HIGH. See HIGH BAILIFF.

BAILIWICK legally means the county or district within which the sheriff's bailiffs may execute their office. Blackstone says that this word was introduced by the princes of the Norman line in

imitation of the French, whose territory was divided into bailiwicks, as that of England into counties.

BAILLEUL, a town of France, department of the Nord, with manufactures of woollens, cottons, lace, hats, beet-root, sugar, &c.—the cheese of its neighbourhood being also celebrated. Pop. in 1836, 5913.

BAILLIE, **JOANNA**, a modern poetess of distinguished merit, was born in 1762 at Bothwell, in Lanarkshire, Scotland. Her father was a Presbyterian clergyman. She received a superior education, and soon began to manifest those talents which subsequently excited the admiration of the public. Her career was a singularly happy one, but devoid of all striking incident. At an early period, she went to reside in London, where her brother, Matthew Baillie, had established himself as a physician. Here she remained till her death, which occurred on the 23d of February 1851, when she had attained the venerable age of eighty-nine. No authoress ever enjoyed a larger share of the esteem and affection of her literary contemporaries. All vied in shewing her a courteous respect, and even America sent its votaries to her little shrine at Hampstead. Her greatest achievement is undoubtedly the *Plays on the Passions*, which, though erroneous in conception, are full of noble and impressive poetry, and often characterised by intense dramatic power. The principle upon which Miss B. proceeded in the construction of these works, was to take a single passion as the subject of a play, and to exhibit its influence on an individual supposed to be actuated by nothing else. In point of fact, such persons do not exist in society; men are swayed by a variety of conflicting emotions; and even when any one of these becomes dominant, it does not wholly destroy the rest, otherwise the victim of a ruling passion would lapse into a monomaniac. The leading personages of Miss B.'s plays are, therefore, rather impersonations of certain elements of human nature, than genuine human beings. They are vivid poetical studies in psychology; not mirrors held up to nature, like the brilliant and variegated creations of Shakspeare. Still, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shown in the minute delineation of a particular passion, and where he is forced to forget the artificial theory of the authoress. The first volume of the *Plays of the Passions* appeared in 1798, and met with remarkable success. Four years afterwards, she published a second volume; in 1804, *Miscellaneous Plays*; in 1812, the third volume of her *Plays of the Passions*; and in 1836, three volumes of dramatic poetry. The most popular as well as the most powerful of her works is the tragedy of *De Montfort*. It was brought upon the stage in London, Kemble acting for eleven nights the character of the hero. Many of Miss B.'s minor pieces are very sweet, simple, and beautiful; and are marked by a sprightly grace of versification, and a playful serenity of spirit, which pleasantly remind one of the personal character of the authoress herself.

BAILLIE, **MATTHEW**, M.D., a distinguished physician and anatomist, was born on the 27th October 1761, in the Manse of Shotts, Lanarkshire, Scotland. His father was descended from the family of Baillie of Jerviswood, so noted in the history of Scotland during the reign of Charles II.; his mother was a sister of the two celebrated anatomists, William and John Hunter; and one of his sisters was Joanna Baillie, the poetess. Talent seems to have been both hereditary and abundant in the family. On account of his abilities, his father was appointed professor of divinity in the university of Glasgow, where young B. went through the

usual curriculum, and afterwards proceeded to Balliol College, Oxford, as an exhibitor on the Snell foundation. In 1780, he commenced his anatomical studies in London under the care of his uncle, and was frequently employed as demonstrator to the latter in his theatre at Great Windmill Street. His success in this capacity was so great, that on the death of Dr Hunter, in 1783, he was found qualified to become his successor. In 1784, he began to lecture, and acquired a high reputation as a vigorous and lucid expositor of the science of anatomy. In 1795, he published a small work entitled, *The Morbid Anatomy of some of the most Important Parts of the Human Body*. It made an era in medical science. In addition to the information formerly scattered through the writings of Bonnetus, Lieutaud, Montagu, and others, it contained a multitude of ingenious observations made by his uncle and himself, and greatly enhanced our knowledge of the changes produced on the human frame by disease. It had a remarkable influence on the study of medicine, and excited in a greater measure, perhaps than any other book, a spirit of careful induction among professional men. In 1799, Dr B. relinquished his anatomical lecturership, and in 1800, his appointment as physician to St George's Hospital, which he had held for thirteen years. He now devoted himself exclusively to his duties as a medical practitioner, and by his honourable assiduity succeeded in realising a large fortune. In one of his busiest years, when he had scarcely time to take a single meal, his professional income is said to have reached £10,000. In 1810, he was appointed physician to the king, and offered a baronetcy, which, however, he declined. At last, worn out with incessant labour, he died on the 23d September 1823.

BAILLIE, **ROBERT**, one of the most eminent, and perhaps the most moderate of all the Scottish Presbyterian clergy during the time of the civil war, was born at Glasgow in 1599, and educated at the university of that city. In 1622, he received episcopal ordination—episcopacy being then nominally the established religion of the country—from Archbishop Law, and was shortly after presented to the parish church of Kilwinning. At first a maintainer of the doctrine of passive obedience, he seems to have changed his opinions on this point some time during 1630—1636. In 1638, he sat in that famous General Assembly of the Kirk of Scotland which met in Glasgow to protest against episcopacy being thrust on an unwilling people, but conducted himself with greater prudence and temperance than was quite agreeable to his excited brethren. However, he soon threw himself eagerly into the national cause. In 1640, he was selected by the Scottish leaders, on account of his pamphlet against Laud's party, as a proper person to go to London, along with other commissioners, to prepare charges against Archbishop Laud, whose rash and tyrannical measures were alleged to have been the origin of the recent hostilities against the sovereign. On his return to Scotland in 1642, he was appointed joint-professor of divinity at Glasgow, along with Mr David Dickson, an equally distinguished, but less moderate divine. In 1643, he was again sent to London as a delegate to the Westminster Assembly of Divines, where he conducted himself in an unobtrusive manner, but cordially concurred in the doctrines which were drawn up. It is curious to notice, in connection with this incident of his career, that though Mr B. had himself experienced the injustice of intolerance, like almost every other theologian of his age, he vehemently disapproved the principle of toleration, and asserted the divine right of presbytery with as much emphasis as Laud did

the divine right of episcopacy. After the execution of Charles I., in 1649, B. was chosen by the church to proceed to Holland, and to invite Charles II. to accept the Covenant and crown of Scotland. Though it was not easy to deal with one of Charles's slippery character, B. is admitted to have borne himself in the matter with great prudence and dignity. After the Restoration, he was made Principal of Glasgow University. He died July 1662. His *Letters* are a valuable contribution to our knowledge of the times.

BAILLIE, ROBERT, of Jarviswood, happily described as the Scottish Sydney, was a native of Lanarkshire, and distinguished himself during the latter part of the reign of Charles II. by his bold opposition to the tyrannical misgovernment of the Duke of Lauderdale. Having on a certain occasion (June 1676) rescued a relative, the Rev. Mr Kirkton, from the clutches of Archbishop Sharpe's principal informer, a wretched profligate of the name of Carstairs, who pretended that he had a warrant for the apprehension of the clergyman, but refused to shew it, B. was actually prosecuted for interfering to prevent the illegal capture of his friend. For this purpose, an ante-dated warrant was furnished to Carstairs, signed by nine of the councillors. The Marquis of Athole afterwards admitted to Bishop Burnet that he was one of the nine who lent their names to this infamous document. The case was therefore made out to be a tumult against the government. B. was fined in 6000 merks (£318). He refused to pay, and was sent to prison; but so strong was the indignation of the Scottish gentry, that he was released at the end of four months, in consideration of payment of one-half of his fine to Carstairs. In 1683, B. took a prominent part in a scheme of emigration to South Carolina, as he saw no other refuge from the degrading tyranny of the government. About the same time, however, he entered into correspondence with the heads of the new Puritan party in London, whose leaders were Russell, Sydney, and the Duke of Monmouth, and subsequently repaired to that city to concert measures for a vigorous insurrection against the government, not, however, so far as he was concerned, with a view to revolution, but as the only means of securing adequate reforms. On the discovery of the Ryehouse Plot, B. was arrested, and sent down to Scotland. Accused of conspiring against the king's life, and of being hostile to monarchical government, B. was tried at Edinburgh, and condemned to death upon evidence at once insignificant and illegal. His bearing both on his trial and during his imprisonment was such, that his cousin, Bishop Burnet, declared 'it looked like a reviving of the spirit of the noblest of the old Greeks or Romans, or rather of the primitive Christians and first martyrs; and the celebrated Dr Owen speaks of him as a 'great spirit,' 'a person of the greatest abilities I almost ever met with.' The sentence was carried into execution on the 24th December 1684. It is to be regretted that so few opportunities were afforded B. of achieving anything really great, for he seems from all accounts to have possessed a remarkable strength of character and noble fearlessness of spirit.

BAILLY, JEAN SYLVAIN, a distinguished French savant, President of the National Assembly of 1789, and Mayor of Paris, was born in that city, September 15, 1736. Originally intended by his father for an artist, he first turned aside into literature, until, becoming acquainted with Lacaillie, he was fortunately induced to study astronomy, which proved to be the true sphere of his genius. In 1763, B. presented to the Académie des Sciences his *Lunar Observations*; in 1766, appeared his *Essay on the*

Satellites of Jupiter, with Tables of their Motions; and in 1771, a treatise on the light of these satellites, remarkable for the profundity of its astronomical views, and which classed him at once among the greatest astronomers of his time. His historico-scientific works, especially his *History of Indian Astronomy*, are full of learning and ingenious disquisition, and written with great elegance. In 1777, he published his *Letters on the Origin of the Sciences*; and in 1799, his *Atlantis of Plato*. In 1784, he was elected a member of the Académie Française; and in the following year, of the Académie des Inscriptions. The *éloges* which he wrote about this period for the Académie des Sciences on Charles V., Molière, Corneille, Lacaillie, Leibnitz, Cook, and Gresset, were very highly praised. Fontenelle was the only Frenchman before him who had enjoyed the honour of being a member of the three académies at once. The revolution interrupted his peaceful studies. During the earlier part of it, he occupied a very prominent position. Elected President of the National Assembly, June 17, 1789, and Mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the National Guard to fire on the masses who were assembled in the Champ de Mars, on the 17th of July 1791, to demand the dethronement of the king. He now threw up his mayoralty, considering it impossible to satisfy either party, withdrew altogether from public affairs, and went to live first at Nantes, and afterwards with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery, and brought to Paris, where he was accused of being a royalist conspirator, condemned and executed with the usual Jacobin preliminary of savage insult, November 11, 1793. Among his papers were found, and afterwards published, an *Essay on the Origin of Fables and Ancient Religions* (1799), and *Memoirs of the Revolution by an Eye-witness* (1804). There cannot be two opinions regarding the merit of B.'s style, but his historico-astronomical speculations are now considered fantastic.

BAILMENT, an English law term, defined to be 'a delivery of goods for a particular purpose, upon a contract, express or implied, that the purpose shall be carried into effect, and that, when that is done, the goods shall be restored by the bailee, or person to whom they are delivered, to the owner or bailor, or according to its directions.'—*Tomlin's Diet.*

BAILY, EDWARD HODGES, R.A., an eminent sculptor, was born at Bristol on the 10th March 1788. In 1807, he went to London, saw Flaxman, and entered his studio. In 1809, he gained the silver medal at the Society of Arts and Sciences, and the silver and gold medals at the Royal Academy. His works during this part of his career were chiefly, if not altogether, classical figures. They exhibit great care in execution, and are simple and pure in conception; but it was not till his twenty-sixth year that the full power and originality of his genius manifested itself in his celebrated 'Eve at the Fountain,' a figure of exquisite grace and loveliness. His next works were, 'Hercules casting Lycus into the Sea,' 'Apollo Discharging his Arrows,' and 'Maternal Love.' George IV. also employed him, along with other artists, to execute the sculpture in front of Buckingham Palace, the figures on the marble arch, and the 'Triumph of Britannia,' as also the *bas-reliefs* that surround the throne-room. Besides these, B. executed a great number of busts and statues of distinguished contemporaries, such as Telford the engineer, Earl Grey (14 feet high), and Sir Astley Cooper. The statue of Nelson, in Trafalgar Square, is likewise the work of his hands. His 'Eve listening

to the Voice,' the 'Sleeping Nymph,' 'Girl preparing for the Bath,' and 'The Graces Seated,' are among the finest efforts of his genius. (Died 22d May 1867.)

BAILY, FRANCIS, an eminent English astronomer, was born at Newbury, Berks, in 1774, and died in Loudon in 1844. In the midst of active business as a London stockbroker, he laid the foundation of his scientific fame, and during the years of life usually devoted to repose, underwent labours and rendered services to astronomy, which entitle him to be regarded as one of the most remarkable men of his time. Among the chief of these services were his share in the foundation of the Astronomical Society, and in the improvement of the *Nautical Almanac*, his laborious repetition of Cavendish's pendulum experiments, and the production of the Astronomical Society's Star-catalogue. The latter, says his biographer, Sir J. Herschel, 'put the astronomical world in possession of a power, which may be said, without exaggeration, to have changed the face of sidereal astronomy.' In addition to several standard works on Life-annuities, &c. (1808—1813), and an immense mass of contributions to the *Memoirs of the Astronomical Society*, he wrote a valuable *Life of Flamsteed* (1835), which gave rise to much hot discussion on the subject of that eminent man's connection with Newton.

BAINI, GIUSEPPE, one of the most distinguished scientific musicians of modern times, was born in Rome on the 21st October 1775. In 1795, when still only a pupil in the Seminario Romano, he was admitted among the singers in the Papal Chapel, on account of his fine voice and his musical acquirements. Having been initiated by G. Zaunaeon into the art of composition, he soon gained distinction by his compositions. The severe gravity and profound science of these contrasted strongly with the careless style and shallow dilettantism of the modern Italian masters. B. has secured for himself a prominent place in musical literature, less, however, by his compositions than by his historical researches, which he found both encouragement and opportunity to make, when he was appointed director of the papal concerts in 1804, and general director of the choir in 1814. His principal work is his *Memorie Storico-critiche della Vita e delle Opere di Gio. Pierluigi da Palestrina*, &c. (2 vols. Rome, 1828). It is a valuable work, although disfigured by prejudices. The German edition of B.'s work, additions and explanations by Kandler, published by Kiese-wetter (Leip. 1834), is especially deserving of notice, as very soon after its first publication it became a rare book on account of the small number originally published. Winterfeld published an edition of the same work with critical remarks (Breslau, 1832). B. died on the 10th of May 1844.

BAIRAKTA'R, or, more correctly, Bairak-dar, signifying Standard-bearer, is the title of the energetic Grand Vizier Mustapha. He was born in 1755, and was the son of poor parents. He entered the military service at an early age, and soon distinguished himself by his valour. When he was Pacha of Rustchuk in 1806, he fought not without success against the Russian army, which had advanced into Moldavia and Wallachia, and had taken Bucharest. After the revolt of the janizaries in 1807, by which Selim III. (q. v.) was deposed from the throne, in favour of Mustapha IV., B. at first concealed his attachment to the deposed monarch, and marched with his troops apparently against the revolted Servians; but as soon as he reached Adrianople, he compelled the grand vizier to return with him to Constantinople, in order to restore the throne to Sultan Selim. On their return, they found this prince murdered, and his dead body lying

in the first court of the seraglio. Filled with rage at this sight, B. caused all those to be executed who had had any share in the murder. He deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on the 28th July 1808. B. was now appointed grand vizier. In the exercise of this office, he deposed the grand mufti, the leader of the janizaries, and all the ulemas who had taken any part in the last revolution; while at the same time he was careful to secure the tranquility of the capital, and strengthened the regular army. His chief object was the annihilation of the janizaries; but, like the unfortunate Selim, he also fell a victim to these fierce bands of soldiery, who resisted everything like military discipline. Favoured by the fanatical people, the janizaries rebelled, and, with the support of the fleet, attacked the seraglio on the 15th November 1808, and demanded the restoration of Mustapha IV. B. defended himself bravely; but when he saw that the flames threatened to destroy the palace, and that he was in danger of falling alive into his enemies' hands, he strangled Mustapha, threw his head to the besiegers, and then blew himself up.

BAIRD, SIR DAVID, Bart., a general in the British army, was born 6th December 1757, at Newbyth, Scotland. He entered the service in 1772 as an ensign in the 2d Foot, was promoted to a lieutenancy in 1778, and immediately after obtained a company in the 73d, a Highland regiment just raised by Lord Macleod, with which he sailed to India. In the course of a few months, the young officer was plunged amid the perils of a sudden and sanguinary war. The English had excited the hostility of Hyder Ali by a gross breach of faith; and in the July of 1780, the latter burst into the Carnatic at the head of 100,000 men, disciplined and commanded by French officers. On the 10th of September, a portion of the English army fell into an ambuscade at Peramboucum, and was cut to pieces. Among the few who remained alive to be taken prisoners was Baird, whose heroism had actually startled the French officers who were opposed to him. He was thrown into a dungeon at Seringapatam, where he endured a captivity of four years, that must have been peculiarly galling to a spirit so fierce, restless, and resolute as his. Released in July 1784, he obtained the majority of the 71st in 1789, and in the October of the same year visited England. In 1791, he returned, a lieutenant-colonel, and took part in several important sieges, attacks, and skirmishes; in 1795, he received a colonelcy; in 1798, he was raised to the rank of major-general; and in 1799 memorably signalled himself at the victorious assault of Seringapatam. He led the storming-party, having obtained that perilsous honour at his own urgent request, Colonel Wellesley (afterwards Duke of Wellington) commanding the reserve. In requital of his brilliant services, he was presented by the army, through the commander-in-chief, General Harris, with the state-sword of Tippee Saib, and also with a dress-sword from the field-officers who served under him at the assault. His merit was likewise acknowledged by the home government. In the following year, he was appointed to the command of an expedition against Batavia, but which was afterwards sent to Egypt. On his return to India, he found that the star of Wellesley was in the ascendant; and B., who had already complained of the preference given to that officer, and who was, besides, of opinion that his own merits were constantly overlooked, applied for leave of absence, and sailed for Europe in 1803. He was received at court with great distinction, knighted in June 1804, and made a K.C.B. in the following August. In 1805, he commanded an expedition against the Dutch settlements at the Cape of Good

Hope, which was successful; in 1807, he commanded a division at the siege of Copenhagen; and in 1808, was sent to Spain with an army of 10,000 men, to assist Sir John Moore. He distinguished himself in the battle of Corunna, January 16, 1809. Moore having been killed in the action, Sir David succeeded to the chief command, and had the honour of communicating intelligence of the victory to government. On this occasion, he received, for the fourth time in his life, the thanks of parliament, and was created a baronet. After this period, he retired from active service. In 1810, he married Miss Preston Campbell, a Perthshire lady, by whom he left no issue. He died, August 18, 1829.

BAIREUTH, a city, with a population of 17,000, capital of the province of Upper Franconia, Bavaria, and formerly the capital of the principality of the same name. B. is beautifully situated on the Red Mayn, about 126 miles due north from Munich. Its streets are broad and well paved, and are interspersed with groves, promenades, fine gardens, and public fountains. Its principal buildings are the old palace, now the residence of the provincial governor; the new palace, containing a gallery of paintings; the mint, opera-house, riding-school, infirmary, and town-hall. Its chief articles of industry are leather, cottons, woollens, linen, tobacco, parchment, and porcelain. Jean Paul Richter died here in November 1823, and a monument has been erected to his memory.

BAJA, an important market-town of Hungary, in the circle of Bacs, on the banks of the Danube, and celebrated throughout Austria for its annual swine-fair. Grain and wine, in large quantities, are produced in its neighbourhood. Pop. 14,500.

BAJAN. See **BEJAN**.

BAJAZET, or **BAJASID** (pronounced Bayazet) I., Sultan of the Turks, was born in 1347. In 1389, he succeeded his father, Murad I., who fell in battle near Kossowa, fighting against the Servians. Immediately on ascending the throne, he inaugurated his rule, after the fashion of eastern kings, by strangling his younger brother Yacub, lest he should dispute the succession. In three years, he conquered Bulgaria, a part of Servia, Macedonia, and Thessaly; he also subdued most of the states of Asia Minor. From the rapidity with which these extraordinary conquests were effected, he received the name of Ilderim—that is, Lightning. He even blockaded Constantinople itself for ten years, thinking to subdue it by famine. To rescue this city, King Sigismund of Hungary (afterwards Emperor of Germany) assembled a large army, in which there were 2000 French nobles under the command of the Duke of Nivey. With this army, King Sigismund attacked the city of Nikopolis, in Bulgaria, situated on the Danube. B. hastened to meet him, and gained a decisive victory over the allied Hungarians, Poles, and French, on the 28th September 1396. Sigismund escaped captivity only by a speedy flight in disguise; but the greater part of the French, through whose impetuosity the battle was lost, were taken prisoners, and were nearly all executed. B. would now have entirely destroyed the Greek empire, if he had not been prevented by Timur (q. v.), who attacked his possessions in Asia Minor, and completely defeated him on the 16th June 1401, near Angora, the capital of what was anciently called Galatia, on the very spot where Pompey had formerly overthrown Mithridates. B. himself fell into the hands of the conqueror, who treated him with great generosity. The story that he was carried about imprisoned in a cage is without any historical foundation. B. died in 1403, in the camp of Timur. He was succeeded in the government by his son Soliman I. B. was

honourably distinguished by his efforts to improve the administration of justice. During the 14 years of his reign, he built a large number of mosques, among others, one at Adrianople, and a second at Broussa, which two cities were then the ordinary residences of the Ottoman princes.

BAJAZET II., son of the Sultan Mohammed II., the conqueror of Constantinople, was born in 1447, and ascended the Ottoman throne after his father's death in 1481. His reign, which lasted 32 years, was a succession of uninterrupted wars against Hungary, Poland, Venice, Egypt, and Persia, which were carried on with various success and without any events of striking importance, yet which served on the whole to establish the Ottoman power. The last years of his reign were much disturbed by disputes between his sons about the succession to the throne. Influenced by the preference shewn by the janizaries for his younger son Selim, B. abdicated in his favour, but died before he could reach the place of his voluntary exile, in the neighbourhood of Adrianople, in the year 1513. B. was a friend to the dervishes, at the same time liberal and fond of pomp and splendour. Many of the most beautiful mosques in Constantinople and Adrianople were built by him, and fitted up in a style of the greatest magnificence.

BAJIMONT'S ROLL, the name given to a valuation, according to which the ecclesiastical benefices of Scotland were taxed, from the end of the 13th c. to the Reformation. It took its name from an Italian churchman, Benemund or Baiamund de Vicci, who was sent from Rome by the pope about the year 1276, to collect the tithe, or tenth part of all the church livings in Scotland, for an expedition to the Holy Land. Hitherto, the Scotch clergy had been taxed according to a conventional valuation, called the *Antiqua Taxatio*. But Baiamund set this aside; and, in spite of their reclamations, assessed the benefices at their actual yearly worth, or *verus valor*. Although more than once referred to as an authoritative document in statutes of the 15th c., no complete copy of B. R., in its original shape, is now known to exist. A contemporary manuscript of so much of the Roll as applies to the archdeaconry of Lothian, or that portion of the diocese of St Andrews which lies to the south of the Forth (comprehending the counties of Berwick, Haddington, Edinburgh, Linlithgow, and part of Stirlingshire), is preserved at Durham. The real value of the benefices in this district, as set down in B. R., exceeds the conventional value in the *Antiqua Taxatio* in the proportion of 420 to 286. A copy of B. R., as it appears to have existed in the reign of King James V. (1513—1542), is preserved in the Advocates' Library at Edinburgh, in a hand of the beginning of the 17th c. It is full of inaccuracies; and it omits all livings of less than 40 marks a year. Of the *Antiqua Taxatio*, which was superseded by B. R., there are good copies in the handwriting of the 13th c., so far as concerns the benefices in the four dioceses of St Andrews, Brechin, Aberdeen, and Moray.

BAJO CCO, or **BAIO'CCO** (pl. Bajocchi), is a copper coin in the Papal States, value nearly a half-penny. It is 1-100th of the scudo, which is equal to 4s. 3½d. In the island of Sicily, the Neapolitan *grano*, the 1-100th part of the ducato (= 3s. 4d.), is also called a bajocco.

BAJUS, **MICHAEL** (properly, De Bay), one of the most distinguished theologians of the Catholic Church in the 16th c., was born in 1513 at Melun. He studied at Louvain, and became professor of theology there in 1550. He was present at the Council of Trent in 1563, and also in 1564. He was the founder of a system of theology, based

directly on the Bible and the writings of the Fathers, and setting aside the scholastic method. He had studied much the writings of St Augustine, and therefore confined himself closely within the circle of ideas held by this Father of the church, whose doctrines of the entire inability of the human will to do good, and the absence of merit in all good works, B. defended against the Jesuits. The assertions that the human will, so long as it is left to its own freedom, can do nothing but sin, and that even the mother of our Lord was not free from original and actual sin, together with other such doctrines, drew on him the accusation of heresy. Seventy-six of his propositions were condemned by a papal bull. B. submitted, but nevertheless did not give up his doctrines, and, in consequence, the persecutions to which he was subjected did not cease. He died December 16, 1589, having earned the reputation of great learning, pure manners, and singular modesty. He may be regarded as the predecessor of the Jansenists, who inherited his Augustinian views, which were at that time termed Bajanism. His writings, mostly of a polemical nature, were published by Gerberon (2 vols. Cologne, 1696).

BAJZA, ANTON, a Hungarian poet and prose-writer, was born January 31, 1804, at Szücsi, in Hertes. His Poems (2 vols. 1835), which were published in Pesth, earned for him a place among the best Hungarian lyric poets. In the *Kritisches Blätter*, to which he contributed from 1831—1836, the *Athenæum*, and the *Figyelmező* (Observer), to which he contributed from 1837—1843, in common with many of the best literary writers of the day, he exercised a beneficial influence on the rising literature of Hungary by his severe criticism, and his solid and theoretically correct essays. He likewise materially aided the Hungarian stage, then in its infancy, by the publication of the *Ausländischen Bühne* (Foreign Dramas, Pesth, 1830), and also by his exertions as director of the National Theatre, opened in Pesth on August 22, 1837. At the same time, he had begun to occupy himself with historical studies, and enriched the literature of Hungary, very poor in this respect, with a *Történelmi Könyvtár* (Historical Library, 6 vols., Pesth, 1843—1845), which contained translations from many excellent foreign historical works. He also published a compilation from the German, *Uj Plutarch* (The Modern Plutarch, Pesth, 1845—1847). His *Világtörténet* (Universal History, Pesth, 1847) is a rather unskilful compilation from Schlosser, Heeren, Rotteck, and other German historians. After March 1848, Kossuth appointed him editor of his half-official organ, the *Kossuth Hírlapja* (July till December 1848), in conducting which, however, he displayed no great editorial talent. B. was made a member of the Hungarian Academy in 1832. (Died 1858.)

BAKER, SIR RICHARD, author of the *Chronicle of the Kings of England*, a book long esteemed and quoted on all matters of English history by the country gentry. Addison makes his model squire, Sir Roger de Coverley, refer to it frequently. Notwithstanding its reputation, however, among that class, the book had no lack of errors, and is now all but forgotten. Its author was born in Kent, or, according to other accounts, in Oxfordshire, about the year 1563. He was educated at Oxford University, and in 1603 was made a knight. About 1620 he married and settled in Oxfordshire, of which county he was made high sheriff; but he was soon after thrown into the Fleet Prison for debt which his wife's family had contracted, but for which he had become responsible. Here he wrote his *Chronicle*, first published in 1611, besides several pious works

of less note. He died in prison, in great poverty, in 1645.

BAK'ERIES, ARMY. Foreign armies have generally the means of obtaining soft or loaf bread; but British troops, on active service, are more frequently confined to biscuit—much to their own dissatisfaction. The French, ever since the time of Louis XIV., have been accustomed to take portable ovens with their armies; those now used will each bake 150 rations at once. Outside Sebastopol, in the winter of 1854, the British soldiers sometimes willingly exchanged with the French three or four pounds of biscuit for one pound of soft bread. From the attention now paid to the wellbeing of the soldiers, there is every reason to believe that improvements will gradually be introduced into our military system in this matter; the army-surgeons and the commissariat strongly recommend a more liberal policy. The French depend more on bread and less on meat than the English; and this may partly account for the difference. The French soldiers are taught to construct field-ovens, and to bake their bread in camp, while government B. are established all over France, entirely conducted by soldiers. Among other lessons afforded by the siege of Sebastopol, was one relating to an improved supply of army-bread. Two screw-steamers, the *Bruiser* and the *Abundance*, were sent out to Bala-klava, one provided with machinery for grinding corn, and the other with machinery and ovens for making and baking bread. In each case, the ship and the machinery were propelled by the same steam-engine. When quietly anchored in the harbour, the mill ground 24,000 lbs. of flour per day—better in quality, and cheaper than could have been obtained by contract. The bakery ship *Abundance* had four ovens of 14 bushels' capacity each; it baked in an excellent manner 6000 loaves of 3 lbs. each per day, which loaves were sent up to the siege-army as soon as cooled. The ships and machinery were sold when the war was over—a proceeding which the commissariat officers much regretted; but the experience thence obtained will not be lost. The improved arrangements suggested for the meat-rations will be noticed under COOKERY, ARMY.

BA'KEWELL, a small but very ancient town in Derbyshire, on the left bank of the Wye, near its confluence with the Derwent, and 24 miles north-north-west of Derby. It lies on the slope of a hill, in the midst of very beautiful scenery, in a carboniferous limestone tract, and in the vicinity of black marble quarries, and of coal and lead mines. Its chalybeate springs and warm baths are much resorted to. The celebrated Arkwright first established cotton-mills here. On the opposite bank of the Wye are the traces of a castle built by Edward the Elder in 924. B. is now the property of the Duke of Rutland, whose seat is Haddon Hall, two miles from the town. B. is a centre for visiting the fine scenery of North Derbyshire and the Peak; and the streams in the vicinity are much resorted to by anglers. It contains a spacious cruciform church, founded in Saxon times, and shewing specimens of ecclesiastical Gothic architecture of three different periods. Three miles from B. stands Chatsworth House, the splendid mansion of the Duke of Devonshire. Pop. (1851) 9897.

BA'KEWELL, ROBERT, a celebrated agriculturist, was born in 1726 at Dishley, in the county of Leicester, and died in 1795. He does not appear to have written anything, even upon the subjects with which he was so well acquainted, so that his fame rests entirely upon his successful efforts to improve the breed of domestic animals.

His reputation was so great as a breeder of sheep, that he is said to have received the fabulous sum of 400 guineas for one season of a ram. The long-horned breed of cattle which he introduced is still known as the Disley or New Leicestershire breed. His horses were also famous, and almost as profitable to him as his sheep. One of his objects was to produce a breed of animals that would fatten on the smallest quantity of food.

BAKHTEGAN, a salt-lake of Persia, province of Farsistan, from which remarkably fine salt is obtained. Its size is variously stated—some writers making it 60 miles in length, with an average breadth of 8 miles; others, only 70 miles in circumference.

BAKING is the mode of cooking food in an airtight chamber or oven. The term is also applied in the manufacture of bricks (q. v.), porcelain (q. v.), &c. The B. of bread will be treated under **BREAD**. The oven attached to kitchen-grates for cooking is simply an iron chamber, with flues for conveying the heated gases of the fire round it. In B., strictly so called, the oven is kept close, so that the steam and aroma arising from the enclosed substances are confined; but by opening ventilators a current of air is produced, and then these ovens may be used for what is called *open-roasting*. The rank taste that often characterises baked dishes is thus avoided. Ovens are now often heated by water, or by steam, and also by gas. Meat for B. is placed in a dish, from the bottom of which it is raised on a wire frame or trivet. In M. Soyer's Baking-dish, a wire frame rests on the edge of the dish, and on this potatoes are laid; a trivet, rising above the frame, supports the meat; while the bottom of the dish contains a Yorkshire pudding; the dripping thus falls upon the potatoes and pudding below.

B., although a convenient mode of cooking, is not considered quite so good as roasting (q. v.). The practice of having recourse to the baker's oven, saves both trouble and expense in heating, and is a matter of necessity with those who have not means of cooking at home; but it has this chief objection, that every dish becomes impregnated with the steam and odours of all the rest. Soyer pronounces it to be semi-barbarous.

BAKONY WALD (Forest of Bakony), a densely wooded mountain-range of Hungary, south of the Danube, dividing the great and little Hungarian plains. Immense herds of swine are annually driven hither to feed upon the mast of the forest. The keepers of these swine furnish those notorious robbers who play so important a part in the ballads of the Hungarian people, and in the imagination of travellers. The saintly King Stephen founded a cloister in the forest 1030 A.D. Only in recent times has this dangerous territory been thoroughly explored. The hills have an average height of 2000 feet, with quarries of valuable marble, in which a considerable export trade is done.

BAKSHISH. The ordinary meaning of this word in Persian is a present; but in the East, in modern times, it has acquired the special signification of gratuity (Ger. *Trinkgeld*), which, however, the orientals do not quietly wait to receive, but demand loudly, and even insolently. Every traveller, whether in Turkey or in Egypt, in Asia Minor or in Syria, if he receives the smallest service from any one, is immediately reminded by the cry of 'Bakshish, Bakshish,' to pay for the courtesy by a gift of money. Even when the ambassadors to the Supreme Porte obtain an audience from the sultan, or from any of the high dignitaries, they are obliged, by the prompt gift of a B., to avoid a peremptory demand

for it on the part of the door-keepers and other servants. By degrees, the B. has been fixed by custom at certain sums.

BAKTSHI-SERAI (the 'City of the Gardens'), the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, not far from the present capital, Simferopol. The city is kept in excellent repair, and has a population of 12,779, consisting almost exclusively of remnants of the old Tatar inhabitants. It thus presents a striking contrast to the modern towns of the Crimea, and is one of the most singular in Europe. The palace of the ancient khans has been completely restored by the Russian government in the oriental style. It consists of a great labyrinth of buildings, courts, and gardens, and is situated about the middle of the town, dividing it into two parts. The chief manufactures of the place consist of articles of copper, Turkish saddles, and silk.

BAKU, a seaport town of the Apsheron peninsula, in the Caspian Sea. It is under the dominion of Russia, and contains 5413 inhabitants. The whole soil around B. is impregnated with naphtha, which forms an important branch of its industry. Some of the fountains ignite spontaneously, and this natural phenomenon has caused B. to be esteemed as a holy city by the Parsees or fire-worshippers, many of whom resort to it from very long distances. Modern travellers have found there some of the sepoy pensioned by the Indian government. B. has several fine mosques and bazaars, and besides its trade in naphtha, it exports cotton, silk, opium, saffron, and salt.

The Arabian, Masudi (q. v.), is the first who mentions B., about 943, and he gives an account of a great volcanic mountain in its vicinity, which is now extinct. B. was ceded by the Persians to the Russians in 1813. The peninsula on which it is built is notable for its volcanoes. In the immediate vicinity of B. there is a remarkable spring of white mineral oil, and in calm weather the people often amuse themselves by pouring tuns of it into the Caspian, and then setting fire to it, the effect being that the whole sea appears as if in flames.

BALA BEDS, a local deposit, occurring in the neighbourhood of Bala, in North Wales, and forming a group in the Lower Silurian of Murchison. They consist of a few beds, rarely more than 20 feet in thickness. The beds are chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice moulding, affording a characteristic by which, at a considerable distance, the B. B. can be distinguished from the rocks of hard gritty slate above and below. Trilobites and Cystidæ are the predominant fossils of the group. Calcareous beds, containing similar fossils, have been noticed in the Silurian district of the south-east of Ireland, and referred to this group.

BALAAM, the name of a prophet who figures prominently in the early history of the Israelites. He is first mentioned in Numbers xxii. 5, where Balak, king of the Moabites, alarmed at the irruption of the chosen people into his territories, is represented as sending messengers to Pethor, in Mesopotamia, the dwelling-place of the seer, to beseech him to come and curse the invaders. The narrative is, of course, familiar to every one, and it is therefore unnecessary to recount it; but it is marked by two peculiarities, which have excited much speculation and controversy. The first is, the admittedly prophetic character of B., who was a *Gentile*; the second is, the curious miracle in the case of his ass. With regard to the supernatural

powers attributed to B. the most prevalent hypothesis is, that he was the last relic of the patriarchal age, during which communion with God was not formally restricted to one race, but diffused more or less among all the Semitic peoples. Some, again, suppose that his knowledge of God, from whom he apparently received miraculous communications, was derived from traditions of the primitive faith scattered over Mesopotamia by Abraham, Jacob, Laban, &c.; though Hengstenberg conceives that he had been led to renounce idolatry by hearing of the miracles which attended the exodus of the Israelites, anticipating, as a reward for his change of worship, a further insight into futurity, and a greater power over nature. B. has ever been considered a type of those men who prostitute their powers and hold the truth in unrighteousness, receiving the wages thereof.

BALÆNA. See WHALE.

BALÆNOPTERA. See RORQUAL.

BALAKLA'VA, a small port in the south-west of the Crimea, separated by a rocky peninsula from the harbour of Sebastopol, from which the direct distance is about 6 miles. Population in 1849, 1067. The harbour, which affords secure anchorage for the largest ships, is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. To the east, overlooking the bay from a rocky eminence, are the ruins of a Genoese fortress. The foundation of the work is excavated into numerous chambers and galleries. It is the *Symbolon Limen* of Strabo; and the present name is supposed by Dr Clarke to be a corruption of the Genoese *Bella-chiava*, or Fair Haven. This was long the seat of a Greek colony; in the 14th c., it fell into the hands of the Genoese; about the end of the 15th, they were expelled by the Turks; and on the conquest of the Crimea by Catharine II. of Russia, it was made a military station for a regiment of Greeks and Albanians. In 1854, a few days after the battle of Alma, the town was occupied by the British army under Lord Raglan, and the harbour formed, during the ensuing campaign, the headquarters of the fleet, and the basis of operation of the army. Here ensued those scenes of mismanagement and confusion that have rendered B. a synonym for chaos, and the recital of which, with the resulting privations and misery to the soldiers, stirred so terribly the heart of England in the winter of 1854—1855. A terrible hurricane on November 14, 1854, in which nine vessels were totally destroyed, and several others seriously injured, tended greatly to increase the confusion which incapacity and divided responsibility first occasioned at Balaklava. Soldiers, six miles distant, were dying for want of food, clothing, and medicine, which were hidden hopelessly beyond reach in store-rooms at B., or stowed away in the holds of ships that were not permitted to enter the harbour. Transport vessels, for which the country was paying enormous sums of money daily, were kept lying idle in port with their most anxiously awaited cargoes (for lack of which the troops were perishing by hundreds) unladen, while poor mutilated and dying soldiers lay miserably exposed on the heights for want of ships to convey them to the hospitals at Scutari. The rebuilding of the greater part of the town, the formation of a line of railway between B. and the camp, and certain official investigations in 1855, completely remedied this disgraceful state of things. The 25th of October 1854 was signalised, on the heights between the town and the Tchernaya, by those unparalleled cavalry charges, the record of which is among the saddest but proudest memories of the British army. A detailed account of the

events connected with Balaklava is given in the *Pictorial History of the Russian War*, published by W. and R. Chambers.

BALANCE (of doubtful derivation), an instrument for ascertaining the weight of bodies in grains, ounces, pounds, or any other units of weight. The ordinary B. consists of a lever called a beam, whose point of support is in the middle of its length, and having dishes or scales suspended from either extremity. As it is of importance that the beam should move easily round its point of support, it rests on polished agate or steel planes, by means of knife-edges of tempered steel, which project transversely from its sides, and serve as the axis of rotation. By this arrangement, the surface of contact is reduced to a mere line, and the friction of the axis of the beam on its support almost entirely obviated. The scales are hung by means of chains attached to steel hooks, which rest also on knife-edges, but turned upwards instead of downwards, as in the first case. The essential requirements of a B. of this description are: 1st, That the beam shall remain in a horizontal position when no weights are in either scale; and 2d, That the beam shall be a lever of equal arms, or have the distances between the central knife-edge and those at either end exactly the same. To insure the first of these conditions, it is necessary that the centre of gravity of the beam lie vertically below the point of support, when the beam is horizontal. When such is the case, the centre of gravity at which the weight of the beam may be considered to act, oscillates as in a pendulum round the point of support, and always comes to rest right under that point, thus restoring to the beam its horizontal position when it has been tilted out of it. If the centre of gravity were above the point of support, the beam would topple over; and if it coincided with that point, there being no restoring force, the beam would occupy indifferently any position into which it was thrown, the B. in both cases being useless. That a B. possesses the second of the above conditions, is ascertained by putting weights into the scales which keep the beam horizontal, and then transposing them, when, if it still remain so, the lengths of the arms are equal. Should the arms be of different lengths, a less weight at the end of the longer arm will balance a larger weight at the end of the shorter arm (see LEVER); but when transposed, the larger weight having the longer arm, and the smaller weight the shorter, the beam can no longer remain horizontal, but will incline towards the larger weight. A balance with unequal arms is called a false B., as distinguished from an equal-armed or just balance. When weighing with a false B., it is usual to weigh a body in both scales, and take the arithmetical mean—that is, half the sum of the apparent weights for the true weight. This is near enough to the truth when the apparent weights differ little from each other; but when it is otherwise, the geometrical mean (q. v.) must be taken, which gives the exact weight in all cases.

Although the preceding conditions are of essential importance, they do not supply all that we look for in a good balance. It is necessary, in addition, that the beam should turn visibly from its horizontal position, when there is a slight excess of weight in the one scale as compared with the other. This tendency is termed *sensibility*, and depends upon the weight of the beam, the position of its centre of gravity, and the length of its arms. Let ABD (fig. 1) represent the beam of a balance, C the point of suspension, G the centre of gravity, and ACB the straight line joining the knife-edges, which may be taken as the skeleton lever of the balance. We shall here confine our attention to that construction

where the three knife-edges are in a line, because it is the most simple and at the same time the most desirable. We may, without altering the principles of equilibrium, consider the beam reduced to the

Fig. 1.

lever AB, and embody its weight in a heavy point or small ball at the centre of gravity, G, connected with C by the rigid arm CG. The scales (represented small in the fig. for the sake of space), with the equal weights in them being at an equal distance from C, have their centre of gravity in that point; and their combined pressure acting there, is met directly by the supporting plane, so that they have no influence in determining any particular position of the beam. If a small weight, p , therefore, be put into the scale at B, the position of the beam is determined by its rotating tendency (moment) round C, and the counter-rotating tendency of the weight of the beam, W , acting at G. The question of sensibility is thus reduced to the action of the crooked lever GCB, with p acting at one end, and W at the other. The relations of the arms and forces of a crooked lever will be found under LEVER. It is only necessary here to state, that the moment of the weight acting at the end of a crooked lever, increases with its size, the length of its arm, and the smallness of the angle which that arm makes with the horizontal line passing through the fulcrum. Let us suppose that, under the effect of the opposing moments, the beam, as represented by the line AB, takes up the position marked by the dotted lines. If, now, we were to lengthen CB', and keep CG' as it is, CG' would rise nearer to the horizontal line, and CB' fall further from it, before equilibrium would be restored; and the inclination of CB', or the beam to the horizontal line, thus being greater, the sensibility of the balance would be increased. Consequently, *the longer the arms of a B. are, all other things being the same, the greater will be its sensibility.* But the same object would be reached by keeping CB' its original length, and shortening CG', or bringing the centre of gravity of the beam nearer to the point of support. The weight of the balance then having a shorter arm, the point G', for the same reason as before, would need to rise higher, and B' sink lower, before A'B' would find its position of rest. Here, also, *the nearer the centre of gravity of the beam is to the point of support, the greater will be the sensibility of the balance.* If now, however, we keep the length of the arms CG', CB' constant, but diminish the weight acting at G', while p acting at B' remains the same, it is manifest, that to make up the deficiency in the weight W , the two arms will turn to the left, as in the preceding cases, so as to give W a longer, and p a shorter effective arm. The smaller, therefore, the weight acting at G, or *the smaller the weight of the beam, the greater will be the sensibility of the balance.*

In the construction of the B., it is a matter of importance to have the sensibility independent of the amount of weight in the scales, so that,

when heavily loaded, a small weight will produce the same inclination as when not loaded at all. This condition is implemented, as we have already shewn, when the three knife-edges are kept in the same straight line. If the line joining the two terminal knife-edges lie below the point of suspension, then the centre of gravity of the equal weights corresponding with the middle of that line, will, upon the turning of the beam, be forced from below that point, and will accordingly have a tendency to resume its former position. The equal weights thus counteract to some extent the effect of the additional weight, in causing the beam to incline, and their influence in this way will be all the greater as they themselves increase. When a B. is too heavily loaded for its strength, the three knife-edges, although previously in a line, do not retain that position, for the arms of the beam yielding to the pressure, cause the terminal knife-edges to sink below the one in the middle, and the knife-edges themselves losing their shape under the pressure, the sensibility is considerably diminished.

When a B. is very sensible, the beam keeps oscillating for a considerable time from one side to the other of the position in which it finally settles. Although such an instrument may be useful for physical and chemical experiments, it is not serviceable for the purposes of ordinary life, where minute quantities of the substance to be weighed are of little value, and where time, and consequently rapidity of indication, are matters of importance. The sensibility of a B. must, therefore, be adjusted to the purpose for which it is designed; sensible balances being employed for weighing finer, and less sensible, or *stable* balances, for weighing coarser materials. The stability, or the tendency of the beam to come quickly to rest, depends on requirements nearly the opposite of those which conduce to sensibility. In the construction treated of above, the stability increases with the moment of the weight of the beam acting at G round C, so that it thus increases with the weight of the beam, and the distance of the centre of gravity from the point of suspension. The stability is also increased, as already

Fig. 2.

shewn, by having the line joining the scale knife-edges below the point of support.

Fig. 2 is the representation of a common form of the delicate balances employed in physical and chemical researches. The beam is constructed so as to combine lightness with strength, and rests by a fine knife-edge on an agate plane. It is surmounted

by a weight moving on a screw, so that the sensibility may be increased or diminished, according as the weight is raised or depressed. In order that the knife-edge may not become blunted by constant contact with the supporting plane, a cross-bar, with two projecting pins, is made to lift the beam from the plane, and sustain its weight when the balance is not in play. The beam is divided by lines marked upon it into ten equal parts, and a small weight made of fine wire bent into the form of a fork, called a rider, is made to slide along to any of the divisions. If the rider be, for instance, $\frac{1}{10}$ of a grain, and if, after the weight of a body is very nearly ascertained, it brings the beam, when placed at the first division next the centre, exactly to its horizontal position, an additional weight of $\frac{1}{100}$ of a grain will be indicated. The use of inconveniently small weights is, by this arrangement, to a large extent obviated. As the beam takes some time before it comes to rest, it would be tedious to wait in each case till it did so, and for this reason a long pointed index is fixed to the beam below the point of suspension, the lower extremity of which moves backward and forward on a graduated ivory scale, so that when the index moves to equal distances on either side of the zero point, we are quite certain, without waiting till it finally settles, that the beam will be horizontal. The same is seen in ordinary balances, only the tongue or index is above the beam; and according to its deviation on each side of the fork or cheeks by which the whole is suspended, is the future position of the beam ascertained. The finer balances are never loaded to more than a pound in each scale, and when so charged, will deflect with $\frac{1}{100}$ of a grain of additional weight in one of the scales, or will turn, as it is technically called, with $\frac{1}{115200}$ of the load. The finest balances turn with $\frac{1}{1000000}$ of the load, and some have been constructed which turned with much less. Even with the best achievements of mechanical skill, no B. can be made whose arms are absolutely equal; and to remedy this defect, the method of double-weighing is resorted to, when the utmost accuracy is demanded. This consists in placing the body to be weighed into one scale, and sand, or the like, into the other, until exact equilibrium is obtained, then removing the body, and putting weights or another body in its place which exactly counterbalance the sand. Both being thus weighed in precisely similar circumstances, must weigh precisely the same.

The Roman B., or *Stedyard* (Ger. *Schnellwage*), is

Fig. 3.

more portable than the ordinary balance. It consists of a lever (fig. 3), AB, moving round a knife-edge or point at C. The body to be weighed, W, is put into the scale which hangs from A; and a movable weight, P, is made to slide along the longer arm, until the lever, AB, remains horizontal. The weight of W is then read off from the division at which P rests. If the lever lie horizontal when unloaded, then equal weights at equal distances from C will balance

each other, so that when W is balanced by P at a distance from C equal to AC, the two are of equal weight; but if equilibrium take place when P, say, is ten times as far from C as A is, then W will be ten times the weight of P; and the same holds for any intermediate point at which P may stand, W weighing as many times P as P's arm is a multiple of W's arm. To weigh a body of 10 lbs. by the ordinary B., a counterweight of 10 lbs. is necessary, making a total load of 20 lbs.; but in the case just supposed, 1 lb. balances 10, making a total load of only 11 lbs. The steelyard has, therefore, this advantage over the common B., that the load on the fulcrum, and consequently the friction, is less. On the other hand, however, there is this disadvantage, that the arms of the steelyard bend unequally under the strain of great weights, which in a B. with equal arms cannot, to the same extent, take place. As the steelyard is ordinarily made, the longer arm preponderates when the lever is unloaded, so that the graduation of the longer arm begins at a point between A and C, and not at C. The *Danish B.* differs from the ordinary steelyard in having the weight fixed to the extremity of the lever, and the fulcrum movable.

The *Bent Lever B.* (Fr. *peson*, Ger. *Zeigerwage*),

shewn in fig. 4, is a lever of unequal arms, A, C, B, moving round the pivot C, having a scale, Q, attached to the shorter arm AC, and a fixed weight, W, to the longer arm CB. The longer arm ends in a pointer moving in front of a fixed graduated arc. When a body is put into the scale, the pointer rises from the bottom or

Fig. 4.

zero point of the arc, and rests opposite the mark corresponding to the weight of it. The higher the weight W rises, the longer becomes its *effective* arm, and the greater must be the weight it balances. The arc is generally graduated experimentally, the geometrical graduation being somewhat complicated.

For other weighing apparatus, see **SPRING-BALANCE; WEIGHING-MACHINES.**

BALANCE AND BALANCE-SPRING. The balance of a watch is a wheel finely poised on its axis; the pivot-holes in which it turns being frequently—in chronometers and clocks, as well as in watches—jewelled, or made of small rubies, diamonds, &c., for the sake of durability. The natural effect of an impulse given to such a wheel would be a complete rotation on its axis. This, however, is convertible, by the escapement (q. v.), and by the balance-spring, into a vibratory motion. The balance-spring is held to be a crowning invention in the mechanism of the watch; and the honour of its first suggestion has been claimed for no less than three very eminent men—for Dr Hooke, an Englishman; for Abbé Hautefeuille, a Frenchman; and for Huygens, the Dutch astronomer. The honour, however, undoubtedly belongs to Hooke.

The balance-spring consists of a coil of steel-wire, so delicately manufactured that 4000 of them scarcely weigh more than one ounce, though often costing more than £1000. In its application to the balance of a watch, one of the extremities (e, fig. 1) of the spring is fastened to a point independent of the balance, while the other is attached near its axis. When the balance is at rest, the spring is inclined neither way, this

position being called the point of rest; but when the impulse is given to the balance by the crown-wheel of the escapement, the balance moves round just so far as the impulse given is able to overcome the elastic resistance of the spring.

Fig. 1.

When that resistance becomes equal to the impulse given, the balance stops for a moment, and then is driven back by the elastic recoil of the spring, and continues thus to vibrate so long as the impulse is repeated or the watch is in motion.

The recoil of the spring is sufficient to drive back the balance to a distance nearly double the length of its first motion; this is, therefore, called the long arc of vibration. But when the motion of the balance is free, with a certain length of spring, the long arc of vibration is made in less time than the short one, to which the impulse is given: with a spring of greater length this relation is reversed; whence it was concluded by Le Roy and Berthoud, that equality of time, or *isochronism*, in unequal vibrations, could be more easily obtained by lengthening the spring than by tapering it. In England, where time-keepers have been brought to their greatest perfection, it is considered that isochronism

Fig. 2.

is most easily attainable by using the cylindrical helical spring (s, fig. 2), which is applied to all marine chronometers.

An improvement in watches, or rather in chronometers, invented by Mr Dent of London, consists in coating the balance and balance-spring with gold by the electro-metallurgic process, by which means they are secured from rust.

BALANCE OF POWER, an expression used in diplomacy for that state of matters in which no one of the European states is permitted to have such a preponderance as to endanger the independence of the others. This idea is not, as some say, confined to modern times. The Greek states acted upon it by a kind of instinct of self-preservation, though it was not directly formulated. It has, however, become more distinctly avowed as a motive of political conduct, and more systematically acted upon, since the time of Charles V., whose overgrown power and ambitious designs awakened the other European powers to the danger of such overwhelming preponderance in one state. The motive of preserving the B. of P. came first distinctly into the foreground in those unions which England, Holland, and Austria repeatedly formed against the menacing schemes of Louis XIV. for acquiring the dominion of all Europe. It was the same cause that broke up the most dangerous (for Louis) of these coalitions; for in the war of the Spanish Succession, when the Hapsburg pretender to the Spanish throne became, by the death of Joseph I., sovereign of Austria and Emperor of Germany, and the power which, in the hands of Charles V., had menaced the equilibrium of Europe, was thus likely to be again wielded by one man, England withdrew from the coalition, and thus saved Louis from a decided overthrow. The aggressions of Napoleon called all the powers of Europe to arms against him in the name of the B. of P.; and in readjusting the map of Europe, the B. of P. was often invoked to cover the jealousy which resisted not a few claims to restitution of territory. For some time, the B. of P. in Europe

has been embodied, as it were, in a pentarchy or permanent congress of the five great powers, who mutually watch one another's movements. This mutual jealousy among the leading powers on the score of extension of boundaries, is the great safeguard of the smaller states, and is the only thing that prevents their absorption by their powerful neighbours. It was the dread of a coalition against him among the other powers, which he was not then prepared to resist, that made the Emperor of Russia agree to the treaty of 1811; this treaty in some degree moderated that influence in Turkey which by private treaties with the sultan he had contrived to raise to a virtual protectorate. The renewed attempt of Russia to extend her dominion, if not territorially, at least politically, over Turkey, gave rise (1854), after a lapse of 40 years, to another war on behalf of the Balance of Power.

BALANCE OF TRADE. In the 'mercantile system' of political economy, which looks upon the possession of gold as the grand aim, it not unnaturally came to be a maxim that a nation becomes richer just in proportion as the money-value of its exports exceeds that of its imports; the excess, it was thought, being paid in gold, is just so much added to the national wealth. Now, the difference between the money-value of the exports and imports of a state is called the 'balance of its trade;' and by the adherents of the mercantile system, this balance was said to be 'in favour' of the country or 'against' it, according as the exports or the imports shewed the excess.

But this view of the matter rests on a twofold error; for, in the first place, the increase of national wealth is by no means to be identified with the immediate influx of hard cash; nor is gold the highest expression of national wealth, but only a means of turning real wealth and the faculty of labour to account. Further, the assumption that excess of exports represents excess of income, is completely false. It takes exports for income (because payment is received for them), imports for expenditure (because they must be paid for), while it would be more consistent with the truth to say that exports are identical with expenditure, and imports with income; so that wealth increases in proportion as the value of the imports (what is received) exceeds that of the exports (what is given away); and that whether these exports and imports consist solely of goods or partly of money. It may sometimes be desirable to get payment of exports in gold—that is, to import bullion. But the case in which this will be beneficial to the merchant seeking his own profit in the transaction, will be that in which it will be beneficial to the community. In the majority of cases, however, the individual merchant finds it his best policy to lay out the money due to him in a foreign country in purchasing the wares of that country as return-value. The far-sighted Venetians early recognised the truth of the principle in a national point of view; for, by a law of 1272, they laid a tax of one-fourth the value on the importation of all coined gold and silver. The mercantile system of political economy, on the contrary, consistently following up the notion of the B. of T., enacted laws prohibiting importation of foreign manufactures, or imposing high duties upon them, and giving premiums and other protective encouragements for exportation; as if it were possible to go on exchanging always for gold only—ever exporting goods and goods alone, and never importing any. If this could be, and if it were true that a nation with the B. of T. constantly in its favour must become richer, while, with that balance against it, it must become poorer, England, whose official

returns have for many years exhibited a large excess of exports over imports, must have had at this time about 500 million pounds in precious metals, while in reality the amount does not exceed perhaps 60 millions. The truth is, that no safe conclusion can be drawn from the B. of T. exhibited in official statements; from the way in which they are arrived at, a great part of the facts of the cases are necessarily left out. Almost all nations exhibit favourable balances, and how could that be possible, if the whole affair were not deceptive? In the regular legitimate commerce between two nations, both actually gain, though the gain may not be exhibitable in the form of a money-balance. If the gains of nations from commerce consisted of differences between the amount of exports and of imports to be compensated by balances in money, nearly all nations would be yearly receiving accessions of gold and silver, the united amount of which would exceed, by more than ten times, the produce of all the mines in the world.

BALANUS, a genus of *Cirrhopoda* (q. v.); the type of a family, including all those cirrhopods which are destitute of a flexible stalk, and of which the shell is symmetrical. These characters at once distinguish them from Barnacles (q. v.). In the genus *B.*, the base is usually formed of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. The name (signifying an acorn) was originally given by the ancient Greeks, from a supposed resemblance of some of the kinds to acorns; and acorn-shell has sometimes been adopted as an English name. There are many species, and they are found in almost all seas, attached to stones, timber, shells, crustaceans, &c. They cover the rocks between high and low water-mark on many parts of the coast as with a white calcareous incrustation, so that arithmetic fails in computing, and imagination in conceiving their multitudes. They may, however, be readily passed over as individually objects of little interest when they are seen after the tide has left them, for then their valves are closed, and they exhibit no sign of life; but if observed in a pool of the rocks, or anywhere under water, they present a very different and extremely pleasing spectacle, the opercular valves continually opening and shutting with a quick but pretty regular motion, and an exquisitely delicate apparatus of feathery arms or cirrhi (see CIRRHOPODA) being as frequently thrown out and retracted like a hand or a little net, to seize and carry in to the mouth the minute nutritious particles or very small animals upon which the creature feeds. Thus, the little balani, immovably fixed to the rock, or carried about at the pleasure of mollusks or crustaceans to which they adhere, obtain their food from the waters around them.

A remarkable fact in the natural history of these creatures has recently been discovered by Mr Thompson of Cork, that in the earlier stages of their existence they are not fixed as in their adult state, but move about very actively in a succession of bounds, by means of swimming-feet like those of the *Cyclops* (q. v.); having, however, a shell, apparently of two valves, resembling a very minute muscle. Still more remarkable is the discovery made along with this, that in their early locomotive state they possess large stalked eyes, which disappear along with the organs of locomotion when they attach themselves—probably by the guidance of some peculiar instinct—to their final place of repose, undergoing a transformation into perfect cirrhopods, and acquiring as a covering their many-valved shell.

Some of the larger species of *B.* were esteemed a delicacy by the ancient Romans. The Chinese entertain the same estimation of *B. tintinnabulum*, which is said to resemble lobster in taste; and *B. psittacus*, a South American species, which is in like manner compared to crab, is exported in large quantities from Concepcion de Chidi to Valparaiso and Santiago. This species is sometimes almost four inches in diameter, the height considerably more. It is chopped off the rocks with a hatchet. The two posterior opercular valves are beaked, from which it receives the name of *Pico*, and its scientific trivial name, *psittacus* (a parrot).

BALASO'RE, a seaport in the district of Cuttack and presidency of Bengal, near the Boorabullung, which enters the sea to the west of the Hoogly or Calcutta River. It is situated in lat. 21° 30' N. and long. 87° E., and has dry-docks and a coasting-trade; but it is entitled to notice chiefly in connection with the past, having been the seat, successively, of Portuguese, Dutch, and Danish factories. It was only in 1846 that the Danes sold their interest in the place to the English.

BALATON, LAKE OF (Platten-See), a lake, the largest in Hungary, about 55 miles south-west of Pesth. Its extreme length is 48 miles, with a breadth of from 3 to 10 miles, and an estimated area, including its frequently submerged marshes, of 420 square miles. Its greatest depth is 39 feet. It is supplied by upwards of thirty streams—the chief of which is the Szala—as well as by numerous springs which rise on its margin. Its outlet is by the Sio, which discharges itself into the Sarvitz, a feeder of the Danube. The waters of *B.* are clear and transparent, except when they are agitated by a storm, when they assume a bluish colour. They have a slightly brackish taste. Fish of various kinds are found in abundance, and sand impregnated with iron, interspersed with which are small garnets, rubies, and other precious stones, is taken from it. Woods and vineyards cover the hills which encircle its northern sides, and on its banks near the town of Fured there is a spring of acidulous water. The surrounding country is rich in rare plants and mineral treasures, and was the scene of several bloody conflicts during the Hungarian war (1848—1849). The lake itself figures prominently in the old romantic ballads of the Magyars.

BALAU'STA. See BERRY.

BAL'AY, or BAL'LAIS, the name now used to distinguish the ruby of a bright rose-colour from the ruby proper, which is of a bright red or cochineal colour, and from the *spinelle* ruby, which is of a red hue approaching to rose-colour. This last kind of ruby has been recognised only in times which are comparatively modern. In the middle ages, they seem to have known only the *B.* ruby and the ruby proper, or *le beau rubis*, as it was often called. M. de Laborde thinks that the term *B.* was anciently employed as a name for all sorts of rubies.

BALBI, ADRIANO, well known by his geographical, and more especially by his statistical works, was born in Venice on the 25th of April 1782. In 1808 he gained so much credit in Italy by his first geographical work, that he was appointed Professor of Geography in the college of San Michele at Murano, and in 1811 Professor of Physics in the Lyceum at Fermo. Subsequently he resided for a time in Portugal, and then went to Paris, to superintend the publication of his *Essai Statistique sur le Royaume de Portugal et d'Algarve* (2 vols., Par. 1822). This work was soon followed by the *Variétés Politiques et Statistiques de la Monarchie Portugaise* (Par. 1822). *B.* lived in Paris till 1832. He was the intimate friend of Malte Brun, from

whose papers he, jointly with Larenaudière and Huot, published the *Traité Élémentaire de Géographie* (2 vols., Par. 1830—1834). He also published several works of comparative national statistics. His *Atlas Ethnographique du Globe* (Par. 1826) is distinguished by its extensive accumulation of facts and views, giving an account of German researches on the subject, and entering into questions of comparative philology. B.'s best known work is, however, the *Abrégé de Géographie* (3d edition, Par. 1838), which has been translated into several languages. In the year 1832 he returned to Italy, and settled at Padua, where he died 14th March 1848. A collection of his *Scritti Geografici* was made by Eugene Balli (5 vols., Turin, 1841—1842).

BALBI, GASPARO, a Venetian merchant of the 16th c., who is worthy of mention as the first traveller who has left an account of India beyond the Ganges. In the pursuit of his calling, B. was often led to Aleppo, and from thence, on one occasion, he made a visit to India, which lasted several years. After his return to Venice, he published, in 1590, the results of his travels in a volume entitled *Viaggio all' Indie Orientali*. A Latin translation was printed in De Bry's *Collection of Voyages and Travels to the East Indies*, published at Frankfort in 1590—1594. B. appears to have set down, without exaggeration, all that he himself saw, and is particularly minute and exact concerning commercial matters; but there is scarcely any limit to his credulity with regard to what he heard from others about the country. From Aleppo, his journey was down the Euphrates until opposite Bagdad; thence down the Tigris to Basorah, where he embarked for the Malabar coast. Having visited Goa and Cochin, and other Portuguese settlements, he sailed for Pegu, then an independent empire, where he remained two years, returning by the same route. The most interesting part of his narrative is that relating to Pegu.

BALBINUS, DECIMUS CÆLIUS, one of the two emperors of Rome whom the senate elected on hearing of the death of the elder Gordian, and his son, in Africa, in opposition to Maximinus, who had the support of the legions in Germany. He was celebrated as an orator and a poet, and was a man of mild disposition. His coadjutor, Marcus Clodius Pupienus Maximus, was a bold and resolute soldier who had risen from the people. They had only reigned a few months, during which time Maximinus had been killed by his own soldiers, who afterwards submitted to Maximus, when they were both killed in 242 A. D. by the pretorians, who at that time were animated by bitter hostility to the civilians, and extended it to the rulers who had been elected by them.

BALBO, CÉSARE, an Italian statesman and author, was born 21st November 1789 at Turin. When 18 years old, B., whose father had enjoyed the patronage of Napoleon, was appointed auditor of the Council of State in Paris, and in 1812 he was made commissioner for the Illyrian provinces, ceded to France by the Peace of Vienna. After the fall of Napoleon, B. went to London as secretary of the Sardinian embassy. After leaving political affairs, he devoted himself to the study of history, and among other works produced during the years 1821—1843, were a *History of Italy*, which, however, extended only to the reign of Charlemagne; and a translation with commentary of Leo's *Development of the Constitution of the Lombardic Towns*. His *Speranze d'Italia* ('Hopes of Italy'), published in 1843, first extended his literary reputation to foreign countries. One of its main objects was to prove that national independence must precede the enjoyment of constitutional liberty; and that to strive after the latter,

however good in itself, so long as the former had not been secured, was both foolish and reprehensible. It gave a vivid and intelligent picture of the political condition of Italy, its aims and prospects. His compendium of Italian history (*Della Storia d'Italia*, &c.) was also successful. B. took a prominent part as a moderate liberal in the political movements of 1847—1848, and subsequently supported the ministry of Azeglio. He died 3d June 1853. He was a man of strict morality and unspotted character. In all his writings, B. adhered strongly to the Roman Catholic Church, whose truth he conceived to be the healing of nations as well as of individuals, and the only source of true culture.

BALBO'A, VASCO NUNEZ DE, a Spanish conqueror, was born of a noble but reduced family at Xeres-de-Caballeros in 1475. After leading rather a dissolute life in his youth, he gladly took part in the great mercantile expedition of Rodrigo de Bastidas to the New World. He established himself in St Domingo, and began to cultivate the soil; but fortune proving adverse, in order to escape from his creditors, he had himself smuggled on board a ship, and joined the expedition to Darien in 1510, commanded by Francisco de Enciso. It is curious to reflect that the man destined to discover the eastern shores of the largest ocean on the globe, should have been compelled to secret himself in a cask before he could share in the new enterprise. An insurrection which took place obtained for B. the supreme command in the new colony. Confused accounts which reached him of a great western ocean, impelled him, in 1513, to set out in quest of it. On the 25th of September of this year, he obtained the first sight of the Pacific Ocean from a mountain-top in the Isthmus of Panama. His natural enthusiasm at this great discovery was shared by all the educated men of his time, and the descriptions of it by contemporary authors may still be read with much interest. The governorship of the territories conquered by B. was obtained in 1514 by Pedrarias Davila, by means of his intrigues at the Spanish court. B. resigned the command into the hands of the new governor, a narrow-minded and cruel man, and, in a subordinate situation, undertook many successful expeditions; but these, and all his other merits, only served to increase the hatred of Pedrarias Davila towards him. The government of the mother-country sought in vain to mediate between them, and B. even married the daughter of Pedrarias. But on the first occasion of dispute which arose, B., having been induced by Pedrarias to deliver himself up, was accused of a design to rebel, and in violation of all forms of justice was beheaded at Santa Maria in 1517.

BALBRIGGAN, a small maritime town in Dublin county, 22 miles north of Dublin. It is a seat of cotton, calico, and stocking manufactures. The cotton stockings made here are remarkable for fineness of texture and beauty of open work. Many females are employed in embroidering muslins. B. is a favourite watering-place. After the battle of the Boyne, William encamped here. Pop. (1851), 2310.

BALCONY, or BALCONY (Ital. Balcone), a projecting gallery in front of a window or of several windows, with a balustrade or parapet before it, and supported by consoles, or brackets fixed in the wall, or by pillars resting on the ground below. The B. was unknown in Greek and Roman architecture, and is probably an Italian contrivance, as the earliest examples of it occur in Italy, to the climate of which country it is peculiarly adapted. Balconies constructed of wood are of constant occurrence in the

cottage architecture of Switzerland, to the picturesque character of which they add very essentially.

Balcony.

BALCONY, the gallery or stern-walk outside the stern of a large ship. Three-deckers have two such balconies, and two-deckers one. Where there are two, the lowermost is connected with the admiral's state-cabin, and the uppermost with the captain's cabin.

BALDACHIN (Ital. *Baldachino*), signifies a kind of canopy, of the form of a tent or umbrella, made of costly materials and richly adorned, which is either supported on pillars, or fastened to the wall over a throne or couch, or over a pulpit, an altar, or other sacred object. One of the most celebrated is the B. in the church of St Peter's in Rome, cast in bronze by Bernini, which is supported on four large twisted columns. B. was also the name formerly given to a kind of umbrella of a square form, made of silk brocade or other rich material, and supported on four poles, which was wont to be carried in the middle ages at solemn processions, coronations, marriages, &c., over the heads of royal personages or high dignitaries as a symbol of their rank. In Europe, the B. is now chiefly used in the processions of the Roman Catholic Church. It is generally borne over the priest who carries the Host. The word B., as well as the thing itself, comes from the east. Partly as a protection from the burning rays of the sun, partly as a symbol of their power and dignity, the rulers and great personages of the east seldom appeared in public, whether on foot or on horseback, in a litter or on an elephant, without a splendid canopy, often borne by the great men or chief officers of their kingdom. These canopies, generally made in the form of a tent or umbrella, were often sent, in the early part of the middle ages, as presents from eastern princes to those in the west; as, for example, from the Calif Haroun-al-Raschid to Charlemagne. During the Crusades, and the consequent trade with the east, they became well known to the Italians. Such canopies, as well as the rich stuffs of which they were made, were called, from the land whence they came, *Babylonica*; and also *Baldachins*, from *Baldach*, the eastern name of the city of Bagdad.

BALDER, or **BALDUR**, a divinity worshipped by the ancient Scandinavians, and probably also by the other Germanic nations, is the hero of one

of the most beautiful and interesting of the myths of the Edda. B., who, according to old northern mythology, was the second son of Odin and Frigga, and the husband of Nanna (maiden), dreamed evil dreams which threatened his life. When he related them to the gods, they held a council and endeavoured to secure his safety. Frigga took an oath from fire and water, from iron and all metals, from stones, earth, and plants, beasts and birds, the serpent, poison and all diseases, that they would not harm Balder. After this was done, the gods in their mirth sported with B., wrestled with him, and cast darts at him, but nothing could injure him. While the gods rejoiced at this, the thing displeased Loki (mischievous cunning or destructive fire). He changed himself into the form of an old woman, and inquiring the cause of the invulnerability of B., was told by Frigga that all things, animate and inanimate, had sworn not to harm him, with the exception of one little shrub, the mistletoe. Loki went in haste to fetch this shrub, and repaired with it to the assembly of the gods, where he placed it in the hands of the blind Höder, the god of war, directed his aim, and B. fell pierced to the heart. The sorrow of the gods was unutterable. Frigga asked who, to win her favour, would journey to Hel—the goddess of Hades or the grave—to release Balder. Hermoder or Helmod (the heroic), the son of Odin, readily offered his services, and Hel consented to grant his request on condition that all things should weep for Balder. All men, all living beings, and all things wept, save the witch or giantess Thöek (the step-daughter of Loki), who refused to sympathise in the general mourning. B. was therefore obliged to remain in the kingdom of Hel until the end of the world.

The myths of B. have been very differently interpreted. B., as the originator of all that is beneficent and good—for B. and the other sons of Odin (see SCANDINAVIAN MYTHOLOGY) are only personified aspects or functions of the dimly conceived one unseen Power that moves all nature—is represented as a hero of so lovely and graceful a manly beauty, that a brilliant light streams from his person; the whitest of the northern flowers is named *Balders-brow*. As the god of peace of the Germanic nations, who conducts to peace through battle and victory, he is a purely ethical conception, a mythical personification of the peace obtainable through conflict, and agreed to by compact among the gods. The gods, foreseeing doubtless that peace cannot long endure, seek in every possible way to secure the precious life of B., as even the weakest and most insignificant have it in their power to destroy peace. Loki, in his symbolical character as the god of retributive justice, stirs up Höder, or War, through whom the god of peace falls. Höder, indeed, is also slain by Wahi, or Val-fader, the battle-god, and the war is ended by a bloody overthrow; but once violated and broken, peace is irrevocably lost along with Balder. Hermoder or Helmod labours in vain to restore it, for the giantess Thöek (retaliation, revenge) prevents it. Holy and true peace can only revive again in a new world, when the old sinful world and the old guilt-stained gods now ruling it shall have been destroyed.—Others (among them Max Müller) see in the myth of B. a representation of the contest between Winter and Summer. Compare Weinhold *Die Sagen von Loki*, in Haupt's *Zeitschrift für Deutsches Alterthum* (Leip. 1849).

BALDNESS (*alopecia*). See HAIR. There are some rare cases on record in which the hair has never been developed. This is termed *congenital baldness*.

Accidental baldness may involve the whole scalp,

or may be only in patches; these patches may run into each other, and hence some consider this condition a species of ringworm. It is caused, says Mr Erasmus Wilson, by an atrophy of the hair-follicles (q. v.). B. in the comparatively young and middle-aged may occur from wearing waterproof caps, which, by preventing evaporation from the head, occasion an unhealthy state of skin. Naval and military officers are liable to B. arising from this cause.

Senile baldness (calvities) is not necessarily the consequence of age—it may arise, like the preceding variety, from an atrophy of those parts on which the hairs depend for nutrition. It generally commences on the crown of the head, where the supply of blood is naturally less abundant. Women have a greater quantity of soft tissue under the skin, therefore the vessels are less likely to be interfered with; hence they are not so frequently bald as men.

The causes of B. are the defective supply of nutrition just mentioned, a family tendency, late hours, dissipation, but especially old age. The hair falls off after severe illnesses, or after other causes of general debility. During pregnancy the hair falls out; and in this country we often see the long hair of young women, victims to consumption, almost completely shed.

Treatment of baldness consists in attention to cleanliness, and in exciting the languid circulation of the scalp to greater activity, by using a hard hair-brush, and the application of stimulants, as the Spanish-fly ointment in the proportion of two drachms to an ounce of lard mixed with about the same quantity of pomatum. Or the stimulants may be applied in the form of lotions. But at the same time constitutional debility should be remedied by attention to the various functions of the body; tonics should be administered; and, if possible, causes of anxiety or night-watching should be avoided. Shaving the whole head is sometimes resorted to. If these remedies are successful, downy white hair, like that of an infant, begins to grow, which may or may not acquire the colour and vigorous appearance of the former growth.

BALDO, MoNTE, a mountain of Lombardy, on the east of Lake Garda, with an elevation of 7100 feet. It contains interesting petrifications, and the fine green sand known as the sand of Verona.

BALDRICK, or BA'DRICK (Fr. *Baudrier*), is a band or sash worn partly as a military and

Baldrick.

partly as a heraldic symbol. It passes round the waist as a girdle, or passes over the left shoulder, and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword. Many of the effigies of knights contain representations of the B., more

frequently as a belt than a shoulder-sash. Queen Victoria frequently wears a blue silken B. on state occasions. The name is derived from the *balleus* of the Roman soldier.

BALDUNG, HANS, called also Hans Grün, a German painter and wood engraver, a contemporary of Albert Durer, to whom, in expression, colouring, and finish, he was little inferior as a painter. He was born in Gmünd, Swabia, about 1470, and died at Strasburg in 1552. His master-piece, a painting of the Crucifixion, is in the cathedral of Freiburg; his wood engravings are numerous.

BA'LDWIN I., the first Latin emperor of Constantinople, was born at Valenciennes in 1171 A.D., his parents being Baldwin, Count of Hainault, and Margaret, Countess of Flanders. In 1193, he succeeded to his mother's possessions, and in the year following, to the title and county of his father. In 1200, he appointed his brother Philip, along with other persons, to the regency of Hainault and Flanders, and joined the fourth Crusade. Part of the Crusaders—B. among others—were induced to assist the Venetians in reconquering Zara, in Dalmatia, from the king of Hungary. While at Zara, the young Alexis, son of Isaac II., emperor of Constantinople, craved the assistance of the Crusaders against his uncle Alexis Angelus, who, having deposed and blinded Isaac II., had usurped the throne. In return for their aid, he promised them a liberal sum of money, and also to help them to recover Palestine. The Crusaders agreed, and soon defeated the usurper's forces, and restored the rightful emperor; but Alexis having some difficulty in carrying out his promises, they turned their arms against him. A revolution breaking out in the city at the same time, Alexis the younger was murdered, and his father is said to have died of grief. Alexis Ducas Murzuphlus then usurped the throne, but was defeated by the Crusaders, and the city was sacked—the Crusaders and Venetians sharing the booty. B. was chosen emperor, and crowned on the 9th May 1204; but he received only about a fourth part of the empire—Constantinople and Thrace—the Venetians obtaining the greater share of the provinces. A part also fell to the French adventurers who accompanied the expedition, and several provinces remained in the hands of Greek princes. The abilities of B.—and they appear to have been of a superior character—were not able to cope with the evils necessarily attending so anomalous a position. The Greeks were discontented, and, backed by Calo-Joannes, king of Bulgaria, while B.'s brother, with the flower of his troops, was away on an expedition in Asia, they rose and massacred the Latins scattered throughout the towns of Thrace, and made themselves masters of Adrianople. B. laid siege to the town with the forces he had at his disposal; but he was defeated and taken prisoner by the Bulgarian king, and died about a year after (1206) in captivity. He was succeeded by his brother Henry.

BA'LDWIN II., emperor of Constantinople, was born in 1217. He was the son of Peter de Courtenay and Yolanda, Countess of Flanders, sister of Baldwin I. Being but 11 years old when, by the death of his brother Robert, he succeeded to the throne, he was placed under the guardianship of John of Brienne, titular king of Jerusalem, who died about 1237. B. then assumed the rod of empire, but he had neither the means nor the ability to wield it successfully against his powerful Greek and Bulgarian opponents. Two beginning visits to Western Europe, in one of which he left his son Philip in pledge at Venice for a

debt, and disposed of several most holy relics for money, were not successful in procuring him sufficient forces to resist his foes; and on the night of the 15th of July 1261, his capital was taken by one of the generals of Michael Palæologus, ruler of Nicæa, and B. fled to Italy. With him terminated the Latin Empire in the East, after it had lasted 57 years. His descendants for more than a century retained the title of emperor.

BALDWIN I., king of Jerusalem, 1100—1118, was born in 1058. He was the youngest brother of Godfrey de Bouillon (q. v.), Duke of Lower Lorraine or Brabant. He took part in the first Crusade; but having quarrelled with Tancred, he retired to Edessa, at the request of the Christian inhabitants of the place, and was soon after elected to be Count of Edessa. After the death of his brother Godfrey, in 1100, he became Protector of the Holy Sepulchre, and Baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He conquered Casarea, Ashdod, and Tripolis, and with the assistance of a Genoese fleet, he became master also of Acre, and subsequently of Sidon, but failed to reduce Ascalon. He died in 1118. Unlike his brother, who was a disinterested enthusiast, B. was worldly and ambitious.—**BALDWIN II.** (Baldwin du Bourg), cousin of Baldwin I., who had made him Count of Edessa when he ascended the throne of Jerusalem, succeeded him, and reigned from 1118 to 1131. During his reign Tyre was taken, in 1124, with the assistance of a Venetian fleet; and the order of the Templars was instituted. Having been taken prisoner by the Turks, B. endured a captivity of six months. He died on the 21st of August 1131, leaving four daughters. Shortly before his death he resigned the crown in favour of his son-in-law, Foulques of Anjou, who reigned till 1134.—**BALDWIN III.**, king of Jerusalem, 1143—1162, the son and successor of Foulques of Anjou, was born in 1129. He was a model of knightly virtue, which, during the period of the first Crusades, was a personification of Honour, Justice, Devotion, and Love. Edessa was lost to the Christians during his reign. In 1152, he fought victoriously at Jerusalem against Nouredin, the sultan of Aleppo. In 1157, after he had defeated the same prince at Jacob's Ford, on the Jordan, he again humbled him severely near Putaha. After this, he ruled in peace, and endeavoured to improve both the external and internal defences of his kingdom. The authority and influence of B. were so great, that even Saracens followed under him the banner of the Cross. By his marriage with Theodora, the daughter of the Greek Emperor Manuel, he gained a faithful ally in that prince. He died, it is believed, of poison, in the flower of his age, at Tripolis, in Syria, on the 10th of February 1162. With his death the Christian power in the east began to decline. He was succeeded in the government by his brother Amalric or Amaury, who died in 1173.—**BALDWIN IV.**, the son and successor of Amalric, surnamed the Leper, reigned till 1183.—When a child of 5 years old, **BALDWIN V.**, the son of Sybilla, sister of Baldwin IV., was called to the throne. He died in 1187, a year before Jerusalem was retaken by Saladin.

BALDWIN'S PHOSPHORUS is a term applied to the nitrate of lime, which, on evaporation, parts with its water of crystallisation, and then, as discovered by Baldwin in 1675, assumes a luminous appearance in the dark.

BALE, JOHN, Bishop of Ossory, in Ireland, was

born at the village of Cove, in Suffolk, in November 1495. He was educated as a Carmelite monk, but afterwards turned Protestant, and, being persecuted by the Roman Catholics, fled to Flanders, where he remained eight years, during which he wrote numerous works. He was recalled by Edward VI., and successively presented to the living of Bishopstoke, in Hampshire, and the bishopric of Ossory. In this latter sphere he made himself so obnoxious to the Catholics by his zeal in the Protestant cause, that on news of the death of Edward, his house was attacked, and five of his servants killed. He himself escaped out of the country after great difficulty, and the loss of all his effects. On the accession of Elizabeth he returned to England, and was made a prebend in the Cathedral of Canterbury. He died in 1563. His fame mainly rests on a collection of British Biography, which, notwithstanding that sections of a book are not unfrequently set down in it as distinct works, and that the names of persons who never wrote anything are set down as authors, is a valuable work. It was first published in 1548 under the title of *Illustrium Majoris Britannia Scriptorum, hoc est, Angliæ, Cambria, et Scotia Summarium*.

BÂLE. See **BASEL**.

BALEARIC ISLES, a group of five islands—Mallorca (Majorca), Minorca, Iviza, Formentera, Cabrera—lying off the coast of Valencia, in lat. 38° 4'—40° 5' N., and long. 1°—5° E. They at one time formed the kingdom of Mallorca, which was united in 1289 with the crown of Aragon. They now form a Spanish province, and have unitedly an area of 1753 square miles, with a population, in 1857, of 266,952. The soil generally is good. Vines, olives, and other fruit-trees are cultivated abundantly; but corn has to be imported. The coasts are precipitous, with some excellent harbours—Port Mahon, in Minorca, being one of the finest in Europe. The Phœnicians visited the B. I. at a very early date, and they were followed by the Greeks, from one or other of whom they are said to have received their name. If from the Phœnicians, the name is derived from a Phœnician word equivalent to the Greek *gunnetas*, signifying light-armed troops; if from the Greeks, then it is from *ballein*, to throw, and was given because of the expertness of the natives in using the sling, to the use of which they were trained from their infancy. Later, the B. I. became subject to Carthage; but after a short period of freedom, during which their inhabitants became pirates, were annexed to the Roman empire by Metellus (*Balearius*), 123 B.C. From that time their history is involved in that of the peninsula. See **SPAIN**.

BALE-FIRE. See **BEACON**.

BALFE, MICHAEL WILLIAM, an English composer of operas, &c., was born May 15, 1808, in Dublin. His musical talent received early culture, and several anecdotes are related of his singular precocity, which, if true, are all the more wonderful, from the fact that B., though a brilliant and popular composer, is not considered remarkably original. When only seven years old, he played publicly one of Viotti's concertos for the violin. At nine, he wrote the ballad entitled *The Lover's Mistake*, which achieved popularity through the singing of Madam Vestris. At sixteen, he made his debut in London, at the Drury Lane Theatre, as conductor of the orchestra. In 1825, he left this situation, in order to visit Italy, where he began his successful career as a composer, with music for the ballet *La Peurouse*, performed at the Theatre La Scala, in Milan. In 1827, he returned to the stage, and sang in the Italian Opera at Paris, where in concert with

Malibran and Sontag, he gained great applause, and many warm friends, who seemed to think it their principal duty in life to lend the young Irishman as much money as he wanted. He, however, returned to Italy, and devoted himself to composition, producing in rapid succession the operas—*I Rivali* (1830), *Un Avvertimento* (1832), *Eurico IV.* (1834), *Assedio di La-Rochelle* (1835), *Manon Lescaut* (written for Malibran, 1836), *C. Grey* (1837), *La Dame Voilée* and *Palstaff* (1838), *Jeanne d'Arc* (1839), *Keolanthe* (1840), and the *Bohemian Girl* (1844). This last opera is one of the few English compositions which have been popular in Germany. The *Bondman* was produced, with some success, in 1846; but failed to excite permanent interest. A few years ago appeared *The Rose of Castile*, an opera which acquired a large measure of temporary popularity through the delightful singing of Miss Louisa Fyne, the principal member of the English operatic company. As a composer, B., as we have hinted, is little more than an imitator (chiefly of Auber), and has no true creative genius; but his opera airs, and other vocal music, are extremely singable, and afford opportunities of display acceptable to singers. (Died Oct. 20, 1870.)

BALFOUR, SIR JAMES, Lord President of the Court of Session, and author of an able book, *Practicks of Scots Law*, was a son of Sir Michael Balfour of Pittendreich and Montquhany, in Fifeshire. In early life he was implicated in the conspiracy against Cardinal Beaton, and being in the Castle of St Andrews when it surrendered, in 1547, he was carried prisoner to France in the same vessel with John Knox. About two years after, returning to Scotland along with other of his fellow-prisoners, he changed his religion, his apostasy gaining for him the appellation of the 'Blasphemous Balfour' from Knox, but unusual honours and emoluments from the queen and court. B. was sagacious enough to notice the increasing influence of Bothwell, and he immediately insinuated himself into his confidence, joined the conspiracy for the assassination of Darnley, and framed the bond for mutual support, signed by the conspirators. He was afterwards accused by Lord Lennox as an accomplice in the murder of Darnley, but the trial was hurried over before proof of his guilt could be brought forward. In 1567, at the instance of Bothwell, he was appointed governor of Edinburgh Castle; and he repaid the kindness of that nobleman and the queen, by handing over to the confederate lords the celebrated letters upon which they endeavoured to found Mary's guilt, and which had been given him by Bothwell for safe custody. He afterwards surrendered the castle to Murray, on certain conditions, in which his own safety and interests were the chief considerations. The great object of B.'s life appears to have been self-aggrandisement, without regard to the means by which that was accomplished. Accordingly, we find him the recipient of favours under the regency, as he was under the queen. He was made a privy-councillor, Commendator of the Priory of Pittenweem; and in exchange for the clerk-registry, he received the Lord Presidency of the Court of Session, and a pension of £500. When Morton was made regent, B. contrived to curry favour with him, and received from him a commission to make a general digest of the law. Not feeling himself safe in Scotland, however, he left it for France, where he remained for some time. When the young king ascended the throne, he joined the party hostile to Morton, but again fled to France, when in 1579 Morton recovered his authority. In 1580 he returned, and was instrumental in obtaining Morton's death, by producing the deed compassing the murder of Darnley, which

that nobleman, along with others, had signed. He died in 1583.

BALFRU'SH (or more correctly **BARFURU'SH**, 'mart of burdens'), an important commercial town in the Persian province of Mazanderan, and situated on the river Bahbul, about twelve miles from its mouth in the Caspian Sea. The river, which is here about fifty yards broad, but shallow, is crossed by a fine stone-bridge of eight arches. It is not navigated, all goods being landed at the port of Mesh-hedi-Ser, on the Caspian, from whence they are conveyed to B. by an excellent road. To the south of the town there is an artificial island, about half a mile in circumference, on which the palace of Shah Abbas formerly stood. B. has excellent bazaars, and several Mohammedan colleges; the population is variously estimated at from 50,000 to 200,000. The latter estimate was made by Fraser, who visited it in 1822, since which time it has been greatly depopulated by plague and cholera. Flax and cotton are much cultivated in the vicinity.

BALI, or **BALLY**, an island to the east of Java, about 70 miles long by 35 broad. With an area of 1500 square miles, it contains a population of about 700,000, being 466 inhabitants to a square mile. It is said to differ from the other islands of the Indian archipelago in shewing a majority of Hindus and a predominance of Hinduism. Like the islands generally in every section of the archipelago, from the Philippines to Sumatra inclusive, B. is volcanic—its highest mountain, with an elevation of 11,326 feet, having been an active volcano as late as 1843. The Dutch have a settlement in Badong, the chief of the eight states into which the island is subdivided, and many Chinese are to be found in the seaports. The lat. and long. of Badong harbour are $8^{\circ} 42' S.$, and $116^{\circ} 33' E.$

BALIOL, JOHN, LORD OF GALLOWAY, and afterwards **KING OF SCOTLAND**, was born in 1259, and on the death of the Princess Margaret in 1290, became a competitor for the crown of Scotland. As the grandson of the eldest daughter of David Earl of Huntingdon, brother of William the Lion, his claim was pronounced superior to that of the other principal competitor, Robert Bruce, Lord of Annandale, son of the second daughter. The arbiter on the occasion was Edward I. of England, who found this a fit opportunity for asserting his claim as lord-paramount of Scotland. That claim was acknowledged by the Scottish estates in submitting the contest to his decision; and, consistently with this ignominious submission, B., before and after receiving the crown (November 30, 1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and, abject as he had shewn himself, the indignities which he experienced at length roused him to an assertion of his rights as king. In 1295 he took upon him, by the advice of his nobles, to conclude an alliance with France, then at war with England. This act of revolt was followed by speedy chastisement. Edward invaded Scotland with a large force; defeated the Scottish troops; took B. prisoner, and compelled him, after performing a humiliating penance, formally to surrender his crown, July 2, 1296. B. was confined for three years in the Tower, enjoying, however, a limited freedom, and something of royal state. At the end of that time he was permitted to retire to his patrimonial estates in Normandy, where he died in 1314, a short time after the battle of Bannockburn. The estimate by his subjects of this unfortunate and poor-spirited prince was significantly indicated by the surname of 'Toom Tabard,' or Empty Jacket.

BALIOL, EDWARD, son of John, makes himself

momentarily conspicuous in history by his daring and successful invasion of Scotland, then under the regency of Randolph, Earl of Moray, in 1332. Accompanied by some English noblemen bent on recovering their forfeited estates in Scotland, he landed with a few hundred followers at Kinghorn, in Fifeshire; defeated the Earl of Fife; pushed boldly into the country; and on Dupplin Moor, in Perthshire, routed with immense slaughter an army upwards of ten times more numerous than his own. On the 24th of September, seven weeks from the date of his landing, he was crowned king of Scotland at Scone. He had only enjoyed the kingly dignity for about three months, when he was surprised in his camp at Annan, and nearly lost his life as well as the crown he had so recently assumed. His subsequent career is the very reverse of what might have been anticipated from so adventurous a beginning, being marked only by weakness, servility, and misfortune. He died at Doncaster in 1363, and with him ended the house of Baliol.

BALISTA, or **BALLISTA** (Gr. *ballein*, to throw), was one among the larger kinds of military weapons in use before the invention of gunpowder. The *B.*, the *catapulta*, the *scorpion*, and the *onager*, propelled large and heavy missiles, chiefly through the reaction of a tightly-twisted rope of hemp, flax, catgut, sinew, or hair; or else by a violent movement of levers. The *scorpion* was a kind of large crow-bar; the *B.* threw stones; the *catapulta* threw heavy darts or arrows, and was somewhat smaller than the *Balista*. One man could manage the *scorpion*, but two or more were needed for the *B.* or the *catapulta*. There was a good deal of mechanism necessary to bring about the propulsive force. The makers of

Balista.

those machines were very particular in the choice of women's hair, the sinews of a bull's neck, and the tendons of the deer, wherewith to fashion the elastic cord. The *onager* was a kind of *B.*, which threw a stone by the agency of a sling instead of a stretched cord. The early chroniclers tell of *catapultas* that would throw an arrow half a mile, or hurl a javelin across the Danube; and of a *B.* which threw a stone weighing 360 lbs. Numerous other weapons of an analogous character were known in the middle ages—such as the *mangonel*; the *trebuchet*, which threw a large stone by the action of a lever and a sling; the *petrary*, which (as its name implies) threw a stone; the *robinet*, which threw darts as well as stones; the *mate-griffon* and *mate-funda*, both slinging-machines; the *tricolle*, which hurled quarrels, or square-headed arrows; the *cepringal* or *springal*, which threw large darts; the *ribaudequin*, a large kind of cross-bow; the *war-wolf*, a stone-throwing machine, &c. The *Arbalest* (q. v.) may be regarded as a small portable arrow-throwing *Balista*.

BALISTÈS, or **FILE-FISH**, a genus of osseous fishes of the order *Plectognathi* (q. v.) of Cuvier; the type of a family, *Balistidæ*, the species of which are

almost all inhabitants of tropical and subtropical seas, frequenting rocky coasts and coral-reefs. Their colours are generally brilliant. The body is remarkably compressed. The ossification of the skeleton, as in the other *Plectognathi*, is very incomplete, and the external covering of the body resembles that of the *Ganoid* (q. v.) fishes, consisting, in some of the genera, of large rhomboidal scales, disposed in regular rows, and not overlapping; in others, of very

Balistes conspicillum.

small rough scales, with stiff bristles, as densely crowded as the pile of velvet. But the most interesting thing in connection with these fishes, is the provision for fixing the first dorsal spine in an erect position, or lowering it at the will of the animal. The spine is articulated 'by ring and bolt to the broad interneural osseous plate.' 'When the spine is raised, a depression at the back part of its base receives a corresponding projection from the contiguous base of the second ray, which fixes it like the hammer of a gun-lock at full cock, and it cannot be let down until the small spine has been depressed, as by pulling the trigger; it is then received into a groove on the supporting plate, and offers no impediment to the progress of the fish through the water. This trigger-like fixing of the spine takes place also in the dead fish; and when a *B.* is removed from the bottle for examination, it is generally necessary to release the spine by pressing on the small trigger-ray.' The spine is roughened with enamel grains, whence the name *File-fish*. The flesh of these fishes is generally regarded as unwholesome.

BALISTRARIA (Ital. *Balestriera*), one of the names given to those narrow apertures so often seen in the walls of old castles, and through which the cross-bowmen discharged their arrows. See **BALISTA**. *B.* do not seem to have come into use till the 13th c. The lower terminations of *B.* are generally circular, sometimes in the form of a shovel. See **LOOPHOLE**.

BALIZE, or **BELIZE**, a British colony on the Bay of Honduras, in the Caribbean Sea, extending in N. lat. from 16° 45' to 18° 30', and in W. long. from 88° 10' to 89°. It forms the south-east part of the peninsula of Yucatan, which here divides the Caribbean Sea from the Gulf of Mexico. Its area is said to be 19,200 square miles—about two-thirds of that of Scotland. In 1850, the population was 10,710; nearly half of the whole being in the town of *B.*, which stands at the mouth of a river also of the

Balistraria.

same name. In addition to the Belize, which traverses the middle of the country, the Rio Hondo and the Siboon form respectively the north-west and the south-east boundaries. The presence of the English in this neighbourhood was naturally enough an object of jealousy to the Spaniards, being long tolerated from necessity, but formally sanctioned only in 1783. Besides teeming with tropical productions in general, B. exports mahogany, cedar, sarsaparilla, logwood, fustic, and other dye-woods. The town is a depôt of British goods destined for Central America, and the river is said to be navigable for 200 miles from its mouth.

BALKAN, or **HEMUS**, the eastern branch of that mountain-system which comprehends the ranges of Montenegro, Herzegovina, and the Dinaric Alps. It extends from the plain of Sophia to Cape Eminch, on the Black Sea, and forms the southern boundary of the basin of the Danube. The B. range runs almost parallel with the Danube, and for about five degrees of latitude divides Bulgaria from Rumania. Culminating in the west in the peak of Tehar-dagh, 9700 feet high, it decreases gradually in elevation as it approaches the Black Sea on the east, losing, to some extent, its wild bare character, and becoming diversified with valleys and wooded slopes. This part of the B. has great strategical importance. Numerous offsets traverse western Bulgaria and Servia. The B. is traversed by five or six passes, the only important one of which is called Porta Trajani, and forms the line of communication between Vienna and Constantinople.

BALKASH, or **TENGIZ** (Tenghiz or Tengüiz), a lake of Central Asia, on the north-west borders of Eastern Turkistan, lat. 44° and 47° N., long. 77° and 80° E. Its length is stated at 150 miles, and its greatest breadth at 75 miles. Its principal feeder is the river Ili. It has no outlet.

BALKH, formerly the most northerly province of Afghanistan, is now subordinate to the khanate of Bokhara, though not incorporated with it. It corresponds to ancient Bactria, and lies between lat. 35° and 37° N., and long. 64° and 69° E. It is bounded on the N. by the river Oxus, on the E. by Budukshan, on the S. by the Hindu-Kush, and on the W. by the Desert. Offsets of the Hindu-Kush traverse it in a north-west direction, and slope down to the low steppes of Bokhara. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between India and Eastern Europe before the sea-route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate, that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense, and the snow lies deep on the ground. The natives are Usbek Tatars; and their character seems to depend very much on that of the country. In the barren regions, they are simply plunderers of caravans; in the more favourable ones, they are peaceful nomades; and in the most prosperous districts they are tillers of the soil, and artisans in towns and villages. Pop. estimated at about 1,000,000.

BALKH, the chief town, 23 miles from the Amu, is situated where the Rudi Haaj is distributed in numerous canals. It is surrounded by a mud wall; but though bearing the imposing title of Amu al Bulud ('mother of cities'), it has little of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur; and as late as 1825, it was plundered by the powerful ruler of Kunduz, Mir-Murad-Bei.

The neighbourhood is famous for its corn and fruits. As a boundary town between Afghanistan and Bokhara, B. assumed a prominent position in the British-Afghan war. Pop. 2000.

BALL. Games with balls were among the most favourite gymnastic exercises of the ancients. They were played almost daily by all, young and old; by the highest statesman equally with the lowest of the people. The Greeks prized the game as a means of giving grace and elasticity to the figure, and erected a statue to one Aristonicus for his skill in it. The effeminate Mæcenas amused himself during a journey by playing B., as we learn from Horace. In the gymnasia of the Greeks, and in the Roman baths, there was a special compartment for B.-playing (*sphærosterium*), where certain rules and gradations of the exercise were to be observed according to the state of health of the player. The balls were of very various kinds; they were generally of leather, and filled with air; others were stuffed with feathers. Ornamented balls, composed of 12 differently coloured segments (such probably as are to be seen in modern toy-shops), are mentioned in Plato's *Phædon*. There was also great variety in the kinds of game, each having a name. In one, the B. was thrown up, and the players strove who would catch it as it fell; another was the same as our foot-ball; in a third, a number of persons threw it at one another, either with a view to hit, or for the B. to be caught and returned; in a fourth, the B. was kept rebounding between the earth and the palm of the player's hand as often as possible.

Ball-playing seems to have been of equal antiquity in the west of Europe, and to have come down uninterruptedly to modern times. In the 16th c., it was in great favour in the courts of princes, especially in Italy and France. The French *jeu de paume*, and the English *Tennis* (q. v.), are often mentioned. Houses were built for playing in all weathers; and in gardens and elsewhere long alleys were laid out for the purpose, the names of which still adhere to many localities. The B. was struck with a mallet—It. *maglia*; Fr. *mail* or *maille*; Eng. *mallet*. The mallet was also called by the compound name *pail-mail*, *pell-mell*, or *pall-mall*, from It. *palla* (Lat. *pila*), a ball. The same names signified also the game or the alley where it was played; hence the English Malls and Pall-Malls. The game is thus described in *Blount's Glossographia*, quoted in Cunningham's *Hand-book of London*:

'Pale Maille (Fr.), a game wherein a round bowl is with a mallet struck through a high arch of iron (standing at either end of an alley), which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley near St James's, and vulgarly called Pell-Mell.'

Towards the end of the 18th c., the game of B. ceased to be played at courts, and at the same time went out of fashion in the higher circles of continental society, though it is still practised by the people in Spain and Italy. The form of it called *Crickit* (q. v.) is still played in England by all classes, and *Golf* (q. v.) is a favourite game in Scotland.

For cultivating graceful motion, agility, and strength, as well as promoting general health of body and cheerfulness of mind, B.-playing is one of the best gymnastic exercises. Ancient physicians were in the habit of prescribing a course of balls to their patients where most modern doctors would likely prescribe *pills*; and in this point at least the ancient practice might be copied with advantage.

BALL. In the somewhat indefinite language of the military and naval arts, all kinds of shot and bullets are occasionally called by the collective name

of ball. This was especially the case when nearly all such projectiles were solid and spherical, before the era of hollow and spheroidal shells. At present, when the varieties are so numerous, it is more usual to employ the terms BULLET and SHOT (q. v.). These, together with SUELL, are subdivided into numerous kinds, the most important of which will be found noticed under their proper designations. A particular class of spherical combustibles is described under BALLS. For BALL-CARTRIDGE, see CART-RIDGE.

BALL (Fr. *bal*), a dancing entertainment. In England there are county balls, attended by the gentry of the shire or county, military balls, court balls, subscription balls, besides balls on various festive occasions. Whether designated balls or assemblies, these entertainments are conducted with great decorum, according to certain established usages. If of a general kind, it is customary to issue tickets only to those producing vouchers for their respectability; and to insure the most perfect propriety, a number of lady-patronesses (married ladies of distinction) take a lead in the management, and grace the assembly by their presence. Ordinarily, the charge for gentlemen's tickets at subscription balls is at least two-thirds higher than those for ladies. According to etiquette, no unmarried lady can attend a ball unless she accompany a gentleman, or a married lady. All, of both sexes, are expected to be in full dress—anything else would be held disrespectful. Fancy balls are entertainments at which every person attending is expected to be in a fancy or peculiar national costume; in other respects, they are conducted like ordinary balls. Masked balls, once so common, have now, for obvious reasons, lost their repute. At all high-class balls, there is an appointed master of the ceremonies, who superintends the proceedings, and, in the event of there being no programme, prescribes the dances.

BALLACHULISH, a parish on the borders of Argyll and Inverness shires, and partly in both counties. In the Argyllshire part of the parish, 11½ miles south-south-west of Fort William, on the south side of Loch Leven, an east branch of Loch Linnhe, are the celebrated quarries of blue roofing clay-slate. These quarries have been wrought since 1760, and now employ 200 men. White and gray marble quarries exist also in the parish.

The slate is exposed on the mountain-side, and the quarries, commencing on the shore, extend southwards along the side of the mountain. The face of the rock is laid open by three workings fronting the west, and rising one above another in successive step-like terraces, all of them being entered from the north end of the bed. The height from the lowest terrace to the top of the workings is about 216 feet, and the face of rock wrought about 536 feet. The situation of the quarries permits the water and débris of broken and waste slate to be at once got rid of into the sea. The great advantage of this is evident when it is remembered that this débris amounts to more than six times the quantity of saleable material raised from the quarries. A few years ago, the annual produce amounted to about 5,000,000 to 7,000,000 of roofing-slates, weighing from 10,000 tons. Pop. (1871) 944.

BALLAD. The name is of Italian origin (*ballate*), and meant originally a dance-song, being derived from the mid. Lat. *ballare* or *tolare*, corresponding to the Gr. *ballizein*, to dance. The B. is a kind of poem which it is very difficult to characterise. In the course of centuries it has undergone various transformations, and the name has been transferred to pieces which in extent, subject, and character

have no longer anything in common with the primitive ballad. The confusion of ideas was rendered still worse from the circumstance that poems of exactly the same nature were styled sometimes romances, sometimes ballads, sometimes epic or lyric-epic, or poetic narratives; so that it was left to the caprice of the poet which of these generic names he would give to his production. As early as the 12th c. the Italians gave the title of B. to short, purely lyrical pieces, allied to the sonnet or still more to the madrigal, and which generally had love-sorrows for their subject. Dante has such *ballate*. Akin to these are those French ballads which Molière set himself against, and which fell into disuse. The earliest ballads, as the word is now understood, are those of England, and of Scotland, beginning about the 14th c. They in so far resemble the Spanish Romances, that the subject in both is narrative, and handled lyrically. See LYRIC. The Spanish romance, however, has more of the lyrical element, and is of a gayer cast, reflecting the southern character of the people; while the northern B. took a more earnest, sombre shape, especially among the Danes; though in the north also there are ballads of a cheerful and sportive tone.

As far as subject is concerned, the B. is a species of minor Epic (q. v.). The name is generally applied to a versified narrative, in a simple, popular, and often rude style, of some valorous exploit, or some tragic or touching story. Ballads are adapted to be sung or accompanied by an instrument. They are comparatively short, the story being circumscribed, and not embracing a combination of events, as the plan of the grand epic does. There can be little doubt that the B. has been the first form of poetry among all nations; and that the earlier epics or heroic poems of the higher kind, such as the Spanish *Cid* and the German *Nibelungen*, grew out of such simple beginnings. Of the popular B., Scotland, or more correctly the border-land of Scotland and England, is allowed to have produced the best examples—as *Cherry Chase*, *Fair Helen of Kirkconnel Lee*, and many others. As a B. of modern composition may be instanced Goldsmith's *Edwin and Angelina*.

Many of the old popular songs of the Germanic nations are just narratives of epic events and incidents in which the feelings of the composer manifest themselves. But the name of B. was not then in use, and such poetical narratives were called simply songs, or more specifically perhaps *lays* (Ger. *leich*). It was not till the last half of the 18th c. that the foreign name was transferred to them.

The B. has, in recent times, been cultivated chiefly by the Germans, and in their hands it has assumed a more artificial development. Bürger may be said to be the creator of the modern ballad. He was intimately acquainted with the more simple Scotch and English B. poetry; but while adhering to its spirit, he gave to his own compositions a far wider extent, surrounded his narration with descriptions of scenery and other decorations, and by means of dialogue imparted to them the vivacity of the drama. His *Leonore* has become at once classical and popular. Bürger, Schiller, Göthe, and Uhland are the greatest German names in this department of composition. Following the practice of these writers, it has become common to confine the name B. to an epic narrative with something fabulous and supernatural in the background. In this sense, Göthe's *Erkönig* is a ballad; and Coleridge's *Ancient Mariner* is perhaps the best exemplification in English.

BALLARAT, the oldest of the considerable gold-fields of Victoria, and in fact the oldest but one of

all the gold-fields of the colony. It is about 100 miles west-by-north of Melbourne. It was first worked in September 1851, the comparatively unimportant ground at Anderson's Creek, which dated from August of the same year, having been the earliest result of the 'prospecting' which, a few months previously, had been stimulated by the newly discovered 'diggings' of New South Wales. Though B. was speedily rivalled by Mount Alexander and Bendigo, yet it has by no means lost its original pre-eminence. As its surface-digging became exhausted, mines were formed—some of them now as deep as average English coal-pits. It was estimated in 1872 that there were 215 steam-engines, of 6461 horse-power, working the alluvial mines, and 140, of 3390 horse-power, used in quartz mining. B. is unrivalled in the fineness of its gold, which averages 23½ carats, being only ½ less than the unalloyed metal.

BALLAST is a heavy substance employed to give a ship sufficient hold of the water, to insure her safe sailing with spread canvas, when her cargo and equipment are too light. The amount of B. required by a ship depends not only on her size and cargo, but also on her build; some forms of construction requiring more B. than others. It is not merely the quantity of B. which a skilful mariner has to consider; he is required also to take into account its *distribution*. If a heavy mass of B. be deposited within a small compass near the keel, it places the centre of gravity very low down; the ship will sail sluggishly, and is said to be 'stiff.' If, on the other hand, the B. be massed too high up, the ship becomes 'crank,' and cannot carry much sail without danger of being upset. Under average circumstances, it is considered that a ship is well ballasted when the water comes up to about the extreme breadth amid-ships.

In ballasting a ship, the cargo and B. are considered together, the quantity and distribution of the latter being made dependent on the former. In a ship of war, the B. is made subservient to the requirements of the necessary stores and war *matériel*; in a merchant or passenger vessel, to the convenience of the passengers and the careful stowage of the cargo. During the last great European war, the ships of the British navy were supplied with a certain conventional weight of B. according to size and armament. Thus, a 100-gun ship had 550 tons of B.; an 80-gun, 440 tons; a 50-gun, 235 tons; a 36-gun, 225 tons; a 20-gun, 110 tons, &c. The recent revolution in the sizes and shape of war-ships, however, and the introduction of steam-propulsion, have rendered all such fixity of ratio inapplicable.

The substances used as B. are various—chiefly iron, stone, gravel, sand, mud, and water. Iron is now superseding the next three varieties in ships of any importance; and water-ballast is gradually being introduced in the collier-ships of the Tyne, Wear, and Tees. Water-ballast is employed in four different ways. *Bag-water* B. is contained in water-proof bags laid on the floor of the vessel, and filled or emptied by means of a pump and a hose. *Bottom-water* B. is confined beneath a false bottom in the vessel. *Hold-water* B., first employed in screw-steamer colliers constructed by Mr Scott Russell, is contained in a large receptacle, which may be filled with the cargo when the ship is not in B. *Tank-water* B. is contained in two fore-and-aft tanks, which can easily be filled and emptied. The customs' laws relieve merchant-ships from certain formalities and payments when leaving a port in ballast.

The term B. is employed by civil engineers to signify the sand or gravelly material which is laid

as a packing between railway-sleepers, in order to give them solidity. No English railway is considered to be complete or safe for transit until it is dressed and finished by ballasting. The possibility of procuring ballast at a cheap rate, considerably affects the cost of railway undertakings.

BALLAST HEAVING has reference to the use of sand or mud ballast. In order to prevent captains from filling up, or otherwise injuring the entrance to rivers, ports, havens, roadsteads, &c., by the discharge of ballast, certain regulations have been made at most maritime places as to its disposal. The Trinity House Corporation has a peculiar jurisdiction over the bed of the Thames, and regulates all the proceedings touching the reception and discharge of ballast. Before the use of water-ballast, the collier captains ballasted their empty ships with gravel or sand, mostly dredged up from the bed of the Thames in and near Woolwich Reach. Generally about 10,000 tons per annum were thus used. The ballast-heavers were men employed by the Trinity House Ballast-office in transferring sand from the bed of the Thames to the empty ships. When the collier vessels returned to the Tyne or its neighbourhood, they were not permitted to empty the sand in the river, but were under penalties to discharge it on shore. This is the origin of the vast mounds, or sand-hills on the banks of the Tyne, which have been made very useful in the construction of railways. Ships coming into, as well as those leaving the Thames in ballast, are equally subject to Trinity House control. The Ballast-office Corporation of Dublin has similar powers in reference to the river Liffey.

BALLATER, a village of Aberdeenshire, Scotland, on the banks of the Dee, 36 miles west-south-west of Aberdeen. It is remarkable as the resort of numerous visitors, on account of its chalybeate springs. Pop. (1871) 691.

BALLENY ISLANDS, a group of five small volcanic islands discovered in the Antarctic Ocean, 1839. Lat. 66° 44' S., long. 163° 11' E.

BALLET (of similar derivation with the word *ball*—see BALLAD), a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. Properly, a B. is a theatrical exhibition of the art of dancing in its highest perfection, and must therefore, in general, comply with the rules of the drama as to its composition and form. The pantomimic sacrificial dances of antiquity, although they may be regarded as the source of Attic tragedy, are not to be considered as directly the origin of the ballet. The B., as known to us, undoubtedly originated in the service of the courts. We find it existing in Italy in the beginning of the 16th c., especially at the court of Turin, where it was enriched by the inventive genius of Count Aglio; and where the princes and princesses of the court themselves took part in it, in song and declamation as well as in dance; for the B. at first appeared in combination with the other theatrical arts, and completed the chaotic medley exhibited in these spectacles, which were at once mythological, allegorical, fantastic, warlike, and pastoral. From these mingled elements the individual species of dramatic entertainments were gradually evolved in their distinct forms. Baltagerini, director of music to Catherine de Medicis, was the first to introduce the B. into France, where it soon became such a favourite, that Louis XIII. danced in one of these ballets, and his example was followed by Louis XIV. in his youth. The latter made his last appearance on the stage in 1699, in the B. of *Flora*. Hitherto, the B. had always appeared in combination with the characteristic features of the opera,

and even of comedy, as is evident from the works of Quinault and Molière, arranged by Lully. The art of dancing possessed then little dramatic expression, and still required to be introduced and explained by singing and recitation. In 1697, Antoine Houbart de la Motte undertook to reform the B., to which he imparted both dramatic action and the expression of passionate feeling. About this time, women first made their appearance in the B., as well as in plays and operas, which had till then been performed exclusively by men. There is no mention of any female B.-dancer of note before 1790. About the middle of the 18th c., Noverre separated the B. from the opera, gave it an independent dramatic form, and laid the foundation in his writings of an ingenious theory on the subject. The Mythological B., a relic of the magnificence of Versailles, came to an end during the Consulate, when it gave place to the newly invented Comie Ballets *Dansomanie*, *La Fille mal Gardée*, and the *Arlequinades*. Vincenzo Galeotti, in Copenhagen, carried out the ideas of Noverre so far as to subordinate the dance to purely dramatic principles, instead of giving it the first place as formerly; and thus he gave to his ballets the character of great rhythmical pantomimes. These splendid and talented performances were longest kept up in the theatre of Milan, where the most lifelike and magnificent tableaux were exhibited in pantomime; and subjects were attempted far beyond the limits of the ballet. The story of *Hamlet* was turned into a B., and the subjects of several other tragedies were similarly treated. In general, the B. has now become unfaithful to its original design and its true artistic signification; and exhausts itself in the exhibition of mere feats of bodily agility, tasteless displays of artificial dexterity, distortions of the person almost to dislocation, and balancings of the figure in attitudes often indelicate. Consisting as it does more of external show than internal meaning, it contributes gradually to blunt the public taste for the enjoyment of the legitimate drama, which speaks more to the mind than to the eye.

BALL-FLOWER, so named from its resembling a ball placed in a circular flower; an ornament peculiar to the decorated style of Gothic architecture which prevailed in the 14th c. The B.-F. is supposed by some to be an imitation of a pomegranate, by others of a hawk's bell. Its form will be better understood from the illustration.

Ball-flower.

BALLINA, a seaport town on the confines of Mayo and Sligo counties, Ireland, but chiefly in Sligo, on the Moy, 7 miles south of its entrance into Killala Bay. The Moy runs through the town, is crossed by two bridges, and separates the two counties. B. proper is on the Mayo side, the Sligo portion being a suburb called Ardarae. The tide runs up to the town, but the river is only navigable from the sea up to a mile and a half below Ballina. B. has a brisk trade in agricultural produce, salmon, and cured provisions. Coarse linens and snuff are manufactured here. Many anglers resort to the river Moy and Lough Conn. Killala Bay was the rendezvous of the French invaders in 1798. They landed, and took B., but were, three weeks afterwards, defeated at Killala. Pop. (1871) 5551.

BALLINASLOE, a small inland town on the borders of Galway and Roscommon counties, near the centre of Ireland, on both sides of the river Suck—which divides the two counties—8 miles

from its confluence with the Shannon, and 81 miles west of Dublin. The Suck at B. is divided into several channels, over which the road from Athlone to Galway is carried by a succession of bridges and causeways 500 yards long. B. is noted for its great annual fair in October, one of the largest in the kingdom. It is the seat of a poor-law union, and the station of the Galway militia staff. Pop. (1871) 4619.

BALLINROBE, a small town of Ireland, county Mayo, picturesquely seated on the Robe, about 3 miles from its mouth in Lough Mask, and about 16 miles S.S.E. of Castle Bar. B. is a seat of petty and general sessions, and has a union workhouse and a barrack. It has a weekly market and two annual fairs. Pop. (1871) 2057.

BALLIOL COLLEGE, Oxford, was founded between 1263 and 1268 by John de Balliol, father of John Balliol, king of Scotland. The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8d. per week for each. In 1340, the establishment was enriched by benefactions from Sir William Fenton and Sir Philip Somerville, the latter of whom gave the college a new body of statutes. Its most important subsequent benefactors were Bell, Bishop of Worcester, in 1566; Wil. Hammond, Esq., in 1575; Peter Blundell's executors in 1615 and 1676; Lady Periam, 1620; Warner, Bishop of Rochester, 1667; John Snell, Esq., 1677; and Mrs Williams, 1830. The society in 1873 consisted of a master, 13 fellows, and 24 scholars. The number of members on the books was 328. The master and fellows enjoy the privilege of electing their own visitor. John Wycliffe was master of this college in 1361; among its scholars have been John Evelyn, and Bradley the astronomer. The Snell Exhibitions for students of Glasgow University, attract annually to this college a few distinguished Scottish students. Among these have been Sir William Hamilton and J. G. Lockhart.

BALLISTA. See **BALISTA**.

BALLISTIC PENDULUM. An instrument so named was invented by Robins. in the latter part of last century, to ascertain the velocity of projectiles, and to prove the quality of gunpowder. It consists of a large block of wood, suspended from a strong horizontal axis; and it is so solidly constructed as to bear the heaviest blow of the heaviest shot without injury. An excavated centre on one side of the block is filled with sand, packed in leather upon an iron frame; four bags form a filling or core. The core, forming the place of impact, is easily replaced after each firing. Straps of wrought iron suspend the block from the wrought-iron axis or shaft. The shaft-ends have knife-edges, which rest on V supports. The construction is such, that a violent percussive makes only a very slight oscillatory movement in the block. A brass graduated limb measures the arc of vibration; and a brass slide is pushed forward by an index attached to a bar connected with the suspension straps. Another form of instrument for similar purposes will be described under **EPROUVETTE**; and some of the results of these experiments will be noticed under **GUNNERY**. See **WAR-SERVICES** in **SUPP.**

BALLIUM. See **BAILEY**.

BALLOON (Fr. *ballon*, a large ball). According to the principle of Archimedes (q. v.), bodies immersed in a fluid are buoyed upwards with a force equivalent to the weight of the fluid displaced by them. If their own weight is not sufficient to counterbalance

this force—that is, if they are lighter than the fluid—they rise upwards with a force equal to the difference of the weight of the displaced fluid, and of their own weight. A B., therefore, which consists of an integument enclosing a gas within it, will rise in air

Balloon.

in the same way that a cork rises in water, provided that the weight of the whole be less than that of an equal volume of air. If one, for instance, occupy as much space as 1000 lbs. of air, but weigh itself—covering, gas, and appendages—600 lbs., it will be impelled upwards with a force of 400 lbs. The gases employed for filling balloons are either hydrogen or ordinary coal-gas. The former, when pure, is between fourteen and fifteen times lighter than atmospheric air, and the latter generally about two and a half.

The B., as it is at present employed, is a large pear-shaped bag, made of any pliable silk cloth, covered with a varnish, made by dissolving caoutchouc in oil of turpentine, to render it air-tight. The common size of this bag varies from 20 to 30 feet in equatorial diameter with a proportionate height. The mouth or neck of this bag is just large enough to enable a man to get inside to make any necessary repairs, and is, of course, turned downwards when the B. is inflated. A net-work of hempen or cotton twine is accurately fitted to the B., and the separate cords, on which it ends, are tied to a circular hoop placed a few feet below the neck. The car, generally a large wicker-basket, is suspended by ropes from this hoop, and hangs at a considerable distance below, so that the aeronaut may be removed from the vicinity of the gas. The net-work serves to distribute the weight of the car and its charge equally over the whole upper surface of the balloon. One of the most important requisites in the construction is the valve, which is introduced into the top of the balloon. It consists of a woollen clapper, four or five inches square, opening inwards, and kept closed by a sufficient spring. A rope attached to this valve descends through the neck into the car, where, to prevent accidental opening, it is allowed to dangle freely. The furniture of the car are the ballast or sand-bags, by emptying which the B. may be lightened; the barometer, or corresponding apparatus for telling the height ascended, or the upward or downward course of the B.; the map and compass, for shewing the direction

of the voyage; and the grappling-iron, tied to the end of a long rope, for anchoring the B. at the descent. During his flight, the aeronaut has at his disposal the means of guiding his air-ship only in an upward or downward direction, the motion of translation being wholly dependent on the wind by which it is borne. If he wishes to ascend, he throws some of the ballast over the side of the car; and if to descend, he pulls the valve-rope, so that, the gas rushing by virtue of its specific lightness through the passage made for it by the open valve, the buoyant material may be lessened. It is evident that the power of thus directing his machine becomes more limited with each exercise of it, for in each case there is an unrepaired loss of the means necessary to it. All attempts at guiding balloons in a horizontal direction have hitherto proved failures. In ordinary flights, the mouth of the B. is left open, so that there is no danger of explosion arising from the expansion of the gas in the rarer regions of the atmosphere. The diffusion that takes place through the open neck is inconsiderable during the few hours that an aerial voyage lasts. Early aeronauts, who kept their balloons closed, frequently ran considerable risk by inattention to the valve when the imprisoned gas demanded vent for its expansion.

The art of traversing the air by means of balloons, generally called Aëronautics, and sometimes Aërostation, is of comparatively recent date. The germ of the invention of balloons is to be found in the discovery by Cavendish, in 1766, of the remarkable lightness of hydrogen gas, then called inflammable air. Professor Black, of Edinburgh, seems to have been the first who conceived the idea that a light envelope, containing this gas, would rise of itself. He requested Dr Monro, the professor of anatomy, to give him some thin animal membrane for the experiment, but for some reason or other, it was never made. The first practical attempts were made by Cavallo, who, in 1772, filled swine's bladders and paper-bags with the gas, but found the former too heavy, and the latter too porous; and he only succeeded in raising soap-bubbles inflated with the gas. The invention of the B. is due to the two brothers Stephen and Joseph Montgolfier, paper-makers at Annonay, in France, whose names are as distinguished in the development of their own branch of manufacture as in the history of aëronautics. It immediately struck these brothers, on reading Cavendish's *Different Kinds of Air*, that the air could be rendered navigable by enclosing a light gas within a covering of inconsiderable weight. Led by their avocation, they fixed upon paper as the most fitting material for the purpose, and first attempted to make balloons of paper filled with inflammable air. Finding that these emptied themselves almost as soon as they were filled, instead of abandoning the paper as an unsuitable covering for the gas, they sought after another gas more suited to the paper. By a chain of false reasoning which need not here be detailed, they thought they found such in the gas which resulted from the combustion of slightly moistened straw and wool, which had, as they imagined, an upward tendency, not only from its being heated, but from its electrical properties, which caused it to be repelled from the ground. It is hardly necessary to say, that this so-called Montgolfier gas possessed no advantages for raising balloons other than that possessed by heated air of any kind; in fact, the abundant smoke with which it was mixed, by adding to its weight, rather detracted from its merits. At Avignon, in November 1782, Stephen Montgolfier first succeeded in causing a silk paralleloiped, of about 50 cubic feet, to rise to the roof of a room. Encouraged by this

success, the brothers made experiments on a larger scale at Annonay with an equally happy result; and finally, in June 1783, in the presence of the states of Vivarais, and of an immense multitude, they raised a B., 35 feet in diameter, to a height of 1500 feet. This last, nearly spherical in shape, was made of packcloth, covered with paper, and was heated by an iron choffer placed beneath it, in which 10 pounds of moist straw and wool were burned.

The news of this extraordinary experiment soon reached Paris, where it produced a most lively impression. A commission was appointed by the Academy of Sciences to report upon it. Public enriosity, however, could not await the tardy decision of this body, and accordingly a subscription was entered into to defray the expense of repeating the Annonay experiment. Such was the excitement that the subscription was filled in a few days, and the construction of the B. was intrusted to the brothers Robert, famous philosophical instrument-makers of the day, and to Professor Charles, a young but experienced physieist. As the detailed account of the Annonay ascent had not reached Paris, and as nothing was therefore known of the Montgolfier gas, Charles fixed upon hydrogen as the gas most likely to insure success. It was, however, a formidable undertaking to produce it in sufficient abundance for a B., as it was at that time only dealt with in small quantities in the lecture-room. By ingenuity and perseverance combined, he triumphed over this difficulty, and succeeded in filling, in the course of four days, a silk globe of 12 feet in diameter. This B. was transferred to the Champs de Mars, the largest open space in Paris, where, on the 27th of August 1783, it ascended in the presence of 300,000 spectators, half the population of the city. At the instance of the commission already referred to, Stephen Montgolfier constructed a fire-B., 72 feet high, and 41 feet in diameter. It ascended before the commission on the 12th of September 1783, but being held captive, it was much injured by a violent wind, which blew at the time, and after it descended it was finally broken up by heavy rains. Another was made of nearly the same dimensions, which ascended on the 19th of the same month at Versailles, the king and royal family 'assisting' at the spectacle. This ascent is worthy of note, from the fact that a sheep, a cock, and a duck were placed in an ozier-basket attached to the lower part of the B., and that these first aerial voyagers reached the ground again in safety.

The B. was now a *fait accompli*, and it began to be seriously discussed whether it might not be serviceable as an air-ship for bearing men aloft as passengers. The solution of this question was first given by Pilâtre des Rosiers. In a Montgolfière, as the heated air-B. was called, 74 feet high, and 48 feet in diameter, supporting at its base a gallery of wicker-work, he, in company with the Marquis d'Arlandes, made the first aerial voyage, 21st November 1783. They remained in the air twenty-five minutes, and sailed across the Seine and over a considerable part of Paris. The year 1783, so fertile in the annals of aërostation, was destined not to pass away without witnessing an additional, and even more satisfactory triumph. On the 1st of December, Professor Charles, along with Robert, rose from the Tuileries gardens with a hydrogen B.—then called a *Charlière*—made from the proceeds of a public subscription. This B. was made of alternately red and yellow gores of silk sewed together, and coated with caoutchouc varnish. It was covered with a net which supported the car, and was furnished with a valve, a barometer, and sand-ballast, and was, in fact, a complete aerial machine. It may be said that

the art of aërostation at once attained perfection in Charles's B., and no essential change or improvement has taken place since. In consequence of the danger attending the use of fire-balloons, and the engrossing attention which they demand of the aëronaut, they have now entirely given way to the hydrogen or coal-gas balloons. Before they became obsolete, several remarkable voyages were made in them. The same Pilâtre des Rosiers made 30 leagues in one of them, the longest voyage ever executed in a Montgolfière. Among the names of the first professional aëronauts, those of Lunardi, Blanchard, and Garnerin deserve special note. Lunardi was the first who made the ascent in Great Britain; and Blanchard, along with the American Dr Jeffries, crossed the English Channel from Dover to Calais in circumstances of almost unparalleled danger, January 7, 1785. Garnerin first descended from a B. by a Parachute (q. v.), October 22, 1797. It is much to be regretted that the first aëronaut, Pilâtre des Rosiers, fell a victim to a blind devotion to his art. In order to outvie Blanchard he constructed a compound machine, consisting of a hydrogen B. above and a Montgolfière below, and started from Boulogne, accompanied by a young natural philosopher named Romain, on the morning of the 5th of June 1785. He had not ascended many minutes, when, as it afterwards appeared, on attempting to open the valve of the hydrogen B. by the rope attached to it, he caused a rent of several yards in it, so that it emptied itself almost immediately, and fell on the Montgolfière beneath. The fire in the latter not being kindled, the whole machine fell with a frightful rapidity to the earth, and the ill-fated aëronauts perished on the spot whence they had risen. It is worthy of remark, that though several melancholy incidents of this kind are on record, the number of casualties in the navigation of the air has been less in proportion than in the navigation of the sea. For 1500 aëronauts and 10,000 ascents, calculating approximately, only 15 lives have been lost, certainly a small proportion considering dangers and inexperience.

In 1794, during the wars of the Revolution, an aërostatic institution was formed at Meudon, near Paris, for training a corps of 'aërosters,' in order to observe the enemy by means of balloons. A balloon under the management of this corps was present at the battle of Fleurus, near Charleroi, fought against the Austrians. During the siege of Paris, 1870—1871, the B. was extensively employed. Countless letters and several persons left the beleaguered city in balloons. There was, of course, no attempt made to come back in such a conveyance: carrier pigeons were the return messengers.

Balloons have been enlisted in behalf of science. The first ascent for scientific objects was made at Hamburg, July 18, 1803, by Robertson and Lhoest. The results obtained, more particularly regarding the diminution of terrestrial magnetism, and the general feebleness of electrical and galvanic phenomena in the rarer portions of the atmosphere, were considered of such importance by the French Institute, that another ascent was determined on; MM. Biot and Gay-Lussac were appointed to take the management of the B. and of the physical experiments; and they started, accordingly, on the 20th August 1804. As this aerial expedition was not altogether successful, a second was undertaken by Gay-Lussac alone, in the same year, in which he rose to a height of 23,000 feet. The observations of the French savans did not confirm those made by Robertson, for after a series of experiments, as careful as their novel situation would admit, they found that no diminution was perceptible in the intensity of electrical phenomena in the upper air. Since

then, many scientific aerial voyages have been undertaken, among which may be mentioned that by Humboldt in America; those made by Mr Rush, in company with Mr Green as steersman, on behalf of the British Association, during 1847—1849; and that by MM. Barral and Bixio (1850) at Paris. Recently, the most remarkable ascents have been made by Mr Glaisher for meteorological observation. On one occasion he ascended to a height of $7\frac{1}{2}$ miles the barometer standing at 7 inches. The B. contained 90,000 cubic feet of gas, and carried 600 lbs. The hygrometric and thermometric laws of the air may yet be ascertained by B. ascents. The nature of aerial currents, at present so imperfectly understood, might also be discovered by the same means. The introduction of coal-gas, instead of hydrogen, by Mr Green, the most famous of English aeronauts, is the most important advance in aërostation since the earliest days of the art. His large coal-gas B., in 1836, bore Messrs Green, Holland, and Mason from Vauxhall Gardens, London, to Weilburg, in the Grand Duchy of Nassau, distant 500 miles, in 18 hours.

In the United States, aërostation has been prosecuted with great zeal. Mr J. Wise has more than once exploded his B., when high up in the air, to shew what he considers to be always the case, that the fragments with the net-work form in such circumstances a parachute, which moderates the rapidity of descent, and shields the aeronaut from danger. During 1859, the longest flight on record was made by Mr J. Wise, Mr La Mountain, and others, who, starting from St Louis with the intention of reaching New York, succeeded in following the course they had mapped out for themselves until they had crossed Lake Erie; when they were caught in an adverse current of air, and forced to abandon their original design, after having travelled 1150 miles in less than 20 hours. In September 1859, Mr La Mountain made a trip of 300 miles in 4 hours. Mr Lowe, another American aeronaut, constructed an immense B., which he, called an aerial ship, the greatest circumference of which was 387 feet, with a capacity to hold 700,000 cubic feet of gas, and a lifting-power of $22\frac{1}{2}$ tons, and furnished with many new appliances for elevating, depressing, and directing the machine. In 1873, Mr Wise undertook the construction of a balloon to cross the Atlantic. He proposed to lay in stores for 30 days.

BALLOT (in French, *ballotte*) is a little ball used in the practice of secret voting, which is thence generally called 'voting by B.,' whether it be a ball or a ticket that is used. Votes may be taken by B. in various ways—e. g., the voter may deposit a ball in either of two boxes, so conjoined that no one shall be able to say into which he drops it; or he may be presented with two balls—a white and a black—and so drop one of them into a box that it shall be unknown which he used. Tickets marked 'Yes,' 'No,' or with the names of candidates, will clearly serve the purpose of balls in private voting. The Dikasts in Greece voted secretly by means of balls, stones, or shells, with marks. From this use of marked shells (Gr. *ostrakon*) in popular voting came the Greek *ostracism*, or secret vote of the people, by which they drove into exile those who became obnoxious to them. Tabulae or tickets were chiefly used by the Romans. If the vote concerned a change in the law, the tickets were marked V. R., the initial letters of the words 'Utī Rogas,' expressing consent to the proposer's proposition; and A. for 'Antiquo,' expressing adherence to the old law. If the vote concerned the election of candidates to a public office, then the tickets bore the names of the candidates. The system of secret voting in Rome was fixed by various laws, of which the

Gabiniana Lex most closely resembles the modern project of vote by ballot.

The system of vote by B. is much in use among moderns in private or social clubs, and in the election of officers and other acts of public or joint-stock companies. The propriety of employing it in private clubs has never been questioned, for to the harmony of these it is essential that the votes of a few should suffice to exclude an obnoxious person; and looking to the personal and invidious nature of the vote, it is equally essential to their harmony that the voting should be secret. A candidate for admission, who succeeds in the face of a few, though not a sufficient number of voters, could not but regard those who voted against him as enemies. But if the voting be by B., all he can know, if the voters keep their own counsel, is that some persons are unfriendly. It is thus left open for him to associate on friendly terms with all the members—a condition of the success and continuance of such associations. But whether the system was suited to political and municipal voting, used to be in this country the subject of keen debate, at a time when it was in use in France, in several of the United States, and in the Australian colonies.

We have said that the system prevailed in Greece, and on its fruit there—especially in the exercise of the ostracism—there have been various opinions. While some have considered that the Athenians, for instance, acted under cover of secrecy, frequently without a just sense of responsibility, there is the authority of Mr Grote, in his *History of Greece*, on the other side, to the effect, that they exercised the right most beneficially. But if we have in Mr Grote an advocate of the B., in Gibbon we have an opponent of it. In his *Decline and Fall of the Roman Empire*, that philosopher dates the decline of the republic from the introduction of secret voting, which, he says, destroyed public confidence—in effect, broke up the ancient relations of patron and client, and caused a general demoralisation of the people. To come to modern times, we find the B. in use in the Venetian senate; and that in Britain it was first demanded, not for the purpose of elections, but of votes in parliament. In Scotland, during the revolutions against the court in the reign of Charles II., the system was actually adopted in the legislature; but it does not appear to have afforded voters in all cases the desired protection. No one would now dream of demanding its introduction in parliament, whose proceedings, according to popular opinion, cannot be too open and above board. On this point it may be mentioned that secret voting was the rule, for over five years (from 1840—1845), in the Chamber of Deputies in France, when it was abolished, as being productive of abuse. This, however, as we have said, bears on a use of the system that has now no advocates. Two illustrations remain of its use in elections. In the colonies of Melbourne and Sydney, the B. is said to have worked well, though it has been doubted whether its efficacy has been properly tested in these countries, in which there is so much individual independence, peculiar to new countries, that those who vote care little for concealment. In the United States, on the other hand, it is said to be the general opinion that the system has proved inefficacious. In the state of New York, where the B. was adopted several years ago, there is now a party demanding open voting, as a cure for the evils introduced by the secret system. They say it has among the Americans opposed no effectual obstacle to coercion and intimidation from the majority, while those to whom the arrangements for secrecy are intrusted, flagrantly betray their trust, and the voters on either side are, as a rule, well known to the public.

The advocates of the B. used to maintain that it would prevent bribery, intimidation, and undue influence. They regarded its reputed failure in America as being beside the question as to its suitability for this country, because in America what the voter has to contend against is the pressure of the many, while with us he seeks to resist coercion by individuals. The tenants, for instance, they said, want security, through concealment, against the loss of their farms, should they vote against the wishes of their landlord. They believed it would prevent bribery, through the uncertainty that the bribed party would vote as he promised. And as a candidate would not give bribes, because he could not trust that he would get value for his money, so intimidation would not be attempted in the absence of any security that it would be of effect. To this it was answered, on the other side, that the case of America was in point, inasmuch as intimidation might arise here, as there, from a majority, and that the case of a shopkeeper and his patrons was that of many against one all over the world. If the B. failed to protect the unit against the crowd in one country, how could it succeed in another? As to the undue influence of individuals over many—as of a landlord over his tenants—it could only be prevented providing the many, in all their public acts, contradict their secret votes. If the many acted publicly as if they agreed with the few, and privately voted against them, we should have had a state of things in which the professed public opinion would have been in antagonism with the public policy, supported by private votes—a state of things justly regarded as being impossible to be produced. The influence of individuals, then, must remain—i. e., the secret voting would be of no use, since, short of lifelong hypocrisy, it must fail to be a protection. As to bribery, the opponents of the B. thought better of human nature than those who would purify it by machinery. ‘Honour among thieves,’ they said: ‘he who takes a bribe, either has no principle left in him for which to vote contrary to his promise, or will be guided by his deceased sense of honour.’ On the other view, they put it, you secure the vote of a rogue, through his playing the knave doubly, by the public in taking a bribe, and by the briber in not fulfilling his pledge. That man will be inclined to give and take bribes as formerly, despite the somewhat diminished security, they appeared not to doubt.

An element in the controversy was the question—whether the franchise was to be regarded as a public trust, or a private power to be used at the individual's discretion. The opponents of the B. maintained the franchise to be a trust, on which view, certainly, it should be openly exercised. Its advocates, on the other view, held the object of the franchise to be the ascertainment of the conscientious opinions of the people. The fact is, the right partakes of both characters: it is a power of expressing opinion by the agent under a sense of responsibility. The B. gives greater security for independence of thought; but the public vote is attended by the greater security for sense of responsibility. It used to be common to sprinkle pleas against the B. with high praise of the whole scheme of British politics, as open, manly, and candid, and with expressions of contempt for the B., as sneaking, and dissonant with that scheme. But the advocates of the B. were not unprepared with a ready and obvious retort to such arguments. Public feeling was kept alive on this question by annual motions in parliament. From 1835, its introduction was an open question with the Whigs. The Radicals, in 1859, were greatly pleased to find Lord

John Russell expressing himself as being almost a convert to their views. The controversy was put an end to in July 1872, when voting at parliamentary and municipal elections in Great Britain and Ireland was decreed to be by ballot.

BALLOT FOR MILITIA. See MILITIA.

BALLOTA. See HORRHOUD.

BALLS, HOLLOW. In military pyrotechny, many varieties of B. are made, differing in purpose from bomb-shells, but, like them, filled with ignitable composition. They are used to give light, to produce a dense smoke, or to diffuse a suffocating odour. Some of them, though called B., are not globular in shape. *Light B.* consist of canvas stretched over a skeleton-frame, and painted; the frame is filled with a composition of saltpetre, sulphur, resin, and linseed-oil, rammed down hard; and is provided with a fuse, the length of which determines the time that will elapse before the composition ignites. These light B. weigh from 5 lbs. to 70 lbs. each, according to their size. They are intended to give out a brilliant light, which may reveal the operations of the enemy during night at a siege or in the field. *Smoke-B.* are made of several thicknesses of paper, shaped by means of a globular core or mould. They are filled with gunpowder, saltpetre, powdered sea-coal, Swedish pitch, and tallow; and are calculated, after being fired off, to send out a dense smoke for nearly half an hour, in order to blind or incommodate the enemy. *Stink-B.* are filled with a composition which, when ignited, diffuses an odour almost intolerable. Some of the contrivances of Captain Norton and other inventors at the present day, noticed under ASPHYXIANTS, are extensions of the same principle as these inflammable balls. It may here be added, that most of these projectiles, especially light B. and smoke-B., are fired from mortars, rather than from guns.

BALLY, BAL, a Celtic word or prefix, signifying ‘town’ or ‘dwelling,’ enters into the composition of hundreds of names of places in Ireland and Scotland. It is allied (see letter B) to Gr. *polis*, city, and to the Lat., Ital., and Span. *villa*.

BALLYCASTLE, a small seaport town in the north of Antrim county, Ireland, in an open bay opposite Rathlin Isle, 88 miles north of Belfast, and 5 miles south-west of Fairhead. It lies at the base of Knocklaid Mountain, 1635 feet high; and the marine and mountain scenery around is very romantic. B. consists of an upper and lower town, a quarter of a mile apart. Its harbour and pier cost £150,000, but the former is now filled with sand. Coal was dug here at least 500 years ago. Linen manufacture and salmon-fishery are carried on here. Near B. are the Bonnamargy Abbey ruins. There is a singular fissure, called the ‘Gray Man's Path,’ in the face of a greenstone precipice near B. on the way to Fairhead. Pop. (1871) 1626.

BALLYMENA, a small inland town in the centre of Antrim county, Ireland, in a plain, on the right bank of the Braid, 2 miles above its junction with the Maine, and 33 miles north-north-west of Belfast. It lies in a densely peopled and well-cultivated district, the inhabitants uniting the pursuit of agriculture with the manufacture of linen. B. is one of the greatest linen and flax markets in Ireland, and its vicinity is covered with extensive bleach-fields. Pop. (1871) 7628.

BALLYSHANNON, a small seaport town in the south of Donegal county, Ireland, the chief town of the county, though not the capital. It is situated at the mouth of the river Erne, on a

small inlet running off from Donegal Bay, and 120 miles north-west of Dublin. A bridge of 14 arches crosses the Erne here. The Erne discharges more water than any other Irish river except the Shannon, and falls 140 feet over a rugged bed in the last 9 miles of its course; 400 yards below the bridge at B. the river falls in a cataract 16 feet high at low water, and 450 feet wide, over a limestone ledge of rock. The chief streets of B. are very steep. There is a valuable salmon-fishery on the river. The export trade is small, in consequence of the existence of a bar at the mouth of the harbour and the prevalence of west winds. Pop. (1871) 2909.

BALM (*Melissa officinalis*), an erect, branching, perennial, herbaceous plant, of the natural order *Labiata*, a native of the south of Europe, naturalised in a few places in England. It has ovate crenate

Balm (*Melissa officinalis*).

leaves, and axillary half-whorls of white flowers on one side of the stem. The whole plant has an agreeable lemon-like smell, on account of which it is frequently cultivated in gardens. The stems and leaves are used in medicine as a gentle aromatic, stimulant, and tonic. B. is also employed for making an agreeable and somewhat exhilarating beverage called B. Wine. B. was formerly in much higher repute than now for its medicinal virtues. Its qualities depend on an essential oil of a pale yellow colour, called Oil of Balm.

For medical use, the herb should be cut before the appearance of the flowers, which begin to expand in July. It is nearly odorless when dried. The taste is somewhat austere, and slightly aromatic. B. scarcely produces any remedial operation upon the system. The quantity of oil which it contains is not more than sufficient to communicate a pleasant flavour to the infusion, which forms an excellent drink in febrile complaints, and when taken warm, tends to promote the operation of diaphoretic medicines.—A variety of the common Cat-mint (*Nepeta cataria*), with a smell like that of B., is often mistaken for it.—**MOLDAVIAN B.** (*Dracocephalum Moldavicum*) is a native of the

country from which it derives its name, and of Siberia, &c.; an annual plant, having, when fresh, a smell like that of B., but less pleasant. It is much used in Germany for flavouring dishes.—**BASTARD B.** (*Melittis Melissophyllum*), a native of the south of England and of many parts of Europe, is a very beautiful plant, which when dried has a delightful fragrance, and retains it long. All these are of the natural order *Labiata*.

BALM OF GILEAD. See BALSAM OF GILEAD.

BALMORAL CASTLE, the autumnal residence of Her Majesty Queen Victoria, is situated in a beautiful dell in Braemar (the south-west district of Aberdeenshire), on a natural platform that slopes gently down from the base of Craigan-gowan to the margin of the river Dee in front; and about 48 miles west of the city of Aberdeen. The castle commands a magnificent prospect on all sides. In 1848, Prince Albert purchased the reversion of a 38 years' lease from the representatives of Sir Robert Gordon, who had held it under the Earl of Fife; and in 1852 he acquired the fee-simple of the estate from the Fife trustees for a sum of £32,000. The old castle not being sufficiently commodious for the royal family, Prince Albert erected a new one at his own expense, in what is called the Scottish baronial style of architecture. The castle consists of two separate blocks of building, united by wings and a massive tower 35 feet square, rising to the height of 80 feet, surmounted by a turret 20 feet high. At a distance, the castle, which is built of granite, has a strong and imposing appearance, looking almost as if it had been hewn out of one huge rock of that material. Great improvements have been made, chiefly those projected by the late Prince Albert in the approaches to the royal residence. The estate now includes Birkhall, Knock Castle ruins, Loch Muick, and 'dark Lochnagar,' celebrated by Byron (which is about seven miles south-west of B. C.), and contains about 10,000 acres, in addition to 30,000 acres of hill-ground, which have been converted into a deer-forest.

BALNAVES, HENRY, of Halhill, an eminent lay-reformer of the 16th c. Born at Kirkealdy in Fifeshire of poor parents, who, however, contrived to give him a university education at St Andrews, he went to the continent, and entered a free school at Cologne, where he greatly improved his scholarship, and received instruction in the principles of the new faith which Luther had just promulgated. On his return to Scotland, he studied law, and acted for some time as a procurator at St Andrews. In 1538, James V. made him a senator of the College of Justice; and on Arran being appointed to the regency, B. was made secretary of state. In 1543, he was imprisoned on account of his Protestantism, but appears to have been liberated in the following year. He now appears to have made himself active on the Protestant side; and it is asserted that he was privy to the conspiracy formed for the murder of Cardinal Beaton, and that he acted for the conspirators at the English court. In 1547, he took refuge in the Castle of St Andrews, and was declared a traitor and excommunicated. When the castle was captured by the French, B., with Knox and others, were sent to Rouen as prisoners of war. While in prison here, B. wrote a treatise on Justification, to which Knox added marginal notes, and prefixed a dedication, and which was afterwards published with the title of *The Confession of Faith*. When Mary of Guise was raised to the regency in 1554, B.'s forfeiture was rescinded, and he returned to Scotland, and took an active part on the side of the Lords of the Congregation, by whom he was appointed one of the commissioners

who settled the treaty of Berwick in 1559—1560, which established by law the reformed religion in Scotland. In 1563, B. was nominated a commissioner to revise *The Book of Discipline*. He afterwards acted for the Regent Murray in the inquiry into the charges against Mary for the murder of Darnley. He died in 1579; one account says 1570. Both Knox and Melville had a high opinion of him alike for his piety, wisdom, and learning.

BALSAM, a name formerly comprehensive of many resinous substances and oils, to which important medicinal virtues were ascribed, as well as of medicines compounded of resins and oils. When the term B. is now used without addition, the balsams of Peru and Tolu are generally intended.—These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *Myrospermum* (or *Myroxylon*), of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, natives of the tropical parts of America. *M. peruvianum*, which is called the Quinquino, a beautiful tree, common from Peru to Mexico, is generally regarded as the species which produces the B. of Peru; and *M. toluiferum*, a very similar species, found on the mountains of Tolu, the banks of the Magdalena, &c., as that which produces the B. of Tolu; but it is doubtful if the difference is not at least as much owing to the modes of procuring and preserving the B.; and other species of the same genus (*M. punctatum* and *M. pubescens*) are supposed also to yield it. B. of Peru appears in two forms, known as *White B. of Peru* and *Black B. of Peru*; the former of which has been said to be obtained from the pods, and the latter from incisions in the trunk of the tree; but it has also been stated that the white B. flows from the trunk, and that the black B. is obtained by distilling down the wood after the manner of tar-burning, or by boiling with water. The actual evidence is insufficient to determine these points with certainty, and it is not improbable that different methods may be employed. White B. of Peru is at first of the consistence of recent honey, and of a light yellow colour; the black B. is of a reddish or blackish brown colour, and of the consistence of treacle. B. of Tolu, until recently, appeared in commerce dry and friable, but is now generally soft and tenacious when first imported, becoming hard by age. Both balsams have a very fragrant odour. They are used in confectionary, to impart a flavour like that of vanilla; also in perfumery, and for pastilles, &c. In medicine, they are administered as gentle stimulants and tonics, and particularly in chronic bronchial affections. *Tolu lozenges* are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers.—They contain Cinnamic Acid, and a peculiar oily substance which has been called *Cinnameinc*, and is also known as Oil of B. of Peru. The name *White B. of Peru* is sometimes given to a balsamic substance which flows from the *Liquidambar styraciflua*. See LIQUIDAMBAR.

BALSAM, or **BALM OF GILEAD**, is a liquid resinous substance, which has long enjoyed a very high reputation in the East, being prized not only for its fragrance, but also for the medicinal virtues which it is supposed to possess. It is the subject of several allusions in the Old Testament, which strongly indicate the prevalent opinion of its preciousness; and is celebrated by Strabo, Pliny, Dioscorus Siculus, and other ancient writers, almost as a cure for every disease. It is still somewhat doubtful what tree furnishes it, but it is generally believed to be a species of *Balsamodendron* (q. v.)—a small tree growing in Arabia and Abyssinia, and known as *B. Gileadense*. The finest balsam, called

Opobalsam or Balm of Mecca, is obtained by incisions, is at first turbid and white, but finally becomes of a golden yellow colour, and of a consistence like honey. Inferior kinds are obtained by boiling the fruit and the wood. B. of Gilead is irritating when applied to the skin, and is believed to resemble B. of Copaiva in its effects upon the human system. *Balsamodendron Opobalsamum*, a species very nearly allied to *B. Gileadense*, is sometimes said to furnish this balsam.

Other substances, sometimes designated balsams, and possessing a somewhat similar fragrance, are produced by different species of *Amyridaceæ* (q. v.). Among them is one called American Balm of Gilead, the produce of a tree called *Iceia Carana*.—Balsamic substances are furnished also by a number of species of *Clusiaceæ*—Balsam of Umiri, a fragrant yellow fluid, by *Humirium floribundum*, a South American tree, of the natural order *Humiriaceæ*.—CANADIAN BALSAM is a kind of turpentine obtained from the Balm of Gilead Fir (*Abies balsamea*); HUNGARIAN BALSAM, from the Mugho or Mountain Pine (*Pinus Pumilio* or *Mughus*); and CARPATHIAN BALSAM, from the Stone Pine (*Pinus pinea*). See FIR and PINE.—BALSAM OF COPAIVA is the produce of different species of *Copaifera*. See COPAIVA.

BALSAM is also the common name of a natural order of succulent herbaceous plants, *Balsaminæ* or *Balsaminaceæ* of botanists, of which the beautiful B. (*Impatiens balsamina* or *Balsamina hortensis*),

Balsam (*Impatiens Noli-me-tangere*).
a, top of stem with leaves and flowers; b, ripe fruit unopened;
c, ripe fruit, elastically opening.

so much cultivated in gardens and green-houses, is a familiar example. Upwards of one hundred species are known, natives chiefly of damp bushy places in the East Indies, and many of them plants of great beauty. They are almost all annuals, and have generally white or red flowers. This natural order is very closely allied to *Ceraniaceæ* (see GERANIUM) and *Oxalidææ* (q. v.), wood-sorrel, &c., but is distinguished from both by the extreme irregularity of the flowers, and from the former also, by the beakless fruit, which is a five-celled capsule, bursting by five elastic valves. The leaves are simple and without stipules, the flowers generally axillary.—The common B. is a native of the

East Indies and Japan. Many fine varieties have resulted from careful cultivation. It has an upright succulent stem, usually about 1—2 feet high, but in favourable circumstances will attain a greater size. It often appears with flowers partially double, but still capable of producing seed. In Britain, the seed is usually sown on a slight hotbed, and the plant is often kept in the green-house; although even in Scotland it may be made an ornament of a sheltered border. It is one of the flowers frequently to be seen in cottage-windows. A vulcerary was formerly prepared from it, whence it has its name. One species of *B. (Impatiens Noli-me-tangere)*, called Yellow B. or Touch-me-not, is a native of Europe, and a doubtful native of Britain. It has yellow flowers, and one of the petals prolonged into a spur. Its ripe capsules burst on the slightest touch. This and two other species are natives of North America.

BALSAM OF SULPHUR is a mixture employed for medicinal purposes, and considered of service when applied to foul ulcers. It is prepared by dissolving 1 part of flowers of sulphur in 8 parts of olive oil, which yield a dark, reddish brown, thickish substance, with a very unpleasant odour.

BALSAMODENDRON (Gr. balsam-tree), a genus of small trees or bushes of the natural order *Amyridaceæ* (q. v.), having small green axillary flowers, small dry oval fruits, and small pinnated leaves with 3 or 5 leaflets. Some of them are spiny: they generally exhibit a scrubby appearance, and have little foliage. They are remarkable for the balsamic substances obtained from their wood and fruit—as Balsam of Gilead (q. v.), Myrrh (q. v.), Bdellium (q. v.), and Oriental Elemi (q. v.). The red resinous wood of *B. Katf* is a common article of sale in Egypt; and a species called Schnee is much cultivated in Afghanistan for its aromatic and stimulant properties. All the known species are natives of the East Indies, Arabia, and the east of Africa, except that which yields African bdellium, which is found in Senegal.

BALTA, a well-built and thriving town on the Kodema, an affluent of the Bug, in the government of Podolia, Russian Poland. Pop. (1867) 14,523.

BALTIC PROVINCES (in Russia). This term, in a wider sense, comprehends the five Russian governments bordering on the Baltic—viz., Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense, it often designates the first three. The B. P. once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th c., through the conquests of Peter the Great, partly under Alexander in 1809. They have still very various constitutions, though the usual 'government' machinery has been introduced, and every effort is made completely to Russianise them. The five governments have an area of about 200,000 square miles, with a population in 1867, of 4,902,513, including St Petersburg.

BALTIC SEA, is the great gulf or shut sea bordered by Denmark, Germany, Russia, and Sweden, and communicating with the Kattegat and North Sea, by the Sound and the Great and Little Belts. Its length is from 850 to 900 miles; breadth, from 100 to 200; and area, including the Gulfs of Bothnia and Finland, about 160,000 square miles. Its depth is on an average 15—20 fathoms, in many places not half so much, seldom more than 40—50, and never exceeding 167. Its shallowness and narrowness, the flat coasts of Prussia on the one side and the rocky coasts of Sweden on the other, and above all the numerous and sudden changes

of wind accompanied by violent storms, make the navigation of the Baltic very dangerous. The group of the Aland Islands divide the south part of the sea from the north part or Gulf of Bothnia (q. v.). The Gulf of Finland (q. v.), branching off eastwards into Russia, separates Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurish and other Halls (q. v.) are not gulfs, but fresh-water lakes at the mouths of rivers.

The water of the Baltic is colder and clearer than that of the ocean. It contains only a fifth of the salt of the Atlantic, and ice hinders its navigation from three to five months yearly. Tides, as in all inland seas, are little perceptible—at Copenhagen, about a foot; yet the water rises and falls at times, though from other causes, chiefly from the varying quantity of water in the rivers at different seasons. Upwards of 250 rivers flow into this sea. The chief from Germany are the Trave, Warnow, Oder, Rega, Persante, Vistula, Pregel, and Niemen; from Russia, the Windau, Diina, Narva, Neva, and Ulea; and from Sweden, Tornea, Lulea, Pitea, Umea, Angerman, Dal, the water of Lake Maeler, and that of Wetter and other lakes through the river Motala. The basin of the Baltic occupies at least 888,710 square miles, or about one-fourth of all Europe; and only about a fourth of the boundary of the basin is mountainous. The principal islands are Zealand, Finen, Bornholm, Samsöe, Möen, Langeland, and Laaland, belonging to Denmark; the Swedish islands Gottland, Oland, and Hveen (in the Sound); the Aland Islands, Dagö, and Oesel, belonging to Russia; and Rügen, to Prussia. The number of vessels that pass the Sound to or from the Baltic annually is very large. See **SOUND DUES**. Timber, hides, tallow, and grain, are the chief exports from the countries bordering on the Baltic. The Eider or Schleswig-Holstein Canal, connecting the Baltic near Kiel with the North Sea at Tonningen, facilitates the grain trade in mild winters. The two seas are also connected by the Gotha Canal, which joins the lakes of South Sweden. The most important harbours in the Baltic are: in Denmark, Copenhagen and Flensburg; in Germany, Schleswig, Kiel, Travemünde (Lubeck), Wismar, Rostock, Stralsund, Stettin, Swinemünde, Danzig, Ellbing, Königsberg, Pillau, and Memel; in Russia, Riga, Revel, Narwa, Kronstadt, and Sveaborg; and in Sweden, Stockholm, Karlskrona, and Ystad.—The shores of the Baltic in Prussia and Courland have been long noted for the amber cast ashore by the waves in stormy weather. Another important phenomenon connected with the Baltic, is an alleged slow vertical movement of its coasts, *downwards* in the south of Sweden, but further north *upwards*, being there supposed to be at the rate of three feet in a century. See Lyell's *Principles of Geology*.—The Germanic nations call this sea *Ostsee*, or Eastern Sea; the name Baltic is derived by Dr Latham, from an island Baltia, mentioned by Pliny, and which Dr Latham considers to be Zealand.

BALTIMORE, a city, port of entry, and seat of justice of Baltimore county, Maryland, U. S., in lat. 39° 17' N., and long. 76° 36' W. It stands round a small bay which runs back from the left side of the Patapsco, about 12 miles from its entrance into Chesapeake Bay, and about 200 miles, by a ship's course, from the open Atlantic. The city was founded so late as 1729. The surest test of its prosperity is to be found in the successive results of its census since 1800. In 1800, there were 26,514 inhabitants; in 1810, 46,455; in 1820, 62,738; in 1830, 80,620; in 1840, 102,513; in 1850, 169,054; in 1853, about 195,000; and in 1870 there were 267,354. Besides its safe and convenient communication with the sea, B. is connected by railway with

Philadelphia, Washington, Winchester, Annapolis, Cumberland, York, Lancaster, and Harrisburg. From east to west, the city is about $4\frac{1}{2}$ miles long; and from north to south, about $3\frac{1}{2}$ broad, and covers about 10,000 acres. It is divided into two nearly equal parts by 'Jones's Falls,' a rapid stream which, though troublesome from its floods, and expensive from its bridges, at once affords immense water-power, and supplies an abundance of pure water for domestic use.

Imports in 1868 amounted to 12,930,733 dollars; and the exports to 13,857,391. In the same year, 299 vessels, of 115,146 tonnage, entered the port, and 595, of 214,250, cleared it. There are 25 newspapers, 8 of which are dailies.

Among the commemorative structures which have gained for B. the name of the 'Monumental City,' the most interesting is an elegant obelisk, which was erected in 1815 to the memory of those who had fallen the year before in defending the town against an attack of the British. As was to be expected in the wealthiest city of Roman Catholic Maryland, the Roman Catholic cathedral takes the lead among the ecclesiastical edifices of B. It is a massive building of granite, being 190 feet long, 177 broad, and to the top of the cross, 127 high; and besides one of the largest organs in the United States, it contains two beautiful paintings, presented respectively by Louis XVI. and Charles X. of France. In B. however, the Roman Catholics are now vastly outnumbered by other denominations, having only 29 churches out of 161.

BALTIMORE-BIRD, or **BALTIMORE ORIOLE** (*Icterus Baltimorei*), a very beautiful American bird, found in all parts of the United

Baltimore-Bird.

States, and as far north as 55° N. lat., but migrating to tropical or subtropical regions in winter. The genus to which it belongs is usually referred to the natural family of *Sturnidae* (see STARLING). The B.-B. is in size somewhat less than a common starling; the bill conical, very acute, and a little curved; the plumage brilliant, particularly in the adult males, glossy black finely contrasting with bright orange and vermillion; the tail longish, rounded, and slightly forked. The bird is remarkably active and lively; its song extremely agreeable. Its nest is a curious and interesting structure—a pendulous cylindrical pouch of six or seven inches long, usually suspended from two twigs at the

extremity of a lofty drooping branch; the materials, which vary according to circumstances, being woven together with great nicety. It is sometimes sewed through and through with long horse-hairs. Thread, which may happen to be bleaching, is very liable to be appropriated to the purpose of nest-building.

The nests of other species of *Icterus* are also pensile. Several are natives of North America, and others of South America. They are quite distinct from the true Orioles (q. v.).

BALTSCHIK, or **BALDJIK**, a town of European Turkey, 18 miles north-east of Varna, noteworthy in consequence of being in the vicinity of the ruins of Tomi, to which place Ovid was exiled.

BALUSTER, popularly, *banister* or *ballaster*, (Ital. balaustro; Fr. balustre), the name given to the small shafts or pillars set in a line at short

Balusters.

equal distances, and supporting a cornice or coping. These miniature pillars have generally either a pear-shaped swelling at the lower end, or consist of two pear-shaped pieces, placed above each other, a ring of mouldings being set between them. This makes the profile resemble an ancient bow or Balista (q. v.), from which some derive the name; others derive it from Lat. *palus*, Eng. *pole* or *pale*.

BALUSTRADE, a range of balusters, together with the cornice or coping which they support. The B. is often used as a parapet for bridges, the

Balustrade.

roofs of large edifices, &c., or as a mere termination to the structure. It is also used to enclose stairs, altars, balconies, &c. Balustrades are made of stone, metal, or wood.

BALZAC, **JEAN LOUIS GUEZ DE**, born at Angoulême in 1594. In his youth he was secretary to Cardinal la Valette at Rome, where he cultivated his taste for elegant composition, and on his return to Paris devoted himself to the refinement of his native language. His efforts in this direction have given him a permanent place in the literature of his country; and though his writings do not possess much intrinsic worth, they heralded the splendid phalanx of genius which adorned the subsequent age of Louis XIV. He was a favourite of Cardinal Richelieu, a member of the French Academy, a councillor of state, and historiographer. His violent literary disputes with Father Goula, caused him to leave Paris and retire to his hereditary property of Balzac, where he died on the

18th February 1655. A collection of the works of B. appeared in Paris, edited by l'Abbé Cassaigne (2 vols. Par. 1665; 3 vols. Amst. 1684). Of all his works, his *Lettres* (3 vols. Par. 1806) have been most generally admired, and are still read. A selection from his writings was arranged by Malitourne (2 vols. Par. 1822). Compare Moreau de Mersan, *Pensées de B.* (Par. 1807).

BALZAC, HONORÉ DE, one of the best of the modern French novelists, was born on the 20th May 1799, at Tours, where his father held a civil office. At the age of twelve, he entered the college of Vendôme, but finished his studies at the Pension Lepitre, in Paris. His father, who had been impoverished by the loss of his situation, then placed him with a notary, to whom he acted as clerk. This occupation proving intolerably irksome, B. soon after began his literary career, and wrote about 30 volumes, under the names, St Aubin, M. de Veillergre, St Alme, &c. He received some trifling assistance in writing these novels, which were, however, so unsuccessful, that he lived in the greatest poverty. In the year 1826, he entered into partnership with the printer Barbier, and published various works; but the speculation turned out so ill, that he fell into debt, and returned once more to book-making. His perseverance was admirable. Although long utterly unsuccessful, he continued to write on until at last he opened a path for himself by his novel *Les Derniers Chouans, ou la Bretagne en 1800* (Par. 1829). In this book he abandoned for the first time the manner of Pigault and Lebrun, which he had hitherto adopted. Among his best works are the *Physiologie du Mariage* (2 vols. Par. 1831), *Scènes de la Vie Privée* (5 vols. 1831), *Scènes de la Vie de Province* (1832), *Scènes de la Vie Parisienne* (1832), *Le Médecin de Campagne*, *Le Père Goriot*, *La Peau de Chagrin*, *La Recherche de l'Absolu*, which were all received with much favour by the public. Of all his novels, two only can lay claim to anything like artistic completeness. They are the *Histoire Intellectuelle de Louis Lambert*, and *Eugene Grandet*. His other works suffer more or less from unnaturalness, diffuseness, and the want of a solid knowledge of the world, although there is a richness of description in portraying individual features of character, as drawn directly from the heart, not to be denied. B. exercises immense power over the female part of his readers. In his *Contes Drolatiques, colligés des Abbayes de Touraine, et mis en lumière par le Sieur de Balzac pour l'esbattement de Pantagruelistes et non autres* (2 vols. Par. 1833), he follows exactly in the footsteps of Rabelais. Success made B. conceitedly ambitious. He thought himself equal to the most distinguished authors of all time, and represented the aim of his literary activity to be, to give a complete picture of human life in all its varied phases. As a dramatic author he decidedly failed. In the year 1850, he was seized with hypertrophy of the heart, of which he died on the 18th of August. Almost the whole literary world of Paris were present at his funeral.

BAMBARRA, one of the states of Sudan, Western Africa, lying, so far as has been ascertained, between lat. 12° and 14° N., long. 15° E. and 5° W., and occupying both sides of the Joliba or Niger, which flows through its centre from south-west to north-east. The principal towns of B. stand on the banks of this river. The mountains in which the Niger has its source divide it on the S. from Guinea; the Sahara desert bounds it on the N.; on the W., Senegambia; and on the E., some of its sister-states. In its general aspect, the country is said to bear a considerable

resemblance to the agricultural districts of England; but in the west there are low chains of granite hills, forming continuations of the highlands from which the Niger springs. The climate in some parts is intensely hot; in others, it is more temperate, but it is generally healthy. The rainy season lasts from June to November. The land is well watered and fertile. Double crops of corn, rice, maize, yams, &c., are raised annually without much labour.

The butter-tree, cotton-tree, oil-palm, baobab, and date, are among the most important indigenous growths. The manufacturing industry of B. is important; the women making a soft coarse cloth, much esteemed for its beautiful blue colour, and the men articles in gold, iron, and ivory, in which a pretty extensive trade is carried on. The inhabitants, chiefly Mandingoes, are said to be superior to their neighbours in intelligence, and to be much sought after as warriors by the petty chiefs around them, who are at constant war with each other. They generally lend their assistance on condition of a certain payment. The upper classes profess Mohammedanism, but the lower are pagans. The introduction of the former religion has had at least one good effect. It has supplied the native dialect with a written speech through the use of Arabic letters. The chief domestic animals are horned cattle, goats, sheep, and fine horses. The wild animals are lions, leopards, elephants, wolves, panthers, &c.; and venomous reptiles, of which the natives are much afraid. Crocodiles are numerous in the rivers, which also abound with fish. The principal towns are Sego, Sansanding, Yamina, and Bammaku, which are all populous. The country has a nominal monarch, but it is in reality ruled by several chiefs.

BAMBERG, a city of Bavaria, in the district of Upper Franconia, beautifully situated on the banks of the Regnitz, not far from its confluence with the Main, and in the midst of vineyards, orchards, and hop-gardens. B., which has considerably declined in importance since the Reformation, is a city of considerable antiquity, having originated, it is said, with a colony of Saxons who settled here in 804. The most noteworthy of its public buildings is the cathedral, a magnificent edifice in the Byzantine style, founded by the Emperor Henry II. in 1004, and restored after fire in 1110. It contains, among other monuments, the elaborately carved tomb of the founder and his empress, Cunigunda. Attached to the cathedral is a library, with valuable missals and manuscripts, and what is represented to be the prayer-book of Henry II. There are several other fine ecclesiastical structures of early date, and the old palace of the former prince-bishops of Bamberg. The ruins of the castle of Altenburg, originally the seat of the Counts of Babenberg, and the scene of many important historical events, stand on an eminence about a mile and a half from the town. The educational institutions of B. are numerous. Pop. (1871) 25,748, chiefly engaged in the manufacture of beer, which is famous throughout Germany, porcelain, jewellery, gloves, musical instruments, &c. A large export trade in liquorice and garden-seeds is carried on.

BAMBINO, a term in art descriptive of the bearded figure of the infant Saviour, which, surrounded by a halo, and watched over by angels, occasionally forms the subject of altar-pieces in Roman Catholic churches. The *Santissimo B.*, in the church of the Ara Coeli at Rome, is held in great veneration for its supposed miraculous power of curing the sick. It is carved in wood, painted, and richly decorated with jewels and precious stones. The carving is attributed to a Franciscan pilgrim, out of a tree that grew on Mount Olivet, and the

painting to St Luke. The festival of the B., which occurs at the Epiphany, is attended by great numbers of country people, and the B. is said to draw more in the shape of fees than the most successful medical practitioner in Rome.

BAMBO'CCIADES, in painting, are grotesque scenes from common or low life—such as country-fairs, penny-weddings, boors merry-making. The name is derived from Peter van Laar, a painter, who, on account of his personal deformity, was surnamed Bamboccio (Cripple); but he was not the first painter of such scenes.

BAMBOO' (*Bambusa*), a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 feet, some 70 or 100 feet in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. They are of great importance to the inhabitants of the countries in which they grow. All of them have a jointed subterranean root-stock (rhizome), which throws up 10—100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the south-east of Asia, has crooked, and sometimes creeping stems. The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper parts, forming a dense thicket; and many of them being strongly armed with spines, they are planted for defence, presenting a formidable barrier, even against regular troops. Some of the smaller kinds are often planted as hedges. The stems are jointed

Bamboo.

like those of other grasses, very hard, but light and elastic, hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. They are, therefore, readily converted into water-vessels of various sorts; and when the partitions are removed, they are used as pipes for conveying water. They are also much employed for house-building, for bridges, and for many other purposes to which wood is usually applied. The smaller stems are converted into walking-sticks, and are imported into Europe under the name of B. Cane, both for that purpose and to be employed in light wicker-work. Some of the species grow to the height only of a few feet; and almost all of them are slender in proportion to their height, although *B. Guadua*, a native of New Granada and Quito, has a trunk 16 inches in diameter. The stems of different species vary also very

much in the thickness of the woody part, and so in their adaptation to different purposes. The external covering of the stem is, in all the species, remarkably silicious; the stem of *B. tabacaria* is so hard that it strikes fire when the hatchet is applied. This species is a native of Amboyna and Java; its slender stems are polished, and used for the stalks of tobacco-pipes. The leaves of some kinds are used for thatch, and the Chinese plait hats of them; of the external membrane of the stems of some, they make paper. From the knots of the B. there exudes a saccharine juice, which dries upon exposure to the atmosphere, and which the Greeks called *Indian Honey*. It is also sometimes named *Tubaris* or *Tabasheer*; but this name more properly belongs to a phosphorescent substance, containing silica and lime, and possessing remarkable properties, which forms in the joints of some species of B., and of other large grasses growing in dry situations. See **TABASHEER**.—The young shoots of some kinds of B. are eaten like asparagus, or are pickled in vinegar. Those of *B. Tulda*, a common Bengalese species, are used for these purposes when about 2 feet long. The seeds of some species are used as rice, and for making a kind of beer. Bamboos are generally of very rapid growth, and they are often found in arid situations, which would otherwise be destitute of vegetation. It is not improbable that they may yet be employed, where they do not naturally abound, to render districts productive which are now little else than deserts, in climates like those of Arabia, the north of Africa, and Australia; and the quality of the grain of different species seems to deserve more attention than it has ever received. The species common in the West Indies (*B. vulgaris*) is supposed to have been introduced from the East Indies. A few species are found in the Himalaya, to an altitude of 12,000 feet, and a dwarf species from that region has been successfully tried in the open air in England.

BAMBOUK, a country of Senegambia, Western Africa, lying in the angle formed by the Senegal and Faléme rivers, in N. lat. 12° 30'—14° and W. long. 10°—12° 30'. Its extent, however, has not been accurately ascertained, but is roughly estimated at 140 miles in length, and from 80 to 100 in breadth. It is populated by Mandingoes, who are ferocious and cruel in the extreme. The climate is sultry and unhealthy, especially during the rainy season. Low ranges of mountains cover the greatest portion of the surface of B. The intervening valleys, which are subject to inundations, are remarkable for their fertility. Trees common to Western Africa here attain enormous proportions. Vast herds of wild oxen roam the hills, and the most formidable wild animals of Africa are found in the forests and rivers. B., however, is chiefly remarkable for its rich gold-mines, the produce of which the natives exchange for salt, cotton, and other manufactured goods. Its inhabitants are professedly Mohammedans, but they cling to many of the pagan superstitions. B. was, four centuries ago, in the possession of the Portuguese, but they appear to have been soon driven out.

BAMBROUGH, or **BAMBOROUGH CASTLE**, one of the oldest castles in Britain, on the coast of Northumberland, 16 miles south-east of Berwick, and crowning a basalt rock, rising 150 feet above the sea, and accessible only on the south-east. In this rock is a draw-well, 145 feet deep, sunk through the basalt into the sandstone below. B. Castle was founded in 1070. It was forfeited by the Forsters in 1715, but afterwards purchased by a seion of the same house, Lord Crewe, Bishop of Durham, who bequeathed the castle and estate for

charitable purposes. In 1830, the income of the charity was upwards of £8000. Connected with the castle is a market for the sale of provisions and groceries to the poor at prime cost; a dispensary for gratis advice and distribution of medicines to the sick; funds for lodging, clothing, and educating the children of the poor gratis; an extensive library, open to all living within 20 miles; life-boats to save the crews of vessels in distress; apartments for shipwrecked sailors; and a constant patrol during stormy nights for 8 miles along the coast. Part of the funds are also employed to increase small benefices, to build and repair churches, to support schools, and to aid young men at the universities. B. village, near the castle, was the site of an old castle once the residence of the Northumbrian kings. Opposite B. Castle are the dangerous rocks called the Farn Isles, abounding in sea-fowl. Here Grace Darling and her father saved the crew of the *Forfarshire* steamer in 1838.

BAMIAN, a fruitful valley and pass of Afghanistan, about a mile in breadth, and enclosed by steep rocks, leading from Cabul to Turkistan. It is at an elevation of 8496 feet, and is as yet the only known pass over the Hindu Kush practicable for artillery and heavy transport. This valley was one of the chief centres of Buddhist worship, as gigantic idols, mutilated indeed by fanatical Mussulmans, still remain to prove. B., with its colossal statues cut out in the rock, was described by the Buddhist monks who traversed Central Asia, on their way from China to India, in the 4th and 5th centuries. The statues are found on a hill about 300 feet high, in which are a multitude of cells excavated in the rock all round, and rising above one another in irregular tiers. The cells are covered with carving. The male figure is about 160 feet, the female, 120. Both are natural in attitude, and clothed in light drapery; the face of the former is the most perfectly preserved. Each figure is hewn out of a deep niche, also elaborately carved, and representing royal personages and a variety of symbols which resemble those on the coins of the Sassanidae. Each contains a winding stair by which it is possible to ascend to the head. The whole valley is covered with the ruins of tombs, mosques, and other buildings, once belonging to the town of Ghulghuleh, which more recently occupied this site, and was destroyed by Genghis-Khan in 1221. Eight miles eastward of B. lies the ancient fortress of Zohak, attributed to the fabulous Persian Serpent-king of that name. The fortress is preserved for the purpose of guarding the important pass. Both there and in the valley of B., a great number of coins, ornaments, and other antiquities have been recently found, and fully described by Masson, Wilson, Prinsep, Wood, and others.

BAMPTON, a small town in the north-east of Devonshire, chiefly on the left bank of the Batham, a tributary of the Exe, and 22 miles north of Exeter. There are here extensive carboniferous limestone quarries. The manufacture of serge and pottery is carried on. St Michael's Church was built in the 14th c., and has a tower 70 ft. high. Pop. (1871) 1111.

BAMPTON IN THE BUSH, a small town in Oxfordshire, 14 miles south-west of Oxford. It has an ancient cruciform church, with a large Norman tower, and examples of every period of the pointed Gothic style. Pop. (1871) 764.

BAMPTON LECTURES. These lectures are so called after the name of their founder, the Rev. John Bampton, Canon of Salisbury, who left estates originally worth £120 per annum, to the university of Oxford, for the endowment of eight divinity-lecture sermons, to be preached at Great St Mary's every year, and to be published, at the

expense of the estate, within two months of their being preached. The preacher is to lecture on one of the following subjects: The Confirmation of the Christian Faith, and the Confutation of all Heretics and Schismatics; the Divine Authority of the Scriptures; the Authority of the Primitive Fathers in Matters of Christian Faith and Practice; the Divinity of Christ; the Divinity of the Holy Ghost; the Apostles' and Nicene Creeds. No person is qualified to preach these lectures who has not taken the degree of M.A., either at Oxford or Cambridge, and the same person shall never preach them twice. The first course was delivered in 1780. In 1834 and 1835, no lecturers were appointed, and no lecture was preached in 1841. With these exceptions, there has been an unbroken series of very valuable, but rather learned than popular, discourses. The most remarkable are the following: Those delivered in 1784, on Christianity and Mohanundanism, by Dr White, who was accused of having obtained assistance in their composition from Dr Parr and Dr Badcock; those by Dr Tatham in 1790, on the Logic of Theology; those of Dr Nott in 1802, on Religious Enthusiasm—this series was directed against the pretensions of Wesley and Whitefield—those of Dr Mant in 1812; those of Reginald Heber in 1815; Whately in 1822; Milman in 1827; Burton in 1829, on the Heresies of the Apostolic Age; Soames in 1830, on the Doctrines of the Anglo-Saxon Church. But of the whole series, none have caused greater excitement and controversy than those delivered by Dr Hampden in 1832, on 'The Scholastic Philosophy considered in its Relation to Christian Theology.' They were attacked on all sides, but especially by the leaders of the Oxford Tract Association. Hampden was accused of Rationalism and Socinianism. When he was appointed Regius Professor of Divinity in 1836, a petition against his appointment was sent up to the throne; and upon this being rejected, a censure was passed upon him in convocation by a large majority, declaring his teaching to be unsound, and releasing undergraduates from attendance at his lectures. Notwithstanding this, he was raised to the see of Hereford in 1847, under the government of Lord John Russell—thirteen of the bench of bishops protesting against the appointment. There has been a recent course of B. L., delivered by Henry Longueville Mansel in 1858, on 'The Limits of Religious Thought,' which have caused a less bitter, but scarcely less interesting controversy. Mr Mansel possessed great power as a dialectician, and his lectures contained many very eloquent passages. The main position which he took up was, 'That the human mind inevitably, and by virtue of its essential constitution, finds itself involved in self-contradictions whenever it ventures on certain courses of speculation,' i. e. on speculations concerning the infinite nature of God. He maintained that all attempts to construct an objective or metaphysical theology must necessarily fail, and that the attainment of a philosophy of the Infinite is utterly impossible, under the existing laws of human thought—the practical aim of the whole course being to shew the 'right use of reason in religious questions.' Mr Mansel was accused by his critics of condemning all dogmatic theology (e. g., all creeds and articles), and of making revelation itself impossible. Mr Maurice has been one of his principal opponents. The B. L. for 1859 were delivered by Geo. Rawlinson, the subject being *The Historical Evidences of the Truth of the Scripture Records, stated &c.* Canon Liddon's lectures in 1866, on our Lord's Divinity, have been the most important recently delivered.

A course of lectures similar to the Bampton was

founded about the same time at Cambridge, by the Rev. John Hulse. See HULSEAN LECTURES.

BAN. This word occurs in most of the modern languages of Europe, and its primary signification appears to have been, 'to make a signal' (see **BANNER**), 'to proclaim' or 'publish.' This meaning it retains in the phrase, *bans* or *banns* (q. v.) of marriage. In Germany, the *acht* or *bannum* was a sentence of outlawry pronounced in the middle ages against those who escaped from justice, or refused to submit to trial. We often read of refractory princes, and even cities, being placed under the *ban* of the empire. The following are the terms of banning used in an old formula: 'We declare thy wife a widow and thy children orphans; we restore all thy feudal tenures to the lord of the manor; thy private property we give to thy children; and we devote thy body and flesh to the beasts of the forest and the fowls of the air. In all ways and in every place where others find peace and safety, thou shalt find none; and we banish thee into the four roads of the world—in the devil's name.' Besides these sentences of outlawry, many other announcements were accompanied with denunciations and imprecations. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing, came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakspeare and Milton, and other old writers.

BAN; ARRIÈRE BAN. Besides the civil use of the word *ban*, as a proclamation or prohibition, there was a military application of the term in former days in France. When the feudal barons, who held their estates and honours from the king, were summoned to attend him in the time of war, they were called the *ban*, or the levy first called out; while the tenants, subordinate to these barons, formed the *arrière ban*, or secondary levy.

BAN, or BANUS, supposed by some to be a contraction of the Illyric word *Lojun*, i. e., lord, but more probably another form of the Slavonic word *Pan*, which possesses the same signification. Formerly, it was a title given to some of the military chiefs who guarded the eastern boundaries of the Hungarian kingdom, and was therefore synonymous with the German *Markgraf*. The *ban*, who was appointed by the sovereign, but not for life, and whose appointment had to be ratified by the national diet, had originally very extensive, in fact, almost unlimited powers. In political, judicial, and military affairs, he was the supreme authority. Within his own territory, he exercised an influence similar to that of the Palatin in Hungary, and only lower than a king. In time of war, he headed the troops of his *Banat* (q. v.), and if the campaign occurred within its limits, it was his duty invariably to occupy the post of danger. He led the van to battle, or covered the rear in retreat. For these services, he was recompensed partly in ready money, and partly by a monopoly of salt. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, Machow, and Szorény, but their boundaries changed so frequently, that at the present day it is impossible to ascertain what they originally were. The encroachments of the Turks in the 16th c. rendered the union of the various banats necessary; and after some time, the whole were formed into the double banat of Dalmatia and Croatia. A still more complete unity was subsequently obtained by centralising the military power. In 1723, the authority of the B. was made entirely subordinate to that of the

supreme government of Hungary. After numerous vicissitudes, his powers, rights, and titles were strictly defined during the reign of Maria Theresa. He was then acknowledged to be the third dignitary of the Hungarian kingdom, appointed a member of the Hungarian council of government, and president of the council of the banat, and at the coronation of the Hungarian king went before him, bearing the golden apple, the symbol of sovereignty. Such was the position of the ban until the 4th of March 1849, when Croatia, Slavonia, and Dalmatia were transformed into Austrian crown-lands, and the ban made wholly independent of Hungary, and endowed with the same extensive powers as the governors of other crown-lands, but retaining, nevertheless, his original title. During the disturbances in Vienna and Hungary, in 1848, the Ban Jellachich (q. v.) rendered important service to the Austrian emperor.

BANANA, a fruit originally East Indian, but much cultivated in warm countries over the whole globe. It is now generally regarded as a mere variety of the Plantain (q. v.); although they were formerly ranked by botanists as distinct species, the Plantain under the name of *Musa Paradisiaca*, and the B. of *M. sapientum*—the specific name signifying 'of the wise men,' and being intended to convey an allusion to a statement by Theophrastus concerning a fruit which served as food for the wise men of India, and which, from his description, is supposed to have been the plantain or banana. The names plantain and B. are somewhat vaguely used in their

Banana.

application to different cultivated varieties, which are very numerous; those called B. have generally dark purple stripes and spots on their stems, and the fruit is smaller, less curved, and of more delicate taste than the plantain, with a soft and luscious pulp. Each fruit is generally about four or five inches long. The B. is always used in a ripe state, and never like the plantain, as a substitute for bread; unless when the pulp is squeezed through a fine sieve, and formed into small loaves, which, when dried, may be kept for a great length of time, but which are saccharine, and not farinaceous. It is sometimes fried in slices; it is often made into preserves; and its juice affords an excellent wine. It has been produced of good quality in hot-houses in Britain.—The fruit of *Musa Cavendishii* is sometimes also called banana. See **PLANTAIN**.

BANA'NA BIRD (*Xanthornus Icterus*), a beautiful bird, allied to the Baltimore Bird (q. v.), which it considerably exceeds in size; a native of the West Indies and warm parts of America. Its colours are tawny and black, with white bars upon the wings. It is very lively and active. It is gregarious, and a number of the nests may often be seen near each other, suspended to the extremities of slender branches of trees, so as to be out of the reach of snakes and monkeys. It is often kept in houses to destroy insects. It is very easily domesticated, and delights to be caressed.

BAN'AT, any district or territory under a ban, but specially applied to a province of the Austrian empire, which has, curiously enough, no ban. It is bounded on the W. by the Theiss; on the S., by the Danube; on the E., by the line of mountains which separates Hungary from Wallachia and Transylvania; and on the N., by the Maros. Pop., in 1858, 1,574,500. It is partly mountainous and partly flat, but is everywhere copiously watered, and exceedingly fertile. The chief rivers are the Temes and Karasch. The climate is warm in summer, and comparatively cold in winter; but, though not unpleasant, it is far from salubrious in the west, on account of the swamps and morasses which abound. Nevertheless, it is, next to Lombardy, the most productive of the Austrian provinces, yielding rich crops of wheat, spelt, and other grains; the vine is little cultivated. Wild fowl are numerous, and the rivers swarm with fish. The mines are valuable; coal, iron, copper, gold, silver, and zinc being procured in considerable quantities. The mineral springs of Mehadia are in great repute. The principal town is Temesvar.

Until recently, the B. belonged to Hungary, but in consequence of an imperial edict of 18th November 1849, it was separated from that country, and formed into an Austrian crown-land under the title of the 'Woiwodina of Servia and Banat of Temes.'

BAN'BRIDGE, a small town in the west of Down county, Ireland, on a steep slope on the left bank of the Bann, 76 miles north of Dublin. It is a thriving seat of the linen manufacture in all its stages, from the preparation of the soil for the flaxseed to the finishing of the finest linen. Miles of bleaching-grounds exist in the vicinity, and numerous factories along the Bann. Pop. 3301.

BAN'BURY, a small town in the north of Oxfordshire, on the right bank of the Cherwell, 23 miles north of Oxford. There formerly existed here a very strong castle, which was built about 1125, and sustained various sieges during the early English civil wars. At Danesmore, near B., the Yorkists were defeated in 1469. B. is the centre of the famous rich red land of Oxford county. This land is among the most fertile in the kingdom. A system of canals connects the town with all parts of England. The vicinity of B. is thickly studded with villages. Numerous remains of the ancient Britons are found in the neighbourhood. B. is noted for its manufacture of agricultural implements, and for its malt liquors, cheese, and cakes. There are also manufactures of plush, shag, girth, and other webbing. B. returns one member to parliament. Pop. of municipal borough, 4026; of parliamentary, 5715.

BANC, legally, is a seat or bench of justice, and in this sense has given rise to the expression of the courts of law at Westminster 'sitting in banc,' or *in banco*—that is, sitting together on the bench of their respective courts, in term-time, and otherwise, as is provided by statute.

BAN'CA, an island on the north-east coast of Sumatra (lat. 2° 20' S., long. 106° E.), from which it is separated by a strait of its own name, with

an area of 4300 square miles, and a population of 47,000; being barely eleven persons to a square mile. It is famous for its tin, exporting annually 4000 tons, mostly to China and Java.

BANCO (It.), a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency consisted, as it often did, of clipped, worn, and foreign coins. These the early banks (Venice, Amsterdam, &c.) received at their intrinsic worth, and credited the depositor in their books with this bank-value. The term is now chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not represented by any coinage. The Hamburg Mark B. (= 1s. 5½d. sterling = 15½ Prussian S. groschen) is to the current mark (= 1s. 2½d. = 12½ S. groschen) as 20 to 16. Sweden has also a peculiar bank-money, 8 dollars B. being equal to 3 dollars specie. Genoa had at one time a bank standard, and the present current money being different from that, is still called 'fuori banco,' outside the bank.

BAN'CROFT, GEORGE, American historian, born 3d October 1800, near Worcester, in Massachusetts, was the son of Dr Aaron Bancroft, an eminent Unitarian minister. He entered Harvard College at the age of 13, and obtaining a valuable exhibition there, proceeded in 1818 to Göttingen, where he studied history and philology under Heeren, Plank, and Eichhorn, and in 1820 obtained the degree of doctor. At Berlin, he attended the lectures of Hegel, and had frequent intercourse with Schleiermacher, W. von Humboldt, Savigny, Varnhagen von Ense, and other literary men of note. Subsequently, he travelled through Germany, and formed an acquaintance with Goethe and Schlosser. Having visited Paris, London, and Italy, B. returned to America, and after some time spent in tuition, devoted himself to politics. He soon became celebrated as a democratic politician, and was made collector of customs at Boston. He still continued his literary labours, especially in lectures upon German literature, philosophy, &c. When Polk was elected president, in 1845, he appointed B. secretary of the navy. While in this office, he established an observatory at Washington and a naval school at Annapolis. In the autumn of 1846, B. was sent by Polk as ambassador extraordinary and plenipotentiary to England, where he remained till 1849, taking advantage of his stay in London to carefully and comprehensively investigate all the authentic sources for materials to aid him in writing the *History of America*. He published the result of his labours in his *History of the Revolution in North America* (Boston, 1852). He had already secured for himself an honourable place among modern historians by his *History of the Colonisation of the United States of North America* (3 vols., Boston, 1834—1840). The whole of these writings are now included in the author's *History of America*, which is a work of solid excellence, picturesque in style, and liberal in sentiment.

BAN'CROFT, RICHARD, Archbishop of Canterbury, and a bitter opponent of the Puritans, son of John B. and Mary, niece of Hugh Curwyn, Archbishop of Dublin, was born at Farnworth, Lancashire, in September 1544. Educated at Cambridge, he took the degree of B.A. at Christ's College in 1567, and that of M.A. at Jesus' College in 1570. He became rector of Teversham, Cambridgeshire, in 1575, of St Andrews, Holborn, in 1584, and treasurer of St Paul's Cathedral in 1585. In the latter year, he was admitted D.D. By the Lord Chancellor, Hatton, to whom he was chaplain, he was presented

to the rectory of Cottingham, Northamptonshire. In 1589 he became a prebendary of St Paul's, in 1592, of Westminster, and in 1594, of Canterbury. Consecrated Bishop of London, May 8, 1597, he attended Queen Elizabeth during her last illness. At the famous Hampton Court Conference under James I., he was one of the chief commissioners on behalf of the Church of England, and took the lead in the disputations. In the convocation of 1603—4, he sat as president. In October 1604, he succeeded Whitgift as Archbishop of Canterbury; and was sworn in one of his majesty's privy council in September 1605, and chancellor of the university of Oxford, 1608. He died November 2, 1610. B. had a high character as a preacher and statesman; and was a vigilant ruler of the church. He is author of two sermons, one of which, preached at St Paul's in 1588, contains a furious invective against the Puritans, and of two treatises respecting church order and discipline. B. left his library to his successors in the see of Canterbury for ever.—His nephew, JOHN B., Bishop of Oxford, 1632, died 1640, built the palace of Cuddesden for the bishops of that see. Burned by the parliament troops, 1644, it was rebuilt, 1679.

BAND, or **BANDS**, a portion of clerical dress, and the only relic of the ancient *amice*, a linen vestment which was used in the ancient church to cover the shoulders and neck of the priest. It also forms a part of the full dress of the bar, the universities, and the leading functionaries in schools of old foundation. At Winchester and some other schools, it is even worn by the scholars themselves. The bands worn by lawyers and other civilians, may be a relic of the wide stiff collar which was a part of the ordinary civilian dress in the reign of James I.

BAND, in Architecture, is the name given to any

kind of ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. *B. of a shaft* is the moulding or suits of mouldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.

BANDA, chief town of a district in Bundelcund, in lat. 25° 28' N., and long. 80° 23' E. In 1847, its population was 33,464. It is a great mart for cotton. It is situated

on the right bank of the Cane or Keyn, an affluent of the Jumna, being 95 miles to the south-west of Allahabad, 560 to the north-west of Calcutta, and 190 to the south-east of Agra. The district of B. contains 2878 square miles, and 532,525 inhabitants.

BANDAGES are used by surgeons to apply pressure on a part, or to retain dressings upon wounds. The most common bandage is a strip of linen, calico, or elastic web, from 3 to 5 or more inches in breadth, rolled longitudinally; hence the name *roller*. There are also B. to suit special purposes, as the four-tailed for the head or knee, which consists of a piece of cloth split up on each side towards and nearly to the centre. When

applied, the tails are crossed and tied so as to make an extemporaneous night-cap. In applying the roller

Bandage.

bandage to a leg, the surgeon first turns it round the foot, then round the ankle; and so by repeated turns, each one of which should overlap about a third of the previous one, till he reaches the calf of the leg, when he must fold at each turn the bandage sharply back on itself, by which manœuvre the bandage will lie flat and smooth on the limb. The operator must remember that the bandage must be applied more tightly at the foot than in the leg, so that it may not impede the course of the blood through the veins. This requires to be practised, as the effect of a bandage is always for good or evil as it is well or ill applied.

BANDA ISLES, a portion of the Moluccas, consisting of 12 islands, 6 of which are uninhabited, about 50 miles to the south of Ceram. Their population is variously stated at from 5000 to 155,000. Their mean lat. and long. respectively are 4° 30' S., and 129° 50' E. Their chief production is the nutmeg, the annual export of that spice being about 500,000 lbs., with a corresponding quantity—about one-third—of the mace. Like most of the islands in this neighbourhood, they belong to the Dutch. They are lofty and volcanic.

BANDA ORIENTAL, a state of South America. See URUGUAY.

BANDA'NA, a kind of printed handkerchief of Indian origin, now extensively made in Britain, usually of cotton. The cloth is first dyed Turkey red, and then the pattern is made by discharging the colour with bleaching liquor in a powerful Bramah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these courses are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real B. style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 500 tons is required to work them clean. See CALICO PRINTING.

BANDEL, ERNST VON, an eminent modern sculptor, was born in 1800, in Anspach. While attending the academy at Munich, he prosecuted his studies so diligently that in 1820 he sent to the exhibition a plaster figure of Mars reposing, as large as life, which procured for him considerable reputation.

Of various models of this kind done by him, one, a figure of Charity, was executed in marble. This work occupied the artist about ten years. It exhibits great chasteness of design, and a minute carefulness of execution. Among his best portrait busts, in which he excels, are those of Maximilian, king of Bavaria (1832), and of the artists D. Quaglio and Peter Hess. He has also executed the monument of the Knight von Skell in the English garden of the Art Institution at Munich, the tombstone of the historical painter Langer, and several figures of the gods. In 1842, B. executed a bust of the poet Grabbe, and a marble statue, as large as life, of Thusnelda, wife of Hermann. She is represented loaded with chains, with her hands crossed on her breast, as when she was led away captive by the Romans.

BANDELLO, MATTEO, an Italian writer of *novelle* or tales, was born at Castelnovo in Piedmont about the year 1480. In early life, he became a Dominican monk, in the Convent delle Grazie at Milan, but soon abandoned this vocation for a more free and independent life. His uncle, who had been elected general of the order in 1501, took him to travel with him; and in Rome and Naples, B. devoted himself to the study of belles-lettres. He then returned to Milan, whence he was driven by the Spaniards, as a partisan of France, after the battle of Pavia in 1525. He accompanied Francis I. to France, and was, in 1550, made bishop of Agen by Henry II. He left the care of his diocese to the Bishop of Grasse, in order to be able to devote himself without disturbance to the completion of his tales, which he published in the Italian language in three volumes (Lucca, 1554), to which a fourth was added after his death, which took place in 1561. The tales of B. rank next to those of Boccaccio in Italy. They are distinguished by unaffected simplicity of style, fluency and vividness of narrative, and a harmonious brevity of periods. It must be confessed, however, that they are not unfrequently very impure in tone. B. wrote several other works.

BANDE NOIRE ('Black Band') was the name given, during the first French Revolution, to the societies of capitalists who bought the confiscated buildings which had belonged to the church, emigrants, &c. The opprobrious name was fixed on them on account of their vandalism in the destruction of old relics, works of art, churches, convents, abbeys, episcopal residences, &c., many of which possessed both a scientific and historical interest. It has, however, been alleged, on the other hand, that these societies have frequently done considerable service to the community, in removing old and useless edifices, and that their minute subdivision into lots of the old territorial domains, has both favoured agriculture and ameliorated the condition of the people.

Banderole.

BANDEROLE, a small streamer fixed immediately under the crook, on the top of the staff of a crosier (q. v.), and folding over the staff.—Also an architectural term for the flat inscribed band used in the Renaissance buildings, similar to those now used for mottoes to coats-of-arms.

BAND-FISH, or **SNAKE-FISH** (*Cepola*), a genus of fishes of the Ribbon-fish (q. v.) family. The body is much elongated and compressed. The bones are little more solid than a mere fibrous net-work, and everything else exhibits a corresponding delicacy, so that specimens are seldom to be obtained in an uninjured state. All the species inhabit quiet depths, and are incapable of contending with

waves and currents. Their singular form, and the beauty of their colours, make them objects of great interest. One species, the Red B. (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about fifteen inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of Fire-flame and Red Ribbon, by which it is known at Nice.

BANDICOOT (*Peramides*), a genus of marsupial (q. v.) quadrupeds, occupying in the zoology of

Bandicoot.

Australia a place somewhat analogous to that of shrews (q. v.) in Europe. Their dentition is remarkable, as they have ten cutting teeth in the upper jaw, and only six in the lower, the posterior ones of which are two-lobed: in other respects, it nearly resembles that of opossums. They have an elongated head and pointed muzzle; the hind-legs are considerably longer than the fore-legs; the thumb and little toe of the fore-feet are little more than simple tubercles, so that there seem to be only three toes; and there is a fleshy tubercle in place of a thumb on the hind-feet. Their movements are similar to those of hares or rabbits. They live on bulbs, insects, &c., make ravages in potato-fields, and devour corn in granaries. There are several species. The Long-nosed B. (*P. nasuto*) is about a foot and a half in length from the extremity of the nose to the origin of the tail, which is not unlike that of a large rat, but better covered with hair. It is chiefly found in the mountainous parts of New South Wales. *P. Gunnii* is common in Van Diemen's Land.

BANDICOOT, BANDICOOT RAT, MALA-BAR RAT, or PIG-RAT (*Mus giganteus*), the largest known species of rat. The name B. is a corruption of the Telinga *pandikoku*, literally signifying pig-rat. The animal inhabits many parts of India, and is plentiful in Ceylon. It is chiefly found in dry situations, and often in hilly districts. It attains the weight of two or three pounds, and is 24—30 inches long, including the tail, which at the base is 2½ inches in circumference. The body is thick, and greatly arched, black above, grayish below. Its flesh is a favourite article of food with the coolies of India, and is said to be delicate, and much to resemble young pork. It feeds chiefly on grain and roots, and is very destructive in gardens. Its nests, when rilled, are frequently found to contain considerable quantities of rice, stored up against the dry season.—Sir J. E. Tennent's *Ceylon*.

BANDIERA, ARTILIO and **EMILIO**, two brothers well known for their tragic fate, were descended from a distinguished aristocratic family of Venice, which had once held a place in the red book of the republic. They were lieutenants in the Austrian navy, their father being rear-admiral; but, instead of sharing the pro-Austrian sentiments of their parent, they cherished enthusiastic dreams of the free and

united republic of Italy. In the year 1812, they entered into correspondence with Mazzini, whom they regarded as almost a demigod. Their glowing and enthusiastic patriotism breathes in every line of their letters. Both were noble spirits, ready for any sacrifice, but unfortunately impressed with the delusive idea that their native country could be saved by means of a conspiracy. Emilio, the younger, of a stronger bodily frame, but of a lighter disposition, was under the influence of his graver and more thoughtful brother. In the year 1813, they believed that the time was come for a revolution by force of arms; but their premature appeal finding no practical response, they fled to Corfu in March 1814, where they endured many bitter disappointments and much misery. Hope alone inspired them with life; but at length, misled by false rumours of a rising in Naples, with which it is supposed the Neapolitan police had something to do, they ventured to land with twenty companions at the mouth of the small river Nieto, in Calabria, believing that their appearance would be the signal for a general insurrection. The Neapolitan government expected them; one of their companions, a certain Boecchicampe, had betrayed them. They were attacked by an overwhelming force, and were nearly all taken prisoners at once. One only fell on the spot, and two escaped. Nothing was ever allowed to transpire respecting the trial of these unfortunate men. Attilio and Emilio were shot along with seven of their comrades in the public square of Cosenza, on the 25th July 1814. They died joyfully, exclaiming 'Viva l'Italia!' The public mind had not then become accustomed to hear of bloody deaths for political causes. A cry of indignation resounded through Europe at this 'kingly revenge,' as it was called in a conservative paper of the day. A year later, their remaining companions were pardoned. The fate of the brothers B. attracted much attention in England, from the circumstance that letters of M. Mazzini, then in London, had been opened in the post-office by authority of government, which was accused of giving such information to the Italian governments as enabled them to entrap the insurgents.

BANDINELLI, BACCIO, the son of a famous goldsmith of Florence, and one of the best sculptors of his time, was born at Florence in 1487. His first instructions were probably received in the workshop of his father, for in those days goldsmiths wrought from their own designs. He was afterwards a pupil of Rustici, and the friend of Leonardo da Vinci. He was an angry and jealous rival of Michael Angelo, whose grandeur of conception he strove to equal, and who is said to have retaliated his enmity by contempt. It must be admitted, however, that we have only prejudiced sources from which to draw our information regarding him. Benvenuto Cellini, whose language is generally passionate and hyperbolic, is his chief accuser, although Vasari also speaks of his proud and envious disposition. Whatever may have been his moral infirmities, it is impossible to deny that, as a sculptor, he was in his day second only to Michael Angelo. His feuds with his brother-artists do not appear to have injured him in the opinions of persons of distinction. He was patronised by Cosmo de' Medici, Charles V., Francis I., Clement VII., and other powerful friends. Clement even bestowed on him an estate. He died at Florence, 1559—1560.

His best works are bassi-rilievi, among which are those that adorn the choir of the Duomo at Florence. On the high-altar in the same building is to be seen his *Corpus* of Christ, supported by an angel, with God the Father, over it. His most ambitious work is Hercules with Cacus at his feet. In the Medicean

Gallery are his copies of the group of the Laocoon—a masterly imitation of the antique, in which he boasted that he excelled even the ancients themselves. He also executed statues of some of his patrons; all his works exhibit power, vigour, and skilful drawing, but it is alleged, apparently with considerable truth, that 'he was too fond of the terrible graces of composition.'

BANDIT, a word originally signifying a 'banished' or outlawed person; then one who, because outlawed, wages war against civilised society; and finally, a highway robber. The banditi, or banditti, formed in Italy in earlier times, as it were, a separate community or guild, who submitted to their own stringent laws, carried on both open and secret war with civilised society, and kept up a certain romantic idea of honour. By means of the severe measures which were adopted in 1820 by the papal government against the banditti and their abettors, their haunts were broken up. Those who still occasionally disquiet the frontiers of Naples are in general people settled on the spot, who regard robbery and murder as equally a branch of their trade with agriculture. Peter the Calabrian, one of the most famous B. chiefs in 1812, assumed the titles of 'Emperor of the Mountains, King of the Woods, and Lord of the Highroads from Florence to Naples.' The government of Ferdinand I. found themselves obliged to conclude treaties with him. The banditti must be distinguished from common robbers, who were called *Malviventi*. In later times, the banditti were joined by adventurers of all kinds, to such an extent, that the Austrian troops who occupied Naples were obliged to make frequent expeditions against them. In Sicily, the banditti are most numerous in the Val Demone. They formerly acquired so much power there, that the Prince of Villafranca, as a piece of policy, declared himself their patron, and treated them with much confidence. In the years 1841—1843, political fugitives united with robbers and adventurers of all kinds in the Abruzzi, Calabria, and Romagna, and since then they have never been entirely extirpated. The revolutions of 1848—1849 added greatly to their numbers, and in several districts of Italy, especially in the States of the Church, between Ferrara and Ancona, they reached, an unheard of degree of boldness, notwithstanding the Austrian army of occupation. Under the command of one Bellino (known by the name of 'Il Passatore'), a daring and talented man, who died in March 1851, they kept the country in terror, and even burned several villages to the ground. They also carried on a real guerrilla warfare against the military forces of the country. Recent events (1859) in Italy have, it is said, recalled numbers of these banditti to a more honourable course of life.

BANDOLEE'R, or **BANDALEER**. Two centuries ago, soldiers' muskets were provided with *matchlocks*, a very slow and ineffective contrivance for firing. The musketeers were furnished with gunpowder in small cylindrical boxes made of wood, tin, or leather, each containing sufficient for one charge. Twelve of these little boxes were fixed to a belt called a *bandoleer*, worn over the left shoulder. In what way these were superseded by a superior arrangement, will be found noticed under **CARRIDGE**.

BANDOLINE is a mucilaginous substance used for stiffening hair, and keeping it in shape or form. It is much used by ladies in the present prevailing mode of wearing the hair, and by gentlemen, to dress their moustaches. The usual receipt for making the B. sold in the shops is to boil Carrageen

(q. v.) or Irish-moss with water till a thick mucilage is obtained, which is afterwards scented with *Eau de Cologne* or other perfumed spirit; a second mode of preparing B. is to soak quince-seeds in cold water for a day or two, then strain, and add perfume; and a third process is to heat gum tragacanth with water, and when a mucilage is obtained, add the scent.

BANDON, a town of Ireland, county Cork (q. v.).

BANDONG, a commercial town on the west coast of Java, in the vicinity of the volcano Gunung Guntour, by an eruption of which eighty villages were destroyed in 1822.

BANDS, MILITARY, consist each of a body of skilled musicians, attached to a regiment in the British service. According to military regulations, the only indispensable instruments are drums, fifes, bugles, and trumpets, all of which are employed to give signals on the march or in active service, either for infantry or for cavalry. To supplement this meagre musical establishment, however, the officers of regiments organise, chiefly at their own cost, effective military bands, who use a variety of instruments—such as flutes, clarionets, bassoons, horns, ophicleides, big drums, cymbals, triangles, &c. What at first appears to have been a matter of individual choice, has at length assumed almost the force of a regulation; for officers are obliged to contribute twelve days' pay in the course of a year, and an extra sum when promoted, to the band-fund. The members of these bands are selected from the ranks; but the band-master, though in uniform, is usually a civilian who is hired for the purpose, and who generally refuses to accompany the regiment abroad, except at an increased rate of remuneration. The musicians, generally, are in an anomalous position; for, whilst serving in the band, their pay, and eventually their pensions, are restricted to those of the private soldier. Good musicians have at all times a tendency to quit the B.; their better prospects as teachers, and players in orchestras and concerts, induce them to obtain release by paying the amount of compensation prescribed by regulation. An attempt made by the Duke of Cambridge in 1856, to relieve the commissioned officers of part of the expense entailed upon them by the present system, failed, and matters remain as they were. In most of the regiments of the line, the band consists of a band-master and about fifteen musicians; but in the choice corps the number is often much larger. When a regiment consists of two or more battalions, the band goes with the first. The band plays on parade and at mess, as a part of regular duty. When M. B. play at festivals, concerts, &c., 'by permission of the commanding-officer,' the payment goes to the musicians; and the chance of obtaining these fees is one of the inducements to the men to remain in a service which has very few attractions in relation to the actual regular amount of pay. The bands of the three regiments of foot-guards—Grenadier, Coldstream, and Scots Fusilier—are very frequently engaged in this way during the London season.

BANNEBERRY. See **ACTÆA**.

BANFF (pron. Banf), the capital of Banffshire, a seaport town in the north end of the county, on the left bank of the mouth of the Doveran, 45 miles north-north-west of Aberdeen. It stands on an abrupt height on the Moray Firth, and consists of an upper or inland town, and a lower or sea town, with the remains of an ancient castle on a height between them. Close to the south side of B. stands Duff House, the seat of the Earl of Fife, with a park 14 miles in circumference. The harbour is liable to be filled with sand. A seven-arched bridge over the Doveran unites B. with the town and seaport of Macduff,

which stands on the east side of the river. The chief exports are corn, cattle, salmon, and herrings. Robert H., in 1372, made B. a royal burgh. Sharpe, the famous Archbishop of St Andrews, was born here in 1613, and the noted robber, Macpherson, was executed in 1700. The August floods in the Doveran, in 1829, carried away several houses, and destroyed much property in Banff. B. unites with Elgin, Cullen, Inverury, Kintore, and Peterhead in sending one member to parliament. Pop., including Macduff, 6000. (Pop. 1871—7439.)

BANFFSHIRE, a county in the north-east of Scotland, bounded N. by the Moray Firth; E., S.E., and S. by Aberdeenshire; W., by Elgin and Inverness shires. It stands fourteenth among the Scotch counties in size, and fifteenth in population. Its greatest length is about 68 miles, its greatest breadth about 32—average, 12; its extent of sea-coast about 30; estimated area, 647 square miles. The surface, especially in the south and south-east, is mountainous, interspersed with fertile valleys and fine pastures; but the surface near the coast is comparatively level. The chief mountain-ranges and rivers, as well as the strike of the stratified rocks, run from south-west to north-east, and the whole county is an extensive slope in the same direction, from the Grampians to the Moray Firth. The coast is rocky, but not high, except to the east of Banff. The highest peaks are the North Cairngorm, 4090 feet; Ben-a-Main, 3874; Ben Rinnes, 2763; Corryhabbie, 2569; Knock, 1416. Ben Muicdhuì, 4296 feet, is partly in Banffshire. The rivers of B. all flow into the Moray Firth. The chief are the Spey—one of the largest of the Scottish rivers, and the most rapid in Britain—which bounds a third of the county on the W.; and the Doveran, 60 miles long, and included within the county. The predominant rocks are granite, quartz rock, mica-slate, clay-slate, syenitic greenstone, graywacke and graywacke-slate, and old red sandstone with fossil fishes. Many patches of metamorphic limestone and of serpentine occur. The serpentine near Portsoy has long been famous as the 'Portsoy Marble.' Beryl and rock-crystal occur on Cairngorm. Slate and limestone are quarried. Lead, iron, antimony, and plumbago occur in small quantity. The soil is very fertile, and highly cultivated on the best modern principles of agriculture, in a tract along the coast two to eight miles broad, as well as along the valley of the Doveran, and in many of the glens. In 1857, nearly a third of the surface of B. was in crop, the chief crops being oats, turnips, and grass. The breeding of cattle is the chief object of the farmer. The chief manufactures of B. are weaving, bleaching, tanning, and distilling. The produce of Glenlivet, near the centre of B., has long been celebrated. The chief exports are grain, meal, and cattle. There are twelve fishing towns and villages along the coast. The herring-fishery is extensively carried on. The salmon-fisheries of the Spey and Doveran employ 200 men, and are very valuable, the Spey ranking after the Tweed and Tay as a salmon-river. B. is divided into the districts of Enzie, Boyne, Strathiska, Strathdoveran, Balveny, Glenlivet, and Strathavon. The chief towns and villages are Banff, Macduff, Portsoy, Keith, Cullen, Buckie, Dufftown, and Tomantoul. Pop. in 1851, 54,171; day-schools, 161, with 8271 pupils; places of worship, 74 (20 of the Established, and 23 of the Free Church). B., along with the counties of Aberdeen and Elgin, enjoys the Dick Bequest (q. v.) for parochial education. Two-thirds of B. belong to four landed proprietors. The county returns one member to parliament, and Banff and Cullen unite with Elgin, Inverury, Kintore, and Peterhead in returning another. B.

contains numerous remains of antiquity, the most remarkable being the old churches of Gamrie and Mortlach. The former, built in 1010, and used for public worship till 1830, is called the 'Kirk of Skulls,' the bones of the Norsemen who fell on the neighbouring field of Bloody Pots having been built into its walls. Mortlach was for a century the seat of a bishop, but David I., in 1139, incorporated the see with that of Aberdeen. (Pop. 1871—62,010.)

BANGALORE, a fortified town of Mysore, situated 70 miles to the north-east of Seringapatam, in lat. 12° 58' N., and long. 77° 38' E. It is the chief military station of the British in the territory. It has a manufacture of silk; but that of cotton is, or has been, far more important, having been at one time estimated to employ 3000 looms. The population of B. is about 60,000. As the place is 3000 feet above the level of the sea, the thermometer, during six successive years, is said to have risen only twice above 90°, and then only to 92° and 93°. During the same period of time, the lowest temperature was 61°. B. was a favourite residence of Hyder Ali; and, in 1791, it was stormed by the British under Lord Cornwallis. Water is good and abundant; and the usual vegetables of Europe come to maturity in the gardens.

BANGKOK, the capital city of Siam, is situated on the banks of the Meinam, about 20 miles from the mouth of that river, in the Gulf of Siam, and in lat. 13° 38' N., and long. 100° 34' E. Its population has been estimated by the Roman Catholic missionaries, who have had the best means of ascertaining it, at upwards of 400,000. Sir John Bowring's 'impression' is that it exceeds 300,000. There are upwards of 200,000 Chinese, in whose hands is centered nearly all the trade of B., which is large. For their right to trade here, the Chinese pay a poll-tax of about three dollars on entering the kingdom, and a similar sum is collected from them every three years. The payment of this tax exempts them from the half-yearly servitude which all other oriental strangers resident in Siam are required to give. The approach to B. by the Meinam, which can be navigated by ships of from 200 to 300 tons burden, is exceedingly beautiful, the banks being skirted by fine trees full of gay birds. As the town is neared, numerous temples present themselves, and floating-houses become common; and finally, the whole city, with its rich gardens, and shining temples and palaces, bursts full upon the view. A large number of the houses float on rafts, and can be transferred from one place to another at pleasure. There are a few houses in the city built of brick and stone, but the greater part are of wood. There are usually in each house a division for males and one for females. The land-houses are raised upon piles, 6 or 8 feet from the ground, and are reached by rude ladders—the daily flow of the tides and the annual inundations rendering this plan necessary. The floating-houses are made of bamboo-boards, wicker-work, or palm-leaves, and have generally a verandah in front, with a small wing at each end. The circumference of the walls of B., which are 15 feet high and 12 broad, is said to be 6 miles. The internal traffic of B. is chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen except in the neighbourhood of the palaces. The chief interest of the kingdom of Siam, according to Sir John Bowring, concentrates itself in Bangkok. B. is the constant residence of the two kings of Siam and their respective courts. The palace of the first king is surrounded by high walls, and is nearly a mile in circumference. It includes temples, public offices, accommodation for some thousands of

soldiers, with their necessary equipments, a theatre, and rooms for about 3000 females, 600 of whom are the wives of the king. The sacred white elephant has also a place within the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The palace of the second king, whose functions are not very clearly defined, is nearly as large as that of the first king, but not so ostentatious. See **SIAM**. The temples of B. are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. Some of them, according to the Catholic bishop Pallegoix, have cost more than 4,000,000 francs (£160,000). In the neighbourhood of B. are iron-mines and forests of teak-wood. The chief exports are sugar, pepper, cardamoms, ivory, feathers, hides, fine woods, rice, salt, and fish. At one time, the exportation of rice and teak was prohibited; and by the treaty concluded by Sir John Bowring in 1855, the Siamese reserve the right to prohibit that of salt, rice, and fish, in cases of threatened scarcity. The imports are tea, manufactured silks, and piece-goods, opium, camphor, porcelain, and glass wares. See Sir John Bowring's *Siam*.

BANGOR, an episcopal city, borough, and seaport town in the north-west of Caernarvonshire, North Wales, on the south-east bank of the Menai Strait, 2½ miles from the Britannia Bridge, and 5½ west of Chester. It consists chiefly of a narrow crooked street, a mile long, stretching south-west through a narrow fertile valley, bounded on the south by steep precipices. The grandeur and beauty of the surrounding scenery has long made it a favourite resort, and the opening of the Chester and Holyhead Railway, on the great line of communication from London to Dublin, has greatly promoted its prosperity. The town has of late years been greatly improved, and mostly rebuilt. Its chief trade is derived from the great slate-quarries of Llandegai, 6 miles distant, and employing 2000 men. The slates are exported to all parts of the world, and also manufactured at B. into tables, chimney-pieces, &c. Pop. 6338. B. unites with Caernarvon, Conway, Criccieth, Nevin, and Pwllheli, in sending one member to parliament. B. is a place of great antiquity. In 525, St Deiniol founded a college here. It was raised to a bishopric in 550, the founder being the first diocesan. The cathedral founded by him was destroyed by the Saxons in 1071, rebuilt in 1102, and again destroyed by fire in 1402. The present edifice, built between 1496 and 1532, is a plain embattled cruciform structure, 214 by 60 feet, with a pinnacled tower 60 feet high. Several Welsh princes and distinguished ecclesiastics are buried here. B. bishopric is the oldest in Wales.

BANGOR, a small seaport town in the north-east of Downshire, on the south side of the entrance to Belfast Lough, and 12 miles east-north-east of Belfast. Pop. 2850. It has linen and cotton manufactures. The embroidering of muslin is carried on. Cattle and provisions are exported. There is much traffic with the west of Scotland. Coal, slate, and copper are found in the neighbourhood. St Cungall, in 555, founded Bangor Abbey ('Ban-choir, the 'White Choir,' whence the name Bangor), of which the ruins still remain. From this abbey, Alfred selected professors when he founded the university of Oxford. In the 9th c. it had 3000 inmates.

BANGOR, a port of entry in the state of Maine, on the right bank of the Penobscot, about 60 miles from its mouth, and at its confluence with the Kenduskeag, which intersects the city, and

affords an extensive supply of water-power. At spring-tides, which here rise 17 feet, the harbour is accessible from the sea for the largest vessels; and, as the navigation cannot go higher, B. is one of the largest lumber depots in the world, absorbing and monopolising the trade of the heavily timbered basins of the Penobscot and its tributaries. During the 8 or 9 months of open water, steam-boats make regular trips between B. and the adjacent ports of Portland and Boston; there is here also a station of the Eastern Railway. Its population, which, in 1850, was 14,432, cannot now, in 1859, be under 20,000. Its lat. and long. are 44° 45' N., and 68° 47' W.

BANGORIAN CONTROVERSY. Dr Benjamin Hoadley, Bishop of Bangor, in a sermon preached before George I., March 31, 1717, on the text, 'My kingdom is not of this world,' advanced opinions regarding the constitution of the church which excited strong opposition from the zealous advocates of ecclesiastical authority. A controversy ensued, which was carried on with great heat for many years, and resulted in a ponderous collection of pamphlets. See HOADLEY.

BANGOR-ISCOE'D (Bangor below the Wood), an inland village, beautifully situated, in a fertile and richly wooded country, on the right bank of the Dee, on the borders of Flint and Denbigh shires, North Wales, 5 miles south-east of Wrexham. Pop. 554. It was once the seat of one of the largest monasteries in Britain. This monastery was founded before 180 A.D., and contained 2100 monks in the time of St Augustine, in the end of the 6th c., when they distinguished themselves in resisting the claims of the papal see. Ethelred, king of Northumbria, in 593, devastated the monastery, and massacred 1200 of the monks.

BANIALUKA, a fortified town of Bosnia, European Turkey, situated on the left bank of the Verbas, with a manufactory of gunpowder, and numerous bazaars and public baths. Pop. 7800.

BANIAN or **BANIAN** (from the Sanscrit *banij*, a merchant), a word used in India to designate a merchant or trader generally. It is more particularly applied to the great merchants in the west of India, especially in the seaport towns of Bombay, Surat, Cambay, &c., who carry on a very extensive trade by means of caravans, with the interior of Asia, even to the borders of Russia and China. Contrary to the general custom of the Indian people, these merchants travel much, and the establishments and counting-houses of Indian Banians are to be found in almost every commercial town of any note in Asia. The banians form a class or division of the caste (q. v.) of the Vaisya, adopt a peculiar costume, and are strict in the observance of fasts and in abstaining from the use of flesh.

BANIAN DAYS, a sailor's phrase, nearly equivalent to the *jours maigres* of the French. The term denotes the days when no meat is served out to a ship's crew. How far this is likely to occur in the royal navy, or the mercantile marine, will be found noticed under **VICTUALLING**. The term is derived from the practice of the Banian (q. v.) traders.

BANIAN-TREE. See **BANYAN**.

BANIM, JOHN, a celebrated Irish novelist, born 1800, whose pictures of manners, in the form of tales, have excited considerable interest in England. His aim was to become for Ireland what Scott had been for Scotland. He has given proof of vigorous intellectual grasp and vivid fancy, in a series of pictures of life, in which he delineates the peculiarities of the Irish character in strong light and shade, and appeals forcibly to the national

feeling. His *Tales of the O'Hara Family* (London, 1825) were followed, in 1826, by a second series, which did not disappoint the high expectations excited by the first. Of these, several have been translated into German by Lindan. Next appeared *The Battle of the Boyne*, *The Croppy* (1828), *The Denounced* (1830), *The Smuggler* (1831), *The Mayor of Windgap*, *Father Connell*, &c. In 1837, general sympathy having been attracted towards B.'s privations, occasioned by disease that precluded all literary exertion, a pension of £150 per annum from the civil list was awarded him by government, which was afterwards further increased by £40 for the education of his daughter, an only child. He died in poverty on the 1st August 1842, at Windgap Cottage, near Kilkenny.

B. failed in his attempt to portray the manners and frivolities of the higher classes; but none of his predecessors, such as Edgeworth, Morgan, and Crofton Croker, have succeeded in depicting so vividly and truly the Irish peasant, with his picturesque peculiarities in his sufferings and errors. Although generally happy in the plot and development of his story, he is too much disposed to dwell on the horrible. His denunciations may be well founded, but they disturb the poetic effect. B. was also not quite free from a somewhat tiresome minuteness of description, and his imitation of Scott is frequently very palpable.

BANISHMENT, excepting in the penal sense of Transportation (q. v.), with which it is popularly synonymous, can only now be said to have a legal meaning historically. Formerly, in England, parties who were required to *abjure the realm*—that is, renounce and depart from the country—were, so to speak, *banished*; but the word appears to have a more technical and precise significance in the Scotch law than in the English, and in Scotch law-books, is defined as the punishment of exile from Scotland inflicted on persons convicted of certain offences for which that punishment is provided. But as a punishment, it has either been abolished in that country by express enactment or become obsolete by disuse. See **TRANSPORTATION**, **PENAL SERVITUDE**.

BANISTER, a corruption of Baluster (q. v.).

BANJERMASSIN, an extensive territory occupying the south-east portion of the island of Borneo, the river Banjer bounding it on the west, and the strait of Macassar on the east. A range of mountains, rising in many places to an elevation of 3000 feet, intersects it from north to south. Pop. 120,000, principally Mohanmedans, and governed by a sultan, who is absolute so far as his people are concerned, but who is to a certain extent subject to the Dutch. The manufactory of all kinds of small-arms has been brought to a state of great perfection in this country. Iron serves in place of money. Coal of good quality was discovered in 1846, and is now profitably worked by the Dutch. The capital, which bears the name of the district, is situated on the left bank of the Banjer, about fifteen miles from its mouth, and has a considerable trade with China through its port at Tabeniow, about fifty miles from the town, a bar at its entrance rendering the Banjer inaccessible.

BANK, BANKING. A banker is the custodian of the money of other persons. Such is his business, viewed in its simplest aspect. A banker, if he hoarded the money deposited with him, would be simply a cash-keeper to the public; his bank would be literally a bank of *deposit*. Even were the business of banking limited to the keeping of deposits, it would be of no small advantage to society: the depositors would be relieved from the care of their money, and in many cases, from the trouble of hoarding

it to those to whom they required to make a payment. If the person to whom the depositor wishes to pay money intend also to deposit it, a transfer in the books of the banker from the one to the other, made on the order or *cheque* of the depositor, would effect the payment. The money itself would lie undisturbed. The Bank of Amsterdam, as it existed in the 17th c., was a bank of deposit, pure and simple. But the business of receiving money on deposit has almost always been, and is now, universally, combined with that of lending it out. A banker does not hoard all the money deposited with him—he gives the greater portion out in loan. The lending of money is as much a part of his business as the receiving of deposits. The advantages accruing to society from the operations of banking are thus immense. A million of money lent out to be used, and which otherwise would have lain dead, either in small portions in the repositories of the owners, or in one large hoard in the coffers of the banker, makes the world one million the richer—or at least prevents it from becoming one million the poorer; for money, so long as unused, serves no end as a means of exchange. With the money thus lent out, manufacturers can purchase raw material to be worked up, and procure food and clothing for their workmen; and traders can go into the markets and purchase commodities for resale. Commodities are thus more quickly turned to useful purposes, and a stimulus is given to the production of more. But a banker deals not with the money only of others; he uses money belonging to himself. This is his *capital*. Few would be found to deposit their money with a person known to possess none of his own. If he should lend deposits to those who fail to repay them—that is, *make bad debts*—he has the means from his capital of replacing the deposits thus lost. Such, then, are the simple functions of a banker: he borrows and lends.

But for the money he lends he receives interest from the borrowers; and in this interest he is paid for his trouble in taking charge of the deposits, and for his risk of bad debts. The services that a banker performs as the cash-keeper of his depositors are very great. In the case of persons not themselves in business, it is quite usual for a banker to make all their money-payments, beyond their small daily expenditure, and to receive the money payable to them. The money transactions of such persons are thus contained in their banker's books. This is effected by the depositor giving a cheque or order on his banker for the sums he has to pay; and by handing to him all the *cheques* or orders the depositor receives for sums payable to himself. Suppose a person's income derived from dividends on government stock: he sends a *power of attorney* or authority to his banker to uplift the dividends for him. These are received by the banker as deposits, and are drawn out by the depositor as occasion occurs, by cheques issued by the depositor to those to whom he requires to pay it away. So he may receive money due to him by a cheque given to him by his debtor. This cheque he sends to his banker, who will obtain payment. If both persons deal with the same banker, a simple transfer in his books will carry through the transaction; and if the bankers be different, and each has had received, in the course of his business, as is always happening, a cheque on the other, there will be a set-off between them; and two payments will be made as well as two deposits, without trouble to the persons concerned, and without the employment of any money. But this mode of managing one's pecuniary transactions is not confined to the case of those not engaged in business; on the contrary, it is followed on a scale out of all proportion greater in carrying

through the money transactions of those in business or trade in the principal industrial countries.

Besides thus performing the function of cashiers to their depositors, in consideration of the profit made on their deposits, many banks allow their depositors interest on their deposits. The rate allowed is, of course, always less than that received by the banker. Frequently a depositor bargains with the banker not to draw out his deposit without previous notice, longer or shorter as may be agreed on; and in this case the banker will allow a higher rate of interest than when the deposit is repayable *on call*—that is, at any time, without previous notice. The practice of allowing interest on deposits always obtained in Scotland, but in England is of later growth. It has led there, of late years, to a great increase in the amount of deposits, especially, it is believed, of small sums. Where banks allow interest on deposits, it is quite common for persons to lodge their money with them, solely for the sake of the return received in the shape of interest from the banks. These persons prefer the low rate of interest which banks give, to the higher rate which may be obtained from individual borrowers, or to the greater return which may be received if they traded on their money. The low rate of interest is compensated for by the greater security, and the absence of trouble and labour to the depositor.

Occasions are always occurring for withdrawing deposits, as well as making them. Traders and commercial men, for example, day by day, deposit with their bankers the drawings or sums of money which they receive in the course of their business; and, on the other hand, day by day, draw out such sums as they require to pay away in purchases of goods, in wages, rent, and other expenditure. A bank, therefore, while continually receiving deposits, is continually repaying deposits; and the amount uncalled for is subject to a daily fluctuation. At one period of the year, or in a certain condition of trade, the amount of deposits may be high; at another, low. As it is a principle, at the very root of banking, that money deposited shall be returned, either on demand, or punctually at the expiry of a stipulated notice, it follows that banks must always have in their coffers as much of the money deposited with them as there is the least likelihood of being called for by depositors. When business is in its ordinary condition, a bank can, after some experience, approximate pretty nearly to the amount of the greatest demand for a return of deposits throughout the year, and provide accordingly. But sometimes the credit of a bank becomes doubted, either from causes peculiar to itself, or on occasions of a *panic* or general distrust, when all who own money wish to have it in their own possession. In these cases, there is a *run* on the bank for repayment of its deposits, and the amount called for may be far beyond the maximum demanded in ordinary times. If the bank has not retained as much of the deposits in its coffers as meet the demand, it is said to *suspend payment*, and, as a general rule, it must wind-up its business; the confidence of the public that it will in future restore its deposits on demand being now destroyed. There are two prime rules in safe banking: the one is, that the bank shall lend its deposits only on good and undoubted securities, however low the profit; and the other is, that the bank shall retain a sufficient amount of its deposits—and this is called the *reserve*—to meet the possible demands of the depositors, even in cases of a run, although there may be no reason to expect a run or unusual demand; for when a run comes, it seldom casts its shadow before. But it is evident that the greater the *reserve* of a bank, the less the amount of deposits

which it is lending out and drawing interest for; hence the temptation which banks lie under of imprudently lending out a too great proportion of their deposits; and it is their yielding to this temptation which almost always precipitates the failures of banks.

The *reserve* of the banking department of the Bank of England is always in coin, or, what is the same thing, in notes against which there is coin lying in what is called the *issue* department of the Bank. In the case of all other banks in this country, the reserve is only partly in coin; sometimes the proportion of coin is very small. A great portion of the reserve is generally in Bank of England notes, equivalent, of course, to coin. These other banks also hold a portion of what is truly their reserve, in the shape of government stock, in which they have invested it. In this way, the banks obtain a return on this last portion of their reserve, in the dividends or interest paid by government on the stock—this return being less, indeed, in the usual case, than if the bank had lent out the money in the ordinary course of business, but better than no return at all, as must be when the coin or notes are lying idle. The reason why government stock, in Great Britain, is a safe reserve is, that it is sure to command a purchaser at all times. If there be a run on a bank, it immediately finds a purchaser for the stock, and with the price, whether paid in gold, or in Bank of England notes, the only other legal tender, it meets the demands of its depositors. Sometimes, a bank has its reserve in the form of a deposit at the Bank of England; or, if a provincial bank, with some London bank which has its own reserve there. From the Bank of England being the channel through which, directly or indirectly, payments are made, and moneys received, by other banks, it is more convenient for them to have their reserve lying as a deposit in it, than lying as gold within their own walls. In the case of a demand on their reserve, the banks will draw out their deposits, in notes, or, if gold be in demand, in gold, from the Bank of England. Whether, therefore, the reserve of a bank is invested in government securities, or is deposited in the Bank of England, or is in Bank of England notes, it is from the coin in that bank that the gold comes in the case of a run. It is apparent from this that it is essential to the stability of all banks in this country, so long as they themselves do not keep a sufficient reserve of coin in their coffers, that the Bank of England shall always be possessed of coin, and never be unable, on demand, to pay its depositors in gold, or to give gold in exchange for all its notes that may be presented to it. It may be added, that while banks gain, through the annual dividends, in keeping their reserve in government stock, they run the risk of a loss in the event of their requiring to sell it in the time of a panic. For at such a time, when many securities and stocks become unsaleable, and all of them suffer depreciation in value, government stock itself falls in price, although less so than the others. Banks often invest portions of their reserve in other stocks than government stock. The higher return obtained on these other is, however, outweighed by the greater risk of depreciation in their value, whether continued unsold or thrown into the market for sale in times of panic.

We have hitherto been treating banks as banks of *deposit* and *loan*; but many of these banks, in all countries where banks are known, are also banks of *issue*. Banks of deposit, as has been mentioned, make loans from their capital and

deposits. If from capital, the banker has no greater profit by the transaction than if he had lent out his money in any other way, equally safe, and involving the same amount of trouble. If from deposits, the interest he receives, in so far as it exceeds the interest, if any, paid to the depositors, and a rateable proportion of the expense of carrying on the business of the bank, is pure gain to him. But a banker may give the loan from his own notes, and in that case his gain is still greater. A bank-note is simply a written promise by the bank issuing it, to pay to the bearer, on demand, a sum of money—that is, in coin of the realm. Of course, the borrower would not accept a loan from a bank in its own notes, unless he believed that it could redeem its promise of paying in coin, and that the public were of the same opinion; for the moment that a suspicion arises that the promise will not be made good, the note will cease to pass from hand to hand as coin, or to perform all the functions which coin performs. But when the loan is accepted in a bank's own notes, it is evident that the interest which the bank draws for the loan of its promises to pay is pure profit, except the rateable proportion—as in the other cases—of the expense of carrying on its business, and the expense of the paper and printing of the notes with the government stamp-duty. In other words, a bank which can get people to pay to it interest for the loan of its promises to pay, draws the same income—barring the comparatively trifling expense of manufacturing the written promises—as a bank does which has to provide itself with gold for making its loans. The motive which a bank has to extend its issues on loans is therefore apparent, so long, of course, as it is not compulsory on it to retain unemployed in its coffers as much in gold as it issues in notes.

But it by no means follows that when a bank makes a loan in its own notes for a definite period, it will really obtain the benefit of the interest on it for that period; for the borrower does not apply for the notes that he may keep them beside him, but that he may pay them away in making a purchase, or in liquidating a debt, and this, most commonly, on the very day he receives them. If the person to whom the notes are thus paid by the borrower has himself no purchase to pay for, or no payment to make, he may, the moment he gets them, return them to the bank that issued them, to lie there on deposit. If the bank pays interest on deposits, as most banks do, then out of the interest drawn by it on the original loan, it will have to pay interest to the depositor of the notes; in other words, the loan is no longer a loan of its notes, but a loan from its deposits. Or, the person receiving the notes from the borrower, may immediately present them to the issuing bank for coin, instead of depositing them. Here, too, therefore, the loan that was made in notes is now converted into a loan of coin, that was in reserve from previous deposits, or that was part of the bank's own capital; in which cases, the bank obtains no advantage whatever in having made the loan originally in its notes. It might equally well, so far as profit is concerned, have originally made it in gold from its reserve of deposits or capital. Notes generally find their way back to the bank that issued them through other banks, into which they have been paid as deposits, or for the liquidation of debts due to them. These banks suffer the loss of profit or interest on the amount of the notes thus received by them so long as they keep them; they therefore immediately present them to the issuing bank for gold, to replenish their own reserves, or to lend out; or, what is the same thing, they present them to the

issuing bank for government stock, or other securities bearing interest, and which that bank has had to provide from its capital and deposits.

It will now be apparent to the reader that there are two checks which prevent a bank issuing notes to any extent it pleases. In the first place, there must be a demand for its notes by borrowers. It is only to people in good credit, and likely to make a profitable use of them, that a bank will lend its notes, and such people will not take an increase of loans unless trade be increasing, and new opportunities be presenting themselves for profitably employing the notes borrowed. True, banks, when imprudently conducted, or when deceived in the character of their customers, frequently lend their notes to reckless persons, who overtrade with them, and become bankrupt. But banks commit this error, when they do commit it, to a far greater extent by loans of their deposits and capital, than by loans of their notes. In the second place, the immediate return of the notes, chiefly through other banks for gold, or for other portions of the reserve of the issuing bank, is a check to its issuing more notes than it has a reserve to meet. This return of notes through banks is called the *exchange* of notes—the notes issued by a bank being returned to it in exchange for the notes held by it of another bank.

Besides issuing its notes in loans, a bank may issue them in repayment of deposits. In this case, there is the same profit to the bank as in the other case. The bank gets the profit which it makes on the money which was originally deposited or lodged with it, without having to pay interest to the persons who made the deposit or lodgment; the deposit, or money lodged, having now been repaid in its notes. But here, too, these notes are equally liable to be returned to the issuer as when they are issued on loans.

Of all the notes issued, in whatever way, by banks, a certain amount is not returned to them, but is kept in circulation, being what is required by the necessities of the public for use as money, passing from hand to hand. It is of course on this portion that the banks make their profit; and, in consequence of this profit, they are able to afford banking facilities to the public more cheaply than they could otherwise do. The profit is just the interest on the notes in circulation—less the expense of manufacturing the notes, a rateable proportion of the expenses of conducting the banks, and the loss of interest or profit on an unemployed reserve kept from prudence, or by the requirement of law, to meet a return of notes. This interest is paid by the persons who originally borrowed these notes from the banks, and who have not repaid them; or if the banks have repaid deposits with the notes, the interest is paid by those to whom they lent what was originally these deposits. The amount of the bank-notes in circulation varies at different periods of the year: at term-times and quarter-days, when more payments than usual are made, there is a greater quantity of money required by the public than at other times, and the notes in circulation increase in amount. This addition to the circulation is drawn from the banks by depositors or borrowers. After it has served its purpose, this additional quantity gradually returns to the banks as deposits or in repayment of loans. If the credit of an issuing bank is at any time suspected, the holders of notes will present them for gold, just in the same way as its depositors will call for a return of their deposits; and a bank requires to provide itself with a reserve—on which, of course, it makes no profit—to meet a *run* from its note-holders, as well as a *run* from its depositors. It has been generally imagined that when issuing banks suspend payments on a *run*, the

run is one on the part of their note-holders; but this is only a popular error. In a well-established bank, the amount of its notes in circulation is almost nothing compared to its deposits; and though the holders of small sums in notes may be more apt than depositors to take alarm and rush in a panic to the bank for gold for its notes, a small proportion of its depositors suddenly demanding a return of their money in gold, as effectually drains a bank of its reserve, as if its whole circulation were to be at once presented to it for gold.

Banks make their loans chiefly in the form of *discounts*; that is, upon bills of exchange. Commodities in the wholesale market are generally sold on credit. The buyer promises to pay the amount at a certain date to the seller, and his promise is contained in a bill of exchange. The seller transfers it to a bank, which, on the faith of it, advances the amount in loan to him, less *discount*, that is, interest of the money till the bill be due. This is called *discounting*. But banks lend on other securities. A holder of government stock, for example, will obtain a loan on the security of his stock; the banker being entitled to sell it, and repay the loan from the price, if the borrower fail to make punctual payment. So also, the holder of stock or shares in any public company, as a railway company, or of a debenture or bond due by such, will, where the company is believed to be in a sound condition, or the security is saleable, obtain a loan from a bank. The owners of commodities lying in a public warehouse, may obtain a loan on depositing with the bank the *warrants* or certificates of ownership. Loans, too, are occasionally made for short periods on the mere note of hand of the borrower, when the banker is satisfied of the ability of the borrower to repay the money. It is seldom in this country that banks lend on mortgages over land. Borrowers, in these cases, generally take loans to lie unpaid for a few years; but to have his money locked up in that way does not suit the trade of a banker. Where a banker finds the security which he has received to be insufficient, and repayment of the loan is not forthcoming, he will, of course, like any other trader, to avoid making a bad debt, take any other security the debtor can give him—such as a manufactory or a mine. Banks have in this way frequently become involved in manufacturing transactions, in their attempts to make more money of the securities than they would have done by an immediate sale of them; they have become manufacturers and miners, and suffered great losses in consequence. And it is not to be supposed that banks always abstain from making loans when the security is known to be doubtful; far from it: banks, like other commercial establishments, have been, on many occasions, recklessly managed. In trying to push business, they have made loans on insufficient security, and banks are under strong temptation, to which they frequently yield, when a trader largely indebted to them is approaching bankruptcy, to sustain his credit by additional advances, in the hope that he may retrieve his affairs, and pay in full both the old and the new advances. The result is often the loss of both. Conduct of this kind has been the ruin of many banking establishments in England, of two or three in Ireland and Scotland, and elsewhere.

Bankers perform another very important function: they *remit* money from one place to another. One illustration will serve to explain how this is managed. A debtor in Edinburgh makes a payment to his creditor in London in this way: he pays the money to a banker in Edinburgh, who, for a small charge, called the *exchange*, gives him a draft for the amount on a banker, his correspondent, in London.

The debtor transmits the draft to his creditor, who presents it to the London banker, and receives the money from him. No actual transmission of the money, however, takes place, for there are debtors in London requiring to pay money to creditors in Edinburgh, and these debtors effect the payment by giving the money to the London banker, and obtaining his drafts on the Edinburgh banker. The London banker is thus refunded for the money he pays away on the drafts upon him by the Edinburgh banker. The one set of drafts are set off against the other. Not only may remittances between two places be thus made without the use of money, but the payments to and by the parties in both places may also be made without it. The debtors may pay for the drafts by cheques on the banker who grants them, and the creditors may receive the money by drawing cheques on the banker by whom the drafts are made payable.

The large amount of money transactions carried through without the intervention of coin or bank-notes, in a country like England, is inconceivable to those not engaged in business pursuits. The manner in which these transactions may be effected without money, would be at once apprehended, if all persons in the same locality dealt with the same bank, and if all the banks scattered throughout the kingdom were only branches of the same establishment. But in practice, matters are so managed as if this were the case. The cheques, bills, or other drafts which come into the hands of a banker, drawn on (that is, payable by) other bankers, are set off and liquidated by drafts, which they have received, drawn on him. The balance or difference only is paid in money. In London, the centre of the money-world, there is an establishment called the Clearing-house, of which most of the London banks are members. There, at a fixed hour daily, attendance is given by a clerk from each of these banks, who presents all the drafts immediately payable which his bank holds on the others; the balance or difference, on the whole, for or against each bank is ascertained; and the bank which holds a less amount of drafts on others than they hold on it, pays the difference by cheques on the Bank of England. There are clearing-houses in New York and Dublin, conducted on a similar principle.

Bank of England.—This institution, which is the largest and most important banking establishment in the world, was projected by William Paterson, a Scotsman, and received its charter of incorporation July 27, 1694. It was constituted as a joint-stock association, with a capital of £1,200,000, which sum was lent at interest to the government of William and Mary, at the time in a state of embarrassment. At its very outset, therefore, the Bank of England was a servant of government; and in a lesser or greater degree, it has enjoyed this character through all the stages of its subsequent history. At first, the charter of the Bank was for eleven years only; but in consequence of the great services of the institution to government, its charter has been at various times renewed. The last renewal was in 1844, and the charter of that year still subsists, its terms being subject to modification or revocation by the legislature at pleasure. By the act or charter of 1844, the Bank was divided into two departments—the *issue* and the *banking*. What led to the division was this: it was supposed that, when a foreign drain of gold from us set in, it would, if the currency or circulation in this country had been purely metallic, have produced a contraction of the circulation, and a consequent fall of prices, and, as an ultimate result, the cessation of the drain. It was further supposed that banks could issue their notes to any extent they pleased; that their excessive

issues increased the currency, and therefore increased prices, which in their turn led to foreign drains; and that, on the occasions of these drains, the continued issues prevented the natural and desirable contraction of the circulation, and aggravated the commercial convulsions occurring at such periods. The object of the act of 1844 was to prevent issues of notes beyond a certain amount, unless against an equal amount of gold held by the issuing bank, so that the mixed currency of notes and coin might thus expand and contract like a self-acting metallic currency. Experience, however, has shewn, that when these foreign drains occur, the gold exported is taken chiefly from the reserves in the Bank of England, being withdrawals of deposits or loans by the Bank; and that the amount of notes in the hands of the public has not been affected by the legislation of 1844. In practice, whenever there are signs of a foreign drain, and the reserve of the Bank is diminishing, the Bank counteracts the tendency to a drain by raising the rate of discount and restricting its loans; the purchasing power of the public is thereby limited, and prices kept down; and, at the same time, gold is attracted to this country for investment. The circulation is in reality not interfered with. It was also intended by the act of 1844 to add to the security of bank-notes by insuring a supply of gold to meet the payment of them at all times. But the solvency of the Bank of England is undoubted; its notes would at any time be taken as gold; and this effect of the act of 1844, and the supplementary act of 1845, has in the case of the notes of other banks been hitherto inappreciable.

In the *issue* department of the Bank of England, its sole business is to give out notes to the public. Before the separation of the departments, the government was due to the Bank £11,015,000. This sum was declared to be now a debt due to the issue department, and for the issues of notes to that amount, no gold requires to be held by it. This was just the same thing as if the Bank had originally lent £11,015,000 of its notes to government, and these notes had found their way into circulation. The Bank was also allowed to issue additional notes on securities—that is, to lend them to a limit which at present amounts to £3,459,900, and this also without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £14,475,000. All notes issued above that amount can be issued only in exchange for gold. At the passing of the act in 1844, the limit of notes to be issued against the government debt and securities was fixed at £14,000,000—past experience having shewn that there was not the least risk of there being at any time less than that amount of Bank of England notes in the hands of the public. The addition of the £475,000 is an extra issue, authorised by the act, in consequence of certain issuing banks having since ceased to issue. The Bank has to account to government for the net profit of this issue loan of notes of £475,000; and the profit the Bank derives from its issue department is the interest received on the £14,000,000 of government debt and securities, which, at 3 per cent., is £420,000 yearly. But out of this the Bank pays to government, for its banking privileges, and in lieu of stamp-duties, £180,000. The expense of the issue department being £160,000, the net yearly profit upon it to the Bank is thus £80,000. The Bank also makes a profit of £20,000 to £40,000 yearly upon bullion and foreign coin. These are brought to the Bank for notes; they are worth £3, 17s. 10½d. per ounce; but the Bank is obliged by its charter to purchase them at £3, 17s. 9d. The holders prefer taking this price to having their bullion and foreign coin coined, free

of charge, at the public mint, as the delay in the coining is equal to a loss of interest of 1½d. per ounce. The amount of notes in the hands of the public averages about £20,000,000; but the amount issued by the *issue* department is greater. The difference is the amount lying in the *banking* department, and represents the reserve of gold of that department; that is to say, the banking department retains only a half or three-fourths of a million of coin, and transfers the bulk of its reserve to the *issue* department, in exchange for notes. We therefore require to regard the reserve of the banking department as gold, though lying in the shape of notes issued by the other department.

Viewed in its *banking* department, the Bank differs from other banks in having the management of the public debt, and paying the dividends on it; in holding the deposits belonging to government, and in making advances to it when necessary; in aiding in the collection of the public revenue, and in being the bank of other banks. For the management of the public debt, the Bank receives about £247,000, against which there has to be set £124,000 of charges. The remaining profits of the Bank are derived from its employment, like other banks, of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1816, it reached £14,533,000—the present amount. There is besides a rest of about £3,000,000. The deposits (public and private) vary between £13,000,000 and £22,000,000.

In 1797, the Bank found itself likely to be obliged to suspend payments, and its notes were declared by law a legal tender, although no longer convertible into coin. This state of matters continued till 1821. The notes during this interval not having been convertible into coin on demand, there was no check upon the Bank in the amount of its issues; and the currency became depreciated—that is, a £5 note would not exchange for five sovereigns; and every man to whom £5 was due, was thus obliged to accept payment in a £5 note, not worth £5. It is, however, said that the value of gold at the time was enhanced owing to absorption by hoarding and by military-chests, and that the depreciation was more apparent than real. The export of gold following on a rise of prices occasioned by an issue of bank or government notes is unlimited, except by exhaustion, if these notes are not payable in coin on demand, and are issued without any check from without or self-imposed. But as prices estimated in these notes rise, the price of bullion, like other commodities, rises too, and the price of coin which can be converted into bullion, or be used abroad at its previous purchasing power, rises also. Since 1821, the Bank has been oftener than once on the verge of a suspension of payments, owing to foreign drains of gold. The separation of the Bank into two departments is regarded by many as having a tendency to produce a suspension in times of panic, when the reserve is reduced by withdrawals to supply a foreign drain, or to meet an internal run. Before the separation, the Bank, in the case of withdrawals of gold, had the whole amount of gold within the Bank to meet them; but now it loses the command of all the gold in the *issue* department. It cannot get that gold unless in exchange for notes, but its reserve being reduced or exhausted, it has none to spare. The restriction of credit consequent upon the approach to an exhaustion of the reserve of the banking department, is so great, that the fear of it occasions a panic; and both in 1847 and 1857, on the possible suspension of payments by the banking department, owing to a reduction of its reserve, being apparent, the government of the day took the responsibility of authorising the Bank to lend additional notes, not

represented by gold, which was an indirect way of getting at the gold in the *issue* department, where the object of the borrowers was to obtain gold. In 1857, it was found necessary to take the benefit of this authorisation.

The Bank of England is situated in the centre of London; but it has a branch in the west end, and several branches in the provinces.

Joint-stock Banks in England and Wales.—There are 95 of these banks, of which 63 in the provinces are entitled to issue notes to the extent of £3,303,357, without its being compulsory to hold any gold in reserve against them. But they are not allowed to exceed that amount; and their actual issue is several hundred thousands less. Most of them have branch-offices—two of them having each about 100 branches and sub-branches. Their paid-up capital varies from £21,000 to £1,000,000; and there are as great differences in the numbers of their partners. The deposits of the joint-stock banks in London are about £40,000,000. All of them allow interest on deposits.

Private Banks in England and Wales.—Of these, there are 312, of which 57 are in London. Of the provincial banks, 151 have a fixed authorised issue of £4,404,935, which cannot be exceeded. The actual issue is about a million less.

In the case of all these banks, whether issuing or non-issuing, their profits are chiefly derived from the use of their deposits. As already mentioned, the issues of those banks possessing the privilege are small compared with their deposits.

There are also in London the establishments of 18 colonial, Indian, and foreign joint-stock banks.

Banks in Scotland.—The earliest banking institution in North Britain was the Bank of Scotland, instituted by a charter of incorporation from the Scots parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. The amount was raised by shares differing in extent, from £1000 Scots, or £83, 6s. 8d. sterling, to £20,000 Scots. In 1774, the amount of stock was extended to £200,000 sterling: now it is £1,000,000 sterling, and the shares £100 sterling.

The Bank of Scotland continued to be the only bank in the country till the year 1727, when a new and similar establishment was constituted under the title of the Royal Bank of Scotland, whose advanced capital is now £2,000,000. In 1746, another association was formed, and incorporated by royal charter, with the title of the British Linen Company. The object of this association was at first to encourage the linen manufacture of Scotland, but gradually it fell into the course of common banking business. From £100,000, its capital has increased to £1,000,000. There are other eleven joint-stock banks, with capitals varying from £1,000,000 to £60,000. There are now no private banks. The amount of deposits is understood to be about 50 millions, on which interest is allowed. Their authorised issue of notes is £2,749,274, but their actual issue is between £1,000,000 and £2,000,000 more. The Western Bank, with a capital of £1,500,000, a circulation of above £400,000, having 1300 shareholders, and about 100 branches, suspended payments in 1857. The shareholders, however, being under unlimited liability, neither the depositors nor the note-holders sustained any loss. The solvency of the shareholders, as a body, being undoubted, the other banks at once paid off the Western Bank deposits, and redeemed its notes, by which they became its creditors at a remunerating rate of interest. Another Scottish establishment, called the Edinburgh and Glasgow Bank, had about the same time to wind up its affairs, with the entire loss of its capital. Both cases of stoppage arose from a

recklessly profuse system of discounting bills. In England and Ireland, the creditors of bankrupt banks have generally found great difficulty in recovering even a dividend on their deposits and notes; but in Scotland, the loss on such occasions has fallen entirely on the shareholders, as in the case of the Western Bank. In consequence of allowing interest on deposits, the banks in Scotland may be said to hold the whole capital of the country, minus only the money passing from hand to hand. This widespread system of depositing is greatly aided by the establishment of branches from the parent-banks; and these branches are found in every small town in the kingdom. The entire number of branch-banks in Scotland, in 1859, was 583, besides some sub-branches. At these branch-banks, the agent (usually a respectable person in business) discounts bills within certain limits, issues letters of credit, and pays out notes, and also gives cash on demand for them; though, strictly, the notes of a bank are only payable on demand at the head-office. By a strict system of supervision, Scottish branch-banks are usually well conducted, and are of great service in every department of trade. For one thing, they have powerfully contributed to extinguish burglary and highway robbery, as no one thinks of keeping money, except to a trifling amount, either in his house or about his person. At all the great fairs, bankers attend to receive deposits, and to pay cheques. Forgeries of Scottish bank-notes are now unknown.

The banks in Scotland, like the banks in Ireland, but unlike the provincial banks in England, are allowed to issue notes beyond their fixed issues, on holding gold equal in amount to the extra issue. But as the gold thus retained is, like the other gold in reserve, liable for all the deposits, as well as for the whole circulation of a bank, if it should fail, the security of the establishment is increased only in a small degree by this arrangement, which, apart from the loss of profit to the bank on the gold unemployed, is attended with inconvenience at those seasons when the circulation is extended. In Scotland, and Ireland also, banks can issue one-pound notes; the English banks are not permitted to circulate notes of less value than £5.

Besides employing money in discounting bills, the Scottish banks grant loans of fluctuating amount, called *cash-accounts* or *cash-credits*. By a cash-account is signified a process whereby an individual is entitled to draw out sums as required, to a stipulated amount, and by an implied condition to make deposits at his convenience towards the liquidation of the same. On entering into this arrangement, he finds security to the bank that he will repay to the bank, whenever called on, the balance of sums drawn out, less those paid in, with the interest that may be due. These accounts are balanced yearly like current or deposit accounts. The only difference between the latter and a cash-account on the face of them is, that if the credit allowed on the cash-account is being made use of, the balance is in favour of the bank; whereas, on the other kind of accounts, the balance is in favour of the bank's customer.

Banks in Ireland.—There are eight joint-stock banks, having 172 branches. Their authorised issue is £6,354,494; the actual issue is a little sometimes above, and sometimes below that amount. Of the authorised issue, £3,738,428 is that of the Bank of Ireland. It is a national bank, lending £2,630,769 of its capital to government. It was established in 1783, with privileges resembling those of the Bank of England. Its capital is about £2,800,000, and its rest £1,043,076. It allows no interest on deposits. The capitals of the other

banks vary from £125,000 to £500,000. Five of them are issuing banks. There are also five private banking firms in Dublin.

Foreign and Colonial Banks.—On the continent of Europe, there are both national or incorporated banks and private banks. The national banks are, to a greater or less extent, government establishments, managing the public debt and finances, and, unlike the Bank of England, subject to government influence or interference. In India and the British colonies, there are joint-stock banks and private bankers. The joint-stock banks of Australia, though in their infancy, are becoming establishments of magnitude. The United States of America are overrun with banks. Insufficient capital, reckless management, and the smallness of the reserve kept, have frequently led to the suspension of payments of these banks. In 1857, even the solvent banks suspended payments in self-defence, when all the others gave way. As a means of securing the note-holders, the law in some states requires the banks to deposit with the state government securities against the notes issued. At all times, the number of forgeries of bank-notes in the United States is very considerable, and great caution requires to be exercised in accepting notes as payment.

BANK-NOTES, MANUFACTURE OF. The chief object in the manufacture of B. is to render forgery impossible, or at least easy of detection. This is sought to be effected by peculiarity of paper, design, and printing, or by a combination of these means, as is done by the Bank of England, and by other banks in America and elsewhere. See **PAPER-MAKING**. The chief reliance, however, has been on mechanical design—that the impression should be such as to make the genuine note readily distinguishable by the public for its high art, and to the bank officials by secret peculiarities in its execution. Thus, the writing, the emblems, and the ornaments are so combined as to render forgery difficult. The ink, too, is peculiar (see **INK-MAKING**), being the blackest and most indelible of inks. As a further security against forgery, a self-registering machine was contrived by the Messrs Oldham, engineers to the Bank of England, and each note was impressed with a distinctive mark known only to the bank authorities.

Copperplate printing was the only printing in use for bank-notes till 1837, when one of the greatest improvements was made in practical engraving which the history of the arts has to record. This was the reproduction of designs by the mill and die, by mechanical pressure, as invented by Messrs Perkins and Heath, for bank-note printing, and which was afterwards attended with such extraordinary results, as applied to calico-printing, as were all but fabulous—creating a new order of means, with a rate of production and style of patterns unapproachable by hand-action. The principle of this great invention is simply this: the pattern is engraved on a soft steel plate, which is then hardened, to transfer the pattern by pressure to a soft steel roller, on which, of course, the pattern is produced in relief. The roller or mill is then hardened, to reproduce the pattern in the plate from which the printing is to be done, and thus almost any number of plates for all common purposes can easily be produced.

This system of siderography continued in use for bank-note printing in the Bank of England till 1855, when electrotype-printing was introduced by Mr Smee, the surgeon of the Bank, with the assistance of the mechanical officials (see **ELECTROTYPE-PRINTING**); and since that time, the notes of the Bank of England have been all produced by surface-printing by the electrotype.

BANKRUPTCY. See **INSOLVENCY.**

BANKS, in Navigation, are elevations of the bottom of the sea; when tolerably smooth at the top, they constitute *shallows, shoals, and flats*; but when rocky, they become *reefs, ridges, keys, &c.* Pilots and captains of ships require to be intimately acquainted with the **B.** along their route; and a chart, if properly prepared, always defines them by means of small dots, if sands, and small crosses, if rocky. In war-time, small vessels often escape capture by running into shallows where larger vessels dare not follow them. The Newfoundland and the Bahama **B.** are well-known examples of this kind of sea-bottom.

BANKS LAND, an island in the Arctic Ocean, 70 miles to the south-west of Melville Island. It is intersected by the parallel of 74° N., and by the meridian of 116° W.

BANKS, SAVINGS'. See **SAVINGS' BANKS.**

BANKS, SIR JOSEPH, a zealous naturalist, was born, according to some accounts, at Revesby Abbey, in Lincolnshire, according to others, in London, in January 1743, and died June 19, 1820. He was descended from a family of Swedish origin, which had been settled in England for about 200 years. To this family belongs also John Banks, who made his name known as a writer of tragedies, in the latter half of the 17th c. **B.** was educated at Eton and Oxford. In 1763 he made a voyage to Newfoundland and Labrador, collecting plants; and from 1768 to 1771, he sailed with Cook round the world in the capacity of naturalist, and wrote the botanical descriptions for the first voyages. In the year 1772 he visited the Hebrides and Iceland, whence he brought back a rich treasure of specimens for his studies in natural history. Before this voyage, Staffa was hardly known beyond its immediate vicinity. It was carefully examined by **B.**, and through him its wonders were made known to the public. In 1777, he was elected President of the Royal Society, an office which he held for 42 years; and in 1781 he was created a baronet. He deserves particular credit for founding and managing the African Association; and the colony of Botany Bay owed its origin mainly to him. Through his efforts, the bread-fruit tree was transferred from Otaheite to the West Indies, and the mango from Bengal, as well as many of the fruits of Ceylon and Persia. Many naturalists and travellers—Blumen-thal, Hornemann, Burekhardt, Mungo Park, and others, were indebted to him for zealous and disinterested assistance in their labours. During the French war, **B.** did much to alleviate the sufferings of all captive men of science, and used his influence with government to procure the restoration of their papers. Cuvier, in his *Ologe* on him before the French Academy of Science, states that no less than ten times had collections, captured by the English, been restored to the Jardin du Roi at Paris through the instrumentality of **B.** No man of science appealed to him in vain for pecuniary assistance; and his splendid library of natural history was at the service of those who desired to consult it. With the exception of articles in magazines, and contributions to the publications of learned societies, especially to the *Philosophical Transactions*, **B.** has written nothing but two small works—*A Short Account of the Causes of the Diseases in Corn called Blight, Mildew, and Rust*, which was printed for his friends in 1803, and for the public in 1805; and *Circumstances Relative to Merino Sheep* (London, 1809). He left a valuable library, of which an excellent catalogue was made by his friend Dryander; and a rich collection of specimens in natural history, both of which he bequeathed to the British Museum.

BANKS, THOMAS, an eminent English sculptor, born in Lambeth in December 1735. **B.** was apprenticed to a landscape gardener and architect, but he soon abandoned these practical arts for the more imaginative one of sculpture. In 1770, **B.** was a successful candidate for the gold prize of the Royal Academy, established two years before. In 1772, with an allowance of £50 a year from the Academy for three years, he went to Rome to study the master-pieces of art there. After a residence of several years in Rome, during which he exhibited two of his finest works, 'Caractacus Pleading before Claudius,' and 'Psyche and the Butterfly,' and having gained much fame but little profit, he returned to England. Here his refined imaginative style was little appreciated in comparison with the popular but inferior performances of some of his contemporaries; and after two years, he went to Russia, where he was well received by the Empress Catharine, who purchased his *Psyche*, and gave him a commission for a group called 'Armed Neutrality.' Having executed this, he returned to England, where he completed perhaps his finest work, 'The Mourning Achilles,' now in the British Institution. **B.** now received several commissions, and was elected a member of the Royal Academy. The monuments of Sir Eyre Coote in Westminster Abbey, and of Captains Burgess and Westcott in St Paul's Cathedral, were among his last works. He died February 2, 1805. It was in purely imaginative works that **B.** most excelled; in practical subjects, his introduction of the ideal was incongruous and inartistic, rendering them far less valuable than those of some of his rivals.

BANKSIA, a genus of Australian shrubs of the natural order *Proteaceæ* (q. v.), named in honour of Sir Joseph Banks. A few of the species become small trees. They have hard dry leaves, generally white or very pale green beneath, and present a remarkable appearance from the umbellate arrangement of their branches, which bear towards their extremities oblong heads of very numerous flowers. The flowers secrete much honey. Some of the species are now frequent ornaments of green-houses in Britain. They are abundant in all parts

Banksia littoralis
in flower.

Fruit and Leaf of *Banksia*.

of Australia, forming, indeed, a characteristic feature of its vegetation, and are called *Honeysuckle trees*.

B. grandis, found at Swan River, exceeds all the rest of the genus in size, attaining a height of 50 feet.

BANN, the name of two rivers in the north-east of Ireland; the one, the Upper B., flowing into, and the other, the Lower B., out of Lough Neagh. The Upper B. rises on the north side of the Mourne Mountains, in the south of Downshire, and runs 25 miles north-north-west through the counties of Down and Armagh, successively in a granite, silurian, trap, and tertiary basin, into the south side of Lough Neagh. It passes Banbridge, Gilford, and Portadown. At the latter place the Newry Canal joins it. The Lower B., strictly the continuation of the Upper, issues from the north-west corner of Lough Neagh, and flows 40 miles north-north-west, through Lough Beg, and dividing the counties of Antrim and Londonderry. It runs past Portglenone and Coleraine, into the Atlantic Ocean 4 miles south-west of Portrush. One mile above Coleraine it falls over a ledge of rock 13 feet high. It bears the surplus waters of Lough Neagh to the ocean, and has important salmon and cel-fisheries. Vessels of 200 tons can reach Coleraine by the river, 4 miles from the ocean.

BANNATYNE CLUB, a literary club deriving its name from George Bannatyne, to whose industry we are indebted for the preservation of much of the Scottish poetry of the 15th and 16th centuries. The B. C. was instituted in Edinburgh in 1823 by Sir Walter Scott, with the assistance chiefly of Mr David Laing of the Signet Library, Mr Archibald Constable, and Mr Thomas Thomson. The object of the institution was to print rare works illustrative of Scottish history, topography, poetry, miscellaneous literature, &c., in a uniform and handsome manner, either at the expense of the club, or as the contributions of individual members. As a general rule, the number of copies of each work printed was limited to the number required for distribution among members, but in some instances a few were printed for sale. The club originally consisted of 31 members only, who paid an annual contribution of five guineas; but owing to the anxiety of many eminent men to become members, the number was gradually extended to 100, where it was definitively fixed, the same annual payment being still required. Its first president was Sir Walter Scott, and its first secretary Mr David Laing, who still continues to discharge the duties of the office. The club had annual meetings in December, which were of a very convivial character, so far as can be judged from an account of their first meeting published in the *Edinburgh Literary Gazette* of February 1824—afterwards reprinted by the club itself—which suggestively says that the *Bannatyne Garland*, No. 1, a song composed by one of the members, was sung 'to the tune of *Four Bottles more*.' These meetings, however, have, within recent years, been given up; and the club itself, which, in 1859, numbered about eighty members, was to be dissolved in a few months. Since its commencement it has numbered among its members many of the most distinguished Scotsmen, and has printed more than a hundred quarto works, besides several octavo ones, some valuable as they are rare, and all bringing high prices at sales.

BANNER, a piece of cloth attached to a pole, and usually bearing some warlike or heraldic device, or national emblem. In this sense B. is a generic term, including many species, such as standard, ensign, pennon, flag, &c. Banners have been used from the earliest times, and in all countries, for the purpose of directing the movements of troops. We read of them constantly in the Old Testament, as in

Numbers ii. 2, 'Every man of the children of Israel shall camp by his standard, and under the ensign of his father's house.' The earliest Roman standard was a bundle of straw fixed to the top of a spear. This was succeeded by figures of animals—the horse, the bear, &c., all of which soon gave place to the eagle, which continued all along to be the chief Roman ensign, and was afterwards assumed by the German, and latterly by the French emperors of the Napoleon dynasty. In addition to the eagle, each Roman cohort had a B., generally a serpent or dragon woven on a square piece of cloth. The standard of the cavalry was a square piece of cloth expanded on a cross, and it was to this that the term *vevillum* properly applied. Examples of these standards are sculptured on the Arch of Constantine at

Roman Standards from the Arch of Constantine.

Rome. The top of the staff was also frequently adorned with a figure of Mars or of Victory, and in later times, with the head of the reigning emperor. After Constantine embraced Christianity, the Cross was substituted for the head of the emperor on the purple B. of Byzantium. Standards were less in use amongst the Greeks than has been usual with warlike nations; but a standard, and sometimes a scarlet flag, was employed as a signal for giving battle. On the rise of Chivalry, in the middle ages, the ordering of banners, like every other branch of military organisation, attained to something like scientific exactitude. From the B. royal, which bore the national emblems, to the small streamer attached to the lance, with its cross or stripes, there was a regular subordination, each emblem having its place and its meaning. The pennon of the simple knight differed from the square B. of the banneret (q. v.), in being pointed at the ends. In addition to their varieties in size, shape, and colour, these banners were distinguished by the emblems which they bore. One of the earliest is the Danish raven, depicted on the standard taken by Alfred, of which Asser mentions the tradition, that 'in every battle, wherever that flag went before them, if they [the Danes] were to gain the victory, a live crow would appear flying on the middle of the flag; but if they were doomed to be defeated, it would hang down motionless.' Nor did the privilege of carrying banners belong to princes and knights alone, bishops and abbots displayed similar ensigus, which were carried before them in religious processions,

and under which their retainers fought in their defence. It was to these that the term 'Goufalon,' a word as to the origin of which much diversity of opinion exists, was more commonly applied. In place of the heraldic emblems of the knight, the B. of the Church, and of towns and communes, usually bore the effigies of saints. Some banners, however, displayed no ensigns whatever, and were known simply by their colour. Of this the *origlumme*, or plain ruddy flag of St Denis, was a famous example. The celebrated Bayeux Tapestry (q. v.) throws considerable light on banners, as well as on other matters connected with the warlike arrangements of the middle ages. Much curious information on this and kindred subjects will be found in Hewitt's *Ancient Armour and Weapons in Europe*. By every warlike people the B. has been regarded as the emblem of national honour, as a palladium for the defence of which the individual warrior was at all times ready to sacrifice his life. From the converse of this feeling, banners and flags taken from the enemy have always been regarded as special trophies of victory, and places of honour in churches and public buildings have consequently been assigned them. As to the flags borne by the ships of different nations, and the arrangements concerning them in peace and war, see FLAG; as to colours of regiments, see COLOURS.

The relation which banners bear to other kinds of flags, in their forms and uses will be explained under COLOURS, REGIMENTAL; ENSIGN; FLAG; PENDANT; &c.

Banner displayed, is the term used by heralds to describe a B. open and flying.

BANNERET, a higher grade of knighthood conferred by the sovereign for some heroic act performed in the field, and so called because the pennon of the knight was then exchanged for the banner—a proceeding which was effected by the very simple means of rending the points from the pennon. The first B. in England is said by Froissart to have been made by King Edward I., and the last time the honour was conferred was by Charles I. after the battle of Edgehill, the recipient being an individual who rejoiced in the familiar name of John Smith. The ceremony of the creation of a Knight-B. must have been very impressive to persons filled with the ideas which were prevalent in the ages of chivalry. The king, or his general, at the head of his army, drawn up in order of battle after a victory, under the royal standard displayed, attended by all the officers and nobility of the court, received the B. elect, who was not necessarily a knight previously, led between two knights of note, or other men famous in arms, carrying his pennon in his hand, the heralds walking before him and proclaiming his valiant achievements, for which he deserved to be made a Knight-B., and to display his banner in the field. The king, or general, then said to him: 'Advance, Banneret!' (*Advances toy Banneret*), and caused the point of his pennon to be torn off. The new knight, with the trumpeters sounding before him, and the nobility and officers bearing him company, was sent back to his tent, where a noble entertainment was provided by the king. Some attempts have been made to revive the title in recent times, as when George III., at a review of the navy at Portsmouth in 1773, conferred it on Admiral Pye and several other officers.

BANNOCK, a cake of home-made bread, common in the country parts of Scotland, but now less so than formerly. It is usually composed of pease-meal or of pease and barley meal mixed; prepared without any leaven, it is baked on a circular plate of iron, called a girdle. When made of mixed

meal, it is called a mashlum bannock. 'Bannocks of barley-meal' form the theme of a popular Scottish song. A superior kind of B., called a Selkirk B., from the place where it is made, resembles the finer and lighter species of tea-cakes prepared by bakers. The word B. is from the Gaelic *bonnach*, a cake. In the west of Scotland, it is pronounced *bunnoch*. There is an amusing fairy-tale called *The Story of the Wee (little) Bunnoch*. The B. is doubtless of great antiquity, being, in fact, the primitive cake, only varied in material, of every country.

BA'NNOCKBURN, a village in the east of Stirlingshire, three miles south-south-east of Stirling, on the Bannock rivulet, which falls, a few miles below this, into the Forth. Near this was fought the great battle of B. on Monday, 24th June 1314. Robert Bruce, with 30,000 Scotch, gained a signal victory over Edward II., with 100,000 English, and secured his throne and the independence of Scotland. The English are said to have lost 30,000, and the Scotch 8000 men. The 'Bore Stone,' on which Bruce is said to have fixed his standard on that eventful day, is still to be seen on an eminence near the scene of the fight. On the south-east of the field of B., at Sauchie Burn, James III. was defeated in 1458 by his rebellious subjects, and assassinated after the battle in a mill where he had taken refuge. B. is now an important seat of the woollen manufactures, especially those of tartans and carpets. It has long supplied the tartan worn by the Highland regiments. Tanning is carried on to some extent, and the neighbouring villages are noted for the manufacture of nails. Pop. 2627.

BANNS, or BANS, in the law of England, means a proclamation, or public notification, or summons, in which general sense, however, it may be said to have become obsolete. It is now chiefly, if not solely, used in the publication of intended marriages, as to which, see next article.

BANNS or BANS OF MARRIAGE. This is one of three alternative preliminary forms now essential to the legal celebration of marriage in England. The other two are marriage by licence, and marriage by a registrar's certificate. B. of M., like many of our ecclesiastical regulations, has its origin in the ancient practice of the Roman Catholic Church, which our reformers wisely refrained from abolishing. By the publication of these B. is meant the legal proclamation or notification within the parish, district, or chapelry, and in the proper church or chapel, of the names and descriptions of the persons who intend to be there married; the object being the notoriety of the solemn act, so that all who have objections to the marriage may be enabled to state them in time. According to the old English canon law, the publication of B. might be made on *holidays*; but a change was made to *Sundays* by the first important Marriage Act, the 26 Geo. II. c. 33; and although that act was afterwards superseded by the 4 Geo. IV. c. 76, the regulation as to *Sundays* has been continued. The latter act is still the principal subsisting statute on the subject of marriage B., although it has been amended and extended by the 6 and 7 Will. IV. c. 85, the 1 Vic. c. 22, the 3 and 4 Vic. c. 72, and the 19 and 20 Vic. c. 119. The law, as contained in these acts of parliament, is as follows: By the 4 Geo. IV. c. 76, s. 2, it is enacted that all B. of matrimony shall be published in an audible manner, according to the rubric prefixed to the marriage-service in the *Book of Common Prayer*, upon three *Sundays* preceding the ceremony, during the time of morning-service, or of evening-service (if on the day of publication there shall be no morning-service) immediately after

the second lesson. The rubric referred to is in the following terms: 'I publish the banns of marriage between M. of — and N. of —. If any of you know cause or just impediment why these persons should not be joined together in holy matrimony, ye are to declare it. This is the first [second, or third] time of asking.' By the 23d section of the same act, all marriages celebrated without such publication of B., or without licence (or now, under the 6 and 7 Will. IV. c. 85, s. 42, without a Registrar's certificate), are declared to be null and void. By the 26th section of the last-mentioned act, the bishop, with consent of the patron and incumbent, may license chapels for the celebration of marriages in populous places; and by the 33d section of the 1 Vic. c. 22, B. may be published in such chapels. By section 9 of the 4 Geo. IV. c. 76, it is provided, that if the marriage be not celebrated within three months after publication of B., the marriage shall not take place until the B. shall have been republished on three several Sundays, unless it be a marriage by licence, or now, by certificate, which two latter alternatives, however, must also be availed of within the three months. It only remains to be added on the law, as contained in these marriage acts, that by section 8 of the last of them, the 19 and 20 Vic. c. 119, it is provided, that in every case in which one of the parties intending marriage without licence shall dwell in Scotland, a certificate of proclamation of B. in Scotland, under the hands of the session-clerk of the parish in which such proclamation shall have been made, shall, when produced to any person duly authorised under the provisions of this act to solemnise a marriage, be as valid and effectual for authorising such person to solemnise such marriage as the production of a certificate for marriage of a superintendent registrar of a district in England would be, in reference to a party resident within such district.

The purpose of the law is to secure public knowledge of intended marriages, and therefore, although the 4 Geo. IV., following in this respect the 26 Geo. II., declares that marriages shall be void without publication of B. (where, of course, that is the chosen preliminary), it is not necessary that such publication should be made in the real baptismal names of both or either of the parties; it is sufficient that the B. be published in the names by which the parties are *known*, or either of them. Nay, it even appears that where the baptismal names have been discovered, having been previously concealed or unknown, it is better, if not necessary, that publication should be made in the names by which the parties are familiarly known in the district, by which, indeed, they may be said to be known to the world. There are numerous cases decided in England from which such doctrine necessarily follows. In one of these cases, Lord Chief-justice Ellenborough, the highest judicial authority that could be named, stated, in giving judgment: 'The object of the act is to secure notoriety, to apprise all persons of the intention of the parties to contract marriage; and how can that be better attained than by publication in the names by which parties are known? I think that the act only meant publication by known and acknowledged names.' It has also been decided, that a fraudulent knowledge of a wrong name in the publication of B. will not void the marriage, unless the fraud should be on *both* sides.

In Scotland, B. have the same Roman Catholic origin as in England. Indeed, Mr Erskine, one of the most authoritative Scotch legal writers, gives it as his opinion, that the Scotch borrowed the practice from the decrees of the *Council of Trent*; but a

recent able writer (see *Fraser's Domestic Relations*, vol. i. p. 113) considers this opinion erroneous, and shows that B. were first sanctioned in Scotland by councils which were held in that country long before the time of the Council of Trent. After the Reformation in Scotland, the practice of proclaiming B., as the phrase is in that country, was continued. They are described in the Scotch Act 1661, c. 34, 'as a part of the laudable order and constitution of the kirk;' and they have since been mentioned in various acts of parliament applicable to Scotland, such as the 10 Anne, c. 7, and the 4 and 5 Will. IV. c. 28. By the first of these acts, the privilege of publicly celebrating marriage was extended to the Scotch *Episcopalian* clergy, but with a proviso that the B. should be duly published three Lord's Days, not only in the Episcopal churches which the parties frequent, but also in the parish church or churches. Should the parish minister, however, neglect or refuse to publish the B. of such parties, the act declares that it shall be sufficient to do so in any Episcopal congregation alone. The 4 Will. IV. c. 28, puts other dissenting bodies in Scotland in the same position as the Episcopal Church there; but there is this little difference, that publication of the B. of such dissenters is required to be made in the *parish* church alone. There is one other regulation of the Scotch law on this subject which is deserving of notice for popular information—namely, that when both of the parties have their *domicile* (q. v.) within Scotland, and enter into marriage in England or Ireland, they must have their B. proclaimed in the parish church of their domicile in Scotland, otherwise they are liable to the penalties of clandestine marriage. Such is the express enactment of the Scotch statute 1661, c. 34.

The Scotch law differs from the English in regard to the effect of non-publication of banns. In England, as we have seen, the consequence is to render the marriage absolutely void. In Scotland, however, marriage, without proclamation of B., is valid; but in such case the parties, celebrator, and witnesses are liable in the above penalties. See MARRIAGE LICENCE, SPECIAL LICENCE, REGISTRAR'S CERTIFICATE.

BANQUETTE, in Fortification, is a raised ledge or step inside the parapet of a rampart, of such a height that musketeers, when standing on it, may be able to fire over the crest of the parapet without too much exposure to the enemy. It is about 4 feet wide, and 4 or 4½ feet below the crest. The musketeers ascend to it from the rampart either by a few steps or by a sloping path.

BANTA'M, a seaport, now decayed, in a district of the same name, which forms the west end of Java. It is 40 miles to the west of Batavia, being in lat. 6° 2' S., and long. 106° 11' E. It was founded by the Dutch in 1602, being their earliest establishment in the island. The district contains 362,242 inhabitants.

BA'NTAM FOWL, a well-known variety of the common Domestic Fowl (q. v.), originally brought from the East Indies, and supposed to derive its name from Bantam, in Java. It is remarkable for small size, being only about a pound in weight, and for a disposition more courageous and pugnacious than even that of a game-cock. A bantam-cock will drive to a respectful distance great dunghill-cocks five times its weight, and has been described as 'a beautiful example of a great soul in a little body.' There are several subvarieties of the bantam. Most of them have the legs much feathered. The flesh and eggs are good, although the eggs are of course small; and the bantam lays well in winter.

BANTENG (*Bos Banteng* or *B. Sondaicus*), a species of Ox (q. v.), a native of Java and Borneo, which, in colour, shape, horns, and want of dewlap bears some resemblance to the Gaur (q. v.) of India, 'but in the skeleton of the gaur, the sacrum consists of 5 vertebrae, and the tail of 19, while in the skeleton of the B., the sacrum consists of but 4 vertebrae, and the tail of 18.' The B. is black, with white legs. The hair is short and sleek, the limbs slender. The muzzle is sharp. The back rises into a high arch immediately behind the neck. The B. inhabits forests, and has been generally described as untamable, but this opinion rests on no satisfactory authority.

BANTRY, a seaport town in the south-west of Cork county, Ireland, in a cove opposite Whiddy Isle, at the head of B. Bay, and 44 miles west-south-west of Cork. The two chief streets converge into an open space towards the sea, and mountains, 933 feet high, rise behind the town. The chief trade is the export of agricultural produce. A little fishing is carried on. In last century, there was an extensive pilchard-fishery here; but the pilchard has now deserted the coast. Many tourists resort to B. in summer. Pop. between 2000 and 3000.

BANTRY BAY, a deep inlet in the south-west extremity of Ireland, between Crow Point and Sheep's Head Point, in Cork county. It is 25 miles long, running east-north-east, with a breadth of 3 to 5 miles. It is one of the finest harbours in Europe, affording safe and commodious anchorage for ships of all sizes. Near the entrance on the north side is a fine large sheltered harbour, formed by Bear Island, with a safe passage on both sides. At the head of the bay are two harbours: the one to the south, or the landlocked roadstead of B. harbour, is formed by Whiddy Isle, opposite B. town; the other to the north, or Glengariff harbour, is also sheltered by an island, but is small, and narrow at the entrance. The coast around B. B. is rocky and high, consisting of Devonian strata, and exhibiting some of the finest scenery in the kingdom. On the north side, 17 miles west of B. town, is the great cataract of Hungry Hill, where three lakes, at the heights of 1011, 1126, and 1360 feet above the sea, discharge their waters, by almost continuous cascades, into Adrigoole Creek. Near the opening of B. B. a skirmish took place, in 1689, between a small English fleet under Admiral Herbert (afterwards Lord Torrington), and the French fleet, which conveyed James II. to Kinsale. Several ships of the French invading expedition under General Hocche anchored here in 1796.

BANTRING (*Tupaia*), a genus of insectivorous quadrupeds, remarkably differing from the other *insectivora* (q. v.) in their habits, as they climb trees with the agility of lemurs or squirrels. They are also remarkable for their very elongated muzzle. They have soft glistening fur, and a long bushy tail. The few species known are all natives of the Indian archipelago.

BANYA (NEGAY), or NEUSTADT, a town of Hungary, province Szathnar, with a royal mint, and productive mines of gold and silver. Pop. 5500.

BANYAN, or BANIAN (*Ficus Indica*), a tree, native of India, remarkable for its vast rooting branches. It is a species of Fig (q. v.); has ovate, heart-shaped, entire leaves, about five or six inches long; and produces a fruit of a rich scarlet colour, not larger than a cherry, growing in pairs from the axils of the leaves. The branches send shoots downwards, which, when they have rooted, become stems, the tree in this manner spreading over a great surface, and enduring for many ages. One has been described as having no fewer than 350 stems, equal

to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The branches are usually covered with monkeys, birds, and enormous bats. The monkeys eat both

Banyan-Tree.

the fruit and leaves. The vegetation of the B. seldom begins on the ground. The seeds are deposited by birds in the crowns of palms, and send down roots which embrace and eventually kill the palm. As the B. gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. The wood of the B. is light, porous, and of no value. The bark is regarded by the Hindoo physicians as a powerful tonic, and is administered in diabetes. The white glutinous juice is used to relieve toothache, and also as an application to the soles of the feet when inflamed. Bird-lime is also made from it. Gum-lac is obtained in abundance from the B.-tree. The B.-tree is beautifully described by Southey in his poem *The Curse of Kehama*.

BANYULS-SUR-MER, a town of France in the Pyrénées Orientales, with a fishing-port on the Mediterranean. The celebrated wines of Grenache and Rancio are produced in this district. Near the town are four old towers, one of which marks the division between France and Spain. B. was the immediate scene of many encounters between the French republicans and the Spaniards during the first French Revolution. Pop. (1872) 2227.

BANYUWANGY, or BANJOUVANGY, an important and populous seaport town and military post belonging to the Dutch, on the east coast of Java, capital of district of same name.

BA'OBAB. See ADANSONIA.

BAPAUME, a fortified town of France, department of Pas-de-Calais. A portion of the allied troops advanced to this place after compelling the French to abandon their fortified position, and to retreat behind the Scarpe, in August 1793. Pop. 2364.

BA'PHOMET is the name of a mysterious symbol, which was in use among the Templars. According to the oldest and most probable interpretation, the word is a corruption of Mahomet, to whose faith the members of the order were accused of having a leaning. The symbol consisted of a small human figure cut out of stone, having two heads, male and female, with the rest of the body purely feminine. It was envired with serpents, and astronomical attributes, and furnished with inscriptions for the most part in Arabic. Specimens are to be found in the archæological collections of Vienna and Weimar. Hammer, however, in his *Fundgruben des Orients*, derives B. from Gr. *baphê*, baptism; and *metis*, council or

wisdom. He charges the knights with a depraved Gnosticism, and makes the word signify the baptism of wisdom—the baptism of fire; in short, the Gnostic baptism—a species of spiritual illumination, which, however, was interpreted sensually by later Gnostics, such as the Ophites (an Egyptian sect of the 11th c.), to whose licentious practices he declares them to have been addicted. But this explanation is generally discredited.

BAPTISM (Gr. *bapto*, to dip or wash, or to stain with a liquid), one of the sacraments (q. v.) of the Christian Church, deriving its name from the outward rite of washing with water, which forms an essential part of it. B. is almost universally acknowledged among Christians as a sacrament, and is referred to the authority of Christ himself, whose express commandment is recorded in the gospels (Mat. xxviii. 19; Mark xvi. 16). B. is frequently mentioned in the New Testament as a divine ordinance.

The name and the rite were not, however, altogether new when the ordinance was instituted by Christ. Religious meanings were early attached to washings with water, both by heathens and Jews; they were among the ordinances of the Jewish law; and it is not necessary to go beyond that law to find the origin of the custom of washing or *baptizing* proselytes upon their admission into the Jewish Church. Washing with water was requisite for the removal of ceremonial uncleanness, and every proselyte must have been regarded as, prior to his admission into the Jewish Church, ceremonially unclean. John the Baptist baptised not proselytes upon their renouncing heathenism and entering the Jewish Church, but those who, by birth and descent, were members of it, to indicate the necessity of a purification of the soul from sin—a spiritual, and not a mere outward change.

One of the most important of the controversies which have agitated the Christian Church as to B., is that concerning the proper subjects of B., whether adults only who profess faith in Christ are to be baptised, or if this ordinance is to be administered to their infants also. See **BAPTISTS**, and **BAPTISM, INFANT**. The B. of adults was certainly more frequent in the apostolic age than it has ordinarily been where the B. of infants has prevailed; for which an obvious cause presents itself in the fact, that the first members of churches were converts from Judaism or from heathenism. It is, however, generally held by those who advocate the B. of infants, that it was the practice of the apostles and of the church of the apostolic age to baptise the infants of Christians; which, on the other hand, is as stoutly denied, and infant B. is alleged to have crept in along with other corruptions. For neither opinion can any positive historical proof be adduced, the arguments on both sides being purely inferential.

It is admitted, on all hands, that at an early period in the history of the church, B. was administered to infants, although, according to Neander, even after 'it had been set forth as an apostolic institution, its introduction into the general practice of the church was but slow.' He finds 'the first trace' of it in Irenæus. It was opposed by Tertullian about the end of the 2d c.; and was advocated by Cyprian, and acknowledged as an apostolic institution in the North African Church and in the Alexandrian and Syro-Persian Churches in the 3d c.; but it was not until the 5th c. that it became fully established as the general practice of the Christian Church. It has unquestionably continued to be the general practice from that period to the present day; feebly

opposed by some of the sects of the middle ages, and more vigorously by some of those who have adopted the general principles of the Reformation. See **BAPTISTS**.

Both the practice of infant B., and the neglect of it in the early ages of the church, were connected with particular views of religious doctrine, and of the nature and purpose of B. itself. The prevalence of the Augustinian doctrine of original sin is generally regarded as a principal cause of the prevalence of infant B.; but Pelagius, whilst opposing that doctrine, maintained the necessity of infant B., apparently upon the ground that the kingdom of heaven can be attained by human beings only through God's grace. No little influence in favour of infant B. must be ascribed to the growing belief of the absolute necessity of B. to salvation, and of a sort of mysterious efficacy in the rite itself. It is certain, on the other hand, that the belief in the forgiveness of sins in B. led to a practice of deferring it as long as possible, that all sins might be blotted out at once; thus the Emperor Constantine the Great was baptised only a short time before his death. The approach of a war or pestilence caused many to rush forward in haste to be baptised, who had previously delayed.

Two modes of B. are practised by immersion or dipping, and by aspersion or sprinkling, concerning which there has been much controversy in the early period of the church's history, as well as in recent times. Afusion, or pouring, the common practice of the Church of Rome, may be regarded as essentially the same with sprinkling. The advocates of sprinkling universally admit the validity of B. administered in the other mode, but the advocates of dipping generally refuse to acknowledge that B. by sprinkling can be true Christian baptism. The opponents of infant B., almost without exception, insist upon immersion; whilst aspersion or afusion of water is general, except in the Eastern churches, wherever the B. of infants prevails. The argument upon which Baptists depend most of all is from the word B., and the verb *baptizo*, to baptise, which also, in classic Greek, signifies to immerse. On the other side, it is contended that a strict limitation to this sense does not well accord with its character as a 'frequentative' form of *bapto*; and instances are adduced from the New Testament itself, in which this signification cannot easily be attached either to the noun or to the verb, as 1 Cor. x. 2, where Paul says that the Israelites were 'baptised unto Moses in the cloud and in the sea;' and Heb. ix. 10, Mark vii. 4, and Luke xi. 38, where both verb and noun are employed concerning the *washings* of the Jews, and the noun even of their washing of 'cups, and pots, brazen vessels, and of tables.—To the argument in favour of immersion, derived from the phrases employed when B. is mentioned in Scripture, as when we are told (Mat. iii. 6) that John the Baptist baptised 'in Jordan,' that our Lord after his B. (Mat. iii. 16) 'went up out of the water,' that Philip and the Ethiopian eunuch (Acts viii. 38) 'went down both into the water;' it is replied that all the passages of this description, even if their meaning were certainly as precise and full as Baptists suppose it to be, are insufficient to sustain the weight of the conclusion as to the necessity of a particular mode of B.; that, however, it is far from being clear that these passages must be interpreted or the meaning of the Greek prepositions so strictly defined as the argument requires; and further, that there are instances mentioned in Scripture which afford a presumptive argument in favour of another mode of B., as where we are told of great numbers added to the church in one day; whilst we have nowhere any

intimation of converts being led to any pond or river to be baptised. To the argument drawn from the language of Paul in Rom. vi. 4, Col. ii. 12 (see BAPTISTS), it is replied that it depends upon a fanciful interpretation of these texts.—According to most of the advocates of B. by sprinkling, the great error of their opponents is that of attaching too much importance to the question of the mode of baptism.

It is, however, indisputable that in the primitive church the ordinary mode of B. was by immersion, in order to which *Baptisteries* (q. v.) began to be erected in the 3d, perhaps in the 2d c., and the sexes were usually baptised apart. But B. was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinic* (sick) B. were evidently prevalent in the time of Cyprian (middle of 3d c.). B. by sprinkling gradually became more prevalent; but the dispute concerning the mode of B. became one of the irreconcilable differences between the Eastern and Western Churches, the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head, or sprinkling on the face, which practice has generally prevailed since the 13th c.; but not universally, for it was the ordinary practice in England before the Reformation to immerse infants, and the *fonts* (q. v.) in the churches were made large enough for this purpose. This continued also to be the practice till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva, and other places of the continent, during the reign of Mary. To this day the rubric of the Church of England requires, that if the godfathers and godmothers 'shall certify him that the child may well endure it,' the officiating priest 'shall dip it in the water discreetly and warily;' and it is only 'if they shall certify that the child is weak,' that 'it shall suffice to pour water upon it,' which, however, or sprinkling, is now the ordinary practice.

B. was accompanied, from an early period in the history of the church, with various forms and ceremonies, besides the simple rite of washing with water and the pronouncing of the formula which declares it to be 'in the name of the Father, and of the Son, and of the Holy Ghost.' These ceremonies are almost all retained in the Church of Rome, and also generally in the oriental churches, but have been entirely or almost entirely laid aside by Protestants. The Church of England retains the sign of the cross made upon the forehead after B., but the other Protestant churches in Britain reject it. It was an ancient custom that the *catechumens*, as candidates for B. were called whilst receiving instruction with a view to that sacrament, when they were to be baptised, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of B.; the renunciation of the devil and his works is required by the Church of England of the person baptised, if an adult, or of the *sponsors* or 'sureties' of a child.—Sponsors (q. v.) were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of B. to salvation led even to B. of the dead among the Montanists (q. v.) in Africa, in which sponsorship was also introduced. Presbyterian and Independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient practice of exorcism (q. v.) immediately before B. has been rejected as superstitious by almost all Protestant churches; as have also

that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three persons of the Godhead—that of breathing upon the baptised person, 'to signify the expulsion of the devil,' and to symbolise the gift of the Holy Spirit—that of anointing with oil (*chrism*, q. v.), to symbolise the same gift, or to indicate that the baptised person is ready, as a wrestler in the ancient games, to fight the good fight of faith—that of giving him milk and honey, in token of his spiritual youth, and of his reception of spiritual gifts and graces—that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian—that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odour of truth and virtue—and that of clothing him after B. with a white robe (the *chrysome*), in token of the innocence of soul which by B. he was supposed to have acquired. The white robe and the anointing with oil were retained in the Church of England for a short time after the Reformation.—The giving of a name in B. (see NAMES, BAPTISMAL) is no essential part of it, but is a custom apparently derived from that of the Jews in circumcision (Luke i. 59—63).—The Church of Rome prefers the use of holy-water (q. v.) in B., but regards any water as fit for the purpose in case of necessity.—According to an ancient usage, long obsolete, the ordinary administration of B. was limited to the two great festivals of Easter and Whitsuntide.—Whether B. may be administered in private, has been much debated, both in ancient and modern times. The administration of B. in private houses, and not in the presence of a congregation, was one of the things earnestly contended against by the Presbyterians in Scotland in the first half of the 17th c.; their opposition being grounded, not only upon hostility to what they deemed usurpation of authority, but upon the danger of superstitious views of baptism. And apparently upon this latter ground, B. in private houses is also discouraged, even while it is allowed, if there is 'great cause and necessity,' by the Church of England; yet it has become very frequent both in the Church of England and among the Presbyterians of Scotland.

Some of the most important questions concerning B. will be most appropriately noticed in the article SACRAMENT, particularly those relating to its place in the Christian system and among the means of grace. The opinions early became prevalent, that forgiveness of sins is obtained in B., and spiritual life begun, and that it is indispensably necessary to salvation—exception being only made, if any was made at all, of the case of believers, adult persons, who desiring B., were prevented from being baptised, and particularly of those who suffered martyrdom, which was generally held to be equivalent to baptism. The Church of Rome still owns, as supplying the place of B. by water, these two—B. by desire, and B. by blood—i. e., in martyrdom.—According to the general doctrine of the Protestant churches, B. is 'a sign and seal' of the covenant of grace, representing as a sign the blessings of the covenant, and as a seal, confirming the covenant. As a sign, it is generally held to represent in its rite of washing, the removal both of guilt and corruption, by the blood and by the Spirit of Christ, and so to relate equally to pardon and regeneration, although some have limited its symbolic reference to regeneration alone. One of the most important points disputed concerning B., is that of baptismal regeneration. See REGENERATION.

Some early Christian sects appear to have rejected B., on grounds somewhat similar to those on which it is rejected by Quakers (q. v.) at the present day,

who explain the passages which relate to it symbolically, and insist that a spiritual B. is the only real B. of Christians.—The Socinians (q. v.) also in modern times have maintained that B. is not an ordinance of permanent obligation, but a merely symbolical rite of little importance.

Much controversy has taken place concerning *Lay Baptism*. Wherever there is a recognised ministry in the church, there is a general agreement in referring the ordinary administration of B. to those who hold this office. It might be expected that the more strongly the necessity of the transmission of *holy orders* by apostolical succession is asserted, the more strongly also would exclusiveness be manifested with regard to the right of the *clergy* to administer B. But this tendency is counteracted by the belief in the necessity of B., or at least of its great importance to the salvation of infants; so that from an early period lay B. was allowed, although not without a struggle, in cases of apprehended danger; and in the Church of Rome, this principle is logically carried out to the fullest extent, and even women are authorised to administer B. in cases of necessity. On the same ground, lay B. was at first permitted in the Protestant Church of England; but the prevalence of other views led to a kind of formal restriction of the right of administering it to 'lawful ministers,' although in practice the validity of lay B. is still generally recognised.

Another question much agitated in the church from early times, is that concerning the validity of B. by heretics. The opinion ultimately prevailed, that B. by heretics is valid, except in the case of those who do not baptise in the name of the three Persons of the Godhead. This continues to be the almost universal opinion. Few Protestant theologians hesitate to acknowledge the validity of B. administered in the Church of Rome.

The *B. of bells* is a custom supposed to have been introduced about the 10th c., and still retained in the Church of Rome. The term *benediction* is sometimes substituted for B.; but the rite itself is very similar to that of B., and is accompanied with many similar ceremonies—'a sort of exorcism,' sprinkling with holy-water, anointing 'with the oil of catechumens' and 'with chrism,' a formula of consecration 'in the name of the Father, Son, and Holy Ghost,' and sometimes also, if not always, the giving of a name to the bell consecrated, and even a kind of sponsorship as by godfathers and godmothers in baptism. This custom has no doubt greatly fostered the notion of an efficacy in the ringing of bells for protection in storms, and for other benefits; indeed, it is expressly avowed that 'the bells are blessed, to turn off storms and tempests from the faithful.'

BAPTISM, INFANT. The chief arguments in favour of infant B. are based upon the proposition that the church is one throughout all changes of dispensation. From this it is argued that as infants were, so they still must be included in the visible church. It is maintained that in all covenants which God has made with men, their children have been included; that the covenant with Abraham was a renewed revelation of the covenant of grace, the temporal promises made to him being connected with the greatest spiritual promises; that circumcision was a seal of the covenant with respect to these, in which the children of Christians have the same interest that Jewish children had; and that B. is a seal of the covenant now as circumcision was, the things to which it has immediate reference being also blessings which children are capable of. It is contended that the arguments in favour of infant salvation derive additional strength from that view of the place of infants in the church

according to which they are entitled to baptism. The passages which connect B. with faith are regarded as exclusively relating to adults, like the passages which connect salvation with faith and repentance. In reply to the argument that there is no express command for infant B., it is argued that the state of the case rather demands of those who oppose it the production of an express command against it, without which the general command must be held to include it; the words and actions of our Saviour (Mark x. 14) with respect to children are quoted as confirming the opinion that the place of infants in the church is precisely what it was under the Jewish dispensation; and it is contended that it would have been a very great restriction of privilege in the new dispensation if infants had been excluded from a place which they held before, as entitled to a seal of the covenant, whereas it is evident that the new dispensation is characterised not by restriction but by enlargement of privilege.—Those who hold the doctrine of infant B. are styled *Pædo-baptists*.

The Roman Catholic and Lutheran Churches regard the B. of infants as admitting them into the church, and making them members of Christ's body. The Reformed (q. v.) Churches hold that the children of Christians are included in the visible church from their birth, and therefore entitled to baptism. These are the natural starting-points of very different systems.

BA'PTISTERY (Gr. *baptisterion*, a large vase or basin), the name given sometimes to a separate building, sometimes to the portion of the church itself in which the ceremony of baptism was performed. In the latter case, the B. was merely the enclosure containing the font, to be seen in most English churches. According to the earlier arrangements of the Christian Church, however, the B. seems usually to have been a building standing

Section and Plan of Baptistery at Asti.

detached from, though in the immediate vicinity of the church to which it appertained. Baptisteries, at first, were either hexagonal or octagonal, but afterwards became polygonal, and even circular. The B. of St Giovanni in Fonte, at Rome, commonly known as the B. of Constantine, is octagonal, whilst the church of St Constantia, which was originally a B., is circular.

The celebrated B. of Florence is an octagonal structure, measuring about one hundred feet in diameter. It stands detached from, but in the immediate vicinity of the cathedral. It is built of black and white marble, in the style which Giotto is said to have introduced, and which is still peculiar to Florence. Internally, a gallery, which runs nearly round the whole building, is supported by sixteen large granite columns, and the vaulted roof is decorated with mosaics by Andrea Tafi, the pupil of Cimabue. But the magnificent bronze doors, with their beautiful bas-reliefs, are the most remarkable feature of this famous baptistry. The most celebrated of the three doors was executed by Lorenzo Ghiberti, the earliest being

the work of Andrea of Pisa. Fifty years were required for their completion; and it is remarkable that the contracts for their execution are still preserved. Next in importance, and of even greater size, is the B. of Pisa. It is circular in form, the diameter measuring 116 feet. Externally, it is divided into three stories, the two under ones being surrounded by columns, of which the upper are smaller and more numerous than the under. The building is raised from the ground on three steps, and terminates in a pear-shaped dome, which is famous for its echo, the sides acting as whispering-galleries. The largest B. ever erected is supposed to have been that of St Sophia, at Constantinople, which was so spacious as to have served on one occasion for the residence of the Emperor Basilicus.

BAPTISTS (sometimes called *Antipædobaptists*, as opposed to *Pædobaptists*, or those who advocate Infant Baptism*). This denomination of Christians refuse to acknowledge any great name as founder of their sect. They trace their origin to the primitive church itself, and refer to the Acts of the Apostles and their Epistles as affording, in their opinion, incontestable evidence that their leading tenets had the sanction of inspiration. When Christianity became corrupted by the rise of Antichrist, they point to the maintenance of their scripture practice among the Cathari and Albigenses and other sects of the middle ages, who, in the midst of surrounding darkness, continued to hold fast the apostolic testimony. They sprung into notice in England under Henry VIII. and Elizabeth. They were persecuted under both reigns, but they received freedom to meet for worship from James II., and complete religious liberty under William III. Ever since, they have diffused their principles extensively in Great Britain and North America; many of their ministers have done good service to the cause of science and literature, and, both as preachers and writers, have taken a position of eminence in society.

The B. hold the plenary inspiration and supreme authority of the Holy Scriptures as a revelation from God; the equal deity of the Son and the Holy Spirit in the unity of the ever blessed Trinity. But, as a condensed view of opinions cannot be expected in this work, it may be as well to state that the denomination are distinguished by almost all the shades of belief which exist in other bodies. They have among them Calvinists both *hyper* and moderate, also high and low Arminians, diverging off in every variety of shade from a common centre. The great body of them in Britain and America hold the doctrine of Calvinism in a modified form; that is to say, they maintain the *sufficiency* of the Atonement for *all men*, the limitation for which some have pleaded, they consider, lies in its *application* to the sinner by the sovereign grace of God through faith. They maintain the necessity of regeneration and holiness of life as essential to true religion, and that 'without holiness no man shall see the Lord;' and their conduct, in general, will bear a comparison with any class of their co-religionists.

Particular B., so called because holding that Christ died for an elect number, and *General B.*, who maintain that he died for all men, constitute the two leading sects into which the body is divided. *English B.*, in their church order and government, are the same as Congregationalists, the

rite of baptism excepted. *Scotch B.*, properly so called, insist on a plurality of pastors in every church, and the exercise of mutual exhortation by the members in their public assemblies. There are Baptist churches in England, however, who are *Scotch* in their order, and *English B.* in Scotland who are *English* in theirs. Seventh-day B., we believe, are to be found almost wholly in America, who observe not the first day of the week, but the seventh, as a day of rest. There are, besides these great divisions, various small associations of B. scattered over Great Britain, America, and the continent of Europe, whose opinions cannot be gathered up into systematic arrangement, and who would not approve of being identified with any of the sectarian designations here set down.

The particular tenet which characterises B. among their fellow-Christians is, that baptism is an ordinance the validity of which depends on an intelligent faith on the part of the recipient. Their views on the matter of baptism may be reduced to two heads—the *subjects* and *mode* of baptism. The subjects of the baptismal rite they hold to be believers in the Lord Jesus Christ. They ground their faith in this matter on the following positions—namely: 1st, The Lord in his commission to his apostles associates teaching with baptism, and *limits* the administration of the rite to the *taught*. 2d, The Acts of the Apostles shews how they understood their Master, for they baptised none but believers, or such as appeared to be so. 3d, That the kingdom of Christ as it appears in this world is restricted to credibly converted persons, as is shewn in his discourse with Nicodemus: 'Except a man be born again, he cannot see the kingdom of God;' and his subsequent statements on to the hour when he emitted his memorable confession before Pilate, 'My kingdom is not of this world,' uniformly proves that its subjects and institutes form a distinct and separate community from the Jewish theocracy, which embraced parents and children in nonage in one commonwealth. 4th, They maintain that the ordinance, as explained in the New Testament, always points to a moral and spiritual change, apart from which it were indeed a meaningless ceremony.

As respects the *mode*, the B. hold that only immersion in water is baptism. They argue, that the original term *baptizo* conveys this meaning, and no other; that nothing less can possibly answer to the apostle's explanation in Rom. vi. 4, 5, and Col. ii. 12, 'buried with him in baptism, wherein also ye are risen with him;' that the many allusions in the epistles to the churches manifestly bear out this interpretation; and, finally, that the fact of John baptising at a spot selected for the purpose 'because there was much water there,' is perfectly conclusive.

Their form of church-government is congregational. They maintain that the only order of officers remaining to the church, since inspiration ceased, are pastors (otherwise called elders and bishops), deacons, and evangelists; that the number of official persons in each of the apostolic churches cannot be ascertained from the record, but must of necessity have depended—and always must depend—on circumstances; that each church is possessed of the power of self-government under its exalted head, Jesus Christ, subject to no foreign tribunal or court of review; that discipline is to be exercised by the rulers in presence, and with the consent of all the members, and parties received or excluded at their voice.

The B. are divided among themselves regarding communion—one portion receiving conscientious Pædobaptists to the Lord's table and membership;

* The Baptists of Great Britain and America reject the name of Anabaptists, as expressing only an accidental circumstance of their tenets—viz., the rebaptising of converts from other sects, who happen to have been baptised in infancy, and also as associating them with the scandals of the German Anabaptists (q. v.) of the 16th c., from whom they claim to be historically distinct. From the same feeling, the modern sect in Germany and Holland style themselves *Taufgesinnete*.

the other refusing this privilege to any but Baptists. The churches of the former are called open communionists; the latter, strict communionists.

Next to the Moravians, the B. were earliest in the field of missions. They have been honoured to plant Christian churches in many parts of continental India, in Ceylon, in the Bahamas, the West Indies, Africa, and China. No mission band has arisen in any denomination, within the century, who have surpassed the agents of the Baptist Missionary Society in ardent zeal, patient perseverance, and invincible fortitude, in carrying out their Lord's commission to preach the gospel to every creature. The names of Carey, Marshman, Ward, and Knibb will be had in grateful remembrance by all succeeding generations; and their footsteps are now being trod by a long list of Christian missionaries of all evangelical persuasions, who are 'the messengers of the churches and the glory of Christ.'

This section of the Christian church was probably less zealous than their brethren, at one time, in preparing their ministers for their work by a sound course of study in theology and general literature; but this reproach has been long rolled away. They have schools of learning inferior to none for training young men of piety for pastoral duties, presided over by men of great ability. At Bristol, Bradford, Regent's Park (London), Pontypool, Haverfordwest, and Nottingham, there exist seminaries of learning which are entitled to give certificates qualifying for matriculation at the university of London; and many of the students have already taken degrees and honours there.

In 1870, the B. of the United States had 17,745 churches, and 1,419,493 members. In 1872, the B. in England had 4013 churches and chapels, and 177,321 members; in Wales, 1072 churches, and 55,855 members; in Scotland, 216 churches, and 7096 members; in Ireland, 77 churches, and 1492 members; in Canada, 74,220 members; in the West Indies, 23,990; in Germany, &c., 19,393.

BAR is any elongated piece of wood, metal, or other solid substance. In the iron manufacture, B. is a rod either round or square shafted. The round ones are made by drawing the iron red-hot through a bore or hole in a plate, and the square ones by passing it likewise red-hot through a roller-mill between two rollers counter-grooved, with their triangular-grooved faces forming the square opening for the passage of the iron. Railway and knee iron are made in the same manner. See IRON MANUFACTURE.

BAR, in Hydrography, is a bank opposite the mouth of a river which obstructs or *bars* the entrance of vessels. The B. is formed where the rush of the stream is arrested by the water of the sea, as the mud and sand suspended in the river-water are thus allowed to be deposited. It is thus that deltas are formed at the mouths of rivers. The navigation of many streams (as the Danube) is kept open only by constant dredging or other artificial means.

BAR, in Music, is a line drawn across the staff, to divide the music into small portions of equal duration; each of these small portions is itself called a *bar*.

BAR, or BARR, in Heraldry, one of those more important figures or charges in heraldry which are known as *ordinaries*. By the heralds of this country, the ordinaries, or, as, by way of eminence, they are called, the 'honourable ordinaries,' are commonly reckoned as ten in number, the sub-ordinaries, or minor charges, being greatly more numerous. The B., like the Fess (q. v.), is formed by two horizontal lines passing over the shield, but it differs

from it in size, the fess occupying a third, the B. only a fifth part of the shield. There is this further difference between these two ordinaries, that the fess is confined to the centre, while the B. may be borne in several parts of the shield. There is a diminutive of the B. called the Closet, which is half a B.; and again of the closet, called the Barrulet, which is half a closet, or the fourth part of a bar.—BAR-GEMEL is a double bar, from the French *jumeau*, *f. jumelle*, a twin.

Bar.

BAR, in Law. This word has several legal meanings; thus, it is the term used to signify an enclosure or fixed place in a court of justice where lawyers may plead, or perhaps more correctly, where they can address their advocacy on behalf of their clients. A veiled-off space within the Houses of Parliament is similarly called the B. See PLEADING. The dock, or enclosed space where persons accused of felonies and other offences stand or sit during their trial, is also called the B.; hence the expression, 'prisoner at the bar.' This word is likewise applied to the gate or rail thrown across a turnpike road for the levying of the toll-duties. It has also a general meaning in legal procedure, signifying something by way of stoppage or prevention. There is also a trial at B., that is, a trial before the judges of a particular court, who sit together for that purpose in *banc* (q. v.). See the following articles: BAR OF DOWER, PLEAS IN BAR, TRIAL AT BAR, TOLLBAR, FELONY, TREASON, BARRISTERS, ADVOCATES.

BAR OF DOWER. Dower, the estate or provision which, by the law of England, a widow is entitled to out of the lands and tenements of her deceased husband, may be barred or defeated by her elopement, her divorce on the ground of her own adultery, the treason of her husband, and other disabilities, and by detaining the title-deeds or evidences of the estate from the heir until she restores them. A woman might also, while fines and recoveries were in force, be barred by these assurances, as she now may by the new method of conveyance appointed by the statute 3 and 4 Will. IV. c. 74, in substitution for a fine or recovery, in the case of a married woman. And another method of barring dower is by jointure, as regulated by the statute 27 Henry VIII. c. 10.—Stephen's *Commentaries*, vol. i. p. 273. See DOWER, JOINTURE, WIDOW, FINES AND RECOVERIES, and COMMON ASSURANCE.

The term corresponding to Dower in Scotch law is TERCE (q. v.), which may also be barred or excluded in various ways; as, for instance, by the widow's express discharge or renunciation, by the deeds of the husband affecting his real estate, by the husband's conviction for treason, by the wife's express acceptance of a different provision in lieu of the terce, and by her divorce on the ground of adultery.

BAR, PLEAS IN. See PLEADING and PLEAS IN BAR.

BAR, TOLL. See TOLL.

BAR, TRIAL AT. See TRIAL AT BAR.

BARABA', a steppe of Siberia, extending between the rivers Ob and Irtysh, and occupying more than 100,000 square miles, and covered with salt lakes and marshes. It was colonised by the Russians in 1767, who have since cultivated parts of it.

BARACOA, a seaport town on the north-east coast of Cuba, belonging to the Spaniards. Lat. 20° 22' N., long. 74° 30' W. In its vicinity is a remarkable mountain called the Anvil of Baracoa.

BARAGUAY D'HILLIERS, LOUIS, a distinguished general of the French empire, was born in

Paris in 1764. After serving under Custine and Menou, he received an appointment in the army of Italy from Napoleon, and was a sharer in all the success of the campaigns of 1796-7. He was made a general of division; and in virtue of Napoleon's treaty with the Venetian Republic in May 16, 1797, commandant of Venice. B. accompanied the expedition to Egypt; and afterwards successively held appointments in the armies of the Rhine, and the Tyrol, and in Catalonia. He headed a division in the Russian campaign of 1812; but on the retreat, he incurred the displeasure of Napoleon. He was sent as governor to Berlin, where he soon after died of grief and exhaustion.

BARAGUAY D'HILLIERS, ACHILLE, a French general, the son of the preceding, was born in Paris on the 6th of September 1795. He rose rapidly through the inferior military grades, and obtained, in 1832, the appointment of governor in the military school of St Cyr, where he suppressed a republican conspiracy that threatened to break out in the institution. After he had served with various success in more than one campaign in Algeria, he was promoted to the rank of lieutenant-general, on the 6th of August 1843; and in 1847, he was made inspector-general of infantry. After the revolution of February 1848, he was chosen a member of the National Assembly, in which he joined the party of reaction, and was in favour of the restriction of the press. In the beginning of November 1849, he went to Rome, as commander-in-chief of the French army sent to sustain the authority of the pope. He returned in 1850; and in January 1851 obtained the command of the army of Paris, in the place of Changarnier. B. concurred in the policy of the *coup d'état* of December 1851, and was made a member of the Consultative Commission. During the Crimean war, he received the command of the French expeditionary corps of the Baltic, and co-operated with the British fleet in the capture of Bomarsund. He was afterwards made a Marshal of France, and commanded in the Italian war of 1859 with distinction. In Oct. 1871, he was made president of the Court of Inquiry appointed to investigate the conduct of the French generals who surrendered fortified places during the late war.

BARAS KHOTUN, or BARS KHOTAN, a ruined city on the banks of the Kherlon, one of the head-streams of the Amur, in the Mongol country. Some suppose it to have been built by the Emperor Kublai; others, that it was erected by Toghon Timur in the 14th c., after the expulsion of the Mongols from China. The remains of the mud-walls shew that the city had been 5 miles in circumference.

BARB, the designation of a noble breed of horses cultivated by the Moors of Barbary, and introduced by them into Spain. Barbs are less remarkable for their beauty and symmetry, than for their speed, endurance, abstinence, and gentle temper.

BARBACAN. See **BARICAN.**

BARBA'DOES, the most easterly of the Caribbees, and the residence of the governor-general of the British Windward Islands. See **ANTILLES**. The lat. and long. of its capital, Bridgetown, are 13° 4' N., and 59° 37' W. Its area is about 166 square miles, or 106,240 acres—the unprecedented proportion of 100,000 being under cultivation. Besides the capital, B. contains 3 other towns, all more or less in a state of decay—Jamestown, Speights-town, and Oistin. B. affords no harbours, being almost encircled by coral-reefs, which here and there extend as much as 3 miles to seaward. Inside of the coral-reefs, the coast, excepting at two points, presents long lines of sandy beach—one of the most remarkable

being Carlisle Bay with its exposed roadstead, on which Bridgetown stands. Setting aside occasional attacks of yellow fever, the climate is healthy. In 1844, the fall of rain was 72 inches; and the temperature is said to have ranged only between 76° and 83° F. Shocks of earthquake are sometimes felt, and thunder-storms are frequent and severe. But hurricanes are the grand scourge of Barbadoes. In 1730, one of them destroyed 4326 persons, and property to the value of £1,320,564 sterling; and in 1831, another destroyed 1591 persons, and property to the value of £1,602,300 sterling. Of the former of these, the violence appears to have surpassed all belief—the winds and the waves between them having carried a 12-pounder gun a distance of 140 yards.

In 1834, the commencement of the apprenticeship under the imperial act of emancipation, the population was 102,231; by 1861, it had increased to 152,727, being an average of 920 inhabitants to every square mile. The trade and the revenue bear a similar testimony to the benefits of emancipation. Between 1833 and 1870, the revenue had increased from £20,975 to £104,932; the imports from £181,610 to £1,069,868; the exports from £408,363 to £973,020; the total tonnage entered and cleared in 1870 was 278,517 tons. During that year, sugar was exported to the value of £591,690; molasses, valued at £98,383; and wheat, at £71,298. Being universally cultivated in regular plantations, the island affords no room for the squatting of negroes on unreclaimed lands, as in Jamaica and other West-India possessions. On this account, if from no other cause, the negro population have been compelled to labour diligently for hire, and are generally in a condition most creditable to their industry and prudence—contrasting, in this respect, with the improvidence and indolence of some of the lower classes among the whites. Altogether, however, the Barbadians are a shrewd and clever people, nor are they deficient in a due appreciation of their own power and importance. B. is the see of a bishop. It contains also many well-endowed seminaries—Codrington College, in particular, having a revenue of £3000 a year. It was first colonised by the English in 1625, having previously been depopulated by the Spaniards.

BARBA'DOES CHERRY, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *M. glabra*, which are cultivated for its sake. Clusters of fruit are produced from the axils of the leaves. The fruit of *M. urens* is small, that of *M. glabra* is like a Mayduke cherry in size and appearance, but inferior in flavour. Each fruit contains three triangular seeds. The leaves of *M. urens* have stinging hairs on the under-side. See **MALPIGHACEÆ**.

BARBA'DOES GOOSEBERRY (*Pereskia aculeata*), a pleasant West Indian fruit, produced by a plant of the natural order *Cactææ* (q. v.), with a round stem, thick flat alternate leaves, and large strong spines. The fruit has expectorant properties.

BARBARA, SAINT, who suffered martyrdom at Nicomedia, in Bithynia, about 236, or, according to other accounts, at Heliopolis, in Egypt, about 306, was of good birth, and well educated by her father, Dioscorus. To avoid disturbance in her studies, he had a tower built for her, where she spent her youth in the deepest solitude. While in this retirement, she was led, through Origen, as is said, to embrace Christianity. Her father, a fanatic heathen, learning his daughter's conversion, and failing to induce her to renounce Christ, delivered her up to the governor, Martianus, to be dealt with by the law. Martianus, struck with the intelligence and beauty of the maiden, attempted first by arguments to make her

relinquish Christianity, and when that failed, had recourse to the most exquisite tortures. At last, the blinded father offered himself to strike off his daughter's head. Scarcely was the deed done, when he was struck with lightning. Hence St B. is to this day prayed to in storms. For the same reason, she is the patron saint of artillery, and her image was at one time frequently placed on arsenals, powder-magazines, &c. The powder-room in a French ship of war is to this day called *Sainte-Barbe*. St B.'s day is the 4th December.

BARBAREA. See **CRESS**.

BARBARIAN (Gr. *barbaros*), among the Greeks, as early as the time of Homer, signified one who could not speak the Greek language; and this restricted signification was not wholly obsolete even in the age of Plato, for the latter divides the entire human race into *Hellenes* and *Barbaroi*. The origin of the word is unknown, if it be not artificially formed, on the principle of imitation, to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars. The Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies. It then meant whatever was opposed to Greek civilisation, freedom, or intelligence; but it could not yet have attained the degraded sense in which it is now used, for the Romans in the time of Plautus accepted the appellation, and called themselves *Barbaroi*. Subsequently, when Rome, under Augustus, became the mistress of the world, the word was applied to all the Germanic and Scythian tribes with whom she came into contact. In modern times, B. signifies savage, uncivilised, or ignorant.

BARBAROSSA. See **FREDERICK I**.

BARBAROSSA, **AROODJE** or **HARUDJ** and **KHAIR EDDIN**, two brothers, renegade Greeks, natives of Mitylene, who, as Turkish corsairs, were the terror of the Mediterranean during the first half of the 16th c. They made themselves masters of Algeria (q. v.) and Tunis, and brought these countries under the sovereignty of the Turkish sultan.

BARBAROUX, **CHARLES**, one of the most distinguished and energetic of the Girondists, was born at Marseille in 1767. The new ideas of equality and fraternity found in B. a warm advocate, and he did much to promote their spread. He was elected the special delegate of Marseille, to attend the Constituent Assembly at Paris. There he opposed the court, and took part with the minister, Roland, then out of favour. After the events of the 10th of August, he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the Convention. In the Convention, he adhered to the Girondists, and belonged to the party who, at the trial of the king, voted for an appeal to the people. As B. boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship, he was, in May 1793, proscribed as a royalist and an enemy of the republic. He wandered about the country, hiding himself as he best could, for thirteen months, when he was taken, and perished at Bordeaux by the guillotine, June 25, 1794. B. understood the revolutionary crisis much better than the most of his party. Had the Girondists generally possessed anything like his energy and sagacity, the Jacobins must have succumbed, and much bloodshed and horror would have been spared to France and the world.

BARBARY, an extensive region in Northern Africa, comprising the countries known in modern

times under the names of *Barea*, *Tripoli Proper*, *Fezzan*, *Tunis*, *Algeria*, and *Marocco*; together with the half-independent province of *Sus*; and in ancient times, under those of *Mauritania*, *Numidia*, *Africa Propria*, and *Cyrenaica*. It stretches from Egypt to the Atlantic Ocean, and from the Mediterranean to the Desert of Sahara, or between long. 10° W. and 25° E., and lat. 23°—37° N. The north-west of this region is divided by the Atlas Mountains into two parts: the northern comprising *Marocco*, *Algeria*, and *Tunis*; the southern, a half-desert region, called *Belud-el-Jerid*, the country of dates. Though pertaining geographically to Africa, B. is not specially African in any of its characteristics; but in climate, flora, fauna, and geological configuration, belongs to that great region which forms the basin of the Mediterranean. It is watered by many small streams, which either flow into the Mediterranean or into the salt-lakes on the edge of the Desert, according as they rise on the northern or southern slopes of the Atlas Mountains. A large portion of the country is capable of cultivation, and sandy or rocky tracts are rare, except on the southern margin. During the times of the Carthaginians, Greeks, and Romans, it was richly fertile, and all the natural conditions of its ancient productiveness still remain.—For an account of the climate, geology, productions, &c., see the various countries.

Among the people, besides the French and other Europeans, seven distinct races may be enumerated: *Berbers* (or *Kabyles*), *Moors*, *Beduins*, *Jews*, *Turks*, *Kuluglis*, and *Negroes*. The *Berbers* and *Beduins* inhabit the open country, while the *Moors*, on the other hand, reside in the towns. Most of the *Berber* tribes are either wholly free, or subject to the mere nominal jurisdiction of native chiefs, *kajids*, *judges*, &c. The *Beduins* luxuriate in equal liberty. *Jews* had settled here in ancient times, but the greater number of that race immigrated when the *Moors* were expelled from Spain. The *Turks* entered B. in the 16th c. They form the dominant race in *Tripoli* and *Tunis*, but never established themselves permanently in *Marocco*. Their sway in *Algeria* was brought to an end by the French. The *Kuluglis* (the children of *Turks* by native mothers) are excluded from the possession of all the paternal rights and privileges. The *negroes* are not natives of B., but are brought thither as slaves, principally from *Sudan* and *Guinea*. They are for the most part domestic slaves. The population, exclusive of *Jews* and *Christians*, is about 10,000,000, all *Mohammedans*. Arabic is the language of commerce and intercourse, and in *Marocco*, the language of government, and the mother-tongue of *Beduins*, *Moors*, and even *Jews*; but in *Tunis* and *Tripoli*, where, as we have said, the *Turks* are still dominant, the language of government is *Turkish*. The *Berbers Proper*, or *Kabyles*, especially in the highlands, to which they have been driven by foreign conquerors, use a peculiar speech among themselves.

In the oldest historical times, we find the *Mauri* (the ancestors of the modern *Moors*) mentioned as residing in the north-west of B., the *Numidians* in the interior and eastern parts, and the *Phœnician* colonies on the coasts. These last people formed settlements and founded cities—among them *Utica*, *Hippo*, *Hadrumetum*, *Leptis*, and afterwards *Carthage*, about 1000 B.C. It does not appear that they ever penetrated far into the interior. Confining themselves to the coast between the *Great Syrtis* and the *Straits of Gibraltar*, they maintained commerce with the people of the interior and the seaports of the Mediterranean. In the 7th c. B.C., the *Greeks* founded *Cyrene*, considerably to the east of *Carthage*, and colonised the plateau of *Barea*, now styled *Jebel-el-Achdar* by the *Arabs*. While the

Phœnician colonies held sway on the coast, the Mauri and the Numidians were divided into several independent tribes, and, like their neighbours the Gætuli, were wholly uncivilised. After the second Punic war, the Romans extended their sway over Carthaginian Africa, which became a Roman province at the close of the third Punic war, when the city of Carthage was sacked and destroyed. Numidia was 'annexed' after the victory over Jugurtha, and Mauritania after the defeat of King Juba, the ally of Pompey's party. The son of Juba, bearing the same name, was allowed to reign as a nominal sovereign by Augustus; but Mauritania was, in fact, a Roman province. Thus, the Romans had acquired a territory in Africa extending from the Great Syrtis to the Atlantic (corresponding to the modern states of B.), which formed some of the largest and most flourishing provinces of their vast empire. Everywhere they built large towns, whose extensive ruins are still to be seen scattered over the whole land, even to the verge of the Desert; as, for instance, those at El-Hamian, in the regency of Tunis, at Sava, Musulupium, and especially the splendid city of ruins, Lambasa, not far from the Desert of Sahara. The Romans had, in general, only two legions, numbering 24,000 men, in their African provinces: nevertheless, their authority was uncontested, and they were enabled to undertake important works, such as the cisterns and aqueducts at Rusicada, Hippo, and Cirta, and the temples and amphitheatres of Calama and Anuna, which clearly shew that the inhabitants enjoyed the benefits of a safe and powerful civilisation.

Under Constantine, North Africa was divided into the several provinces, Mauritania-Tingitana, Mauritania-Cæsariensis (on the east of the former), Mauritania-Sitifensis, Numidia, Zeugitania, Byzacium, Cyrenaica, and the Regio Syrtica. At the division of the empire, the whole of these provinces, with the exception of the last, fell to the share of the Western Empire. About this time, Christianity was promulgated in Africa, and with such success, that in the three Mauritanias there were more than 169 dioceses. As Roman power declined in Europe, the consequences were severely felt in the African provinces. Religious disturbances, native revolts, and the ambitious aspirations of the Roman governors after independence, loosened the political bands which bound the provinces together, and made them an easy prey to the Vandals, who landed in Africa, in 429 A.D., under the ferocious Genseric, and in an incredibly short space of time overran the country, which they savagely misgoverned until 533, when they were defeated by Justinian's great general, Belisarius. Meanwhile the Numidians and the Mauri had made themselves masters of the interior and of the coast of Mauritania-Tingitana, and the Greek-Roman territories were restricted to the neighbourhood of Carthage and some points on the coast. The whole country of B. was thus made an easy prey for the Arabs, and in 647, Abdallah-ben-Said, with 40,000 fanatical Mohammedans from Egypt, defeated and slew the Greek prefect, Gregorius, at Tripoli. He did not, however, follow up his victories; but in 665-670 A.D., the Arabian general, Akbah, conquered the coast-towns of Tripoli, founded Cairo, and extended his sway almost to the Desert. Hassan, the general of the Calif Abd-el-Malek, in 692, stormed, plundered, and destroyed the new Carthage, and, in fact, annihilated the Greek-Roman dominion in Africa. In the course of less than a century, the greater part of the native tribes were converted forcibly to the faith of Islam. In 789, the western provinces separated themselves from the others, and Edris-ben-Abdallah founded there the dynasty of the

Edrisites. After 800, when the governor, Ibrahim-ben-Aglab, declared himself independent, and founded the dynasty of the Aglabites, Africa was lost to the califs. From this time down to 1269, the changes of dynasty in B. were so frequent, that we cannot here describe them in detail. The results were, that independent states arose in Algeria, Oran, Bugia, Tenez, &c. About this time, also, began the reaction of the Christian world against Mohammedanism in North Africa and Spain. St Louis undertook an expedition against Tunis. The Moors were, by and by, expelled from Spain, and settled themselves on the coast of Northern Africa, there to begin that course of piracy by which they became odious to Europe, first as a fierce retaliation against their Christian persecutors, but ultimately as a barbarous profession. As early as the time of Ferdinand the Catholic, the Spaniards sought to check their insolent ravages, and landed in Africa on several occasions, capturing the ports of Centa, Melilla, Oran, Bugia, the island before Algiers, and Tripoli. The Portuguese landed on the coast of Morocco, where at first they had great success; but they were ultimately compelled to leave the country. After various changes of fortune, Algiers, Tunis, and Tripoli were brought under the government of the sultan. Since 1830, however, the first of these (see ALGERIA) has been under French sway, while for many years the other two have been only nominally dependent on the Turkish ruler. A similar fate, at a much earlier period, befell the western part of B., where the successors of the Arabian Sherif, Mula-Mehemed, overthrew the kings of Morocco and Fez, and established the Sherif dynasty, which rules to the present day over these lands.—*Shaw's Travels and Observations relative to several Parts of B.; Mauroy, Du Commerce des Peuples de l'Afrique Septentrionale* (Par. 1845).

BARBARY APE, PIGMY APE, or MA'GOT, a small species of ape or tailless monkey, interesting as the only one of the monkey-race which is found in Europe. The only European locality, however, in which it occurs is the Rock of Gibraltar, and it is said to have been originally brought from the north of Africa. It inhabits the precipitous sides of the Rock, inaccessible to human foot, and enjoys a certain measure of protection from firearms in return for the amusement afforded by its manners. It is gregarious, and large numbers are often seen together, the females carrying their young upon their backs. In some parts of the north of Africa, the B. A. is

Barbary Ape.

extremely abundant, inhabiting rocky mountains and woods. It displays great agility in passing from tree to tree, and its bands often plunder gardens, one of their number keeping careful watch. It feeds on fruits, roots, &c.; and its fondness for eggs is supposed to have given rise to the ancient story of

the battle of the pigmies and the cranes. It is of a greenish-gray colour, paler underneath; and in size resembles a large cat. The characters agree with those of the genus *Macacus* (Wanderoo Monkey, q. v., &c.), except that the tail is reduced to a mere tubercle. The muzzle is somewhat elongated, although not nearly so much as in the baboons, with which this ape has sometimes been classed, and the facial angle is much higher than in them. The face is almost naked, and somewhat wrinkled. The ears are in form not unlike human ears. The eyes are round, reddish, and of great vivacity. The B. A. is one of the monkeys most frequently to be seen in captivity, at least in Britain; and possessing a considerable degree of intelligence, is capable of being trained to many tricks. In order to this, however, it must be taken young, as the older ones are often sullen and mischievous. It usually walks on four feet, although it can be trained to stand or walk, in a more awkward manner, on two. It is filthy in its habits.

BARBASTELLE. See **BAR.**

BARBASTRO, a walled town of Spain, in the province of Aragon. It is situated on the Vero, has a cathedral with some paintings by Antonio Galeeran. Pop. 6500.

BARBAULD, ANNA LETITIA, an English authoress, was born at Kibworth-Harcourt, in Leicestershire—where her father, the Rev. John Aikin, a dissenting clergyman, kept an academy—on the 20th June 1743. Her private education, the religious influence of her home, and secluded life in the country, were well fitted to develop early her natural taste for poetry; but it was not until 1773 that she was induced to give her effusions to the public, who appreciated them so highly that four editions were called for during the year. Encouraged by this, she the same year, conjointly with her brother, published *Miscellaneous Pieces in Prose* (Lond. 1773), which also passed through many editions. In the following year, the poetess married the Rev. Rochemont Barbauld, a dissenting minister at Palgrave, in Suffolk, in which village the newly married pair opened a boarding-school for boys. The literary fame and the assiduity of Mrs B. soon made it celebrated. During the ten years Mrs B. was engaged in the duties of tuition here, she published *Early Lessons for Children*, and *Hymns in Prose*, works which have been often reprinted in England for youthful readers, and translated into several languages. Her *Devotional Pieces* was also published during this period. In 1792, she commenced with the brother previously mentioned—who wrote the most of them—the well-known series, *Evenings at Home*, which were completed in three years. In 1795 she edited Akenside's *Pleasures of Imagination*, and Collins's *Odes*, prefixing to each a critical essay. In 1804, she began to edit a selection from the *Spectator*, *Guardian*, *Teller*, &c.; and in 1810 published a collection of the British Novelists, the task of editing which she had undertaken to divert her mind from the loss she had sustained two years previously in the death of her husband. *The Female Spectator* (Lond. 1811) contains a selection from her writings. Her last poetical effort was an ode, entitled *Eighteen Hundred and Eleven* (Lond. 1812). All her compositions are characterised by simplicity of feeling, an easy, flowing style, and pure and elevated sentiment, and give token of a mind well versed in classical literature. She lived in quiet retirement till her death, which happened on the 9th March 1825. The life of Mrs B. has been written by Lucy Aikin, also known as an authoress, and prefixed to the collection of the *Works of A. L. Barbauld* (2 vols., Lond. 1825). The same lady

also published from the posthumous papers of the authoress, *A Legacy for Young Ladies* (Lond. 1826).

BARBED AND CRESTED, heraldic terms, by which the comb and gills of a cock are designated, when it is necessary to particularise them as being of a different tincture from the body. The common English term is *Wattled and Combed*, gules, or whatever else the tincture may be.

BARBEL (*Barbus*), a genus of fishes of the family of the *Cyprinidae* (q. v.), differing from *Cyprinus* (Carp, Gold-fish, &c.) in the short dorsal and anal fins, in having one of the rays of the dorsal fin strong and serrated, and the mouth furnished with four soft barbules (whence the name B., from Lat. *barba*, a beard), two near the point of the snout, and one at each angle of the mouth. The

Barbel.

upper jaw also extends considerably beyond the lower. The species are numerous. Like the other *Cyprinidae*, they are all inhabitants of fresh water, and generally of muddy ponds and rivers, where they seek food by ploughing up the mud with their snouts, like swine, and are said often to seize the small fishes which come to share with them the worms and insects of the mud. They also feed upon the leaves and roots of aquatic plants.—The Common B. (*B. vulgaris*) is abundant in many of the rivers of the temperate parts of Europe. It is the only species found in Britain, and only in some of the still and deep rivers of England. It is very abundant in the Thames, frequenting the weedy parts of the river in shoals in summer, and seeking the deeper water in winter, becoming so torpid during cold weather, that the fishermen sometimes take it with the hand, or by pushing it with a pole into a small net fastened to an iron hoop. It grows to a large size, sometimes 3 feet in length, and 15 to 18 pounds in weight; it is rather of a long shape, in section nearly circular; the general colour of the head and upper part of the body, greenish brown, becoming yellowish green on the sides, the belly white, the tail somewhat forked, and of a deep purple colour. It affords sport to anglers, but is a very coarse fish, and little used for food except by the poor, who often boil bacon with it to give it a relish. The larger barbels are esteemed the best. The roe has poisonous qualities, although its effects are disagreeable rather than permanently injurious.

Another species, called the Binny, or B. of the Nile, is very abundant in that river; attains a very great size, 70 lbs. or upwards; is much esteemed for food; and is taken by hooks baited with dates steeped in honey. A number of baited hooks, each attached to a separate strong line, are enclosed in a mass of clay, flour, dates, &c., which is sunk in the river, and to which, as it begins to dissolve, the binnies are attracted; when boring into it with their snouts, and devouring the dates, they are caught. The fish being generally hooked by the projecting upper jaw, is allowed to remain in the water, the line being fastened on shore, and is taken out when wanted for immediate use.

BARBEL, ANGLING FOR. The B. is a ground-feeding fish, grubbing on the bottom for his sustenance.

The baits principally used to capture him are worms and maggots, greaves, and cheese; and the means of angling for him are chiefly with a dead-line, called a ledger, or with float-tackle. The ledger is a perforated leaden bullet; through this the line runs freely. To prevent its slipping down on the hook, a large shot or other substance is fastened on the line, about a yard above the hook. The hook (about No. 5 or 6 in size) is baited either with a lob-worm or greaves, and the lead is cast into the water, and remains motionless on the bottom. When a fish bites, the angler feels the tug, and strikes smartly; as the fins of the B. are large, and his muscles powerful, he frequently offers considerable resistance. The rod used for ledger-fishing is short and stiff. In float-fishing for B., the tackle is finer, and the hook smaller. A cork-float suited to the depth and rapidity of the river is used, and it is fixed at such a height upon the line that the bait just touches the bottom. The instant the float disappears, the angler strikes, but not so forcibly as in ledger-fishing. Previous to angling for B., it is desirable to bait the place to be fished, for the purpose of drawing the fish together. This is accomplished by chopping up and casting into the water from 500 to 1000 lob-worms, and it should be done 18 or 20 hours before fishing. In float-fishing for B., the float should be allowed to travel down a considerable distance of water, at least 30 or 40 yards, in order that no spot where a portion of the worms may have lodged should be missed. This is sometimes done by the use of a float called a slider, which is not fixed on the line, but by the management of the angler, accommodates itself to the depth of the water. In this fishing, the bait trails along the ground, and the rod should be at least 14 or 15 feet in length, and the line very light and fine. B. will sometimes take a spinning bait, and are often caught by the angler while trout-fishing; but this is by no means a certain method of angling for them. The B. may be said to be gregarious; he spawns in May or June, choosing some gentle shallow for that purpose. He soon recovers his strength again, however; and about the end of July, he seeks the deep rapid streams, and may be seen vigorously springing from the water in his endeavours to rid himself of the parasitical insects which attach themselves to him during his quiescence. Here he remains the greater part of the summer and autumn. Frosty weather renders the B. torpid, and he takes shelter under some large stone or weed, where he can lie up during the winter. Although the B. is by no means an estimable fish for the table, it is much used by the Jews in their fasts and festivals.

BARBER (Lat. *barba*, the beard), a shaver of the beard, and who ordinarily includes hair-cutting in his profession. Barbers are of great antiquity, if not for the shaving of the beard, at least for shaving a portion of the head. The office of the B. is referred to by the prophet Ezekiel: 'And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard.'—Ezek. v. 1. In all oriental countries, including China, the shaving the whole or part of the head continues to be performed by barbers. In every part of the world, the professional B. and hair-dresser is celebrated for his garrulity and general obliging qualities, such being required by those who place themselves in his hands. The amusing character of the B. in one of the tales in the *Arabian Nights Entertainments*, and also of the B. in Rossini's opera of *Figaro*, will readily occur to recollection. As will be seen from the succeeding article, barbers at one time acted as a kind of surgeons, and accordingly occupied a higher social

position than they now enjoy. Latterly, on account of the simple mode of trimming the hair, and of the prevalence of private shaving, the business of the B. in England has greatly declined, and his services are chiefly confined to the humbler classes. In the United States, the business of the B. is almost exclusively in the hands of the coloured population. Anciently, one of the utensils of the B. was a brass basin, with a semicircular gap in one side to compass a man's throat, by which means, in applying the lather to the face, the clothes were not soiled. Readers will recollect that Don Quixote crazily assumed a barber's basin as a helmet. At the end of a pole, the brass basin is still hung out as a sign at the door of the B. in Great Britain, France, and other countries.

BARBER-SURGEONS. In former times, as stated in the foregoing article, barbers acted as a kind of surgeons, or at least phlebotomists, and such appears to have been the case in all countries. Till this day, on the pole on which the barber's basin is suspended, there is represented a twisted or spiral ribbon, which symbolises the winding of a ribbon round the arm previous to blood-letting. In London, Edinburgh, and elsewhere, the B. formed corporations with certain privileges. The surgical duties of these bodies now pertain to the corporations of surgeons. The existence of B. as professors of the healing art, in England, can be traced as far back as the reign of Edward IV. in 1461, when they were first incorporated; and from thence till the reign of Henry VIII., when they were united with the surgeons, until the time of George II., when the B. ceased to be anything but barbers, as we now understand the term. In the latter reign, an act was passed, the 18 Geo. II. c. 15, from the preamble of which we learn that not till then had the discovery been made that the business or trade of a barber was 'foreign to, and independent of, the practice of surgery;' and it therefore proceeds to dissolve the connection between the two bodies, and to remit the B. to the more humble functions they now perform. But this is done with an express saving of all their privileges as a company or corporation, and as such they exist to the present day. See an interesting account of them in Knight's *History of London*, vol. iii. pp. 177—192, which concludes with the following curious extract from the list of officers to Heriot's Hospital in the statutes of that charity compiled in 1627: 'One chirurgion barber who shall cut and pole the hair of all the scholars of the hospital; and also look to the cure of all those within the hospital who anyway shall stand in need of his art.' And see the Report of the Royal Commissioners appointed to inquire into the corporations of London, and printed in 1837, in which all particulars relating to the government and working of this company at the present day are given. The report states, that the company exists 'for using and exercising the art and mystery of barbers, which includes hair-dressers within the suburbs and liberties of the city;' and it concludes as follows: 'The company possess extensive powers for the regulation of the trade, but in practice none are exercised except the power of compelling all persons using the trade or business of barber (which, as before mentioned, includes hair-dressers) within the city to become free of the company.' The barbers still retain their ancient hall—which they possessed before the surgeons were disunited from them—in Monkwell Street, Cripplegate, in the city of London. See APOTHECARIES, SURGEONS, TRADE CORPORATIONS.

BARBERINO-DI-MUGELLO, a town of Tuscany on the Siere, 15 miles north of Florence, with

a population of 9000, engaged in the manufacture of straw-hats. The royal villa of Caffegiolo, the ancient residence of the Medicis, stands in the environs.—*B. DI VAL-D'ELSA*, a village in the same district, with a beautiful situation on the ridge between the valleys of the Pesa and Elsa, and celebrated as the place where Pope Urban VIII. was born. One of the palaces of the Barberini is here.

BARBERRY (*Berberis*), a genus of plants, of the natural order *Berberideæ* (q. v.). All the species, which are numerous, and found in temperate climates in most parts of the world except Australia, are shrubs with yellow flowers, having a calyx of six leaves, a corolla of six petals, and six stamens, which, when touched at the base, display a considerable degree of irritability, starting up from their ordinary position of reclining upon the petals,

Common Barberry (*Berberis vulgaris*):
a, a flower; b, ripe fruit.

and closing upon the pistil, apparently a provision to secure fecundation. The fruit is a berry with two or three seeds. Not a few of the species are evergreen. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the sub-genus *Berberis*, and those with pinnate leaves the sub-genus *Mahonia*, or Ash-leaved *B.*—The Common *B.* (*B. vulgaris*) is a native of most of the temperate parts of Europe, Asia, and North America. It produces its flowers and fruit in pendulous racemes; has obovate, slightly serrate, deciduous leaves; and numerous straight three-forked spines. It is a very ornamental shrub, especially when covered with fruit. Its berries are of an elongate oval form; when ripe, generally of a bright red colour, more rarely whitish, yellow, or almost black. They contain free malic acid. The fruit of the ordinary varieties is too acid to be eaten, but makes excellent preserves and jelly. Malic acid (q. v.) is pretty extensively prepared from it in France. A yellow fungus, *Accidium Berberidis*, is very general upon the under-side of the leaves of the *B.*; and a notion prevails that it produces rust in corn, which is erroneous, the rust (q. v.) of corn being a totally different fungus, which, like this, is apt to appear in humid weather. The prevalence of this notion, however, appears to have prevented the general employment of the *B.*

as a hedge-plant, for which it is admirably adapted, hedges made of it being easily kept free from gaps, and becoming more and more impervious by new shoots thrown up from the root. The yellow root of the *B.* is used for dyeing yellow, and especially the inner bark of it, and also of the stem and branches. The bark is capable of being employed for tanning leather. In like manner, *B. glauca*, *B. ilicifolia*, *B. tomentosa*, and *B. lutea* are used for dyeing in Chili and Peru; *B. tinctoria* by the inhabitants of the Neigherry Hills, and *B. aristata* in Nepal; and a strong similarity of properties appears to pervade the whole genus. *B. Lycium*, a native of the north of India, is characterised by great astringency, and an extract prepared from it is valuable in ophthalmia. Most of the species are more or less spiny, and some of the evergreen species might be very ornamentally employed for hedge-plants; as *B. dulcis*, now frequent in shrubberies in Britain. This species, sometimes called the Sweet *B.*, is a native of the south-west coast of America. Its leaves much resemble those of the common *B.*; it has solitary flowers on rather long stalks, and globose black berries about the size of a common black currant. The fruit is produced very copiously in Britain, is quite sweet when fully ripe, and makes excellent jelly. When unripe and very acid, it is used for tarts. Pleasant fruits are produced also by *B. aristata* and *B. Asiatica*, the berries of both of which are dried in Nepal, after the manner of raisins; *B. concinna*, also a Himalayan species; *B. microphylla*, found in the southern parts of South America; and *B. trifoliata*, found in Mexico. Those of some of the other species are either disagreeable or insipid, which is particularly the case with most of the ash-leaved barberries, natives of North America and the north of India.—Numerous species of *B.*, both from the Himalaya and South America, are daily becoming more frequent in Britain as ornamental shrubs.

BARBET (*Bucco*), a genus of birds generally placed by ornithologists in the family of the *Picidae*, or Woodpeckers (q. v.), but regarded as the type of a very distinct sub-family, exhibiting points of resemblance to the cuckoos. They have a large conical beak, surrounded with tufts of bristles directed forwards—a characteristic from which the name *B.* is derived (Lat. *barba*, a beard). They prey on insects, and some of them also on young birds; some are at least partially frugivorous. They inhabit warm parts both of the eastern and western hemispheres, and most of them are birds of gay plumage. The Linnean genus has been subdivided, and includes, besides the true barbets, the Barbaeous (*Monasa*), South American birds—the Barbicans (*Pogonias*) of Africa and India—the American Puff-birds (*Tomatia*), &c. The Puff-birds are remarkable for erecting their plumage till they resemble a round ball. Being birds of short wing, both they and the true barbets wait for their prey, generally sitting with great patience on some withered branch till it comes near them, when they suddenly dart upon it. They often choose positions close to human habitations, and shew little fear.

BARBETTE, an earthen terrace inside the parapet of a rampart, serving as a platform for heavy guns; it has such an elevation that the guns may be fired over the crest of the parapet instead of through the embrasures, to give them a freer scope by swivelling round into different directions.

BARBICAN (Ital. *barbacâne*), a projecting watch-tower, or other advanced work, before the gate of a castle or fortified town. The term *B.* was more specially applied to the outwork intended to defend the drawbridge, which in modern fortifications

is called the *ête du pont*. 'To begin from without, the first member of an ancient castle was the B., a watch-tower, for the purpose of despoiling an enemy at a greater distance' (Grose's *Antiquities of England and Wales*), and, to the same effect, Camden, speaking of Bedford Castle, says it was taken by four assaults; in the first was taken the B.; in the second, the *outer balia*. See BAILEY. See also Parker's *Glossary of Architecture*. There are

Barbican.

a few perfect barbicans remaining in England, as at Alnwick and Warwick; but the best examples of it, as of the other parts of the fortification of the middle ages, are probably to be seen in the town of Carcassone (q. v.). A very curious and minute account of the siege of Carcassone in 1240, in the form of a report to Queen Blanche by the seneschal who defended it, preserved in the archives of France, has been published in Hewitt's *Ancient Armour* (p. 355, *et seq.*), in which the uses of the B. are fully illustrated. The street called Barbican in London, near Aldersgate Street, marks the site of such a work, in front of one of the gates of the old city.

BARBITON, or BARBITOS, a stringed instrument of the ancient Greeks, made of ivory, in the form of a lyre, with seven strings, and said to have been invented by Anacreon.

BARBOU, the name of a celebrated French family of printers, the descendants of John B. of Lyon, who lived in the 16th c. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh B., removed from Lyon to Limoges, where, among other works, his celebrated edition of *Cicero's Letters to Atticus* appeared in 1580. Joseph Gerard B., a descendant of the same family—who in the beginning of the 18th c. settled in Paris—continued in 1755 the series of Latin classics in duodecimo—rivals to the Elzevirs of an earlier date—which had been begun in 1743 by Coustelier, at the instigation of the learned Lenglet Dufresnoy. This series of classics, which is much prized for its elegance and correctness, was purchased, along with the rest of the business, by Delalain, from the heirs of Hugh B., who died in 1809. There is a complete set of the B. classics in the Royal Library of the British Museum.

BARBOUR, JOHN, an eminent Scottish poet of the 14th c., regarding whom history has not much to record beyond the production of the national epic, entitled *The Bruce*. Nothing is known of his parentage, and of his birth it can only be conjectured to have been about 1320. The ascertained facts of his life are few. We are informed only that in his own age he was accounted a man of great learning and worth; that he was Archdeacon of Aberdeen as early at least as 1357, and held that office till his death in 1395; that in 1357, he travelled into England, accompanied by three scholars, for the purpose of studying at Oxford;

that he repeated his visit to England for the same purpose in 1364; that in 1365, he obtained a passport 'to travel through England with six companions on horseback towards St Denis and other sacred places;' that in 1368, he again received permission to travel through England with two servants and two horses, on his way for scholarly purposes to France; that in 1373 he was Clerk of Audit of the household of King Robert II., and one of the auditors of Exchequer; that in 1375, his great poem was more than half finished; that in 1377, he had a gratuity of ten pounds from King Robert II.; that in 1378, he received from the same prince a perpetual annuity of twenty shillings, which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should sing a yearly mass for the rest of his soul; that in 1381 he had a gift from the crown of the ward of a minor, whose estate lay within the parish of which he was rector; that in 1383, and again in 1385, he was one of the auditors of Exchequer; that in 1388, King Robert II. granted him a pension of ten pounds a year; and that he died between Martinmas 1394 and Whitsunday 1395, probably on the 13th March of the year last named, his anniversary in the cathedral of Aberdeen being celebrated on that day until the Reformation. Besides *The Bruce*, B. wrote another poem, now lost, called *The Brute*, in which he recounted the origin and history of the royal house of Stuart. *The Bruce* is distinguished by great purity and clearness of style, the language and versification contrasting advantageously with those of any contemporary English poet, not excepting even Chaucer. His imagery is not rich, but he is seldom other than lively, simple, and energetic. Fortunate in the choice of a noble theme, he has depicted, in rough but faithful outline, the life, manners, and deeds of a truly heroic time, and given to his country, not only the first poem in her literature, but the earliest history of her best and greatest king.—The best edition of *The Bruce*, accessible to the public, is that of Dr Jamieson (Edin. 1820); but a superior one, under the care of Mr Cosmo Innes, was produced for the Spalding Club in 1856.

BARBU'DA, one of the British Caribbees, lying 30 miles to the north of Antigua. Of its north end, the lat. and long. are 17° 33' N., and 61° 43' W. Its area is estimated at 75 square miles, and its inhabitants number about 1500. The proportional density, therefore, of population is only about $\frac{1}{5}$ of that of Barbadoes (q. v.). In fact, the island, small as it is, has never been cleared for cultivation, the greater part of the interior being a dense forest interspersed with patches of savanna. The agriculture, such as it is, is confined to the rearing of stock and the growing of provisions. B. is of coral formation, and is beset with reefs. It has a roadstead, but no harbour.

BARBY, a walled town of Prussian Saxony, on the left bank of the Elbe, 15 miles south-east of Magdeburg. It is well built, and has an old castle. Pop. 5212, chiefly engaged in the manufacture of woollens and linens.

BARCA, a country in the north of Africa, in lat. 26°—33° N., and long. 20°—25° E., between the Great Syrta (now called the Gulf of Sidra) and Egypt. It forms the eastern division of Tripoli, having the rest of that dominion on the W., the Mediterranean Sea on the N., the Libyan Desert on the S., and it is separated from Egypt on the E. by no definite line, but by a number of roving independent tribes. It nearly corresponds with the ancient Cyrenaica (q. v.). Population variously estimated from 300,000 to 1,000,000. The climate is

healthy and agreeable in the more elevated parts, which reach a height of about 1200 feet, and in those exposed to the sea-breeze. There are none but small streams, but the narrow terrace-like tracts of country are extremely fertile, realising all that is said of the ancient Cyrenaica. Rice, dates, olives, saffron, &c., are produced in plenty. The pastures are excellent; the horses still celebrated, as in ancient times. But the good soil extends over only about a fourth of B.: the east exhibits only naked rocks and loose sand. Many ruins in the north-western parts attest a former state of cultivation much superior to the present. So early as the time of Cyrus, B. became a state, which proved dangerous to the neighbouring state of Cyrene; but within a single century it sank, and became subject to Egypt. In the Roman period, its inhabitants were noted for their predatory incursions. It was afterwards a province of the Greek empire, and had declared itself independent when the Arabs invaded and conquered it in 641. The present inhabitants consist of Arabs and Berbers, who profess the Mohammedan religion, and are subject to the Pacha of Tripoli, to whom each of the beys pays an annual tribute.

BARCARO' LLE, a species of song peculiar to the gondoliers of Venice. The name is applied to musical compositions for voice or pianoforte of a similar character.

BARCELO'NA, the most important manufacturing city in Spain, in the province of the same name, is beautifully situated on the Mediterranean between the mouths of the Llobregat and the Besos, in the midst of a district as luxuriant as a garden. It is walled, and possessed of a citadel, which, however, is effectually commanded by the fortress of Montjoux on the south-west. B., like Edinburgh, is divided into two parts—the old town and the new—by the *Rambla* (river-bed), which has been planted with flowering shrubs, and formed into a beautiful promenade. The streets of the old town, forming the north-west division, are crooked, narrow, and ill paved. Those of the new are much more spacious and regular. There is a large suburb to the east of the town, where the seafaring portion of the population chiefly reside. In 1864, the population was 190,000; but in 1865 it had been reduced to 167,095, chiefly by a frightful cholera epidemic in 1865. B. is the see of a bishop. It has a university, and colleges and schools for general and special educational purposes; public libraries, in one of which there is a splendid collection of MSS.; several hospitals and other charitable institutions; the finest theatre in Spain; and numerous ancient and elegant churches, with a cathedral which, begun in 1298, is not yet completed. B. manufactures silk, woollens, cottons, lace, hats, firearms, &c., which form its principal exports. It imports raw cotton, coffee, cocoa, sugar, and other colonial produce; also Baltic timber, salt-fish, hides, iron, wax, &c. Next to Cadiz, it is the most important port in Spain. Indeed, more vessels clear out of its port than out of Cadiz; but they are of smaller size, the entrance to the harbour, which is itself commodious, being obstructive to large vessels. The number of vessels that entered in 1863 was 5464, with a tonnage of 626,000 tons; cleared out 2887, with a tonnage of 383,299 tons; value of imports in 1863, 405,872,631 reals; exports, 132,915,919 reals. B. is a place of great antiquity, and associated with many historical events. Local tradition fixes the date of its foundation 400 years before the Romans; and it is said to have been refounded by Anidear Barca, the father of Hannibal, from whom its ancient name, *Barcino*, was derived. An important city under the Romans,

Goths, and Moors, B. in 878 became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it, and to hold the title of Counts of Barcelona until the 12th c., when its ruler adopted the title of King of Aragon, to which kingdom it was annexed. During the middle ages, B. became a flourishing seaport, rivalled in the Mediterranean by Genoa only. To its commercial code, framed in the 13th c., much deference was paid by the whole of Europe; and it was at this time, says Ford in his *Handbook of Spain*, 'a city of commerce, conquest, and courtiers; of taste, learning, and luxury; and the Athens of the troubadour.' Columbus was received here in 1493 by Ferdinand and Isabella, after his discovery of America. In 1640, it appealed to France against the tyranny of Philip IV.; but it turned against that country in the war of the Spanish Succession, and adhered to Austria. In 1705, the fortress of Montjoux was surprised and captured by Lord Peterborough, and the city surrendered shortly afterwards. In 1714, after a most heroic defence, it was stormed by the Duke of Berwick, and given over to fire and sword. Napoleon perfidiously obtained possession of it in 1808; and with one or two reverses, and in the face of great difficulties, it was held by the French until the treaty of peace concluded in Paris in 1814. For thirteen years, B. remained quiet under the iron rule of España; but in 1827 its old turbulent spirit returned, and it rose in favour of Don Carlos. Since that time, B. has successively supported the pretensions of any party in the state whose ascendancy at the moment seemed to offer most advantages to itself.

BARCLAY, ALEXANDER, a poet and prose writer, born about the end of the 15th c., whether in England or Scotland is not certain. He studied at Oxford, and then obtained, through his patron, Bishop Cornish, an appointment as one of the priests or prebendaries of St Mary Ottery, in Devonshire. He afterwards became a monk of the Benedictine monastery of Ely, where he continued until its suppression in 1539. He died in June 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The Shyp of Follys of the Worlde*—partly a translation, and partly an imitation of the German *Narrenschiff* by Brandt—which was printed by Pynson in 1508, and since several times reprinted. It is interesting (as most satires are), as shewing the manners and customs of the times satirised. He published several works besides; among others, *The Myrroure of Good Manners*, *The Castell of Labour*, *The Egloges*, the first eclogues that appeared in the English language; and also made a translation of Sallust's *History of the Jugurthine War*. In his lifetime, he was admired for his wit and eloquence, and his writings exhibit a refinement not common in that age.

BARCLAY, JOHN, a clever poet and satirist, was born about 1582, at Pont-à-Mousson in Lorraine, where his father, William B., a Scotsman, who died in 1605, had held the office of Professor of Law. He studied in the Jesuit College of that place; and the distinguished talents which he early displayed, caused the Jesuits to try to induce him to enter their order. On account of his rejection of their proposals, he, as well as his father, suffered much persecution. He accompanied his father to England in 1603, where he soon attracted the attention of James I., to whom he dedicated one of his works, *Euphormionis Satyricon* (Lond. 1603), a politico-satirical romance, chiefly directed against the Jesuits. Next appeared his *Conspiratio Anglicana* (Lond. 1605), and his *Icon Animarum* (Lond. 1614). In

1615, he left England, and went to Rome, where he died August 12, 1621. In the same year his celebrated work *Argénis* appeared in Paris (Paris, 1621). It was written in Latin, and has been translated into several languages. There are no fewer than three translations into English; the last appeared in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the League. *Argénis* was admired both by Cowper and D'Israeli.

BARCLAY, ROBERT, the celebrated apologist of the Quakers, was born on December 23, 1648, at Gordonstoun in Morayshire, Scotland. His father was the son of David Barclay of Mathers, the representative of an old Scoto-Norman family, which traced itself through fifteen intervening generations to Walter de Berkeley, who acquired a settlement in Scotland about the middle of the 12th c.; his mother was the daughter of Sir Robert Gordon, the premier baronet of Nova Scotia, and historian of the House of Sutherland. Young B. received the rudiments of learning in his native country, and was afterwards sent to the Scotch College at Paris, of which his uncle was rector. Here he made rapid progress in his studies, and excited the admiration of his preceptors, as well as of his relative, who offered to make him his heir, if he would remain in France, and formally adopt the Roman Catholic religion, to the ceremonies of which he had been habituated during his residence there. This, however, B. refused to do; and in compliance with the wish which his mother had expressed on her death-bed, he returned home in 1664. Though only sixteen, B. was an excellent scholar, and could speak in the Latin language with wonderful fluency and correctness. In 1667, he embraced the principles of the Society of Friends, for reasons more highly respected in our day than in his. He states in his *Treatise on Universal Love*, that his 'first education fell among the strictest sort of Calvinists,' those of his country 'surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called reformed churches;' that shortly afterwards, his transition to France had thrown him among the opposite 'sect of papists,' whom, after a time, he found to be no less deficient in charity than the other; and that, consequently, he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalise his mind, by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics, he found an absence of 'the principles of love,' 'a strictness of doctrine,' and a 'practice of persecution,' which offended his idea of Christianity, as well as his gentle and generous nature. He therefore allied himself gladly to this new sect, whose distinguishing feature was its charity and pure simplicity of Christian life, and soon became one of its most devoted adherents and its ablest advocate. In the course of his life, he made several excursions into England, Holland, and Germany, earnestly propagating his peaceful views wherever he went, and occasionally enjoying the companionship of William Penn. His first publication was *Truth Cleared of Calumnies*. It appeared in 1670, and was intended as a refutation of the charges—many of them notoriously false—made against the new sect. In 1673 appeared *A Catechism and Confession of Faith*, the answers to the questions being—to avoid theological dogmatism—in the words of Scripture. This was followed by *The Anarchy of the Ranters*, &c. In 1675, he published his *magnum opus*, elaborately entitled *An Apology for the True Christian Divinity, as the same is held forth and Preached by the People called in scorn Quakers: Being a full Explanation*, &c. It contains a statement and defence of fifteen

religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate revelation; and that the faculty, if it can be technically defined, by which such intuition is rendered possible, is the 'internal light,' the source of which is God, or, more properly, Christ, 'who is the light that lighteth every man that cometh into the world.' The identity of this doctrine with that held by Mr Maurice and others of the Broad Church in the present day has been more than once remarked. In 1677 appeared his *Treatise on Universal Love*. It was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honourably distinguished the Society of Friends. It was addressed to the ambassadors of the several princes of Europe, met at Nimeguen. In 1686, he published his last work, which was a defence of the doctrine of 'immediate revelation.' He died at Ury, in Kincardineshire, October 3, 1690. His estate remained in the possession of his descendants till 1854, its owner at that time being Captain Barclay, the famous pedestrian. 'The Apologist's Study,' which remained much as he left it, was long an object of pilgrimage with members of the Society of Friends: it was destroyed a few years ago, when the old house of Ury was pulled down.

BARCLAY DE TOLLY, MICHAEL, PRINCE, one of the most distinguished Russian generals, was descended from a branch of the same Scotch family to which the two preceding—Barclay the poet, and the apologist of the Quakers—belonged, some of whom had settled in Mecklenburg and Livonia. He was the youngest of three brothers, and was born in 1759 in Livonia, where his father, Gottlieb B. de T.—at one time a member of the town-council of Riga—possessed an estate. Having been adopted by General van Vermoulen, B. de T. entered a Russian regiment of cuirassiers, at first with the rank of sergeant. He fought with great bravery in the Turkish war of 1788—1789; in the campaign against Sweden in 1790; and in those against Poland in 1792 and 1794. In the year 1806, at Pultusk, as major-general, he commanded Benningsen's advanced-guard. He lost an arm at the battle of Eylau. Although much hated by the Russian national party, because regarded by them as a German, he was appointed minister of war by the Emperor Alexander in 1810—an office which he held till 1813. In 1812, he was made commander-in-chief of the army of the west. His retreat to Smolensko, and the loss of the battle fought there on the 17th of August, raised the hatred of the Russian national party to a greater height than ever, and he was obliged to yield the chief command to Kutusow. It has been maintained by many, that B. de T. was the originator of the Russian system of defence in 1812. He had indeed advised a retreat to the interior, and recommended the avoidance of a battle; but the system of defence, as a whole, originated with General Pnel, who had left the Prussian service, and constantly accompanied the Emperor Alexander from the year 1807, without holding any distinct official appointment. At Moskwa, B. de T. commanded the right wing. After the death of Kutusow, he again obtained the chief command of the army, which he held at the battle of Bantzen, and retained till the truce. He afterwards commanded the Russian army in Bohemia, and took part in the battles of Dresden, Culm, and Leipsic. He was commander-in-chief of the Russian army in France, and in consequence of this was made a prince and a field-marshal. He died in 1818 at Insterburg, on his way to the Bohemian

haths. Two or three years before his death, the estate of Tolly or Towie, in Aberdeenshire, the old inheritance of his family, was for sale, and he was pressed to buy it, but refused, on the ground that his family had been so long expatriated that Scotland was now to them a strange country.

BARCLAY AND PERKINS' BREWERY, one of the largest establishments of the kind in the world, is situated in Park Street, Southwark, London, the buildings covering upwards of ten acres. The brewery was founded by Dr Johnson's friend, Henry Thrale, who, in 1773, according to a statement made by the doctor on his Hebridean tour, was paying as much as £20,000 annually to the Exchequer. After Thrale's death, it was sold by the executors to Barclay (a descendant of the author of the *Apology for the Quakers*) and Perkins, who had been Thrale's chief clerk, for £135,000. Since that time, the business has assumed vast proportions, as the following statistics will serve to shew: Two steam-engines, together equal to 75 horse-power, are required to work the machinery; there are 24 malt-bins, each equal in size to an ordinary three-storied house; and Westminster Hall is not much larger than the great brewing-room; more than 100,000 gallons of water are used daily, and 2000 quarters of malt weekly; 10 brewing coppers have an aggregate capacity of 120,000 gallons; there are 4 fermenting vessels, each capable of holding 1500 barrels of beer; the cooling-floor has a surface of more than 1000 square yards; 300 vessels of 300 gallons each are used in the working-off of the yeast from the beer, which is stored in 150 vats, the largest of which holds 108,000 gallons; and the average gives 30,000 gallons each. 200 horses and drays are employed in distributing the beer to London retailers.

BAR-COCHIBA, SIMON, the leader of the Jews in their great insurrection against the Romans, under the Emperor Hadrian, from 131—135 A. D. Three times had the oppressed Jews revolted without success, from 115 to 118; and in 130, soon after Hadrian's return from Syria, a new rebellion broke out, for which they had been secretly preparing. At the head of it was one Simon, who assumed the name of Bar-cochba, i. e., 'Son of the Star,' pretending that the prophecy was to be fulfilled in him, 'There shall come a Star out of Jacob' (Numb. xxiv. 17). He fought at first with great success against the Romans, and even obliged them to evacuate Jerusalem, where he was proclaimed king, and caused coins to be struck with his name. The war spread over all the country of Palestine, and fifty towns, besides many villages and hamlets, came into the possession of the Jews. But on the arrival of Hadrian's general, Julius Severus, Jerusalem was retaken; and in August 135, Bethur, the very last strong fortress held by the Jews, was stormed by the Romans. B. fell on the day of this bloody conquest. During the war, hundreds of thousands of Jews were destroyed, many were executed, and very cruel edicts were subsequently issued against them. From this last struggle dates the final dispersion of the Jews over the face of the earth. The Holy City was razed to the ground, and rebuilt under another name. The Jews still retain in their liturgy hymns which they chant in mournful memory of this tragic event. For a particular history of the struggle, see Münter's *Der Jüdische Krieg unter den Kaisern Trajan und Hadrian* (Altona, 1821).

BARD, the name, known to the Romans since 200 B. C., by which the Gauls and other Celtic peoples (British, Welsh, Irish, and Scotch) designated their minstrels. Like the Seöps of the Anglo-Saxons, and the Skalds of Scandinavia, the bards celebrated the deeds of gods and heroes at religious

solemnities, and the festivities of princes and nobles, accompanying their recitations with the harp or chrotta (Ir. *cruid* and *clarsach*); they excited the armies to bravery, preceded them into the fight, and formed the heralds of princes, and the mediators of peace. The institution early disappeared among the Gauls, but lingered long in Wales, Ireland, and Scotland. The bards formed a hereditary order, and exercised a decided national influence. The minstrels among the Celts, as among the Germans, were the organ of the people, and the channel of all historical tradition. It is supposed that in Wales, about 940 A. D., their privileges were defined and fixed by the laws which bear the name of King Ifwel Dha; and in 1078 the whole order is said to have been reformed and regulated anew by Gryffith ap Conan. At Caerwys, Aberfraw, and Mathralval, there were held from time to time great competitions in minstrelsy, called Eisteddfods, at which the judges were appointed by the prince. When Wales was conquered by Edward I. (1284), the bards lost their privileges, and were, according to tradition, persecuted and put to death; but succeeding princes countenanced the institution, and Eisteddfods were repeatedly held under royal commission down to the reign of Elizabeth. Since then, exertions for the revival of national Welsh poetry and the bardic profession have been made by several societies: the Gwyneddigion, founded in 1770; the Cambrian, in 1818; and more recently, the Metropolitan Cambrian Institution. To these societies, and to the patriotism of individuals, we owe collections of the relics of the lays of the Welsh bards, none of which, it should be added, can be traced to MSS. of an older date than the 12th c. The most interesting of those relics are those of Liwarc'h-Henn, Aneurin, and Taliesin. See Jones's *Relics of the Welsh Bards* (Lond. 1794); Owen's *Myrrian Archaeology of Wales* (3 vols., Lond. 1801—1807); *Poèmes des Bardes Bretons du vie Siècle*, par T. H. de la Villemarqué (Paris, 1850), &c.

In Ireland, the bards are believed to have been a hereditary guild, divided into three classes: the Filedha, who sung in the service of religion, and in war, and were the counsellors and heralds of princes; the Braitheamhain, who recited or chanted the laws; the Seanachaidhe, who were chroniclers and genealogists to princes and nobles. Their ample privileges and endowments of land gave them an exorbitant influence, which both princes and people had sometimes to rise against and curb. The great skill of the Irish bards on the harp was acknowledged everywhere. After the conquest of Ireland by Henry II., the profession began to sink. Still many of the chiefs maintained bards in their families, whose songs and legends kept up the national feeling. This occasioned several measures of the English rulers against the Irish bards; Elizabeth ordered the bards that were captured to be hanged, as the instigators of rebellion. Turlogh O'Carolan, born 1670, died 1737, is reckoned the last Irish bard; his poems were translated into English by Furlory. Other lays of the bards have been translated by Miss Brooke, *Relics of Irish Poetry* (Dub. 1789), and Hardiman, *Irish Minstrelsy* (Dub. 1831).

The bardism of Scotland may be conjectured to have been similar to that of Ireland; but nothing is certainly known of the subject beyond the fact, that there were poets or bards, of different degrees, in the Highlands down to the 17th c.

The name of B. was unknown among the Germanic nations; though a corrupt reading in some MSS. of the *Germania* of Tacitus (*barditus* for *barditus*, the 'war-cry') led Klopstock and others to write wild religious and war songs, which they called

'Bardits,' under the notion that they were restoring a branch of the national literature. This Ossianic aberration soon came to an end.

BARD, a fortress and village of Piedmont, situated on the left bank of the Doire, about 23 miles south-south-east of Aosta. When the French crossed the St Bernard in 1800, the fortress of B. offered a resistance to their further advance into Italy, which might have proved effectual had the Austrian garrison been sufficiently on the alert. The French failed to take the fortress by storm, but they succeeded in dragging their artillery under and past the guns of the fort during the night, and were far on the road to Ivrea before the Austrian commander was aware that they had passed. B. was taken a short time after by the French, and razed, but it has since been restored.

BARDESANES (properly, Bar-Deisan), the founder of a Gnostic sect, was a native of Edessa, in Mesopotamia, and flourished towards the end of the 2d c. He stood high in favour with the monarch Abgar-bar-Maanu, but little is known regarding him. It is stated that he held a disputation with the philosopher Apollonius, who appeared in Edessa in 165 A. D., in the suite of L. Antonius Verus. He was first a disciple of Valentinus, whose heresy he afterwards abjured, and wrote against it, and also against other heresies; but ultimately he relapsed into partial agreement with his old master. His *Gnosis* was not purely dualistic. He did not consider evil the eternal coefficient of good, but merely the result of a temporary reaction of matter on spirit. Yet, inexplicably enough, he maintained the devil to be a self-existent, independent being. He denied the doctrine of the resurrection of the body, and in conformity with such a conviction, asserted that Christ's body was not real, but only an illusive image brought down from heaven. He diffused his opinions through the medium of hymns, of which he is reckoned the first writer in Syria. These hymns, fragments of which are still extant, exhibit a rich and pure fancy. His followers were called *Bardesanists*. They never formally separated themselves from the orthodox church, though they continued to exist as late as the 5th c. See Hahn's *B. Gnosticus Syrorum primus Hymnologus* (Leip. 1819).

BARDOLINO, a town of Austrian Italy, with a harbour on Lake Garda, and about 14 miles west from the fortress of Verona. The battle of Rivoli was fought in its vicinity in January 1797.

BA'REFOOTED (Lat. *discalceati*, i. e., shoeless), an appellation given to certain monks and nuns who abstain from wearing any covering on the feet, either entirely (as the Alcantarines, who originated at Placentia, in Spain, in 1540, but who are chiefly found at present in the kingdom of Naples), or for a specified period of the year (as the nuns of our Lady of Calvary); or who, instead of shoes, wear merely sandals, i. e., soles of wood, leather, rope, or straw fastened by thongs. They do not constitute a separate order in the Roman Catholic Church, but are to be found as a higher grade of asceticism with more or less severity of observance, among most of the orders, Carmelites, Franciscans, Augustines, Eremites, Capuchins, &c. They are, however, steadily ignored by the more dignified Dominicans, though the latter are themselves mendicant friars. The origin of this form of religious austerity is to be traced generally to the custom which prevailed among the Jews and Romans of putting off their shoes on the occurrence of public calamities, that in this condition of mourning and humiliation they might implore the divine Being for deliverance; but perhaps more particularly to

the command which Christ gave his disciples (Matt. x. 10; Luke x. 4).

BARÈGES, a small watering-place in France, situated in the Pyrenees, about 18 miles from Bagnères de Bigorre. The mineral water for which it is celebrated contains principally sulphuret of sodium, with portions of carbonate, muriate, and sulphate of soda, nitrogen, and sulphuretted hydrogen. Its efficacy in the cure of wounds, rheumatism, stiffness of joints, and scrofulous complaints is said to be very remarkable. See Murray's *Hand-Book to France*.

BARÈGES, mixed tissues adapted for women's dresses, called in France *Crêpe de Barèges*. The name is derived from the place noticed in the above article; in reality, however, B. were never made in that little watering-place, the seat of the manufacture being at Bagnères de Bigorre. B. are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in colour, and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear. The best are still manufactured in France.

BA'REGINE. Many Algae are found growing in mineral springs, especially those of a sulphuric nature. The product of their growth is a mucous-like substance somewhat resembling the white or glair of an egg. This deposit is particularly abundant in the hot springs at Barèges, whence the name of baregine. It imparts a flesh-broth flavour and odour to the water, which is prized, and is sometimes imitated by adding animal gelatine to the sulphur-baths where B. is deficient.

BARAILLY, the chief city of a district of the same name in Rohilcund, British India—a district which, with an area of 2937 square miles, contains 1,143,657 inhabitants, and which is bounded on the E. by Oude and Nepal. The city itself, with an estimated population of about 100,000, is in lat. 28° 23' N., and long. 79° 28' E., being 788 miles to the north-west of Calcutta, and 152 miles to the east of Delhi. It is pleasantly situated in a well-wooded country on the left bank of the Jooa, an affluent of the western Ramgunga. Besides a brisk and lucrative commerce, it has considerable manufactures, more particularly in the article of ornamental chairs and tables. B. became a name of notoriety in the great mutiny of 1857. On the 31st of May, the city was a scene of rapine and bloodshed. The native garrison, without any European troops to overawe them, rose against their officers, and seized the public treasure. They murdered every European who had not the means of escaping. But fortunately, from a suspicion of the outbreak, the ladies and children of the Company's servants, both civil and military, had been sent off in safety to Nynce Tal, in the Himalaya. B. was recovered by Sir Colin Campbell, now Lord Clyde, in the May of the following year.

BARE POLES. When a ship has all her sails furled, she is said to be 'under bare poles.'

BARÈRE DE VIEUZAC, BERTRAND, a member of the French National Convention, born at Tarbes, 10th September 1755. He became an advocate in the court at Toulouse. After acting as a deputy in the National Assembly, the department of the Hautes-Pyrénées elected him to the National Convention in 1792. He is said to have been naturally in favour of moderate measures, but he was easily overawed by the influence of the party of the Mountain, with whom he generally acted, and whom he supported by his eloquence, which was so flowery and poetical in style that he came to be designated the Anacree of the guillotine. He

was president of the Convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: 'The law is for death, and I am here only as the organ of the law.' His natural mildness warring with the instinct of self-preservation, made him alternately a supporter of merciful measures and an advocate of the guillotine, and his whole public conduct betokens a man much more selfish than patriotic or humane. After the death of Robespierre, in which he had concurred, B. nevertheless proposed the continuation of the Revolutionary Tribunal, for which he was denounced by Lecointre, and afterwards impeached and sentenced to transportation; his sentence, however, was not carried into effect, and he partook of the general amnesty of the 18th Brumaire. He was elected as a deputy to the Chamber in 1815, during the Hundred Days. After the second restoration, he was banished from France, and went to Brussels, where he devoted himself to literary work till the revolution of July permitted his return. In the year 1832, he was once more elected as a deputy by the department of the Hautes-Pyrénées; his election, however, was annulled, on account of errors of form, whereupon the government called him to be a member of the administration of that department, which office he continued to hold till 1840. He died on 14th January 1841. He bestowed upon the younger Carnot his *Mémoires*, which have been published (2 vols., Par. 1842). His many other political and historical writings are now of no importance.

BARETTI, JOSEPH, an Italian writer, born at Turin, 1716. He was intended for the law, but devoted himself to literature. In 1751, he established himself as a teacher of Italian in London, where, in 1757, he published the *Italian Library*, giving an account of the most eminent Italian authors and their works. He was about this time appointed secretary for the foreign correspondence of the Royal Academy. In 1762, he published an account of his travels through Portugal, Spain, and the south of France to Italy in *Lettere Famigliari*, which, with additions and a new title, were afterwards republished in England. B. now lived some time in Italy, and published at Venice a journal called the *Literary Scourge*, which brought upon him many prosecutions. On his return to England, he published, among other works, an Italian grammar, and an Italian and English dictionary, which have since gone through many editions. One evening, he became involved in a street-brawl in London, and stabbed with his penknife a man, who died soon after. B. was tried for murder, made his own defence, and was acquitted—Dr Johnson, Burke, and Garrick testifying to the excellence of his character. He died in 1789 in London.

BARFLEUR, a seaport town of France, in the department of La Manche, about 15 miles east of Cherbourg. It is now a place of little importance, but it is noteworthy as being the port from whence, according to report, William the Conqueror set out on his invasion of England. In the 13th and 14th centuries, B. was twice pillaged by the English.

BARGAIN AND SALE, in the law of England, is a mode of conveyance whereby property, real and personal, may be assigned or transferred for valuable consideration. It finds a chief place, however, in law-books in connection with the conveyance of real estate. In regard to personal estate, *assignment* (q. v.) appears to be the more appropriate, as it is the more usual term. B. and S., then, may be described as a conveyance, in the way of a real

contract, by means of which property in lands and tenements, whether that property be in possession, remainder, or reversion, is conveyed from one person to another. In its terms, it consists of a B. and S. by the seller to the intended vendee for money; and by the statute of frauds, 29 Chas. II. c. 3, it must be in *writing*; and by the statute of enrolments, the 27 Hen. VIII. c. 16, it cannot pass a freehold, unless it be by *indenture enrolled* within six months after its date, or with a *custos rotulorum* of the county. But hereditaments lying within any city or town corporate, the officers of which have authority to make enrolment of deeds, are excepted from this statute. A B. and S. for a term of years, however, will be effectual without enrolment. But see LEASE and RELEASE.

No particular form of words is essential to the validity of a B. and S.; 'bargain and sell' are the words of transfer ordinarily used. But other words will have the same effect, and the distinctive character of the conveyance is determined by the consideration on which it is founded. This consideration, however, is held to be a mere matter of form, and sufficiently complied with if the conveyance purport to be so founded. To this end, any trivial sum may be inserted in the conveyance, though the consideration which really passes between the parties be of larger amount; or even though it be, in fact, not of a pecuniary nature. It is also immaterial whether the sum so inserted be actually paid or not.—*Stephen's Commentaries*, vol. i., pp. 535—537. See CUSTOS ROTULORUM, POSSESSION, REMAINDER, REVERSION, INDENTURE, LEASE, and RELEASE.

There is no such title to land or other real estate in the Scotch law, but in that system there may be a *bargain* as to land, the evidence of which must be in writing, the Scotch law in this respect agreeing with the regulations of the English statute of frauds above referred to. The term bargain is also used by Scotch lawyers to signify a contract or agreement for the sale of personal or movable property, and to such a bargain the intervention of writing is not necessary, but it may be proved by witnesses.

BARGE, an ancient town of Piedmont, in the province of Saluzzo, 30 miles south-west of Turin. Pop. 7000, who are engaged in the manufacture of firearms and the quarrying of slate. A brisk general trade is also carried on.

BARGE. Various forms of vessel receive this appellation. The Admiralty and city of London

Barge—Royal.

barges, used on ceremonial occasions, are elegantly fitted out, and supplied with accommodation for many rowers. The B. belonging to a man-of-war, for the occasional use of the superior officers, is a well-trimmed, though not showy boat, light enough to be easily hoisted in and out of the ship. On our rivers and canals, a B. is a clumsy, flat-bottomed vessel of burden, employed either in conveying goods from one town or quay to

another, or to aid in bringing stores to and from ships. There are several kinds of this last-named craft—namely, coal-barges, sand-barges, west-country

Barge—Common.

barges, &c. For the chief points of difference between barges and other boats, see **BOAT**.

BARGE-BEARD. Where the roof, in Gothic houses, extends over the wall, the gable is generally furnished with a board, which either covers the

Barge-board.

rafter, or occupies the place of a rafter itself. These barge-boards were often very richly ornamented, particularly in the 14th and 15th centuries. The accompanying illustration is copied from Parker's *Glossary of Architecture*.

BARI (ancient *Barium*), a city in the kingdom of Naples, capital of a province of the same name, is situated on a peninsula in the Adriatic, in lat. 41° 8' N., and long. 16° 53' E., and about 140 miles north-north-east from Naples. Pop. 27,300. It is strongly fortified, and defended by a massive old castle of Norman origin, nearly a mile in circumference. The city is divided into the old town and the new. The streets, with some few exceptions, are confined and gloomy. B., which is the see of an archbishop, has manufactories of cotton, silk, linen, soap, &c., and carries on an active export-trade in oil, corn, and fruit with Trieste and Dalmatia. Its harbour does not admit of the entrance of large vessels; but

its quay and roadstead are good. It has some fine ecclesiastical structures, the most notable of which is the priory of St Nicholas, a noble specimen of the Lombard style of architecture, founded in 1087, and liberally endowed by the brothers Guiseard. Within the walls of this building, Urban II., in 1098, held a council of Greek and Latin bishops, with the view of settling the differences between the two churches; and Roger II. was here crowned king of Sicily. The priory contains some interesting monuments and relics, the most remarkable of which is the tomb of Bona Sforza, queen of Poland, who died in the castle in 1557. B. is one of the cities believed to have been founded by Iapex, son of Dædalus. Its coins shew it to have been a place of considerable note among the Greeks as early as the 3d c. B.C. The Romans appear to have held it in but little repute; but it rose in esteem when, in the 10th c., it fell into the hands of the Greek emperors, who made it the capital of Apulia, and the residence of a viceroy. It was twice taken in the 11th c. by the Normans, who added to its strength and importance.

BARIGA'ZZO, a village of Modena, province of Lamigiana, remarkable for the streams of fire which issue out of the soil to a height of several feet, and which continue to burn for days without intermission.

BARILLA, an impure carbonate of soda, procured from plants which grow in salt-marshes or other places near the sea, and which forms a considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of B. are produced in Spain and the Balearic Islands; but the Canary Islands, Italy, and France, also contribute a part. It is procured by burning the plants, much in the same way that sea-weeds are burned upon the coasts of Scotland to procure kelp. The Spanish B. is most esteemed, especially that produced near Alicante, which is chiefly obtained from the *Salsola sativa*, a plant of the natural order *Chenopodiaceæ*. This plant is there cultivated in grounds close by the sea, embanked on the side nearest it, and furnished with floodgates, through which the salt water is occasionally admitted. It is cut in September, dried in small heaps, and then burned in a hole in the ground. The exportation of the seed is prohibited by the Spanish government under the severest penalties. Other species of *Salsola* (Salt-wort), as *S. Tragus* and *S. Kali* (the latter, a common native of the shores of Britain), are also burned for B., although they yield it in smaller quantity than *S. sativa*. B. is made in France from *Salicornia herbacea* or *annua* (Glass-wort), another of the *Chenopodiaceæ*, plentiful also in salt-marshes on the shores of Britain and other parts of Europe. See **SALT-WORT**.

BARING. The firm of Baring Brothers is one of the greatest commercial houses in the world. Its founder was John B., a German, who settled in a small business in Exeter, England, in the first half of the 18th c. Two of his sons, Francis and John, established in London in 1770 the now existing house.

FRANCIS became a director of the East India Company, and being a staunch supporter of Pitt, was created a baronet by that minister in 1793. He took an active part in the discussions relative to the Bank Restriction Act of 1797.

SIR THOMAS B., eldest son of the above, born June 12, 1772, succeeded his father in the baronetcy. He appears to have taken no active part in the business of the firm, being chiefly remarkable as an admirer and encourager of art. His magnificent

collection of paintings was dispersed by public sale after his death in April 1848.

ALEXANDER B., brother of the above. See LORD ASHBURTON.

SIR FRANCIS THORNHILL B., son of Sir Thomas, whom he succeeded, was born in 1790, was educated at Oxford, where in 1817 he took a double first class. He entered parliament as M.P. for Portsmouth in 1826. Under successive Whig governments, he held the offices of a Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty. He was more noted for his business aptitude than as a politician. He died September 1866.

THOMAS B., brother of the above, born in 1800, devoted himself early to commercial pursuits, and also to politics, taking the opposite side to his brother. He is, however, much more widely known as a partner of the firm of B. Brothers than as a politician.

The firm is engaged to a large extent in the negotiation of national loans, in exchange and money broking, in the produce-trade, home and colonial, in importation and exportation upon their own foreign accounts, &c.

BARITAH (*Barita*), a genus of large Australian birds, placed by some ornithologists in the family of Shrikes (q. v.), (*Laniidae*), and by others in that of Crows (q. v.), (*Corvidae*). The bill is large, conical, scarcely curved, the base of it extending remarkably backward on the forehead. The best known species is the Piping Crow, or Piping Grakie, or Jar-ra-warang of New South Wales (*B. Tibicen*). It preys on small birds, is gregarious, assembling in small flocks, has a melodious voice, is easily tamed, and becomes very familiar and amusing, learns to whistle tunes extremely well, and exhibits a great power of mimicking the voices of other birds.

BARIUM is the metal present in heavy spar (sulphate of baryta) and baryta. Till lately, it was regarded as a white metal, but the recent researches of Dr Matthiessen have demonstrated that it possesses a yellow colour. As yet, the metal B. has not been obtained in mass, but only as a powder. It decomposes water readily at ordinary temperatures, and exposed to the air, quickly combines with oxygen, forming the *oxide of B.* (BaO), or BARYTA. The latter substance is an earth resembling ordinary caustic lime, and may otherwise be prepared by adding finely divided black oxide of copper (CuO) to a solution of sulphuret of B. (BaS), when the sulphuret of copper (CuS) is thrown down, and the baryta (BaO) is left in solution. On evaporation, the water of solution passes off as steam, and leaves the solid earthy-looking substance, baryta. A third mode of preparing baryta is to heat strongly the nitrate of baryta ($BaONO_3$), when the nitric acid (NO_3) flies off, and leaves the baryta (BaO). The *sulphuret of B.* (BaS) is obtained when the sulphate of baryta ($BaOSO_4$) in powder is mixed with finely-pulverised coal, and the whole being placed in a crucible, is raised to a red heat in a furnace. The result is, that 4 atoms of the carbon (C) of the coal carry off the 4 atoms of oxygen in the sulphate of baryta as carbonic oxide (CO), whilst the B. united solely with sulphur is left behind as the sulphuret of B. (BaS). The *chloride of B.* is prepared by adding hydrochloric acid (HCl) to a solution of the sulphuret of B. (BaS), when hydrosulphuric acid (HS) escapes, and chloride of B. remains behind, and on evaporation of the liquid, is obtained in crystals.

BARK. See BARQUE.

BARK (*cortex*), in phanerogamous or flowering plants, is the external covering of the stem. It is

composed of layers of cellular tissue, whilst the woody stem, to which it forms a sort of sheath, is vascular. In endogenous plants (palms, &c.), there is not, in general, a very marked line of separation between the B. and the vessels or vascular bundles of the stem, so that these plants are generally, but incorrectly, said to have no bark. It is in exogenous plants, and especially in perennial woody stems, that the development of B. is most perfect, and the distinction between wood and B. most marked. The outermost layer of the B. of exogenous plants is the *epidermis* (q. v.), which, however, is in general only to be seen in annual stems, and in the youngest parts of woody stems; peeling off as the stem becomes older along with the outer layers of the true bark. Beneath the epidermis is the true B., of which the outer layer is called the *epiphloem* (Gr. outer bark), and consists of cells, usually rectangular and flattened, with thick walls. The inner layer of the true B. is called the *mesophloem* (Gr. middle bark), and is generally formed of a cellular tissue of roundish cells with thin walls. These layers are sometimes very distinctly separated from one another, and sometimes pass gradually into one another; sometimes there is merely a continuous cellular tissue. Within the true B. is a very distinct layer, the inner B., *liber* (Lat.) or *endophloem* (Gr. inner bark), also frequently called Bast, which is composed of bundles of woody fibre or vascular tissue mixed with cellular tissue. The layer of Cambium (q. v.) is often regarded as belonging to the inner B., but rather belongs to the vascular part of the stem. In the inner B. are sometimes found cells containing a milky juice, as in the *Apocynaceae*, or vessels for a milky juice, as in the common fig. The combined strength and flexibility of the fibres of the inner B. render it in many cases useful for various purposes. See FIBROUS PLANTS and BAST. In the true B., the peculiar juices and most characteristic substances elaborated by the plant are very generally found, for which reason that part is often of the greatest importance in medicine and the arts. The B. of many trees abounds in *tannin* (q. v.) or *tannic acid*.

The B. of a stem or branch of not more than one year old exhibits only a cellular integument or epidermis with an interior lining of woody fibre—the inner B.; but new layers are added from year to year, the B. as well as the woody stem being increased from the cambium, the mucilaginous layer which is interposed between them, and which particularly abounds in spring, when the separation of the B. from the stem is most easy. The annual layers, however, cannot long be distinctly recognised in the B. as in the wood; and in the older portions of woody stems, the outermost parts of the B. become desiccated and lifeless, and are in general gradually thrown off. On this account, those mosses, lichens, and other plants which attach themselves only to the outermost layer of the B. of trees, and derive their nourishment from it, cannot be regarded as true parasites, as they are in no degree supported by the juices of the stem, but only consume and remove external matter already destitute of life. The B. of some trees is remarkable for the thickness which it acquires, as that of the cork-tree, in which the *epiphloem* is formed of many layers of cells. The outer parts of thick barks very often crack, to admit of the expansion of the stem within; in the lace-bark tree of the West Indies, the fibres of the inner B. become partially separated as it is distended, forming lozenge-shaped meshes arranged with beautiful regularity.

The connection between the cellular tissue of the B. and that of the pith in the centre of the tree is continually maintained by means, in exogenous

stems, of the medullary rays. See EXOGENOUS PLANTS and PITH. The B. is a protection to the young and tender wood; it appears also to exercise functions analogous to those of the leaves, which, when young, it resembles in its colour, and which are regarded as dilatations of it, so that it has been called the 'universal leaf' of a plant.

BARK, in Medicine, &c. The principal barks used in medicine will be found noticed in separate articles. See *ANDIRA* (*Cabbage B.*, *Surinam B.*); *ANGOSTURA B.*; *CARIBBEE B.* (*Jamaica B.*, *St Lucia B.*, *Piton B.*); *CASCARILLA* (*Cascarilla B.*, *Eleutheria B.*); *CINCHONA* (*Cinchona B.*, *Peruvian B.*, *Jesuits' B.*, *China*, *Cascarilla*, *Arica B.*, *Calasaya B.*, *Carabaya B.*, *Huamalies B.*, *Huanuco B.*, *Jaen B.*, *Loza B.*, *Maracaibo B.*, *Ash B.*, *Croen B.*, *Silver B.*, *Yellow B.*, *Tan B.*, &c.); *CLOVE B.*; *COPALCIE B.*; *CULILAWAN B.*; *WINTER'S BARK*.—When B. is mentioned without any prefix, it is always *Cinchona*, otherwise called *Peruvian* or *Jesuits' B.*, which is intended.

The barks used for dyeing, tanning, and other purposes in the arts, being generally named from the trees which produce them, particular references here are unnecessary.

BARK, FOR TANNING. The B. of many trees is capable of being used for tanning (q. v.), but those kinds of B. are preferred which particularly abound in tannic acid. Oak B. is principally used in Britain, and throughout Europe; also in North America, although that of America is obtained from species of oak different from the European; in Spain, the inner layer of the B. of the cork oak, or cork-tree, is employed, and it is to some extent imported into Britain for the use of tanners. The B. of the chestnut is also much esteemed. Larch B. and willow B. are used in preparing some kinds of leather. The B. of the birch and that of the alder are also employed; birch B. being, however, more esteemed for steeping fishermen's nets and cordage, to preserve them from rotting, than for the preparation of leather. Different species of *Acacia* (q. v.) and of *Eucalyptus* (q. v.) furnish barks used for tanning in Australia, some of which have, to a small extent, become articles of commerce.

The *barking* of trees can be accomplished with facility only in spring, when the sap has begun to circulate. The tree being felled, the rough external lifeless parts of the B. are removed as useless, by means of a sharp instrument called a *scraper*; the smaller branches are cut into lengths of about two feet, and their B. is loosened by beating with a mallet, and easily taken off—as boys at the same season make plane-tree whistles; the B. of the trunk and main branches is cut through by a chisel-like instrument, called a *barking-iron*, into similar lengths, each of which is divided longitudinally, and finally stripped off by the aid of mallets, chisels, &c. The B. is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a very free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, the larger pieces of B. being placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of B., as it is much spoiled if allowed to get mouldy, and is liable to suffer injury from rain or from the exposure of its inner surface to the sun.—Oak and birch B. are usually about equal in their price, which, however, varies very much, from £4 to £8 per ton. Larch B. is much less valuable; it is also of much greater bulk in proportion to its weight. The B. is a very important source of the revenue derived from many woods and coppices.

BARK BEETLE, or **BARK-CHAFER**, a name common to many of the large family of Coleopterous Insects (q. v.), called by entomologists *Xylophagi* (Gr. wood-eaters). They are all small, and generally of uniform colour; they have hard bodies, and short, often club-shaped antennæ. Most of the family live in wood or other vegetable substances, as mushrooms, dried plants in herbariums, &c., and some of them are extremely injurious to living trees. Those called B. beetles or bark-chafers bore holes in the bark, and deposit their eggs in the inner bark, in which the larvæ excavate pathways, often causing the death of the tree. One species in particular, sometimes called the common Bark-chaffer (*Tomicus typographus*), and sometimes the *Typographer Beetle*, from the figure of its burrows, has

Tomicus typographus.

a, natural size; b, insect magnified; c, galleries made by the insect.

from time to time appeared in extraordinary numbers, ravaging the forests of Germany. In 1783, it caused the death of a million and a half of pines in the Hartz Forest alone. This insect is mentioned in some of the old German liturgies under the popular name of 'the Turk,' which its dreaded ravages obtained for it.

BARKAL, or **JEBEL BARKAL**, a singular sandstone rock in Nubia, situated in lat. 18° 31' N., and long. 31° 46' E., about a mile from the right bank of the Nile. It is quite isolated, perpendicular on the side facing the river, and very steep on all. It is about two miles in circumference at the base, and 400 feet in height, its summit forming a pretty broad plateau. Between it and the river are the remains of some magnificent temples, the two principal ones being known as the Typhonium, and the Great Temple, one of the largest monumental ruins of Nubia. The ancient city of Napata is supposed to have been situated in the vicinity. The two red granite lions, now in the Egyptian Room of the British Museum, were brought from B. in 1832 by Lord Prndhoe.

BARKER, EDMUND HENRY, a well-known English philologist, was born 22d December 1788 at Hollym, in Yorkshire, and studied at Cambridge. Besides editions of several Latin classics, and numerous contributions to periodicals, particularly to the *Classical Journal*, he was led, during a residence

with the famous philologist Parr, to undertake a revision of Stephens's *Thesaurus Linguae Graecae*. This gigantic work was violently assailed in the *Quarterly Review* by Blomfield, against whom B. wrote his *Aristarchus Anti-Blomfieldianus* (Lond. 1818); yet he and his publisher, Valpy of London, carried it on and completed it in a spirited manner (13 vols., 1816—1828). In 1812 appeared the first volume of his *Classical Recreations*. He also supplied materials for the composition of Sturtz's *Etymologicum Gudianum*. He likewise translated some works of German philologists, among others, Buttman's *Greek Grammar for Schools*. He collected the mass of anecdote and criticism relative to his friend Dr Parr, which was published in 2 vols. in 1828—1829, under the title of *Parriana*, a work well-nigh unreadable, from the superabundance and ill-digested nature of its matter. He also assisted Professor Dunbar in the compilation of the Greek and English Lexicon published in 1831. He lost all that he had in a lawsuit about a valuable inheritance, so that he was obliged to sell his fine library, and was put into the debtors' prison. He died in London, March 21, 1839, in extreme poverty.

BARKER, JOHN, descended of an English mercantile family, became, in 1799, agent for the East India Company at Aleppo; in 1826, British consul at Alexandria; and afterwards consul-general in Egypt. In the year 1834, he removed from this situation to the lonely but lovely valley of Suedia on the Orontes, 4 leagues from Antioch, where he employed himself in the cultivation of the choicest fruits of Asia and Europe. We are indebted to him for the Hanwick Nectarine, the most delicious yet introduced into our gardens. The good terms on which he stood with the people around him and with the government, enabled him to render many valuable services to European travellers. He died at Suedia on the 5th of October 1850.

BARKER'S MILL (Fr. *Roue à réaction*, Ger. *Segner's Wasserrad*), a water-wheel invented by

Fig. 1.

Dr Barker towards the end of the 17th c. It is represented in its simplest or typical form in fig. 1. A is a wide metal pipe, resting at its lower end by the steel spindle T, on a metal block B, and kept in a vertical position by the spindle S,

at its upper end, which passes through the frame of the machine, so that it can easily revolve round its axis. Near its lower end, two smaller pipes or arms, C, C, are inserted, which project horizontally from it, and these have each, at the outer extremity, a hole cut vertically in them, opening towards opposite sides. The water is supplied by the pipe P, which opens over a funnel-like widening on the upper part of A, and the quantity is so regulated that while the pipe A is kept nearly full, no more is admitted than issues from the lower orifices. The reaction caused by the water gushing from the arms, forces them backwards, and gives to the whole machine a rotatory motion. This reaction is much the same as is seen in the recoil of a gun when fired, or in the pushing back of a small boat by the foot on stepping ashore. It may be also thus explained: Suppose that the arms were closed all round, the water would press against the sides with a force proportional to the height of the water in the pipe A, and the pressure against any particular surface of the side would produce no motion of the arm, because an equal pressure is exerted in a contrary direction by a corresponding surface opposite to it. Now, if one of these surfaces be cut out, the pressure against the other being uncounteracted, forces the arm in the opposite direction to that of the side in which the hole is made. This being done to both arms on opposite sides, two equal pressures are produced, which conspire in generating the same motion of rotation. As soon as motion ensues, centrifugal force comes into play, which, throwing the water out towards the ends of the arms, increases the rapidity of its discharge, and also its reacting power. When the wheel is in action, the water thus acts under the influence of two forces—one being the pressure of the column in A, and the other the centrifugal force generated by the rotation of the wheel itself. The motion of the wheel is transmitted by the spur-wheel fixed to the spindle S, to the machinery which is to be driven by it, or, in the case of a corn-mill, the spindle passes directly through the lower millstone, and is firmly fixed into the upper one.

The power is manifestly increased by heightening the water-column, or by lengthening the arms—the former increasing the pressure of the water, and the latter increasing the leverage at which this pressure acts. In the mill shewn in the figure, the column in A cannot be advantageously heightened, for the higher it rises, the greater must be the weight which the conical spindle, T, has to sustain, and the greater, consequently, becomes the friction. It is from this circumstance that such mills are found, in practice, to yield but a small mechanical effect—the friction consuming too large a proportion of the work of the wheel. Hence, in the reaction-wheels now in use, the original B. M. has been so modified as to allow of the water being conducted from the reservoir below the arms instead of above. This is effected by making the vertical pipe revolve below in a stuffing-box at its junction with the conduit, and above, by a pivot moving in the fixed frame. By this arrangement, the friction attending the rotation is reduced to a minimum, for not only is the weight of the water placed out of account, but also a large proportion of the weight of the wheel itself, which is borne by the upward pressure of the water. The mechanical performance of such wheels is said to be highly satisfactory, producing, with a limited supply of water falling from a considerable height, a useful effect, hardly to be obtained by any other contrivance. The power of these machines may be also

increased by using curved (fig. 2) instead of straight arms. With straight arms, a considerable loss of force is incurred by the sudden change of the direction of the current when it leaves the arm, which does not take place to the same extent with curved arms, where this change is effected gradually. In

Fig. 2.

Whitelaw's Mill (hence called the Scottish turbine), the form of B. M. generally met with in Scotland, there are three instead of two curved arms of this description. Considerable difference of opinion still exists as to the merits of B. M., some considering it as the most perfect way of applying water-power, and others putting it in the same rank as an under-shot wheel, with the same water-supply. Of late years, it has been more extensively employed than formerly, both in this country and on the continent. See WATER-POWER.

BARK-STOVE, in Gardening, a kind of hot-house intended for those plants which require not only the greatest heat, but also a continually moist atmosphere. It derives its name from the use of tanners' bark, for the purpose of producing this atmospheric condition. The bark is placed in a pit, lined and paved with brick, and pots containing tropical plants are sunk in it; by which means the plants not only enjoy a moisture resembling that of their native climates, but the earth around their roots is kept uniformly and moderately heated. The principle of the B. is adopted in pineries, palm-houses, orchid-houses, &c., also in forcing-stoves employed for producing the ordinary fruits and vegetables of temperate climates at unusual seasons. A considerable heat results from the fermentation of tanners' bark, but it is not upon this that its value in the B. chiefly depends.

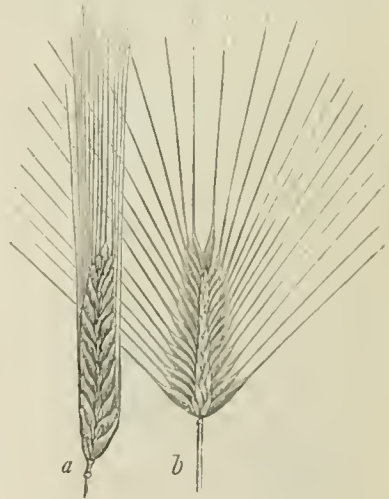

BARLAAM AND JO'SAPHAT, one of the most widely-spread religious romances of the middle ages, relating the conversion of the Indian prince Josaphat by the hermit Barlaam, and thereby illustrating the power of Christianity to overcome temptation, and proving its superiority over all other creeds. The celebrated divine, John Damascene, has been by some erroneously supposed the author of the original Greek MS., while others have attributed it to the church historian Anastasius Bibliothecarius. At all events, it was the production of an eastern, possibly an Ethiopian Christian. The Greek original was first published by M. de Boissonade, in the 4th volume of his *Anecdota* (Paris, 1832), and translated into German by Liebrecht (Münst. 1847). But even in the middle ages, a Latin version of this romance had been extensively circulated. About the end of the 15th c., it was often printed in a detached form, and later, it appeared amongst the works of John Damascene (Paris, 1609). Vincent de Beauvais wove the story into his *Speculum Historiale*. From the Latin version sprung three French poetical versions belonging to the 13th c., and as yet unprinted. The Italian *Storia di S. Barlaam* (latest edition, Rome, 1816) may be traced to a Provençal original as early as the beginning of the 14th c. In Germany, Rudolf von Ems derived his poem, *B. and J.*, first printed at Königsberg (1818), and later at Leipzig, from the Latin of John Damascene. There is also an Augsburg impression of a prose translation of the ancient Latin text, belonging to the close of the 15th c. The Spanish *Historia de B. y J.*, by Juan de Arze Solorzano (Madrid, 1608), the Polish poetical version, by Kulizowsky (Cracow, 1688), as well as the

Bohemian (Prague, 1593), are all borrowed from the Latin; while the Icelandic *Barlaams Saga*, and the Swedish popular tale, *B. och J.*, have a German source. A Norwegian version, printed from an old vellum MS. of the beginning of the 13th c., said to have been translated by King Ilakon Sverreson, appeared in 1851. This romance has even been rendered into the Tagala language of the Philippines, and there printed (Manilla, 1712).

BAR-LE-DUC, or **BAR-SUR-ORNAIN**, a town in the department of the Meuse, France. It is situated on the Ornaïn, about 125 miles east from Paris, with which it is connected by railway, and with the Rhine by canal. Pop. 13,331, who manufacture cotton and calicoes, and carry on a considerable trade in timber from the Vosges, for the use of Paris, and in iron, wool, and wine. B. has a communal college, normal school, and public library. Its origin dates from the 10th c.

BARLETTA, a fortified seaport of Naples, province of Bari, on the Adriatic. Pop. about 23,000, who carry on a large shipping-trade with Greece, the Ionian Islands, and other ports of the Adriatic. The town is well built, handsome, and clean; has a fine cathedral, a colossal statue supposed to represent the Emperor Heraclius, a college, theatre, and castle, formerly one of the most impregnable fortresses in Italy. A feature of B. is the large and magnificent gateway which leads to its harbour. During the blockade of B. by the French in 1502-1503, which ended in the defeat and death of their commander, the Duke of Nemours, the celebrated combat between eleven cavaliers of France, and as many of Spain, in which the Chevalier Bayard so distinguished himself, took place, and ended in a drawn battle.

BARLEY (*Hordeum*), a genus of Grasses, to which belongs one of the most extensively cultivated kinds of grain. The genus is distinguished by

Barley.

a, two-rowed barley; b, sprat or battledore barley.

spiked inflorescence, three spikelets being always situated upon each tooth of the rachis, of which sometimes only the middle one is fertile, and sometimes all the three, so that in the former case the fruit-bearing spike is two-rowed, and in the latter case, six-rowed; the glumes are two, containing a

BARLEY.

single floret; the paleæ two, the outer one awned; and the seed is surrounded by the paleæ. The species of this genus are almost all annual, although some varieties of *B.* are sown in the end of autumn, and the cultivation of them extends over the winter. *B.* is mentioned in the books of Moses and other books of the Old Testament, also by the Greek and Roman writers, and has been extensively cultivated from remote antiquity. Beer made from it was known to the Greeks, the Egyptians, and the ancient Germans. The cultivation of it appears to have extended from Italy northwards in Europe, but it is better adapted than any other grain to the most northern regions, some of its varieties being cultivated with advantage where the climate is too cold, or the summer too short, for any other cereal crop; and it is deemed probable that its native country is Northern or Central Asia. It is capable, however, of being cultivated in very warm climates, and extends over a wider climatic range than any of the other grains. *B.*-meal is used for bread in the northern parts of Europe, but in other parts of the world, *B.* is more generally converted into malt for the making of beer (see BREWING), or merely deprived of its outer skin, and so used as an article of food. *B.* intended for brewing is first subjected to the process of *malting*, by which it is converted into MALT (q. v.). *B.* simply deprived of the husk (*paleæ*) in a mill is called *Pot B.* or *Scotch Barley*. When the pellicle of the seed is also removed, and the seed itself rounded and polished, it is *Pearl Barley*.—What is sometimes called *Patent B.*, is a farina obtained by grinding pearl *B.*, and differs from *B.*-meal in being quite free from a degree of acidity which the latter derives from the integuments of the seed.

It is doubtful if this grain is produced by more than one species, or whether what have been described as distinct species by botanists, are not really mere varieties, the result of long cultivation. *H. vulgare* is usually distinguished as having the grains disposed in four rows; *H. hexastichon*, as having them in six rows; and *H. distichon*, as having the lateral spikelets abortive, and the grains, therefore, in two rows. But the lower part of the spike in the varieties ranked under *H. vulgare* is often six-rowed, and only the upper part four-rowed; and in rich soils, a tendency to resume the six-rowed form is otherwise manifest. Nor are the kinds known as *Naked Barley*, in which the seed separates readily from the paleæ, to be looked upon as more distinct. The four-rowed or six-rowed varieties are generally coarser, but more productive than the two-rowed; and some of them, often called BEAR, or BIGG, are regarded as most suitable for exposed situations and inferior soils. A kind with naked seeds, called *Siberian B.* (*H. caeleste* of some writers), is extensively cultivated in some parts of Europe, and its straw is regarded as affording a richer food for cattle than that of most other kinds. The *Nepaul* or *Himalaya B.*, another variety with naked seeds, and further characterised by the irregular manner in which the grains are placed in the spike, paleæ three-lobed at the end, and very short awns—and which is therefore regarded by some botanists as a distinct species (*H. trifurcatum* or *H. Aegiceres*)—has been recommended as particularly adapted for cold mountainous regions, yielding good crops in the Himalaya at an elevation of 14,000 feet above the level of the sea.—Of the two-rowed *B.*, there are many varieties, of which the Common or Early English *B.*, the Italian *B.*, and the *Chevalier B.* are among the most esteemed, the latter being in particular demand for the brewing of the finest ales. It takes its name from M. Chevalier, who introduced it.—The *Sprat* or *Battledore B.*

(*H. zeocriton* of many botanists) is also two-rowed, but is distinguished by the grains standing out from the spike, their awns spreading very widely. It is sometimes called *German Rice*, as it swells by boiling in the way that rice does, and for some purposes forms a good substitute for it. It is scarcely cultivated in Britain, but is in much esteem in Germany, and succeeds well in the Alps at an elevation of 3360 feet.

Three species of *Hordeum* are natives of Britain, of which one (*H. murinum*), a small grass, is pretty common on waste-grounds, especially in England, and is apt to prove troublesome by its long awns causing inflammation in the mouths of cattle. Still more injurious in this way is the North American *H. jubatum*, or Squirrel's Tail. Another, MEADOW *B.* or MEADOW *B.*-GRASS (*H. pratense*), frequent in meadows in England, is reckoned a good pasture-grass. *H. bulbosum*, a native of the south of Europe and north of Africa, is cultivated in Britain for herbage, of which it yields a large quantity, much relished by cattle, and particularly by horses. Several species are natives of North America.

BARLEY, CULTIVATION OF. Barley was cultivated largely by the Romans, as well as many other nations of antiquity. Though sometimes used as food by the soldiers, it was most generally used as food for horses. The ancient inhabitants of Gaul prepared a spirituous liquor, a kind of beer, from it. Many of the other western nations latterly applied it to the same use, and it also became an important article of food. On the whole, its growth in modern times has been greatly restricted on the continent of Europe. Other crops are found to be more profitable. Being a plant which is most productive where the climate is moderately dry and warm, the excessive heats of many parts of Europe are adverse both to the quantity and quality of its grain. It is only cultivated to a large extent on a few limited tracts where the soil is specially suited to it, such as in Belgium, Holland, Prussia, and Denmark. Indeed, while most of the countries of Europe send us wheat, it is chiefly Denmark and Silesia that supply us with barley. For this reason, the prices of *B.* have been relatively higher in this country than those of wheat, since the introduction of free-trade in grain. No country seems to possess a soil and climate so well suited to its growth as many parts of Britain. In former times, this grain was largely used in the British Islands as human food; but this is the case now only in Ireland and the Highlands of Scotland, where the condition of the population has undergone comparatively little amelioration. In Scotland, however, a considerable quantity is made use of in the making of broth. In this case, the grain is denuded of its husk by the friction of revolving millstones, and goes under the name of *Pot Barley*. But the larger proportion of the *B.* grown in Great Britain, as well as that which is imported, is employed in the distillation of spirits, and in the manufacture of beer, ale, and porter. The inferior qualities are taken up by the distillers, while the brewers of ale and porter require the finest, which are known by the silvery colour of the husk, and the specific gravity of the grain. Fine malting *B.*, therefore, always commands a ready demand in the London market, as well as a high price.

Perhaps the cultivation of *B.* occupies as prominent a share of the arable lands of Suffolk and Norfolk as of any other part of Britain. Fine malting qualities are grown on the turnip-soils of these counties, as well as throughout the south-eastern counties, where the four-course rotation is adopted. In this rotation, the *B.* follows the turnip-crop, which is usually consumed on the land by sheep. The ground is carefully prepared by

ploughings and rollings, to pulycrise it thoroughly before the reception of the seed, which is usually sown by a drill-machine at the rate of about two bushels to the acre. Even on the strong clay-soils of the eastern counties, excellent crops of B. are obtained by the peculiar modes of culture adopted. On the strong lands of Suffolk and Huntingdon, for example, the B.-crop is sown after a summer-fallow or a green-crop, in which case the soil is ploughed before the frosts of winter set in, to render it friable by spring. As soon as the weather permits, after the first week of February the seed is committed to the ground. A fine mould is in this way obtained, and the crops are usually abundant and of good quality. In the south of England, the grain is allowed to stand till it is fully ripe, when it is either cut with the scythe or the reaping-machine. In many parts, it is not bound up into sheaves, but remains in the swath for a few days, when it is afterwards carted, and stored into barns. A large portion of the B.-crop is still thrashed out by the flail, owing to the maltsters being under the impression that the thrashing-mills injure the germinating powers. The chief varieties grown in England are the Chevalier, the Common, the Early English, and the Norfolk. The first-named is the most largely sown, as the quality is superior to any other, and, under liberal treatment, the yield is greater. The produce is more influenced by the seasons than that of wheat, as it is liable to suffer from droughts in the early part of the year. On well-farmed land, from 48 to 60 bushels and upwards are got to the acre. In the peaty-soils of the fens of Lincolnshire B. is not raised, as it is too liable to lodge with the rain; neither is B. a favourite crop in the moist climate of the west of England. It does not endure the rains so well as wheat, nor bear to be highly farmed. In Wales and Lancashire, it is generally grown after a crop of wheat, and the cultivation and management are not so careful as in the east.

Barley has long been grown in Scotland, and comes to great perfection where the soil and climate are suitable. The level parts of the Lothians and other counties in the east of Scotland are the districts in which the finest crops are raised. In these rich districts, the six-course rotation is generally followed, and B. is sown after a portion of the turnip-break. For this reason, it does not occupy so large a proportional breadth as it does under the Norfolk four-course. The produce is equally abundant, however, and the quality of the grain is not much inferior. Chevalier is the favourite variety there also. The crop, when ripe, is cut by sickle, scythe, or reaping-machine; bound up at once, and put into stooks, to defend it from the weather till ready to cart, and to be built up in neat round stacks. The grain is invariably thrashed out by machinery. In the higher districts of Scotland, where the soil and climate are not so good, the inferiority of the grain, both in quality and quantity, is very considerable. It is only in fine seasons that the quality is such as to render it an object to maltsters, and distillers can only make use of it at a reduced price. The chevalier variety is too late for inferior climates, and the early English and other kinds that come sooner to maturity are preferred. In Berwickshire, the five-course rotation—of two years' grass, oats, turnips, and B.—is more generally adopted than in any other county in Scotland, and a large quantity of this grain is raised, but the quality is generally inferior to that of the crops in East Lothian. Along the light soils fringing the Moray and Cromarty firths, as fine quality of grain is got as in East Lothian. On the other hand, in the less genial climate of the

western counties, and also of the upper parts of Aberdeenshire, less B. is sown, and oats frequently succeed the green-crops. In these parts, the variety known as bear, or bigg, is preferred to any other, as it is not so liable to lodge, and it withstands wet weather far better. Bear, too, is the variety which is cultivated by many of the small cotters in the Highlands and Islands, where agriculture has made little advance for centuries. Instead of a rotation in which green-crops find a place to husband and spare the natural resources of the soil, a succession of corn-crops are taken. Late sowing is generally adopted, as the want of manure in the soil can be so far made up by the more genial weather of summer. For this reason, sowing is often delayed till June, and the frost of autumn often causes the premature ripening of the grain.

There is not much deserving special notice in the manuring of the crop. On the turnip-soils of the south of England, the land is enriched by the droppings of the sheep which consume the turnips. In the strong soils of Norfolk and Huntingdon, guano, rape-cake, or other manures abounding in nitrogen, are applied when the seed is sown. In the west of England, the moist climate renders the application of manures more precarious, and B. is frequently taken after a crop of wheat without any application of fertilisers. Manures containing phosphates might be used there with great advantage. When the turnip-crop is drawn from the land, as it often is in East Lothian, guano is the manure held in most estimation; the quantity applied is from 2 to 3 cwt. per acre. In Berwickshire, as in Norfolk, the prevalence of the five-course shift, and the general practice of eating the crop on the ground, secure a sufficiently liberal manuring. In other parts, where B. is taken after wheat, farmyard manure is often applied, as well as guano and phosphoric manures. In the Highlands, where bear is sown on the small farms, the chief manure is shell-sand, or lime. There is one point in the manuring of the crop which ought to be attended to—that is, the earlier it is sown in the season, the more liberal ought to be the application of nitrogenous manures. On the other hand, the later it is sown, manures containing nitrogen should be used more sparingly, and a portion of phosphoric manures should be substituted in their stead.

BARLEY-BREAK, a popular amusement, very common in the reign of James I., and, with certain modifications, in name and practice still existing among young persons, both in England and Scotland. Originally, it was played by six people, three of each sex, who were formed into couples. A piece of ground was then apportioned into three parts; and into the centre one, called *hell*, a couple was doomed by lot. The sport consisted in the two in the condemned part 'catching' one of the other couples while they were in the act of changing places, when the couple caught had to go into the centre. It was, however, no easy matter for the two in the centre to capture another couple, for, by the rules of the game, they were bound to keep united, while the others, when hard pressed, might sever. Thus, Sir Philip Sidney, in describing the game, says:

Soop as the middle two
Do, coupled, towards either couple make,
They false and fearful do their hands undo.

When the whole had been caught, the game was ended, and the last couple taken was said to be in *hell*. Their punishment appears to have consisted in kissing each other. Herrick says, in referring to the game:

If kissing be of plagues the worst,
We'll wish in hell we had been last and first.

In Scotland, the game consisted in one person chasing the rest round the stacks in a farmyard; and when one was caught, he or she had to assist in capturing the rest. The origin of the name is doubtful. Dr Jamieson suggests that, in Scotland, the locality of the game may have given it its name—'barla-bracks, about the stacks.' The same authority also adds: 'Perhaps from *barley* and *break*, q., breaking of the *parley*, because after a certain time allowed for settling preliminaries, on a cry being given, it is the business of one to catch as many prisoners as he can.' This supposition is not improbable. In the modern games of 'Shepherds a-warning,' and 'Tig,' which appear to have been derived from B., 'a barley' means a *parley*.

BARLEYCORN, JOHN, a personification of the spirit of barley, or malt-liquor, used jocularly, and also in humorous poetical effusions. There exists a whimsical English tract of old date, under the title of *The Arraigning and Indicting of Sir John Barleycorn, Knt., printed for Timothy Tossopot*, in which Sir John is described as of 'noble blood, well beloved in England, a great support of the crown, and a maintainer of both rich and poor.' See Hone's *Every-day Book*, vol. i.

BARLEY-SUGAR, a confection prepared with sugar and a decoction of barley. See **SUGAR**.

BARLOW, JOEL, an American poet and politician, born in 1755 at Reading in Connecticut. He studied at Yale College in Newhaven. He was intended for the profession of the law, but served as a military chaplain during the War of Independence. In 1787 he published a poem called *The Vision of Columbus*, which in 1805 appeared anew in an enlarged form as *The Columbiad*. It abounds in beautiful passages, but is overburdened with political and philosophical disquisitions, and disfigured by singularities of expression. B. accepted a commission in 1788 to prosecute the sale of lands for the Ohio Company in England and France, where he signalled himself by zealous republicanism; published in 1792 in London a poem entitled *The Conspiracy of Kings*, and endeavoured also to work upon the public mind in England by political pamphlets. In autumn 1792 he was deputed by the London reformers, with whom he was associated, to proceed to Paris, where he received the rights of French citizenship. He spent some years on the continent of Europe in political, literary, and mercantile pursuits, and was for a short time American consul at Algiers. He returned to America in 1805, and was appointed ambassador to France in 1811. He died in October 1812 at Zarnawitze, near Craeow, when on his way to a conference with the Emperor Napoleon at Wilna.

BARM. See **YEAST**.

BARMECIDES, or **BARMEKIDES**, a Persian family, distinguished amongst the most powerful in the province of Khorasan, the cradle of the greatness of the Abbaside califs, whose cause the *children of Barmek* espoused. *Khaled-ber-Barmek*, the first of these whose authentic history has reached us, was the prime-minister of Abul Abbas Al-Saffah, the first Abbaside calif; and his influence enduring through the reigns of Al-Mansur and Mohdi, the latter intrusted him with the education of his son, the celebrated Harun Al-Raschid. Yahya, the son of Khaled—according to eastern historians, equally conspicuous for virtue and talent—was made vizier by Harun upon his accession to the califate (786 A. D.), and both by his military skill and civil administration, contributed largely to the prosperity of the reign—the calif himself bestowing on him the appellation of Father. Harun, however, afterwards

becoming jealous of the growing power and popularity of two of Yahya's sons, Fadhl and Jarfar (the Giafar of the *Arabian Nights*), had them executed, and the whole of the B. throughout the kingdom arrested, and their goods confiscated. Harun even carried his enmity so far as to forbid the mention of their name on pain of death; but their virtues and their glory are celebrated by almost all Mohammedan poets and historians.

BARMECIDE'S FEAST, a phrase originating most probably in the story of the barber's sixth brother, recorded in the *Arabian Nights*, and abridged in the *Guardian*, No. 162. The substance of the story is as follows: One Schacabac being in great want, and not having tasted food for two days, ventured to visit a rich Barmecide (see **BARMECIDES**) noted both for his hospitality and eccentric humour, in the hope of generous entertainment. The Barmecide, on learning his condition, invited him to dinner. Schacabac was presented with an empty plate, requested to 'make himself at home,' and by and by, asked 'how he liked his rice-soup.' It was apparently a cruel jest to play off on a starving man. Schacabac, nevertheless, feigned to enter into the humour of his host, and expressed his conviction that the rice-soup was delicious. The Barmecide continuing the imposition, next asked his victim if he ever saw whiter bread. Poor Schacabac, who saw neither bread nor meat, nor indeed anything eatable, made a prodigious effort to look happy; he even went the length of gently remonstrating with his host for not supposing him completely satisfied. In this way a magnificent but fictitious dinner was disposed of. When wine, however, was produced, Schacabac pretended only to taste it on the ground that he was 'quarrelsome in his liquor,' and might do his host an injury. The Barmecide forced him, however, and at last Schacabac, who was really in a most excusable rage at being so elaborately tantalised, feigned to have got flustered, and gave the eccentric old gentleman 'a good box on the ear.' This put a stop to the joke. The Barmecide was mightily pleased with the patient humour of his guest, a visible dinner was immediately ordered up, and Schacabac now enjoyed in reality what he had previously partaken of only in imagination.

BARMEN, a most charming valley, about two leagues in length, on the Wupper, about two leagues from Elberfeld, in the province of Rhenish Prussia. It is divided into Upper and Lower B., and contains five towns or villages, which united form the town of B., with 41,442 inhabitants, chiefly Protestants. Nowhere in Germany is so much manufacturing industry accumulated in a single spot. B. is the principal seat of the ribbon-manufacture on the continent. Its fabrics go to all parts of the world. It produces linen, woollen, cotton, silk and half-silk ribbons of every quality, and all sorts of stay-laces, &c. It has also considerable manufactures of woven lace, sewing-thread, the coarse cotton cloth called *Siamoise*, &c. There are, besides, in the valley, numerous bleachfields and dye-works. Lower B. has a mineral spring and a bathing establishment.

BARNABAS, St, properly **Joses**, mentioned in the Acts of the Apostles as a fellow-labourer of Paul, and even honoured with the title of apostle. He is also supposed to have founded the first Christian community at Antioch. According to tradition, he became the first Bishop of Milan, but he is differently reported to have died a natural death, and to have suffered martyrdom at the hands of the Cypriot Jews, 61 A. D. The Epistle ascribed to him is of very doubtful authenticity.

BARNABAS, ST, EPISTLE OF. This Epistle contains twenty-one chapters. Its aim is obviously to strengthen the faith of believers in a purely spiritual Christianity. It commences by declaring that legal sacrifices are abolished, and then proceeds to shew, though not in a very coherent or logical manner, how variously Christ was foretold in the Old Testament. In the tenth chapter, it spiritually allegorises the commands of Moses concerning clean and unclean beasts; in the fifteenth, it explains the 'true meaning' of the Sabbath; and in the sixteenth, what the Temple really prefigured. This concludes what may be termed the doctrinal portion of the Epistle; the remainder, which is of a practical character, describes the two ways of life—the way of Light and the way of Darkness, and closes with an exhortation that those who read it may so live that they may be blessed to all eternity. It is a simple, pious, and earnest work; but makes a far more judicious use of the New Testament than of the Old.

BARNABITES, an order of monks which sprung up at Milan in 1530. They were so called because the church of St Barnabas in that city was granted them to preach in. They were approved of by Pope Clement VII. and Pope Paul III. Their special duties were, to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain, and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth, viz., not to sue for church preferments. In France and Austria, they were employed in the conversion of Protestants; but they have now, as a body, almost fallen into oblivion. Only a few monasteries exist here and there in France and Italy.

BARNACLE, or BERNICLE (*Lepas*, also called *Anatifa* and *Pentalasmis*), a kind of shell-fish, a genus of *Cirrhopoda* (q. v.), the type of a family of articulate animals distinguished by a long flexible stalk or peduncle, which is provided with muscles, upon the summit of which, in the true barnacles, are shelly valves, five in number, enclosing the principal organs of the animal, and opening and closing on one side like the opercular valves of *Balanus* (q. v.), to admit of its spreading out and retracting its net—an apparatus similar to that by which the animals of that genus obtain their food. Barnacles abound in almost all seas, attaching themselves in great numbers to logs of wood, ships' bottoms, &c. They grow very rapidly. Some of the

Barnacle.

species are eaten in some parts of the world, and perhaps they were among the *balani* which the ancient Romans esteemed a delicacy.—In some cirrhopods, very nearly allied to the true barnacles, and

resembling them in general form, the shelly valves almost entirely disappear.

In former times, the B. was supposed to be the embryo of a goose or bird of some kind; a notion which doubtless arose from a fancied resemblance between the convolutions of the fish in its shell and the embryo of a bird in the egg. It was, therefore, believed that the barnacle goose, described in next article, sprung from these marine shells. Hollinshed gravely affirms that such was the case; and the most learned men of their time were weak enough to give credence to the absurdity. Gerard, in his *Herbal* (1597), declares, that after 'a thing in form like a lace of silke finely woven, as it were, together'—which he correctly enough states to be 'the first thing that appeareth' when 'the shell gapeth open'—there next follow 'the legs of the bird hanging out;' and at last the bird, increasing in size, 'hangeth only by the bill,' and 'in short space after it cometh to full maturity, and falleth into the sea, where it gathereth feathers, and groweth to a fowl bigger than a mallard, and lesser than a goose,' &c. All this was represented as constantly taking place on the coast of Lancashire and the Hebrides, and continental writers of greater name reported in like manner the same fable, against which Ray and other early naturalists were obliged seriously to argue. The B. however, really undergoes transformations not less wonderful than the fabled ones, which have rendered it an object of so much interest. See *CIRRHOPODA*.

BARNACLE GOOSE, or BERNICLE GOOSE, often also called **BARNACLE, or BERNICLE** (*Anser*

Barnacle Goose.

Bernicla or *leucopsis*), the bird which the fables of former days represented as deriving its origin from the cirrhopod of which it bears the name. It is in size smaller than the common wild goose, being only a little more than 2 feet long, and about 5 lbs. in weight. It is very prettily marked, having the forehead, cheeks, and throat white, the bill black, and a black stripe extending from it to the eye; the crown of the head, neck, and upper part of the breast black; the rest of the plumage on the upper parts of the body chiefly ash-gray and black, in undulating bars—on the lower parts, white. It is a common winter visitant of the western coasts of Britain and of Ireland, but in the eastern parts of Britain it is rare. It retires in spring to more northern regions, where it breeds, vast numbers passing northward along the coast of Norway to the Arctic Ocean. It is highly esteemed for the table.

The Brent Goose, or Brent Barnacle (*Anser Brenta* or *torquatus*, *A. Bernicla* of some naturalists), has frequently received the name of the B. G., and no

little confusion has existed concerning them in books of science, although the birds are sufficiently distinct. The Brent Goose is smaller than the B. G., being only about 21 inches in length. It is also of much darker plumage, the whole head, throat, and neck being black, except a small patch on each side of the neck, which is white, mixed with a few regularly placed black feathers; the upper parts of the body generally almost black, and the lower parts slate-gray, except the vent and under tail-coverts, which are white. It is remarkable for length of wing and powerful flight, and for its distant migrations. It is very common in winter on the British shores, but breeds in high northern latitudes. It is a winter-bird of passage in the United States and Canada, as in Britain and on the continent of Europe. It is excellent for the table.

Very nearly allied to these species is the Red-breasted Goose, or Red-breasted Barnacle (*Anser ruficollis*), a beautiful bird, of which the neck and upper part of the breast are of a rich chestnut red. In size, it resembles the Brent Goose; it is a very rare visitant of Britain and of the continent of Europe, and is abundant only in the extreme north of Asia.—Another species, called Hutchins' Goose or Barnacle (*A. Hutchinsii*), of dark plumage, and with a triangular patch of white on each side of the head and neck, is abundant in Hudson's Bay, and the extreme north of America.

These species are regarded by some naturalists as constituting a genus *Bernicla*, distinguished chiefly by a shorter and more slender bill from the ordinary or true geese.

The Egyptian Goose or Bargander (*Anser Egyptianus*) is sometimes ranked with these, sometimes made the type of a distinct genus, *Chenalopez*, upon account of the longer bill, a short spur with which the bend of the wing is armed, and the anatomical peculiarity of a hollow bony enlargement at the bottom of the trachea of the male. It has long been kept in parks and pleasure-grounds in Britain, chiefly on account of the beauty of its plumage, and has become partially naturalised. It is a little smaller than a common goose; its voice more resembles that of a wild-duck. The prevailing colour of the plumage is light chestnut brown, minutely rayed with darker lines; the neck and part of the wings are white. Large chestnut patches surround the eyes. It is very abundant on the Nile, and is frequently figured in Egyptian sculptures. It is much esteemed for the table, and was kept and fattened for it by the ancient Egyptians. It is the *Chenalopez* of Herodotus.

BARNACLES, in Heraldry, resembling what are now called twitchers, were instruments used by farriers to curb and command unruly horses. B. are frequently introduced into coats of arms as a charge.—The term **BARNACLES**, applied to spectacles, is derived from *bernyllus*, a transparent stone; dim. *bernylicula*, *bernylicula*, *bernycula*. Old Fr. has *bericula*; the dialect of Berri, *bernyques*. Twitchers resembled the original spectacles that clasped the nose.

BARNARD CASTLE, an inland town in the south of Durham county, on the right bank of the Tees, about 40 miles from its mouth, and 26 miles south-west of Durham. It stands on the slope of an eminence rising from the river. Its chief manufactures are hats, carpets, shoemakers' thread, leather, plaids, and stockings. It has one of the largest corn-markets in the north of England. On a rocky height over the river are the ruins (covering 6½ acres) of a castle, founded about 1180 by Bernard, son of Guy Baliol, a follower of the Conqueror, and ancestor of John Baliol, king of Scotland, who was born in the castle, and founded

an hospital for the poor in the town. B. C. is the scene of part of Sir W. Scott's poem of *Rokby*. Pop. 4608.

BARNAUL, a town of West Siberia, in the government of Tomsk. It is situated at the junction of the Barnaul with the river Oby, and has a population of about 10,000, who are chiefly engaged in the mining and smelting of the metals found in the vicinity, which consist of silver, lead, and copper. B. has 120 furnaces at work, is the seat of a mining board, and has a magnetic and meteorological observatory.

BARNAVE, ANTOINE-PIERRE-JOSEPH-MARIE, a distinguished character and victim of the French Revolution, was born at Grenoble in 1761, was the son of an advocate, adopted his father's profession, and early attracted attention in the parliament of Grenoble by the talents which he displayed. A pamphlet which he published against the feudal system led to his being returned as deputy from his province to the States-general in 1789. He zealously advocated the proclamation of the Rights of Man, was vehement in opposition to the Absolute Veto, carried through the confiscation of church-property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganisation of the colonies. As a leader of the extreme party in the earlier stages of the revolution, he became the idol of the people, and particularly after his victory over Mirabeau, in the question of the power of peace and war, which Mirabeau wished to remain with the king, and B. successfully claimed for the National Assembly. He subsequently, however, became inclined to a more moderate course; the consequences of the sudden changes in the colonies appear first to have alarmed him; and being sent, along with Latour-Maubourg and Petion, to bring back the king after his flight, he was much moved by the spectacle of the misfortunes of the royal family, and thenceforth endeavoured to render them all the assistance in his power. He defended, in a speech of great vehemence, the inviolability of the king's person, and resisted the assertion by the Assembly of power to remove ministers. His general opposition to the increasing violence of the revolutionary torrent, and this last step in particular, destroyed his popularity; he was regarded as a renegade from the national party, and was assailed by the fierce vituperations of the daily press. He retired to his native place on the dissolution of the National Assembly; but after the 10th of August 1792, he was impeached, along with Lameth and Duport-Dutertre, on account of correspondence with the court; was brought to Paris, tried before the Revolutionary Tribunal, condemned, and guillotined on the 20th of November 1793.

BARNET, CHIPPING, a town in the south of Hertfordshire, on a hill-top, 11 miles north-north-west of London. Pop. 2380. It was formerly a great thoroughfare, but since the advent of railways, its once bustling appearance is sadly altered. Here, in 1471, was fought the famous battle of B. between the Yorkists and Lancastrians, in which the latter, after a desperate struggle, were routed, and their leader, Warwick, 'the king-maker,' killed, by which event Edward IV. was firmly established on the throne. A commemorative obelisk is now erected near the spot.

BARNEVELDT, JAN VAN OLDEN, Grand Pensionary of Holland, born 1549, early shewed great ardour in the cause of the independence of his country. As advocate-general of the province of Holland, he proved equally his insight into affairs and

his address in diplomatic management. Penetrating the secret designs of Prince Maurice (q. v.) of Orange, he became the head of the republican party, which aimed at subordinating the stadtholder to the legislature. It was he also who opposed the warlike tendencies of Maurice, concluded (1609) a truce with Spain, and prevented the States-general from taking part in the revolt of the Bohemians. His increasing influence excited the House of Nassau to still greater jealousy, which in the religious controversies between the Remonstrants (q. v.) and Gomarists degenerated into the bitterest hostility. With the view of obviating a civil war, B. proposed an ecclesiastical assembly, which resulted in agreeing to a general toleration in respect of the disputed points. The states at first concurred in this wise measure; but the intrigues of the Orange party brought about a change of views, by representing the Remonstrants as secret friends of Spain. B., who sympathised with the more tolerant principles of that party, was attacked in scurrilous publications, and was insulted even in the meeting of the states by the mob, with whom Maurice was an idol. The strife between the Remonstrants and Gomarists became hotter every day, and threatened to end in civil war. In the meantime, Maurice procured the summoning (1618) of the Synod of Dort (q. v.), which condemned the Remonstrants with the utmost rigour and injustice. This decision encouraged Maurice to proceed to the most violent measures. Regardless of the opposition of the states, he arrested B. and other chiefs of the Remonstrants, and got 26 venal judges to condemn as a traitor the innocent man to whom his country owed its political existence. It was in vain that his friends and relations raised their voice; equally vain was the interference of the Dowager Princess of Orange and of the French ambassador; Maurice was not to be moved. On May 13, 1619, the venerable man of 72 years of age mounted the scaffold, and laid down his head with the same firmness that he had shewn through all the events of his life. His sons, Wilhelm and René, were at the same time dismissed from office. Wilhelm and the Remonstrants formed a conspiracy against the life of the prince; but it was discovered, and Wilhelm escaped to Antwerp. His brother René was seized in his stead, and condemned to death, although he had dissuaded Wilhelm from his attempt. The mother, who had not sued in the case of her husband, because he was innocent, now, when there was blame, interceded with the prince for the life of her son; but in vain; he, too, was executed, 1623.

BARNESLEY, a town in the West Riding of Yorkshire, 39 miles south-west of York, on the river Dearne and the Dearne and B. Canal. It is situated on a hill, has coal and iron mines, linen manufactures, bleaching and dye works, iron foundries, wire-works, and glass-works. The damasks and drills, and the iron-wire made here are said to be unrivalled. Much of the flax spun in Leeds is woven at Barnesley. An explosion in Oak Colliery in 1847 killed 72 persons. Pop. 14,913. (1871—23,021.)

BARNSTAPLE, a town in north-west Devonshire, on the right bank of the Taw, 6 miles from its mouth, and 34 north-west of Exeter. Being the chief city of north Devon, and occupying a fine healthy situation, it is the residence of many respectable families. The Taw is here crossed by an ancient bridge of 16 arches, which has been widened by iron-work on each side. In consequence of the river and harbour having become filled up with sand, unfitting them for large ships, much of the trade of B. has been transferred to Bideford. It has manufactures of pottery and lace. It sends two

members to parliament. B. has existed since the reign of Athelstan, who built a castle here. The poet Gay was born near the town, and educated at its grammar-school. Pop. 8667. (1871—11,790.)

BAROCHE, PIERRE-JULES, an eminent French politician, was born at Paris on the 8th November 1802. He passed as an advocate in 1823, and distinguished himself by his talents as a pleader. In 1847, he was sent to the Chamber of Deputies as representative of Rochefort, took his position among the moderate reform party, and was one of those who signed the accusation drawn up against the Guizot ministry. During the republic, he voted at first along with the democratic party, but subsequently supported General Cavaignac, and, after the 10th December, the politics of Louis Napoleon. B. was now made Procureur-général of the Republic at the Paris appeal court, in which function he played a conspicuous part. In March 1850, he succeeded Ferdinand Barrot as Minister of the Interior, after which he became a decided Bonapartist, and carried through several restrictive measures, both commercial and political. In April 1851, he was appointed Minister of Foreign Affairs, with Leon Faucher as colleague. After the *coup d'état* of the 2d December 1851, B. accepted the vice-presidency of the Consultative Commission, and was authorised to make known officially the result of the *plebiscitum*. Since that period, B. has stood high in favour with the emperor, and in 1855 received the grand cross of the Legion of Honour.

BARODA, a city of Guzerat, in lat. 22° 16' N., and long. 73° 14' E. It is 40 miles from Tunkaria, on the Gulf of Cambay, 81 to the north-north-east of Surat, and 231 north of Bombay. It stands on the Biswamintri, which is here crossed by a stone-bridge of singular construction—an upper range of arches resting on a lower one. B. is the residence of the Guicowar, a protected Mahratta prince. Pop. about 140,000; trade considerable. It occupies an important position between the coast and the interior. Some years ago, the Guicowar contemplated the construction of a railway to Tunkaria; and at last English capital is accomplishing a far longer line, which, as its name implies, will connect B. with Bombay in the one direction, and with Central India on the other.

BAROMETER (Gr. *baros*, weight; *metron*, a measure), an instrument for measuring the weight or pressure of the atmosphere. The term is generally understood to refer to one in which the measure is the height of a column of liquid sustained by atmospheric pressure. The fundamental principle of the construction of the B. is best shewn in the experiment which led Torricelli to the first discovery of the pressure of the air. A glass tube, about 33 inches in length, open at one end, is completely filled with mercury, and, being firmly closed by the thumb, is inverted and placed vertically in a cup containing mercury. When the thumb is removed, the mercury sinks in the tube till it stands, generally, about 30 inches above the level of the mercury in the cup, leaving in the upper part a space free of air, which receives the name of the Torricellian vacuum (fig. 1). The mercury within the tube being thus removed from the pressure of the air, while that in the cup is exposed to it, the column falls, till the pressure at the section of the whole, in the same plane as the surface of the mercury in the cup, is the same within and without the tube. A similar experiment is seen when, in a U-shaped tube, having one branch much wider than the other, a column of mercury in the narrow branch balances a column of water nearly 14 times as high in the other. In the Torricellian experiment, we

BAROMETER.

have the air and the space occupied by it taking the place of the wide water branch of the U-shaped tube, and the glass tube and mercury forming the narrow branch, as before; the narrow branch, however, in this case being closed above, to prevent the air from filling, as it were, both branches. In both cases, the heights of the columns are inversely as the specific gravities of the liquids of which they consist; and as air is about 10,000 times lighter than mercury, we should have the aerial column 10,000 times 30 inches high. It will be found, under ATMOSPHERE, that from the air lessening in density as it ascends, the height is considerably greater. Any changes that take place in the height or density of the aerial column will be met by corresponding changes in the height of the mercurial column, so that as the latter rises or falls, the former increases or diminishes. We have, then, in this simple tube, an infallible index of the varying amount of atmospheric pressure, and, in fact, a perfect barometer. The changes, however, are indicated on a scale at least 10,000 times diminished, so that the variations in the tube shew very considerable changes in the weight of the atmosphere. If water be used instead of mercury, the water column would be 14, or, more correctly, 13.6 times as high as the mercurial column, or about 34 feet; and the scale on which the changes take place would be correspondingly magnified, so that a water B. should be much more delicate than a mercurial one. Water is, however, exposed to this serious objection, that its vapour rises into the empty space above, and causes by its elasticity a depression of the column, the depressions being different for different temperatures. At zero, Fahrenheit, for instance, the depression thus arising would be $\frac{1}{2}$ an inch, and at 77°, more than 1 foot. It would be doubtful, likewise, at the time of any observation, whether the space referred to was filled with vapour of the elasticity corresponding to the observed external temperature or not, so that the necessary correction could not with certainty be made. The vapour of mercury, on the other hand, at 77° F.—a temperature considerably above the average—produces in the B. a depression of only $\frac{1}{1250}$ of an inch, an amount practically inappreciable. After 200 years of experience and invention, we have yet no better index of the pressure of the atmosphere than the simple mercurial column of Torricelli, and in all exact observations it is taken as the only reliable standard.

Simple as the B. is, its construction demands considerable care and experience. It is of the first importance that the mercury to be used is chemically pure, otherwise its fluidity is impaired, and the inside of the tube becomes coated with impurities in such a way as to render correct observation impossible. Mercury as usually sold, is not pure; and before being employed for barometers, must be shaken well with highly dilute but pure nitric acid, to remove extraneous metals and oxides. The same object is effected more thoroughly by keeping it several weeks in contact with the dilute acid, stirring every now and then. After either process, the metal must be thoroughly washed with distilled water, and dried. In filling the tube, it is essentially necessary to get the column free from air and moisture. To effect this, the mercury, after filling, is boiled in the tube, so that air and moisture may be expelled, partly by the heat, and partly by the vapour of the mercury. This process demands great experience and skill, but the same end may be more easily and as effectually attained by boiling the mercury, in the first instance, in an atmosphere of carbonic acid, and then pouring it into the previously heated tube by a filler reaching to the bottom of it. Such care is only expended on the best instruments; ordinary weather-glasses, not needing to be quite accurate, are mere

simply filled. Notwithstanding all these precautions, minute bubbles of air manage to keep secreted, and creep up in the course of time into the Torricellian vacuum. When the space above the column is considerable, these become, as it were, lost in it, and produce no sensible depression, and this, of course, must be kept in view in the construction.

Barometers are usually divided into two classes—cistern barometers, and siphon barometers. The simplest form of the cistern B. is that shewn in fig. 1, which only requires to be set properly in a frame, and provided with a scale, to make it complete. Fig. 2 presents another form of that class, being that generally seen in weather-glasses or

ordinary barometers. The tube is bent at the bottom, and the cistern is merely an expansion of the lower end. Very generally, the cistern is hidden from view, and protected from injury by a wooden cover in front. There are two causes of inaccuracy in cistern barometers—one being the capillarity arising from the mercury not wetting the tube, which tends to lower the column; and the other being the difference of level in the cistern caused by the fluctuations in the tube, which renders the readings on the fixed scale above at one time too great, and at another too small, according as this level rises above or falls below the original level from which the scale was measured. The effect of capillarity may be avoided by using tubes of more than half an inch in bore, in which the depression becomes so small, that it may be left out of account; and in smaller tubes it may be estimated from tables constructed for the purpose. Wide tubes have the additional advantage, that atmospheric changes are seen earlier in them than in narrow tubes, there being less friction in the former than in the latter. It is worthy of notice, that the capillary depression is less in boiled than in unboiled tubes, in consequence of the admixture of a minute quantity of the oxide of mercury, formed in the process of boiling, which lessens the repulsion between the mercury and glass. With reference to the error of level, it must be borne in mind that the height of the column sustained by the atmosphere is always to be reckoned from the lower level. This error becomes all the less the larger the capacity of the cistern is compared with that of the tube, for then a very considerable rise or fall in the tube, when spread over the surface of the cistern, makes only a slight difference of level in it.

BAROMETER.

Care must be taken, then, in ordinary barometers, to make the cistern as large as possible. The only B. in which the error of level is completely obviated, is that invented by Fortin, which, from its being in every respect the most perfect cistern B., deserves particular notice. The cistern, and the lower portion of the tube of this B., is shown in fig. 3. The cistern is made of boxwood, with a movable leather bottom, *bb*, and a glass cylinder is inserted into it above, all except the glass being encased in brass. In the bottom of the brass box a screw works, on the upper end of which the leather rests, so that by the sending in or taking out of the screw,

Fig. 3.

Fig. 5.

Fig. 8.

the bottom of the cistern, and with it the cistern level of the mercury, can be raised or depressed at will. A small ivory pin, *p*, ending in a fine point, is fixed to the upper frame of the cistern; and when an observation is made, the surface of the mercury is made to coincide with the point of the pin as the standard level from which the barometric column is to be measured. The tube of the B.—the upper part of which is shown in fig. 4—is enclosed in one of brass, which has two directly opposite slits in it for shewing the height of the column, and on the sides of these the graduation is marked. A brass collar, *cc*, slides upon the tube with a vernier (*q. v.*), *rr*, marked on it for reading the height with the greatest exactness, and in which two oblong holes are cut, a little wider than the slits in the brass tube. When a reading is taken, the collar is so placed that the last streak of light is cut off by the two upper edges of the holes, or until they form a tangent to the convex mercurial curve. By this means, the observer is sure that his eye is on a level with the top of the column, and that the reading is taken exactly for this point. This is the contrivance usually adopted to prevent the error of parallax, or that caused by the eye being slightly above or below the top of the column, by which the scale and the top of the column are projected too high or too low, the one upon the other, as the case may be. The only other arrangement worthy of mention for effecting the

same object is that by Weber, who etches the scale on a piece of silvered glass placed over one side of the tube; and when—the mirror and tube being vertical—the image of the eye appears along with the vertex of the column, the eye is in the same horizontal line with it. Fortin's B. is generally arranged so as to be portable, in which case the screw, *s*, is sent in until the mercury fills the whole cistern, by which the air is kept from entering the tube during transport, the leather yielding sufficiently at the same time to allow for expansion from increase of temperature. It packs in a case, which serves as a tripod when the instrument is mounted for use. On this tripod it is suspended about the middle, swinging upon two axes at right angles to each other, so that the cistern may act the part of a plummet in keeping the tube vertical—the position essential to all correct measurements.

The siphon B. consists of a tube bent in the form of a siphon, having the same diameter at the lower as at the upper end. Fig. 5 represents a simple form of it. The tube travels along the board on which it is placed by passing easily through fixed rings or collars of brass. A scale, divided in inches and parts of an inch, is fixed on the upper part of the board; and when an observation is taken, the tube is adjusted by the screw, *s*, working below it, so that the top of the lower mercurial column may be on a level with the fixed mark, *a*, which is the point from which the fixed scale is measured. In the best forms of the siphon B., both tube and scale are fixed, the latter being graduated upwards and downwards from a zero-point near the middle of the tube, and the height of the column is ascertained by adding the distances from it of the upper and lower levels. The siphon B. is in many respects a more perfect instrument than the cistern barometer. In the first place, the bore at the upper and lower ends of the tube being the same, the depression arising from capillarity is alike for both, and the error from this cause disappears in taking the difference of the heights. In the second place, since the final reading is got from a reference to both upper and lower surfaces, the error in the cistern B. produced by the different capacities of the tube and cistern, is effectually avoided. On the other hand, the taking of two readings, one for each column, is a serious addition to the labour of observation. Gay-Lussac's siphon B. (fig. 6) is bent near the bottom, so as to allow of the lower branch being placed in the same straight line as the upper one—a position highly favourable to accurate observation. When constructed for transport, the tube at the bend is narrowed, as in the figure, to a capillary width, which effectually excludes the air; and when the tube is inverted (fig. 7), being the position in which it is carried, the mercury is nearly all held in the longer branch. Such a tube when mounted, like Fortin's B., makes an excellent travelling instrument, and is comparatively light, from the small quantity of mercury it contains. See ANEROID BAROMETER.

The wheel B., originally invented by Hook, and generally seen as a parlour ornament, has little to recommend it as a trustworthy instrument. Fig. 8 shows the main features of its construction. It is essentially an ordinary B. like the siphon B. below, but having a cistern above, to increase the amount of variation in the lower branch. A small piece of iron or glass, *f*, floats on the open surface, and a thread is attached to it, and passed over a small wheel, *a*, fixed to a horizontal axis, to which it is kept tight by a small weight, *c*, hanging at the other end. A pointer, *p*, is fixed to the other extremity of the horizontal axis, which moves to the right or left of the dial, *dd*, according

as the mercury falls or rises in the lower branch. The great sweep which the index takes, as compared with the comparatively minute variations of the mercurial column, is the only merit of this instrument. It is easy to see, that with so much intervening between the mercury and the index, the chances of error from friction and other causes are very considerable.

The correction of the B. for temperature is of importance. Mercury expands $\frac{1}{9990}$ of its bulk for every degree of Fahrenheit's thermometer; consequently, a column of 30 inches at 32° F., or the freezing-point, would, at 65° F., for instance, be $\frac{95-32}{9990}$ times 30 inches, or nearly $\frac{1}{10}$ of an inch longer, for 30 $\frac{1}{10}$ inches of mercury at 60° produce the same pressure as 30 inches of it at 32°. In order, therefore, that all observations may be compared correctly with each other, the observed heights are reduced to what they would be at 32° F. as a standard temperature. The rule for reduction is very simple: Multiply the number of degrees above or below 32° F. by the observed height, divide the product by 9990, and subtract or add the quotient from or to the observed height for the reduced height. Corrections are sometimes also made for the expansion of the scale, but this is almost needless refinement.

The variations of the B. are found to be both periodical and accidental. Periodical variations are those taking place at stated and regular intervals, and accidental, such as have no regular period of recurrence. The only truly periodical variation is the daily one, which amounts to about $\frac{3}{1000}$ of an inch, although the accidental variations, when taken on the average, constitute something like periodical variations at the different seasons of the year. Accidental variations have a range of about 3 inches. See ATMOSPHERE.

The uses of the B. may be classified into physical, hypsometrical, and meteorological. It is of essential use in all physical researches where the mechanical, optical, acoustical, and chemical properties of air or other gases are dependent on the pressure of the atmosphere. Its use in hypsometry, or the art of measuring the heights of mountains, is very valuable. When a B. is at the foot of a mountain, the pressure it sustains is greater than that which it experiences at the top by the weight of the column of air intervening between the top and bottom. A formula of considerable complexity is given by mathematicians for finding very nearly the true height of a mountain from barometrical and thermometrical observations made at its base and summit, the interpretation of which does not come within the compass of this work. The following rules give very nearly the same result: 1. Reduce the mercurial heights at both stations to 32° F. 2. Take the logarithms of the corrected heights, subtract them, and multiply the result by 10,000, to give the approximate height in fathoms of the upper above the lower station. 3. Take the mean of the temperature at both stations, take the difference between this mean and 32, multiply the difference by the approximate height, and divide the product by 435. This last result is to be added to the approximate height, if the mean temperature is above 32, and subtracted, if below, to find the true height in fathoms. A Fortin's or Gay-Lussac's B. is employed in measuring heights.

The best known use of the B. is as a meteorological instrument, or as a weather-glass. Experience has attached to certain heights of the B. certain states of weather, and at certain points of the scale the words 'Rain,' 'Changeable,' 'Fair,' &c., are marked, although the connection thus instituted is by no means invariable. Many of those

who have observed most carefully the connection of barometric heights with states and changes of the weather, are inclined to discard entirely the use of these terms, and they tell us that it is the tendency rather than the actual position of the column which prognosticates the nature of the coming weather. Several elaborate codes of rules have been drawn up to serve as a key to the variations, but as these are more or less of a local character, they would be out of place here. Generally speaking, a falling B. indicates rain, a rising B., fair weather. A steady B. foretells a continuance of the weather at the time; when low, this is generally broken or bad, and when high, fair. A sudden fall usually precedes a storm, the violence of which is in proportion to the suddenness of the fall. An unsteady B. shews an unsettled state of weather; gradual changes, the approach of some permanent condition of it. The variations must also be interpreted with reference to the prevailing winds, each different wind having some peculiar rules. The connection between changes of weather and the pressure of the atmosphere is by no means well understood. One reason is given, which may to some extent account for the B. being lower in wet than in dry weather—viz., that so long as aqueous matter remains in the air in the form of elastic vapour, its elasticity assists in supporting the barometrical column; but when it is precipitated in the form of rain, this force is lost, and the column accordingly falls. The connection may, however, with more reason, be attributed to the nature of the winds than to anything else. The south and south-west winds, which are, in Western Europe, more than any other, the rain-bringing winds, are warm winds. Now, a column of warm air, to be of the same weight as one of cold air, must be higher; but this it cannot well be in the atmosphere, for no sooner does the warm column, by its lightness, rise above the surrounding level of the upper surface of the aerial ocean, than it flows over, and becomes nearly of the same height as the cold air around it. The interchange taking place less interruptedly, and consequently less slowly, in the higher strata than in those near the ground, it is some time before the equilibrium thus disturbed is restored, and meanwhile the B. keeps low under the pressure of a rarer atmospheric column. On the other hand, the northerly and easterly winds, being comparatively cold and dry, are accompanied with fair weather and a high barometer. It is thus to the warmth, and not to the moisture of these winds that the low pressure is to be ascribed. So far, then, as this reason holds, the rain attendant on a low B., as well as the fine weather accompanying a high B., are the accidents of our geographical position—of our having the land to the east, and the ocean to the west of us. On the La Plata river, things are the reverse of what they are with us; there the cold south-east wind, coming from the ocean, brings rain with a high B., and the land winds, warmed by the plains of South America, maintain fine weather with a low barometer. That the temperature, and not the moisture of the air, is at least an important cause of the changes of the B. is also shewn by the fact, that in the tropics, where the variations of temperature are slight compared with the temperate zones, the B. experiences almost no change, being as high in the rainy as in the dry season.

BAROMETZ, or Tartarian or Scythian Lamb, the prostrate stem (rhizome) of a fern (*Aspidium Barometz*) which grows in the salt-plains near the Caspian Sea. It is shaggy with a silky down, and has a sort of general resemblance to an animal. In the days of ignorant credulity, when the story of the phœnix was received as a truth of

natural history, and barnacles were believed to grow into geese, and horses' hairs into eels, marvellous tales were told of the B., which was supposed to partake of the natures of a plant and an animal, to grow on a stalk, and eat grass like a lamb, &c. Erman (*Travels in Siberia*) supposes that the fables regarding the B. may have some connection with the cotton plant.

BARON. This term, as to the origin of which much difference of opinion exists, is probably derived from the Latin word *baro* (allied to *vir*, a man, a hero), which originally signified a stupid, brutal man, afterwards came to signify a man simply, and latterly, by one of those strange transmutations which are not uncommon in language, a man pre-eminently, or a person of distinction. Teutonic, Celtic, and even Hebrew derivations have also been assigned to the word; but the fact of its having been introduced into this country by the Normans, seems in favour of a Romanic origin. It is now the title which we apply to the lowest degree of hereditary nobility. The degree of B. forms a species of landing-place, corresponding amongst noblemen, in a certain sense, to that of gentleman, at a lower stage of the social pyramid. It was in this sense that the word was used in former times to include the whole nobility of England, because all noblemen were barons, whatever might be the higher ranks in the peerage which they occupied. The word peer has recently come to be used with the same signification, perhaps because it is no longer necessarily the case that every nobleman should be a B., there being instances in which earldoms and other honours have been given without a barony being attached to them, and in which the barony has been separated from the higher degree by following a different order of descent. The general theory of the constitution, however, still is, that it is as barons that all the peers sit in the upper house; and it is on this ground that the archbishops and bishops are said to sit in virtue of their baronies. The distinction into *greater* and *lesser* barons seems from an early period to have obtained in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, as it was called, of the crown; whilst the lesser held of the greater by the tenure of military service. The greater barons, who corresponded to the *Freiherren* (free lords) of Germany, had a perpetual summons to attend the great councils of the nation; whereas the latter were summoned only in case of their lands embracing a certain extent, which in England was thirteen knights' fees and a quarter. See KNIGHT'S FEE. When the representation of the middle class in England came to be confided to the knights of the shire and burgesses of towns, the minor barons ceased to receive the royal summons, and by degrees the title B. came to be applied to the greater barons, or lords of parliament, as they were called, exclusively. For an account of the barons of England immediately after the Conquest, and of the lands which they held, see DOomsday-Book. The habit of conferring the rank of B. by letters-patent, by which it was converted into a mere title of honour, apart from the possession of landed property or of territorial jurisdiction, was first introduced by King Richard II., who, in 1383, created John Beauchamp, of Holt Castle, B. of Kidderminster. In Germany, the old barons of the empire were for the most part raised to the dignity of *grafs* (counts) and princes; whilst the lesser, in place of passing into the ranks of the untitled gentry, as in England, constituted a grade of the lower nobility, to which no duties were assigned, and scarcely any political privileges belonged.

When a B. is summoned to the House of Lords by writ, a letter, in the sovereign's name, directs him to repair to the parliament, to be hollen at a specified time and place, to advise with his sovereign, the prelates, and nobles, about the weighty affairs of the nation. On the arrival of the new peer, he is presented by two barons to the lord-chancellor, his patent or writ being carried by a king-at-arms. This having been read by the chancellor, he congratulates him on becoming a member of the House of Peers, and invests him with his robe. The oaths are then administered by the clerk of parliament, and the new B. is conducted to a seat on the barons' bench. In addition to barons by writ and barons by patent, barons by prescription are usually mentioned, but incorrectly according to Blackstone, who remarks that 'those who claim by prescription must suppose either a writ or patent made to their ancestors, though by length of time it is lost.' (Kerr's Ed., vol. i. p. 406.) There are some distinctions between a creation by writ and by patent which ought to be mentioned. 'The creation by writ,' says Blackstone, 'is the more ancient way, but a man is not ennobled thereby, unless he actually takes his seat in the House of Lords; and some are of opinion that there must be at least two writs of summons, and a sitting in two distinct parliaments, to evidence an hereditary barony.' In consequence of the inconvenience thus attending it, the creation by writ may now be considered as obsolete, although the eldest son of a peer is still frequently called up to parliament by means of it, there being in that case no danger of the children losing their nobility even should their father never take his seat. But though creation by patent is thus in general the surest way of insuring the hereditary character of the peerage, it labours under one disadvantage as compared with a creation by writ—viz., that whereas in the latter case the dignity once insured by possession, passes to the heirs of the holder without any words to that purpose, in the former there must be words to direct the inheritance, else the dignity endures only to the grantee for life. Where the patent, again, in place of being silent as to the succession, expressly sets forth that the dignity is for life merely, it was held, in the Wensleydale case, that it does not make the grantee a lord of parliament at all.

The coronation and parliamentary robes of a B. differ very slightly from those of an earl. The right of wearing a coronet was conferred on barons for the first time by King Charles II.; their head-dress till then having consisted of a cap of crimson velvet, lined with ermine, and having a plain gold band. A baron's coronet is adorned with six pearls, set at equal distances on the chaplet. Coronets are worn only on great occasions of state ceremonial. In ordinary garb, there is nothing to distinguish a B. from a commoner. A

Baron's Coronet.

B. has the title of 'Right Honourable Lord,' &c., and is addressed as 'My Lord,' or 'Your Lordship.' His wife has also the title of 'Right Honourable,' and is addressed as 'Madam,' or 'Your Ladyship.' A B., in signing, sinks his Christian and family surname, and subscribes his titular designation. His children enjoy the prefix of Honourable, as the 'Honourable Mr'—mentioning Christian and surname. In literature and conversation, a deceased B. is referred to by his Christian name, according to his number in the list of peers of the same title, as 'Henry, eighth baron.'—The Barons of Exchequer (q. v.) and of the Cinque Ports (q. v.) are examples still existing of the ancient barons by office.

In the United Kingdom, there are persons who

possess the title of B. imparted by some foreign power; as, for example, 'Baron Rothschild.' No such honour can be legally enjoyed without the consent of the sovereign; but at best the title is only honorary, and communicates no special privileges. A good article on the Baronage will be found in the *Cyclopædia of Political Knowledge*, published by Bohn, London, 1853. See PEER.

BARON AND FEME, or FEMME. These are two Norman-French words used in English law-books to denominate HUSBAND AND WIFE (q. v.); and see MARRIAGE.

BARON AND FEMME, in Heraldry, is the expression used to designate the bearing by which the arms of husband and wife are carried per pale, or marshalled side by side on the same shield. The husband's arms are always carried on the dexter side. Where the wife is an heiress—i. e., the representative of her father's house—her husband carries her arms, not *per pale*, but in a shield of pretence; and they are quartered with the paternal coat by the issue of the marriage.

BARON OF BEEF, a large piece of beef, consisting of both sides of the back, or a double sirloin, and weighing, according to the size of the animal, from 50 to 100 lbs. This monstrously large piece of beef, roasted, is served only on particular festive occasions at the English court, and at great public entertainments. When served according to ancient custom at civic feasts in Guildhall, London, the B. is honoured with a distinguished place on a kind of elevated rostrum, where it is ceremoniously carved for the assembled guests. The term B. probably originated in a fanciful allusion to the word *sirloin*; inasmuch as a *baron* is superior in rank to a *sir*.

BARONET. This title, which is the diminutive of baron, is the lowest degree of hereditary honour in the United Kingdom. Baronets were instituted, for the first time, by King James I., on the 22d May 1611. The ostensible object was to promote the plantation of Ulster, in Ireland, with English and Scottish settlers; but the real aim was to raise money. Each B. was bound to maintain 30 soldiers in Ireland for 3 years, at the rate of *5s.* per diem for each man; and the wages of one whole year to be paid into the exchequer on the passing of the patent. The sum thus exacted, with the fees of honour due to the officers, amounted to upwards of £1000 on each patent. It is a striking proof of the passion for hereditary distinction, that 200 persons were willing to accept the honour on such terms. It was part of the bargain that no title should be created between a B. and a baron, and that the number of the former should be permitted to diminish as the families of the original 200 died out, thus enhancing the value of the title to those that remained. But the latter stipulation was very speedily departed from, and a new commission was appointed to fill up the vacant places, and even to treat with new applicants. Such was the origin of English baronets. From the date of the Union, in 1707, those created in England and Scotland were baronets of Great Britain. Irish baronets were created until 1800, since which period all baronetcies are of the United Kingdom. There is no limit to the creation of baronets but the will of the sovereign. At investiture there is no ceremony. The rank is communicated by patent or writ, issued under authority of the crown; the fees of office being considerable. There are differences in the terms on which the honour descends (suggested, perhaps, by the recipient according to family circumstances). Sometimes, according to the patent, the rank is confined to direct heirs-male; sometimes it embraces heirs-male collateral; and sometimes, in default of direct

male heirs, it passes to the husbands of heirs-female. For the style and privileges of Baronets, in matters of ceremony, see Burke's *Peerage and Baronage*. Baronets have precedence of all knights, except those of the Garter, bannerets made under the royal banner in open war, and privy-councillors. They are entitled to have *Sir* prefixed to their name, along with B. as an affix. The wife of a B. is legally styled *Dame*; but in common speech she is called Lady, and addressed as 'Your Ladyship.' The rank of B. does not raise a person above the degree of commoner; but many baronetcies have, in course of time, been heritably acquired by peers, which lessens the ostensible number.

Baronets of Scotland and Nova Scotia originated in a project of James I.; but were not instituted till 1625, by Charles I. The professed object was to encourage the settlement of Nova Scotia in North America; and a grant of a certain portion of land in that province, to be held of Sir William Alexander, afterwards Earl of Stirling, who was then his majesty's lieutenant in Nova Scotia, actually accompanied the title—the grants of land being of course illusory, for their very designations were a fiction. The first person who received the honour of a Nova Scotian baronetcy was Robert Gordon of Gordonstone, a younger son of the Earl of Sutherland, whose patent bears date May 28, 1625. There are no new additions to this branch of the baronetage; the latest creation having been in 1707, the year of the Union of Scotland and England. In point of title and popular recognition, there is no distinction between these and other baronets.

BARONIUS, CESAR, an eminent Roman Catholic ecclesiastical historian, born at Sorà, in Naples, on the 30th October 1538, and educated at Naples and Rome. He was one of the first pupils of St Philip Neri, who founded the congregation of the Oratory, of which B. became superior in 1593. He soon after became Father Confessor to the Pope, Apostolical Prothonotary, and finally, in 1596, Cardinal, and Librarian of the Vatican Library. On the death of Clement VIII., in 1605, 30 voted in conclave for the election of B. as Pope; and but for the opposition of the Spaniards, who were indignant at him for his treatise *De Monarchia Sicilia*, in which he argued against Spain's claim to that country, he might have been elected. The controversy against the work called the *Magdeburg Centuries* (q. v.), which had already been weakly attempted by Muzio in 1570, seemed at that time the most important undertaking for the learning of the Church of Rome. B. entered upon this controversy with great energy and in a position most favourable for access to authorities, composing his *Annales Ecclesiastici a Christo nato ad ann. 1198* (12 vols., Rome, 1588—1607), in which work he laboured till his death, 30th May 1607. As his object was to prove that the Church of Rome has not departed in doctrine or constitution from the Christian Church of the 1st c., B. has been accused of not using his authorities according to their proper historical sense, but artfully concealing, obscuring, and falsifying many things—sometimes, perhaps, from ignorance of the Greek, but more frequently with design. His *Annals* have been frequently reprinted, but the reprints are often incorrect and incomplete. The most recent, provided with copious notes, &c., and containing Pagi's *Critical Examination* and Rinaldi's continuation, although not yet entirely correct, is the edition of Mansi (43 vols., 1738—1757). The *Critica in Annales Ecclesiasticos Baronii* of Anthony Pagi, the Franciscan (4 vols., Antwerp, 1705, improved by Francis Pagi, Antwerp, 1724), corrects B. in many points, especially of chronology. Among the continuations of the *Annals*, all of

which are inferior in value to the work itself, the most rich in matter are that of Bzovius, extending to 1572 (9 vols., Rome, 1616—1672), and that of Rinaldi (10 vols., Rome, 1646—1677), who availed himself of the materials left by B., for the period from 1198 to 1571. Amongst the other works of B., his publication of the *Martyrologium Romanum* deserves to be noticed (Rome, 1586, and repeatedly).

BARONS OF THE EXCHEQUER. See EXCHEQUER, BARONS OF; COMMON LAW; COURTS OF COMMON LAW; REVENUE.

BARONY is, or, it may rather be said, was a manorial and hereditary right arising out of land, known to the law both of England and Scotland. In England, manors were formerly called baronies. In the Scotch law, a right of B. is a right in relation to lands which have been erected, or at least confirmed by a clause in crown-charters making the grant *in liberam baroniam*, as it is called; and by the crown alone could such a right be conferred. It involved a civil and criminal jurisdiction to which, in theory, all the inhabitants of the B. lands were amenable. But such jurisdiction has, by modern legislation, been so limited and obstructed as scarcely ever to be exercised; and, indeed, in regard to the right of B. itself, the clause in crown-charters erecting baronies has, since the abolition of heritable jurisdictions by the 20th Geo. II. c. 43, become obsolete. But by the 35 Geo. III. c. 122, they are permitted on the sea-coast for encouragement of fisheries, and the bailies thereof (see BAILIE) are to have the powers of justices of the peace. In England, the lord or baron of the manor may hold his COURT BARON (q. v.; see also MANOR, JURISDICTION).

BARO'SMA. See BUCK.

BARQUE, or **BARK**, is a name frequently given to ships, but with no very definite meaning. Sometimes it denotes simply a ship of small size; sometimes a broad-sterned vessel without a figure-head;

Barque.

but more technically it applies to three-masted vessels whose mizzen-sails are fore-and-aft instead of being square. An *armed B.* is one variety of a special sort of vessel noticed in another article. See ARMED SHIP.

BARR, or **BARRA**, a petty Mandingo kingdom of Western Africa, at the mouth of the Gambia, with an estimated area of about 250 square leagues, and a population of 200,000, the males being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated.

BARRA, a pleasant suburban town about 3 miles east of Naples, with a population of 12,000. It has numerous fine country residences.

BARRA, a small island near the south extremity

of the Hebrides, Scotland, belonging to Inverness-shire, and 42 miles west of Ardnamurchlan Point; lat. of Barra-head, 56° 48' N., long. 7° 38' W. It is 8 miles long, and 2 to 4 broad, with deep inlets of the sea. A low sandy isthmus, over which the sea nearly breaks at high water, connects the two parts into which B. is divided. The south or larger part contains a rocky mountain, 2000 feet high, and is divided into small valleys. The island is formed of gneiss. The soil is sandy, but sheep and cattle are fed on the hill and meadow pastures. Pop. 1624, chiefly Roman Catholics, speaking Gaelic with great purity; and among the most industrious of Scottish fishermen. Their boats are sharp fore and aft, and are built by the fishermen themselves, who engage extensively in the cod, ling, herring, and shell-fish fisheries. 200 horse-loads of shell-fish (cockles, limpets, muscles, razor-fish, lobsters, crabs) have been taken off the sands in one day during the summer spring-tides. The light-house on Barra-head, the leftmost in Britain, is 680 feet above the sea, and is seen 33 miles off.

BARRACKPORE, a native town and military cantonment on the left or east bank of the Hoogly, and 16 miles up the stream from Calcutta, in lat. 22° 46' N., and long. 88° 26' E. On account of the salubrity of its air, B. is a favourite retreat for Europeans from Calcutta, the governor-general having here his country residence. In fact, B. appears to have long enjoyed this kind of distinction; Mr Job Charnock, the founder of Calcutta, having erected a bungalow here as far back as 1689. In 1857, B. became famous as the cradle of the formidable mutiny or rebellion of that year. Several regiments of native troops were stationed at Barrackpore. The men objected to bite off the ends of the cartridges for the Enfield rifle, believing the paper to be polluted by animal fat. The troubles connected herewith—a mere prelude to the fatal outbreak at Meerut in May—commenced about the beginning of February, and continued to assume various degrees of intensity, till at last two regiments of Bengal native infantry had to be disbanded—the 19th, on 31st March; and the 34th, on 5th May. It was in the last-named corps that the first blood would appear to have been drawn, an intoxicated sepooy having attacked and wounded his officer, Lieutenant Baugh, with sword and pistol. This fellow, whose name was Mungal Pandey, would seem to have had the equivocal honour of giving the local designation of Pandies to the entire body of insurgents.

BARRACKS are permanent structures for the accommodation of soldiers, as distinguished from huts and tents. Originally, the word, derived from the Spanish *barracas*, applied to small cabins or huts; but in England, the term is now always considered to relate to structures of brick or stone. Great opposition was made in this country to the introduction of permanent B. during the early part of the last century, on the ground that the liberty of the subject might possibly be endangered by thus separating the soldiery so completely from the citizens, and placing them in the hands of the ruling power. On the other hand, it was contended that the older system of billeting the soldiers on the people is vexatious and burdensome; and that the morals of towns-people and villagers are liable to be vitiated by the constant presence of soldiers. The permanent B. were few in number down to the year 1792, when George III. obtained the consent of parliament for the construction of several new ones, and for the founding of the office of barrack-master-general. Various changes in the arrangements were made from time to time. The

expenditure for B., in building, rebuilding, enlarging, and repairing, between 1793 and 1804, was £4,100,000; between 1804 and 1819, £3,220,000; and between 1819 and 1859 (including Aldershott B.), upwards of £7,000,000. It has been found, on a detailed examination, that in 17 B., constructed between 1832 and 1857, the cost varied from £27 to £209 per soldier accommodated, according to the heaviness of the work, and to the inclusion or exclusion of mess-rooms and quarters for the officers.

The condition of British soldiers has, ever since the disasters in the Crimea in the winter of 1854, been an object of much public solicitude. This solicitude was so strongly expressed as to break through the cold formalities of the official departments. Returns were ordered, and commissions and committees appointed, partly to inquire into existing facts, partly to suggest improvements. The Barrack-master-General was replaced at the beginning of this century by Commissioners for Barracks, whose functions were absorbed by the now extinct Board of Ordnance in 1822. Barracks are now under the supervision of the Surveyor-General of the Ordnance, who provides for their construction and maintenance through the Royal Engineers; and for their victualling and daily service through Commissaries of the Control Department. Under these commissaries are barrack-clerks and barrack-sergeants, to assist them in the duties. The furniture of the B. is bought by the War Office. The French have a singular plan of *hiring* such furniture at 15 francs per man per annum; the English cost is about 25s. per man, and some of our officers are of opinion that it might with advantage be superseded by the French plan. The barrack-rooms have arm and accoutrement racks, shelves, and pegs; with a regular order for depositing everything thereon. During the day, all the bedding is placed in exact array; as well as dishes, tins, and canteens. A subaltern officer visits every room every day. The iron bedsteads are turned down every evening, and up every morning. One non-commissioned officer (sergeant or corporal) has control over each room, and is responsible for quiet, cleanliness, &c. Married women, in the ratio of 6 to a company of 100 soldiers, may live in the B. with their husbands, in separate rooms known as 'Married Soldiers' Quarters,' but not unless the marriage has been with consent of the commanding officer. The married soldier may, however, sleep out of B., and is allowed an extra 2*l.* per day if he does so. Each soldier in a barrack has an iron bedstead, a rug, a pailasse, a bolster, two blankets, and two sheets; he pays nothing for these. Each soldier has his name and number written near his bed and knapsack.

Notwithstanding the order and regularity established in B., committees of inquiry appointed in 1855 and 1857 ascertained the existence of grievous defects. It was found that, out of 252 B., only 20 had separate sleeping-rooms for married soldiers; the wives of such soldiers, in the other 232, being obliged to put up with arrangements repugnant to all decency and propriety, or else sleep away from the B. altogether.

In regard to sanitary arrangements, great efforts have been made at vast cost in recent years to improve all the hygienic conditions, such as drains, ventilation, means of ablution, recreation, circulation of air, &c. The result has been very apparent in the reduced rate of mortality. Army-physicians recommend 600 cubic feet of room-space per soldier; and this is the standard now demanded in all practicable cases by the War Office. It has been estimated that a new barrack for 1000 footguards in London would cost £150,000, *besides land*, the cost

of which would depend wholly on the particular site selected. The necessity for grounds for exercises, stores, surgery, offices, &c., renders a barrack a very costly congeries of buildings. Twenty acres may be taken as the minimum space needed for 1000 men. In relation to all the various subjects of barrack-life, a committee of military officers has drawn up a most comprehensive scheme of reform; but unfortunately the cost of making these improvements would be so enormous, that nothing better than a very gradual adoption can be expected.

The finest existing B. in this country are perhaps those at Aldershott, attached to the camp noticed in another article. See ALDERSHOTT CAMP. The buildings extend in two long lines, branching out of the Farnborough and Farnham road, with a large parade-ground between them. The infantry and artillery B. are on the north side of this space, and the cavalry B. on the south. The infantry B. are divided into blocks, forming each a spacious quadrangle, with a courtyard in the centre. Each block is a complete barrack for a full regiment, with all the men's rooms, store-rooms, school-rooms, offices, &c. The officers' rooms are, however, separate, and occupy open spaces between the blocks of buildings. All the four sides of each quadrangle are occupied by various rooms and buildings; the men's living and sleeping rooms being mostly on the side next to the parade-ground. The sleeping-rooms, each for 24 men, are very large and airy; the washing-rooms are ample and well fitted; and the cooking-rooms will each cook for 350 men. Dry play-grounds and drill-yards, under glass roofs, are provided. A broad balcony outside every range of sleeping-rooms enables the soldiers to look out upon these grounds. The married soldiers and their wives are comfortably provided for, in rooms wholly apart from the rest. The artillery and cavalry B. resemble in their general features those for the infantry.

By the Military Forces Localisation Act of 1872, £3,500,000 is to be raised and expended in building and adapting barracks for the 70 sub-district brigades among which the infantry is now to be divided.

BARRACOOON, the appellation given to a *depôt* for newly captured slaves on the coast of Africa, and where they remain under restraint until carried off by vessels in the slave-trade.

BARRA'DA, or BURA'DA, a river of Syria, which rising in lat. 33° 50' N., long. 36° E., flows in a south-south-east direction towards Damascus, above which it divides, one branch being diverted to irrigate the city and its gardens, while the other passes on the north side. The branches, which it is supposed were the *Pharpar* and *Abana* of Scripture, afterwards unite, and flow into the marshes and lake of Bahr-el-Merj.

BARRAFRA'NCA, a town of Sicily, in the district of Piazza, about 10 miles south-east of Caltanissetta, with a population of about 6000.

BARRAS, PAUL-JEAN-FRANÇOIS-NICOLAS, COUNT DE, a distinguished character of the French Revolution, was born at Foy, in Provence, 30th June 1755. In his youth he served as a lieutenant against the British in India, and after his return home, wasted his property in Paris in dissipation. He eagerly joined the revolutionary party, and was a deputy of the *Tiers Etat* in the States-general in 1789. He was actively concerned in the storming of the Tuileries, was appointed administrator of the department of Var, and afterwards of the county of Nice. In the Convention, he voted for the execution of the king without delay or appeal, and on the 31st May 1793 declared against the Girondists. The siege of Toulon, and triumph of the

revolutionary party in the south of France, were in a great measure owing to his activity and energy; and after the victory, he was deeply concerned in all the bloody measures which were adopted. Yet he was hated by Robespierre and the Terrorists, as one of the less decided revolutionists; and their overthrow was accomplished mainly by him, the Convention appointing him commander-in-chief, and virtually investing him with the dictatorship for the time. While holding this high office, in which he acted with great decision and vigour, and on the same day on which Robespierre fell, he paid a visit to the Temple, and provided for the better treatment of the king's son; he hastened also to the Palais de Justice, and suspended the execution of a large number of persons who had been condemned to death. On subsequent occasions, he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendemiaire (5th October 1795), being again appointed commander-in-chief by the Convention, he called his young friend Bonaparte to his aid, and crushed the sections with merciless discharges of artillery. The Directory being appointed in November 1795, B. was nominated one of the five members, and in this capacity he procured the nomination of Bonaparte as commander-in-chief of the army in Italy. It was he who arranged the marriage of Bonaparte with the widow Beauharnais. On 18th Fructidor (see FRANCE, HISTORY OF), he was again invested with the dictatorship, and was again victorious. His authority now became preponderant in the Directory, and he affected the pomp of a king, and began to give splendid entertainments in the palace of the Luxembourg. This continued for about two years till the decline of the power of the Directory. After 30th Prairial, Sièyes and he had the whole executive power in their hands; and whilst B. secretly negotiated, it is said, with the Bourbon princes, demanding a large reward for their restoration, Sièyes, in secret understanding with Bonaparte, brought about the revolution of 18th Brumaire. Notwithstanding the favours he had formerly conferred on Bonaparte, he was now, perhaps unavoidably, an object of suspicion to him, was compelled to remove from the neighbourhood of Paris, resided in Brussels, then in Marseille, was banished to Rome, and thence sent to Montpellier, being kept under constant surveillance of the police, and actually found to have been engaged in conspiracies for the restoration of the Bourbons. After the Restoration, he returned to Paris, and purchased an estate in the neighbourhood of it, where he died on 29th January 1829. He had acquired a considerable fortune in the Revolution. His Memoirs, which must be of historic importance, were seized by the government.

BARRATRY, COMMON, or, as it is called in old English law-books, *Barrettry*, is the offence of inciting and stirring up suits and quarrels among the queen's subjects. *One* offensive act of the kind is not sufficient in order to maintain an indictment for this offence; but it must be shewn that the party accused *frequently*, or at least on more than *one* occasion, conducted himself in the way imputed; and therefore the principle of the law appears to strike at the *habit* or *disposition* of evil-minded persons, who would incite to quarrelling, or busybodies, as they are in fact called in old law-reports; who, to use a familiar expression, 'set people by the ears.' This term is supposed by some to be derived from the French word *Barrateur*, which signifies a deceiver; by others, from the Latin word *Barratro*, a vile knave. Some, again, account for it by the suggestion that it is made up of *Barra*, the bars

of courts of justice, and *Rettum*, an old word signifying an offence; while, by other antiquarian lawyers, it is supposed to have been borrowed from the Normans; the Anglo-Norman *baret* signifying a quarrel or contention. In old English indictments, charging this offence, the accused is not only described as *pacis domini regis perturbator*, but also *oppressor vicinorum suorum*; that is, he who is guilty of B., is not only a disturber of the public peace, but a nuisance to his neighbours. The punishment for this offence is fine and imprisonment; but if the offender belongs to the profession of the law, as is too frequently the case, he may besides be disabled from practising his profession for the future. And, indeed, it is the existing statute law of England, that if any one who has been convicted of B. shall practise as an attorney, solicitor, or agent in any suit, the court, upon complaint, shall examine the matter in a summary way; and if the fact of such conviction be proved, may direct such offending attorney, solicitor, or agent to be kept in penal servitude for not more than seven or less than three years.

Akin to this offence is another of equal malignity and mischief; namely, that of suing another in the name of a fictitious plaintiff. If committed in any of the superior courts, this offence is treated as a high contempt, punishable at discretion, and in inferior courts, by six months' imprisonment, and treble damages to the party injured.

B., in the sense above explained, is not a technical term in the law of Scotland. But in that system there is a word *Baratry*, which is defined as the crime committed by a judge who is induced by a bribe to pronounce a judgment, or who barter justice for money.

There is also *Baratry of Mariners*, which signifies—in the law not only of England and Scotland, but also of France and other European states—the fraud of the master or mariners of a ship tending to their own advantage, but to the prejudice of the owners. Such conduct, however, is one of those risks which are usually insured against in marine policies of insurance. See MARINE INSURANCE.

BARREL (It. *barile*; Fr. *baril* = *barrigue*), primarily, a large vessel for holding liquids—probably from *bar*, in the sense of to guard, confine, contain—and then a certain *measure*, but varying in every locality, and almost for every liquid. In the old English measures, the barrel contained 31½ gallons of wine, 32 of ale, and 36 of beer—the wine gallon itself differing from that of ale and beer. In imperial gallons, their contents would be: old wine barrel = 26½ gal.; ale do., 32½; beer, 36½. The Italian *barile* varies from 7 to 31 English gallons; the French *barrigue* of Bordeaux = 228 French litres = 50 English gallons. Four *barriques* make a *tonneau*. In many cases, *B.* signifies a certain *weight* or other quantity of goods usually sold in casks called barrels. In America, flour and beef are sold on the large scale in barrels: a B. of flour must contain 196 lbs.; of beef, 200 lbs. A B. of butter = 224 lbs.; of soft soap, 256 lbs.; of tar, 26½ gallons.

BARREL, GUN. The relation which the barrels of small-arms bear to the stock, lock, and other parts, is described in such articles as MUSKET, PISTOL, RIFLE, REVOLVER, BRECH-LOADING ARMS, &c.; but the remarkable processes of manufacturing these barrels may be briefly noticed once for all.

The iron for all good musket-barrels contains a portion of steel, or undergoes some kind of steeling process. Horseshoe nails or stubs, after much violent usage, yield a very tough kind of iron when re-heated; and English gun-makers have been

accustomed to buy such refuse on the continent; but the foreign makers now use the old nails themselves; and Birmingham puts up with those of English make, which are inferior in quality. The best barrels are now made in England of laminated, twisted, and Damascus steel. To prepare *laminated steel*, Mr Greener, a celebrated Birmingham gunsmith, collects scraps of saws, steel-pens, files, springs, and steel-tools, from the various workshops; cuts them into small and nearly equal pieces; cleans and polishes them by revolving in a cylinder; fuses them into a semifluid state; gathers them into a 'bloom' or mass; forges this bloom with a three-ton hammer; hardens and solidifies it with a tilt-hammer; rolls it into rods; cuts each rod into pieces six inches long; welds these pieces together; repeats the rolling, cutting, and welding several times; and thus, finally, brings the metal into a very hard, tough, fibrous, and uniform state. *Twisted steel* for barrels is made by taking thin plates of iron and steel, laying them alternately one on another in a pile, welding them by heat and hammering, and twisting them by very powerful mechanical agency, until there are twelve or fourteen complete turns to an inch; the length becomes reduced one-half, and the thickness doubled, by this twisting. *Damascus steel* barrels are made of steel which has undergone a still further series of welding and twisting operations. *Stub Damascus* barrels are made of a mixture of old files with old horse-nails; the files are heated, cooled in water, broken with hammers, and pounded in a mortar into small fragments; three parts of these fragments are mixed with five of stub; and the mixture is fused, forged, rolled, and twisted. An inferior kind of Damascus-twist is made by interlaying scraps of sheet-iron with charcoal, and producing an appearance of twist, but without the proper qualities. *Threepenny-skelp* and *Twopenny-skelp* are inferior kinds of barrel-iron; and the worst of all is *sham-dam skelp*, of which gun-barrels are made for hawking at a cheap price at country-fairs, and for barter with the Indians in fur-hunting countries.

The gun-barrel manufacture of England is now almost wholly conducted at Birmingham and at Enfield, very few barrels being made elsewhere. The best barrels are all twisted into form. The skelps, or long strips of prepared steel, are twisted into a close spiral a few inches long; several of these spirals are welded end to end; and the fissures are closed up by heating and hammering. The rough barrel, with a core or mandril temporarily thrust in it, is placed in a groove, and hammered cold until the metal becomes very dense, close, strong, and elastic. The interior is then bored truly cylindrical by a nicely-adjusted rotating cutting-tool. If, on narrow inspection, the interior is found to be straight and regular, the exterior is then ground on a rapidly revolving stone, and finally turned in a lathe. Commoner barrels are not twisted: the skelps are heated, laid in a semi-cylindrical groove, hammered till they assume the form of that groove, placed two and two together, and heated and hammered until one B. is made from the two halves. See PROOF.

Common barrels are browned externally with some kind of chemical stain; but the best are rubbed with fine files, and polished with steel burnishers.

BARREL-BULK, a term denoting a measurement of 5 cubic feet, used chiefly in the coasting-trade.

BARREL-ORGAN. An organ (q. v.) in which the music is produced by a barrel or cylinder, set with pins and staples, which, when driven round by the hand, opens the valves for admitting the wind to the

pipes according to the notes of the music. The number of tunes that any one instrument can play is, of course, very limited. Barrel-organs are generally portable, and mostly used by street-musicians. A street-organ costs from £30 to £70, according to size. The most perfect barrel-organs are those which are driven by a motive-power, of which the best are made in Vienna, and cost from £100 to £300. The *Orchestrion*, made by Kaufmann in Dresden, is a large self-acting barrel-organ. See ORCHESTRION.

BARRHEAD, a town of recent growth in the east part of Renfrewshire, 6 miles south-west of Glasgow. It has cotton-mills, and bleaching and print works. Pop. (1871) 6209.

BARRICADES are defence-works employed both in the military and naval services. Military engineers, and sappers and miners, are instructed in the art of barricading streets and roads with beams, chains, *chevaux-de-frise*, and other obstacles, either in defending a town against besiegers, or in suppressing popular tumults. In a ship, a strong wooden rail, supported on stanchions, and extending across the foremost part of the quarter-deck, is called a barricade; during a naval action, the upper part of this barricade is sometimes stuffed with hammocks in a double rope-netting, to serve as a screen against the enemy's small-shot. B. have been made use of in street-fights since the middle ages, but they are best known in connection with the insurrections in the city of Paris. As early as 1358, the streets of Paris were barricaded against the Dauphin, afterwards Charles V. A more noteworthy barricade-fight was that in 1588, when 4000 Swiss soldiers, marched into Paris by Henry III. to overawe the Council of Sixteen, would have been utterly destroyed by the populace, firing from behind B., had the court not consented to negotiation; and the result was, that the king fled next day. The next barricade-fight of importance in Paris was that of 1830, which resulted in the expulsion of the Bourbons from the throne of France, and the election of the citizen king, Louis Philippe. During the three days which this revolution lasted, the number of B. erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials—overturned vehicles, trees, scaffolding-poles, planks, building-materials, and street paving-stones, men, women, and children taking part in their erection. In February 1848, the insurrection against Louis Philippe commenced with the erection of B.; but the most celebrated and bloody barricade-fight was that between the populace and the Provisional Government, which, commencing on the night of the 23d June 1848, lasted throughout the three following days, when the people had to surrender. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8000 taken prisoners. The Emperor Napoleon III. has so widened and macadamised the principal streets of Paris since he ascended the throne, as to render the successful erection of B. next to impossible. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead Road joins the New Road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral cortege deemed it prudent to change his course, and pass through a more central part of the metropolis. During the revolutions of

1848, B. were successfully carried in Paris, Berlin, Vienna, and other places, by abandoning the attack in front, and breaking through the houses of contiguous streets, taking their defenders in the rear.

BARRIER ACT, the name commonly given to an act of the General Assembly of the Church of Scotland, 8th January 1697, intended as a barrier against innovations, and a hinderance to hasty legislation. It provides that no change can be made in the laws of the church without being submitted by that General Assembly which first approves it, to the consideration of all the presbyteries, and approved by a majority of them; after which it still remains to be considered by the next General Assembly, which then may or may not pass it into a law. The B. A. is regarded as of the greatest importance, both in the Established Church of Scotland, and in the Free Church. Analogous regulations have been adopted by other Presbyterian churches.

BARRIER REEF, an immense coral-reef extending along the north-east coast of Australia for nearly 1300 miles, at a distance from the shore of from 10 to upwards of 100 miles. The reef is, in general, precipitous, and in many places rises out of great depths, lines of 280 fathoms having failed to reach the bottom on the outer side. Formerly, ignorance of anything like its precise extent and character led to many shipwrecks; but within the last thirty years, it has been surveyed, and pretty accurately laid down on charts. In the course of its length there are several breaks or passages in it. In the voyage from Sydney to Torres Strait, the inner route is usually taken. It is narrow, and requires delicate steering; but it is safe, and not so much exposed as the outer route, which enters Torres Strait by Flinders Entrance.

BARRING OUT, a practice formerly very common in schools, but now almost, if not altogether, abandoned. It consisted in the scholars taking possession of the school, and fastening the doors against the master, at whose helplessness they scoffed from the windows. The usual time for B. O. was immediately prior to the periodical vacation. It seems to have been an understood rule in B. O., that if the scholars could sustain a siege against the master for three days, they were entitled to dictate terms to him regarding the number of holidays, hours of recreation, &c., for the ensuing year. If, on the other hand, the master succeeded in forcing an entry before the expiry of that period, the insurgents were entirely at his mercy. The masters, in most cases, appear to have acquiesced good-humouredly in the custom; but some chafed at it, and exerted their strength and their ingenuity to storm or surprise the garrison. Addison is said to have been the chief actor in a B. O. of the master of Lichfield. One remarkable and fatal case of B. O. occurred at the High School, Edinburgh, in September 1595. The scholars had to complain of an abridgment of their usual holidays by the town-council, who, on being remonstrated with, refused, even though the claim was supported by the master, to grant more than three of the eight days which the boys demanded as their privilege. They, accordingly, took advantage of the master's temporary absence to lay in a store of provisions, and having done so, they barricaded the doors. The magistrates, the patrons of the school, in vain sought admission, the boys saying they would treat with their master only; and after a day and night had passed, it was resolved to force an entrance. The result was, that one of them, Bailie Maeroran, was shot dead on the spot by a scholar named Sinclair. The scholars of Witton School, Cheshire, were directed by the statutes drawn up

by the founder, Sir John Deane, to observe the practice: 'To the end that the schollars have not any evil opinion of the schoolmaster, nor the schoolmaster should not mistake the schollars for requiring of eustoms and orders, I will that upon Thursdays and Saturdays in the afternoons, and upon holidays, they refresh themselves—and a week before Christmas and Easter, according to the old custom, they bar and keep forth the school the schoolmaster, in such sort as other schollars do in great schools.' This school was founded in 1558. See Brand's *Popular Antiquities*, Chambers's *Domestic Annals*, and Carlisle's *Endowed Grammar Schools*.

BARRINGTONIA CELL, a natural order of exogenous trees and shrubs, natives of tropical countries, and generally very beautiful both in foliage and flowers. Few plants, indeed, exceed some of them in beauty. The stamens are very numerous, and form a very conspicuous part of the flower. The fruit is fleshy, with bony seeds lodged in pulp. That of some species is eaten, as *Careya arborea*, an Indian tree, the stringy bark of which is used in the countries along the foot of the Himalayas as a slow match for matchlock guns. Humboldt and Bonpland mention that children become quite yellow after eating the fruit of an American species, *Gustavia speciosa*, of which, however, they are very fond; but that this colour disappears in a day or two. The **MOORDILLA** (*Barringtonia speciosa*) is described by Sir J. E. Tennent as a tree which much attracts the attention of travellers in Ceylon. It has dark, glossy leaves, and delicate crimson-tipped white flowers. 'The stamens, of which there are nearly 100 to each flower, when they fall to the ground, might almost be mistaken for painters' brushes.' Some botanists include this order in *Myrtaceæ* (q. v.).

BARRISTER, REVISING. See **REVISING BARRISTER**.

BARRISTERS, or **BARRASTERS**, as sometimes spelt in old books. This is the distinctive name by which the advocates or pleaders at the English and Irish bars are known; and thus its derivation is perhaps sufficiently accounted for. They are admitted to their office under the rules and regulations of the **INNS OF COURT** (q. v.), and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts civil and criminal, presided over by a superior judge. In certain of the inferior tribunals, attorneys are allowed to practise without the assistance of counsel; but the disposition of the judges of these inferior courts is to encourage the presence of the regular bar, and to give them exclusive audience. In Scotland, the same body are styled **ADVOCATES** (q. v.), and they have the same exclusive privileges that B. enjoy in England and Ireland. These Scotch advocates, however, are members of the Faculty of Advocates, or Scotch Bar, properly so called, and are not to be confounded with the advocates who practise under that name in the town and county of Aberdeen, and who, as explained in a former article, are simply country attorneys. See **ATTORNEYS AND SOLICITORS**.

Barristers were first styled *Apprentices*, who answered to the bachelors of the universities, as the state and degree of a serjeant did to that of a doctor. These apprentices or barristers seem to have been first appointed by an ordinance of King Edward I. in parliament, in the twentieth year of his reign (Stephen's *Commentaries*, vol. i. p. 17, and authorities there referred to). Of barristers, there are various ranks and degrees, and among each other they take precedence accordingly; the general name, 'counsel,' being, in the practice of

the court, common to them all. But they may be divided into three leading bodies. 1st, Barristers simply, or utter barristers, who occupy the position of junior counsel, wearing a plain stuff-gown and a short wig; 2^d, *Serjeants-at-law*, a legal order of very ancient state and degree, and who are distinguished by the *coif* and other peculiarities (see *SERJEANTS-AT-LAW*); and 3^d, *Queen's Counsel*, or Her Majesty's Counsel learned in the law, as they are more formally called, and who may be selected either from the outer or junior bar, or from the serjeants. They may be described as the ordinary leaders of the bar, and are distinguished by a silk gown, and on state-occasions, and always in the House of Lords, they wear a full-bottomed wig. For further details, see *QUEEN'S COUNSEL*. Besides these three orders or gradations of rank at the English bar, the crown sometimes grants letters-patent of precedence to such barristers as Her Majesty may think proper to honour with that mark of distinction, whereby they are entitled to such rank and pre-audience as are assigned to them in their respective patents. See *PRECEDENCE*, *PATENT OF*.

Thus constituted, the English bar perform their functions, enjoying many professional privileges and immunities, and a high social position. As we have before stated, they have exclusive audience in all the superior courts, where upon terms and conditions, and according to an etiquette, which are all well understood by attorneys and solicitors, they take upon themselves the protection and defence of any suitor, whether plaintiff or defendant. With the *brief* (q. v.), or other instructions, by means of which their professional services are retained, B. receive a *fee*, or such fee is endorsed on the brief or instructions, and afterwards paid. Such, generally, is the existing practice at the English bar, differing in this respect from the practice of the bar in Scotland—and, we believe, to a great extent in Ireland also—where *pre-payment* of the fee is the rigid etiquette. The amount of this fee in England depends, of course, on the nature of the business to be done, the time to be occupied, and the labour to be bestowed; and it is usually, especially in the case of leading counsel, a liberal sum. The barrister's fee, however, is not a matter of express contract or stipulation, recoverable at law like an attorney's bill of costs, but is regarded as a mere honorary reward—*quiddam honorarium*, as it is called in law-books. There is, therefore, no means of enforcing its payment, and indeed, in this respect, the barrister has nothing to rely upon but the honour and good faith of those who employ him. Where, however, it can be proved that the client or party gave money to the solicitor or attorney, with which to fee the counsel, the latter may maintain an action against the former for the amount.

In order to encourage due freedom of speech in the lawful defence of their clients, and, at the same time, to give a check to unseemly licentiousness, it has been held that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in his client's instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless;* but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured; and counsel guilty of deceit or collusion are punishable by the statute Westm. I. (3 Edw. I., c. 25) with imprisonment for a year and a day, and perpetual silence in

the courts—a punishment which may be inflicted for gross misdemeanours in practice, although the course usually resorted to is for the Benchers of the Inn of Court, to which the person so offending belongs, to *disbar* him. See *Stephen's Commentary*, and *Ker's Blackstone*, and see *BENCHERS* and *DISBAR*.

But besides advocacy and forensic disputation, B. in England have other business to which they have extended their practice, to the great advantage of the public. This additional practice consists in advising on the law by their opinion on a case stated, by means of which harassing and fruitless litigation is often prevented (see *OPINION* or *COUSSEL*); in drawing or preparing the pleadings or statement of facts on which an action or suit is founded (see *PLEADING*); and in preparing the drafts or scrolls of legal instruments, indentures, deeds, contracts, or other conveyances. See *CONVEYANCING* and *CONVEYANCER*. As a correlative privilege of the position in which they stand in respect of their fees, barristers are not personally liable for the injurious consequences of any erroneous advice they may give; and they claim absolute control over the conduct of all litigation in which they may be engaged, even to withdrawing it from court altogether, and referring it to arbitration; and until lately, it was the opinion of the profession that counsel might at any time, during the progress of a cause, compromise the matter in dispute; but the exercise of such discretion was successfully opposed in a recent case, and it may now be doubted whether B. have any *ex officio* privilege beyond the guidance and conduct of actual litigation in court.

It is from the body of B. that all the judges in England, superior and inferior, are appointed; but B. are also usually chosen for the office of police magistrate. The only exception to the exclusive appointment of B. to judicial offices, is the case of the Court of Quarter Sessions—a court of anomalous constitution and jurisdiction, but which works well in practice, and has many claims to consideration. See *QUARTER SESSIONS*.

The bar in Ireland stands on the same footing, and has the same ranks and degrees, and is subject very much to the same rules and regulations, as the English bar; and in that country, barrister also is the name by which the profession of an advocate is distinguished. In Scotland, the same office is simply called by its own name of *Advocate*. See *ADVOCATES*, *FACULTY OF*.

At the bar of the House of Lords, and before parliament generally, before the privy-council, and also, it is believed, in all trials for high treason, whether in England, Ireland, or Scotland, the three bars rank on a footing of equality, taking precedence according to the date of their call and admission to their own respective bars, with the exception of those who are Queen's counsel, who recently have also been introduced into Scotland, and now are next in precedence to the Lord Advocate (see *ADVOCATE*, *LORD*), the *Solicitor General of Scotland* (q. v.), and the *Dean of Faculty* (q. v.). It was at one time disputed between the Lord Advocate of Scotland and the Attorney-General of England, which of them should lead the other at the bar of the House of Lords; and a case occurred in 1834 in the House of Lords, before Lord Chancellor Brougham, in which very high pretensions were urged on behalf of both functionaries. These were the present Lord Chancellor Campbell as attorney-general, and the late Lord Jeffrey as lord advocate, who contended that as he was not only the first law-officer of the crown in Scotland, but also a high political officer, he was entitled to lead the former. But the House decided that the attorney-general of England has precedence over the Lord Advocate of

* But the publication of the counsel's statement by a *third party* may expose such third party to an action.

Scotland, in all matters in which they may appear as counsel at their lordships' bar; and it is presumed that the same rule would be followed before parliament generally, the privy-council, and in all trials for high treason, whether in England, Ireland, or Scotland. The relative rank of the *Irish* law-officers has not been determined.

It only remains to be added, that as the three bars are on a footing of equality in the House of Lords, and the other imperial and supreme tribunals above mentioned, the English bar have no exclusive audience in these, even in English cases; but all causes whatever there, whether English, Irish, Scotch, or colonial, may be equally and indiscriminately taken and advocated by English, Irish, or Scotch counsel.

BARROS, JOÃO DE, the most distinguished of Portuguese historians, was born of an ancient and noble family at Viseu in 1496; became a page to King Emmanuel, and afterwards companion to the Crown Prince. He pursued his classical and other studies with great diligence, and wrote a historical romance in his 24th year, which attracted much admiration by the peculiar beauty of its style. Hereupon the king assigned him the task of writing the history of the Portuguese in India, which he undertook, but of which only the first three decades proceeded from his pen, under the title of *Asia Portuguesa* (Lish. 1552—1563); the continuation extending to twelve decades, was the work of Diego de Conto. (A new edition of the whole appeared at Lisbon, in 8 vols., in 1778—1788.) B. was for some time governor of the Portuguese settlements in Guinea, and afterwards treasurer and general agent for the Indies. In 1539, the king bestowed on him the province of Maranhao in Brazil, that he might found a colony there; but he was obliged to renounce the enterprise after much loss. He died at his estate of Alitem on the 20th of October 1570.

BARROSA, a village of Spain 16 miles south-east of Cadiz, celebrated in history as the place where General Graham (afterwards Lord Lynedoch), in March 1811, with a handful of English troops, succeeded in gaining over the French, after his Spanish allies had retreated, one of the most glorious victories of the Peninsular campaign. More than 2000 French were killed and wounded (some authorities give nearly 3000 killed alone), 300 prisoners taken, 6 pieces of cannon, and an eagle—the first captured in the war.

BARROT, CAMILLE HYACINTHE ODILON, a French jurist and statesman, son of a member of the Convention, and afterwards of the Council of Five Hundred, was born at Villefort, Lozère, 19th July 1791. In 1814, he became an advocate in the Court of Cassation, Paris, and soon acquired a high reputation as an eloquent pleader. Entering the Chamber of Deputies young, he in time came to be regarded as one of the most influential leaders of the liberal opposition. At the Revolution of 1830, he was one of the three commissioners appointed by the provisional government to accompany Charles X. from Rambouillet to Cherbourg, on his embarkation for England. Under the new government, he was appointed prefect of the department of the Seine; and in Lafayette's ministry, a member of the Council of State. In a few months, however, he resigned his office of prefect, and declined the post of ambassador at Constantinople, offered him by Louis Philippe. After Casimir Périer became minister, he lost also his place in the Council of State. He now began his opposition career in the Chamber of Deputies against the reactionary policy of the government, and became the rallying-point for all who desired the carrying out of the principles

of the July revolution. He essentially contributed to the removal of the Doctrinaires (q. v.) from office, in February 1836, and energetically opposed the ministry of Molé, even supporting the Doctrinaires in accomplishing its overthrow, in January 1839. The same year he visited England and Scotland. When, in March 1840, Thiers was placed at the head of the government, B. for the first time declared himself in favour of the ministerial policy on the oriental question. On the return of Guizot to office in October following, his opposition to the government was renewed. Taking a conspicuous part in the Reform movement of 1847, he attended several of the provincial reform banquets, which led to the revolution of 1848. On the outbreak of the struggle of 23d February, when Louis Philippe called upon Thiers to form a new ministry, B. was appointed president. His advice to the king to withdraw his troops proved fatal to the throne of July. In the last sitting of the Chamber of Deputies, B. supported the claim of the Count de Paris to the throne, and the regency of the Duchess of Orleans. Under the presidency of Louis Napoleon he was for some time a minister, and conducted the government with success till 1851, when he retired from active political life. Since then, almost his only public appearance has been at the conferences in favour of Poland, held at Paris in 1864. In his retirement, he has, however, written a pamphlet, *De la Centralisation et de ses Effets* (1861), and several other papers on political subjects.

BA'ROW, a distinctive term applied to two prominent localities of the Arctic Ocean in honour of the secretary to the Admiralty of the same name, the prime mover in the more recent era of northern discovery.—1. *Point B.*, in lat. 71° 23' N., and long. 156° 31' W., generally received as the most northerly spot on the American mainland; see, however, BELLOT STRAIT, and MURCHISON PROMONTORY. From this circumstance it has also been called *Cape North*—a designation inconveniently ambiguous, as tending to confound this headland at once with Cape North in Asia, and with North Cape in Europe.—2. *Barrow Strait*, the earliest of Parry's discoveries, leading to the west out of Lancaster Sound, which Parry's immediate predecessor, Captain, afterwards Sir John Ross, had pronounced to be landlocked in that direction. Besides its main course, B. Strait throws off *Prince Regent's Inlet* to the south, and *Wellington Channel* to the north. The passage averages about 40 miles in breadth, extending, pretty nearly along the parallel of 74° N., from 84° to 90° W.

The interval between these two localities, thus spanning 66° of long. or at least 2000 miles, only one navigator has ever traversed—the indefatigable McClure, carrying his good ship, the *Investigator*, round Point B., and leaving her behind him only when almost in sight of B. Strait.

BA'ROW, a river in the south-east of Ireland. Of the Irish rivers, it is in importance next to the Shannon. It rises in the north of Queen's County, on the north-east slope of the Slieve Bloom ridge of mountains. It flows first east past Portarlington to the border of Kildare County, and then south between Queen's, Kilkenny, and Waterford counties on the west, and Kildare, Carlow, and Wexford counties on the east, passing the towns of Athy, Carlow, and New Ross. It has a course of 100 miles through a carboniferous, granitic, and silurian basin. Two miles above New Ross it receives the Nore (q. v.), and eight miles east of Waterford, it is joined by the Suir (q. v.). These three rivers (called the Three Sisters, from their rising in the same mountain-ridge, and joining near

the sea, after flowing through different counties) form, near the sea, the large and secure estuary of Waterford harbour, 9 miles long. The B. is navigable for ships of 300 tons to New Ross, 25 miles up, and for barges to Athy, 65 miles up, whence the Grand Canal communicates with Dublin. The B., below Portarlington, falls 227 feet.

BARROW, ISAAC, an eminent English mathematician and divine, was born in 1630. He received his early education at the Charter-house, where he was distinguished chiefly by his negligence and pugnacity. At Felstead school, in Essex, to which he went next, he greatly improved; and in 1643, he was entered at Peter-house, Cambridge, under his uncle Isaac Barrow, then a fellow of that college, and finally bishop of St Asaph. On the ejection of his uncle in 1645, he removed to Trinity College, where he became B. A. in 1648, fellow in 1649, and M.A. in 1652. Finding that to be a good theologian he must know chronology, that chronology implies astronomy, and astronomy mathematics, he applied himself to the latter science with distinguished success. To the classics he had already devoted much study, and on the vacancy of the Greek chair, he was recommended for the office; but a suspicion of Arminianism interfered with his success. After this disappointment, he went abroad (1655), and travelled during four years through France and Italy, to Smyrna and Constantinople, back to Venice, and home through Germany and Holland. On the voyage from Leghorn to Smyrna, his determined personal courage seems to have been instrumental in scaring away an Algerine pirate, after a brisk exchange of shots. Soon after his return he took orders, and in the following year was appointed professor of Greek. The neglect with which he was treated after the Restoration is celebrated in his couplet addressed to the king—

Te magis optavit redditurum, Carole, nemo,
Et nemo sensit te rediisse minus.

In 1662, he was appointed to the Gresham professorship of geometry, which, on his being appointed to the Lucasian professorship in 1663, he thought it his duty to resign. The latter also he resigned in 1669, in favour of his pupil Isaac Newton. On quitting his professorship, he obtained from his uncle a small living in Wales, and from Dr Seth Ward, bishop of Salisbury, a prebend in that cathedral. He devoted the revenues of both to charitable purposes, and resigned them in 1672, on being appointed by the king Master of Trinity College. To him, while in this office, is due the foundation of that valuable library, which is one of the chief ornaments of the university. In 1675, he was nominated vice-chancellor of the university; and in 1677, he died at the early age of 47, having achieved, by his numerous able works, and the force of his noble personal character, a reputation which time has left unimpaired. Of his original mathematical works, the principal are his *Lectiones Geometricæ* and *Lectiones Opticæ*, of which it has been said that they are 'a mine of curious interesting propositions, to which geometry is always applied with particular elegance.' As a theologian, his fame rests chiefly on his sermons, which are very remarkable as specimens of clear, exhaustive, and vigorous discussion. His sermons, it may be added, were generally of excessive length. One, on charity, lasted three hours and a half; and at Westminster Abbey, he once detained the audience so long that they got the organ to play 'till they had blowed him down.' B.'s English works, consisting of sermons, expositions, &c., have been edited by Dr Tillotson, Dean of Canterbury, and prefaced with a life by Mr Hill. His works,

besides those already mentioned, are very numerous, and include *Euclidis Elementa*, *Euclidis Data*, *Mathematicæ Lectiones*, *Opuscula*, containing Latin sermons, poems, speeches, &c. *Lectiones Mathematicæ* and *L. Geometricæ* have been translated by Kirby and Stone. *Euclidis Elementa* has also been translated.

BARROW, SIR JOHN, BARONET, an English traveller, was born on the 19th June 1764, at Drayleybeck, in Lancashire; was early instructed in mathematics; and after having published a small volume on land-surveying, filled a situation in a Liverpool iron-foundry, visited Greenland with a whaler, and after his return taught mathematics in an academy at Greenwich. He received an appointment as private secretary and keeper of accounts to Lord Macartney, who went as ambassador to China. He availed himself of his residence in China to learn the Chinese language, and to collect valuable materials for the account of China, which he afterwards gave to the world, partly in articles in the *Quarterly Review*, and partly in his *Travels in China* (Lond. 1804). When Lord Macartney afterwards became governor of Cape Colony, B. availed himself of his residence in South Africa to make extensive excursions in the interior of the country, which he described in his still valuable *Travels in the Interior of Southern Africa* (2 vols., Lond. 1801—1803). Having returned to London, in the year 1804, he was appointed by Lord Melville secretary to the Admiralty, which situation he continued to hold till 1845, except for a short time in 1806. Besides the works above mentioned, B. published *A Voyage to Cochín-China in the Years 1792 and 1793* (Lond. 1806), *The Life of Macartney* (2 vols., Lond. 1807), *A Chronological History of Voyages into the Arctic Regions* (Lond. 1818); also a series of Lives of English Naval Worthies. Under Peel's ministry in 1835, he was raised to the baronetcy. In the year 1845 he retired from public service, but afterwards published *An Autobiographical Memoir* (Lond. 1847), and *Sketches of the Royal Society*, and died at London, 23d November 1848. He rendered many services to geographical science by suggesting and promoting scientific expeditions; with him also originated the idea of the Geographical Society, founded in 1830, of which he was vice-president till his death.

BARROW-ON-SOAR, a village in the north of Leicestershire, 10 miles north of Leicester. It is noted for its blue lime or terras, which makes good cement under water. It has manufactures of lace and stockings. It has free schools and several charities; and is the seat of the Poor-Law Union of the district, with a workhouse capable of accommodating 500 persons.

BARROWS, artificial mounds of earth generally believed to have been erected for sepulchral or monumental purposes. They are very numerous in Great Britain, and many of them are supposed to belong to a period long prior to the Roman invasion. The counties of Wilts and Dorset are especially rich in these remains, and the B. of the former have been thoroughly explored, described, and classified by Sir R. C. Hoare in his *Ancient Wiltshire* (2 vols. fol. 1810—1821). In the sepulchral B., the human remains are buried either in a rude stone 'cist' or chest, in which the body was doubled up, or are laid at full length in the earth, accompanied by arms and other utensils. Where the body was burned, the remains were laid on the floor of the barrow, in a cist excavated on the spot, or at a later epoch, in a clay urn. Sir R. Hoare considers the Wiltshire B. as indicating three stages in the progress of society. The first class contains spear and arrow heads of flint and bone; the second,

of brass; and the third contains arms and instruments made of iron. One of the largest barrows in Europe is Silbury Hill, near Marlborough, in Wiltshire, which covers 5 acres, 34 perches of land, and has a slope of 316 feet, with a perpendicular height of 170. According to Sir R. Hoare, barrow-burial was practised down to the 8th c., from a period of unknown antiquity. The practice of erecting sepulchral mounds prevailed among all the principal nations of antiquity both in Europe and Asia, and they are found in great numbers in Central America. Many barrows are only partly artificial; natural mounds having been shaped by human hands into the form, round or oblong, which it was wished they should take.

BARRY, a small island, of about a mile long, in the Bristol Channel, off the south coast of Glamorganshire, 10 miles south-west of Cardiff. It has the ruins of an ancient castle and of two chapels. On Nell's Point, in the south part of the island, is a fine well, to which great numbers of women resort on Holy Thursday, and having washed their eyes in the spring, each drops a pin into it.

BARRY (in Heraldry), the term applied to a shield which is divided transversely into four, six, or more equal parts, and consisting of two or more tinctures interchangeably disposed.

Barry.

Barry-bendy.

Barry-pily.

Barry-bendy is where the shield is divided into four, six, or more equal parts, by diagonal lines, the tincture of which it consists being varied interchangeably.

Barry-pily is where the shield is divided by diagonal lines, the colours being interchanged as in the example.

BARRY, COMESSE DU. See VAUBERNIER.

BARRY CORNWALL. See PROCTER, BRYAN WALTER.

BARRY, SIR CHARLES, R.A., architect of the two Houses of Parliament, son of Walter Barry, Esq., Westminster, was born there in May 1795. Educated at private schools in Leicestershire and Bedfordshire, he was indentured to Messrs Middleton and Bailey, architects, Lambeth. In 1817, at the age of 22, he went to Italy. A wealthy countryman of his own, attracted by the beauty of his drawings, took him with him to Egypt, as his companion, defraying his expenses. He also visited Greece and Rome. On his return to England after an absence of three and a half years, he became the successful competitor for the design of a church at Brighton. He was also the architect of the Manchester Athenæum, a building in the Grecian style; and of the Grammar School of King Edward VI. at Birmingham; the latter esteemed the most beautiful of his works. In London, he designed the Traveller's Club, and the Reform Club, both in Pall Mall, and the College of Surgeons, Lincoln's Inn Fields. After the burning of the old Houses of Parliament in 1834, on a public competition, B.'s design for the new building was adjudged the best. The work was commenced in 1840; and on 3d February 1852, Her Majesty opened the Victoria Tower and Royal Gallery in state, and on the occasion knighted the architect. Chosen a Royal Academician in 1842, Sir Charles was also a Fellow of the Royal Society,

of the Society of Arts, and of the Institute of British Architects. He died May 12, 1860.

BARRY, JAMES, a historical painter, born at Cork, October 11, 1741; and distinguished more by the force of his conception than the excellence of his manipulation, or the beauty of his colour. Dr Johnson's criticism on his works was: 'Whatever the hand may have done, the mind has done its part. There is a grasp of mind there which you will find nowhere else.' The *chef-d'œuvre* of B. is the *Victors at Olympia*—a work, the sight of which, Canova said, was of itself sufficient to repay a journey to England. B. was a protégé of Edmund Burke. He was of irritable temper, which led him into many quarrels; and the result of one with the Royal Academy was his expulsion from the academy. He died on the 23d of February 1806, in poor circumstances, while some friends were engaged in raising subscriptions to purchase him an annuity.

BARRY, MARTIN, a physiologist of eminence, was born at Fratton, Hampshire, in 1802. He studied at the medical schools of London, and also at the university of Edinburgh, where he took his degree of M.D. in 1833. He wrote much on physiological subjects, and especially on animal development and embryology, for discoveries in which he is best known. Until the publication of his papers in the 'Philosophical Transactions' of the Royal Society of London in 1840-1843, it was not known that spermatozoa actually penetrate *within* the ovum; and physiologists are also indebted to him for the knowledge of the segmentation of the yolk in mammals. In his private capacity, B. was amiable and greatly benevolent. His means being ample, he gave his professional services largely to the poor; and he acted as house-surgeon to the Edinburgh Royal Maternity Hospital. He died at Beccles, in Suffolk, in April 1855.

BARSCH, or **BARS**, a fortified town of Hungary, capital of the county of the same name. It is situated on the Gran, which divides it into Old and New B. It is a mart of some importance for grain and fruit. Pop. of county, 137,191.

BAR-SUR-AUBE, a town of France, in the department of Aube, situated on the right bank of the river of that name. It is an ill-built ancient town; numerous old coins and urns attesting that the Romans must have had a station here. B. was destroyed by the Huns in the 5th c., but rebuilt again soon after, when it became a place of commercial importance. A chapel built on the bridge which here crosses the Aube, now marks the spot from which the Bastard of Bourbon was hurled into the river by command of Charles VII. in 1440. B. is also noteworthy as the place where the council of the allied sovereigns, which decided the plan of the campaign ending in the first fall of the Empire, was held in February 25, 1814; and where, two days after, the French were defeated by the allies, under the chief command of Schwartzemberg. B. has a population of 4356; a good trade in wine, wood, hemp, corn, and wool. Its principal industrial products are calicoes, table-covers, brandy, paper, vinegar, and nails.

BAR-SUR-SEINE, an ancient town of France, in the department of Aube, pleasantly situated on the left bank of the Seine. It has a trade in grain, brandy, wool, and wine. Pop. 2443. It is celebrated as the place where the allies, under the Prince of Würtemberg, defeated the French under Macdonald, in March 1814.

BARTA'N, a town of Anatolia, situated near the mouth of the Chati-su (ancient *Parthenius*) on the Black Sea. Pop. 10,000, who carry on a brisk trade with Constantinople.

BARTAS, GUILLAUME DE SALLUSTE, a soldier, diplomatist, and man of letters, was born at Montfort, in Armagnac, about the year 1544. His reputation was great during his lifetime, alike in 'the court, the camp, the grove.' His chief poem is *The Divine Weeks and Works*, which gives an account of the creation, and the history of the Jews as far as the book of Chronicles, and is said to have had a considerable influence on Milton's *Paradise Lost*. Thirty editions of the work passed through the press in six years. Dryden, when a boy, thought his verse incomparably superior to Spenser's; an opinion, however, which he lived to be ashamed of having ever entertained. B.'s name is now quite forgotten, or remembered only in connection with bad taste. It is not to be denied, however, that his fancy, though generally grotesque and lawless, occasionally strikes out most picturesque imagery and epithets. His use of compound words first led to their introduction into England, through his translator Sylvester (q. v.), and to the consequent enrichment of our poetry. He died of wounds received at the battle of Ivry, 1590.

BARTER, in commerce and political economy, a term used to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is usual to suppose that in the history of any community B. preceded the other methods of commerce, as people would find the convenience of exchanging one article for another before they were acquainted with money or credit. In point of fact, ships visiting savage countries are generally to some extent freighted with weapons, tools, or ornaments, to be used in B., if it be desirable to carry on a trade with the inhabitants. Under old artificial systems of political economy, there was much useless discussion about the question, whether a B.-trade or a money-payment trade was more advantageous to the community at large, and which of them should be encouraged while the other is depressed. On the one side, it was maintained that nothing but an export sale for cash was really profitable; on the other, that it was more advantageous to get goods in return, because thus there was a double transaction and double profit. See **BALANCE OF TRADE**. But the simple doctrine of the present day, that whatever the merchant finds most profitable to himself will also be most profitable to the community, saves the necessity of making these distinctions, and of acting upon them by interference with commerce. B. is, in reality, one of the commonest forms of trade, taken at large in the present day. The exporter sends goods to his agent, who, without probably ever touching hard cash in the course of the transaction, lays in a cargo of import goods with the value, and these are literally brought home in exchange for those sent out.

In law, **BARTER**, or **EXCHANGE**, as it is now more generally called in law-books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from *sale*, which is a contract for the transference of property in consideration of a price in *money*. See **EXCHANGE**; **SALE**.

BARTFA, or **BARTFELD**, a small but very old free town of North Hungary, in the province of Saros, on the Tepla, 155 miles north-east of Pesth. Its position on the borders of Galicia has frequently made it a place of refuge for Poles and Russians. Its hot baths are much frequented, and a trade in wine, brandy, linen, and earthenware is carried on. Pop. 5303.

BARTII, HEINRICH, Ph.D., D.C.L., an enterprising modern African traveller, born at Hamburg, 19th

May 1821, received his education in his native town, and afterwards went to the university of Berlin. In his youth his favourite studies were the Roman and Greek classics and antiquities, along with the geographical sciences. Hence he imbibed a strong desire to explore the shores and countries of the Mediterranean. After visiting Italy and Sicily, he embarked, in 1845, at Marseille, and from Gibraltar passed over to Tangier in Africa. Proceeding along the Algerian coast he made excursions into the interior, to Tunis, Tripoli, and Bengazi. On his journey thence to Cairo, he was attacked by a band of Arab robbers, whom he bravely resisted, but was severely wounded, and lost all his effects and papers. He afterwards extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece. These travels occupied him for nearly three years, and in 1849 he published, at Berlin, an account of a portion of them in a work entitled *Wanderungen durch die Küstenländer des Mittelmeeres*. On the 8th December of that year he again sailed from Marseille, having been (along with Dr Overweg) appointed by the British government scientific companion to Mr James Richardson, then charged by the Foreign Office with a political and commercial mission to Central Africa. Starting from Tripoli on the 4th February 1850, Dr B. and his companions crossed the Great Desert amid much difficulty and danger. B. soon separated from his friends, and pursued his researches for the most part by himself. Both Mr Richardson and Dr Overweg succumbed to the climate, and thenceforward B. was quite alone. He did not, however, return disheartened, but continued his explorations, which, when he returned to Tripoli in September 1855, had extended over 21 degrees of latitude and 20 of longitude, from Tripoli in the north to Andamawa in the south, and from Bagirmi in the east to Timbuktu in the west, upwards of 12,000 miles. The result of his researches was given to the world in his *Travels and Discoveries in Central Africa*, 5 vols. (Lond. 1857—1858). Afterwards, he made several journeys in Greece, Turkey, Asia Minor, and other countries on the Mediterranean. Shortly after returning from one of these, he died at Dresden, Nov. 25, 1866. In 1858, appeared his *Reise von Trapezunt durch die nördl. Hälfte Kleinasiens nach Skutari*; in 1862, his *Sammlung und Bearbeitung central-afrik. Vocabularien*.

BARTH, JEAN, or **BART**, a French naval hero, the son of a fisherman, born in 1651 at Dunkirk, but, according to others, in the Netherlands. At an early age he entered the Dutch navy, but on the commencement of the war with Holland he passed over to the French service. As persons not of noble birth could not then obtain the rank of officer in the navy, he became captain of a privateer. In this capacity he displayed astonishing bravery, so that Louis XIV. despatched him on a special mission to the Mediterranean. His exploits at last induced the king to appoint him lieutenant of a man-of-war. In an action against a superior English force he was taken prisoner, and carried to Plymouth, from which he made his escape in an open fishing-boat to France, where the king now raised him to the rank of captain. In the year 1696, Louis XIV. received him with distinction at Versailles, but at the same time spoke continually of the mischance which had befallen him the year before. Stung by this, B. hastened to Dunkirk, and in spite of the blockade of the harbour by the English, undertook a cruise, in which he was remarkably successful. Louis XIV., in a personal audience in 1697, appointed him to the command of a squadron, upon which B. exclaimed: 'Sire, you have done well in this.' The courtiers laughed, as at a piece of gross rudeness; but the king took the answer in

good part, and B. very soon shewed how well he merited such an appointment. The peace of Ryswick terminated his active career. He died at Dunkirk in 1702. His rough frankness and coarse wit, in which he spared neither high nor low, made him popular, no less than his boldness and readiness for battle. When the Prince de Conti was nominated king of Poland, B. was required, by command of Louis XIV., to convey him to Elsinore, and the ship being attacked by the English on the voyage, was near being taken. After the action, the prince expressed to him his great delight that they had escaped from the enemy. 'We had no need,' was the reply, 'to be afraid of being made prisoners; I had despatched my son with a match to the powder-magazine, to blow up the ship on the first wink!'

BARTHELEMY, JEAN JACQUES, a historian and antiquary, born 20th January 1716, at Cassis, near Aubagne, in Provence. He was educated under the Jesuits for the church, but soon abandoned all thought of becoming a priest, and devoted himself to the study of the Greek, Hebrew, Syriac, Arabic, and Chaldee languages, though he retained the dress and title of an abbé. He first acquired distinction by the discovery of the Palmyran alphabet. In 1745, he was appointed assistant-superintendent of the Royal Cabinet of Medals, and in 1747 elected a member of the *Académie des Inscriptions et Belles-lettres*. To complete his studies, he visited Rome in 1754, in the suite of M. de Stainville, afterwards Duke of Choiseul, and then French ambassador, where he was courteously received by Pope Benedict XIV. After his return, he was again employed in the arrangement of the Royal Cabinet of Medals, which he augmented by a great number of costly specimens. The Duc de Choiseul, who became minister in 1758, placed him, by means of a pension and other favours, in a position to devote himself entirely to learned researches, which he quietly pursued till the revolution of 1789 deprived him of his offices. In September 1793, he was imprisoned on charge of being an aristocrat, but almost immediately released. Shortly after, he was offered the situation of national librarian then vacant, but his age and infirmities compelled him to decline accepting it. He died on the 30th April 1795.

His most celebrated and popular work is the *Voyage du jeune Anacharsis en Grèce dans le Milieu du quatrième Siècle avant l'ère Chrétienne*. Paris, 1788, 4 vols. (Travels of the Young Anacharsis in Greece about the Middle of the Fourth Century B. C.). The work (see ANACHARSIS) is a very pleasing and agreeable performance; exhibits an extensive knowledge of the ancient world, especially of Greece and its colonies; and abounds in observations which, if not profound, are at least judicious. Later and more severe criticism has, however, pointed out many deficiencies and anachronisms. It has been translated into almost every European language. Among B.'s other works may be mentioned a romance, entitled *Caryte et Polydore* (Paris, 1760); *Explication de la Mosaique de Palestine* (Paris, 1760); *Réflexions sur l'Alphabet et la Langue de Palmyre* (Paris, 1754).

BARTHELEMY SAINT-HILAIRE, JULES, a learned Frenchman, member of the Institute, and formerly a representative of the people, was born at Paris on the 19th of August 1805. He first held a subordinate office under the minister of finance. During 1828—1830, he was one of the editors of the *Globe*, a Paris paper. After the July revolution, he took part with the society *Aide-toi et le Ciel t'aidera* (q. v.), revised several of its democratic manifestoes, established the *Bon Sens*, and continued to attack the government of Louis Philippe in the *Constitutionnel*, the *Courrier-Français*, and the

National. In 1833, he desisted from political strife, and betook himself to more quiet studies. In 1834, he was named *Repetiteur* for the French Literature Class in the *École Polytechnique*; and in 1838, professor of Greek and Latin philosophy in the *Collège de France*. The revolution of February, however, brought him once more into the political arena. He was appointed secretary to the Provisional Government, but refused his support to the government of Cavaignac, and even appeared as his accuser, though he failed to establish his charges against the suppressor of the June insurrection. B. was at first in favour of Louis Napoleon, but the *coup d'état* on the 2d of December, and the overthrow of the constitution, compelled him to become an oppositioist. He then retired for a time from public life, and resigned his chair; but in 1852 he was reappointed, and, at the general election of 1869, was returned to the Corps Législatif as deputy for the first circonscription of Seine-et-Oise.

His principal writings are his translations of Aristotle's works—*Politique d'Aristote* (Paris, 1837); *De la Logique d'Aristote* (1838); *La Logique d'Aristote*, translated into French for the first time (1839—1844, 4 vols.); *Psychologie d'Aristote, Traité de l'âme* (1846); *De l'École d'Alexandrie* (1845); *Rapport sur la Comparaison de la Philosophie Morale et Politique de Platon et d'Aristote, avec les Doctrines des plus grands Philosophes Modernes* (1854); *Des Védas* (1854); *Du Bouddhisme* (1855). An enlarged edition of this last work, containing an account of Buddhism as practised in Ceylon at the present day, was published in 1860.

BARTHEZ, PAUL JOSEPH, one of the most learned physicians of France, son of a distinguished engineer, born in Montpellier, 11th December 1734. After serving as an army-physician, he founded at Montpellier a medical school, which rose to a high European reputation. His *Nouveaux Eléments de la Science de l'Homme* (Montpell. 1778; 2d ed., 2 vols., Par. 1806), in which he set forth a system founded on dynamical principles, was translated into most of the languages of Europe. He became, in 1783, titular chancellor of the university of Montpellier; and consultations with him on serious cases were sought from all parts of the civilised world. The revolution deprived him of the greater part of his property and his places, and compelled him to leave Paris; but Napoleon recalled him, and heaped honours and dignities upon him in his old age. He died in great suffering, after an operation for stone in the bladder, on 15th October 1806. Of his numerous writings, the following deserve special mention: *Nouvelle Mécanique des Mouvements de l'Homme et des Animaux* (Carcassonne, 1798; *Traitement des Maladies Goutteuses* (2 vols., Par. 1802; new ed., 1819); and *Consultation de Médecine* (2 vols., Par. 1810).—See Lordat, *Exposition de la Doctrine Médicale de Barthez, et Mémoires sur la Vie de ce Médecin* (Par. 1818).

BARTHOLIN, the name of a Danish family distinguished for learning and authorship, and the members of which have filled many important offices, especially in the university of Copenhagen. KASPAR B., born 12th February 1585, at Malmø, where his father was a minister, studied theology and philosophy at Rostock and Wittenberg, and afterwards studied medicine. In the year 1610, he was made doctor of medicine at Basle. He practised for some time in Wittenberg, and in 1613 accepted an invitation to be professor of the Greek language and of medicine at Copenhagen, where, in 1624, he became professor of theology. He died at Sorø in 1629. His *Institutiones Anatomice* (Wittenb., 1611, and often reprinted), which were translated into the

German, French, English, and Oriental languages, served in the 17th c., in many universities, as a text-book for prelections. Of his sons, who are all known in the learned world, the following especially deserve to be mentioned: the orientalist, JACOB B., born 1623, died at Heidelberg, 1653, known as the editor of the cabalistic works, *Bahir* and *Mojan Hachochma*; and THOMAS B., equally celebrated as a philologist, naturalist, and physician, who was born 20th October 1616. He became, in 1647, professor of mathematics, and in 1648 professor of anatomy, at Copenhagen; demitted these offices in 1661, and thereafter lived in retirement upon his estate of Ilagestad. In 1670, the king appointed him his physician in ordinary, which situation he filled till his death, 4th November 1680. He enlarged the new edition of his father's *Anatomy* (Leyd., 1641; often reprinted) with a mass of new observations. Besides many other valuable anatomical and medical works, his works on biblical and other antiquities, and on natural philosophy, are particularly worthy of notice. He was one of the most learned and studious of physicians, and warmly defended Harvey's doctrine of the circulation of the blood. His son, KASPAR B., born 1654, died 1704, was likewise an accomplished anatomist; and another son, THOMAS B., born 1659, died 1690, is the author of a standard work on northern antiquities—the *Antiquitatum Danicarum Libri Tres* (Copenh., 1689); also of *De Causis Contemptæ a Danis adhuc gentilibus Mortis*.

BARTHOLOMEW, ST., one of the twelve apostles, supposed to be the same person as Nathaniel. He was a native of Galilee, but nothing authentic is known regarding his life and labours. According to the traditional record of Eusebius, he carried Christianity into India; Chrysostom speaks of him as a missionary in Armenia and Asia Minor, while a still later legend declares that he was crucified at Albania Pyla, the modern Derbend, a town on the Caspian Sea. The relics of St B. 'appeared' at Rome in 953 A.D., and are preserved there in the church bearing his name. The Roman and Anglo-catholic Churches hold a festival in his memory on the 24th August; the Greek Church, on the 11th June. The primitive church possessed an apocryphal Gospel under his name, but it is now lost.

BARTHOLOMEW, ST., a Caribbean island, ceded, in 1784, by France to Sweden, whose single transatlantic colony it is. It lies about 30 miles to the west of St Kitts, the lat. and long. of its east point being respectively 17° 53' N., and 62° 52' W. With an area of only 35 square miles, St B. contains about 10,000 inhabitants. The soil is fertile, though, as is generally the case in the group, fresh water is scarce. Like most of its neighbours, St B. is difficult of access, its only harbour being on its west side, near the chief town Gustavia.

BARTHOLOMEW FAIR, formerly held at West Smithfield, London, but discontinued since 1855. The charter of this fair was granted by Henry I., in 1133, to a monk named Rayer or Rahere, who had been his jester, and had founded the church and priory of St Bartholomew, with an hospital attached. The fair was held annually at the festival of St Bartholomew (August 24, old style), and, like all ancient fairs, was originally connected with the church, under whose auspices Miracle-plays (q. v.), founded on the legends of saints, were represented, which gave place to Mysteries, and these again to Moralities; afterwards, profane stories were introduced—the origin of the modern English drama. After the opening of the fair, it was customary anciently for

wrestlers to exercise their art. Wild rabbits were hunted for sport by the mob, and the scholars from the different London schools met at the priory for disputations on grammar and logic, and to wrangle together in verse. In the first centuries of its existence, B. F. was one of the great annual markets of the nation, and the chief cloth-fair of the kingdom. The clothiers of England and the drapers of London had their standings, during the fair, in the priory churchyard. A pedlar's court, or court of *Pie Poudre* (q. v.), was held within the priory gates, for debts and contracts, before a jury of traders formed on the spot, at which the prior, as lord of the fair, presided by his representative or steward. In 1445, four persons were appointed by the Court of Aldermen as keepers of the fair and of the court of *Pie Poudre*, the city being thns in that court represented as joint lord of the fair with the prior. As the fair prospered, its chief articles of traffic were, in the first instance, cloth stuffs, leather, pewter, and live cattle; while it was rendered attractive to the crowds that attended it by a variety of popular amusements. All manner of shows, exhibitions, theatrical booths, &c., thronged the fair; and tumblers, acrobats, stilt-walkers, mummers, mountebanks, and merry-andrews resorted to it in great numbers. On the suppression of the religious houses, the priory was disjoined from the hospital, and the latter, on 27th December 1546, was, by Henry VIII., transferred to the corporation of London, a new hospital being established on the site of the former. The priory was purchased for £1064, 11s. 3d. by Sir Richard Rich, Chancellor of the Court of Augmentations, afterwards Lord Chancellor under the title of Lord Rich, and became his town-house. Towards the close of the 16th c., streets of houses began to be built on the site of the Cloth Fair, a name which is still retained. In 1593, the keeping of the fair was, for the first time, suspended by the raging of the plague. The same thing happened in 1603, in 1625, in 1630, in 1665, and in 1666. At this fair, foreigners were at first licensed for three days, and the city freemen as long as they would, which was six or seven days. In 1661, after the Restoration, the fair lasted for fourteen days or more. In 1685, it was leased by the city to the sword-bearer. After this period, it began to decay as a place of trade. In 1691, the continuance of the fair was limited to three days, besides the proclamation-day. In 1701, it was represented as a nuisance. In 1750 it was again limited to three days. By the alteration of the calendar in 1752, the fair, in the following year, was, for the first time, proclaimed on 3d September. In 1798, the question of abolishing the fair was discussed by the corporation. It had long ceased to be a place of traffic, and was only considered as a haunt of amusement, riot, and dissipation. The fair had lately been attended only by the keepers of a few gingerbread-stalls; and in 1839, measures were first seriously adopted for its suppression. In 1840, the exhibitions were removed to Islington. Wild-beast shows were allowed, but dwarfs and giants were excluded. In 1850, the last proclamation by the lord mayor took place, and in 1855 the once famous B. F. came to an end. An octavo volume, entitled *Memoirs of Bartholomew Fair*, by Henry Morley, was published in London in 1859.

BARTHOLOMEW'S (ST) DAY (Fr. *La St-Barthélemy*; Ger. *Bartholomæusnacht*, i. e., Bartholomew's Night, or *Bluthochzeit*, i. e., Blood-wedding), the appellation given to the massacre of the Protestants in Paris on the night of St B. D., between 24th and 25th August 1572. After the death of Francis II. in 1560, Catharine de' Medici (q. v.), as

regent for her son, Charles IX., a minor, in order to annoy the Catholic party of the Duke Francis of Guise (q. v.), had granted an edict of toleration to the Reformed, at whose head was the Prince of Condé. Both parties took up arms, and there ensued a war which lasted for eight years, the cruelties of which, through mutual exasperation, are almost incredible. The Duke Francis of Guise was murdered by an assassin, and the Prince of Condé was taken prisoner in the battle of Jarnac, in 1569, and shot. The young Prince Henry of Bearn, afterwards King Henry IV., a nephew of Condé, then became leader of the Reformed, along with Admiral Coligny (q. v.). It was not till the strength of both sides was exhausted, that the peace of St Germain-en-Laye was concluded in 1570, whereby the Reformed obtained the free exercise of their religion. Catharine de' Medici now expressed much friendliness towards the Reformed, and even endeavoured to lull them into negligence by the marriage of the youthful Henry of Bearn with her daughter Margaret, 18th August 1572. Admiral Coligny was drawn to Paris, and the king not only made him costly presents, but gave him an important office in the council of state. However, all this was only the basest hypocrisy. When, by means of the marriage of Prince Henry, the most eminent of the Reformed had been allured to Paris, Admiral Coligny was wounded by a shot from a window of the palace on 22d August 1572. The king, indeed, hastened to him, and swore to avenge him; but, on the very same day, the king was persuaded by his mother that the admiral sought his life. 'By God's death!' he exclaimed, 'let the admiral be slain, and not him only, but all the Huguenots, till not one remain that can give us trouble!' That night, Catharine held a council, and appointed St B. D. for carrying into effect the long-contemplated massacre. After Coligny had been murdered, a bell in the tower of the royal palace, at the hour of midnight, gave the signal to the assembled companies of citizens for a general massacre of the Huguenots. The king himself fired from his palace upon those that were fleeing past. The Prince of Condé and the king of Navarre only saved their lives by going to mass, and appearing to conform to the Catholic Church. The provinces were at the same time summoned to similar slaughter; and although in some of them the officials were ashamed to publish the murderous commands which had been transmitted to them, there were found bloodthirsty fanatics enough, who perpetrated the greatest horrors for several weeks together in almost all the provinces, so that it was reckoned that 30,000 (some authorities make the number 70,000) persons were murdered. The pope celebrated the events of St B. D. by a procession to the church of St Louis, a grand *Te Deum*, and the proclamation of a year of jubilee. Many of the Huguenots fled to pathless mountains and to La Rochelle, to which the Duke of Anjou laid siege. Upon receiving intelligence, however, that he had been elected king of Poland, he made an arrangement on July 6, 1573, according to which the king granted to the Huguenots an amnesty, and the exercise of their religion in certain towns.

BARTHOLOMEW'S (St) HOSPITAL, Smithfield, London, was originally a part of the priory of St Bartholomew, founded in 1102 by Rahere, the first prior. At the dissolution of the religious houses, it was founded anew by Henry VIII., and the endowment has been subsequently enlarged from various sources, public and private. The hospital contains more than 600 beds, and affords relief to 70,000 patients annually. There is a medical school attached. The revenues are large and ample.

BARTIZAN, a small stone closet, thrown out upon corbels over doorways, and on other parts of mediæval castles, generally for defence, but sometimes only for convenience to the inmates and defenders.

Bartizan.

BARTLETT, WILLIAM HENRY, an artist and popular writer, was born at Kentish Town, London, on the 29th March 1809. He was a pupil of the eminent architectural antiquary, Mr John Britton, of London, and during his apprenticeship displayed more than ordinary talent for drawing, which was fostered by his master sending him into many of the most interesting counties in England, to make sketches from nature. Mr Britton afterwards employed him to make drawings for his *Cathedral Antiquities*, and also for his *Picturesque Antiquities of English Cities*. Subsequently, B. visited the continent, the Holy Land, and America several times, on each occasion enriching his portfolio with innumerable interesting scenes. No fewer than nineteen quarto volumes, containing about 1000 engravings from his sketches, and letterpress from his own pen and those of his fellow-travellers, Dr W. Beattie, N. P. Willis, and Miss Pardoe, were devoted to these countries. Several other volumes, of which he was the sole author as well as artist, have also been published. Some of the books had a wonderful success, especially those on Switzerland, the Holy Land, and Egypt. B. died on the voyage from Malta to Marseille on September 25, 1854. He had been revisiting Palestine, and the materials he had collected were given to the world in a posthumous volume entitled *Jerusalem Revisited*.

BARTLETT is also the name of several American authors, the most eminent of whom is John Russell B., born at Providence, Rhode Island (U. S.), in October 1805. He was employed by the United States' government, in 1850—1853, as a commissioner for determining the Mexican boundary-line, and, in 1854, published an account of his explorations and adventures, &c., in that capacity. He is also the author of *The Progress of Ethnology*, a popular *Dictionary of Americanisms*, *Bibliography of Books relating to the Civil War*, and other works.

BARTOLINI, LORENZO, a celebrated Italian sculptor, was born at Vernio, in the north of Tuscany, in 1777. Circumstances brought him to Paris while still a young man, where he practised his art for some time with very little pecuniary success; but at length, having obtained an academy prize for a bas-relief of Cleobis and Biton, he was suddenly ushered into notice and prosperity. Several influential persons patronised him, such as Deon and Regnaud de St Jean d'Angely. Through the first, he obtained a commission to execute one of the bas-reliefs in the hall of the Vendôme palace, and also the bust of Napoleon over the door of the Institute of France. Napoleon himself gave him a multitude of orders, many of which, unfortunately, were never executed. In 1808, the emperor sent him to Carrara, to establish a school of sculpture. Here he remained till 1814, when he accompanied his imperial master to Elba. After the battle of Waterloo, he repaired to Florence, where he was

subsequently appointed director of the sculpture department in the Academy of the Fine Arts, an office he retained till his death in 1850. B. was a very prolific artist. Besides the works already mentioned, B. executed busts of Cherubini, Melul, Madame Regnauld, a magnificent statue of Napoleon I. (now in America), several exquisite sepulchral monuments, such as that of Lady Stratford Canning in the cathedral of Lausanne, and various groups, the most celebrated of which are his 'Charity,' and 'Hercules and Lycus.' In England and France, his style is in general greatly esteemed; in Germany, it is less highly thought of. His figures are characterised by their truthfulness of proportion and classic repose, though they also possess a remarkably lifelike expression. After Canova, B. is reckoned the most distinguished Italian sculptor of modern times.

BARTOLOMEO, SAX, a town of Italy, in the province of Capitanata, with a population of 5400.

BARTOLOZZI, FRANCESCO, an eminent engraver, was born in Florence about 1730. After practising his art under Wagner of Venice, he went to Rome, where he executed his admired plates from the life of St Nilus. He was afterwards commissioned by Mr Dalton, librarian of George III., to engrave a series of drawings by Guercino, and was induced by the same gentleman to settle in England. Here B. produced his spirited and highly finished engravings of the 'Virgin and Child' after Carlo Dolci, and 'Clytie' after Annibale Carracci, which entitle him to occupy the front rank in his profession. He also engraved numerous specimens of the works of his friend Giovanni Cipriani, of Michael Angelo, Cantarini, Cortona, &c., with equal truth and effect. B. likewise enriched Alderman Boydell's Shakspeare Gallery with many fine engravings. In 1802 he received a flattering invitation from the Prince Regent of Portugal, to take the superintendence of a school of engravers at Lisbon, whither he repaired three years afterwards, in his seventy-fifth year, and there resided until his death in 1818. He was the grandfather of Madame Vestris, the celebrated comedienne.

BARTON, BERNARD, an English poet, born 31st January 1784, in London. His parents were members of the Society of Friends, to the tenets of which body B. adhered through life. In 1810 he became clerk to a banking-house at Woodbridge, in which situation he continued until within two years of his death. His first poetical efforts, published in 1812 under the title of *Metrical Effusions*, brought him into correspondence with the poet Southey. *Poems by an Amateur* (1818), and *Poems* (Lond. 1820), increased his reputation, and gained him the friendship of Lamb and Byron. *Napoleon and other Poems* appeared in 1822, and was followed within five years by several other productions. All the poems of B. are pervaded by pious sentiment, and some passages display much natural tenderness and religious fervour; but he is, on the whole, rather a fluent, pleasant versifier than a poet. So early as 1824, a reading-club founded by him in Woodbridge collected the sum of £1200 sterling, and presented it to him. Some years before his death, he received, through Sir Robert Peel, a pension of £100 sterling. In addition to the works mentioned, he published *Fisher's Juvenile Scrap-book* (Lond. 1836), *The Reliquary* (Lond. 1836), and *Household Verses* (Lond. 1845). After his death, which took place suddenly, 19th February 1849, his daughter published *Selections from the Poems and Letters of Bernard Barton* (Lond. 1849).

BARTON, ELIZABETH, commonly called 'the Holy Maid of Kent,' a wretched creature, subject to

spasmodic nervous affections, during which she gave utterance to incoherent exclamations and phrases. About the year 1525, she was servant in a tavern at Aldington, in Kent; and the cunning priest of the parish seeing her in her paroxysms, on the strength of her misfortune conceived the idea of presenting her to the world as a prophetess. Under his directions, she played her part so well that not only the common people, but even men of intellect and education like Sir Thomas More, and Barham, the Archbishop of Canterbury, were deceived by her. The former, however, afterwards recognised her true character. She became a nun, and when, in 1532, Henry VIII. quarrelled with the court of Rome, she was induced to denounce loudly the king's separation from his first wife, and his marriage with Anne Boleyn, and even to prophesy his death. Being arrested by the king's command, along with her accomplices, she made before the judges a confession, which was afterwards publicly repeated before the people, of the fraud which had been perpetrated, and was sentenced to ecclesiastical penance and to imprisonment. She was afterwards accused of high treason, and executed along with some of her accomplices in 1534.

BARTON BEDS, a group of strata, composed of clay and sand, and forming part of the Middle Eocene formation, included in the Bagshot series (q. v.).

BARTON-ON-HUMBER, a town in North Lincolnshire, on the south side of the Humber, six miles south-west of Hull. It is a very ancient place, having been one of the chief ports of the Humber before the foundation of Hull. It was once surrounded by a rampart and fosse, as a protection against the incursions of the Danes and Saxons. The ferry across the Humber, on the great road from London to Hull, used to be here; but the London and Hull inland traffic has now been diverted from B. by the steam-ferry at New Holland, six miles below Barton. The chief manufactures are ropes, sacking, bricks, tiles, pottery, and whiting. There are quarries of chalk and oolite. The tower of St Peter's Church, which was built about the time of the Conquest, has both round and pointed arches; and, with the part of the building to the west, constitutes one of the few existing examples of undoubted Anglo-Saxon architecture. St Mary's Church is a handsome structure of the 14th c. Pop. (1871) 4332.

BARU, a fine woolly substance found at the base of the leaves of the *Sagurus saccharifer* (also called *Arenga saccharifera*), one of the most valuable sago-palms of the Indian Archipelago. It is much employed in calking ships, in stuffing cushions, and for other similar purposes.

BARUCH (i. e., the Blessed), the son of Neriah, was the person to whom the prophet Jeremiah dictated his oracles. During the siege of Jerusalem by Nebuchadnezzar, both he and the prophet were, by their own countrymen, shut up in a narrow prison, but obtained from the conqueror freedom and permission to choose their own residence. B. remained for some time in Palestine, but afterwards accompanied Jeremiah to Egypt. His subsequent history is unknown. An apocryphal work in the Greek language has come down to us under his name—viz., the Book of B., which contains words of comfort for the Israelites, and predicts the rebuilding of Jerusalem. There is usually appended to it, as chapters vi. and vii., a letter—also apocryphal—of the prophet Jeremiah to the exiles in Babylon.

BARWOOD. See CAMWOOD.

BARYTA, or **BARYTES**, or Oxide of Barium (q. v.)—symbol BaO—is the earth present in the minerals *witherite* (carbonate of B.) and *heavy spar*

(sulphate of B.). It may be prepared in several ways: 1. By acting upon the carbonate of B. ($BaCO_3$) by nitric acid (NO_3), which causes the disengagement of the carbonic acid (CO_2), and the nitric acid combining with the B. forms the nitrate of baryta ($BaONO_3$). On evaporating the latter substance to dryness, and igniting the residue, the nitric acid volatilises, and leaves the baryta (BaO). 2. Another mode of preparing the same substance is to act upon a solution of sulphuret of barium (BaS) by the black oxide of copper (CuO), when an interchange of elements occurs, the sulphur uniting with the copper, producing sulphuret of copper (CuS), and the oxygen with the barium, forming B. (BaO), which remains dissolved in the water, and, on evaporation, deposits crystals in the hydrated condition ($BaO.HO$). B. belongs to the group of alkaline earths, and has the property of acting like an alkali (q. v.) on colouring matters. It has a very harsh taste, is highly caustic, and is very poisonous. A solution of B. is used by the chemist as the best indication of the presence of carbonic acid gas in the atmosphere, for when a plate or other vessel containing the solution is exposed to the air, the carbonic acid floating across the surface combines with the B., and forms a film of white carbonate of baryta ($BaO.CO_2$). Otherwise, B. possesses little interest, as it is not put to any commercial or medicinal use. The compounds of B. are, however, of considerable importance. The *sulphate of B.* ($BaOSO_4$), otherwise called *ponderous* or *heavy spar*, is found in the mineral kingdom, diffused in fissures or cracks,

Crystal of Sulphate of Baryta.

passing through other rocks, especially in Cumberland, Durham, and Westmoreland, and in the island of Arran. At the latter place, an extensive mine of heavy spar has been worked for many years. In its native condition, the sulphate of B. occurs of a crystalline texture, is sometimes found pure and white, but generally presents a flesh-red colour, from the red oxide of iron (rust) incorporated in it. The rust can be got quit of by reducing the sulphate of B. to a fine powder under rollers or travelling-wheels, and subjecting the pulverised material to the action of dilute sulphuric acid, which dissolves the red oxide of iron, and leaves the sulphate of B. as a white dense powder. The principal use of *heavy spar* is as a pigment under the name of *permanent white*; but having little opacity, it cannot be employed by itself, but only when mixed with ordinary white lead. When added to the latter, however, it must be regarded as an adulteration, for the little opacity it possesses renders it of service only as an increaser of the bulk of the white lead. Several mixtures of sulphate of B., and white lead are manufactured, and are known in commerce. *Venice White* contains 1 part Sulphate of B., and 1 part White Lead. *Hamburg White* contains 2 parts Sulphate of B., and 1 part White Lead. *Dutch White* contains 3 parts Sulphate of B., and 1 part White Lead. The native sulphate of B. has been employed by the celebrated potter Wedgwood in the manufacture of jasper ware, and for the formation of white figures, &c., on coloured jars and vessels. The *Carbonate of B.* found native as *Witherite*, and the *Nitrate of*

B., have been previously referred to in this article and that on BARIUM.

BARYTON (Viol di Bardoni), an old chamber-instrument, somewhat like the viol di gamba in tone: had a broader finger-board, with seven gut-strings, while under the neck there were sixteen strings of brass wire, which were touched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow.

BARYTON, that species of the human voice which lies between the bass and the tenor, the tone-character of which is more allied to the bass.

The compass of a B. voice is from

but the principal notes of the voice are from

; and these should possess the en-

getic character of a bass voice, and, above all, be produced from the chest, excepting perhaps the highest. In former times, the music for this species of voice was written on a staff with

the F clef placed on the 3d line, thus:

BAS, or **BATZ**, a small island in the English Channel, belonging to France, and situated off the north coast of the department of Finisterre. Its length is about 3 miles, and its breadth 2. It has a light-house, in lat. $48^{\circ} 45' N.$, and long. $4^{\circ} 11' W.$, on an elevation 223 feet above the sea, and is defended by two forts and four batteries. Pop. above 1000, whose chief occupation is fishing.

BASALT, strictly a variety of trap-rock (q. v.), although some writers use the words as synonymous. It is composed of the same materials as greenstone (q. v.), and other varieties of trap, viz., hornblende and felspar, with a small quantity of iron; but these exist in a state of finer division than in greenstone, shewing that the crystalline action has been stopped at its commencement by the more rapid cooling of the mass. To this is owing its sharp conchoidal fracture and its hardness. As the hardness is frequently accompanied with tenacity, it makes B. a valuable material in the making of roads. It is of a more uniform dark-gray colour, approaching to black, than the other varieties of trap.

A rock of a similar appearance and structure occurs as a variety of lava, in volcanic districts. This Lava-B. differs from the older Trap-B. in the form which the silicates of magnesia and lime assume when crystallising. In the newer rocks, they appear as augite; in the older, as hornblende. These two minerals can scarcely be distinguished by their chemical composition, the different formulas given by mineralogists being the result of the presence, in the specimen analysed, of accidental ingredients or impurities. The slightly differing crystallographic angle has been accounted for by the supposed more speedy cooling of the volcanic rocks. Rose, indeed, has shewn that the hornblende of melted greenstone, in re-cooling, crystallises as augite; and we have observed that the same change has taken place in specimens of recrystallised B., obtained from works which existed lately at

Basalt section.

BASALT.

Birmingham for converting this rock into an opaque glass for various economic uses.

The remarkable columnar structure which B. frequently assumes, is its most striking characteristic. The columns vary in the number of their angles from three to twelve; but they have most commonly from five to seven sides. They are frequently divided transversely by joints at nearly equal distances. The direction of the columns is always at right angles to the greatest extension of the mass, so that when B. occurs as a bed, either overlying, or

interstratified with the regular strata, the columns are perpendicular, while they are horizontal when the B. exists as a dike.

The columnar structure was at first believed to be owing to a modification of the crystalline force. Such a supposition was favoured by the external form of the columns; but the total absence of internal structure shewed that the explanation must be sought elsewhere. In 1804, Mr Gregory Watt propounded a theory of the origin of the structure, ascribing it to the pressure of numerous spheres

Fingal's Cave.

on each other, during the process of cooling, such spheres being produced in planes of refrigeration or absorption. They increase by the successive formation of external concentric coats, until their growth is prevented by the contact of neighbouring spheres; and as in a layer of equal-sized spheres, each is pressed on by six others, the result is that each sphere will be squeezed into a regular hexagon. Watt published this theory as the result of his celebrated observations on the cooling of a mass of molten basalt, in which he noticed the production of numerous spheroids, having a radiate structure. Many greenstones, in weathering, present such a structure, giving often to the rock the appearance as if it were composed of a mass of cannon-balls, and Watt's experiments satisfactorily explain this phenomenon; but they will not go further. Anxious, however, that they should throw some light on the structure of basaltic columns, he manages it by the following remarkable assumption: 'In a stratum composed of an indefinite number in superficial extent, but only one in height, of impenetrable spheroids, with nearly equidistant centres, if their peripheries should come in contact in the same plane, it seems obvious that their mutual action would form them into hexagons; and if these were resisted below, and there was no opposing cause above them, it seems equally clear that they would extend their dimensions upwards, and thus form hexagonal prisms, whose length might be indefinitely greater than their diameters. The further the extremities of the radii were removed

from the centre, the greater would be their approach to parallelism; and the structure would be finally propagated by nearly parallel fibres, still keeping within the limits of the hexagonal prism with which their incipient formation commenced; and the prisms might thus shoot to an indefinite length into the undisturbed central mass of the fluid, till their structure was deranged by the superior influence of a counteracting cause.' Unfortunately, such dreams too often meet with more acceptance than the drier deductions from observed facts; which must, however, in the end, form the only basis of all geologic science. But there is no occasion here to urge even the most imaginative to resort to hypothesis, for the formation of columns in other substances than B. is quite familiar, and their producing causes evident. In starch, columns having the external prismatic appearance, and the internal earthy structure, are produced simply from the escape of vapour, and consequent shrinking of parts. We have seen singularly regular joints produced in the argillaceous ironstone at Wardie, near Edinburgh, on its exposure on the beach, the contractions forming the columns evidently resulting from the escape of the moisture retained by the bed while it was covered by other strata. The same occurs in beds of fine clay that have been recently exposed. But the most regular series of columns that have been noticed by us, were produced on bricks which formed the bottom of a public oven. The long-continued and powerful heat to which they had been subjected, though it had not caused fusion, had

so affected them as to produce a beautiful series of regular hexagonal prisms. The columns had a diameter of nearly half an inch. Their direction was at right angles to the oven floor. The earthy structure of the brick remained. The columns, in short, were in every respect, except the material of which they were formed, true basaltic columns. It is surely better to look for an explanation of this structure in causes similar to those which have produced the examples adduced, than to find it in such groundless assumptions as are at the foundation of the generally received theory of Watt. The columnar structure of B. seems to have been produced subsequently to the cooling of the mass, by changes in the solid rock, probably from the escape of some volatile matter.

The two best known and most beautiful examples of columnar B. are Fingal's Cave, in the island of Staffa, on the west coast of Scotland, and the Giants' Causeway, on the north coast of Ireland.

BA'SCINET. See **HELMET.**

BASE, in Heraldry, the lower portion of the shield is called the B.; there is a dexter base, middle base, and sinister base, marked by the letters

Base.

G, H, I, in the accompanying diagram, in which, for the convenience of the heraldic student, the other points of the escutcheon are also indicated. The *chief* or principal part of the escutcheon is the top, marked A, B, C. The *dexter* or right-hand side is that marked AG; the *sinister* or left-hand side, CI, an arrangement which is explained when we consider that the shield is always supposed to be on the arm of the wearer, and that it is his right and left hands, not those of the spectator, which are kept in view. The *ground* or surface of the shield, on which all the *charges* or figures are depicted, is called the *field*.

IN BASE.—When any figure is placed in the B. part of the shield, it is said to be *in base*.

BASE (Fr. and Ital.). the foot or lower member of a pillar, on which the shaft rests. Of the classical orders, the Doric column alone had no base. The height of the B. is usually about half the lower

Tuscan Base.

diameter of the shaft; and it is divided into the *plinth*, or flat projecting square block or blocks, immediately above the ground, and the *mouldings* (q. v.), or fillets, which surround the column, and are usually circular. In the early Norman style, the bases of pillars still retained, from the Romanesque, forms closely resembling the Tuscan order. As Gothic architecture advanced, and emancipated itself from the arbitrary rules by which the classical orders were governed, bases became infinitely varied in detail, though something approaching to the original conception of a strong and firm foundation for the column, adhered to them throughout.

BASE, in Chemistry, is a term applied to a compound body, generally consisting of a metal

united with oxygen. Thus, the metal potassium (K), when it combines with oxygen (O), forms the B. potash (KO); sodium (Na) and oxygen, the B. soda (NaO); lead (Pb) and oxygen, the B. oxide of lead or litharge (PbO). A distinguishing feature of a B. is that it unites with an oxygen acid, such as sulphuric acid (SO₃) to form a *salt* (q. v.). Thus, the B. potash (KO) combines with sulphuric acid (SO₃) to make the salt sulphate of potash (KOSO₃); potash with nitric acid (NO₅) to form the salt nitrate of potash, or nitre (KONO₅). Occasionally sulphur replaces the oxygen in a base. Thus, the metal potassium (K) unites with sulphur (S) to form the *sulphur* base, sulphuret of potassium (KS), which can unite with a sulphur acid like sulpharsenious acid or orpiment (As₂S₃) to make the salt sulpharsenite of potash (KS,AsS₃). The metal half of a B. need not be a simple element, but may be a compound body which, for the time, plays the part of a simple substance. Thus, the compound ethyl (C₂H₅) can combine with oxygen to form ordinary ether ([C₂H₅O]); and the B. thus produced can, in its turn, combine with acids to form salts. A base may be soluble or insoluble in water. Thus, the bases potash (KO), soda (NaO), ammonia (NH₃O), baryta (BaO), strontia (StO), lime (CaO), and magnesia (MgO), are more or less soluble in water; whilst the oxide of iron or rust (Fe₂O₃), the red oxide of lead (Pb₃O₄), the red oxide of mercury (HgO), are insoluble in water, but soluble in acids. See **CHEMISTRY**, in **STRP.**

BASE, or **BASS** (from *basis*, the foundation), in Music, is the deepest or lowest part, by whatever instrument it may be performed. The B., next to the upper part, is the most striking, the freest in its movements, and richest in effect. Its movement downwards is unfettered, unceaseful, and undisturbed, whereas the middle parts are circumscribed and concealed. In respect to harmony, the B. is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that most important and effective figure in music called 'organ-point' (q. v.).—B. is also the name of the lowest and deepest quality of the human voice. The compass of a B. voice is

generally from which should all be chest-notes, except, perhaps, the highest. The most

useful range, however, is from In

the characteristic use of the B. voice, the old masters were unquestionably the greatest, especially Handel and Bach. The B. voice only begins to shew itself at the years of manhood, and is generally a change from the alto voice of a boy.—B. is also the name of an old stringed instrument, with from five to six strings, tuned variously to suit the music, and played with a bow. It was a sort of middle instrument between the contra-bass and violoncello, but is now out of use. Double B. (contra-bass) is the deepest-toned of stringed instruments.

BASE OF OPERATIONS, in Military Manœuvres, is some spot or line which the general of an army relies upon as a stronghold and magazine. An army cannot take with it all the food, forage, and ammunition for a long war; the consumption is enormous, and a constant supply is indispensable. Again, the sick and wounded cannot accompany the army through toilsome marches; the commander endeavours to send them back to some place of safety. Furthermore, fresh troops must have some spot from which they can safely advance through the enemy's country. To secure all these advantages, a

B. of O. is necessary. It may be a port, a stretch of sea-coast, a river, a mountain-range, according to circumstances; but it must be such as to serve as a magazine of supply, a place for retreat under disaster, and the end of a line of open communication extending to the spot occupied by the army. When Lord Raglan and Marshal St Arnaud advanced from the Alma towards Sebastopol, in September 1854, they intended to attack the great fortress on the north side; but the tactics of the Russians prevented this; and the allies, changing their plan, resolved on the celebrated flank-march to Balaklava, by which they secured the whole coast from Balaklava to Kamiesch as a *B. of O.* during the siege of Sebastopol. See BALAKLAVA. In the military contests arising out of the Indian mutiny, in 1857 and 1858, Cawnpore was the chief *B. of O.* whence Havelock, Outram, and Clyde made those advances towards Lucknow which led ultimately to the suppression of the revolt. In the Italian war of 1859, the Austrian *B. of O.* was very fluctuating, owing in part to the disaffected state of the Lombard population around the great fortresses of Mantua, Peschiera, &c.; and indeed the only reliable base was furnished by the Eastern and Tyrolese Alps. The French and Sardinian base, in the same war, was virtually Genoa, and the line of country extending thence to the great stronghold of Alessandria.

BASE-COURT (*basse-cour*), the outer court of a feudal mansion, which contained the stable-yard and accommodation for servants. It was distinct from the principal quadrangle, and was sometimes constructed of timber.

BASEDOW, JOH. BERNH. (properly, Joh. Berend Bessedan, or Bernh. von Nordalbingen, as he is often called), a remarkable educationist of the 18th c., was born, 8th September 1723, at Hamburg, where his father was a peruke-maker. He attended the Johanneum there from 1741 to 1744, and afterwards studied philosophy and theology in Leipsic, from which he went in 1746 as a private tutor to Holstein. In the year 1753, he was appointed a master in the academy for young noblemen at Sorøe. In 1761 he was removed from the Gymnasium at Altona on account of heterodox opinions. Rousseau's *Emile* awakened in him, in 1762, the thought of improving the method of education, and of reducing to practice Rousseau's maxims and those of Comenius. Contributions from princes and private persons, amounting to 15,000 thalers (about 22171 sterling), covered the cost of his *Elenentarwerk*, which, after the most pompous announcements, appeared as an *Orbis Pictus*, with 100 copper-plates by Chodowiecki, and was translated into French and Latin. Therein the young receive a large number of representations of the actual world, whereby *B.* sought at once to delight the eyes, and to awaken a sentiment of cosmopolitanism, at which his whole method aimed. As a model school on this method, he established in 1774 the *Philanthropin* at Dessau, to which place he had been called in 1771. His restlessness of disposition, and the quarrels in which he was involved, especially with his active but capricious coadjutor Wolke, caused him to leave the *Philanthropin*; but he proceeded with as much eagerness as ever in endeavours to give effect to his ideas by educational works, which, however, aimed more at popularity than solidity, until, after many changes of residence, he died at Magdeburg, 25th July 1790. His influence on the public mind of his age, particularly in Germany, was very great. He has been justly reproached with disparaging the ancients, a consequence chiefly of his own want of sound scholarship, and with a multitude of

exaggerations, mistakes, and conceits; yet it cannot be disputed that his numerous philosophical and educational works powerfully awakened attention and interest in the much-neglected subject of education, and that he set many excellent ideas and weighty truths in rapid circulation among men.

BASEL, or BASLE (Fr. *Basle*), a city and canton of Switzerland. The canton was divided in 1833 into two sovereign half-cantons, called *Basel-city* (Basel-stadt, or Basle-ville) and *Basel-country* (Basel-landschaft, or Basle-campagne), each having half a vote in the diet. The half-canton of *Basel-city* consists only of the city, with its precincts, and three villages on the right bank of the Rhine; the remainder of the canton forms the half-canton of *Basel-country*. The canton of *B.* is bounded by France and Baden, and by the cantons of Aargau, Soleure, and Berne, and has, according to different estimates, an extent of from 170 to about 200 square miles. Lying on the northern slope of the Jura, it is a country of hills and valleys. The mountains attain an elevation of from 2000 to 3000 feet. The chief rivers of *B.* are the Rhine (which flows through the north part of the canton) and its tributaries, the Birz, and Ergloz. The soil is fertile and well cultivated. The climate, except in elevated situations, is very mild. The inhabitants are chiefly employed in agriculture, the cultivation of fruit-trees and of the vine, cattle-husbandry, fishing, salt-works, the manufacture of ribbons (which are manufactured to the value of £400,000 sterling annually), paper, woollens, linens, and leather. The transit trade is very considerable.

The city of *B.* arose out of the Roman fortified post of Basilia or Basiliana, near Augusta Rauracorum, of which once more important place the little village of Augst, near *B.*, exhibits a few ruins. On the division of the Frank Empire, the district of *B.* fell to Louis or Ludwig the German. The Emperor Henry I., in the earlier part of the 10th c., rebuilt the town, which had been destroyed. It then became a place of importance, and belonged for a time to Burgundy, but after 1032 formed part of the German empire. It became at an early period the seat of a bishop, who, from the 11th c., shared in the supreme power with the imperial governor, a number of noble families, and the burghesses. Amidst many internal and external disturbances, the power of the nobility was gradually broken, that of the bishop restricted, and the authority of the burghesses extended. Surrounding towns were also destroyed, or conquered, and purchased, along with their territories, so that the city extended its dominion over a country district which until very recently was kept in a state of dependence and subjection. Involved in many feuds with the House of Hapsburg, *B.* closely allied itself to the Swiss confederacy; and after the peace between the Emperor Maximilian I. and the confederacy, *B.* formally joined it in 1501. From 1519 onwards, the writings of Luther were printed in *B.*; and at the end of twenty years from that time, the reformed doctrine had become generally prevalent, the chapter of the cathedral had left the city, and the convents had been suppressed. After the union with Switzerland, the triumph of the burghess party became also more complete, part of the nobility emigrated, and those who remained were placed upon the same level with the freemen of the municipal corporation. Orderly industry, economy, and an external severity of manners, became the characteristics of the citizens; but the peace of the city was not unfrequently disturbed by strifes consequent upon the assertion of what was deemed undue authority by the magistrates. The government of the city, to which the whole canton was subject, was intrusted to a Great and a Little

Council, under the presidency of alternate burgo-masters and chief wardens of the guilds; but the Little Council, uniting legislative and judicial functions with the highest executive authority, became gradually more and more preponderant. All parties in the city, however, remained always well combined against the country district; and persons belonging to the city were appointed to all offices, civil and ecclesiastical, whilst the depression of the country district was completed by the neglect of a proper provision for education. This state of things caused great dissatisfaction, which repeatedly broke out in fruitless rebellion. Under the impulse communicated by the French Revolution, equality of rights was conceded in 1798; but in 1814, although the equality of rights remained apparently intact, the new constitution of the canton was so framed, and the representation so distributed, as virtually to make the city again supreme. The discontent of the country district became so great that, after unsuccessful attempts to obtain redress of grievances by petition, civil war broke out in 1831, which did not cease till the troops of the Swiss Confederation took possession of the canton, and the diet recognised the separation of the city and the country district, as sovereign half-cantons, in 1833. The constitutions of the two half-cantons are in most respects similar, and are framed on the basis of the old constitution, modified in accordance with the principle of universal suffrage. According to the census of 1871, the half-canton of Basel-city contained 47,760 inhabitants, of whom 34,457 were Protestants; and Basel-country, 54,127, of whom 10,245 were Roman Catholics. Each division sends one member to the diet, but they have only one vote between them, and that does not count at all when the deputies take opposite sides, which as a rule they do. The capital of Basel-country is Liestal. Since its separation from the city, more ample provision has been made for education, and there has been a rapid increase of material prosperity. Both Roman Catholic and Protestant clergy are paid by the state, and the parishes of the Reformed Church have received the right of choosing their own pastors.

The city of B. was much more populous in the middle ages than it is now. Its population in 1870 was 44,834. In the 14th c., the number of its inhabitants was greatly reduced by the plague, or 'black death' (q. v.), which raged in it with terrible severity, and is sometimes mentioned as the 'death of Basel.' It is well-built and clean, but its appearance does not proclaim it the wealthiest city in Switzerland, which, however, it is. Amongst its buildings are a cathedral, founded in the beginning of the 11th c., by the Emperor Henry II., and a bridge over the Rhine, built in 1226. The Rhine divides the city into two parts—Great B., on the south side, and Little B., on the north. B. is connected by railway with Strasbourg on the one hand, and Berne, Lucerne, Zurich, &c., on the other. It has many benevolent and educational institutions, among which are an orphan asylum, and an institution for deaf mutes; a university, founded in 1459, which has a library of 50,000—60,000 volumes, and a very valuable collection of manuscripts, a numismatic collection, a botanic garden, and a museum of natural history; the new museum, in which there are several pictures of the younger Holbein, who was long resident in B. (some accounts say, he was born here); a public library of 70,000 volumes. During the Reformation, the university was a central point of spiritual life, and it has numbered among its professors men of great eminence in learning and science, including Erasmus, who died here in 1536, and the

mathematicians Euler and Bernoulli, who were natives of B.; but it is now little frequented. The population of the whole canton in 1870 was 82,217.

BASEL, COUNCIL OF, a memorable and important ecclesiastical council, held in the city of Basel. It was summoned by Pope Martin V., and his successor Eugenius IV., in accordance with an announcement made at the Council of Constance, and was opened on 14th December 1431, under the presidency of the Cardinal Legate Julian Cesarini of St Angelo. The hall in which it met is still shewn at Basel. It addressed itself to the reconciliation of the Hussites with the Roman Catholic Church, and to the reform of abuses in the church itself. But the first attempt to conciliate the Hussites, whom an army of crusaders had in vain sought to subjugate, was met with resistance by the pope, who not only refused his sanction, but empowered the cardinal legate to dissolve the council. The council strongly repelled the pope's pretension of right to dissolve it, and proceeded with its business. His injunctions, that it should remove to Italy, were equally disregarded. It renewed the decree of the Council of Constance, asserting the right of a General Council to exercise authority over the pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him, and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in name of the church, with the Calixtines, the most powerful section of the Hussites, by the Prague Compact of 20th November 1433, granting them the use of the cup in the Lord's Supper. By this, the Emperor Sigismund was much helped in obtaining possession of Bohemia; and he in return sought to reconcile the council with Eugenius IV., who, being hard pressed by insurrections in the States of the Church, and afraid of losing his whole influence in France and Germany, solemnly ratified all its decrees, by a bull dated 15th December 1433. Desirous, however, of limiting the papal prerogatives, the council restored to the chapters of cathedral and collegiate churches the free right of election to stalls and benefices, of which the pope had assumed the right of disposing; and with a view to the reformation of gross abuses, restricted the power of granting interdicts, and prohibited *annats* and other grievous exactions. It left the pope the right to dispose of those benefices only which belonged to the diocese of Rome, and prohibited the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy; and prohibited Festivals of Fools, and all the indecencies which had been commonly practised in churches at Christmas. It adopted decrees concerning the election of popes, and for the regulation of the College of Cardinals.

Eugenius, exasperated to the utmost, complained loudly to all sovereign princes. At this time, a prospect was opened up of the union of the distressed Greeks with the Church of Rome; and both the pope and the council endeavoured to make use of this for the advancement of their own interests and influence. Both despatched galleys for the Greek deputies, but through the intrigues of his agents, the pope was successful, and brought the Greek deputies to Ferrara. The Archbishop of Tarentum, a papal legate at B., circulated an ordinance in name of the council, and sealed with its seal, recommending Udine or Florence as the place of conference. The ordinance was a forgery, and this proceeding put an end to forbearance on the part of the council, which, on July 31, 1437, again cited the pope to its bar; and not only on his failing to appear, declared him contumacious, but on his opening an

opposition council at Ferrara, went so far as, on January 24, 1438, to decree his suspension from the functions of the papedom. His party, however, was so strong that this decree could not be carried into effect; and some of those who had been among the most influential members of the council, the Cardinal Legate Julian himself, and the greater number of the Italians, left B., and went over to his side. All the more resolutely did Cardinal Louis Allemand, Archbishop of Arles, a man of most superior understanding, courage, and eloquence, now guide the proceedings of the council, which, on May 16, 1439, declared the pope a heretic, for his obstinate disobedience to its decrees; and in the following session, formally deposed him for simony, perjury, and other offences. On this occasion, the holy relics which were in B. were deposited in the places from which the Spanish and Italian members of the council had disappeared; and the sight of them produced much emotion, and reanimated the courage of the assembly, still consisting of 400 prelates, priests, and doctors, mostly French and German. On November 17, 1439, the council, notwithstanding the still further diminution of its numbers, caused by the plague in B., elected Duke Amadeus of Savoy to be pope, who then lived as a hermit in Ripaglia, on the Lake of Geneva. He accordingly styled himself Felix V., but was recognised only by a few princes, cities, and universities. The Emperor Sigismund was dead, and even France and Germany, although they accepted the reforming decrees of the council, thought proper to remain neutral in the question regarding the papedom. The friendship of the Emperor Frederick III. strengthened the party of Eugenius; and the council gradually melted away, till careful only for personal security, its members, after three years of inactivity, held its last session at B. on May 16, 1443, and removed its seat to Lausanne. Here a few prelates still remained together under the presidency of Cardinal Allemand, till in 1449, after the death of Eugenius, and the resignation of the anti-pope Felix, an amnesty was offered to them by the new pope, Nicholas V., which they joyfully accepted. The B. reforming decrees are contained in the Roman Catholic collection of decrees of councils, and are held to be invalid by the canonists of Rome; yet they are of authority in canon law in France and Germany, where they were included in pragmatic sanctions, although their application has been modified by more recent concordats.

BASEL, TREATY OF. Basel gives its name to two important treaties of peace, concluded there on 5th April and 22d July 1795, between the representatives of the French Republic, Prussia, and Spain, by which Prussia withdrew from the coalition against France, took under her protection all the states of Northern Germany which should, like herself, relinquish the war in which the German empire was engaged, and also gave up to the victorious republic her possessions beyond the Rhine; whilst Spain gave up her portion of St Domingo, and prepared the way for that alliance with France which was afterwards productive of consequences so important.

BASELLA, a genus of plants, generally regarded as belonging to the natural order *Chenopodiaceæ* (q. v.), but by some botanists as the type of a distinct order, *Basellaceæ*. The species are all tropical. *B. alba* and *B. rubra* are known in Britain as stove biennials. They are plants with twining stems, in common use as pot-herbs in the East Indies, and cultivated in China. In the neighbourhood of Paris, they are raised on hot-beds, transplanted into warm borders, and furnish a substitute for spinach in summer. *B. rubra* yields a

very rich purple dye. The great fleshy root of *B. tuberosa*, a South American species, also with a twining stem, is edible.

BASEMENT-STORY. See **STORY**.

BASHIAN, or **BATANÆA**, a country of Palestine, stretching from Mount Hermon in the Anti-Libanus on the north, to the brook of Jabbok on the south, and bounded on the west by the Jordan, its eastern limits not being very clearly defined. Ashtareth and Edrei were its chief cities, and the residence of its kings during the Amoritic dynasty. The last of its Amorite rulers was Og, who with all his sons was killed by the Israelites under Moses, at the battle of Edrei; and the half tribe of Manasseh settled in the land. The men of B. were remarkable for their stature, its pastures for their richness, and its sheep and oxen for their size and fatness. B. belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II.

BASHAW' (Turkish, *basch*; Arabic, *bascha*; Persian, *pasha*, the way in which the word is now commonly written) signifies head, or master, a Turkish title of honour given to viceroys, provincial governors, generals, and other distinguished public men. The term B. is also used to characterise a man of an arrogant and domineering disposition.

BASHEE' or **BASHI' ISLANDS**, a small cluster in the line between Luzon, the chief of the Philippine chain, and Formosa, the lat. and long. being respectively 21° N. and 122° E. Politically, they are a dependency of the Philippines, having been ceded by the Spaniards in 1783. Physically, they form a link in the vast archipelago which, from Formosa to Sumatra inclusive, connects the south-east of China with the west of Malacca. They were discovered in 1687 by Dampier, who called them the Bashi Islands, on account of the popularity among the islanders of an intoxicating liquor of that name.

BASHI-BAZOU'KS are irregular troopers in the pay of the Sultan. Very few of them are Europeans; they are mostly Asiatics, from some or other of the pashalies in Asiatic Turkey. They are wild turbulent men, ready to enter the Sultan's service under some leader whom they can understand, and still more ready to plunder whenever an opportunity offers. During the Russo-Turkish war of 1854, &c., they had many encounters with the enemy in that kind of irregular warfare which the Russians intrust to Cossack horsemen; but the peaceful villagers had almost as much distrust of the B.-B. as of the Russians. When the British government resolved, in 1855, to take into pay a Turkish contingent, to aid in the operations of the war, they intrusted to General Beatson, an officer who had seen much Indian service, the collecting and drilling of a corps of bashi-bazeuk irregulars; but it was a troublesome and unpleasant duty, and the war came to an end before the men were fit for service.

BASIDO'IL, or **BASSADO'RE**, the principal station for British ships in the Persian Gulf, situated at the west end of the island of Kishm.

BASIEN'TO, or **BASEN'TO**, a river of Italy, which, rising in the Apennines, west of Petenza, flows in an east-south-east direction through the province of Basilicata to the Gulf of Taranto, which it enters 25 miles west-south-west of Taranto city. Near its mouth are the remains of the once famous city of *Metapontum*, where Pythagoras ended his days.

BASIL, surnamed **THE GREAT**, and called **St B.**, one of the most eminent and eloquent of the Greek Fathers, was born about 329 at Cæsarea, in

Cappadocia; studied under the heathen philosophers at Athens, and became an advocate in his native city, but afterwards founded a monastic society; was ordained a presbyter in 362; and succeeded Eusebius as Bishop of Casarea in 370, in which office he continued till his death in 379. He resolutely resisted invitations to the court of Julian the Apostate, with whom he had contracted an intimacy as a fellow-student at Athens, and displayed great constancy when the Emperor Valens began to persecute him, on account of his opposition to Arianism. He was engaged in most of the controversies of his time, but conducted controversy in a peaceful and generous manner. His rules of monastic life are still followed in the Greek and other oriental churches, in which he is highly honoured as one of the greatest of saints. In the Roman Catholic Church, also, they are followed in a few convents, styled of the order of *Basilians*. The influence of B. was greatly felt in the promotion of monasticism throughout the West as well as the East, and to him is ascribed the introduction of the three universal monastic vows of obedience, chastity, and poverty. The best editions of his works are that of the Benedictines (3 vols., Par. 1721—1730, fol.), and that of the brothers Gaume (3 vols., Par. 1835—1840, 8vo); but the authenticity of many of the moral and ascetic pieces is doubtful. His anniversary is celebrated, in the Greek Church, on the 1st of January—the day of his death; in the Latin Church, on the 14th of June—the day of his ordination.

BASIL I., the Macedonian, Emperor of the East, was born in a village of Macedonia, in 813 A. D., or, according to others, in 826. His early life is differently related, but his biographers agree that he came to Constantinople when still a young man, and was appointed chamberlain to the Emperor Michael in 861. Subsequently, the emperor made him his colleague in the sovereignty, B. now used his influence to restrain Michael from committing those excesses which rendered him hateful to the people; but when he found his remonstrances unavailing, he headed a conspiracy against him, the result of which was the assassination of the emperor in 867. His first care was to heal the wounds both of the church and the state. He replaced Ignatius upon the patriarchal throne, and dismissed Photius, whom, however, he re-established in his authority the year after. His valour made him the terror of the Saracens, from whom he reconquered Asia Minor. The prodigality of Michael had exhausted the public treasury; by a wise economy, B. refilled it. All extortioners, moreover, were sought out and punished. The profligate companions of the late monarch were condemned to disgorge one half of the largesses which Michael had showered upon them. B. also entered into a treaty of alliance with the Russians of Kiev, to whom he sent missionaries to preach the gospel, and who, from that time, began to embrace Christianity, and acknowledge the authority of the Greek Church. He died in 886, from wounds which he received while hunting a stag. Several letters of his are still extant, besides a book full of wise advice addressed to his son.

BASIL (*Ocymum*), a genus of plants of the natural order *Labiata* (q. v.). The species are all natives of the tropics, or of the warmer temperate parts of the world, and are generally characterised by a pleasant aromatic smell and taste. They are reckoned among *sweet herbs*.—SWEET B. (*O. Basilicum*) is an annual plant, a native of the East Indies, about one foot high, with ovate or oblong leaves, and flowers in whorls of six, which has long been cultivated in Europe for culinary purposes, being used as a seasoning. It has also enjoyed the reputation

of being a palliative of the pains of childbirth.—BUSB B. (*O. minimum*), also a native of the East

Basil (*Ocimum Basilicum*).

Indies, is cultivated for the same purposes, and possesses the same qualities. It is a plant about six inches high, with an orbicular bushy head. In Britain, the seed of both species, obtained from the south of Europe, is generally sown on a hot-bed, from which the plants are afterwards removed to the open ground.—A native British plant of the same order (*Clinopodium vulgare*) bears the name of WILD B., and another (*Acinosa vulgaris*, formerly *Thymus Acinos*) is known as B. THYME. Both are fragrant and aromatic.—B. Vinegar is made in the same manner as Mint Vinegar, by steeping the leaves in vinegar. It is used for seasoning, in winter, when the fresh plant cannot be obtained.

BASILICA, a code of laws of the Grecian empire, the compilation of which was begun in the reign of the Emperor Basil I., the Macedonian, who died in 886—from whom it is generally supposed to have derived its name; completed by his son Leo, the Philosopher; and revised, in 945, by order of Constantine Porphyrogenitus, the son of Leo. There is some doubt whether the work has come down to us as completed by Leo, or as revised by Constantine, and unfortunately we do not possess the whole of the sixty books of which it originally consisted. It was very much an adaptation of the code of Justinian to altered circumstances, and is of great value for the interpretation of the *Corpus Juris*. The principal editions are that of Fabrot (7 vols. fol., Par. 1647), and the recent one of Heimbach (vols. 1—5, Leip. 1833—1850), which includes portions discovered since Fabrot's time. The B. has been the subject of many commentaries.

BASILICA (Gr. *Basilike*, from *Basileus*, a king). Originally, the B. seems to have been the hall or court-room in which the king administered the laws made by himself and the chiefs who formed his council. When monarchy was abolished at Athens, the second of the magistrates who succeeded to the kingly power was called the Archon-basileus,

the first being styled the Archon by pre-eminence; and it is as the court or hall (stoa) in which the Archon-basileus administered justice, that the B. first appears in authentic history. But it was amongst the Romans that the B. attained its chief importance; and in addition to its original use as a court of justice, became a market-place, an

exchange, a place of meeting for men of business generally. It was not till a comparatively late period, however, that a B. was erected at Rome. The first we hear of is the B. Porcia in 182 B.C. From this period till the time of Constantine, they were constructed in great numbers. Some twenty are known to have existed in Rome and latterly,

Section of Trajan's Basilica, Rome.

every provincial town, even those of small extent, had each its B., as that of Pompeii, which is now the most perfect example, still testifies. The most frequented part of the city was always selected for the site of a B.; and as this was almost always the Forum, the words Forum and B. are occasionally used as synonymous by ancient writers. The earliest basilicas were entirely open to the external air. It was usual, for this reason, as well as for the convenience of those who might be compelled to frequent them in bad weather, to select for them a sheltered and convenient position. Latterly, an external wall was substituted for the peristyle of columns with which the original basilicas were surrounded; the external columns, if continued at all, being used only as a decoration, and confined generally to the vestibule. It was in this form that the B. suggested the idea of the Christian Church, as has already been explained under Apse (q. v.); and the readiest mode of explaining the structure of the B. to a modern, is to imagine the process which was then performed reversed, and in place of converting the B. into a church, to convert the church into a basilica. This will be effected by simply removing the roof from the nave, the aisles remaining covered, and even being frequently furnished with galleries, as in Protestant churches. The judge's seat was generally in a circular portion of the building which protruded from its further end, in which the altar was afterwards placed (see APSE), the great entrance to the B. fronting it, as the western door of a cathedral fronts the high-altar. The space required by the prætor for his court was separated by a railing from the other portions of the building, which were devoted to the various purposes we have mentioned. It must not be supposed from this description, that the form of the B. was always the same. Sometimes there was no hemicycle or apse, as in the B. at Pompeii, in which case the tribunal was cut off from the nave; sometimes there were two, as in the B. of Trajan. Again, the B. was sometimes entered, not from the end, but from the sides, where the transepts of a modern church are situated; and at the end opposite that in which the tribunal was placed, there was often a row of small chambers, the uses of which do not seem to be very accurately ascertained, and probably were not invariable. In the plan of the B. of Pompeii, there was an outside stair which led to the upper gallery, which in this case passed entirely round the building.

The gallery was the place to which loiterers usually resorted for the purpose of watching the business

Ground-plan of Basilica of St Paul, Rome.

proceedings below; and the one half of it is said to have been devoted to men, the other, to women. Of the vast size of some of these buildings, we may form a conception from the accommodation which must have been required for the tribunal alone, where, in addition to the curule chair of the prætor, and space required by the suitors and their advocates, seats had to be provided for the *judices* or jurymen, who occasionally amounted to as many as 180.

Many of the principal churches in Italy, and particularly in Rome, are still called *Basiliche*.

The term B. was also applied in the middle ages to the large structures erected over the tombs of persons of distinction, probably from their resemblance to small churches; thus, the tomb of Edward the Confessor, in Westminster, is called a B. (see chronicle of the Mayors of London, quoted by Parker).

BASILICATA, a former province in the south of the kingdom of Italy, now Potenza, includes nearly the same territory as ancient Lucania. Capitanata and Principato Ultra bound it on the N.; Bari and Otranto, on the N.E. and E.; the Gulf of Taranto and Calabria Citra, S.E. and E.; and the Principato Citra and the Mediterranean, on the W. Its area is 4000 square miles. Pop. (1871) 508,880. The capital is Potenza; the other chief towns are Francavilla and Tursi. B. lies mainly on the east side of the main ridge of the Apennines, between it and the Gulf of Taranto. The interior is wild and mountainous, and though there are some large forests in the province, the general aspect is bare and barren. Four considerable rivers—the Basiento, Brandano, Agri, and Sinno—flow through it from the west in an east-south-east direction, forming as many valleys, which slope gradually into an exceedingly fertile plain, varying in breadth from 4 to 10 miles. Here corn is raised in abundance, also wine, hemp, tobacco, and liquorice. Swine, sheep, and goats are reared in the mountainous districts, and silk forms a product of the valleys. B. is greatly in need of good roads, and is much subject to earthquakes.

BASILICON (Gr. 'royal,' or of great virtue), a name given to an ointment composed of yellow wax, black pitch, resin, and olive oil. Hence it was called *Unquentum Tetrpharmacum* (*tetra pharmaka*, four drugs). The resin, wax, and pitch are melted together over a slow fire; the oil is then added, and the mixture, while hot, strained through linen. The straining is directed in consequence of the impurities which resin often contains. B. ointment, or resin cerate, as it is sometimes called, is much used as a gently stimulant application to blistered surfaces, indolent ulcers, burns, scalds, and chilblains.

BASILICON DO'RON (Gr. royal gift), a celebrated prose work of King James VI. of Scotland, written for the instruction of his son, Prince Henry, a short time previous to his accession to the English throne. It consists of three books. The first treats 'Of a King's Christian Duty towards God;' the second, 'Of a King's Duty in his Office;' and the third, 'Of a King's Behaviour in Indifferent Things.' It was first published in 1599; afterwards in London in 1603, 8vo; and translated into Latin by Henry Peacham, who presented it, richly illuminated, to the prince. This Latin version was published in London in 1604, 8vo. A French edition appeared at Paris in 1603, 8vo, and another in 1604, 16mo. Like the royal author's famous work on *Demonology*, and his *Counterblast to Tobacco*, the *B. D.* is now only considered as a literary curiosity.

BASILIDES, an Alexandrian Gnostic, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. Regarding his life, little is known. He is said to have taught in Antioch; afterwards in Persia; and, finally, in Egypt, where he is supposed to have died shortly before the middle of the 2d c. He was a disciple of one Glaucias, not elsewhere mentioned in history, but whom he terms an interpreter of St Peter, and from whom he alleges that he had received the esoteric faith of that apostle. B. probably considered himself a Christian, but his fantastic speculations bore a greater resemblance to the doctrines of Zoroaster, and in some points to the Indian philosophy, than to the religion of Christ. According to the system of B., there are two eternal and independent principles—the one, good; the other, evil. Whatever exists, emanates from these. The good principle—i.e., the Supreme God, or Father—constitutes, with his seven perfections, viz., the Mind, the Word, the Understanding, Power, Excellences, Princes, and Angels, the blessed ogdoad (combination of eight). These seven perfections, or

powers, in which the Supreme God is reflected, are in their turn themselves reflected, but more feebly, in seven other angelic powers, which emanate from them; and so on through the whole circle of emanations, which amount to 365, the mystic number so often inscribed on the symbolic stones in the Gnostic schools (see *ABRAXAS STONES*). Each of these angelic powers governs a world. There are, consequently, 365 worlds, to each of which B. gave a name. The head of the 365th, or lowest world, rules the material universe, which, along with other angels, he also created. He is the God or Jehovah of the Old Testament, and when the earth was divided among the rulers of the material universe, the Jewish nation fell to the share of himself, who was the prince of the lowest class of angels. But wishing to absorb all power himself, he strove against the other angels, and to make them subject to his 'chosen people,' the result of which was war, strife, division in the world, together with the loss of the true religion, to restore which the Supreme God sent the first *Æon* (*Nous*, or Intelligence), who united himself to the man Jesus at his baptism, and so taught men that the destiny of their rational spirit was to return into God. This *Nous*, however (who was the true Christ), did not really suffer crucifixion, for, changing forms with Simon of Cyrene, he stood by *laughing* while Simon suffered, and afterwards returned to heaven. B. also taught the doctrine of a purgatorial transmigration of souls in the case of the wicked. His disciples (Basiliidians) were numerous in Egypt, Syria, Italy, and even in Gaul, where they continued to exist till the 4th c. They were accused by their enemies of Antinomianism and 'magic,' but whether on good grounds or not, cannot be ascertained.

BASILISK, according to ancient and medieval authors, a terrible creature, which, however, may be regarded as entirely fabulous—the fables concerning it being so many and so monstrous, that it is vain to seek for any foundation of truth, or to inquire if any of them originally had reference to any particular creature whatever. The ancients, as Dioscorides, Galen, and Pliny, describe it as a serpent: in the middle ages, it was generally represented as more of a lizard appearance, but provided with eight instead of four feet. It appears to have been at last pretty completely identified with the Cockatrice (q. v.), which was believed to be generated in a very wonderful manner, being produced from an egg laid by an extremely old cock, and hatched by a toad; for which reason we find the B. sometimes figured with something like a cock's head. The B. was the king of dragons and serpents, all of which left their prey to it whenever it approached; whence its name, *basiliscus* (Gr.), diminutive of *basileus*, a king—sometimes exactly translated into Latin by *regulus*. It had some prominences on its head, which, when it was figured in books, assumed very exactly the appearance of a crown. It inhabited the deserts of Africa, and, indeed, could only inhabit a desert, for its breath burned up all vegetation; the flesh fell from the bones of any animal with which it came in contact, and its very look was fatal to life; but brave men could venture into cautious contest with it by the use of a mirror, which reflected back its deadly glance upon itself.—These things are still necessary to be mentioned, were it only on account of the allusions to them by poets and other writers.—The blood of the B. was, of course, extremely valuable to magicians. It occupies an important place in some of the legends of the saints, and Pope Leo IV. is said to have delivered Rome from a B. whose breath caused a deadly pestilence.

The word B., and its equivalent *regulus*, are some-

times used in the Latin Vulgate, where the authorised English version of the Old Testament sometimes has *adler*, and sometimes *cockatrice*; but no trace of any of the marvels concerning the B. is to be found there.

BASILISK (*Basiliscus*), in modern Zoology, a genus of saurian reptiles of the family of *Iguanide* (see *IGUANA*), differing from the iguanas in the want of the dewlap or appendage of skin under the throat, and of the series of pores on the inside of each thigh; also in having a continuous elevated crest along the back and tail, capable of being erected or depressed at pleasure, and apparently intended to aid the motions of the animal in water like the corresponding fin of a fish.—The basilisks are remarkably adapted both for climbing trees and for swimming. Their feet are not webbed, their toes rather long. They are perfectly harmless creatures, very active and lively, and it is difficult to say why they should have received the name of the fabulous monster of antiquity, unless because their appearance is far from agreeable to those unaccustomed to it, and perhaps because an appendage at the back of the head may have been thought to represent the crown of the dragon king. This appendage is most conspicuously developed in the Mitred or Hooded B. (*B. mitratus*), a native of the tropical parts of America, and consists of a hood or membranous

Hooded Basilisk.

bag, capable of being dilated with air, and then about the size of a pullet's egg, which is supposed, notwithstanding its extremely different situation, to have a use somewhat analogous to that of the air-bladder of fishes. The mitred B. is from 25 to 30 inches long, including the long and very tapering tail.—Another and larger species, of a generally greenish colour (*B. Amboinensis*), inhabits the islands of the Indian Archipelago, and is much used there for food. Its flesh is said to be very white and tender. It is often seen on the branches of trees above water, into which it drops when alarmed.

BASIN, a geographical term of considerable importance. The *B.* of a river is the whole tract of country drained by that river, and is, of course, more or less concave. The line or boundary which separates one river-basin from another is called the water-shed. By tracing these water-sheds, the whole of a country or continent may be divided into a number of distinct basins; and this is one of the most instructive elements in the physical geography of a country. The *B.* of a lake or sea, again, is made up of the basins of all the rivers that flow into it.

BASIN, in Geology, is a term applied to depressions in the strata, in which beds of a later age have been deposited. Thus, the London B., consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the south, and by the chalk-hills of Berks, Wilts, Bucks, and Herts on the north. The term has also been applied to synclinal depressions of strata, which have been produced by the elevation or depression of all the strata contained in the B., as the coal-B. of South Wales.

BA'SINGSTOKE, a town in the north of Hampshire, 46 miles west-south-west of London. It is a place of much activity, being situated at the junction of five main roads to London from the south and west of England. The country around is fertile and wooded. The chief trade is in corn, malt, coal, and timber. Near the town is a tract of 108 acres, on which every householder has the right of pasturage. There is also, not far from the town, an ancient camp, surrounded by an irregular oval embankment, 1100 yards in circumference, with an entrance on the east and west sides. Basing House Castle, belonging to the Marquis of Winchester, long withstood the forces of the Commonwealth, but Cromwell at last took it by storm, and burned it to the ground in 1645. Pop. (1871) 5374.

BA'SKERVILLE, JOHN, a celebrated English printer and letter-founder, was born in 1706 at Wolverley, in Worcestershire. He became a writing-master in Birmingham, and afterwards carried on the business of japanning there with great success. He began about 1750 to make laborious and costly experiments in letter-founding, and succeeded in making types which have scarcely yet been excelled. He printed an edition of Virgil at Birmingham in 1756, which was followed by other Latin classics, a few English and Italian authors, and a New Testament (Oxf. 1763), much admired as specimens of printing, although not otherwise possessing high merit. His services to the art of printing met with little encouragement and no requital. He died in 1775. He was a man of obliging disposition, but of a gloomy temperament, and condemned all religious service as superstition. B. was buried in a tomb of masonry in the shape of a cone, under a windmill, in his garden; but the ground becoming valuable for building purposes, his remains were exhumed in the summer of 1821, and deposited in the vaults of Christ Church, in the neighbourhood of the spot where they were originally interred. Baskerville editions of works are now prized by persons of taste.

BA'SKET (Welsh, *basged*, or *basgaved*, a netting or weaving of splinters), a domestic utensil, usually made of willows, reeds, or chips, interwoven, although sometimes the materials are gold, silver, iron, glass, &c. Baskets have been in use from very early ages. The Israelites were commanded (*Dentronomy* xxvi. 2) to offer unto the Lord, as soon as they came into possession of the land of Canaan, 'the first of all the fruit of the earth' in a *basket*. The baskets used on such occasions by the rich Jews were made of gold and silver, and were returned to the offerers; but those used by the majority of the people were of barked willow, and were retained by the priests. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of B.-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Diemen's Land. In this country the willow is chiefly used in the manufacture of baskets. In several parts of England and Scotland, great attention is paid to the cultivation of the willow; and judging from the statements of some of the cultivators, the returns yielded are very satisfactory. One calculates his profits at £18, 10s. per acre, and another at £10 per acre. The tools required being few and inexpensive, a large number of poor persons are engaged in the manufacture of baskets, that are hawked about the streets by their wives and children. B.-making also forms a part of the industry of almost all blind asylums. Baskets are of all shapes and sizes, and their uses are so well known to all as to

BASNAGE DE BEAUVAL—BASS ROCK.

obviate the necessity of description here. Baskets to the value of £30,000 or £40,000 are annually imported from the continent.

BASNAGE DE BEAUVAL, JACQUES, the most distinguished of a distinguished French family, mostly supporters of the Protestant cause, was the son of Henry Basnage, an able advocate in the parliament of Normandy, and was born at Rouen, August 8, 1653. Having studied theology at Geneva and Sedan, he became pastor of the reformed church in Rouen (1676). That church being interdicted in 1685, B. obtained leave to retire to Holland, where he finally settled as stipendiary minister of the Walloon Church in the Hague, having gained the friendship of the Grand Pensionary Heinsius. Here, while zealously discharging his religious duties, he was called upon to take an active part in state affairs, particularly in negotiating the defensive alliance concluded between France, England, and the States-general, 14th February 1717. Amid all these duties and distractions, B. cultivated literature with ardour, and was no less distinguished for his extensive learning than for the polish of his manners and the integrity of his character. B., who commanded in a singular degree the esteem both of Protestants and Catholics, died on the 22d September 1723.

His chief works, which have been frequently laid under contribution without being named, are *La Communion Sainte* (Rott. 1688), a work approved even by Catholics, and often reprinted; *Traité de la Conscience* (Amst. 1696, 2 vols.); *Histoire de l'Eglise* (Rott. 1699, 2 vols. fol.); *Histoire des Juifs* (Rott. 1706, 5 vols.), one of B.'s best productions, and translated into English by Th. Taylor (Lond. 1708); *Dissertation Historique sur les Duels et les Ordres de Chevalerie* (Amst. 1720).

BASQUE PROVINCES, a district of Spain, in lat. 42° 25'—43° 28' N., and long. 1° 44'—3° 25' W., and comprising the three provinces of Biscay, Guipuzcoa, and Alava, which constituted the ancient *Cantabria*. They form a sort of triangle, the base of which is the Bay of Biscay on the north, and the apex the town of Logrono in the south; the boundary-lines of Navarre on the east, and Santander and Burgos on the west, forming the two sides. The total area of the provinces is about 3000 square miles, and the population in 1867, 461,850. The surface of the B. P. is very mountainous, particularly that of Alava, which is everywhere cut up into deep narrow valleys by offsets from the main chain of mountains. The rivers of Biscay and Guipuzcoa, none of which are important, empty themselves after a short course into the Bay of Biscay; those of Alava flow down the opposite slopes into the Ebro, which carries their waters to the Mediterranean. The climate in all the three provinces is, on the whole, mild and salubrious. The general aspect of the country is very picturesque, the hills in most cases being covered with wood to the very summit. The principal trees are oak, beech, and chestnut. The fruit of the chestnut forms an article both of diet and of export. The soil in the valleys and plains, though not very rich, has been rendered productive by the energy of the people, who spare no labour in the cultivation. But as yet, science and machinery have done little or nothing to assist nature and manual exertion. A spade, or prong-fork, is the chief mechanical aid the Basque peasant has. The farms are small, usually only about four or five acres, and rarely more than can be managed by the farmer and his family. Notwithstanding, the roads and agriculture of these provinces contrast very favourably with those of Spain generally. The products are wheat,

barley, maize, flax, hemp, &c.; the wheat, however, only ripening in the most favoured localities. Pasture-land occupies a considerable portion of the surface; and a poor wine, called *chacoli*, is made in large quantities, and forms the chief beverage of the inhabitants, who appear to relish it, although it is disliked by all travellers.

There are numerous rich veins of iron in the hills, which are extensively wrought; and copper and tin are also obtained, as well as marble of various kinds, porphyry, and jasper. The fisheries employ a goodly number of people on the coast, and many are engaged in the preparation of charcoal. The Basques are said to be the first Europeans who went to the whale-fishing.

The Basques are a simple, brave, and independent people, willing to undergo any hardships rather than surrender their mountain-freedom. None of their many invaders were ever able to effectually subdue or expel them. The B. P. still retain a separate constitution, guaranteeing them many political and fiscal privileges not possessed by the rest of Spain. They have freedom from conscription, and free-trade in salt and tobacco, upon which a heavy duty is levied in the adjoining provinces. The Basques are even prouder than Spaniards, and the mere fact of being born in their territory secures the privilege of 'universal nobility.' *Euscaldunac* is the name the Basques give themselves; their country they call *Euscaleria*; and their language, which is peculiarly their own, *Euscara*—the prefix *Eusc* being 'the old *Osc*, *Vesc*, *Vasq* of Italy and Iberia.' The origin of the Basques is doubtful. Humboldt considers them descendants of the ancient Iberi, who once occupied the whole of the peninsula, and spoke the language now confined solely to the B. P.; while Mr Borrow's opinion is, that the language is of Tatar origin. The Basques are fond of music, and on their chief holiday, Sunday, they indulge in singing, dancing, and single-stick, which they enjoy immensely. For a more particular account of the B. P., we would refer to that excellent manual, *Ford's Hand-book of Spain*.

BAS-RELIEF. See ALTO-RELIEVO.

BASS. See BASE.

BASS ROCK, a remarkable island-rock near the mouth of the Firth of Forth, about 2 miles from Canty Bay, Haddingtonshire; opposite the ruined castle of Tantallon. It is composed of fine granular greenstone or clinkstone, and is about a mile in circumference, nearly round, and 350 feet high. It

Bass Rock.

is inaccessible on all sides except the south-west, where it shelves down to the water, and there the landing is difficult, and almost impossible, when there is any swell. On the west, north, and east,

the precipices rise perpendicularly out of the sea, often to the height of 200 feet. These are the abode of immense numbers of solan geese (it is estimated that 10,000—15,000 of these fowls resort here annually) and other aquatic birds, which give to the surface of the rock quite a snowy appearance in the distance. A huge cavern traverses the rock from north-west to south-east, and is accessible at low tide. There is a spring on the island, and a few sheep are pastured on it, the mutton of which is much prized. How early the Bass was tenanted, is doubtful; but there is a tradition to the effect that St Baldred resided on it as early as the 7th c. It is also not very certainly known when the Bass was first fortified, but it formed a retreat for the son of Robert III., afterwards James I. of Scotland, before his nineteen years' captivity in England. James VI. visited the Bass in 1581, and was anxious to obtain it for state purposes; but its owner, 'Lauder of the Bass,' refused to part with it. The Registers of the Church of Scotland were sent to the Bass in 1651, for preservation from Cromwell; but the Protector forced their surrender in the following year. In 1671, Charles II. purchased the rock for £4000, and within its dreary dungeons many of the most eminent of the Covenanters were confined during that and the following reign. It is a somewhat curious fact, that the Bass was the last spot in the British Islands which held out for the Stuarts. A mere handful of adventurers in the Jacobite interest, 24 in number, had the address to capture the island, and to retain it in name of King James, from June 1691 till April 1694, against all the forces which the government of William III. sent against them; at last, the spirited little garrison surrendered on honourable terms, and only from a consciousness of failing provisions. For an account of this romantic incident, see *Pictorial History of England*, vol. iv. p. 16, new edition. In 1701 the fortifications were demolished by order of William III. Five years afterwards, the Bass passed into the possession of Sir Hew Dalrymple, to whose lineal descendant it now belongs. The king of the Belgians (then Prince Leopold) visited the rock in 1819, and, three years afterwards, George IV., on passing it on his voyage to Scotland, was honoured with a royal salute from some guns then on it. The Bass is let to a 'keeper,' who pays a considerable sum for it annually, the rent being made up by the money obtained for the young geese, which are used as food, and by the fees exacted from visitors to the rock. There is an interesting volume on the Bass, historical, geological, and botanical, the joint production of Dr M'Crice, jun., Hugh Miller, and Professors Fleming and Balfour.

BASSA, or **BATTA**, an excellent port on the Grain Coast, Guinea, formerly much resorted to by trading-vessels for coarse pepper; latterly, for slaves. The country around produces lemons, oranges, and bananas in abundance.

BASSANO, a town of Italy, in the former province of Venice, 19 miles north-east of Vicenza, on the Brenta—population about 12,000. It is situated on a rising-ground in an extensive plain, and has a considerable trade in wine, olives, silk, leather, &c., as well as a great printing establishment. It has 30 churches, and a number of fine palaces. One of its gates, the work of Palladio, is greatly admired. It is famous for a victory of Bonaparte over the Austrian field-marshal, Wurmser, on 8th September 1796, and was the scene of other battles between the French and Austrians in the wars of that period.

BASSANO (or, more properly, **GIACOMO DA PONTE**), an artist of great eminence, was born at

Bassano, in the north of Italy, in 1510. He was first educated in the principles of his art by his father, Francesco da Ponte, who was himself a painter of considerable merit, and afterwards visited Venice, where he became a pupil of Bonifazio Veneziano. Here he enjoyed opportunities of studying the designs of Parmegiano, Titian, Tintoretto, and others. The earlier stages of his professional career clearly indicate that these great painters had kindled a rich and emulative enthusiasm in B., for his works display a loftier genius, both as regards conception and execution, than at a later period. His principal effort, belonging to this higher epoch, is a fresco painted on the front of the house of the Michelli family. It represents Samson destroying the Philistines; the figure of the mighty Israelite being considered not unworthy of Michael Angelo. After his father's death, he returned to Bassano, where he devoted himself to a simpler style of art. From this time, however, dates his celebrity. He may even be said to have founded a school, whose peculiarity was the delineation of common things, markets, fairs, country inns, farm-yards, &c. He had a passion for introducing cattle into his pictures, even under the most inappropriate circumstances. The special merits of this lower style, into which B. finally lapsed, are its vigorous and picturesque colouring, and its accurate imitation of nature. B.'s landscapes, however, betray a comparative ignorance of perspective. Occasionally, during his later years, B. shewed that his early love of the sublime was not wholly extinguished, by painting several altar-pieces, which exhibit a noble grandeur of execution, such as the 'Entombing of Christ,' in the church of St Maria, Padua; a 'Nativity,' now in the Louvre, Paris; 'St Roche interceding with the Virgin for a People infected with the Plague,' at Vicenza; 'The Wise Men's Offering,' and the 'Seizure of Christ in the Garden.' His rural pictures are abundant in the Italian galleries and in English collections. B. also painted heads of several of his contemporaries, Tasso, Ariosto, &c., and was in high favour with the Emperor Rudolph II., for whom he also executed several works. He died in 1592. He left four sons, who all followed their father's profession, but were not marked by any special originality of manner.

BASSE (*Labrax*), a genus of sea-fishes of the Perch (q. v.) family, distinguished from the true perches (*Percæ*) by having the tongue covered with small teeth. The species are found on the shores both of Europe and America. The only British one is the Common B. (*L. lupus*), a fish which in its fins, scales, &c., much resembles a perch, but has a more elongated and salmon-like form. It is pretty abundant on some parts of the British coasts, and is not unfrequently taken by angling from the rocks, or by small seine-nets on sandy shores; often, also, by the hand-line and by the long line. It is a strong, active fish, and was well known to the ancients; *labrax* is its Greek name; the Romans called it *lupus* (i. e., wolf), from its remarkable voracity. It is much esteemed for the table. It sometimes attains a large size, fifteen pounds or more in weight, but is generally much smaller. It not unfrequently ascends rivers to some distance, and the experiment of keeping it in a fresh-water pond has even been tried with success.—The Striped B., or Rock-fish of the United States (*L. lineatus*), very nearly resembles the common B., but attains a larger size, and is marked by seven or eight longitudinal black lines. The name Stone B. is given to the *Polyprion cernium*, a fish very rare on the coasts of Britain, but abundant in more southern parts of the Atlantic Ocean, as far as the Cape of Good Hope, and found on the

American coasts and in the Mediterranean. In general appearance, it resembles the common perch more nearly than the B., but differs from both in having only a single elongated dorsal fin. It sometimes follows ships of which the bottom is covered with barnacles, is easily taken, and is esteemed excellent for the table.

BASSE-CHANTANTE, in Music, the higher of the two basses in a score, partaking of more melody, and performed by the violoncello.

BASSE-CONTRAÎTE, a French term in music, meaning a bass melody of a few bars repeated throughout the piece, while the other parts vary.

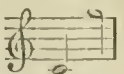

BASSEIN, the name of two cities in India.—1. B., in *Pegu*, the capital of a district of the same name, stands on the left bank of an arm of the Irrawaddy, which joins the Bay of Bengal a few miles to the south of Cape Negrais. It lies in lat. 16° 45' N., and long. 94° 50' E.; and though it is 90 miles from the sea, yet it is easily and safely accessible to the largest ships. In a military view, also, the place is important, as it completely commands the navigation of the stream. It was captured by its present masters, the British, in 1852, the first year of the second Burmese war. Its estimated population is about 3000.—2. B., in the *presidency of Bombay*, is situated on an island of the same name; lat. of the island, 19° 20'—19° 25' N., and long. 72° 48'—72° 54' E. It appears to be the mere wreck of former grandeur, having been found by Bishop Heber, in 1825, with many churches and convents, to be altogether uninhabited and desolate. In 1531, it was ceded to the Portuguese; in 1765, after a possession of 231 years, it was wrested from them by the Maharrattas; in 1780, it surrendered to the British, after a regular siege of twelve days. The island, which contains about 35 square miles, is separated from the continent by a narrow channel, which, as a shelter for shipping, constituted its value in the eyes of the Portuguese. Historically, B. is of some interest, having been promised, though never delivered, as part of the dowry of Charles II.'s Portuguese consort.

BA'SSES, two ledges of rocks to the south-east of Ceylon, distinguished as *Great* and *Little*—the former group being more to the south-west, and the latter more to the north-east. They lie in N. lat. 6° 11'—6° 26', and in E. long. 81° 40'—81° 59'. Their importance arises merely from their position, which is in a great thoroughfare of traffic.

BASSE-TERRE, a French term, equivalent to the English *Lowlands*, or, rather, *Lowland*, appropriately applied to several localities in the West Indies.—1. The capital of St Kitt's, on the west coast, in lat. 17° 17' N., and long. 62° 42' W. It is a low, hot, dusty place, standing at the outlet of a lovely valley of the same name. Its population is about 7000; and its trade, as the port of the island, is considerable. The designation of the valley and town is a memorial of the former occupation of the half of St Kitt's by the French.—2. The capital of Guadeloupe, giving its name to the larger of the two islets into which Guadeloupe is divided by an arm of the sea, known as Salt River. B. stands on the south-west coast, in lat. 16° N., and long. 61° 44' W., having nothing worthy of the name of harbour, but merely a roadstead. It contains about 6000 inhabitants.—3. The chief town of Marie Galante, a dependency of Guadeloupe, which is about 12 miles to the north-west. It is otherwise ambitiously called Grand Bourg.

BASSET HORN (corno di bassetto), the richest and softest of all wind-instruments, invented in Passau, in 1770, improved by Lotz in Presburg, in 1782. It is similar to a clarinet in tone and

fingering; its compass is two and a half octaves,

the notes written for it being from 

but the instrument sounds a fifth lower than the notes are written.

BA'SSIA, a genus of plants of the natural order *Sapotaceæ* (q. v.). The species are trees, tropical or sub-tropical, the flowers of which are remarkable for their fleshy corolla, and for the abundance of oil or butyraceous fat which the seeds contain, and which is used for many purposes by the inhabitants of the countries to which they are indigenous. The fruit has a pulpy rind, and 3 or 4 1-seeded cells. The ovary has 8 cells; but some of them are always abortive. The **BUTTER-TREE**, described by Mungo Park as growing in the interior of Africa, in the country of Bambarra, has been supposed to belong to this genus, and named *B. Parkii*. According to the eminent botanist Robert Brown, however, the seed of the butter-tree, as figured by Park, scarcely belongs to the genus B., but rather to the nearly allied genus *Pittularia* or *Lucuma*. It produces the *Galam Butter*, also called *Shea Butter* (i. e., Tree Butter), which is highly valued, and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit, which resembles an olive, are dried in the sun, or in a peculiar kind of oven, and the kernels are then boiled in water, in order to obtain the butter from them, which not only keeps for a whole year without salt, but is also whiter, more solid, and more pleasant to the taste than the butter of cows' milk. This butter is used both as an article of food and of medicine. It has been supposed that the introduction of this tree might be of great importance in other tropical countries.—The **MADHUCA**, **MAIWA**, or **MAHOWA** Tree of the East Indies (*B. latifolia*), is described as resembling a good oak in size, and is a valuable timber-tree. It is found in the mountainous parts of the Circars, Bahar, Bengal, &c. Its flowers are eaten raw, and a kind of arrack or spirit is distilled from them. The seeds yield, by expression, a considerable quantity of a concrete greenish-yellow oil, which is used for lamps, and occasionally for frying articles of food.—The Indian **BUTTER-TREE**, or **PHULWARA** or **FULWA** Tree (*B. butyracea*), is found in some of the more mountainous parts of India, and attains a height of 50 feet. Its timber is light and of no value. The leaves are 6—12 inches long. The fruit is of the size of a pigeon's egg, and although eaten, is not much esteemed; but from the seed, a concrete oil or butter is obtained, by expression, of a delicate white colour, much valued for medicinal uses, and as an unguent. It keeps for many months without becoming rancid.—The seeds of the **ILLUPIE-TREE**, or Indian **OIL-TREE** (*B. longifolia*), a native of Coromandel, yield a large quantity of oil, which is used for lamps, for soap-making, and also by the poorer classes in cookery. The fleshy flowers are eaten, and are much esteemed; and the timber is very hard and durable, so much so, indeed, as to be compared in quality to teak.

BASSINET. See **HELMET**.

BASSOMPIERRE, **FRANÇOIS DE**, Marshal of France, was born in 1579 at Harnel, in Lorraine. Belonging to one of the oldest French families, he came, at the age of 20, to the French court, where he gained the favour of Henry IV. After the murder of Henry IV., he attached himself to the party of the queen, who appointed him colonel of the Swiss Guards; but on the murder of Concini, he sought to establish himself in the favour of the young king, and when the quarrel broke out betwixt

mother and son, he particularly contributed to the overthrow of the former. He was raised to the rank of Marshal of France in 1622; was sent on embassies to Spain, Switzerland, and England; was actively employed in the siege of La Rochelle; took the pass of Susa by storm in 1629; and commanded for a little while the troops raised in Languedoc against the Huguenots. He became, however, an object of suspicion and dislike to Richelieu, who caused him to be cast into the Bastille in February 1631, from which he was not liberated until the death of Richelieu, in 1643, after he had been twelve years imprisoned. He died in 1616. He was an accomplished courtier, extravagant, and excessively addicted to gallantries. At the time of his arrest, he destroyed 6000 love-letters. His *Mémoires* (2 vols., Cologne, 1665; 4 vols., Amst. 1723), written in the Bastille, are rendered interesting by their spirited style.

BASSOON (Ital. *Fagotto*), a well-known wind-instrument of the reed species, made of maple-wood or plane-tree. The B. is an Italian invention; its name *fagotto*, meaning a *bundle*, probably from its being made in different pieces laid one against the other. The French call it *Basson de haubois*; the Germans retain its Italian name. Its invention is attributed to Canonicus Airanio, in Ferrara, in 1539. In the middle of the 16th c., it had already reached great perfection. Sigmund Schnitzer, in Nürenberg, who died in 1578, was a celebrated maker. The B. consists of a bored-out tube of wood in several pieces, fixed together alongside each other, so as to bring the holes and keys within the reach of the fingers of each hand. The B. has, in general, not less than 8 holes and 10 keys. In the narrow end of the wooden tube is fixed a small tapering brass tube in the form of an S, on the end of which is placed the reed for producing the tone. The compass of the B. is from

but the best tones are those

from . The lowest C sharp, and

B natural, are wanting. The notes for the B. are written on the bass clef for the lower part, and on the tenor clef for the higher. The best keys for the B. are E flat, B flat, F, C, G, D, and A; all the other keys are more or less difficult. For military bands there are different sizes of bassoons—one a fourth lower; another, the contra B., an octave lower; and a third, the tenor B., a fifth higher—all of the same construction. The best instruction books for the B. are by Almenræder, Fröhlich, Ozi, and by the Paris Conservatorium. B. is also the name of an organ-stop, the pipes of which are made to imitate the tones of the instrument.

BASSORA, **BUSSORA**, or **BASRAH**, a town of Asiatic Turkey, pashalic of Bagdad, is situated on the western bank of the Euphrates, here called the Shat-el-Arab, about midway between the mouth of the Tigris and the Persian Gulf, from which it is 70 miles distant. Lat. 30° 30' N., long. 47° 34' E. There are many gardens within the walls of the city, and many plantations of roses around it, but it is very dirty. The river, which is navigable up to B. for ships of 500 tons, is there divided into a number of channels, and by evaporation and frequent overflowing, makes the climate very unhealthy. The inhabitants, 60,000 in number, are for the most part poor Arabs and Persians; the officials and military alone are Turks. Commerce is in the hands of Armenians. Most of the houses are low huts, built

of unburned bricks. An extensive trade is carried on in the exchange of the productions of Turkey and Persia with those of India, and also in European goods, particularly articles of British manufacture. Amongst the exports, are strong and beautiful horses. Caravans travel to Persia, and also by Bagdad and Aleppo to Constantinople. To guard against the incursions of the Arabs, a wall of about 94 miles in length has been erected in the neighbouring desert, at all the gates of which a watch is maintained. B. was founded in 636 by the Calif Omar, and soon became one of the most famous and opulent cities of the East. The possession of it has been the subject of many contests between the Turks and the Persians. It is a place of great note in the history of Arabic literature. A number of Arabian poets and scholars derive from it the surname of Basri.

BASSORA GUM, a whitish or yellowish-opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water. Its source has not been satisfactorily ascertained.

BASSO-RILIEVO. See **ALTO-RILIEVO**.

BASS'S STRAIT separates Tasmania from Australia. It contains many islands, chiefly in its southern section, and is greatly beset by coral-reefs. It runs almost due east and west, has an average breadth of about 200 miles, and is pretty nearly bisected by the parallel of 40°.

B. S. deservedly bears the name of its explorer, who, without having been professionally a seaman, is entitled to a very high place among maritime discoverers. After having made shorter excursions from Port Jackson, in a mere wherry of 8 feet in length, Mr Surgeon Bass resolved to settle, in a whaling-boat, the question as to the connection or separation of New Holland and Tasmania. In his frail craft, he penetrated as far as Western Port, near the entrance of Port Phillip, where, from the trending of the land and the swell of the sea, he inferred that he had most probably reached the open ocean. He did not rest contented, however, until, in a tiny bark of 25 tons, he actually circumnavigated Tasmania. The discovery, so deliberately prosecuted, and so satisfactorily completed, soon proved to be fertile of results; for in 1802, only four years after the exploration of Bass, Port Phillip was entered; in 1804, Tasmania was colonised; and now the strait is the highway for a trade of more than a million sterling between Victoria and Tasmania—a trade which has very recently received an additional impetus from the laying of a telegraphic cable between the two colonies at their joint expense.

BAST, or **BASS**, also called *Inner Bark*, *Liber*, or *Endophlæum* (see **BARK**), the fibrous inferior layer of the bark in the stems of exogenous plants, which is particularly conspicuous in exogenous trees, as a peculiar substance interposed between the true bark and the wood. It consists in great part of saps-vessels (laticiferous vessels, see **LATEX** and **SAP**) lying close together, and assuming the appearance of tough fibres. In a fresh state, it has generally a whitish colour; and it is often composed of several layers, to which, however, the collective name of B.-layer is very often applied. The uses of this part of plants in the arts are very numerous; the fibres of hemp, flax, jute, &c., are nothing else than bast. The name B., however, is more commonly applied to the inner bark of trees, and is originally Russian, designating the inner bark of the lime-tree (q. v.) or linden-tree, which is employed for making a coarse kind of ropes, mats well known as B.-mats, and a kind of shoes much worn by the Russian peasantry. The trees are cut when full of sap in spring. For B. to be plaited into shoes, young stems of about

three years old are preferred; and it is said that two or three are required to make a single pair of shoes. Trees of six or eight years old are cut down for the better kind of mats, which are exported in large quantities from Russia, and particularly from the port of Archangel, and so much used for packing furniture, for covering tender plants in gardens, supplying strands with which plants are tied, &c. The trees from which the B. is taken are very generally burned for charcoal. After the bark is dried, its layers are easily separated by steeping in water. The finest layers are the inner, and the coarser are the outer ones.—The manufacture of B.-mats is nearly confined to Russia and Sweden. Not fewer than 3,500,000 are annually exported from Russia, and from 500,000 to 800,000 are annually imported into Britain. A few are made in Monmouthshire. Lime-tree B. is used in the south of Europe for making hats. The name B.-hat is, however, very often given to a hat made of willow-wood plaited off in thin ribbons, and plaited in the same manner as straw-hats. The inner bark of *Grewia didyma*, a tree of the same natural order with the lime-tree, is used for making ropes in the Himalaya Mountains.

BASTARD BAR. In popular speech we frequently hear of a *Bar-sinister*, as a mark of bastardy. But a bar-sinister, strictly speaking, is an impossibility, inasmuch as the Bar (q. v.) is not formed of diagonal but of horizontal lines. A Bend-sinister (q. v.), which, by the French, is called a bar, has with more reason been confused with the true mark of illegitimacy, and has on that account been avoided even by heralds. But the real B. B. differs very essentially from the bend-sinister, being half of the scarp, which again is half of the bend-sinister.

Bastard Bar.

‘The half of the scarp,’ says Nisbet, ‘with the English, is called a *Batton-sinister*; by the French, *Baston-sinister*; it is never carried in arms but as a mark of illegitimacy, commonly called the *Bastard-barr*.’ In modern practice, the baton does not touch the extremities of the shield, or of the quarter in which the paternal arms are placed, but is *couped*—that is, cut short at the ends. In this form the baton, when used as a mark of illegitimacy, is placed over the paternal coat of the bastard, whether used singly or in a quartered shield. Nisbet informs us that the baton-sinister, both in England and Scotland, is comparatively of modern invention, natural children in earlier times not having been permitted to assume the arms or even the names of their fathers. ‘The unlawful children of John of Gannt, Duke of Lancaster, begot on Katharine, daughter of Sir Payen Roat Guyn, King of Arms, did not carry the arms of their father the king, though nobilitate, with a baton-sinister, as now used; . . . but after the legitimation of these three natural sons by act of parliament, they then assumed the sovereign ensigns of England, with a *bordure gobbonated* (q. v.), *argent and azure*.’

Earl of Murray's Arms.

According to the practice of France, which probably was followed in England also, the bastard could not cancel or alter the baton without the consent of the chief of the family, or the authority of the sovereign. Even where the baton was not removed, it was common to grant his permission to

carry it *dexter*, in place of *sinister*. Charles VII. of France allowed John, the Bastard of Orleans, for his valour against the English, to turn his *sinister* traverse to the *dexter*, with which he and his issue afterwards *bruised* the arms of Orleans, as dukes of Longueville. The same privilege was granted to James, Earl of Murray, natural son of King James V. of Scotland, by his sister Queen Mary, and he thenceforth carried the Lion and tressure of Scotland thus bruised, quartered with the fendal arms of the earldom of Murray. The general practice of the milder heraldry of our own day is to substitute the gobbonated *bordure* for the B. B., not only in the case of the legitimate children of bastards, but of bastards themselves.

BASTARD EIGNÉ is the name given in English law-books to an eldest son illegitimate by birth, but whose father and mother were subsequently married, and had other children born in wedlock. See **BASTARDS AND BASTARDY**.

BASTARDS AND BASTARDY. Bastards, as described by Blackstone, are such children as are not born either in lawful wedlock, or within a competent time after its determination. The Scotch lawyers, again, true to their peculiar law of marriage, define a bastard as a child born of a woman, who was not married to the father at the time of conception, and who was never thereafter married to him. It was at one time the law of England, when divorces *a mensa et thoro* were adjudged by the ecclesiastical courts, that if the wife had children during the legal separation occasioned by the former kind of divorce, such children were *primâ facie* bastards—for the law presumed the parties to live conformably to the sentence of separation. But in modern times, the presumption has changed, and now always favours legitimacy.

Bastards are incapable of inheriting real property; nor can they claim any share of personal estate as next of kin to a party dying intestate. They are said to be *fili nullius*, or *fili populi*, the sons of nobody, or the sons of the people, having no inheritable blood in them. As laid down, however, in many authorities, and among others in the last (4th) edition of Stephen's *Commentaries*, there is an exception to this rule in the case of a bastard *eigné* and *mulier puisné*, and where, it may be observed, the principle of the Scotch law of legitimation appears to some extent to be admitted. Thus, where a man has a bastard son, called a *bastard eigné* (q. v.), and afterwards marries the mother, and by her has a legitimate son, who, in the language of the law, is called a *mulier puisné*—if the father dies, and the *bastard eigné* enters upon his land, and enjoys it to his death, and dies seised thereof, whereby the inheritance descends to his issue, the *mulier puisné* and all other heirs are totally barred of their right, because the laws of England pay such a regard to a person in the situation of the *bastard eigné*, that after the land had descended to his issue, they would not unravel the matter again, and suffer his estate to be shaken. But this indulgence was shewn to no other kind of bastard; for if the mother was never married to the father, such bastard could have no colourable title at all. And the above exception would almost appear to be the law of England at the present day. But a recent statute renders this opinion somewhat doubtful, for by the 3 and 4 Will. IV. c. 27, s. 39, it is enacted that no *descent cast*, after the 31st day of December 1833, shall defeat any right of entry or action for the recovery of land. By *descent cast* is meant an heir of a party who had contrived illegally to enjoy the land without challenge during his life, and was thereby enabled to transmit it to his heir, who thenceforward had a title which could

not be impeached either by the original rightful owner, or by any of his descendants. The above statute, however, has cut off the rights in this behalf of all such descents cast, and the true owner can now, under the provisions of the act, always recover. But is the son of a *bastard eigné* such a 'descent cast' as is contemplated by the 3 and 4 Will. IV. c. 27? It may be doubted whether he is. The expression 'descent cast' is generally applied in law-books to the case of a *stranger who*, under a forcible, wrongful, and illegal entry on the land, had succeeded in diverting the inheritance from the direct and original channel. But such is not the position of a *bastard eigné*. He is not, in any sense of the word, a stranger; nor is the above privilege or favour allowed him and his family at all in respect of his position towards, or of anything that can be called his title to the *land*, but such privilege and favour are given him solely because of his *peculiar bastardy*. In fact, it is just because he is *not* a stranger, but his father's eldest son by birth, that the law from ancient times decided that he should not be altogether deprived of what otherwise would have been his natural rights. The rule, as we have suggested, appears to be founded on the principle of the Scotch law of subsequent legitimation; and the intention probably was to give effect to the good feeling of the second or other legitimate son, who, from a regard to his mother's character, as well as his brother's position, might find himself excused from asserting his claims. Whether the above statute can, by its general terms, be understood arbitrarily to alter such a reasonable and natural law of family succession, is a question for lawyers and law-courts. The point, however, is important for popular explanation. In all other cases, the law of England appears to be as distinct as it is severe. It has even been decided that a child born before wedlock in a foreign country, and according to whose law such child was legitimate, could not inherit land in England where his bastardy was indelible.

There can be no collateral succession through bastards; for as they cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. A bastard is not entitled to the name either of his reputed father or of that of his mother, though he may acquire for himself a surname by reputation; nor can he take property by the mere description of *child* of his reputed parent, until he has acquired the reputation of standing in that relation to him. Nor does a bastard follow, as legitimate children do, his father's place of parochial settlement under the poor-laws, but he has and follows the settlement of his mother until he attains the age of 16, or until he acquires a settlement in his own right, and after that age his primary settlement is in the parish where he was born. Another peculiarity of the status of bastardy is, that a bastard being *filius nullius*, the consent of his father or mother to his marriage is not required, and is of no avail; but a guardian may be appointed by the Court of Chancery for the purpose, or a licence may be granted upon oath made that there is no person authorised to give consent. To this may be added, that although in general a father may by deed or will appoint a guardian for his infant child, in the event of his decease, he has no such privilege if the child be illegitimate.

Such may be stated to be the principal peculiarities attaching to bastardy in the law of England. In other respects, a bastard is very much in the same position as a legitimate person. Thus, he can hold land in fee-simple, and can dispose of it as he may think proper, making an unlimited alienation of it; and of course he can make a will bequeathing his whole estate; a simple and reasonable privilege,

however, which, strange to say, was not conceded to bastards in Scotland dying without lawful issue, till the year 1836, when an act of parliament was passed, the 6 Will. IV. c. 22, which, on the preamble that 'it is just, humane, and expedient,' empowered bastards in that country to dispose of their personal property by testament or will in like manner as other persons might do, any law or practice to the contrary notwithstanding! In regard to his whole estate, although the crown is entitled to such in the case of a bastard dying intestate, the royal claim is not strictly enforced; but upon petition, the crown's right will be transferred to the nearest member of the deceased bastard's family. In the Scotch law, also, the crown may, by what is called a *gift of bastardy*, grant not only the personal, but the real estate of an intestate bastard to the 'donatory,' or person similarly entitled, as in the case of personal property in England. It is also to be observed, that the prohibitions as to marriage which extend to collaterals, and to those related by the half-blood only, also apply although one of the parties be a bastard. Again, the laws relative to incest apply to a bastard with equal force as to others; the principle of the two latter points being that, although the bastard be *filius nullius* as to many civil consequences, his relationship to his natural parent is recognised for moral purposes. Of course, it need not be added that a bastard may be made legitimate by an act of parliament for all purposes, even for that of inheriting land, 'as was done,' says Blackstone, 'in the case of John of Gaunt's bastard children by a statute of Richard II.'

The paternity of a bastard or illegitimate child in England is ascertained by several statutes—7 and 8 Vict. c. 101, 35 and 36 Vict. c. 65, 36 and 37 Vict. c. 9; and the father is bound to make a proper allowance for the child's support till sixteen. But it is on the mother herself that the maintenance of the child in the first instance devolves. She is for this purpose entitled to its custody in preference to its father; and she is bound to maintain it as part of her family while she remains unmarried, or until the child attains the age of 16, or gains a settlement in its own right, or (being a female) is married; and in the event of the mother's marriage, the same liability attaches to her husband. If the mother be of sufficient ability to maintain the bastard, while he is so dependent on her, and neglect that duty, so that he becomes chargeable to a parish, she is liable, by 7 and 8 Vict. c. 101, s. 6, to be punished under the provisions of the *Fagrant Act* (q. v.). Whether the mother is of sufficient ability or not, she can, by affiliation proceedings, compel the father to pay a sum not exceeding five shillings a week till the child is sixteen (35 and 36 Vict. c. 65).

Besides the points in the Scotch law to which we have adverted, it is to be observed that in that system, the maintenance, or 'aliment,' as it is called, of illegitimate children, is a joint burden upon both parents. The mother is entitled to the custody of the child, but it does not appear whether she is to have such custody for any fixed time. It is in the discretion of the Court of Session to determine this, and it would seem that the period may vary according to circumstances, from seven to fourteen years. During this time, the father is bound to contribute his proportion of the expense; and if neither the father nor mother can support the child, it must be maintained by the parish in which the mother has a settlement.

There is a nice and curious difference in the laws of England and Scotland as to the mode of ascertaining the paternity of a bastard child. According to the statutes we have referred to, that fact may

be proved in England by the evidence of the mother, provided her statement is supported in 'some material particular' by other testimony. But in Scotland, the order of the inquiry is reversed; the woman's evidence in that country being taken last, and only where the other and independent evidence amounts to what is called a *semiplena probatio*—that is, such evidence as induces a reasonable belief, although not complete evidence, in which case she is admitted to give what is called her *oath in supplement*.

Both in England and Scotland, the widow of a bastard, whether there be issue or not of the marriage, is entitled to dower, terce, *jus relicte*, and all the other legal rights of widows. See LEGITIMACY, SEPARATION, DIVORCE, MARRIAGE, DESCENT, CASE, INHERITANCE, FEE-SIMPLE, SUCCESSION, PARISH SETTLEMENT, ULTIMA HERES, VAGRANT ACT, OATH IN SUPPLEMENT, and SEMIPLENA PRORIATIO.

BASTARDY, GIFT OF. See preceding article.

BASTARDY, DECLARATOR OF. This is a suit which may be instituted in the Court of Session in Scotland, for having it declared that the lands or effects which belonged to the deceased bastard, belong to the donatory in virtue of the gift from the crown. The 'defender,' or person against whom the suit is formally brought, is the party who would have succeeded to the bastard, had he been legitimate. B. can also be judicially declared by a similar mode of proceeding at the suit of a party who has any other interest, or, indeed, any interest whatever, to have such illegitimacy determined.

By a recent act of parliament, the 21 and 22 Vict. c. 93, the same conclusion may be substantially obtained by the English proceeding, directed by the act in the Court for Divorce and Matrimonial Causes. The act in question, it is declared, may be cited for all purposes, as the 'Legitimacy Declaration Act, 1858.'

BASTIA, the former capital of Corsica, is picturesquely situated on the slope of a mountain, rising from the sea in the form of an amphitheatre, in the north-eastern part of the island, in lat. 42° 42' N., and long. 9° 27' E. It has about 20,000 inhabitants. The streets are narrow and crooked. It has a harbour suitable for small vessels, defended by a mole, at the mouth of which is a rock resembling a lion couchant, and designated 'Il Leone.' There is a considerable trade in leather, skins, wine, oil, figs, and pulse; and many stilettes and daggers are manufactured here, which are principally exported to Italy. Until recently, the printing-presses of B. were actively employed in the production of Italian publications that would not have been permitted to appear in that country itself. B. was founded in 1380 by the Genoese Leonel Lomellino. During last century, it was oftener than once taken by the British. It was made, in 1791, the capital of the French department of Corsica, which rank was afterwards transferred to Ajaccio. It is the seat of the highest courts of the island.

BASTIAT, FRÉDÉRIC, an eminent political economist, was born at Bayonne on the 29th of June 1801. His father was a merchant, and educated his son with a view to the same profession. After completing his studies, B. entered the commercial house of one of his uncles, established at Bayonne, and employed his leisure hours in the study of political economy. Circumstances called him into Spain and Portugal in 1840, where he took advantage of the opportunity afforded him to study the customs and institutions of these two countries, which have still much to learn before they can be on a footing of equality with other nations in

matters of finance and political economy. His first appearance as an author was in 1844, when he published, in the *Journal des Economistes*, an article 'On the Influence of French and English Tariffs on the Respective Futures of the two Peoples.' It contained in germ B.'s theory of political economy, who, from that moment, was a decided opponent of the system of protection. Subsequently, in the same journal, he combated the economic fallacies of Socialism and the rights of labour. During a visit to England, he made the acquaintance of Cobden, and on his return to France, he translated (1845) the speeches of the free-traders, which he published with an introductory preface, entitled *Cobden and the League, or the English Agitation in Favour of Free Trade*, in which he gathered up into one solid mass the inconveniences of the protective system. B. now went to reside in Paris, where he continued to propagate his views with considerable success; he became secretary of the societies, and chief editor of the journal, established to vindicate the principles of free trade. After the revolution of 1848, he was elected successively a member of the Constituent and Legislative assemblies. In 1850, he came forward as the antagonist of the Socialist writer, Proudhon. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on the 21st December 1850.

Besides the writings mentioned, B. published *Sophismes Economiques—Propriété et Loi, Justice et Fraternité—Protectionisme et Communisme, Harmonies Economiques*, and several other important treatises, all of which exhibit extensive knowledge of the subjects discussed, convincing logic, and a power of sprightly and biting satire. The *Harmonies Economiques* has been translated into English by P. J. Stirling (*Harmonies of Political Economy*, Murray, Lond. 1860). The soundness of the principles which the writings of B. uphold, notwithstanding the protectionist tendencies of the late president, M. Thiers, is now (1873) generally acknowledged in France.

BASTIDE, JULES, a French journalist and politician, Minister of Foreign Affairs in 1848, and member of the Constituent Assembly, was born at Paris in 1800. In 1821, he became one of the first members of the French Carbonari; and after the July revolution, he was conspicuous among the writers of the radical opposition. On the reconstitution of the National Guard, B. was elected commandant-in-chief of the legion of artillery, in which the republicans were grouped, and took part in two insurrectionary movements, for the second of which—the *émeute* at Paris, 5th June 1832—he was condemned to death, but escaped to London. Pardonned in 1834, he returned to Paris, and again devoted himself to politics in the columns of the *National*. B., however, being one of those Neo-catholic republicans who regarded the Church of Rome as the religious synonym of democracy, could not heartily sympathise with the tone of that newspaper on religious topics, and in 1847 he founded the *Revue Nationale*, in which he advocated his peculiar opinions. During the revolution of 1848, he was a supporter of General Cavaignac, and an opponent of Socialism. In 1858, he published *La République Française et l'Italie* in 1848; and in 1859, *Guerres de Religion en France*.

BA'STILLE was, in France, a general term for a strong fortress, defended by towers or bastions (q. v.), and in this sense it was used in England also after the Norman Conquest. The famous prison to which the name latterly was appropriated, was originally the castle of Paris, and was built by order of Charles V., between 1370 and 1383, by Hugo Aubriot, Prévôt or Provost of Paris, at the

Porte St Antoine, as a defence against the English. Afterwards, when it came to be used as a state-prison, it was provided, during the 16th and 17th centuries, with vast bulwarks and ditches. On each of its longer sides the B. had four towers, of five stories each, over which there ran a gallery, which was armed with cannon. It was partly in these towers, and partly in cellars under the level of the ground, that the prisons were situated. The unfortunate inmates of these abodes were so effectually removed from the world without as often to be entirely forgotten, and in some cases it was found impossible to discover either their origin or the cause of their incarceration. The B. was capable

The Bastille.

of containing 70 to 80 prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV. Though small compared to the number which an ordinary prison contains, these numbers were considerable, when we reflect that they rarely consisted of persons of the lower ranks, or such as were guilty of actual crimes, but of those who were sacrificed to political despotism, court intrigue, ecclesiastical tyranny, or had fallen victims to family quarrels—and were lodged here in virtue of *lettres de cachet* (q. v.)—noblemen, authors, savans, priests, and publishers. On the 14th of July 1789, the fortress was surrounded by an armed mob, which the reactionary policy of the court had driven into fury, and to the number of which every moment added. The garrison consisted of 82 invalids and 32 Swiss. The negotiations which were entered into with the governor led to no other result than the removal of the cannon pointed on the Faubourg St Antoine, which by no means contented the exasperated multitude. Some cut the chains of the first drawbridge, and a contest took place, in which one of the besieged and 150 of the people were killed, or severely wounded; but the arrival of a portion of the troops which had already joined the people with four field-pieces, turned the fortune of the conflict in favour of the besiegers. Delaunay, the governor—who had been prevented by one of his officers, when on the point of blowing the fortress into the air—permitted the second drawbridge to be lowered, and the people rushed in, killing Delaunay himself and several of his officers. The destruction of the B. commenced on the following day, amid the thunder of cannon, and the pealing of the Te Deum. This event, in itself apparently of no great moment, leading only to the release of three unknown prisoners—one of whom had been its tenant for thirty years—and four forgers, and in which it is said only the 654 persons whose names now appear on the column in the Place de la Bastille, took part, nevertheless finally broke the spirit of the court-party, and changed the current of events in France.

BASTINADO (from the Fr. *baston* or *bâton*, a cudgel), the name given by Europeans to the punishment in use over the whole East, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

BASTION, in Fortification, is one of the principal defence-works in a fortified place. It is a kind of tower, very broad in relation to its height. The plain wall, called the *curtain*, which often surrounds a fortified town, is usually a polygon of many sides; and in that case, bastions occupy all, or nearly all, the salient angles. Bastions are mostly five-sided: the two outermost sides are the *faces*, meeting in an angle towards the enemy; the two on either side of these are the *flanks*, meeting two curtains or portions of wall; and the fifth side, open to the interior of the fortified place, is the *gorge*. Bastions may be regarded as projections, which enable the defenders to watch the approach of the enemy to the foot of the wall, and to frustrate them by a flanking fire. Taking the average range of modern ordnance and muskets as a basis, engineers decide on a distance of 300 to 400 yards between B. and B.; but if Armstrong or Napoleon guns, and Enfield or Minié rifles, should hereafter be employed in attacking and defending fortified places, these figures will probably need modification. The length of each face and flank of a B. is so regulated, that two bastions can defend each other and the intermediate portion of wall. This principle was partly acted upon in the middle ages; but some of the Italian military engineers of the 16th c. first constructed the B. proper. The main substance of a B. is an immense mound of earth, capable of supporting heavy guns, and of receiving the fire of the enemy; but it is faced and strengthened in many parts with brick and stone. The top is broad enough to allow room for the large guns, and for infantry and artillery soldiers. A *hollow* B. has the space within it kept down to the level of the town or natural ground; but a *solid* B., filled up to the top with firm materials, is considered to be the best defensive construction. Vauban, the great French engineer, devised the plan of having large *detached* bastions opposite the chief angles of the place, with a ditch behind each; a tower or small B. being placed at the real angle of the wall behind. This was intended to enable the besieged to hold out for some time, even after the great bastions were taken.

The relation which bastions bear to the general system of attack and defence, is noticed under FORTIFICATION and SIEGE; while various details on the subject will be found under BATTERY, CASE-MATE, CURTAIN, DITCH, EMBRASURE, ESCARP, PARAPET, RAMPART, &c. In wood-cuts illustrating many of these articles, the relative position of the B. will be better shewn than by any diagram in this place.

BA'SYLE is the name given by chemists to a simple or compound substance which can unite with oxygen to produce a base (q. v.). Thus, all the metals are examples of simple basyles, and ammonium (NH₃), ethyle (C₂H₅), methyle (C₂H₆), &c., represent compound basyles. Another property which a B. possesses is, that it can unite with a salt radical (q. v.), like chlorine or cyanogen, to form salts. Thus, the B. sodium (Na) combines with chlorine to produce a salt—in fact, common salt (NaCl); and mercury (Hg) unites with cyanogen (Cy) to form the salt cyanide of mercury (HgCy).

BAT, the common name of all animals of the class *Mammalia* which are furnished with true wings, and so are capable of really flying or propelling themselves in the air. They were all included by Linnaeus in the genus *Vespertilio* (old Latin name), now subdivided and forming the family

Vespertilionida, which is very generally regarded as of precisely equal extent with the sub-order *Cheiroptera* (Gr. hand-winged), although some naturalists still follow Cuvier in regarding the *Galcopthecidae* (Colngos or Flying Lemurs) as another

Long-eared Bat (*Plecotus auritus*).

family of *Cheiroptera*. But besides other characters which connect the Colngos with Lemurs rather than with bats, they greatly differ from bats in having a mere extension of the skin of the flanks attached to the limbs—as in the Flying Squirrels and Petaurists or Flying Phalangiers, and in the Flying Dragon among saurian reptiles—capable of sustaining them in the air like a parachute in a very extended leap, but not of being expanded and closed by a succession of strokes for true flight. The power of true flight, bats, on the contrary, possess; and some of them not only fly rapidly, but wheel about very nimbly in the air, in pursuit of their insect prey.

It is very interesting to compare the organs of flight in bats with those of birds, both as to the points in which they agree, and those in which they differ. They beat the air, as birds do, with their anterior members; but the requisite extension of surface is not obtained by quills, but by a great elongation of the arms and fingers, upon which a thin membrane is stretched, folding close to the body by means of their joints, when the wing is not in use. A little attention to the accompanying figures of the skeleton of a bat and of a bat flying, will make plainer than mere words can the relation of the bones of a bat's wing to the bones of the human arm and hand, or to the ordinary bones of the anterior extremities in quadrupeds which have fingers or toes. The thumb, *a* (in figure of skeleton), is short, armed with a strong nail, and not at all included in the wing-membrane, nor used in flight.

Skeleton of Bat.

The bones most elongated of all are the metacarpal bones, or bones of the hand, *b*; the true finger-bones,

c, are not so much so. The fore-arm, *d*, has not two bones (radius and ulna), but only one (the ulna), with a sort of rudiment of the other; the rotatory motion, of which these two bones afford the means, being not only unnecessary to bats, but at variance with the purpose chiefly designed in this part of their structure, of a powerful stroke in one particular direction. For a similar reason, 'the fingers of this strange hand are incapable of closing towards the palm, as ours do, when grasping an object: their only movements are such as fold up the wing against the side of the body, by laying the fingers close along the side of the fore-arm, as in closing a fan.' Great strength, however, was requisite in the shoulder; and, accordingly, we find an analogy to birds in the size and solidity of the bones in this part, as well as in the thickness of the muscles by which the wings are moved, and still more in the great dimensions of the sternum, or breast-bone, to which they are attached. The sternum is also furnished with a medial ridge, as in birds, for the better attachment of the muscles. The ribs are large; but the other bones generally, as those of the head and of the pelvis, are delicate, and appear designed for lightness.—The wing-membrane of bats extends along the flanks to the hind-legs, although these aid little in flight; but it is attached to them so as to leave the feet free, which are much like the feet of ordinary small quadrupeds with toes and claws, and are employed along with the thumbs of the anterior limbs in creeping upon the ground, in climbing perpendicular rough surfaces, or for

Bat in repose.

hanging with the head downward in that remarkable posture of repose in which bats pass great part of their lives, and in which they differ from all other animals.

In the greater number of species of B., the wing-membrane extends not only to the hind-legs, but beyond them to the tail, which is included in it, a peculiar bone (*e* in fig. of skeleton) also arising from each heel to afford further support to this part of it, which seems to serve purposes analogous to the tail of birds, acting as a rudder, and enabling the animal to make those rapid evolutions in the air, which it is so pleasing to see as bats flit about in the summer evening. The fruit-eating bats of tropical regions, which have no need to perform such evolutions, are destitute of this interfemoral part of the membrane; and according to the habits for which each species has been designed, the tails are long or short, entirely included in the membrane, or only for part of their length, or produced a very little beyond it, and terminating in a hard tip, so that the tail is capable of being used to aid in creeping or climbing, evidently possessing considerable power, and being curved and moved in a

manner which suggests a slight analogy to the prehensile tails of monkeys.

Bats were placed by Linnæus in his order *Primates*, along with monkeys and lemurs, with which they agree in their pectoral teats and in other characters, particularly of the organs of reproduction. In one genus (*Dysopus*), there is an additional resemblance to the Primates in the partially opposable thumbs of the hind-feet, and a trace of this character is to be found in the fore-thumbs, already noticed. Bats are now, however, generally placed by naturalists in the order *Fera* or *Carnaria*, although, like many other animals of that great order, most of them are by no means exclusively carnivorous. The greater part of them feed chiefly on insects, some chiefly on fruits. They exhibit considerable variety both in the number and character of their teeth, as might be expected in animals which differ so much in their food. All of them have four rather large canine teeth; the incisors vary much in size and form, as well as in number. The digestive apparatus exhibits a variety corresponding with that of the teeth; the intestinal canal of the Vampyres (q. v.), which live by sucking the blood of animals, proceeding almost in a straight line from one extremity of the body to the other, whilst that of some of the

mentioned, the stretch of wing is 5 feet. Of British species, the largest is the Noctule B. (*Vespertilio noctula*), a very local species, found chiefly in the south of England; the Pipistrelle B. (*V. Pipistrellus*) is perhaps the most common. It was long confounded by British naturalists with the common B. of the continent of Europe (*V. murinus*), which is much larger, and very rare in Britain. In some parts of the country, the Long-eared B. (*Plecotus auritus*) is very common. It is distinguished by its enormously large and very beautiful ears, which, when it is asleep, are folded up in a remarkable manner under the arm, the long *tragus* then resembling a slender

a Great Bat or Noctule Bat (*Vespertilio noctula*).
b Greater Horseshoe Bat (*Rhinolophus Ferrumequinum*).
Both British.

Head of Pteropus.

frugivorous bats, as the Kalong (q. v.) (*Pteropus*) of Java, is seven times as long as the body.

Except in the power of flight and things essential to it, bats present no resemblance to birds. The old English name *Flittermouse*, and the German *Fledermaus*, indicate an early popular recognition of their true place in creation. They are generally nocturnal animals, or, at least, prefer the twilight, although one of the British species may occasionally be seen pursuing insects during winter at mid-day. They generally spend the day in caves, hollow trees, and other dark recesses, often under roofs of houses, and in crannies of ruined or deserted buildings. They are found in almost all parts of the world, except the very coldest, but are most numerous and of greatest size within the tropics. Those of temperate climates generally spend the winter in a state of torpidity, in which, although circulation continues very languidly, respiration does not ordinarily take place. The whole number known to Linnæus amounted to a very few species, not half so many as are now known to inhabit Great Britain alone. Upwards of 130 species have been described, and there is great probability that the actual number existing is very much greater. It is not unlikely that some exaggerated accounts of the great bats of warm climates gave rise to the fable of the Harpies, which Virgil introduced into the *Æneid*. The bats of Europe are all small; the body of the largest British one is not so large as a mouse, and the fullest stretch of its wings about 15 inches, whilst the common British species are much smaller; but in the Kalong, already

ear. This great development of the ears is characteristic of certain genera of B., that part of the ear called the *tragus* attaining also a remarkable size, so that it seems like a smaller ear in front of each large one. In many species, only two of which are found in Britain, there is a still more remarkable membranous or leaf-like appendage on the nose, which in some is simple, in some, complex, and often of large size, giving an extraordinary appearance to the face. Some of the larger species, having a nasal crest, are called Spectre Bats (q. v.). Only two species of B. (*Rhinolophus*), possessing such an appendage, are found in Britain, both of them very rare; from the form which it assumes, they are called Horseshoe Bats. It is supposed that this nasal appendage is of use as a very delicate organ of touch, perhaps also of smell; as the great ears may be of use both for touch and hearing. These senses must often guide bats when that of sight cannot be employed; and the sense of touch appears to be possessed in no ordinary degree even by the wing membrane. By supposing it to be affected by the pulsations of the air, Cuvier accounted for the power displayed by bats which had been cruelly deprived of sight, of avoiding objects amongst which they flew, without the necessity of ascribing to them, as Spallanzani had done, the possession of a sixth sense.

It deserves to be here noticed that, amongst the peculiarities which distinguish certain genera of bats, is the absence not only of the upper cutting teeth in the East Indian and African genus *Megaderma*, but even of the bone in which these teeth are usually placed; and that another tropical genus, *Nycteris*, of which the species are found in Africa and Java, have the skin attached to the body only at a few points, and capable of being blown up like a bladder, at the pleasure of the animal, by means of air which is inhaled through the nostrils into cheek-pouches communicating by small apertures with the general skin-bag. The use of this is wholly unknown.

Bats walk or creep awkwardly upon the ground, one side of the body being jerked forward, and then the other, yet they run with considerable celerity. There is a common notion, that they cannot rise easily from a level surface, but must find some eminence from which to throw themselves. Of the fallacy of this, any one will soon be convinced

who gets a B. and places it upon the floor.—Bats commonly produce one or two young at a birth.—

Bat walking (*Plecotus auritus*).

Some of the species are very gregarious; others often fly about in pairs; great numbers, and of different species, are often found congregated in their places of hybernation or repose.—Some of the species are easily tamed, and become very familiar; but their odour is disagreeable, and it is generally found difficult to keep them long alive.

Fossil remains of *Cheiroptera* are occasionally found in eocene rocks, but owing to the delicacy of the bones, great difficulty has been experienced in the determination of the genera and species.

BAT, or BÂT (Fr.), in military matters, was originally the name of a kind of pack-saddle; and hence a bat-horse was a baggage-horse bearing a bat or pack, and a bat-man was a servant in charge of the horse and bat. By a modification of meaning, a bat-man is now any soldier allowed to act as servant to an officer. When British troops are sent on foreign service, bat-horses or mules are provided (if carriages are not forthcoming) for carrying the regimental books, the kettles and tents, the medicine-chest, the veterinary medicine-chest, intrenching tools, armourers' stores, saddlers' stores, &c.—about 20 such horses or mules to each battalion. Bat-horses and bat-men are also provided for carrying officers' camp-equipage. An allowance for procuring these accommodations is usually called Bat-money.

BATA'NGAS, a seaport town of the Philippines, island of Luzon, and capital of the province of the same name. Lat. 13° 45' N., long. 121° 5' E. Distance from Manilla, 50 miles S.; founded 1581. Pop. of town and district, 17,000. B., which is well built, and has an elegant appearance, is finely situated on an extensive bay which opens into the Strait of Mindoro. Considerable advantage is taken of its facilities for commerce.

BATARDEAU', a strong wall of masonry, built across the outer ditch of a fortress, to sustain the pressure of water when one part of the ditch is dry and the rest wet. It is built up to an angle at the top, and is armed with spikes, to prevent the enemy from crossing; and sometimes a stone tower is provided to strengthen the defence. There is a sluice-gate to regulate the admission of water.

BATA'TAS, or SWEET POTATO (*Convolvulus Batatas*, or *Batatas edulis*, the genus *Batatas* having recently been separated from *Convolvulus* [q. v.], chiefly upon account of the four-celled ovary), a perennial plant with long creeping stems, heart-shaped leaves on long stalks, and variously lobed, large purple flowers much resembling those of the best known species of *Convolvulus*, and very large oblong acuminate tubers. It is a native of the East Indies, but is now cultivated in all tropical and sub-tropical countries for its tubers, which are highly esteemed as an article of food, and are eaten either roasted or boiled; they are sweet, wholesome, and nutritious, but somewhat laxative. The B. forms, next to maize, the principal food of the poorer classes in some parts of America. Its cultivation is very

easy; it is readily propagated by tubers or by cuttings of the stem, requires little attention, and soon produces its tubers. In hot-houses in Britain, these are without difficulty obtained of 1 lb. or 2 lbs. weight. The cultivation of the B. has been introduced into the south of Europe. In America, it is little cultivated to the north of New Jersey, and even there is inferior. The leaves are used as a boiled vegetable. It is the B., or sweet potato, which is usually meant by the older English writers, when they mention potatoes. Its tubers were imported into England by way of Spain, and sold as a delicacy, before the potato was known.—*Batatas paniculata*, or *Convolvulus paniculatus*, a nearly allied

Batatas.

species, is cultivated in the same way as the common B., and its tubers are similar in quality.—To the new genus *Batatas*, has been referred also the plant formerly known as *Ipomoea macrorhiza*, now *Batatas jalapa*, so called from supposed purgative qualities of the root, which, however, it is found not to possess, being white, insipid, saccharine, and farinaeous, and of great size, 50—60 lbs. in weight. The plant inhabits sandy soils in Georgia and Carolina.

BATA'VI (or, according to some MSS, VATAVI), the name of a German people, who anciently inhabited a part of the present Holland, particularly the island which was called after them, Batavia, formed by the branch of the Rhine which falls into the sea at Leyden, the Waal, and the Meuse. Their country, however, extended across the Waal, but its boundaries cannot now be precisely determined. According to Tacitus, they were originally a branch of the Chatti, who emigrated across the Rhine. They were conquered by Germanicus; became subject to the Romans, and served them so well, that they obtained the honorary title of friends and brothers of the Roman people; were exempted from taxes and assessments, being only required to provide a proportion^o of troops; and were permitted to choose their commanders from amongst themselves. Their cavalry were particularly good, and were often employed by the Romans. The first who terms the insular district inhabited by these Gauls, Batavia, is Zosimus, who also informs us that in the time of Constantius (358 A. D.) it had fallen into the hands of the Salii, a Frankish tribe.

BATAVIA, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name **BATAVIAN REPUBLIC** was given to the Netherlands on their new organisation of 16th May 1795, and they continued to bear it till they were converted into the kingdom of Holland, under Louis Bonaparte, 5th June 1806.

BATAVIA, the capital of the empire of the Netherlands in the East Indies, stands on the north-west coast of Java, at the mouth of the Tjiliwong, frequently called the *Jaccatra*, from the former native town, on the ruins of which the present city was built. There is good anchorage for large ships in the offing, and it is navigable for smaller vessels towards the interior. The influence of a vertical sun on this Holland in miniature led it to become proverbial as the grave of Europeans. Latterly, however, the climate has been greatly improved by draining. The temperature, though not extreme, is oppressive from its uniformity, the mean of winter being 78-1° F., and that of summer only 78-6°. The latitude is 6° 7' 40" S., and the longitude 106° 52' E. Pop. 55,000. Notwithstanding the growing prosperity of Singapore, B. continues to be the commercial emporium of the far East. Its markets present at once all the productions of Asia, and all the manufactures of Europe. In 1811, while Holland was a vassal of France, B. fell into the hands of the English, by whom it was restored to its former owners in 1816. Latterly, B. has found Singapore a formidable competitor for the trade between East and West. The Dutch government has recently laid a telegraphic cable along a line of 600 miles from B. to Singapore.

The province of Batavia is low, but rises gently towards the south. The forests have all been cut down for the use of the sugar factories. It is well adapted for fruit-trees and vegetables, which are cultivated by Chinese gardeners. Pop. 401,563, consisting of 4145 Europeans, 41,137 Chinese, 355,333 natives, and 943 foreign orientals. The peculiar character of the people has been lost by the influx of and intermarriage with strangers from all districts of the Indian archipelago. The language is a mixture of Sundanese, Malay, and other tongues, and is called low Malay. The largest estates are held by Europeans, the smaller by Chinese and natives. The religion is chiefly Mohammedan. There are good post-roads. The industries continue to increase, and chiefly consist of factories for making machinery for distilling and for sugar works; distilling arrack, copper and tin work, dyeing, &c. The nutmeg, cacao, and cocoa-nut tree are successfully grown.

BATAWA' PALM. See **CENOCARPUS**.

BATENBURG, a town of the Netherlands, in the province of Gelderland, situated on the right bank of the Maese, 9 miles west of Nynegen. It is worthy of notice only on account of its association with the Romans, whose *Oppidum Batavorum* it was.

BATH, the chief city in Somersetshire, England, is beautifully situated in a wooded valley in the north-east part of the county, on the Avon, 20 miles from its mouth, and 106 miles west of London. The houses are built wholly of white freestone—'Bath oolite,' worked in the neighbouring quarries—bricks being entirely discarded. The city has a finer appearance than any other in England, the variety of level giving very commanding sites for its fine and regular streets, crescents, and public buildings. The beauty and sheltered character of its situa-

tion, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs, have long rendered B. a favourite fashionable resort. The springs, which are four in number, were known to the Romans, who built baths on the spot in the 1st c., of which extensive remains were discovered in 1775. The temperature of the springs varies from 97° to 117° F.; they rise near the river bank, in the centre of the city, and discharge 184,320 gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Though the gaiety of B. has greatly waned since the days of the Prince Regent, there has been a great general improvement in the city, but the population somewhat diminished during the twenty years 1851—1871. It has two parks, and many public walks and open places; theatre, concert-rooms, and other places of amusement; subscription library, museum, club-house, educational institutions, &c. The Abbey Church is a cruciform structure in the latest perpendicular style, with a fine roof in the style of Henry VII.'s chapel, and a central tower 159 feet high. About a mile to the north-west is Beckford's Tower, built by the eccentric author of *Katech*, but now a cemetery chapel. It is 151 feet high. B. returns two members to parliament. Pop. 53,704, at times much increased by visitors. B. has no manufactures of any note. Coal is found in the neighbourhood. The Great Western Railway from London to the west passes through the city. B. is of great antiquity; it was a Roman station called *Aque Solis*, at the intersection of the great Roman ways from London to Wales, and from Lincoln to the south coast of England. Richard I. granted B. its earliest extant charter, which was subsequently confirmed by Henry III., and greatly extended by George III. A greater number of Roman remains have been found in and near B. than elsewhere in Britain; they form a collection unrivalled in extent and value.

BATH, KNIGHTS OF THE. The name of this order is derived from the ceremony of bathing, which used to be practised at the inauguration of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. The

Collar and Badge of the Bath.

ceremony is of unknown antiquity, and is spoken of by writers of the 13th c. as an ancient custom. See **KNIGHT**. The earliest authentic instance of its observance which we have in this country, is in the time of Henry IV., who, in preparing for his coronation, made forty-six knights at the Tower of London, who had watched all the night before, and

bathed themselves. The last knights of the B. created in the ancient form were at the coronation of Charles II. in 1661. From that period till the accession of the House of Hanover, the order fell into oblivion. It was revived by George I. in 1725, and is now the second order in rank in England, the first being the Garter. By the statutes then framed for the government of the order, it was declared that, besides the sovereign, a prince of

Star of the Bath.

the blood, and a great master, there should be thirty-five knights. At the conclusion of the great war, it was thought expedient, with a view to rewarding the merits of many distinguished officers, both military and naval, to extend the limits of the order, which was effected on the 21 January 1815. But the order was still purely military, and it was not till 1817 that it was placed on its present footing by the admission of civil knights, commanders, and companions. The following is its present organisation.

First Class.—Knights Grand Cross (K. G. C.); the number not to exceed, for the military service, 50, exclusive of the royal family and foreigners; and for the civil service, 25.

Second Class.—Knights Commanders (K. C. B.); military, 102, and civil, 50, exclusive of foreigners. These, like the first, have the title *Sir*, and take precedence of Knights Bachelors.

Third Class.—Companions (C. B.); military, 525, and civil, 200. They take precedence of Esquires, but are not entitled to the distinctive appellation of knighthood. No officer can be nominated to the military division of this class unless his name has been mentioned in the *London Gazette* for distinguished services in action; and the order has never been conferred on an officer below the rank of a major, or commander in the navy.

BATH, BATHING. By bathing is usually understood the immersion of the body, or a part of it, in water. In a more extended signification, it means the surrounding of the body with any medium differing in nature or temperature from its usual medium; thus, we speak of a blood-bath, a vapour-bath, a cold-air bath, a compressed-air bath (q. v.), an earth-bath. A fourfold division may be made of baths: 1. According to the substance with which the body is surrounded—into water, oil, milk, gas, sand, and other baths; 2. According to the manner of application—into river, slipper, plunge, shower, dropping, vapour, and douche baths; 3. According to the parts of the body subjected to the application—into whole, half, sitz, foot, hand, and eye baths; and 4. According to the temperature of the substance applied—into cold, tepid, warm, and hot baths.

The practice of bathing undoubtedly reaches back

to the earliest times in the existence of the human race, and the most ancient historical accounts as well as popular myths make mention of it. Among the Egyptians, the bath was practised as a religious rite; and, in general, we find the opinion prevailing throughout antiquity, that purification of the body induced or signified moral purity. Man, it was thought, ought to present himself pure in body and soul, when he engaged in the service of his god, or in any transaction that brought him into immediate contact with that being. In making the bath a religious ordinance, Moses may have had in view the prevention or more speedy cure of those skin-diseases so prevalent in the East. The Mosaic Law prescribes expressly, in some cases, the use of running water, which has given rise, through a misunderstanding, to the deleterious cellar-baths of the Jews. In Palestine, the wealthier Jews had private baths in their houses, and ponds in their gardens, an arrangement which prevailed in all the civilised parts of the East, and which does so still. There were, besides, public bath-houses among the Jews, as among other nations. Among the Greeks, also, bathing was very early in use. The practice is often alluded to in Homer. Bathing, among the Greeks, as among other nations, was counted a religious rite, and was connected with the preparations for sacrifice, for the reception of oracles, for marriage, &c. We possess, however, no detailed accounts of the construction and arrangements either of private or of public baths in Greece, which last were mostly connected with the gymnasias. The men bathed together; that there were public baths for women, appears probable from various indications.

Among the Romans, although warm-baths (*therma*) were in use from the earliest times, yet it was only at a late period that they were so extensively adopted; and then the increase and universal spread of luxury had driven the primitive object of bathing into the background, so that the public baths were looked upon as places of general resort for pleasure. The most of these public baths were built under the emperors. They were numerous in Rome and in the provincial cities. Their construction may be gathered from their numerous remains, and from the descriptions of them given by Roman writers; they resembled the Turkish and Russian baths.

The essential parts of a Roman bath were as follows.—1. The *hypocaust*, or stove, in the basement-story, for heating both the bath-rooms and the water. The water was contained in three receptacles or boilers, so arranged that the undermost, immediately over the fire, contained the hot water; the one in the middle, the tepid water; and the uppermost, the cold water. These vessels were so connected by pipes, both with the bath-rooms and with one another, that the hot water that flowed from the lowest boiler was replaced by tepid water from the one above; and that, again, by cold from the uppermost.—2. The *apodyterium*, or room for undressing.—3. The *frigidarium*, a room with a basin for cold bathing.—4. The *tepidarium*, the purpose of which cannot be exactly determined, but which seems to have been intended for bathing in tepid water, and also for allowing the body to cool down in a mild temperature.—5. The *caldarium*, in which sometimes the *sudatio*, or sweating-bath, and sometimes the real hot-water bath, were taken. This room had hollow walls, and the floor rested on low pillars over the hypocaust, so that it was surrounded on all sides with heated air. The *laconium*, which is spoken of as a part of the *caldarium*, was probably a kind of stove that was heated from the hypocaust, and contributed to

raise the temperature. In the bath-rooms there were basins (*alvei*) for holding the water, and round the walls were benches or seats, which, in the caldarium, were raised as in an amphitheatre, in order to give the bathers the choice of the higher

temperature of the upper part of the room, or of the more moderate of the lower. The caldarium contained also a *labrum* or vase of several feet diameter, filled with cold water, into which the bathers dipped after the hot bath. With these essential parts of

Roman Bath, from a Painting on the Walls of the Thermæ of Titus at Rome.

a bath, there were usually connected an *unctuarium* or *elvothesium*—i. e., an anointing-room, and often gardens, covered walks, rooms for games, &c.

The process of bathing was this: After undressing in the apodyterium, the bather was anointed in the elæothesium with a cheap coarse oil, and then proceeded to a spacious apartment devoted to exercises of various kinds, among which games at ball held a prominent place (hence the hall was called *spharisterium*). After exercise, he went into the caldarium, either merely to sweat or to take the hot bath; and during this part of the process, the body was scraped with instruments called *strigiles*. Being now dried with cloths, and slightly anointed all over with perfumed oils, he resumed his dress, and then passed a short time successively in the tepidarium and the frigidarium, which softened the transition from the great heat of the caldarium into the open air.

The public baths for women were of similar construction, and were much frequented even by the most respectable. The women bathed in company, like the men. The irregularity of men and women bathing together is also alluded to by ancient writers; and in later times, the baths in general became the scenes of all sorts of debauchery, as was the case at Baia.

The most remarkable remains of Roman baths are those of the baths of Titus, of Caracalla, and of Diocletian in Rome, and the recently excavated thermæ at Pompeii: remains of the kind are also to be found in Germany, France, and England. The extent and magnificence of those edifices it is difficult for us now to conceive. Speaking of the baths of Caracalla, Mr Fergusson, in his *Hand-book of Architecture*, says: 'St George's Hall, at Liverpool is the most exact copy, in modern times, of a part of these baths. The hall itself is a reproduction, both in scale and design, of the central hall of Caracalla's baths, but improved in detail and design, having five bays instead of only three. With the two courts at each end, it makes up a suite of apartments very similar to those found in the Roman examples. The whole building, however, is less than one-fourth of the size of the central mass of a Roman bath, and therefore gives but little idea of the magnificence of the whole.'

The ancient Germans seem, according to Tacitus and other writers, to have been fondest of the cold river-bath. When Roman luxury was driven out by German habits, and the north of Europe got the upper-hand of the south, baths ceased to be of public importance, and amid the tempestuous irruptions and fluctuations of the different nations, those splendid edifices fell into ruins. Christianity, however, by the institution of baptism, had preserved for the bath its religious signification; and in the middle ages, among the ceremonies preceding the solemnity of conferring the honour of knighthood, the bath was held essential. The Arabians and the Mohammedans generally had more completely adopted bathing into their manners and customs. Islam enjoins on the believer the careful preservation of corporal purity; and for this purpose, prescribes repeated daily ablutions. Besides these, certain circumstances and times make the use of the B. ritually obligatory on both men and women. For this end, not only did the rich erect splendid baths in their houses and gardens, but bath-houses for the people in general were established in every town in which there was a mosque. The public baths of the Turks of the present day are a copy of those ancient Arabian baths. The construction of those oriental baths, imitations of which are now to be found in some European cities, is as follows: The building is of stone, the bath-rooms have a floor of marble, which is heated from below, and tubes in the walls conduct the heat in all directions. The bather undresses, wraps himself in a blanket, puts on wooden slippers, to protect him from the heat of the floor, and enters the bath-room. Here a general perspiration soon breaks through the skin, which is washed off with cold water. The body is then rubbed with woollen cloths, and smeared with a soap or salve beneficial to the skin. This is generally accompanied by the operation of 'kneading.' The bath-attendant stretches the bather on a table, pours warm water over him, and then begins to press, squeeze, and twist his whole body with wonderful dexterity. Every limb is straightened and stretched, and when he has finished one side, he begins on the other. He kneels upon the bather; he seizes him by the shoulders, makes his backbone crack, and every vertebra quiver, or applies soft

blows to the fleshy parts. He then takes a hair-cloth, and rubs the whole body, rubs off the hard skin of the feet with pumice-stone, anoints the bather with soap and perfumes, and finishes by cutting his hair and beard. This treatment lasts some three-quarters of an hour; and the feeling after it is as of being born anew. An inexpressibly delicious sensation of comfort pervades the body, and soon ends in a sweet sleep. After bathing, people repose in a cooler room, stretched on couches, and finally partake of coffee, sherbet, or lemonade.

In England, France, and Germany, public establishments for bathing were long unknown. It was during the Crusades, which brought the East and West into contact, that Europeans first became acquainted with the baths of the Asiatics; and the want of such institutions came to be more sensibly felt from the leprosy and other skin-diseases which intercourse with Asia introduced into Western Europe. The evil was at first sought to be met by establishing hospitals; but as these were found insufficient, baths and bath-rooms were erected, which gradually became public establishments.

Besides the kinds of baths already described, there are now to be found in the larger cities of Europe, generally in connection with water-baths, imitations of the vapour-baths which have been long in common use in Russia. The **RUSSIAN BATH** consists of a small apartment built of wood, with broad benches running round it, on which the people lie undressed. By throwing water upon glowing hot pebbles, a dense hot steam is produced, which envelops the bathers, and throws them into such a heat, that the perspiration breaks out over the whole body. In this atmosphere of steam, the thermometer often rises to 112°—140° F. After they have sweated for some time, and from time to time cooled themselves again, by having cold water poured over them, the skin is rubbed with soap, and with towels made of inner bark, or with brushes; they are flogged with softened birch-twigs, and then washed with tepid, and afterwards with cold water; and at last have cold water dashed over them. A bather will also go direct from the sweating-bath, and plunge into a river or a pond, or roll himself in the snow. These baths are a necessary of life in Russia, and are to be found in every village. The German vapour-bath differs in this, that the steam is produced in a boiler, and that the bather remains for some time in an adjoining room of moderate temperature, wrapped in blankets, to allow the perspiration to go on, and the blood to become calm. A ruder kind of sweating-bath, in a hole in the earth, or in a baking-oven, is practised among many nations; among the Finns, the natives of Mexico and South America, &c.

As regards detergency, the vapour-bath is the only kind of bath that is really effectual. Seated naked in a room filled with hot vapour (which produces no inconvenience in breathing), the scurf, which, notwithstanding all sorts of previous ablutions, has accumulated on the skin, is gradually softened and loosened, and is rubbed off in a surprising manner by the hands of the bath-man who is in attendance at these establishments. As in the Turkish bath, the person is cooled down by being dashed with tepid and cold water. After this kind of bathing, the sensation is exceedingly agreeable. The process just mentioned may be said to resemble that in use by the Romans; the hands of the operator having much the same effect as the *strigiles* of the ancients. Few of the ordinary bathing establishments in Great Britain have vapour-baths, at least not on a proper footing; and the great value of this species of bath as a purifier of the skin is little known.

Bathing is a very important agent in the preservation and restoration of health. Besides promoting cleanliness, the refreshing and invigorating effects of cold bathing in its various forms have always been more or less understood, as have also the soothing effects of the warm bath. But the virtues of water as a curative agent have been more fully developed in modern times, since the rise of the system of therapeutics known as the water-cure or hydrotherapy. With that exaggeration which is incident to everything new, the first promoters of this system gave it out as a panacea 'for all the ills that flesh is heir to.' But now that these quackish pretensions are all but universally given up, it is very generally admitted that water is capable of a large range of effects, some of them apparently of the most opposite kinds; while the mode of action is nothing mysterious, but capable of explanation on the recognised principles of physiology. The fuller exposition of this part of the subject will be more conveniently considered under **HYDROPATHY**.

A **MEDICATED BATH** is one in which some substance, intended to act as a medicine, has been mixed with the liquid. This is one of the most important methods known to medical art of bringing remedies to bear upon the system. The skin is by no means impervious to foreign substances; and no other organ presents at once so large a surface to the matter to be imbibed; at times, also, the other channels by which remedies are introduced into the body cannot be used. Baths of this kind are partly imitations of natural mineral waters, and partly other remedial mixtures. The mineral substances used are common salt, chloride of lime, nitric acid, corrosive sublimate, potash or soda caustic or carbonated, ashes, soap, iodine, sulphur, iron, &c.; the vegetable are wine, vinegar, solutions of essential-oils, infusions of thyme, rosemary, lavender, worm-wood, willow, oak, and Peruvian bark, &c.; such animal substances as milk, blood, bouillon of meat, &c., are also sometimes employed as baths, with a view to impart nourishment, but whether much is taken up into the system, is doubtful. In the case, also, of vapour-baths, medicaments are added to the water with good effect; these must, of course, be volatile. If the whole body is to be immersed in the vapour, nothing must be used that might injure the organs of respiration; when the application is partial, and by a special apparatus, this precaution is less necessary. In connection with this may be mentioned the so-called **SMOKE-BATHS**, or medicated fumigations, in which the whole body, with exception, of course, of the head, or particular parts of it, are brought in contact with the vapours of dry medicinal substances. Resinous aromatic substances, incense, myrrh, benzoin, amber, sulphur, cinnabar, and mercury are used for this purpose. The application must be made in what is called a fumigating-box, in which the particular part of the body alone is enclosed along with the vapour, in order that the respiratory organs may not be incommode. The utmost precaution is requisite with the vapours of sulphur and mercury, as they are apt to occasion serious accidents.

Another species of vapour-bath is what is called an **ANIMAL BATH**, which was known to the ancients, and was in great reputation in cases of lameness. Either the whole body of the patient is wrapped in the skin of a newly slaughtered animal, or an opening is made, and the diseased limb inserted into the breast or belly of the animal while yet alive, or into the newly drawn blood. Sometimes smaller animals are killed, split up, and immediately applied to the diseased part.

Of **GAS BATHS**, the most generally used are those

BATHS AND WASH-HOUSES.

of sulphuretted hydrogen and carbonic acid gas, which are to be had at certain mineral springs. The first, mixed in small quantity with atmospheric air, lowers the irritability of the air-tubes, and affords relief in many diseases of the respiratory organs. A stronger mixture of it, brought in contact with the outer surface, is of use in disorders arising from depression of the functions of the skin. Carbonic acid gas gives a gentle stimulus to the skin, promotes menstruation, and is much used in many places in the form of half-baths. In recent times, at Ischl and other places, the vapours that arise from the mineral springs loaded with saline particles, are received in close rooms, in which the patients walk about, and allow the vapours to act upon the lungs and skin.

The terms *water-bath* and *sand-bath* have been adopted in chemistry, to signify a contrivance by which vessels that are to be heated to a certain temperature are not brought into immediate contact with the fire, but receive their heat through the medium of hot sand or water, so that the heating takes place uniformly, and overheating is avoided.

BATHS AND WASH-HOUSES, PUBLIC. The last few years have witnessed the erection of a number of public establishments, at which the masses may enjoy a bath for the merest trifle of their weekly earnings. Where steam-engines are employed in connection with cotton-factories or other works, there is usually a certain quantity of waste steam or waste hot water at disposal, which could, at an insignificant cost, be directed into baths for the use of the workmen of the establishment. We are aware of one instance where seven baths were comfortably fitted up at the small expense of £80, in which the men and women bathe on alternate days, to the number of from thirty to eighty a week—paying a mere trifle to the keeper, who attends an hour and a half each evening, and finds towels, soap, &c., nothing being charged by the proprietors for the original outlay. But this is only a small part of the cure for a great evil. Where the masses are densely packed in lanes and alleys, where house-accommodation is dear and limited, where the necessaries of life have to be continually struggled for, and these conventional evils increased, in too many instances, by improvidence—the house is but a night-shelter, affording little or no convenience for the necessary operations of the housewife. Independent of this, a public wash-house is, in point of economy, preferable to any number of isolated efforts. By co-operation, superior accommodation, better apparatus, and a cheaper and more satisfactory result can be obtained; and thus the public wash-house, where self-paying and self-supported, may be classed among the co-operative arrangements which characterise the social features of the age.

Mrs Catherine Wilkinson of Liverpool, in a year of cholera, bravely offered the use of her small house, and the value of her personal superintendence, to her poorer neighbours, to facilitate the washing of their clothes at a time when cleanliness was more than usually important. The success attending the exertions of a single individual led to the formation of a benevolent society, and ultimately to important municipal arrangements.

In 1844, a public meeting was held at the Mansion House, attended by many persons of wealth and influence, to encourage the formation of B. and W. in London; hence resulted an 'Association for Promoting Cleanliness amongst the Poor.' Independently of this movement, a reform had already been commenced by a 'Committee for the Houseless Poor,' who, among other things, purchased or rented an old roomy building in Glasshouse Yard, surrounded by

the poor and dense population of the London Docks district. A bath-house and a wash-house were fitted up; baths, cisterns, boilers, cold and hot water, towels, soap, soda, were provided; and the poor were invited to come in, and wash and bathe without expense to themselves. There were also provided pails, brushes, and whitewash, to those who would take the trouble to give a little cleanliness to their poor dwellings. This was effected mainly through the benevolent exertions of Mr Bowie, a surgeon, who applied himself with earnestness to the subject. The association, afterwards founded at the city meeting, sought two objects—to induce a wish for cleanliness among the poor; and to render public B. and W. *self-paying*, as a guarantee for their permanency. Having obtained plans and estimates from architects, the association built a model establishment in Goulston Square, Whitechapel; but the outlay unfortunately reached £20,000. In the meantime, another society had succeeded in establishing B. and W. in George Street, Hampstead Road, favoured by a liberal arrangement on the part of the New River Company in the supply of water: this establishment was opened in August 1846. In the same year, parliament passed an act to enable borough-councils and parish vestries to establish public B. and W., supported by borough and parish rates, if the householders should sanction such a proceeding. In 1847, another act strengthened the former; and the two together contain the necessary clauses for defining the details of the plan (see the following article). The parish of St Martin's-in-the-Fields was the first to take advantage of the new act; and before the close of 1852, six parishes had erected public B. and W. At the beginning of 1856, the list had nearly doubled. The original free but humble building in Glasshouse Yard had been abandoned; but the model establishment in Goulston Square, and the separate undertaking in Hampstead Road, remained. There are, in 1873, about sixteen of these public and parochial B. and W. in the metropolis.

It is not to be supposed that these efforts have been confined to London. Liverpool took precedence in date, and has since worthily maintained her interest in the matter. Manchester, Oldham, Hull, Bristol, Birmingham, Preston, Bath, Wolverhampton, Coventry, Plymouth, Chester, Sunderland, Bolton, Macclesfield, Oxford, Maidstone, Exeter, Rotherham, Colchester, South Shields, Dublin, Belfast, Glasgow, Dundee, Aberdeen, and other towns, have since adopted a similar course; and it may safely be predicted that borough and parochial B. and W. will increase in number year by year; for if they do not actually pay their full expenses at the low tariff charge, the deficiency will be so small as to be practically unfelt by ratepayers.

When the legislature took up the subject, the purpose of the committee appointed in 1844 was in great part answered; but that committee continued to exist until 1855; and the exertions of its members were attended with very beneficial results, in drawing the attention of influential persons in various countries to the advantages of public B. and W. The French government voted 600,000 francs to assist the promotion of such institutions in France, after the plan of the model establishment; and a scheme was set on foot for erecting fourteen establishments in Paris, for which 2,000,000 francs would be required. The municipality of Venice marked out an expenditure of £33,000 in the erection of B. on the same plan. The Norwegian government applied to the committee for the plans, &c., of their wash-house at Goulston Square, as a guide for the erection of one at Christiania; and a subscription was made for the erection of B. and W.

BATHS AND WASH-HOUSES.

at Copenhagen. The Belgian government, and the authorities at Hamburg, Turin, Munich, Amsterdam, Lisbon, New York, and other places, were in like manner furnished with information on the subject.

In nearly all the London establishments, which may also be taken as types of those in the country, the characteristic features are as follows: The B. for males and females are on opposite sides of the building. The separate B., in large well-lighted and well-ventilated rooms, are shut in by walls, generally of slate; and the B. themselves, supplied with fifty or sixty gallons of water for each bather, are either of zinc or enamelled iron. There are two, three, or four classes of B., charged differently according to the amount of accommodation afforded. At the St Martin's establishment, where there are only two classes of B., it has been found that the second-class bathers are thrice as numerous as the first. Arrangements, slightly varying in different establishments, afford means for conveying hot and cold water to every bath. In some instances, there are tepid as well as cold swimming or plunging B.; while two or three of them afford facilities for shower and vapour baths. The washing-rooms, in most of these establishments, are provided with numerous small compartments, doorless and roofless, each for one person. Each compartment contains a boiler and a washing-tub, with taps for hot water, cold water, waste water, and steam: all unlimited in quantity, wilful waste of course being guarded against. An American washing-board assists the operations; and a rack-work stand protects the feet. The steam from all the compartments is carried upwards to one great ventilating shaft. The 'wringing' of the wet washed linen is effected by putting the articles into a sort of perforated cylinder, which is then rotated with great velocity; the centrifugal force drives out the water through the perforations and interstices, leaving the linen, though damp, much drier than it can be made by the familiar laundry process. The clothes are then taken to the drying-room, where they are hung on frames or 'horses' in small chambers heated with hot air to about 200° or 210°. 10,000 articles of washed clothing can now be dried with about £1 worth of fuel, or much less in the towns of the north. In some of the improved establishments, there is a drying compartment belonging to each washing compartment, effecting a manifest saving of time to the washers; in some of them, too, there is an ironing-board to each compartment; but the general plan is to have a large ironing-room, well provided with irons, ironing-blankets and boards, and heating arrangements. The charge is from 1*d.* to 2*d.* per hour, according to the class and the accommodation.

One particular establishment at Manchester may usefully be described more in detail, as a type of the general class of B. and W. There is a men's swimming-bath, 70 feet by 25, with a pavement of polished York stone on a foundation of concrete and cement; the sides are of porcelain tiles laid in cement. There are 32 enclosed dressing-closets. Over these, on iron pillars, are 17 men's warm baths, each 8 feet by 7. Separated from this gallery by an open passage are 5 extra first-class baths, larger in size, and having shower-baths. There is a second-class swimming-bath nearly like that for the first-class; with its gallery of small baths over. The women's baths, in a different part of the building, comprise 4 first and 7 second class. The laundry is at one end of the building. The washing-room is 64 feet by 33; it comprises 6 first-class and 30 second-class compartments, each of the former provided with three tubs, and each of the latter with two.

There is provision for drying any amount of clothes in twenty minutes after the washing and wringing are completed. All the women have access to two patent wringing-machines. There is an ironing-room adjoining, fitted up with stoves. The water-tank has a capacity of 3000 gallons; the baths, if all full, would hold 50,000 gallons.

Since the taking up of this subject by the municipal authorities of various towns, there have been few reliable statistics obtainable relating to the extent to which these valuable establishments are used; but it is known that the B. and W. established by the several parishes either pay their working expenses wholly, or approach so near to it as to encroach very little on the parish rates.

One satisfactory feature connected with the system is, that when the local authorities are slow to establish B. and W., wealthy manufacturers or townsmen often take up the matter at their own expense, and then leave the ratepayers nothing more to do than to provide the small balance of annual working accounts. As an example of free baths for men and boys (without washhouses), may be cited the establishment opened at Derby in June 1873, and presented to the corporation by Mr Ball, M.P. for the borough. It comprises two swimming-baths, one for men and one for boys, each 100 feet long by 50 in width. There are 57 half-closed dressing-boxes around the men's bath, and 72 open boxes around the boys'. The two baths together hold 200,000 gallons of water, which is renewed once a week.

The least satisfactory part of the system in its practical operation, is that which relates to the wash-houses. Laundresses, boarding and lodging house keepers, and families in the middle ranks of life, use these W. rather than really poor families; they do so because the expense is very low, not because they are unable to pay higher. It is sometimes believed that those for whose benefit the system was established are ashamed to bring their scanty, coarse, and much-worn apparel to a place where it may meet the eyes of others: if this be so, surely a remedy might be applied!

BATHS AND WASH-HOUSES, ACTS REGARDING. The establishment of public B. and W. is regulated in England and Wales by two acts of parliament—the 9 and 10 Vict. c. 74, and 10 and 11 Vict. c. 61—which are to be considered as one act. The sanitary regulations so legalised are merely permissive, and in no respect made compulsory on the public; but their wisdom, benevolence, and consideration for the health of the people, strongly recommend their adoption. The provisions of the act may be adopted for any incorporated borough, or for any parish not within any such incorporated borough; subject, however, in the case of a parish, to the approval of one of Her Majesty's principal secretaries of state. In the case of a borough, the adoption of the act is left to the discretion of the council of the borough; and the expense is to be charged upon the borough fund, the council being empowered to levy, either as part of the borough rate, or by a separate rate, such sums as may from time to time be necessary. In the case, again, of a parish, it is left to the vestry, with the sanction of one of the secretaries of state, to decide on the adoption of the act; and in such case, the vestry shall appoint not less than three, and not more than seven persons, ratepayers, to be *Commissioners* for carrying out the provisions of the act. Regulations for the proceedings of these commissioners are prescribed in the act. The expense is to be charged upon the poor-rate. The vestries of any two or more parishes may concur in carrying out the act.

The act contains numerous other provisions and regulations relating to the facilities required for the operations of the borough councils and parish commissioners: thus, they may borrow money with the approval of the Treasury; they may have money advanced to them by the Public Works Loan Commissioners; they may avail themselves of the Railway Companies Clauses Consolidation Act of 1845 for certain limited purposes, such as borrowing money on mortgage, the accountability of officers of the company, the making of by-laws subject to other provisions, and the recovery of damages and penalties.

After these preliminary facilities, the act proceeds to specify the powers of the borough councils and parish commissioners, as to erection or purchase of buildings, &c., for the purposes contemplated. Among other things, it is provided that the number of baths and the number of washing-tubs for the labouring-classes shall not be less than twice the number of those for any higher class or classes.

The council and commissioners respectively are empowered to make by-laws for regulating the use of the B. and W., which, however, shall not be enforced until they have been approved by a secretary of state. These by-laws must make sufficient provision for a variety of purposes specified in the schedule (A) to the act 9 and 10 Vict. c. 47; the scope of those purposes being to secure order, cleanliness, and decency. The charges for the use of the B. and W. are regulated by another schedule attached to the act 10 and 11 Vict. c. 61. In the baths for the labouring-classes, a single cold bath is not to exceed one penny; a single warm or vapour bath is not to exceed twopence. B. for any higher class are not to exceed three times the charges for those of the labouring-classes. In the wash-houses for the labouring-classes, the use of a single washing-tub, and other conveniences, is not to be charged more than one penny for one hour, or threepence for two hours together.

The various Local Management Acts, passed since the above-cited acts of 1816 and 1817, have strengthened the powers of town-councils, &c., for the establishment of B. and W.; but the principle of operation remains nearly uniform—viz., that any surplus outlay, beyond the receipts from bathers and washers, shall be defrayed out of the rates. It may safely be asserted that no item in house-rate is more wisely applied than this. So great is the importance now attached by medical men to bathing, that the Metropolitan Board of Works is (1873) taking into consideration the expediency of establishing free public swimming-baths in various parts of the metropolis, to supplement the parochial B. and W.

BATHGATE, a town in the centre of Linlithgowshire, 17 miles west-south-west of Edinburgh. The old town lies on a steep slope, and the new on a more level site. Freestone, coal, and carboniferous limestone, are wrought in the vicinity. In 1663, King Charles II. granted B. a charter, since which time it has been a free burgh of barony. In the vicinity is the site of an ancient castle, which Margaret, daughter of Robert the Bruce, brought as a part of her dowry to her husband, Walter, great steward of Scotland, who died here. The celebrated gas coal called Torban Hill mineral, which has been the subject of so much litigation, and of discussion and difference of opinion among scientific men, is worked here. B. has manufactures of cotton goods, but mining is the chief occupation of the inhabitants. Pop. (1871) 6942.

BATHORI, ELISABETH, the niece of Stephen Bathori, king of Poland, and wife of Count Nadasdi, a Hungarian nobleman, was born in the latter half

of the 16th century. Her diabolical cruelty has condemned her memory to eternal infamy. By means of large bribes, she induced an old man-servant and two female servants to kidnap and convey to her, either by stratagem or force, young girls from the neighbouring country, whom she slowly put to death in the dungeons of her castle by the most horrible tortures. It is related that on a certain occasion, having violently struck one of her victims, the blood spirted up into her own face, and, as she fancied, left the skin whiter when it was wiped off. An infernal idea instantly possessed her. She invited to a grand banquet all the young girls round about, and caused 300 of them to be put to death, being under the impression that a bath of blood would renew her youth. So monstrous a story is probably exaggerated, but it at least shews that she was conceived capable of it. Inquiry was at length made into the appalling rumours, when it was discovered that this female fiend had murdered, in cold blood, not fewer than 650 maidens. The domestics who assisted her were either beheaded or burned alive; but the countess, whose crimes merited infinitely the greater punishment, was merely imprisoned for life in her fortress of Eseej, where she died in 1614.

BATHOS (Gr. *bathos*, depth) is a term employed by critics to designate a ludicrous descent from a lofty thought to a mean one, or a sinking below the ordinary level of thought in a ridiculous effort to aspire. See **CLIMAX**. It is of the essence of B. that he who is guilty of it should be unconscious of his fall, and while grovelling on the earth, should imagine that he is still cleaving the heavens. A good example of B. is the well-known couplet:

*And thou, Bathousie, the great god of war,
Lieutenant-general to the Earl of Mar!*

BATH-STONE, a building-stone extensively used in England on account of its beauty, is obtained from quarries in the Lower Oolite, in Wiltshire and Somersetshire. It is fine grained, of a rich cream colour, and is composed of about 94½ per cent. of carbonate of lime, and 2½ per cent. of carbonate of magnesium, but is free from silica. It is easily wrought in the quarry, some beds cutting almost as readily as chalk, and hardens on exposure to the air, but is not very durable. Within twenty-five years after the reparation of Henry VII.'s chapel, in Westminster Abbey, with this stone, it had begun to decompose. The name is derived from the neighbourhood of several of the quarries to Bath.

BATHURST, EARL (HENRY BATHURST), an eminent Tory statesman, born 23d May 1762, son of second earl (Lord Chancellor from 1771 to 1778), was in 1804 appointed Master Worker of the Mint. In 1807, he became President of the Board of Trade, and was Secretary of State for Foreign Affairs from 11th October to 6th December 1809. Appointed, 11th June 1812, Secretary for the Colonies, in the administration of the Earl of Liverpool, he held that office for sixteen years. In 1828, in the Wellington administration, he became President of the Council, which office he retained till the resignation of the ministry in 1830. He died 26th July 1834. At the time of his death, he was a teller of the Exchequer, clerk of the Crown, and elder brother of the Trinity House, K. G., D. C. L., F. R. S., F. S. A., &c. He was much esteemed by his party. His son, Henry George, succeeded as fourth earl. He died in 1866, and was succeeded by his brother, William Lennox, fifth earl.

BATHURST, a name applied to various localities in honour of Earl Bathurst, Colonial Secretary

at the time.—1. B. in *New South Wales*, the first county that was settled beyond the Blue Mountains (q. v.), long believed to be impassable. It was not before 1813 that a practicable route was formed; and in April 1815 Governor Macquarie crossed the range by the newly made road with his lady and a numerous retinue, in order to mark with becoming 'pomp and circumstance' so important an epoch in the growth of the colony. B. has been still further distinguished in the history of New South Wales as the seat of its gold-fields. As early as 1844, the precious metal had, on geological grounds, been supposed to exist in Australia; but it was only on 12th February 1851 that Mr Hargreaves, a digger of California experience, washed the glittering prize out of a tin dish of gravel on the B. Plains. The county is bounded on the N.E. by the Macquarie, and on the S.W. by the Lachlan. The whole district is admirably adapted to pastoral pursuits. It is well watered, and, being 1970 feet above the level of the sea, it has a moderate temperature. Its chief town, which is now the third in New South Wales, is a handsome city with numerous elegant public buildings, and was erected into a municipality in 1862. Pop. (1871) of city and district, 16,826.—2. B. Island, off *North Australia*, about lat. 12° S., and long. 130° E. It is fully 2' due west of Port Essington, with Melville Island between. Its area may be estimated at 1000 square miles. Excepting the west end, which is barren, the island is densely wooded.—3. B., the principal settlement of the British colony on the Gambia. It is situated on a small island at the mouth of the river, in lat. 13° 28' N., and long. 16° 32' W. Pop. about 3000, chiefly negroes. The principal buildings are the government house, an hospital for liberated Africans, and Wesleyan schools. The exports consist of gum, wax, hides, ivory, gold, tortoise-shell, rice, cotton, teak, palm-oil, and native cloths.—4. B., in Upper Canada, a district on the right bank of the Ottawa, here the boundary between the two Canadas. It contains the Rideau River and Canal, thus occupying an important position with regard to the inter-provincial trade. The removal, in 1858, of the seat of government to Ottawa, tended still further to promote the prosperity of the district.—5. An island in the Arctic Ocean, intersected by the 100th meridian, and situated immediately beyond the 75th parallel. Sherard Osborn here found the vertebrae of an ichthyosaurus—one of the few instances of organic remains occurring on the American side of the polar basin. See ARCTIC OCEAN.

BATIGNOLLES, a thriving town of France, in the department Seine, north-east of Paris, of which city it forms a suburb.

BATLEY, a town in Yorkshire, near Dewsbury (q. v.).

BATN-EL-HA'GAR (Womb of Rocks), a stony district, stretching along the Nile, in lat. 21°—22° N., and long. 30° 40'—31° 10' E. The Nile, in the upper portion of the district, is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks, and cataracts. The district is peopled by Beduins, and other Arabs, who go naked and derive a scanty subsistence from beans and the fruit of a wild shrub called *kerkedan*.

BAT'ON—variously written Battoon, Batune, and in old French Baston—is the figure in heraldry commonly known as the Bastard Bar (q. v.).

BAT'ON is the name of a short staff, presented by the sovereign to each field-marshal, as a symbol of his newly bestowed authority. It is also the name of the long staff carried by the drum-major of an infantry regiment.

BATON ROUGE, since 1847, capital of the state of Louisiana, having in that year superseded New Orleans. As far back as 1838 it was the seat of a college. Its population is about 5500. Besides the Louisiana Penitentiary, B. R. contains an asylum, where all the deaf and dumb of the state from 10 to 30, and all the blind from 8 to 25, are entitled to be educated and maintained at the public charge. It contains also an elegant state-house, 4 churches, and 2 newspaper offices. On the opposite side, too, of the Mississippi, another town of the same name contains nearly an equal population.

BATRA'CHIA (from Gr. *batrachos*, a frog), in Zoology, one of the four orders into which the class Reptiles (q. v.) is now usually divided; although some naturalists regard the differences between this and the other three orders as so important that they make this a distinct class of vertebrate animals, under the name *Amphibia* (q. v.). Of these differences, the most essential and important is that the young B. undergo metamorphoses, and breathe by gills alone, in the earlier part of their life; whilst in their adult state they either breathe by lungs alone, or possess at once both lungs and gills. The body is also covered with a soft naked skin, through which water is imbibed, and through which the aëration of the blood appears to be in part carried on. The B. are all oviparous; their eggs are not covered with a hard shell, but merely with a soft membrane. Fecundation commonly takes place after the eggs have been deposited. It is sometimes given as a distinctive character of B., that, in their adult state, they have limbs, but in some genera these are very rudimentary, and they are altogether wanting in *Cæcilia* (q. v.), a genus which is now decidedly referred to this order, because it has been found to undergo the metamorphosis from a gill-breathing to a lung-breathing state, and which Cuvier, with hesitation, placed among serpents, because the fact of its metamorphosis had not then been ascertained. The ordinary number of limbs is four, but in the *Siren* (q. v.) there are only two.—Another character frequently given as distinctive of the B., that their feet are destitute of claws, is in like manner only general, and not universal.

In the earlier period of life, the form of the B. is fish-like, of which the common tadpole, the young of the frog, is a familiar example; and this form some of them retain with comparatively little modification, whilst some of them ultimately acquire a form resembling that of lizards, with which the newts were indeed ranked by Linnæus as species of the same genus; and others, as frogs and toads, assume a peculiar quadruped form, the tail entirely disappearing, except in the elongated oöcygeal bone which represents it to the anatomist.

In their anatomy, the adult B. present some important points of resemblance to fishes; in some important points, they differ both from fishes and from other reptiles. The skull resembles that of fishes in its general form, although rather agreeing with other reptiles in the parts of which it is composed. Teeth are often entirely wanting, sometimes they are present only in one jaw; when present, they are generally small and numerous, either in a single row or aggregated. In some of the fossil genera, however, which are referred to this order, the teeth are of large size.—The B. have either no ribs, or they have mere rudimentary ribs. They have, however, a breast-bone, often in great part cartilaginous, to which some of the most important muscles are attached. They breathe air by a sort of gulping.—The heart of the B. was long believed to have only one anricle and one ventricle, but the apparently single anricle is now known to consist of two divisions. As in the other reptiles, only a part

of the blood received from the circulating system is sent to the organs of respiration, and another part returns immediately into the circulation. See REPTILES.

In the wonderful transformations which the B. undergo, the circulation of the blood is changed in accordance with the change in the organs of respiration. These, in the earliest stage, are external gills, which appear as long coloured fringes, hanging loosely upon each side of the neck. In some B., these external gills, which resemble those of the aquatic mollusca, remain till the lungs are sufficiently developed for respiration; in some, as the Axolotl (q. v.), of which a description and figure have already been given in this work, they are permanent during the whole of life. In the greater part of the B., however, the external gills soon disappear, and are replaced by internal gills, when the tadpole exhibits its most perfectly fish-like form, its mode of progression also corresponding with that of fishes. Its respiration is carried on essentially as in fishes, water entering the cavity of the mouth, and being forced out through the gill openings, so as to come in contact with the minute filaments of the gills. The gills are attached, as in fishes, to arches connected with the hyoid bone. In this stage of existence, the large arterial trunk which proceeds from the ventricle of the heart, sends forth, from a bulbous enlargement which it forms, as in fishes, an artery to each of the gills, and the blood after being aerated in them, is collected into an aorta, and proceeds into the general circulation. But an

also going on. The tadpole which subsisted on vegetable food, and possessed a mouth adapted to the purpose of feeding on it—a small horny beak—acquires a mouth fitted for seizing and swallowing small insects, slugs, &c., upon which the adult B. chiefly or exclusively feed, and its habits change accordingly. The mouth of the *Siren*, however, always retains a character somewhat similar to that of the tadpole.—In the course of transformation, a pelvis is formed, and limbs sprout forth, which in some B., as frogs, become very perfect and powerful. Whilst the limbs grow, with all their bones, joints, muscles, blood-vessels, and nerves, the vertebrae, in many B., diminish in number, and the tail gradually shortens and disappears.

The extremely different characters of the adult B. suggest the idea of an arresting of the metamorphosis at different stages; but whilst this idea may be helpful to our understanding of the close affinities which really pervade the whole order, it must be remembered that it does not equally apply to all parts of the animal system; and that even as to those which have been particularly mentioned in the brief account above given of the metamorphosis of the B., some in their perfect state appear to have one part in what, for convenience, may be termed a more advanced state than another; whilst all are adapted with equal perfection to the situations in which they are appointed to live, both with reference to the wants of their own existence and the preservation of that of their species.

If the limbs of the tadpole or the frog are injured or destroyed during their growth, the loss is wonderfully repaired. This power of reproducing lost limbs continues to be possessed in an extraordinary degree by the adult newt (q. v.).

B. are generally inhabitants of warm or temperate climates. Those which inhabit temperate climates generally become torpid during winter. They are either almost entirely aquatic or are found in moist situations. The British species are very few. In some of the Scottish isles they are unknown.

B. are commonly divided into two sub-orders—*Caducibranchiata*, in which the gills (*branchiæ*) disappear (are *caducous*), and *Perennibranchiata*, in which they are persistent (*perennial*). The *Perennibranchiate* B. are comparatively few. *Axolotl*, *Siren*, and *Proturus* are examples. The *Caducibranchiate* B. are subdivided into *Tailless* or *Anourous*, as Frogs, Toads, &c.; and *Tailed*, as Newts, Salamanders, &c. Some of the frogs and toads of warm climates are much larger than those of Britain; but the largest known B. are the *Stiboldia maxima* of Japan, and *Protonopsis horrida* of the Ohio (variously styled Hellbender, Mud Devil, Ground Puppy, Young Alligator, and Fish Salamander), both creatures of the newt or salamander form, the latter of which is two feet long, and the former is of still greater size.

Fossil remains and footprints in rock attest the existence, in former geological periods, of B. of large size. 'It is only in tertiary and post-tertiary strata that extinct species referrible to still existing genera or families of this order have been found.' These occur both of the tailed and tailless forms. One of them has been a subject of particular interest, because its remains, when first discovered by Scheuchzer, in the beginning of the 18th c., were mistaken for the remains of a human being, and the discoverer enthusiastically urged them upon the attention of his contemporaries as a proof of the deluge. To this salamandroid fossil the name *Andrias* (from the Gr. for man) *Scheuchzeri* has been given.—Footmarks in the sandstones and shales of the coal-measures in Pennsylvania seem to have belonged to B. resembling frogs or toads, but of

Newt, in successive stages.

artery is also provided on each side for the conveyance of blood to the lungs, both the lungs and their arteries being at first rudimentary, but increasing, whilst the gills, on the contrary, diminish along with the blood-vessels connected with them; and the gill-breathing is gradually transformed into a lung-breathing animal, no longer perfectly aquatic, as at first, or capable of existence only in water, but amphibious, or almost entirely terrestrial, and incapable of remaining long under water without coming to the surface to breathe.—Whilst these changes take place, others no less extraordinary are

great size, some of the footprints being two inches in diameter, and a breadth of nearly four inches between the right and left footprints.—Some of the older batrachian fossils differ so widely from all existing types, that new sub-orders have been formed for them. Those of the sub-order *Gonocophala*—of which *Archegosaurus* (q. v.) is the best known—are remarkable for having the head covered with bony plates; those of the order *Labyrinthodontia*, for the labyrinthine structure exhibited in the transverse section of the teeth. See LABYRINTHODON.

BA'TRACHOMYOMA'CHIA (the War of the Frogs and the Mice), a Greek mock-heroic poem, erroneously ascribed to Homer, with whose works it has been generally printed. Pignes of Caria, who lived in the times of the Persian wars, was named amongst the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humour.

BA'TRACHUS. See FROG-FISH.

BATSHIA'N, one of the Moluccas, lying to the south-west of Gilolo. It belongs to the Dutch, who, in 1610, took it from Spain, or, rather, from Portugal, then a portion of the Spanish monarchy. Its area is estimated at 900 square miles. It is almost intersected by the equator, being only 35' S., with a long. of 127° 35' E. B. produces large sago and cocoa palms, good rice, and the best cloves in the Moluccas. Chief town, Batshian, near the centre of the island, with a pop. of 1100.

BATTA, in relation to the British army in India, is an allowance in addition to the ordinary pay of officers. The pay is fixed; but the B. varies according to the part of the country in which the troops are placed, and also depends on the circumstance of their being in the field or in cantonments. If in the field, or more than 200 miles from the presidential government cities, the officers receive full B.; if in garrison, or in cantonment within that distance, half batta. During the troubles of 1857 and 1858, the government was frequently embarrassed in determining whether particular officers were entitled to full or half B., owing to the confusion into which the whole military system was temporarily thrown.

BATTALION is the unit of command in infantry. It comprises the largest number of men who, when drawn up in array, can conveniently hear the word of command from an officer. In whatever ways the armies of Europe differ in other particulars, they seldom depart very far from a mean *war-strength* of 1000 men per battalion. Two or more of those units combine to form a *regiment* (with exceptions presently to be noticed); and those regiments are further aggregated into *brigades*, *divisions*, and *corps d'armée*, or other large groupings. The unit, or B., is divided into *wings*, and these into *companies* and *squads*. The continental regiments are for the most part so large as to comprise several battalions each; but the British infantry regiments, in time of peace, have mostly only one B. each. The usual way of increasing the British infantry in war-time is, not by creating new regiments, but by increasing the number of battalions per regiment, and of companies per battalion. In 1873, there were 110 regiments of line-infantry; of these, 83 have only 1 battalion each, 25 have 2 battalions, and 2 have as many as 4. The full complement of a B. is usually 12 companies; and when these are drawn up on parade, two ranks in depth, the two choice companies, called the 'grenadier' and the 'light-infantry' companies, are placed at the right and left extremities of the whole line; the other eight companies,

each designated by a number or letter, being between them. In this form, the front of a B. of 1000 men is about 300 yards in length.

An English B. of 900 private soldiers approaches near 1100 strong when the officers, &c., are included. The following may be taken as the component elements, under the average *war* arrangements of the British service: 10 regimental staff-officers (lieutenant-colonel, 2 majors, adjutant, instructor in musketry, surgeon, paymaster, and quartermaster); 36 company officers (captain, lieutenant, and sub-lieutenant); 1 warrant officer (regimental school-master); 10 non-commissioned staff officers (staff and chief sergeants); 50 non-commissioned company officers (colour-sergeants and sergeants); 900 rank and file (50 corporals, 850 privates, and 24 drummers).

The relation which the B. bears to the regiment, in various details of discipline and service, will be better noticed under REGIMENT; while a few related matters of a more general nature will be found treated under BRITISH ARMY.

BATTAS, a people inhabiting that part of Sumatra between 0° 20' and 4° 20' N. lat. They claim to be the first settlers of Sumatra, and cling to the customs of their ancestors. The B. are light-brown, of middle stature, have somewhat prominent features, and long hair. They believe in a supreme creator, and the influence of good and evil spirits. The men are lazy, and engage in hunting, while the women grow rice, collect pepper for trade, weave and dye cloth. Iron is made into large knives and weapon-points. Their houses are of wood, and the villages have earthen walls. The B. are nominally governed by the kings of Simamore, Salindong, and Batar. The language is a Malay dialect, written on bamboos, in a peculiar alphabet, from the bottom upwards, but laid horizontally, and read from the left. A man pays a dowry of ten buffaloes for a chief's daughter, and five for one of lower rank, but has usually only two wives, who are as slaves. Cannibalism exists, though checked by the Dutch. They never eat the flesh of women, and only murderers, prisoners of war, and adulterers, who are first speared to death.

BATTASZEK, a market-town of Hungary, county Tolna, on the west of the Danube. Pop. (1871) 6542.

BATTEL, TRIAL BY, or WAGER OF BATTEL. This relic of our legal barbarism is happily of the things of the past, having been abolished by act of parliament, the 59 Geo. III. c. 46, and might have been passed over with a brief notice, had it not been for a circumstance which we shall presently mention, and which affords a curious and striking illustration of a principle peculiar to the character of English law, as distinguished from the legal systems of other countries.

The trial by B. was a proceeding by way of appeal, and it obtained in civil and criminal cases, and also in military matters, to which, indeed, it was more appropriate. It consisted of a personal combat between the parties in presence of the court itself; and it was grounded on the impious idea of an appeal to Providence, the expectation being, that Heaven would give the victory to the innocent or injured party. In civil cases, the B. was waged by champions, and not by the parties themselves; but in criminal cases, the parties fought in person, unless the appellor were a woman, a priest, an infant, or a man of the age of sixty, or lame, or blind, all of whom might refuse the wager of B., and compel a trial by jury. Peers of the realm also could not be challenged to wage B., on account of their personal dignity, nor, by special charter,

could the citizens of London, fighting being considered foreign to their education and employment. Whether by champions or in person, the mode of proceeding was the same. The appellee, or defendant, as he might be called, threw down his glove, and declared that he would prove his right, or defend himself with his body. The appellor, or prosecutor, in accepting the challenge, took up the glove, and replied that he was ready to make good his appeal, body for body; and thereupon the parties, holding each other's hands, joined issue before the court in a very formal and solemn manner. The weapons used were batons or staves an ell long, and a four-cornered leathern target, and the combatants were obliged to swear that neither of them would resort to sorcery or witchcraft! The B. lasted till the stars appeared in the evening, and the party who by that time had either killed or got the better of his opponent, was considered the successful suitor of justice. In a charge of murder, if the accused was slain, it was taken as proof of his guilt, and his blood was attainted; and if so far vanquished as not to be able or willing to fight any longer, he was adjudged guilty, and sentenced to be hanged immediately!

So late as the year 1818, this barbarous procedure was solemnly decided by the Court of King's Bench to be a valid and legal mode of trial, which the king's subjects were free to adopt! Of course, the principle was, that all laws, no matter how unsuitable to the times, could be enforced, unless expressly repealed by act of parliament. As a matter of curiosity, we may give the names of the parties (they were of the labouring-class) who seriously submitted their contention in the above form before Lord Chief-justice Ellenborough and his brother-judges of the period. The case is that of *Ashford v. Thornton*, and is reported in the first volume of *Barnwall and Alderson's Reports*, p. 405. As we have stated, the court decided in favour of the validity of the trial, one of the judges remarking that sufficient had not been stated to induce their lordships to refuse the B., and another more plainly and unequivocally observed that the defendant was 'entitled to this his lawful mode of trial.' But Lord Ellenborough put the matter more clearly by stating, that 'the general law of the land is in favour of the wager of B., and it is our duty to pronounce the law as it is, and not as we may wish it to be; whatever prejudices, therefore, may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it.' Happily, the pugnacious litigant who obtained this judgment was induced to go no further, and the above statute, the 59 Geo. III. c. 46, was passed, by which the shocking ordeal was wholly abolished.

In Scotland, we believe the matter would have been differently disposed of; for the judges there, following the doctrine of the Roman law, would have held the proceeding to have been in desuetude and obsolete, and there the matter would have ended. Mr Rush, the then American envoy to the British court, thus justly remarks on this case in his *Residence at the Court of London* (published 1833). 'To repeal laws belongs to the legislature. Courts expound and apply them. Free government is complex, and works slowly; tyranny is simple, and does its work at once. An absurd law may sleep in a free code, because overlooked; but whilst there, it is the law. It is so, I suppose, that we must reason; and generally, the reason would be right. Yet it might have been thought that, in a case like this, long disuse added to obvious absurdity, would have worked the silent repeal of the law, according to the doctrine of desuetude under the Roman code.'

Montesquieu, in his *Spirit of Laws*, book 28, chapters 20 and 22, very ingeniously and plausibly deduces the modern practice of duelling and the so-called laws of honour from the above barbarous judicial combat. See ORDEAL.

BATTEN, or **LAY**, or **LATHE**, is the swing utensil of a loom, by which the weft or woof is struck home, and in which the shuttle runs. B. and lay are synonymous, B. being the English name, and lay the Scotch. See WEAVING.

BATTENS, a species of sawn fir timber, of smaller dimensions than the kind called planks. B. are usually from 12 to 14 feet long, 7 inches broad, and 2½ inches thick. Cut into two boards (1½ inch thick), they are used for flooring; cut into three boards, they are put on roofs below slates; in narrower pieces, they are put upright on walls for fixing the laths for plastering. The best B. are brought from Norway, and sold wholesale by wood-merchants.

BATTER, in Architecture, used as a verb to express the manner in which the walls of towers, which are smaller at the top than the bottom, slope inwards. The walls of wharfs, and those built to support embankments and the like, usually batter.

BATTERING-RAM, an engine of war used in ancient times, and in the middle ages. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a *ram* (in Lat. *aries*). In its simplest form, it was borne and impelled by

Battering-ram.

the hands of the soldiers; afterwards, it was suspended in a frame, and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*ustudo*) was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 feet in length, the head sometimes weighed above a ton, and as many as 100 men were employed in impelling the machine. When the blows were long enough continued, hardly any wall could resist. When or where it was invented, is unknown. It is mentioned by Ezekiel. The Romans derived it from the Greeks.

BATTERSEA, a south-west suburb of London, situated in Surrey, on the south bank of the Thames, at the bridge to Chelsea, which is nearly opposite. It lies in B. parish, which is partly laid out in market-gardens for London, and has many manufactories. The church has a monument to the celebrated Lord Bolingbroke. The flats, called B. Fields, once famed as a rich botanical station, are now formed into a public park. Adjacent to the park, the Thames is crossed by B. Bridge (lately rebuilt), Albert Bridge, Chelsea Suspension Bridge, and a railway bridge. The first asparagus raised near London was grown by the market-gardeners of Battersea; but railways have much changed the locality.

BATTERY.

BATTERY, in criminal law, means the beating or wounding, or, more correctly, an assault by beating or wounding of another. Violence or force is not a necessary element in this offence, but the least touching, however trifling, of another's person in an angry, rude, insulting manner, is a B.; for the law, says Blackstone, cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it, every man's person being sacred, and no one having a right to meddle with it in any the slightest manner. The remedy for an injury of this kind may be either by a civil action, as for damages, or by indictment, as for a misdemeanour. Where the B. is on a man's wife, the former may sue for damages by action of trespass, and it must be brought in the names of the husband and wife jointly; but if the maltreatment be so serious as to have deprived the husband for any time of his wife's company, the law then gives him a separate remedy, by an action in which he may recover special damage, on the ground of the loss of his wife's society, whilst suffering from the beating. By the Common Law Procedure Act, the 15 and 16 Viet. c. 76, the remedy for such ill usage is further varied, for by section 40 of that act, it is provided, that in any action brought by a man and his wife for an injury done to the latter, it shall be lawful for the husband to add thereto claims in his own right, and separate actions brought in respect of such claims may be consolidated, if the court or a judge shall think fit.

It is a good defence to prove that the alleged B. happened by accident, or that it was not in anger, or that it was merely the correction which a parent or master is entitled to use to a child, or scholar, or servant, or that it was done in self-defence, or in defence of a wife, a husband, a parent, a child, a master, or a servant; or that it was such personal force as a proper officer was entitled to employ, or that the defendant has already been summarily proceeded against under the 24 and 25 Viet. c. 100, by sections 44 and 45 of which act it is provided that further proceedings shall be barred where the complaint has been disposed of by two justices either by conviction or dismissal of the case, provided, in the former case, the defendant has paid the penalty, and suffered the imprisonment awarded; and, in the latter, the magistrates have dismissed the case, because it was justified, or so trifling as not to merit punishment, and this be forthwith certified under their hands.

In the Scotch law, there was what was called a B. *pendente lite*, which consisted in assaulting an adversary in a lawsuit during its dependence. This peculiar offence was created by two old Scotch statutes passed respectively in 1584 and 1594—and which curiously provided as a punishment the loss of the cause to the offender—but they were repealed in 1826 by the 7 Geo. IV. c. 19.

BATTERY, in military language, has two meanings: the one relating to field-operations; the other, to fortification. A battery in Field-operations consists of from 4 to 8 (in the British army, usually 6) pieces of ordnance, together with the necessary gun-carriages, ammunition-wagons, horses, artillerymen, and officers. A B. of foot-artillery (see **ARTILLERY**, **ROYAL REGIMENT OF**) is usually called a *field-B.*, as distinguished from a *horse-B.* There are also *heavy* and *light* batteries, according to the weight of the ordnance. The term B. is also applied in a narrower sense to the *personnel*, or complement of men and officers attending such a set of guns. The designation for this used to be, in the foot-artillery, a *company*, and in the horse-artillery, a *troop*; but by an order issued in 1859, both these terms are now nearly superseded by the word B., thereby

giving complexity to a term already used in two different meanings. The personnel of a field-B. of six 12-pounder rifled guns, is thus composed: 1 major, 1 captain, 3 lieutenants, 1 surgeon, 1 battery sergeant-major, 1 battery quartermaster-sergeant, 6 sergeants, 4 corporals, 4 bombardiers, 66 gunners, 2 trumpeters, 1 farrier and carriage-smith, 3 shoeing-smiths, 2 collar-makers, 1 wheeler, 61 drivers (privates)—in all, 153. In war, gunners and drivers would be added till the total strength of the battery became 277. Two batteries together form the command of a lieutenant-colonel, and have the services of a veterinary surgeon between them.

The *matériel* for a 12-pounder B. of 6 guns comprises 6 carriages for the guns, 1 spare gun-carriage, 3 store-wagons, 1 store-cart, 1 forge-wagon, 1 rocket-wagon, 12 gun-ammunition wagons, and 6 wagons for small-arms ammunition for the use of the infantry. To draw these guns and vehicles are required in war about 212 horses, together with 35 saddle-horses, and eight baggage-horses. The vehicles and boxes are prepared for the reception of 1284 rounds of ammunition for the guns, 150 rockets, and 93,280 rifle cartridges. There is also carried a supply of empty cartridges, port-fires, fuses, quick match, slow match, and an immense number of tools and small articles, besides stores for the wheelers, shoeing-smiths, and collar-makers. Nearly all these supplies are equally divided, so as to make each independent of the others; but some of the stores are in reserve, for the use of the whole battery.

A battery, in Fortification, is a row of large guns of any number from two to twenty or upwards, mounted on an earthwork or other platform. It differs from an artillery or field B. in having no horses or vehicles immediately belonging to it. Siege-guns are mostly placed in or on such batteries; and when an army is preparing to resist the occupation of a particular place by an enemy, a B. of position is frequently one of the defensive means adopted. On the other hand, the fortifications on and within the walls of a stronghold generally obtain other names than that of B.; although particular rows of guns in certain places may be so called. Military engineers distinguish many different kinds of batteries, according to the nature of the duty which they are to fulfil, or of the ground on which they are placed. An *elevated B.* has the parapet raised above the ground; the earth for forming it being obtained from a ditch in front. A *half-sunken B.* has the interior slope sunk a little below the surface. A *sunken B.* has the base from 24 to 42 inches below the level of the ground. The guns mounted on these three kinds of batteries partake in the varying elevations of the batteries themselves, and are adapted to different modes of firing on the enemy. A *siege-B.* consists of a range of heavy guns, for silencing the enemy's fire, ruining parapets and buildings, and making a breach through which infantry may enter. A *cavalier-B.* is especially elevated, to fire over a parapet without embasures. *Enfilade, en revers, en écharpe, ricochet, cross, oblique* batteries, and others variously named, differ chiefly in the direction in which they pour out the fire of their guns upon the enemy. The distinction between *gun-batteries, howitzer-batteries, and mortar-batteries*, depends on the kind of ordnance employed. A mortar-B. has a ditch of extra width, to afford spare earth for a platform of extra strength and solidity. A military engineer, in planning a B., imitates a civil engineer in planning a railway; he makes his calculations in such form that the quantity of earth taken out at one spot may about equal that heaped up in another.

These batteries are all nearly alike in the general principle of their construction. They consist

primarily of an *épaulement*, or built-up shelter, behind which the guns are placed; the platform on which the guns actually rest may or may not be above the ordinary level of the ground, according to the nature of the battery. The *épaulement* or parapet is of immense thickness, to resist the action of the enemy's cannon-balls. The thickness at the top is seldom less than 12 feet, and may be as much as 20; for it is found that a 24-pounder ball will penetrate 18 feet of earth. The guns are placed about 20 feet apart, behind the parapet. Some batteries are straight, with all the guns parallel; while others may be portions of a triangle (*redan*) or of a polygon, and the earthwork has to be constructed accordingly. There is generally a ditch from 12 to 20 feet wide, outside the parapet, and the depth from the crest of the parapet to the bottom of the ditch is 12 to 16 feet. For gun and howitzer batteries, there are embrasures through which the firing takes place; but mortar-batteries are without those openings.

Sometimes the *épaulement* is thrown up loosely, in haste; but for the better kinds of batteries, fascines, gabions, and sand-bags are largely employed. The main structure is lined with fascines 9 feet long, and the embrasures lined with other fascines 18 feet long—40 or 50 of the two kinds being required per gun. The fascines here spoken of are long bundles of brush-wood, weighing 30 to 200 lbs. each. Sometimes sand-bags are used instead of fascines, each containing about a bushel of sand or earth; and sometimes gabions, which are wicker cylinders filled with earth. A 6-gun sand-bag B., made wholly of these materials, requires nearly 8000 sand-bags.

The fate of a field-B. often decides a battle. At the battle of the Alma, when once the Guards and Highlanders had reached the Russian batteries on the hill, the day was won. At the battle of Inkermann, the issue depended mainly on the possession of a small 2-gun sand-bag B., which remained, after many vicissitudes, in the hands of the allies.

BATTERY, FLOATING. See **FLOATING BATTERY.**

BATTERY, ELECTRIC and GALVANIC. See **ELECTRICITY and GALVANISM.**

BATTHYANYI, one of the oldest, richest, and most celebrated families of the Hungarian magnates, which can trace its origin as far back as the invasion of Pannonia by the Magyars, in 884 A.D., and which has given to Hungary many warriors and statesmen. The surname is derived from lands obtained in the 14th c.—Balthasar von B., who was the head of the family in the latter half of the 16th c., fought with distinction in the Turkish wars, and constantly maintained at his own expense 1200 infantry and 500 cavalry.—Charles, Prince of B., a Lieutenant-field-marshal of the Empire, distinguished himself in the Bavarian War of Succession, and particularly by a victory over the French and Bavarians at Pfaffenhofen on 15th April 1745.—Count Casimir B., a member of the principal branch of the family, was born 4th June 1807. He was Minister of Foreign Affairs in Hungary during the insurrection in 1849, in which he also distinguished himself as a military governor. After the catastrophe of Vilagos, he fled, along with Kossuth, into the Turkish territory, where he remained till 1851. He then went to France, and died at Paris, 13th July 1854. Count Louis B., belonging to another branch of the same family, and born at Presburg in 1809, having espoused the national cause, yet seeking to maintain the connection with Austria and his allegiance to the Austrian sovereign, was appointed President of the Ministry, when Hungary obtained a ministry of

its own, in March 1848. His ability was not equal to the goodness of his intentions, and the circumstances in which he was called to act were very difficult and embarrassing. He did not hold the office long, and afterwards took part in public affairs, chiefly as a member of the diet, and with great moderation. Yet, after the Austrians entered Pesh, he was arrested in January 1849, and on 6th October was executed by sentence of martial law. His condemnation was unexpected, and awakened the more sympathy, because all men regarded it as unjust.

BATTLE, a town in East Sussex, 8 miles north-west of Hastings, where the country rises in wooded swells. Consisting of one street, built along a valley extending from north-west to south-east. Pop. 3315. It is noted for its manufacture of gunpowder, well known to sportsmen as B. powder. It was anciently called Hetheland or Epiton, and derives its present name from the battle (usually called the Battle of Hastings), fought on the heath between it and Hastings, on 14th October 1066, when the Normans, under William the Conqueror, finally overthrew the Saxon dynasty in England. William, to commemorate his victory, founded in 1067, on the spot where Harold's standard was taken, a splendid abbey, which was endowed with all the land within a league of it. The abbey had the privileges of a sanctuary, and the Conqueror's sword and a roll of his barons were deposited in it. The existing ruins, which belong to a building erected subsequently to the original abbey, occupy three sides of a quadrangle, and are about a mile in circumference.

BATTLE is a combat between large masses of troops, or whole armies. Every B. ought to have for its object the determination, if possible, of the whole contest, or at least the effecting of some important step to that end. It is therefore the aim of a general to bring about an engagement at the decisive point. This constitutes Strategy, while Tactic is concerned with the handling of the troops in the actual battle. Victory on the battle-field is not enough for a general; it is only by following up his victory to the annihilation, if possible, of the beaten army, that its fruits are secured. **ORDER OF B.** is the particular way in which the several corps of different arms are disposed for entering into an engagement. It varies at different times, and is modified according to locality.

No general account of a B. can be given. Information on the various elements of which a B. consists will be found described under such heads as **ATTACK, ARTILLERY, CAVALRY, INFANTRY, CHARGE, FLEET, GUNNERY, TACTICS, &c.** The more important individual battles will be found described, in their causes and results, under the names of the places with which they are associated.

Considered in their political relations, the importance of battles is not always in proportion to their magnitude. 'There are some battles which claim our attention, independently of the moral worth of the combatants, on account of their enduring importance, and by reason of their practical influence on our own social and political condition, which we can trace up to the results of those engagements. They have for us an actual and abiding interest, both while we investigate the chain of causes and effects, by which they have helped to make us what we are; and also while we speculate on what we probably should have been, if any one of those battles had come to a different termination.'—Professor Creasy's *Fifteen Decisive Battles of the World, from Marathon to Waterloo*. The fifteen battles which, in Professor Creasy's opinion, have had the most decisive influence, are the following:

- n.c.
 490. Battle of Marathon.
 413. Defeat of the Athenians at Syracuse.
 331. Battle of Arbela.
 207. " " the Metaurus.
 A.D.
 9. Defeat of the Romans under Varus.
 451. Battle of Chalons.
 732. " " Tours.
 1066. " " Hastings.
 1429. Joan of Arc's victory at Orleans.
 1588. Defeat of the Spanish Armada.
 1704. Battle of Blenheim.
 1709. " " Pultowa.
 1777. Defeat of Burgoyne at Saratoga.
 1792. Battle of Valmy.
 1815. " " Waterloo.

BA'TTLE, WA'GER OF. See BATTEL.

BA'TTLE-AXE was a weapon much used by the early northern nations, Celtic and Scandinavian, requiring great strength in its use. Some were held with one hand, some with two; the former kind could be wielded equally by horse and foot, but the latter was for foot-soldiers only. The B. had a longer handle, and a broader, stronger, and sharper blade than the common axe. During the

Battle-axes.

middle ages, and somewhat earlier, it was much used in sorties, and to prevent the escalading of a besieged fortress. The *pole-axe* differed but little from the battle-axe. The *black bill* and *brown bill* were a sort of halbert, having the cutting part hooked like a woodman's bill, with a spike projecting from the back, and another from the head. The *glaive* was a kind of pole-axe or bill used by the Welsh.

BAT'LEMENT, a notched or indented parapet used in fortifications. The rising parts are called

Early English Tracery Battlement.

cops or merlons; the spaces by which they are separated, *crenels*, embrasures, and sometimes loops. The object of the device is to enable the soldier to

Simple form of Battlement.

shelter himself behind the merlon, whilst he shoots through the embrasure. The bas-reliefs of Nineveh, and the Egyptian paintings, testify to its antiquity,

and there is perhaps no nation by which it has not been adopted.

BA'TTLE-PIECES are paintings representing battles. The modern mode of warfare is less favourable for this branch of art than the ancient, where personal valour had more room to display itself. Among the greatest paintings of this kind are, the battle of Constantine, sketched by Rafael, and executed by Giulio Romano; Lebrun's battles of Alexander; and the battle of the Amazons by Rubens. In smaller scenes, such as skirmishes and surprises, Antonio Tempesta, Hans Snellink, Pet. Sydners, Pulcone, Phil. Wouverman, &c., are distinguished. The most eminent of recent battle-painters is Horace Vernet.

BAT'TUE (from Fr. *battre*, to beat). The B. is a method of killing game on a great scale, by causing animals to be driven forward to a point where a number of shooters are waiting to shoot them. The driving is effected by beating the bushes; hence the term *battue*. This term, like the practice which it imports, is only of modern date; yet a plan of killing deer by driving them forward in herds in an ever-narrowing circle to a place where they are to be shot, is an old usage in the Highlands, where it is called the *tinchel*. The B. is at best a common-place and butcherly amusement, for it can scarcely be said to have the merit of being attended with even a reasonable degree of exercise and excitement. It is practised chiefly in extensive preserves of pheasants and hares during the autumn and winter months, when country gentlemen invite acquaintances to their mansions for the sake of field-sports. The B. takes place early in the day, and with good arrangements, it is attended with neither fatigue nor danger. The number of shooters is usually eight or ten, each provided with at least two guns, which are loaded by an assistant as quickly as they are discharged. When the shooters are stationed at safe distances from each other, and ready to commence work, the beaters begin theirs by driving the game before them. Sometimes, however, pheasants will run a long way before rising on wing, and to make them take to flight on approaching the guns, a low net is stretched across their path. It should be stated, however, that in the B., hares, rabbits, &c., are shot as readily as pheasants; and at length the ground is covered with slain, like a field of battle. By means of the B., large quantities of game are killed, and sent to market; the profits derived from this species of stock on some estates amounting to no inconsiderable sum annually. For an account of B.-shooting, we refer to *The Shot-gun and Sporting Rifle*, also, *Manual of British Rural Sports* (London, 1859).

BATU'M, BATOOM, or BATOUM, a maritime town in the Turkish pashalic of Trebizond, from which city it is 108 miles north-east (lat. 41° 39' N., long. 41° 37' E.), with about 3000 inhabitants, mostly Turks and Lascians, or Laz. The harbour is one of the best on the east coast of the Black Sea. A pretty extensive trade is carried on. Hides, wax, honey, and, above all, oak for ship-building, are the principal exports. Great ruins of Greek churches and other buildings are found in the neighbourhood, which belong to a period in the middle ages when B. was a place of great consequence.

BATURIN, a town of Russia, in the government of, and 78 miles east from, the city of Tchernigov, on the Seim. It was founded by Stephen Bathory, king of Poland, and was at one time the favourite residence of the Hetmans of the Cossacks, of whom Mazeppa, who, in 1708, sold himself to the Swedes, is the most notorious. The palace of the Hetmans,

with its once beautiful grounds, is now going rapidly to decay.

BAUDEKYN, a corruption of Baldachin (q. v.).

BAUER, BRUNO, a celebrated biblical critic and philosopher, belonging to the extreme school of German rationalism, was born at Eisenberg, in the duchy of Saxe-Altenburg, on the 6th September 1809. He is the son of a porcelain-painter, and studied at the university of Berlin, where he became doctor of theology in 1834. From this period, he has devoted himself exclusively to what is termed in Germany the scientific criticism of Scripture—that is to say, a criticism based on the conviction, that the contents of the Bible have a natural, and not a supernatural origin, and ought to be subjected to the same process of philosophical analysis as other human productions are. In 1839, B. became a *privat-docent* in the university of Bonn, but in 1842 was forbidden to deliver any more theological lectures. He then removed to Berlin, where he has since resided. He has passed through various stages of anti-supernaturalism. At first, he contented himself with believing that the substance of the Christian religion might be extricated from the entanglements of a confused and erroneous system of interpretation. Such is the idea that runs through his earliest works, his *Criticism of Strauss's Life of Jesus*, published in the *Berlin Year-book of Scientific Criticism* (1835—1836), his *Journal of Speculative Theology* (1836—1838), and his *Critical Exposition of the Religion of the Old Testament* (Berlin, 1838). He soon, however, advanced so far in his 'scientific' demands, that it became quite clear the Scriptures, in his eyes, had lost even the moderate authority which he originally supposed them to possess. To this period belong his *Doctor Hengstenberg* (Berlin, 1839), and *The Evangelical Church of Prussia and Science* (Leip. 1840). In the former of these works, B. appears as an opponent of the school of apologetic theologians, and exposes what he conceives to be the weakness of their system as a method of apprehending characteristic differences in the historical development of Christian doctrine; in the latter, he wished to prove that true philosophic union is the dissolution of the outward dogmatic church in the realm of the universal and free self-consciousness—language which is not very intelligible to the finite Anglo-Saxon mind. In his *Critique of the Evangelical History of John* (Brem. 1840), and *Critique of the Evangelical Synoptists* (Leip. 1840), he attempted to shew that the so-called facts of the gospel never really had a historical existence, and that those artistic compositions which we term the gospels, were simply the product of the human self-consciousness. B. considers Strauss, a mere apologetic theologian, a comparatively orthodox writer! and regards his conclusions with the supercilious contempt of one who has reached a far higher elevation, while he conceives that his own special work in this world has been to strike off the last head of the Hydra of the Tradition-hypothesis. The persecutions to which he was now subjected brought about a complete rupture between him and the church; the consequence of which was a brochure entitled *The Question of Liberty, and my own Private Affairs* (Zurich, 1843). Then followed his *Christianity Unveiled* (Zurich, 1843), in which he expressed the same conviction that he had previously done in two ironical treatises—viz., that a dogmatic religion was opposed to our self-consciousness. About this time he broke with his old friends, the liberals, by writing a pamphlet against the emancipation of the Jews, *Die Judenfrage* (Brunswick, 1843). This tractate forms the transition point to the third period

of B.'s intellectual activity, in which he seems to have abandoned theology altogether as something hopeless. He now occupied himself exclusively with literature and political philosophy. The number of his writings in this department is very great. The principal are, *History of the Politics, Civilisation, and Enlightenment of the 18th Century* (Charlottenburg, 1843—1845); *History of Germany during the French Revolution and the Reign of Napoleon* (Charlottenburg, 1846); *History of the French Revolution until the Establishment of the Republic* (Leip. 1847); *Western Dictatorship; The Actual Position of Russia; Germany and Russia; Russia and England*. The prominent idea in the whole of his works belonging to this period is, that the failure of the popular and national struggles in the 19th c. results from the essential weakness of the 'enlightenment' of the 18th c. More lately, B. has again returned to theology. In 1850—1851, appeared his *Critique of the Gospels and the History of their Origin*, and his *Critique of the Epistles of St Paul*, the latter of which the author considers wholly apocryphal, and written during the 2d c. Besides the works mentioned, B. has composed various other treatises on important points of history, theology, and politics. All B.'s writings exhibit great learning, industry, research, and acumen; but are completely antagonistic to the received opinions in theology, or to any form of evangelical religion. He is generally admitted to be quicker in the discovery of error than of truth, and to have a greater talent for overthrowing than for building up.

BAUGÉ, a town in the department of Maine-et-Loire, France, 23 miles east-north-east of Angers. The English, under the Duke of Clarence, was defeated here in 1421. Pop. (1872) 2891, who are engaged in the manufacture of linens and woollens.

BAUHIPIA, a genus of plants of the natural order *Leguminosæ*, sub-order *Casalpinceæ*. The upper petal is somewhat remote from the rest. The leaves are generally divided into two lobes. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants, or *lianas*, stretching from tree to tree in the tropical forests; but some are small trees, as *B. porrecta*, the Mountain Ebony of Jamaica, so called from the colour of its wood. The inner bark of *B. racemosa* (the Maloo Climber), of *B. scandens*, and of *B. parviflora*, East Indian species, is employed for making ropes. *B. retusa* and *B. emarginata*, also East Indian, exude a brownish coloured mild gum; whilst the astringent bark of *B. variegata* is used in Malabar for tanning and dyeing leather, and also in medicine. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties.—Livingstone mentions a species of B. in South Africa, called the Mopan Tree. It is remarkable for the little shade which its leaves afford. They fold together, and stand nearly erect during the heat of the day. On them the larvæ of a species of *Psylla* cause a saccharine secretion, in circular patches, beneath which the pupa of the insect is found. The natives scrape it off, and eat it as a dainty.

BAUMGARTEN, ALEXANDER GOTTLIEB, a clear and acute thinker of the school of Wolf, was born at Berlin on the 17th of July 1714, studied at Halle, and in 1740 became Professor of Philosophy at Frankfurt-on-the-Oder, where he died on the 26th of May 1762. He is the founder of *Æsthetics* (q. v.) as a systematic science of the beautiful, though his mode of treatment is objected to by the more transcendental Germans, as being purely psychological; that is to say, he makes *æsthetics* only a portion of

the philosophy of the senses, and contrasts it with logic, which belongs to the sphere of the reason. The idea of a science of the beautiful first appears in his treatise, *De Nonnullis ad Poema Pertinentibus*, published at Halle, 1735. In 1750—1758, he issued two volumes of his *Æsthetica*, but his death hindered the completion of the work. His writings in other departments of philosophy are marked by clearness and precision; his *Metaphysica* (Halle, 1739; 7th edition, 1779) is still considered one of the most useful books for the study of the Wolfian philosophy.

BAUMGARTEN-CRUSIUS, LUDWIG FRIEDRICH OTTO, a German theologian, born at Mersburg, 1788, and died at Jena, 31st May 1843. He studied theology at Leipsic, and in 1810 became university preacher. In 1817, he was appointed Professor of Theology at Jena, and always distinguished himself as a champion of religious liberty, on behalf of which he wrote various treatises. In 1820 appeared his *Introduction to the Study of Dogmatics* (Leip. 1820), a work of considerable originality and richness of thought. More complete exhibitions of his opinions are to be found in his *Manual of Christian Ethics* (Leip. 1827); *Outlines of Biblical Theology* (Jena, 1828); and *Outlines of Protestant Dogmatics* (Jena, 1830). In 1831—1832, he published a *Text-book of the History of Doctrines*; in 1834, a work on *Schleiermacher, his Method of Thought, and his Value*; and also *Considerations on certain Writings of Lamennais*. After his death, Kimmel published the whole of his exegetical prelections on the Gospels and Pauline Epistles.

B. was conspicuous for the breadth and solidity of his learning, the originality of his spirit, and the acuteness of his understanding, but was nevertheless deficient in clear and vivid expression. He attached himself to no school theological or philosophical. At an early period, he had been greatly influenced by the metaphysics of Schelling, from which, however, he ultimately emancipated himself. His thinking was, to a certain extent, rationalistic, but on the whole approached more closely to the direction of the spiritual Schleiermacher.

BAUMGARTNER, ANDREAS RITTER VON, or CHEVALIER DE, was born at Friedberg, in Bohemia, 23d November 1793, and studied at Vienna, where, in 1823, he became Professor of Natural Philosophy. Whilst filling this office, he gave popular lectures on Sundays upon mechanics, &c., for artisans and operatives, which met with much approbation. A result of these lectures was his *Mechanik in ihrer Anwendung auf Künste und Gewerbe* (2d ed. Vienna, 1823), and his *Naturlehre* (Vienna, 1823). An ailment of the throat induced him to resign his professorship, but he was appointed director of the imperial porcelain, mirror-glass, and smalt manufactories, and afterwards superintendent of tobacco manufactories. In the year 1846, the setting up of the electric telegraph was committed to him, and he was intrusted with the principal charge of the making of the Austrian railways. After the events of March 1848, he was Minister of Mines and of Public Buildings, and chief of one of the departments in the Ministry of Finance. In May 1851, he was appointed Minister of Commerce, Trade, and Public Buildings. At the same time, he was appointed President of the Austrian Academy of Sciences, of which he had been vice-president for a number of years. He published in 1862, *Chemie und Geschichte der Himmelskörper nach der Spectralanalyse*; in 1864, *Die mechan. Theorie der Wärme*. He died in 1865; and *Freiherr Von B. Eine Lebensskizze* was published during the following year.

BAUR, FERDINAND CHRISTIAN, the founder of the 'New Tübingen School of Theology,' was born on the 21st of June 1792. In 1817, he became professor in the seminary of Blaubeuren, where he gave the first indications of his remarkable abilities by the publication of his *Symbolism and Mythology, or the Nature-religion of the Ancients* (Stuttgart, 3 vols., 1824—1825), a work which indicates the influence of Schleiermacher over the author. In 1826, he was called to Tübingen, where he held the chair of Protestant theology. His whole life was consecrated to religious studies—the history of doctrines, the symbolism of the church, and biblical exegesis. On account of the universality of his culture, the wonderful activity and fertility of his mind, his rare combination of speculative thought with solid knowledge, and that faculty of historic divination or insight which enabled him to draw decisive results from separate, obscure, and neglected *datu*—he has been regarded by many in Germany as the most massive theological intellect since Schleiermacher. Unlike Bruno Bauer, he made comparatively little use of the Hegelian philosophy in his writings; and when he did, it was professedly only that he might more clearly understand historical phenomena in their internal spiritual connection, and be enabled to represent the logical process of their development. His method of investigating the progressive history of religious opinion, however, incurred the reproach of formalism from its adversaries, who said that he applied it, too rigorously, and made dogmas develop themselves with a kind of abstract inevitable regularity from previous historical conditions, without allowing for immediate and extraordinary providences. His most important works in the history of doctrine are—*Die christliche Gnosis oder die christliche Religionsphilosophie* (Tübingen, 1835), (The Christian Gnosis, or the Christian Philosophy of Religion); a work which makes the Christian Gnosis of the 2d and 3d centuries the starting-point of a long series of religious-philosophical productions traceable uninterruptedly down through middle-age mysticism and theosophy to Schelling, Hegel, and Schleiermacher; *Die christliche Lehre von der Versöhnung* (Tübingen, 1838), (The Christian Doctrine of the Atonement); and *Die christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841—1843), (The Christian Doctrine of the Trinity and the Incarnation). In reply to Möhler, the celebrated Roman Catholic theologian, who had attacked the Protestant Church, he wrote *Der Gegensatz des Catholicismus und Protestantismus* (Tübingen, 1836), (The Opposition between Catholicism and Protestantism). Besides these works, based on a historical treatment of religion, to which class also belongs his *Lehrbuch der christlichen Dogmengeschichte* (Compendium of the History of Christian Dogmas), (Stuttgart, 1847), he published various critical treatises on parts of the New Testament; such as, *Die Christuspartei in der Korinthischen Gemeinde; der Gegensatz des Paulinischen und Petrinischen Christenthums; der Apostel Petrus in Rom* (1831), (The Christ-party in the Corinthian Community; the Opposition of the Pauline and Petrine Christianity; the Apostle Peter in Rome), a work in which the author endeavours to demonstrate the existence of deep-rooted differences in that sphere of primitive Christianity, in which we are accustomed to see nothing but unity and harmony. His inquiries concerning the Gnosis led him to study minutely the pastoral epistles, the result of which study was *Die sogenannten Pastoralbriefe des Apostels Paulus* (Stuttgart, 1835), (The So-called Pastoral Epistles of the Apostle Paul), in which he combats the idea that St Paul was their author, and refers them to the 2d c. Of a similar nature

is his *Paulus, der Apostel Jesu Christi* (Stuttgart, 1845), (Paul, the Apostle of Jesus Christ). His work on the Gospel of John produced a startling effect, as up to B.'s time that gospel had generally been held prior in date to the three synoptic gospels, whereas B. strove hard to shew that it was of post-apostolic origin. In 1847, appeared his *Kritische Untersuchungen über die canonischen Evangelien, ihr Verhältnis zueinander, ihren Ursprung und Charakter* (Critical Inquiry Concerning the Canonical Gospels; their Relation to each other; their Origin and Character). In 1851, he published *Das Markus-evangelium nach seinem Ursprung und Charakter* (The Origin and Character of St Mark's Gospel). B. died Dec. 1860. In these and other works of a similar nature, B. maintained that we must extend our notions of the time within which the canonical writings were composed to a period considerably post-apostolic, and which can only be determined approximately by a careful investigation of the motives which apparently actuated their authors. The chief characteristic, therefore, of the 'Tübingen School,' as exhibited in the works of its founder, is, the union of a subjective criticism with a strong conviction of the historic reality of the New Testament writings. The most distinguished adherents of this new school of German theology are Zeller, Schwegler, Küstlin, and Hilgenfeld.

BAUTAIN, LOUIS-EUGENE-MARIE, a French philosopher and theologian, born at Paris, February 17, 1796. He studied under Cousin at the Normal School. In 1816, he was appointed professor of philosophy in the College of Strasbourg, and soon distinguished himself by the influence he exerted over the earnest youth of that city, who carried their admiration even to the length of imitating his walk and dress. The religious tendencies of his character, however, not finding a satisfactory expression in philosophy, he threw himself into the arms of the church, and became a priest in 1828. After the events of 1830, he resigned his professorship, which until then he had retained; but his reputation for orthodoxy, never very strong, had been destroyed in the eyes of his bishop by his work *La Morale de l'Évangile comparée à la Morale des Philosophes*, published a few years before, and he was in consequence suspended from sacred offices for several years, but reinstated in 1841. In 1838, he was made dean of the Faculty of Letters at Strasbourg, and afterwards director of the College of Jully. At a still later period, he was translated to Paris, and appointed vicar-general of the metropolitan diocese. In 1848, he attempted to give a religious direction to the revolution. He was selected as one of the professors of the Theological Faculty of Paris, and was an extremely popular preacher. His principal works are—*Philosophie-psychologie Expérimentale* (1839), *Philosophie Morale* (1842), *Philosophie du Christianisme* (1835), *La Religion et la Liberté considérées dans leurs Rapports* (1848), *La Morale de l'Évangile comparée aux divers Systèmes de Morale* (1855). He died in 1867.

BAUTZEN, or, in official language, **BU'DISSIN**, capital of the circle of the same name, kingdom of Saxony. It has a population (1871) of 13,165, including many *Wends*, remnants of the old Vandals. It is situated on a rising ground overlooking the river Spree, and is the seat of the chief offices of justice in the circle, which has a population (1871) of 339,133, including 30,000 *Wends*. It has several churches, a royal palace—formerly the residence of the markgrafs of Meissen—numerous schools, and two public libraries and an hospital. The chief branches of industry are manufactures of woollens, fustian, linen, hosiery,

leather, and gunpowder. B. is a place of considerable antiquity, and was known in the time of Henry I. (931), but was first made a town under Otho I. Its several privileges, and the reputation of certain holy relics preserved in St Peter's Church, made the place important. It suffered greatly in the war with the Hussites, and still more during the Thirty Years' War. Meissner, the poet, who died in 1805, was born here. B., however, is chiefly celebrated as the place where Napoleon, with an army of 150,000 men, after an obstinate resistance, won a barren victory over 90,000 of the allied Russians and Prussians, May 20—21, 1813. The allies lost in the two days 15,000 in killed and wounded; in addition to 1500 prisoners, mostly wounded, which the French captured. The French left 5000 dead upon the field, and upwards of 20,000 were wounded. The result of the battle, and the splendid retreat of the allies, were most disheartening to the French army, and even to Napoleon himself.

BAVARIA (Ger. *Baiern*, and officially, *Bayern*), one of the states of the German empire; according to its size, the second in importance. B. is divided into two unequal parts, which are separated by the Baden and Hesse-Darmstadt dominions. The eastern portion, comprising fully eleven-twelfths of the whole, is situated between lat. 47° 20', and 50° 41' N., and long. 9° and 13° 45' E. It is bounded N. by the Prussian province of Hesse-Nassau, the Thuringian principalities, and the kingdom of Saxony; E., by Bohemia and Austria; S., by the Tyrol; and W., by Württemberg, Baden, and the Grand Duchy of Hesse. The western part, occupying the Rhine Palatinate, on the left bank of the Rhine, lies between lat. 48° 57' and 49° 50' N., and between 7° 5' and 8° 27' E. Rhenish Prussia, the Grand Duchy of Hesse, and Baden bound it on the W., N., and E., and France on the S.

B. is divided into eight circles, as follows:

Circles.	Area in sq. miles.	Pop. in 1871.
Upper Bavaria,	6,493	841,597
Lower Bavaria,	4,091	602,005
Palatinate,	2,272	615,104
Upper Palatinate,	3,679	497,950
Upper Franconia,	2,632	540,963
Middle Franconia,	2,914	583,417
Lower Franconia,	3,409	536,122
Swabia and Newburg,	3,643	532,883
Military in France,		11,364
Total,	29,138	4,861,402

Surface, Hydrography, Railways, &c.—B. may be described as a mountainous country. It is walled in on the south-east, north-east, and north-west by mountains ranging from 3000 feet to upwards of 10,000 feet in height. The highest elevation is reached on the south, the Zugspitz of the Noric Alps being 10,150 feet high. On the east, the highest points of the Böhmerwald, dividing B. from Bohemia, are the Arber and Rachelberg, which are respectively 4613 feet and 4561 feet high. On the north-east, the Schneeberg, in the Fichtelgebirge range, attains a height of 3481 feet. A branch of this chain, which is connected on the north-west with the Thuringerwald, extends south between the rivers Regnitz and Vils. The Rhöngebirge, the greatest height of which is 3000 feet, forms the northernmost chain of Bavaria. In the Rhine Palatinate, the principal mountain is the Hardt, whose culminating peak is about 2300 feet high. In the interior, B. is intersected in several directions by various less elevated ranges, alternating with extensive plains and fertile valleys. B. is rich in wood, nearly one-third of its surface being covered with forests, mostly of pine and fir.

As to its *hydrography*, B. has the Rhine flowing along the whole eastern boundary of the circle of

the Palatinate, which is also watered by the Speyer, the Lauter, and the Queich. The Danube enters B. Proper at Ulm, where it is joined by the Iller, and pursues its course in an east-north-east direction through the centre of the country, until it passes out at Passau into the Austrian dominions. Including its windings, the length of the Danube in B. is about 270 miles, which can be navigated throughout. In its passage through B., it receives no fewer than 38 rivers, the chief of which, on the right bank, are, besides the Iller, already mentioned, the Lech, the Isar, and the Inn; and on the left, the Wörnitz, the Altmühl, the Kocher, the Naab, the Regen, and the Iiz. The north part of B. is in the basin of the Main, which, rising in the north, flows with many windings through the kingdom in a south-west direction to the Rhine, with which it unites at Mayence. Its most important tributaries are the Regnitz, the Rodach, the Tauber, and the Saale. B. has several lakes, the principal of which are the Chiem, which has a circumference of 35 miles; the Wurm, with a length of 14 miles, and a breadth of 4 miles; and the Ammer, with a circuit of 27 miles. These lakes are situated in the south, at the foot of the northern slope of the Noric Alps. A corner of Lake Constance also belongs to Bavaria. The lakes and rivers abound in fish. There are a few canals in the country, the most important of which is the *Ludwigs-Kanal*, which, taking advantage of the rivers Main, Regnitz, and Altmühl, unites the Rhine and Danube, and through them, the German Ocean with the Black Sea. This canal was executed by government at a cost of upwards of £800,000. B. has altogether about 1000 miles of railway in operation. The longest is that between Augsburg and Lindau on Lake Constance, a distance of 80 miles. These lines join Munich with Augsburg, Donauwörth, Nürnberg, Bamberg, Ulm, and Kufstein. B. has nearly 6000 miles of public roads, and over 1400 of telegraphs.

Climate, Soil, Products, &c.—The temperature of B. varies considerably, being cold and bleak in the mountainous regions, and very hot in summer in the plains and valleys. The climate may be described generally, however, as mild and salubrious. The soil, particularly in the valleys of the Upper and Lower Danube, is very fertile, second to none in Central Germany; but its capabilities as yet have not been fully developed, although even now the wealth of the country consists almost wholly of its agricultural produce. The plain south of Munich has been described as the granary of Germany, in consequence of its great productiveness, while the circles of Upper and Middle Franconia are styled the hop-garden of Bavaria. Wheat, rye, oats, and barley are the chief articles of produce, but buck-wheat, maize, and rice are also grown to a small extent. The vine, as well as the hop-plant, is cultivated extensively in Franconia, and the wine is held in great esteem. Rhenish B. also produces good wine. The quantity annually produced in B. is estimated at upwards of 9,000,000 gallons. Fruit, tobacco, flax, hemp, linseed, liquorice, and beet-root are cultivated. Cattle-rearing forms the exclusive occupation of the inhabitants on the slopes and at the foot of the Alps, pasturage being found at an elevation of 8500 feet. Sheep, goats, and pigs are reared in Middle and Upper Franconia, and horses chiefly in Upper B. and Swabia, but the live-stock is far from being adequate to the extent and capacity of the country. The forests of B. annually furnish large quantities of timber. The soil is rich in mineral wealth, which as yet has not been drawn upon to anything like its full extent. The chief minerals are salt—which is a government monopoly, and obtained by evaporation, principally

from the rich mines in the south-east corner of the Alps—coal, and iron, which is worked almost everywhere throughout the territory. In Rhenish B., copper, manganese, mercury, and cobalt are found; quicksilver and black-lead are obtained in some places; marble in great variety is common, so also are gypsum, alabaster, and some of the finest porcelain clay in Europe.

Manufactures, &c.—The manufacturing industry of B., like its agriculture, is generally in an undeveloped state, and not centered in the hands of capitalists, who can largely take advantage of new inventions to prosecute it with energy and success, but distributed among numerous small manufacturers.

This is not the case with beer, the manufacture of which is carried to great perfection in B., and to an extent, if we take population into account, quite unparalleled in Europe. There are upwards of 6000 breweries in B., making nearly 155 million gallons of beer annually, which are mainly consumed in the country, the quantity of beer that a Bavarian can imbibe being quite marvellous. Nearly two-thirds of the revenue of the state are said to be derived from this source alone. Next to beer, coarse linen is the most important product of manufacturing industry, and of late years some considerable cotton-factories have been erected; but the supply of cotton, woolen, and worsted goods is not equal to the home consumption. Leather is pretty extensively manufactured, so also are paper, articles of straw and wood, porcelain, glass, nails, needles, jewellery, beet-root, sugar, and tobacco. The mathematical and optical instruments of Munich are held in high repute. The exports consist of timber, grain, wine, cattle, wool, salt, hops, fruits, beer, leather, glass, jewellery, optical and mathematical instruments, butter, cheese, &c. The annual value of these is estimated at about £1,500,000. The principal imports are sugar, coffee, woollens, silks, stuffs, drugs, hemp, and flax. The position of B. gives it the transit trade between North Germany and Austria, Switzerland and Italy.

Population, Religion, Education.—The growth of the population of B. is much checked by the regulations which relate to marriages. No marriage can take place until the authorities who superintend the relief of the poor are fully satisfied that the persons wishing to marry have adequate means to support a wife and family; and certain military obligations have also to be fulfilled before a man can enter into wedlock. These restrictive laws have another consequence besides that of preventing a rapid increase of the population; they have tended to increase inordinately the number of illegitimate children. B. has a very bad pre-eminence in this respect on the continent. In the capital, the illegitimate births about equal the legitimate; and over the whole kingdom the proportion ranges from 1 in 4.5 to 1 in 5 of the total births, equal to a percentage of from 22½ to 20 illegitimate births. In 1817, the population was 3,564,757; in 1833, 4,187,390; and in 1855, it had only increased to 4,541,556. During recent years, however, the increase has been more rapid, the population in 1864 amounting to 4,807,440; and in 1871, to 4,861,402. The Bavarians, notwithstanding their beer-bibbing propensity, are essentially a sober and industrious people. Though all of German origin, they differ materially in character. The Franconians are intelligent, diligent, and steady; the Swabians, good-naturedly indolent; and the inhabitants of the Palatinate, lively and enterprising; while the Bavarians proper are dull and superstitious.

As to religion, in 1867, the Roman Catholics numbered 3,441,029; Protestants, 1,328,713; Jews, 49,840; and other minor sects, 4839. The state

allows perfect toleration, guaranteeing the same civil rights to Catholic and Protestant alike. Individuals of every sect have the privilege of worshipping privately without fear of molestation; and on application to the king by a sufficient number of families, the right of public worship can be secured. A concordat with Rome divides the state into 2 archbishoprics and 6 bishoprics. The consistories of Anspach, Baireuth, and Speyer, under the superior consistory of Munich, govern the Lutheran Church, the Munich consistory being in some degree subject to a section in the home department, which manages the temporal concerns of all the churches. The president of the Munich consistory has a seat and vote in the council of the state. The revenues of the Church of Rome are derived from lands and endowments, the Protestant Church is supported by the state. Of late, the Bavarian government has become conspicuous by opposing the Ultramontanes, and encouraging the 'Old Catholics.'

B. has a good system of education, under the supreme direction of a minister of public instruction, to whom certain members of the provincial governments, specially instructed to watch the educational interests of the communities, are subordinate. They, again, have numerous inspectors under them, who make systematic reports as to the state of education in the country. It is obligatory on all children, whose parents have not received permission to have them educated at home, to attend school until they are 14 years of age, and they are then required to attend a Sunday school for two years longer. B. has three universities, Munich and Würzburg, which are Catholic, and Erlangen, Protestant. These universities are well attended both by natives and foreigners. Munich has the greatest repute both at home and abroad, Erlangen the least. There are numerous schools for special instruction in the kingdom.

Government, Revenue, &c.—B. is a constitutional monarchy, the throne hereditary in the male line. Its constitution dates no further back than 1818, when it was declared a part of confederated Germany. The king is the executive. The legislature consists of a chamber of senators, and one of deputies. The senators are hereditary, the king, however, having the power, within certain limits, to nominate members for life. The Chamber of Deputies consists of five different classes—one-eighth of the whole members being chosen from landed proprietors, who exercise judicial powers in right of their property, and have no seat in the upper house; another eighth from ecclesiastics of the Protestant and Roman Catholic churches; a fourth from the inhabitants of cities and market towns; and a half from landed proprietors who neither possess judicial rights, nor a seat in the other chamber. There are, besides, three members from the universities—one from each. There is one member in the Chamber of Deputies for every 7000 families, or 35,000 inhabitants. In the event of there not being a dissolution, the chamber lasts for six years. The usual length of the annual session is two months. The chambers, in ordinary circumstances, meet once a year for the dispatch of business, and it is compulsory on the king to summon them once in three years. No deliberation can take place unless two-thirds of the deputies are present. All matters relating to public burdens, &c., come first under the consideration of the Chamber of Deputies; with reference to other questions, the king exercises his own discretion as to which chamber shall first discuss them. No alteration in taxation, and no new law, can be promulgated without the consent of the legislature; but the royal prerogative is loosely defined.

The cabinet consists of seven members, chiefs of the departments of foreign affairs, justice, home affairs, public worship and instruction, finance, commerce, and public works and war. They are not necessarily members of the chambers, though they are privileged to be present at the deliberations. The privy council is composed of the king, certain royal princes, the ministers of state, and six councillors nominated by the king.

The revenue of B. in 1871 amounted to 87,144,606 florins of the Rhine (£7,262,050), of which 10,330,000 florins were raised by direct taxation, 27,755,155 florins by indirect taxation, the rest chiefly from domains and state monopolies. The expenditure during the same year amounted to 87,144,606 florins (£7,262,050). The interest on the national debt swallowed up about 34 per cent. of the whole expenditure; the army, 22½ per cent.; and the educational establishments, about 19½ per cent. In 1870, the public debt amounted to 425,355,551 florins (£35,446,296), 163,423,900 florins being contracted for railways. In 1858, the public debt was 122,830,495 florins, and the debt on railways was 88,643,834 florins.

The raising of the army of B. was in 1871 adapted to the Prussian method of conscription, as was also that of all the states of the empire. Every Bavarian is liable to service for seven years, and no substitution is allowed. The period of active service is four years, the remaining three being spent in the army of reserve; and the soldier, after quitting the reserve, is bound to serve other five years in the Landwehr. When B., in November 1870, became one of the kingdoms of the German empire, her army, on the established conditions of its formation, was enrolled as the second corps of the imperial army, consisting of two divisions, under the command of the king of B. in times of peace, but controlled by the emperor of Germany in war. On the peace-footing, the infantry consists of 16 regiments, 48 battalions, 26,768 men in all. There are 10 battalions of cavalry, consisting of 5540; and 32 battalions of Landwehr, made up of 512 men each; the entire number of men being thus 32,820. The war-footing is, of course, on a much larger scale.

History.—The Boii, a race of Celtic origin, were the first inhabitants of B. of whom tradition furnishes any account. From them, its German name, Baiern, as well as its old Latin name, *Boiaria*, is said to have been derived. They appear to have conquered the country about 600 B. C., and they retained it until shortly before the Christian era, when they were subjugated by the Romans; the country being made an integral part of the Roman empire, under the names of *Vindelicia* and *Noricum*. After the decay of the Roman power, the Ostrogoths and Franks successively held possession of it, until Charlemagne conquered it. After his death, it was governed by lieutenants of the Frank and German kings, until 1070, when it passed into possession of the Guelph family; and it was transferred by imperial grant, in 1180, to Otho, Count of Wittelsbach, whose descendant now occupies the throne. The Rhenish Palatinate was conferred on this family by the Emperor Frederick III. in 1216. Now followed quarrels between relatives, and divisions of territory, until the dukedom of B. was severed from the Rhenish and Upper Palatinates (see *PALATINATE*); of the latter, however, it repossessed itself in 1621—the peace of Westphalia, in 1648, confirming the title of its princes to that possession, as well as its right to the electoral dignity to which it had been raised in 1624. In the war of the Spanish Succession, B. supported France, and suffered considerably in

consequence; but in 1777, on the extinction of the younger Wittelsbach line, it received the accession of the Rhine Palatinate. In 1805, B. was erected into a kingdom by Napoleon I. The king assisted Napoleon in his wars, and in consideration of his aid received large additions of territory. In 1813, however, the Bavarian king opportunely contrived to change sides, and thus managed to have confirmed to him, by the treaties of 1814—1815, an extent of territory nearly as valuable as the possessions which the treaties of Presburg and Vienna had given him, and which he had now to restore to Austria.

In 1818, as already intimated, the new constitution came into existence, but owing to various causes, it did not secure that measure of popular freedom and contentment that had been expected. In 1825, Louis I. ascended the throne. He was a well-meaning, liberal, and intellectual monarch, and was favourable to the liberty of the people and the press; but he lavished the wealth of the kingdom to an extravagant degree on the embellishment of the capital, and on works of art, while he neglected to a considerable extent works of practical value, that would have tended to enrich the country, diminish the public burdens, and consequently increase the welfare of his people. In 1830, a wave from the French revolution swept over the country, disturbing its equanimity, but not to any serious extent. The Bavarian government, however, took alarm, and restricted the freedom of the press. These restrictions excited so much opposition, that they were soon after rescinded, but new dissatisfaction was created by the imposition of new taxes. The Jesuits now obtained an immense influence with the king, which they used to the detriment of popular rights. The wrath of the people was further aroused against their monarch by his connection with the notorious Lola Montez, who was looked upon as an agent of the Ultramontanists—an imputation which that lady, in her autobiography, published in 1858, indignantly repudiates, maintaining that she was the inveterate enemy of that party, and the true friend of the people. In March 1848, following the example set by the French revolutionists, the people of Munich seized the arsenal, and demanded reforms and the expulsion of Lola Montez. The king had to consent; but in the same month he abdicated his throne, in accordance, says Lola Montez, with a promise made by him to her. His son, Maximilian II., ascended the throne. He died in 1864; and Louis II., a distinguished patron of Wagner, the great musician, now (1873) reigns. See GERMANY, in SUPP.

BAVARIA, a colossal female statue at Munich, which bears the name of the country of which it is a personification, is said to be second in size only to the famous Colossus of Rhodes. It was erected by King Louis I., the model having been executed by Schwanthaler. Externally, the figure bears a German aspect. A long folding garment reaches from the middle to the naked feet; over the half-naked breast a skin is cast, and the hair falls freely over the back. The brow is adorned with sprigs of oak; in the left hand, which is raised, she holds a wreath of oak; and in the right, which is bent towards the breast, a sword; at her side reposes the Bavarian lion, the guardian of her kingdom, in a sitting attitude. The statue is 65 feet high, the pedestal being 30, so that the whole monument has a height of 95 feet. The statue was cast from the bronze of Turkish and Norwegian cannon. Internally, it is very remarkable. Through the back part of the pedestal, a door leads to a stone staircase, consisting of 60 steps. The figure itself is hollow, and resembles a mine, with side-passages

which lead into the lion. A staircase of cast iron, of 58 steps, leads through the neck up into the head, where there are two sofas, and several openings for the enjoyment of the view. At the highest part of the head, there is the following inscription: 'This Colossal figure, erected by Louis I., King of Bavaria, was designed and modelled by L. von Schwanthaler, and cast in bronze, in the years 1844 to 1850, by Ferdinand Miller.' The head contains standing-room for thirty-one persons. The whole figure consists of seven pieces, and the lion, of five. The monument was formally uncovered, amidst great rejoicings, on the 7th August 1850.

BA'VINS, in the pyrotechny of warfare, are small bundles of easily ignited brushwood, from two to three feet in length. They are made by arranging the bush-ends of the twigs all in one direction, tying the other ends with small cord, dipping the bush-ends into a kettle containing an inflammable composition, and drying them. They are employed among the combustible materials in fire-ships.

BAWBEE', or BA'BEE', the popular designation of a half-penny in Scotland, now dropping out of use. The origin of the term is obscure; but it is most probably a corruption of *bas billon*, Fr., applicable to debased copper money. In the plural form, the word is often popularly used in Scotland to signify money generally. In Scottish song, B. is synonymous with a girl's fortune or marriage-portion—as, *Jenny's Bawbee*.

BA'XTER, RICHARD, one of the most eminent of the Nonconformist divines, was born, November 12, 1615, of poor but genteel parents, at Rowton, in Shropshire. His early education was somewhat neglected. Instead of attending, as he wished, one of the universities, he was obliged to content himself with a course of private study, in the midst of which he was induced, singularly enough, for he was habitually serious, to try his fortune at court. Hither he accordingly bled, fortified with an introduction to the Master of the Revels. A month sufficed to convince him that he was out of his element at Whitehall, and a protracted illness after his return helped to deepen the earnestness of his religious convictions. Soon after, at the age of 23, he was ordained, and entered on the Mastership of Dudley Grammar School, from which he removed to act as assistant to a clergyman at Bridgenorth, where he resided nearly two years. In 1640, he was invited to become parish clergyman of Kidderminster, an offer which he accepted; and within a comparatively brief period, not only did he establish his reputation as one of the most remarkable preachers of the time, but what was better, succeeded in effecting a wonderful improvement in the manners of the people. On the breaking out of the civil war, his position became somewhat peculiar. Sincerely attached to monarchy, his religious sympathies were almost wholly with the Puritans; and though a Presbyterian in principle, he was far from admitting the unlawfulness of episcopacy. These views, which, some time before the Restoration, became extremely popular, were now too catholic for the general taste, and the open respect shown by Baxter to some leading Puritans exposed him to some danger from the mob. He accordingly retired to Coventry, where he ministered for two years to the garrison and inhabitants. He afterwards accepted the office of chaplain to Colonel Whalley's regiment, and was even present at the sieges of Bridgewater, Exeter, Bristol, and Worcester. His influence was at all times exerted to modify the intolerance of partisanship, and to promote 'the spirit of love and of a sound mind.' On the urgent invitation of his parishioners, he returned to Kidderminster, when ill

health forced him to leave the army, and continued to labour there for some time. During this period, he greatly extended his fame by the publication of his *Saints' Rest* and *Call to the Unconverted*. He never dissembled his sentiments with regard to the execution of the king and the usurpation of Cromwell, even in the presence of the Protector himself, who endeavoured, without success, to enlarge his ideas on the subject of revolutions. On the return of Charles, B. was appointed one of his chaplains, and took a leading part in the conference held at the Savoy to attempt a reconciliation between the contending church factions, a project defeated by the bigoted obstinacy of the bishops. B. was tempted with the offer of the see of Hereford, but declined the honour, praying instead to be permitted to return to his beloved flock at Kidderminster. He asked no salary, but his request was refused. The Act of Uniformity at length drove him out of the English Church, and in July 1663 he retired to Acton, in Middlesex, where he spent the greater part of nine years, chiefly occupied in the composition of some of the most important of his numerous works. These he produced with a rapidity unparalleled in modern generations, at least in this one respect, that the quality was not always in the inverse ratio of the quantity. The Act of Indulgence in 1672 permitted him to return to London, where he divided his time between preaching and writing. At length, in 1685, he fell into the brutal clutches of Judge Jefferies, who condemned him, for alleged 'sedition' in his *Paraphrase of the New Testament*, to pay a fine of 500 marks, and in default, to lie in the King's Bench Prison till it was paid. The circumstances of the trial are graphically described by Macaulay in the second volume of his History. After a confinement of nearly eighteen months, B. was released and pardoned, on the mediation of Lord Powis. He lived after this to see better times, and died on the 8th December 1691, in the seventy-fifth year of his age.

B. is said to have preached more sermons, engaged in more controversies, and written more books than any other Nonconformist of his age; and Dr Isaac Barrow has said of him, that 'his practical writings were never mended, and his controversial seldom confuted.' The total number of his publications exceeded 160. Of these, by far the most popular and celebrated are his *Saints' Rest*, *Call to the Unconverted*, and *Dying Thoughts*—20,000 copies of which were sold in a twelvemonth, and it was translated into all European languages. More important, however, in a theological point of view, are his *Methodus Theologicæ* and *Catholic Theology*, in which his peculiar system—a compromise between Arminius and Calvin—is embodied. His autobiographical narrative is historically valuable; the review of his religious opinions is spoken of by Coleridge as one of the most remarkable pieces of writing in religious literature. A complete edition of his works, in 25 vols., with a life by Orme, was published in 1850. His *Practical Works*, in 4 vols., were published in 1847.

BAXTERIANS is the term that was formerly applied to those who adhered to Baxter's theological system, the peculiar doctrines of which were: 1st, That though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2d, The rejection of the dogma of reprobation; 3d, That it is possible even for saints to fall away from saving grace. The tendency of Baxter's views was towards a more liberal theology, but they are deficient in logical consistency. Nevertheless, they have been, and still are, embraced by many pious people—especially among the dissenters—who shrink from accepting what they consider

the hard conclusions of Calvinism, or the latitudinarian views of Arminianism. The two most eminent B. are Dr Isaac Watts and Dr Philip Doddridge.

BAY (from a Saxon root, 'to bend') is properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay, and has often a narrow opening. These terms are often loosely applied; Baffin's Bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red Sea, &c. Hudson's Bay, the Persian Gulf, and the Gulf of Mexico, might with propriety be termed seas.

BAY, a name given to a number of trees and shrubs more or less resembling the Laurel or Victor's Laurel (*Laurus nobilis*), which is also called SWEET BAY (see LAUREL); the name *Baye*, which was once exclusively applied to the fruit, having been extended to the whole plant. The Common Laurel or Cherry Laurel (*Prunus Laurocerasus*) is sometimes called BAY LAUREL. See LAUREL.—The RED BAY of the southern states of America is *Laurus Caroliniensis*. See LAUREL.—The WHITE BAY of America is *Magnolia glauca* (see MAGNOLIA), and the LOBELLOLY BAY of the same country is *Gordonia Lasianthus*. See GORDONIA.

From early times, bay-leaves have been associated with popular superstitions and usages. Along with other evergreens, they have adorned houses and churches at Christmas; and in token of rejoicing or of some meritorious deed, sprigs of bay, as well as of laurel, have been worn in the hat, or wreathed around the head. There appears to have been a notion that the B. was an antidote against the effects of thunder. In an old play, *The White Devil*, Cornelia says:

'Reach the bays:

I'll tie a garland here about his head,
'Twill keep my boy from lightning.'

According to Shakspeare, the withering of bay-trees was reckoned an omen of death. Thus Richard says:

'Tis thought the king is dead; we'll not stay.
The bay-trees in our country are withered.'

The following passage occurs in *Parkinson's Garden of Flowers*, 1629, p. 598: 'The bay-leaves are necessary both for civil uses and for physic, both for the sick and for the sound, both for the living and the dead. It serveth to adorn the house of God, as well as man; to crowne or enriche, as with a garland, the heads of the living; and to strike and deeke forth the bodies of the dead; so that from the eradle to the grave, we have still use of it, we have still need of it.' For other notices of this kind respecting the B., we refer to *Brand's Popular Antiquities*, also to *Hone's Year Book*. Bay-leaves are sometimes used in cookery for the sake of flavouring.

BAY ISLANDS, a small group in the Bay of Honduras, about 150 miles to the south-east of Balize, embracing only 25' of lat., and 1° 15' of long. The cluster was proclaimed a British colony in 1852. The chief island is Ruatan (q. v.); and the others of any consequence are Bonacca, Utila, Burburet, Helena, and Morat.

BAY OF ISLANDS, near the northern extremity of New Ulster, the more northerly of the New Zealand Isles. Lat. 35° 14' S., long. 174° 11' E. On its coasts, which are pretty nearly the antipodes of the Straits of Gibraltar, are the British settlements of Russell and Kororarika.

BAYA (*Ploceus Philippinus*), a small East Indian bird, of the great family of the *Fringillidæ* (q. v.), and of a genus to some of which, from their remarkable manner of constructing their nests, the name

Weaver Bird (q. v.) is often given. It is described by the older ornithologists under the name of the Philippine Crossbeak, or *Loria Philippina*. It is yellow, spotted with brown, the throat black, the beak conical and large. Its nest is very curious. Suspended from a slender twig of a lofty branch, so that monkeys, squirrels, and serpents may not reach it, it is rendered still more secure by its form, which is very like that of a common Florence flask, the entrance, however, being from beneath, and not from above, with lateral openings to separate chambers, in one of which the female sits upon the eggs, whilst another is occupied by the male, who there pours forth his song. It is composed of fine fibres of leaves and grass. The B. is very easily tamed, will perch on the hand, and can be trained to fetch and carry at command.

BAYADERES (from the Portuguese *bailladeira*, that is, dancing-girl) is the name given by Europeans to the dancing-girls and singers in India, who are divided into two great classes, each comprising many subdivisions. The first of these classes, who are called Devadasi—that is, slaves to the gods—are divided into two distinct grades, according to the rank of the families whence they have sprung, the dignity of the idol to which they are devoted, and the authority and riches of the temple to which they belong. Those of the first rank are chosen from the most influential families of the Vaisya caste, to which the rich landed proprietors and merchants belong. Those of the second class are chosen from the chief Sudra families, who correspond to our mechanics. No girls can be admitted among the Devadasis but such as are still in childhood, and free from any bodily defect. The parents of the girl must renounce by a solemn agreement all right to their child, who then receives the necessary instruction. The employment of the Devadasi is to sing the praises of their god at festivals and solemn processions, to celebrate his victories and great deeds, and to dance before him, to weave the wreaths with which the images are adorned, and in general to perform subordinate offices in the temple and for the priests. On the other hand, they are excluded from the celebration of such rites and ceremonies as are accounted peculiarly sacred, as, for example, at sacrifices for the dead, sutis, &c. The Devadasis of the first rank live within the enclosure of the temple, which they are not permitted to leave without the special permission of the high priest. They must remain unmarried for life, but are, notwithstanding, permitted to choose a lover, either in or out of the temple, provided he belongs to one of the high castes. A connection with a man of low rank would be punished with the utmost severity. If they have children, the girls are brought up to their mother's profession, and the boys are educated for musicians. The Devadasis of the second rank differ but little from those of the first, but they have more freedom, as they live without the temple. A certain number of them must attend daily at the temple service, but at public processions they are all obliged to appear. They not only dance and sing before the images—for which they receive a fixed allowance of rice-money—but when summoned by the nobles, they perform at marriages, banquets, &c. All the Devadasis reverence, as their special patroness and protectress, the goddess Ramba, one of the most beautiful dancers in the paradise of Indra. They bring a yearly offering in spring to her and to the god of love. The singing-girls who travel about the country are of an essentially different class from the Devadasis. They perform only at private feasts, entertain strangers in the *tshultris*, or public inns, and get different names according to the special arts in

which they excel. Some of them live independently in bands, consisting of from 10 to 12 persons. They travel about the country, and divide their gains with the musicians who accompany them. Others are under the authority of *dayas*, or old dancing-women, who receive all the money they gain, and give the girls only enough for food and clothing. Some are really the slaves of such old women, who have procured them in their infancy either by purchase or by capture, and have instructed them in their art. To one of these classes belonged those B. who visited several of the European capitals in 1839. The costume of the B. is not without a certain alluring charm. Their dances do not resemble what we are accustomed to call dancing, but are rather a species of pantomime, which is explained by the songs recited by the accompanying musicians. The themes of these songs are usually either happy or despairing love, jealousy, &c. Europeans have spoken with much enthusiasm of the charms of these pantomimes; but to judge by the performances of the above-mentioned B. during their visit to Europe, these descriptions must be looked upon as very much exaggerated; for although these dancers possessed great physical agility, their movements were wanting in dignity and grace.

BAYARD, PIERRE DU TERRAIL, CHEVALIER, the knight *sans peur et sans reproche*, born 1476, at Castle Bayard, near Grenoble, was perhaps the only hero of the middle ages who deserved the unmingled praise and admiration bestowed upon him. Simple, modest, a sterling friend, and tender lover, pious, humane, and magnanimous, he held together in rare symmetrical union the whole circle of the virtues. After acting as page to the Duke of Savoy, B. entered the service of Charles VIII., whom he accompanied to Italy, and gained renown in the battle of Verona, where he took a standard from the enemy. At the beginning of the reign of Louis XII., B. was engaged in a battle near Milan, where he followed the defeated and retreating forces with such impetuosity that he entered the city with them, and was made a prisoner, but the Duke Ludovico Sforza released him without ransom. At Barletta, in 1502, B., with ten other French cavaliers, fought a tournament with an equal number of Spaniards, in order to decide their respective claims to superiority; and although seven Frenchmen were overthrown in the first charge, the result, chiefly through B.'s bravery, after a six hours' combat, was declared equal. Next, we find him fighting bravely in Spain, and against the Genoese and Venetians. When Pope Julius II. declared war against France, B. hastened to support the Duke of Ferrara; but failed in his scheme for making the pope a prisoner. Subsequently, he won fresh laurels in Spain. In the war with Henry VIII. of England—who had threatened Pearly, and besieged Terouane, in 1513—when the French, on one occasion, were about to lay down their arms, B. made a sudden attack on an English officer, and, pointing his sword at his breast, said: 'Surrender, or I take your life.' The Englishman gave his sword to B., who returned his own, saying: 'I am Bayard, your prisoner; and you are mine.' The emperor and the king of England exchanged their prisoners without any demand of ransom for Bayard. When Francis I. had ascended the throne, B. was sent into Dauphiné to make a way for the army over the Alps and through Piedmont. In this expedition, he made Prosper Colonna a prisoner. Next, B. gained, at Marignano, a victory for the king, who, in consequence, submitted to receive the honour of knighthood from Bayard. When Charles V. broke into Champagne, at the head of a large army, B. defended Mezieres against all assaults, and

on his entry into Paris, he was hailed as the saviour of his country, was made knight of the order of St Michael, and appointed over a company of 100 men, led in his own name, an honour which until then had been confined to princes of the blood-royal. He was slain by an arrow from an arquebuss, while crossing the Sesia, April 30, 1524. So highly was he esteemed for all noble qualities, that his death was lamented not only by the French king and nation, but also by his enemies. His love of virtue, especially of that kingliest of virtues, *justice*, was so passionate, that he was wont to declare that all empires, kingdoms, and provinces where justice did not rule, were mere forests filled with brigands. His body was taken by the enemy, but was restored to France, and interred in the church of the Minorites' monastery, near Grenoble.

BAYAZID, or **BAYZEED**, a town of Turkish Armenia, in the pashalic of Erzeroum, from which place it is distant east-south-east about 150 miles. It is situated about 15 miles to the south-west of the foot of Mount Ararat; is fortified; and has a population of about 5000, mostly Kurds. Prior to 1830, its population was estimated at upwards of 15,000, and it had a brisk trade; but since that time, on account of Russian interference, its commerce and inhabitants have gradually decreased. Being near the Russian frontier, it has been the scene of several conflicts; during the Crimean campaign, the Russians gained a victory over the Turks here.

BAYAZID I. See **BAJAZET**.

BAYBERRY. See **CANDLEBERRY**.

BAYER, JOHANN, a German constructor of charts of the stars, was born, either at Augsburg or at

Rhain, in Bavaria, in the latter part of the 16th c., and fulfilled the duties of a Protestant pastor in several places. His zeal for the Protestant Church was so conspicuous that he obtained the cognomen, *Os Protestantium* (the Mouth of Protestants); other accounts state that he was an advocate at Augsburg. It matters little which, as he is now remembered only on account of his *Uranometria* (1603, and 2d ed. 1639), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio Characterum Ercis Tabulis Insculptorum* (Stras. 1624). Although his maps are not remarkable for accuracy, even for his time, he has the merit of introducing the simple plan of distinguishing the stars of a constellation by means of letters. The largest star of the constellation he named by the first letter of the Greek alphabet (α), and the rest in the order of their apparent brilliancy, by the following letters. This convenient plan is still followed.

BAYEUX, a city of Normandy, in France, dep. Calvados, situated on the Aure, not far from its mouth. Pop. (1872) 7716. B. is chiefly built of wood and plaster, is famous for its porcelain, and has also manufactories of lace, linen, calicoes, leather, and hats. It is a town of great antiquity—its cathedral being said to be the oldest in Normandy. In it was preserved for centuries the famous Bayeux Tapestry (q. v.), now in the Hôtel de Ville of the place. B. is the seat of a bishop, and has a college.

BAYEUX TAPESTRY, a web of canvas or linen cloth, 214 feet long by 20 inches wide, preserved in the public library, Bayeux, upon which is embroidered, in woollen thread of various colours,

Bayeux Tapestry.

Harold coming to anchor on the coast of Normandy.

a representation of the invasion and conquest of England by the Normans. Tradition asserts it to be the work of Matilda, wife of William the Conqueror, and it is believed that if she did not actually stitch the whole of it with her own hand, she at least took part in, and directed the execution of it by her maids; and afterwards presented it to the cathedral of Bayeux, as a token of her appreciation of the effective assistance which its bishop, Odo, rendered to her husband at the battle of Hastings. Some antiquaries contend that it was the work not of Queen Matilda (the wife of the Conqueror), who died in 1083, but of the Empress Matilda (the daughter of

King Henry I.), who died in 1167. According to Mr Bruce, the latest authority on the subject, the tapestry contains, besides the figures of 505 quadrupeds, birds, sphinxes, &c., 'the figures of 623 men, 202 horses, 55 dogs, 37 buildings, 41 ships and boats, and 49 trees—in all, 1512 figures.' The tapestry is divided into 72 distinct compartments, each representing one particular historical occurrence, and bearing an explanatory Latin inscription. A tree is usually chosen to divide the principal events from each other. This pictorial history—for so it may be called, and indeed, in several particulars, it is more minute than any written history we

have—opens with Harold, prior to his departure for Normandy, taking leave of Edward the

Bayeux Tapestry.
The crown offered to Harold by the people.

Confessor. Harold is next observed, accompanied

Bayeux Tapestry.—Battle of Hastings.

by his attendants, riding to Bosham with his hawk and hounds; and he is afterwards seen, successively, embarking from the Sussex coast; anchoring in France and being made prisoner by Guy, Earl of Ponthien; redeemed by William Duke of Normandy, and meeting with him at his court; assisting him against Conan, Earl of Bretagne; swearing on the sacred relics never to interfere with William's succession to the Saxon throne, &c.; and finally re-embarking for England. The tapestry then represents Harold narrating the events of his journey to Edward the Confessor, whose death and funeral obsequies we next see. Harold then receives the crown from the Saxon people, and ascends the throne; and next we have the news brought to William, who takes counsel with his half-brother, Odo, Bishop of Bayeux, as to the invasion of England. Then follow representations of the active war-preparations of the Normans; their embarkation; disembarkation; march to Hastings, and formation of a camp there; the battle, and death of Harold, with which the tapestry finishes.

The B. T. gives an exact and minute portraiture of the manners and customs of the times; and it has been remarked that the arms and habits of the Normans are identical with those of the Danes, as

they appear in the miniature paintings of a manuscript of the time of King Cnut, preserved in the British Museum.

M. Lanclot appears to have been the first to direct attention to the existence of this curious monument, by a description of an illuminated drawing of a portion of it he had discovered, in a paper presented to the Academy of Inscriptions and Belles-Lettres, in 1724. This led to the discovery of the tapestry itself, in the Bayeux Cathedral, by Père Montfaucon, who published an engraving of it in 1730, with a commentary on the Latin inscriptions. In 1767, Dr Ducarel gave an account of it in his *Anglo-Norman Antiquities*. From that time until 1803, when Napoleon had it conveyed to Paris, the B. T. excited little attention. Its exhibition, however, in the National Museum there awakened public curiosity concerning it, and gave rise to various speculations as to its age, intention, &c. The discussion satisfactorily established it to be what tradition asserted it—a contemporary pictorial record of the events of the Norman Conquest. The Society of Antiquaries (London) published an engraving of the whole in the sixth volume of the *Vetusta Monumenta*. The B. T. would have been destroyed at the Revolution, had not a priest fortunately succeeded in concealing it from the mob, who demanded it to cover the guns. It was formerly preserved in the cathedral of Bayeux, where it was wont to be exhibited, on certain days every year, in the nave of the church, round which it exactly went. Bruce's *Bayeux Tapestry Elucidated* (London, 1855); *Archæologia*, vols. xvii., xviii., xix.; *Vetusta Monumenta*, vol. vi.; *Pictorial History of England*.

BAYLE, PIERRE, one of the most independent thinkers in the 17th c., was born in 1647 at Carlat, in the old county of Foix, France, and studied philosophy under the Jesuits at Toulouse. The arguments of his tutors, but especially his friendly intercourse and quiet disputation with a Catholic clergyman, who lived in his neighbourhood, led him to doubt the orthodoxy of Protestantism, and shortly prevailed so far that he openly renounced his father's creed, and adopted the Catholic one. In the course of about 17 months, however, the conversation of his relatives brought him back to the Protestant profession. To escape ecclesiastical censure, he now went to Geneva, and thence to Coppet, where he studied the philosophy of Descartes. After a few years, he returned to France, and in 1675 was elected to fill the chair of philosophy in the university of Sedan. In this office he remained until 1681, when the university was disfranchised. His next appointment was that of professor of philosophy at Rotterdam. The appearance of a comet in 1680 having given occasion to a widely spread alarm, B., in 1682, published his *Pensées Diverses sur la Comète*, a work full of learning, and treating, in discursive style, many topics of metaphysics, ethics, theology, history, and politics. This was followed by his *Critique Générale de l'Histoire du Calvinisme de Maimbourg*. In 1684, he commenced a periodical, *Nouvelles de la République des Lettres*. The religious persecutions in France gave B. occasion to write his *Commentaire Philosophique sur ces Paroles de l'Evangile: 'Contrains les d'entrer,'* which professed itself to be a translation from the English, and contained a strong defence of the principle of toleration. In

consequence of the accusations brought forward by the theologian, Jurieu, who regarded B. as an agent of France, and the enemy of Protestants, B., though he skillfully defended himself, was deprived of his licence to teach (in 1693). He now assiduously devoted his leisure to the *Dictionnaire Historique et Critique* (1st edition, 2 vols. Rotterdam, 1696—last edition, 16 vols., Paris, 1820). This was the first work published under his own name. Again Jurieu came forward as B.'s adversary, and induced the consistory of Rotterdam to censure the Dictionary, chiefly on account of the supposed irreligious tendency of the article on 'David,' and the commendation bestowed on the moral character of certain atheists. B. promised to expunge all the objectionable matter; but afterwards, when he found that the public entertained a different and more favourable opinion of the peculiar passages than the Rotterdam Consistory, he judged it best to allow them to remain as they were, or made only slight alterations. New opponents were called into the arena by his *Réponse aux Questions d'un Provincial*, and the continuation of his *Pensées sur la Comète*. Jacquetot and Leclerc now attacked his religious opinions, while others persecuted him as the enemy of Protestantism and of his adopted country, Holland. These literary and theological controversies had a bad effect on his failing health, and a disease, for which he refused to employ medical aid, proved fatal. He died, December 28, 1706.

B. stands at the head of modern sceptics and logicians. Accustomed to view every question scrupulously on all sides, he was apparently led to doubt on religious matters generally; at least, it is not to be denied that his scepticism carried him the length of doubting the worth or the wisdom of the religious dogmatism that ruled both Catholics and Protestants in his day. B. was thus the antithesis of a bigot, but his hostility to bigotry rather originated in his indifference to the doctrines about which theologians quarrelled, than in any clear or high perception of the iniquity of religious persecution. With great eloquence and persistency, he vindicated the doctrine that moral characteristics and convictions may exist and flourish independently of particular religious opinions; and considering the barbarous manner in which the rival churches in B.'s time sought to enforce conformity of sentiment, and crush the liberty of private judgment, it is not to be wondered at that this doctrine, however objectionable abstractly, should have found a wide acceptance in Europe. Voltaire calls him 'a more admirable logician than a profound philosopher;' and adds that 'he knew almost nothing of physics.' This probably means no more than that he was ignorant of the then recent discoveries of Newton; for the scientific articles in the Dictionary presuppose a knowledge of the theories of Descartes (q. v.), with which he was conversant enough. The style of B. is clear and natural, but diffuse, and often impure. The articles in the Dictionary seem to have been chosen merely as vehicles to introduce numerous digressions in notes, many of which are prolix and uninteresting; but the greater number of the articles are characterised by good sense, logic, critical acumen, and great learning. Though it is impossible to detect the presence of a religious or a philosophical system in the work, it everywhere gives indications of the high intelligence, honest principle, and universal knowledge of the author. It was proscribed both in France and Holland, and was consequently very widely diffused in both countries, and has exercised an immense influence over the literature and philosophy of the continent. It was the dawn of scepticism in the 18th c., and may be historically regarded

as the protest of the enlightened human intellect against the irrational dogmatism of the churches. In his personal character, B. was amiable, obliging, disinterested, and modest, but at the same time morally courageous and independent. His *Œuvres Diverses* were published in four volumes at the Hague, 1725—1731. See life of B. by Des Maizeaux (Amsterdam, 1712).

BAYLEN, a town in the province of Andalusia, Spain, situated 22 miles north-north-east of Jaen. It has manufactures of linen, glass, bricks, tiles, soap, &c. Pop. 4976. B. is celebrated as the place where the Spaniards won their first and only victory over the French in July 1808, and that more by accident, and the errors of the French commander, Dupont, than by good generalship on their part. About 18,000 French soldiers laid down their arms at B., the only condition being, that they should be sent to France; and other detachments of French troops afterwards offered their submission. The Spaniards, however, basely broke faith with them, and sent them to the hulks at Cadiz. The capitulation had the worst effect on the French arms. Joseph Bonaparte at once fled from Madrid, and Napoleon could find no words strong enough to express his indignation at the folly and pusillanimity of the surrender.

BAYONET, supposed to be named from Bayonne, as the place of its invention, is a dagger or small spear fixed at the end of a musket or similar weapon. The first bayonets, used in France in 1671, called *bayonets-à-manche*, had handles which fitted into the muzzle of the guns; but at a later date were introduced the *bayonets-à-douille*, or socket-bayonets, having a socket which enabled the B. so to be used as not to interrupt the firing. The use of pikes went out when that of bayonets came in. It seems very probable that the first B. was a dagger, which the musketeer stuck by means of its handle into the muzzle of his weapon, to shield him from a cavalry charge; and that the usefulness of the contrivance suggested a permanent arrangement. Bayonets are now made with great rapidity at the government rifle factory at Enfield. Two pieces of metal are first selected—viz., a piece of the very best cast steel, 7 inches long by $\frac{3}{4}$ inch square; and a piece of the best wrought-iron rod, 4 inches long by about 1 inch in thickness. The steel is to form the blade, and the iron, the socket-handle. The steel being properly shaped at one end, is joined to the iron by welding. A forging-machine is next employed to give a rough outline of the required shape. Then comes the action of a swaging-machine, with dies which come down upon the metal in great force, and counter-dies beneath the metal. The metal is then annealed; turned in a cutting-machine to remove a wire-edge thrown up in the act of stamping; cut to a proper length, and the socket-end made square; drilled and bored, to make the socket hollow; shaped and furrowed along the blade; bent at the neck; hardened and tempered; and finished by a numerous train of minor operations. The B.-charge is now one of the most terrible manœuvres of trained infantry, in which each nation fancies itself to excel all others.

BAYONNE, one of the most strongly fortified towns of France, in the department of the Basses-Pyrénées, situated at the confluence of the Adour and Nive, about 3 miles from the mouth of their united waters in the Bay of Biscay. These rivers divide the town into three parts—Great and Little B., and the suburb of St Esprit. Population in 1872, 17,977. B. is beautifully situated at the foot of the Pyrenees, and is itself a handsome place. It has extensive ship-yards, rope-walks, glass-

manufactories, sugar-refineries, and distilleries, and a brisk export trade in hams, for which it is famous, chocolate, liqueurs, timber, tar, and cork. Its chief imports are wool, olive-oil, and liquorice. It is the see of a bishop, has a cathedral, a mint, and schools of commerce and navigation. B. is also historically interesting. It is said that here Catharine de' Medici and the Duke of Alba planned the massacre of the Huguenots, which took place on St Bartholomew's Day, 1572. Here the great Napoleon cozened Charles IV. out of the crown of Spain, after he had ineffectually endeavoured to get Ferdinand VII., to whom Charles had previously resigned it, to give it up. The forcing of the passage of the Nive, immediately in this vicinity, by the British, in December 1813, occasioned some of the most bloody conflicts of the Peninsular campaign. The place was invested by the British early in the following year, and a sally from it by the French, in April 14, was only repulsed after great loss on the side of the British. B. is also famous as the place where the bayonet was invented about the year 1670.

BAY-SALT is a name applied to common salt which is obtained from sea-water by solar evaporation. It is extensively obtained from *salt-marshes* which exist along the coasts of France and on the shores of the Mediterranean. See **SALT**.

BAY-WINDOW, or (corruptly) **BOW-WINDOW**, a window peculiar to Gothic architecture, so called because it forms a *bay* or projecting space outwards from a room. The external walls of bay-windows are, for the most part, either rectangular or polygonal, the semicircular form from which the term *bow* was probably derived having been unknown previously to the introduction of the debased Gothic.

Bay-Window, at Compton, Wingate, Warwickshire.

Though mentioned by Chaucer, bay-windows are not found in any of the styles before the perpendicular, during the prevalence of which they were frequently introduced, particularly in halls. Bay-windows generally reach to the floor, and are frequently supplied with a seat, which is called the *bay-stall*. There are many very beautiful examples of bay-windows in the colleges and halls of Oxford and Cambridge. When used in upper stories, such windows are supported on corbels, or large projecting mouldings. See **ORIEL**.

BAZA (the *Basti* of the Romans), a town of Spain, in the province of Granada, and about 50 miles east-north-east of the city of that name. It lies in a rich plain, is generally ill built and irregular, with no feature of architectural interest. Population about 11,000, who are chiefly engaged in agricultural pursuits, but who also manufacture to some

extent hats, linens, and earthenware. B. is famous for its red wines; and its women, according to Ford, are among the prettiest in Spain. In early times, B. was a place of considerable note, and many remnants of antiquity are still found in its vicinity. In 1480, Isabella captured it from the Moors, after a seven months' siege, and some of the rough iron cannon used by her army still ornament the town. In November 1810, the Spaniards, under Blake and Freire, were beaten in front of B. by the French under Soult.

BAZAR, or **BAZAA'R**, an oriental market-place, either open or covered, where various articles, including slaves, are exposed for sale, and where eastern merchants meet for transaction of business, as on 'Change or at the Bourse in England and France. The B. of Ispahan is one of the most splendid, and that of Tauris is the largest. In London, Paris, and other European cities, several places opened for the sale of various articles (chiefly fancy goods) are now styled bazars.

BAZARD, **AMAND**, the founder of French Carbonarism (q. v.), and subsequently an earnest disciple of St Simon, was born at Paris on the 19th of September 1791. After the Restoration, along with several other 'patriots,' he established, under the disguise of freemasonry, the revolutionary society of the 'Friends of Virtue;' and in 1820, in concert with his friends Dugied and Joubert, who had brought from Naples the statutes of the association of Italian Carbonari, he founded a similar association in France, which in the course of a year had extended over the departments, and contained 200,000 members. He was the leading conspirator in the 'plot of Befort,' which, however, proved a failure, and nearly cost him his life. After some time, a change passed over Bazard. Experience seems to have taught him the worthlessness of mere political agitation and reform. Impressed with the narrow and one-sided character of common democracy, and the necessity of a total reconstruction of the conditions of society, before any radical improvements could become possible, he attached himself to the school of St Simon, and along with *Enfantin*, undertook to elaborate the theoretical and speculative portion of the system. In 1825, he became one of the editors of a St Simonian journal, termed *Le Producteur*. In 1828, he delivered at Paris a series of prelections on his politico-religious creed, which met with extraordinary success. His socialistic views were afterwards published in the *chef-d'œuvre* of the sect, *Exposition of the Doctrine of St Simon* (1828—1830), of which only the first part was by B., the second, containing the principles of the new social religion, being the composition of *Enfantin*. After the July revolution, a larger scope was afforded to the St Simonians. The masses were attracted by the flattering doctrine, that 'all social institutions ought to have for their end the moral, intellectual, and physical amelioration of the poor.' In a short time, B. and his coadjutors had 'created a new society, living in the midst of the old,' with peculiar laws, manners, and doctrines. But B.'s connection with it was of short duration. He differed from *Enfantin* on the doctrine of a 'community of wives,' and in November 1831 succeeded in disgust. His efforts to found a school of his own proved unsuccessful, and during a heated discussion with his former friend *Enfantin*, he was struck with apoplexy, from the effects of which he never recovered. He died at Courtry, near Montfermeil, on the 20th July 1832.

BAZOCHE, or **BASOCHE**, a kind of burlesque translation into French of the Latin word *basilica*, i. e., royal palace. When the French parliament

ceased to be the grand council of the king, and confined itself exclusively to administering justice, a distinction of name necessarily sprang up between those noblemen who formed the royal train and the *habitués* of the court of justice. The former were called *courtiers*; the latter, *basochians*, or parliamentary clerks. But inasmuch as the word *basilica* necessarily presupposed a king, the *basochians*, to keep up their dignity, gathered round a mock one of their own making, who resided at the Château des Tournelles or the Hôtel St Pol, just as the courtiers did round the reality at the Louvre. Such was the origin of the Basochian king and kingdom. Their historical existence can be traced to the beginning of the 14th c., when Philip the Fair conferred on the brotherhood certain privileges. The principal authorities in this harmless monarchy, after the sovereign himself, were, the chancellor, the masters of requests, the referendary, and the attorney-general. Henry III. suppressed the title of king, and conferred all the privileges and rights attached to that office on the chancellor. Still the B. continued to exist as a kingdom, minus its head, and affected on all occasions the language of royalty. Its jurisdiction included the consideration and decision of all processes and debates that arose among the clerks. It administered justice twice a week, and also caused a species of coin to be struck which had currency among its members; but if we are to judge from the proverb about *la monnaie de basoche*, it did not enjoy an immense credit in the outer world of hard cash. The mock-monarch also possessed the extensive privilege of selecting at his pleasure, yearly, from the French royal forests, a tall tree, which his subjects, the clerks, were in the habit of planting, on the 1st of May, before the grand court of the palace, to the sound of tambourines and trumpets. But this was not all. In the public sports, this fantastical little kingdom was worthily honoured; its chancellor had rooms at the Hôtel de Bourgogne; at the carnival, the *basochians* joined themselves to the corps of the Prince of Fools, and to the performers of low farces and 'mysteries.' They acted in their turn a species of satirical 'morality' (q. v.), in which they made extensive use of the liberty granted to them, in ridiculing vices and the favourites of fortune. Of course, they could not fail to provoke enmity and occasion serious scandal. Louis XII. patronised these amusements. In 1500, he gave the brotherhood of the B. permission to perform plays in the grand saloon of the royal palace. Francis I. witnessed them in 1538; but in 1540, they were interdicted as incorrigible. This interdict only applied to those of Paris, for several years after, we read of the Basochian farces of Bordeaux. In their later development, they seem to have resembled the *Fasnachtspielen* (Shrove-Tuesday Spectacles), so popular in Germany both before and after the Reformation. They were the beginning of French comedy.

BDELLIUM, a gum-resin, resembling myrrh (q. v.) in appearance and qualities, but weaker, and at the same time more acrid. High medicinal virtues were ascribed to it by the ancients, but it is now little used. It is supposed to be the produce of *Balsamodendron Roxburghii* in India, and of *B. Africanum* (also called *Hindolotia Africana*) in Senegal—trees or shrubs belonging to the natural order *Amyridaceæ* (q. v.), so remarkable for the number of similar substances which it produces.—**EGYPTIAN B.**, however, is obtained from the Doom (q. v.) palm, *Hyphane Thebaica*. A similar substance is yielded also by *Ceradia furcata*, a half-succulent plant of the natural order *Compositæ*, inhabiting the most sterile regions of the south-west of Africa;

whilst the **STICLIAN B.**, formerly used in medicine, is produced by *Daucus gummifer*, a species of the same genus to which the carrot belongs, growing on the coasts of the Mediterranean.—The B. mentioned in Gen. ii. 12 is probably not a gum-resin at all; but what it is, is uncertain.

BEACHES, RAISED. Modern geology teaches that the frame of the land is liable to risings and depressions, even in the present age. Several districts in different parts of the world have been raised, in consequence of earthquakes, within the remembrance of the present generation. There is good proof that certain parts of Eastern Sweden, bordering on the Gulf of Bothnia, have been elevated about three feet within the last hundred years. These facts prepare us to learn that, around the British Islands, and in other parts of the earth, there are tracts of ground at various elevations above the present sea-level, which have evidently been sea-B. at a former time. The evidences consist of, first, the levelness of the ground in the general direction of the present shores over considerable spaces; second, the alternating beds of sand and gravel, such as we see composing the present B.; and, third, the presence of marine shells, which, in our country, are generally of species now living in the boreal seas. There are also what may be called terraces of erosion—indentations made in a rocky coast by the lip of the sea in ancient times—usually consisting of a flat platform presenting patches of gravel, and of a backing wall or sea-cliff, the latter sometimes penetrated with deep caves. In Scotland, there is a very decided terrace of erosion all round the bold coasts of the West Highlands and Western Islands, at an elevation of about 25 feet above the level of the similar, but scarcely so well-marked indentation which the sea is now making. In Lapland, there is a similar terrace, but stooping from 220 to 85 feet in the course of thirty miles. There is also a clear and well-marked terrace of the same kind, at about 520 feet above the present sea-level, behind Trondhjem in Norway. The whole subject is treated elaborately in *Ancient Sea-margins*, by R. Chambers, 1818, where a series of gravelly terraces are described as existing in Scotland at various heights above the sea, telling of an uprise of the frame of the land in stages, and indicating by their uniformity of level that this movement was equable.

BEACHY HEAD, the loftiest headland on the south coast of England, projecting into the English Channel, $2\frac{1}{2}$ miles south-south-west of Eastbourne, Sussex. It consists of perpendicular chalk-cliffs, 564 feet high, forming the east end of the South Downs. Several caverns have been cut out in the rock, for shipwrecked seamen to take refuge in; but shipwrecks have been far fewer since 1828, when the Bell Tont Light-house was built here. This light-house is 285 feet above the sea, in lat. $50^{\circ} 44' 24''$ N., long. $0^{\circ} 12' 42''$ E., and is seen above 20 miles off. The view from B. H., in clear weather, extends to Hastings, the Isle of Wight, and France. The cliffs are the resort of myriads of sea-fowl. Off this point, the French fleet beat the combined English and Dutch fleets in 1694.

BEACON (allied to *beck* or *becken*, to give a signal) denotes any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great event. These fire-signals were in use in the earliest times, and notices of them are found in the literary remains of ancient Persia, Palestine, and Greece. They were made by kindling a pile or bale of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered

as to emit a dense smoke by day. There were various preconcerted modes of exhibiting the light or smoke, so as to indicate the nature of the intelligence. Thus, an act of the parliament of Scotland, in 1455, directs that one bale on fire shall be warning of the approach of the English in any manner; two bales blazing beside each other, that they are *coming indeed*; and four bales, that they are coming in great force.

An early instance of B.-signals is found in the book of the prophet Jeremiah, in his call, in chap. vi. 1, to the people of Benjamin to kindle a fire-signal on one of their mountains: 'Set up a sign of fire in Beth-haccereim; for evil appeareth out of the north, and great destruction.' An instance of the use of a line of beacons in very ancient times is given in a passage of the tragedy of *Agamemnon*, by the Greek poet Æschylus. The commander-in-chief of the Greek army at the siege of Troy is represented as communicating the intelligence of the fall of the city to his queen, Clytemnestra, at Mycenæ, in the Peloponnese. The line consists of eight mountains, and the news is supposed to be conveyed in one night from Troy.

In England, the beacons were kept up by a rate levied on the counties, and had watches regularly stationed at them, and horsemen to spread the intelligence during the day, when the beacons could not be seen. They were carefully organised while the Spanish Armada was expected. In the beginning of 1856, an old B.-work on Malvern Hill, in Worcestershire, which had done its part in former days in spreading the intelligence of the appearance of the Armada, of the approach of the Young Chevalier, and of that of the Dutch fleet afterwards, dealt with by Admiral Blake, was lighted up in anticipation of the close of the Crimean war, and afforded an interesting amusement to scientific persons in estimating the distance at which the blaze could be seen from distant mountains.

BEACON, in maritime affairs, is a signal for warning against dangers, or for indicating the proper entrance into a channel, harbour, or river. Generally speaking, a B. is fixed; whereas a *buoy* floats. The power of constructing these beacons rested at one time in the sovereign; but in 1565 an act of parliament empowered the Trinity House corporation to erect them on such parts of the sea-coast and forelands as appeared to be most in want of those safeguards; and tolls were levied on the maritime counties for their maintenance. In recent times, the construction of *floating* beacons has occupied a good deal of attention, as it is conceived that they might in many cases supply the place of much more costly light-houses. Messrs Brown and Lenox have constructed for the Trinity Board a B. for the Goodwin Sands—comprising a hollow wrought-iron floating vessel, with 6 water-tight compartments; a tower 28 feet high, tapering in diameter from 7 to 3½ feet; and a ball at the top of 3½ feet diameter. This B. was visible from a considerable distance; but some leakage frustrated its continued use. Mr Herbert, in 1854, introduced a new B., intended to float upright in all states of the winds, tides, and currents. It consists of a wrought-iron pear-shaped body, circular in plan, with an apex at the top, and the weight so distributed that the centre of gravity shall be situated a little below the centre of the plane of flotation; the bottom is made concave, and raised up internally so as to form a cone, to the internal apex of which the mooring-chain is to be attached. Many beacons are now made in which a bell is sounded instead of a light shewn, as a warning. One of the most recent is Messrs Brown and Lenox's, patented in 1858, and so constructed as to yield a continuous bell-ringing,

so long as tide or current is flowing. There is a keel at the bottom, to make the B. turn with the tide. There are channels below the line of flotation, through which the tide-water or current flows; the water causes two undershot wheels to revolve; and this revolution, by means of axes, cranks, rods, guides, and levers, is made to bring the force of a hammer to bear on a bell. Some beacons on this principle have already been constructed with a bell of 2 cwt. The distinction between these and other sea-marks is further illustrated under BUOY and LIGHT-HOUSE.

BEAD, BEADE, or BEDE (allied to 'bid'), in Anglo-Saxon and Old English, signified 'a prayer,' and hence came to mean the small perforated balls of gold, silver, glass, ivory, hard wood, &c., used for keeping account of the number of prayers repeated. A certain number strung on a thread makes a rosary (q. v.). A *bedesman* or *bedeswoman* is one who prays for another. Persons of station and wealth in old times 'had regularly appointed bedesmen, who were paid to weary Heaven with their supplications.' Bedesmen appointed to pray for the king and state, sometimes lived together, and hence *bedehouse* is synonymous with an almshouse. A common form of signature at one time was: 'Your bounden bedesman,' or, 'Your humble bedeswoman,' instead of the modern, 'Your obedient servant.'

BEAD, in Architecture, a small round moulding, sometimes called an astragal. It is of frequent occurrence in architecture, particularly in the classical styles, and is used in picture-frames, and other objects carved in wood.

BEADLE is an inferior parish-officer chosen and appointed by the vestry. His business is to attend the vestry, to give notice of its meetings to the parishioners, to execute its orders, to assist the parish constable, and generally to do and execute all the orders and business of the vestry and of the parish, as their messenger or servant. *Shaw's Parish Law*, c. 19. See PARISH; VESTRY. The B. holds his office during 'pleasure, and he may therefore be dismissed at any time for misconduct by the parishioners assembled in vestry.'

BEADS, small perforated ornaments, usually of a globular shape, worn by women in necklaces, bracelets, head-dresses, &c.; and also used in the ornamentation of slippers, purses, watch-guards, and a variety of fancy articles. B. are made of various materials—gold, diamond, amber, pearl, coral, garnet, crystal, steel, paste, glass, wood, &c.; but incomparably the greatest quantity are of glass manufacture. Glass B. seem to have been manufactured by the Phœnicians more than 3000 years ago. The Egyptians, however, as would appear from the adornment of their mummies with them, were also early acquainted with the manufacture of glass B., which was introduced into Europe on the revival of civilisation by the Italians. Glass B. are commonly manufactured over the blowpipe, the glass, which had been previously drawn out into a tube, being, when sufficiently heated, blown into a bulb of the size required for the bead. At Murano, near Venice, where there are extensive manufactories, the process is somewhat different. There, glass tubes of various colour having been cut into small uniform pieces, the pieces are thrown into a mixture of wood-ashes and fine sand, and stirred about until their cavities are filled; they are thence transferred to an iron pan, heated by a moderate fire, and agitated until they assume a smooth rounded form. Taken out, and their bores cleared, they form beads.

When the glass is not originally coloured, a colouring matter is applied to the inside of the tube.

In commerce, B. are known as the hollow, the

common, the tube, and the bugle. The hollow are the most expensive kind, and include a great variety of colour, the price varying from 2s. to 10s. the bunch of 12 strings. Common black B. are sold at from 10d. to 1s. per pound.

Large quantities of B., used for dolls' eyes, are manufactured at Birmingham. Glass B. are imported into this country from the continent to the annual value of £8000 to £10,000.

BEADS, St CUTHBERT'S, a title popularly given to the single joints of the articulated stems of *Encrinurus* (q. v.). The central perforation permitted them to be strung as beads; and from the fancied resemblance, in some species, of this perforation to a cross, they were formerly used as rosaries, and associated with the name of St Cuthbert:

On a rock by Lindisfarne
St Cuthbert sits, and toils to frame
The sea-born beads that bear his name.

They are also known as *Entrochites*, or wheel-stones.

BEAGLE, a small variety of hound, formerly much used in England for hare-hunting. It has now been almost wholly superseded by the Harrier (q. v.), to which its name is also sometimes given. The true B. is smaller than the harrier, not above ten or eleven inches in height at the shoulder, sometimes considerably smaller, stout and compact in make, with long pendulous ears, smooth-haired, sometimes dark-brown, with a streak or spot of white about

Beagle.

the neck, sometimes white with black or reddish spots. There appears to have been also a rough-haired variety. The B. is remarkable for its exquisite scent and perseverance; and although much distanced by the hare at first, is almost sure to kill it. It was customary in England, in former times, when beagles were used, to follow the chase on foot, a hunting-pole being employed to assist in leaping. During the chase, the B. gives utterance to a cry which has been regarded as particularly musical; and Queen Elizabeth had little 'singing-beagles,' one of which could be placed in a man's glove. The smaller breeds were preferred, perhaps, at first, for the prolongation of the chase; and the diminutive size of a pack or 'cry' of beagles became a boast. The smallest are sometimes called *lap-dog beagles*. The origin of the name B. is uncertain.

BEAK. See **BILL**.

BEAK'ED, BECQUÉ. When the beak of a fowl is of a different tincture from the body, it is then said, in heraldry, to be beaked of such a tincture. If its legs are of the same tincture, it is then beaked, and membered so and so. In place of B., Guillim commonly says 'armed.'

BEA'KER, a term formerly in use, signifying a kind of drinking-bowl or cup, derived from the same root as the German *becher*, the Italian *bicchieri*, or the barbarous Latin *baccarium*. The Scotch call a hooped wooden dish a 'bicker.'

BEAM (Ger. *baum*, Dut. *boom*, Ang.-Sax. *beam*, signify 'a tree'), any piece of wood, long like a tree. In the arts, the word has many special technical applications. It is the name, for instance, for three parts of a weaving-loom (q. v.), for a part of the balance (q. v.), and for a part of the steam-engine (q. v.). In ship-building (q. v.), it is applied to any of the transverse pieces of framing extending across the hull. In ship measurement, it means breadth at the wales. See **TONNAGE B.**, in engineering, is a strong stay of wood or of iron, for supporting lateral pressure. See **STRENGTH OF MATERIALS**.

BEAM, of a ship, is one of the main timbers which aid in supporting the decks. Beams stretch across from side to side, aiding to strengthen and uphold the sides of the hull as well as the decks; and they are themselves supported at the ends by massive pieces, called knees, standards, and clamps. Each is made of one fine piece of timber, if possible; but if the length be too great for this, two or more timbers are scarfed together. Wherever it is practicable, the beams are upheld at or near the middle by pillars. In the *Great Eastern* steam-ship, the beams are of iron, and, like most other parts of the vessel, are cellular in construction. In the old timber-built sailing ships-of-war, now rapidly becoming obsolete, the *beak-head* B. was the broadest in the ship; the *midship* was the longest; the *orlop* was that which supported the orlop deck, and strengthened the hold. The old 74-gun ships had each 24 beams under the lower deck. Many of these characteristics still prevail; but others have given way to change, owing to the increased length of war-steamer, and to the necessity of making room for the machinery. The beams of all ships are generally made deeper in the middle than at the ends, in order that the decks supported by them may have a slight convexity on the upper surface, to carry off the rain-water readily, and to lessen the recoil of the guns.

The position of the beams, stretching across a ship at right angles to the direction of the keel, has given origin to many technical phrases used on shipboard. 'On the starboard B.' is applied to any distant point out at sea, at right angles to the keel, and on the starboard or right hand—as viewed from the stern—side of the ship. 'On the larboard B.' similarly applies to the left hand. 'On the weather B.' is that side of the ship which receives or is towards the wind. 'Before the B.' is the bearing of any object when seen more in advance than on the beam. 'Aft the B.' is the reverse of the expression just noted. 'On her B.-ends' is applied to the position of a ship when so much inclined to one side that the beams become nearly vertical.

BEAMING is a handicraft process in the cloth-manufacture preliminary to weaving, and was formerly done by the weaver himself; but it has long since become a special employment, followed by workmen trained to the business as beamers, and, like hand-weaving, is tending to extinction by machinery—warping and beaming, in weaving by power, being conjoined into one operation. See **WEAVING**. B. is simply the art of winding the web on the weaver's beam in a manner suitable for weaving—the two essential requirements being firmness in the winding on of the web sufficient to withstand the reaction of weaving, and evenness in the spreading of the yarn at the required width. This is effected by what is called a beaming machine, which is simply a kind of roller-mill, extending from end to end of the beamer's shop. The weaver's beam, on which the web is to be wound, is set horizontally on two upright standards

at the one end of the shop, and at the other end there is a friction-roller, set likewise level in a heavy frame, fixed to the floor, on which the web is wound like a rope, with the thrum-end out.

The number of pins or strands in the web being known, the beamer has merely to take a ravel (a comb-like utensil) with the corresponding number of teeth in the breadth required for the web, and filling each tooth successively with its respective pin, the spreading is completed; and the web being attached to the beam, the winding on of the web is a common crane operation, in which the tension on the yarn is regulated by the friction on the friction-roller. The beamer may thus beam for 400 weavers. The price of beaming a web varies from 3*l.*, to perhaps 8*l.* or 10*l.*

BEAM-TREE, WHITE (*Pyrus Aria*, see **PYRUS**), a tree of 20—40 feet in height, a native of almost all parts of Europe and of corresponding climates in Asia, not uncommon in the mountainous districts of Britain, and frequently planted. It has been variously referred by botanists to several allied genera, *Sorbus*, *Crataegus*, and *Mespilus*. It has a straight erect trunk, and a round or oval head; the leaves are ovate, cut and serrated (in some varieties, deeply lobed), white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, of the size of small peas. The fruit is acid and astringent, but becomes agreeable by incipient decay; it is sometimes called Sorb or Service-berry, and resembles the true Service (q. v.) in quality, although much smaller. Beer is made of it by fermentation. The wood is very hard and fine-grained; it is used for eggs for the wheels of machinery. The whiteness of the foliage makes the tree—sparingly introduced—ornamental in plantations.

BEAN (*Faba*), a genus of plants of the natural order Leguminosæ, sub-order *Papilionaceæ*, included by Linnaeus and many other botanists in the genus *Vicia* (see **VETCH**), from which it is distinguished chiefly by the leathery tumid pods, spongy within, and by the large scar on the end of the seed.—The **COMMON B.** (*F. vulgaris*, *Vicia Faba* of Linnaeus) is

Bean leaves and flower.

somewhat doubtfully supposed to be a native of the borders of the Caspian Sea; it has been in cultivation from remote antiquity in Europe as well

as in Asia. It is an annual plant, generally from two to four feet high, with thick angular stem, leaves with 2—5 oval leaflets, and destitute of tendrils. The pods are thick, long, and woolly within; the seeds more or less ovate and flattened. The flowers, which are almost without stalks, are ordinarily white, with a black spot in the middle of the wing; but there is a variety with flowers entirely white, and another in which they are scarlet. The flowers are deliciously fragrant. Burns alludes to this in the lines—

The zephyr wanted round the bean,
And bore its fragrant sweets along.

A field of beans perfumes the summer air for a considerable distance. The varieties and sub-varieties in cultivation are very numerous, differing in the size and form of the seed, the colour of the flower, the period which they require for growth, the height, the stem in some unbranched, in others divided at the base into a number of stalks—the pods in some mostly solitary, in others clustered, &c. The B. is cultivated both in fields and gardens, and the seeds (beans) are used for feeding cattle, also for making a sort of meal for human food, and in a green state are put into broths or boiled for the table. They are very nutritious, containing when ripe about 36 per cent. of starch, and 23 per cent. of legumine, a nitrogenous substance analogous to the casein of milk. Whether for man or for cattle, however, they particularly require to be mixed with other food. The straw is used for fodder, and is very nutritious when cut before it is fully ripe. The B. succeeds best on a dry and moderately rich soil. A well-drained clay is very suitable for it. Its tapering and deeply penetrating root unfits it for shallow soils. The varieties of B. preferred for the garden are generally much larger, both plant and seed, than those cultivated in the field. The Windsor B. has seeds of a flattened, almost circular shape, fully an inch in diameter; whilst those of the Horse B., or Tick B., cultivated as a field-crop, are often not more than half an inch in length, and not quite three-eighths of an inch in breadth. Garden-beans, in Britain, are usually sown in spring, in rows two feet or more apart; and sowings are made at different dates, that there may be a succession of unripe beans for culinary use. The Windsor, Long Pod, and Early Mazagan, are among the most approved garden varieties.

The roots of the B. are diuretic, and a decoction of them has been used with advantage in cases of dropsy.

B. crops are very liable to be injured by a species of *Aphis* (q. v.), *A. Faba*, sometimes called from its colour the Collier *Aphis*, and sometimes the Black Dolphin Fly, which destroys the leaves, and so renders the plants incapable of bringing the ordinary amount of seeds to perfection. The most effectual remedy known is to cut off the tops of the plants, which are always first attacked, as soon as the *Aphis* appears, and so to prevent its multiplication. The *topping* of beans is regarded by many gardeners as a good practice, even when they are quite free of the *Aphis*.

The Kidney B. (q. v.), or Haricot (*Phaseolus vulgaris*), is an entirely different plant from the Common Bean.

BEAN, in Agriculture. The B. was cultivated to a small extent at least in ancient times, both in Palestine and Egypt. The Roman family of the *Fabii* are said to have derived their name from this plant. It requires a rich or alluvial land to grow the bean in perfection, and hence it is only found entering into a regular rotation of cropping upon soils of the best class. Since the introduction of

maize into the south of Europe, the land under this plant has been considerably restricted. The maize thrives better, and is far more productive than the B., in warm climates. In the north of Europe, too, the potato, flax, beet, and other fallow crops are more productive and certain. Indeed, the high summer temperature of the continents of Europe and America is by no means favourable to the growth of the bean. In the west of England, the summers are rather too moist for its yielding its seeds in abundance. The straw and haulm are apt to be developed too much, and the blossoms do not set well. Beans are largely cultivated on all the better descriptions of clay soils in the eastern counties, such as Kent and Suffolk. The variety most generally grown there is the *Common Tick* or *Fiehl B.*, having much resemblance to the *Scotch* or *Horse Bean*.

The modes of cultivation are very various, and a large breadth is still sown broad-cast. The great objection to this mode is the liability of weeds to spring up and check the growth of the crop. Beans are considered one of the fallow crops; but the soil, after it has borne a crop of beans, is little fitted for a cereal crop, unless it has been hoed and kept clean in summer. To effect this end, beans are usually sown in rows, and hoed during their early growth either by the hand or horse hoe. In preparing the land for a bean crop in England, the stubble, after being liberally dressed with farm-yard manure in autumn, receives a deep furrow, so as to expose the soil to the winter frosts. The surface is then scarified, and after being harrowed, the beans are sown in drills of 18 inches in width, at the rate of 3 to 3½ bushels per acre. The sowing begins as soon after the month of January as the soil admits of the necessary operations, and may be practised up to the middle of March. The earlier the crop is put in, the better in general is the chance of its being productive. The greater liability of the eastern counties to drought, renders the crop more subject to the attacks of insects, such as the 'black dolphin,' or *B. Aphis*, which usually makes its appearance as soon as the plant suffers from the want of moisture. For this reason, the B. crop is rather an uncertain one in the climate of the eastern counties, and other crops are gradually encroaching on the breadth which it used to occupy. The Russian or winter beans are sown in these counties to some extent in autumn, and from ripening earlier, often escape the attacks of vermin, and suffer less from the drought.

Perhaps East Lothian is as favourable, in respect both of soil and climate, to the cultivation of the field bean, as any part of Europe. The summers are comparatively cool, and the rains generally moderate, and pretty well diffused over the growing season. The crops are less liable to depredations of the 'black dolphin,' and the long period over which the growth of the plant is extended, is favourable to large crops. Sometimes the crop is sown broad-cast, when the land is clean and well manured; and it is said that as large crops have been raised in this way as by sowing in rows. The produce by this mode of cultivation, however, is much more irregular, and the land is often left in a foul condition. Drilling is therefore the general practice in cultivating this crop in the Lothians. The stubble is usually manured and ploughed in autumn, and when the weather admits, in spring it is ploughed again, and the beans are sown by a small machine in every third furrow; or the land is merely ploughed in autumn, and formed into drills or ridges by the double mould-board plough in spring. Into these the farm-yard manure is put and spread, and the beans are sown above it either broad-cast or by a three-barrelled machine. The seed is then covered

by the double-moulded plough, as in the planting of potatoes. By this mode, the plants receive a plentiful supply of nutriment in their early stages of growth. When land is out of condition, or when the crop is sown upon lighter and inferior descriptions of soil, this is perhaps the most advisable method to follow. Mr Hope of Fenton-barns has lately introduced the English method of cultivating the B. into East Lothian. The stubble is dug and ploughed in autumn, and as soon as the land is dry in spring, about 3 bushels of beans are drilled, 18 inches apart, by means of Garrett's machine. As soon as the crop appears above ground, Garrett's lever horse-hoe is put over the ground, to stir the surface, and keep it free from weeds. During the spring and early summer, the horse and hand hoeing are repeated as often as it is deemed advisable, until the crop covers in the land by its abundant foliage, and keeps down all weeds. Mr Hope's experiments indicated that the yield of grain is greater by the farrow than by wide drilling.

In England, the crops of beans vary from 20 to 40 bushels per acre; but in dry and warm seasons, the produce often falls below the first-named quantity. The weight per bushel is from 60 to 64 lbs. On some of the best soils in Fife, and in the Lothians, as many as 60 bushels per acre are obtained in favourable seasons, and the weight of the bushel is sometimes as much as 66 lbs. In Scotland, the straw is more abundant than in England. It forms good fodder both for cattle and horses, as well as supplying material for the dung-heap. Beans are usually cut by the sickle, allowed to lie a few days unbound to winnow, and when bound, put up into *stooks*. In late seasons, when there has been a considerable growth of leaves, they are often long before they are ready for carrying to the stack. Notwithstanding the relatively high price of beans, the breadth under this crop has been diminishing also in Scotland. It is said that the draining of the soil has not been so beneficial to the B. as to other crops. The greater returns which the land gives under potatoes in the B. soils of Fife and the Lothians since the opening of the railways, has encroached upon the extent formerly assigned to it in the six-course rotation. In the Carse of Stirling and Falkirk, it retains its hold much better, and forms the chief preparation for the wheat-crop. The field B. is now little used as an article of human food. It is considered to be specially adapted for the feeding of horses which are subjected to hard work. For this purpose, it is usually roughly ground, and mixed with a little bran. In the winter season, a portion is often boiled, and given to them at night. When the price is moderate, a mixture of ground beans and oilcake, or linseed, is much esteemed for milch cows, as well as for fattening cattle and sheep. Special or light manures are less applied to the B. crop than to any other. In many instances, nitrate of soda and sulphate of lime have been used with advantage, but farm-yard manure is almost essential to its free growth.

BEAN-CAPER. See ZYCOMYLLACEÆ.

BEAN GOOSE. See GOOSE.

BEAN-KING'S FESTIVAL, a social rite principally observed in France, from which country it would seem to have been transplanted to Germany. On the evening of Twelfth Day (q. v.), or, as the Germans call it (in allusion to the legend, that the wise men of the East who came to worship Christ were three kings), Three Kings' Day (*Dreikönigstag*), companies assemble to spend a few hours in mirthful relaxation. A large cake is baked, with a bean hidden somewhere in it. The cake is then divided

into pieces, each person present receiving one, and whoever obtains the piece with the bean is king for the year. In this capacity, he holds a mock-court, and receives the homage of the company, who also amuse themselves with other diversions. The Bean King, however, is compelled to pay for his dignity, for he has to give an entertainment on the next Twelfth Night, that an opportunity may be afforded to choose another king. In France, this custom was at an earlier period so common, that even the court indulged in it, although the church, in the 17th c., exerted itself zealously for its suppression. The opinion that the B. K. F. owes its origin to the Roman saturnalia, when even the children, partaking in the universal glee, were wont to elect a king, is not destitute of probability.

BEAN, St IGNATIUS'S. See STRYCHNOS.

BEAR (*Ursus*), a genus of quadrupeds, the type of a family called *Ursidae*, belonging to the order *Fereæ*, sub-order *Carnivora*, and tribe *Plantigrada*. In the *Ursidae* or B. family, are included not only the true bears, but also badgers, gluttons and wolverines, racoons, coatimondis, binturongs, the kinkajou, the panda, &c. (See these articles.) Walking on the whole sole of the foot (plantigrade), the animals of this family are not, in general, capable of running very swiftly; and the nearly equal length of their fore and hind legs unfits them for leaping; most of them are also heavy both in form and gait. But whilst thus deficient in the powers which other carnivorous animals possess for obtaining prey, they really exhibit the same beautiful mutual adaptation of endowments and wants; they are, in fact, by no means strictly carnivorous; no animals are more thoroughly omnivorous than some of them; whilst others, even of the true bears, always give a decided preference to vegetable food when it can be obtained, and their teeth and digestive organs are in exact accordance with such tastes. Their jaws are much more elongated than those of feline animals, and their bite proportionally less powerful, although some of the bears are still very formidable from their great general strength and the size of their canine teeth. Their claws are not retractile, and are adapted for digging in the earth, or for climbing trees, rather than for seizing prey. All animals of the family have five toes to each both of the fore and hind feet.

Bears have six cutting teeth above, and six below, one canine tooth on each side in each jaw, with four false molars and two molars (or grinders) on each side above, and four false molars and three molars below. The false molars are, in general, soon lost by the more carnivorous species. The true molars are very large and tuberculous, the false molars comparatively small. The tuberculous crowns of the molars exhibit the adaptation to vegetable food.—The tail in all species of B. is very short, so that some of them almost appear tailless. Most of them may be described as nocturnal in their habits.

Bears are found in Europe, Asia, and North and South America, and both in warm and cold climates, the species belonging to cold climates being in general the most fierce and carnivorous. The ancients mention them as occurring in Africa; it must, therefore, be regarded as a curious circumstance that no recent accounts make certain the existence of any species in that continent. Nor is any known to belong to Australia.

The common B. of Europe, or Brown B. (*Ursus Arctos*), was at one time a native of the British islands. Bears were carried from Britain to Rome, for the cruel sports in which the Romans delighted, and they certainly were not exterminated in Scotland

before the latter part of the 11th c. The Brown B. is usually about four feet long, and two and a half feet high. Its claws are about two inches long, and much curved. It has a convex forehead, and generally a brown fur, which is somewhat woolly in the younger animals, but becomes smoother with age.

Brown Bear.

It produces from one to three young ones at a birth, which remain blind for about four weeks. It is generally believed to be the only European species, although different varieties occur; and one, the Black B., has been regarded by some naturalists as specifically distinct. The common B. is very widely distributed over the whole of Europe and of the north of Asia, Japan, and North America. In America, it is known as the Barren Ground Bear. It is a solitary animal, and generally inhabits mountainous regions or thick forests. It sometimes preys on lambs, kids, &c., is fond of fish, which in some countries, as in Kamtchatka, constitute a great part of its food; climbs trees in quest of honey, eats also fruits and vegetables, and in confinement, exhibits a strong appetite for bread. It usually prefers vegetable to animal food. The skin is valued for making fur-cloaks, &c.; the flesh is used as food, often in the shape of hams, as is that of the American Black B.; the paws are esteemed a delicacy. The fat (bear's grease) is in great request as an unguent for the hair. The intestines are used in Kamtchatka, instead of glass, for windows. To the people of Kamtchatka, indeed, bears, which are there very abundant, afford many of the necessaries and comforts of life.—The common B., like others of the genus, in cold climates, usually spends the winter in a torpid state. It selects a cavern or the hollow of a tree for its hibernation, or makes a hole for itself by digging; it is also said, but this needs confirmation, sometimes to construct a sort of hut with branches of trees, lined with moss. The winter being spent without food, it is said to be very lean on the return of spring. This and other species of B. are very often killed in their winter dens.

The American Black B. (*Ursus Americanus*) is found in all parts of North America. Its total length seldom exceeds 5 feet. The fur is soft and smooth, and generally of a glossy black; but there are varieties of other colours, as the Cinnamon B., the Yellow B., &c. The American Black B. usually exhibits a timid disposition; seldom attacks man; feeds chiefly on berries, when they can be obtained; occasionally visits gardens for the sake of cabbages and other vegetables; and strongly prefers vegetable to animal food, but has recourse to the latter when pressed by hunger, and in such circumstances occasionally approaches human habitations and captures

pigs, which it endeavours to carry off. In such cases the B. walks on its hind-legs, the pig being firmly squeezed between its fore-paws and breast, making a noise which frequently leads to a rescue. This and other species of B., when assailed, not unfrequently hug their adversaries in the manner here described, when their strength renders them very dangerous. The skin of the American Black B. is used for caps, rugs, &c., and great numbers are annually killed upon this account, chiefly by the Indians in the employment of the Hudson's Bay Company. Almost 10,000 skins are annually imported into Britain, of which, however, the greater part are again exported. In the beginning of the 19th c., the number imported was more than twice as great as now; the skins were also of much higher price. A B.'s skin is still worth from £1 to £3.—The Grisly B. (*U. ferox*) of North America, found chiefly on the Rocky Mountains and the plains to the eastward of them, from Mexico to lat. 61° N., is much larger than either of the species already noticed, and much more fierce and carnivorous. It sometimes measures more than 9 feet from nose to tail, and the claws of the fore-feet more than 6 inches in length. It has a lengthened and narrowed muzzle, a very short tail, and long grised hair. No animal of the New World is more formidable than the Grisly B. It is capable of overpowering the bison, and dragging away the huge carcass. It feeds, however, also on fruits and roots.—The Arctic B., or Polar B., also called the White B. (*U. maritimus*), resembles this species in size and

from semicircular yellow marks above its eyes, a native of the Andes of Chili.—The Long-lipped B., or Sloth B. (*U. labiatus*), of the East Indies, is the kind commonly led about by Indian jugglers. Its

Syrian Bear.

long hair, short limbs, high back, peculiarly uncouth appearance, and gentleness of disposition, recommend it for this purpose. In a wild state, it is said to feed chiefly on fruits, honey, and ants. It possesses in a remarkable degree the power, common in some measure to all the bears, of protruding the lips in order to lay hold of food.—Some other East Indian species, which feed chiefly on fruits and honey, are known as Sun-bears, as the Malayan B. (*U. Malayanus*) and the Bornean B. (*U. Eurystylus*). They are characterised by an extremely long extensile tongue. They are of gentle disposition, and become very affectionate when tamed. Sir Stamford Raffles had a Malayan B., which was very playful and quite harmless, although a powerful animal, and which shewed refinement of taste in refusing to eat any fruit but the mangosteen, or to drink any wine but champagne. This species in a wild state does much damage to cocoa-nut plantations, by climbing the trees, and eating off the terminal bud, when it is said also to drink the sap (toddy) which flows out in abundance.

Remains of several extinct species of B. have been discovered in caves in Germany, England, and other countries, some of which appear to have been larger than the present bears of Europe, and of more decided carnivorous propensities. Of these, the *U. spelæus*, or Great Cavern B., has the skull of considerable vertical elevation from the upper end of the muzzle, and larger than that of the biggest Brown B. The *U. Arctoides* has a skull nearly of the configuration of that of the *U. Americanus*, and of the size of that of *U. spelæus*. The *U. prisæus*, or Ancient B., has the skull of a smaller size, and differing less from that of living bears.

ANT B. is a name of the Great Ant-eater (q. v.).

BEAR, BERE, or BEER. See BARLEY.

BEAR, GREAT AND LITTLE. See URSA MAJOR AND MINOR.

BEAR-BAITING. In different countries, bears were formerly made objects of cruel sport, by being baited with dogs. In England, B. was one of the established amusements, not only among the common people, but among nobles, and even royalty itself; it is related that Queen Elizabeth did not consider it unbefitting her sex or rank to attend these rude entertainments. Pennant, in his *Zoology*, quoting from *The Household Book of the Earls of Northumberland*, says: 'Our nobility also kept their bearward; twenty shillings was the annual reward of that officer from his lord, the fifth Earl of Northumberland (who died 1527),

Polar Bear.

fierceness, but is very distinctly characterised by its flat head and comparatively long neck. It has a smooth white fur. It is the only known species of B. which is strictly marine in its habits, never being found far from the sea. It inhabits the most northerly shores of Asia and America, Spitzbergen, &c., where it pursues seals, both in the water and upon the ice, and preys upon fishes, birds, &c. Amongst the articles of its food are eggs and berries in their season, and in confinement it will subsist long on bread and other vegetable food. Like other species of the genus, it displays great affection for its young, and will brave all dangers in their defence.—Of other species of B., the Syrian B. (*U. Syriacus*) may be mentioned, as perhaps the species particularly intended by the name B. in the Old Testament. It is generally of a dingy-white or brown colour, and has a stiff mane of erect hairs between the shoulders. Flocks are not safe from it, yet it more frequently commits ravages on crops of pulse. In its habits generally, it much resembles the common B.; as do also the Tibet B. (*U. Tibetanus*), and the Spectacled B. (*U. ornatus*), so called

“when he comyth to my lorde in Christmas, with his lordshippe's beests for making his lordship pastyme the said twelve days.” The places where bears were kept and publicly baited were called bear-gardens. There is a spot in the neighbourhood of the court at Westminster, which, until lately, was known as the Bear-garden. B., like bull and badger baiting, has long been unknown in England.

BEARBERRY. See **ARBUTUS**.

BEAR LAKE, GREAT, in British America, in N. lat. 65°—67°, and W. long. 117°—123°. It is the most northerly of that chain of fresh-water seas—Huron, Superior, Winnipeg, Athabasca, Great Slave, Great Bear—which mark a continuous hollow in the middle of the continent. Great Bear Lake is irregular in shape, with a surface estimated at 14,000 square miles, equal to about half the area of Scotland. It sends forth a river of its own name to the Mackenzie. Its height above the ocean is computed at 230 feet. The climate is, of course, severe. The rigour of the winter may be inferred from the fact, that boats are sometimes blocked up by solid ice, after the crews have begun to suffer from the heat and the mosquitoes.

BEAR-LEADER. In former times, bears were led about with a chain, muzzled, and made to dance or stand on their hind-legs for popular entertainment; small dancing-dogs being usually added, for the sake of attractiveness. As a measure of police, these somewhat dangerous and painful exhibitions are now stopped. From this old practice has been taken the phrase, B., now used jocularly to signify a discreet person who takes charge of a youth of rank on his travels to see the world.

BEAR-PIT, a pit prepared for the keeping of bears, usually seen in zoological gardens. A pit of this kind is circular, measuring about 25 feet in diameter, and 20 feet deep. The sides are built with brick; the bottom is level, and paved with stone; and around are vaults with doors for the residence of the bears. From the centre of the pit rises a stout and tall pole, on which are cross-spars at proper distances, to enable the bears to climb to the top. As is well known, the animals are fond of climbing up these poles, and catching morsels of bun from the visitors. The poles are sufficiently distant from the sides to prevent the bears from leaping out. The vaulted receptacles require to be cool and dry.

BEAR'S GREASE. Under this name there are sold by perfumers and others, large quantities of pomades, tastefully done up for the toilet, and which are represented to be of great efficacy in nourishing and promoting the growth of hair. These so-called preparations of B. G. are for the most part composed of purified beef-marrow, hog's-lard, or fat of veal, and spermaceti, along with almond oil, and some scenting ingredients. The genuine bear's fat or B. G. would appear to possess the virtue of encouraging the growth of, and strengthening the hair, in an eminent degree; but the scarcity of the commodity is such that substitute fats are employed to supply the demand. See **HAIR**.

BEARD, the hair which grows on the upper lip, and on the chin and cheeks of the male sex. It is usually, though not always, of the same colour as the hair of the head, but somewhat shorter, stronger, and more wiry; it is invariably the colour of the hair on the eyebrows. The B. is the distinctive sign of manhood. In women, an incipient B. sometimes appears in the later years of life. Instances also occur of women with a B. almost equal to that of the male sex, but these are recorded as prodigies. The B. is generally luxuriant in persons of the

Slavic and Celtic races. The aborigines of America, who are naturally almost beardless, make themselves entirely so by plucking out the hairs of the beard. In early times, the B. was considered by almost all nations a sign of strength and an ornament of manhood, was carefully cherished, and even regarded as sacred. Among the Turks, Arabs, Persians, and many other nations, the removal of the B. was, and is yet to a very great extent, regarded as a severe punishment and an extreme degradation. The case of David's ambassadors, recorded in 2 Samuel, chap. x., illustrates the same feeling as prevalent among the ancient Jews. The Moslems carry combs constantly about with them for the purpose of dressing the beard. It is common to do so immediately after prayers, the devotee remaining on his knees during the operation. The hairs that fall out are then carefully picked up and preserved for entombment with their owner when he dies; frequently he himself deposits them beforehand in his destined tomb. The ancient Jews did not dye their beards, and the Turks rarely, but the practice was common among the Arabs and Persians. The Arabs dyed the B. red, not only because (dye of that colour (being merely a paste of *hemia* leaves) was easily obtainable, but because it was an approximation to golden yellow, the colour recommended by their prophet Mohammed, who hated black, the colour the Persians preferred. The Persian kings are said to have interwoven their beards with gold thread. It is customary among the Turks to anoint the B. with perfume, and to smoke it with incense. The Jews also anointed their beards. The Moslems commonly clipped their whiskers, the Jews did not. The Egyptians shaved their beards except in time of

Egyptian Beard-case.

From the Memnon's head in the British Museum.

mourning, when they let them grow. From some of the ancient Egyptian statues, however, it would appear that beard-cases were worn, which would seem to indicate that the practice of shaving was not universal. The fashions of beards have been very different at different times and in different countries.

A neglected B. was a sign of mourning among the Jews. According to Levi's *Succinct Account of the Rites and Ceremonies of the Jews at this present Time*, they are forbidden to shave or cut their nails, or bathe for thirty days after the death of a father, mother, brother, sister, son, daughter, wife, or husband. In Greece, the B. was universally worn till the time of Alexander the Great, who ordered shaving, that the beards of his soldiers might not be laid hold of by their enemies in battle. Shaving was introduced among the Romans

about 300 B. C. Pliny says Scipio Africanus was the first Roman who shaved every day. Subsequently, the first day of shaving was regarded by the Romans as the entrance upon manhood, and celebrated with great festivities. Under Hadrian, the B. was allowed to grow again; and this fashion prevailed till the time of Constantine the Great, when it was discontinued. Peter the Great compelled shaving in Russia by imposing a heavy tax upon the B., and further, by having the beards of all whom he found wearing them plucked out by the roots, or shaved with a blunt razor. The B. was commonly worn in France till the time of Louis XIII., when, because the monarch was young and beardless, the fashion changed at the court and throughout the kingdom. A similar change took place in Spain on the accession of Philip V. With regard to our own country, the Anglo-Saxons wore beards for a considerable time after their invasion of Britain; and the B. appears to have been general among the people at the time of the Norman Conquest. But the Normans not only shaved themselves, but compelled the conquered to do so likewise; and many of the English preferred to leave the country rather than submit to have their whiskers shaved. It would appear, however, from the sculptured representations on the tombs of kings and nobles, that not very long after the Conquest some of the Normans adopted the custom they had prohibited among the vanquished. Edward III. is represented on his tomb in Westminster Abbey with a very long beard. In the time of Elizabeth, beards were of the most varied and fantastic out. Taylor, the 'Water-poet,' thus satirises the extravagance of beards prevailing in that and the succeeding reign:

Some seem as they were starched stiff and fine,
Like to the bristles of some angry swine;
Some cut and pruned like to a quick-set hedge,
Some like a spade, some like a fork, some square,
Some round, some mowed like stubble, some stark
bare;

Some sharp stiletto-fashion, dagger-like,
That may with whispering, a man's eyes out-pike,
Some with the hammer-cut, or Roman T,

That heights, depths, breadths, trifonn, square, oval,
round,
And rules geometrical in beards are found.

The B. gradually declined under Charles I.; in the reign of Charles II., whiskers and moustaches only were worn; and the practice of shaving the whole face soon became general all over Europe; and it is only within the last 60 years that the B. has been in some measure restored, the soldiers of Bonaparte setting the example. But until within the last two or three years, it was regarded by some of the continental governments as a badge significant of democratic sentiments, and as such was interfered with by police regulations. Physicians recommend that the B. should be allowed to grow on the chin and throat in cases of liability to inflammation of the larynx or of the bronchiæ; and moustaches and whiskers are reckoned useful for prevention of tooth-aches and nervous diseases of the face. The British soldiers in the Crimea were allowed to wear their beards; and with some limitations, the British army generally are now permitted to do so. The wearing of the B. has, in short, been a matter of fashion in all ages and countries—an extreme in one way usually leading to an extreme in the other. At present (1860), the tendency in England and elsewhere is to let the B. grow, though in a way suggested by the taste of the individual. The B. is itself liable to the same diseases with the hair of the head, and to a peculiar disease (*mentagra*)

occasioned or kept up by shaving, consisting in a bark-like exudation from the inflamed sebaceous glands of the hair. For detailed information, see Kitto's *Pictorial Bible*; Bulwer's *Artificial Change-ling* (Lond. 1653); Hotoman's *Popinias* (Leyden, 1586), reprint ed in the *Lesion of Pitiscus*; Taylor's *Whip of Satire*; &c.

BEARD MOSS. See USNEA.

BEARDIE. By this name is the little fish called the loach known in Scotland. See LOACH.

BEARING, of a ship at sea, is the direction in which she sails, in reference to the points of the compass. Or, in a more comprehensive sense, it is the direction in which each of two objects is situated in reference to the other. When the latitudes and longitudes of two places are known, their respective bearings from each other can be calculated by trigonometry. On shipboard, seamen often conveniently refer the B. of another ship, or of an object on shore, not to the points of the compass, but relatively to the line followed at the moment by the ship's keel. Thus, the B. of the distant object may be *ahead*, *astern*, on the *starboard bow*, on the *larboard quarter*, &c.; the bow being between the head and the midship, and the quarter between the midship and the stern.

Bearing, or rather the verb *to bear*, is much used as a technical direction on shipboard. Thus, to 'bear in with the land,' to 'bear off from the land,' to 'bear up,' to 'bear away,' &c., are nearly equivalent to sailing, or steaming, or steering, in such and such directions.

BEARING THE BELL, a phrase which signifies to take the lead or first place in anything, or to carry away the prize. This old colloquial phrase is said to have originated in a practice, at the early part of the seventeenth c., of giving a small golden or silver bell as a prize to the winner at horse-races. See BELL. In Dudley Lord North's *Forest of Varieties*, p. 175, we read:

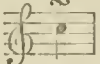

Jockey and his horse were by their masters sent
To put in for the bell—
Thus right, and each to other fitted well,
They are to run, and cannot misse the bell.

BEARN, formerly one of the thirty-two provinces into which France was divided, and now forming the greatest portion of the Basses-Pyrénées. B. was a portion of Aquitania under the Romans, and after the downfall of that empire, under its ruling dukes, it was a country of considerable importance. From the intermarriage of the ruling family, the Counts of Foix, with that of Navarre, sprang the French monarch Henry IV., who, because he was born and brought up in B., was derisively called the Bearnois. When he ascended the throne of France, it, of course, virtually became a part of that country; but was only formally incorporated with it in 1620 by Louis XIII. In 1813, after the British had crossed the Nive, and established themselves in Urogne, St Jean de Luz, &c., the rich fields of B. furnished them ample supplies, the peasants taking their produce, for which they were well paid, as regularly to the British stations as to market.

BEAS, anciently *Hypphasis*, one of the five rivers which give name to the Punjab, or land of five waters—Jelum, Chenab, Ravee, Beas, and Sutlej. It rises on the verge of the Ritanka Pass of the Himalaya, in lat. 32° 34' N., and long. 77° 12' E., its source being 13,200 feet above the sea-level. After a course of about 220 miles, it joins the Sutlej, 35 miles to the south-south-east of Amritsir. It is subject to periodical rises and falls, being in the dry season generally fordable; but after the rainy months, it is sometimes nearly half a mile in

breadth about 20 miles above the point of confluence.

BEAT, in Music, a species of embellishment,

written thus: , and played as follows,

. Beat also means a signal given by the hand or foot in music to insure simultaneous performance—the hand or foot being raised on the unaccented, and lowered on the accented part of the bar.

BEAT OF DRUM, in military matters, is a signal or instruction conveyed by a particular mode of drum-beating. It is an audible semaphore, a telegraph that speaks to the ear instead of the eye. There are many varieties, known by the names of the general, the reveillé, the assembly, the foot-march, the grenadiers' march, the retreat, the taptoo or tattoo, the call to arms, the call to church, the pioneers' call, the sergeants' call, the drummers' call, the chamade, the rogue's march, the long roll, &c. Some of the same instructions or commands are also given by the bugle, and some by the trumpet.

BEATIFICATION is a solemn act in the Catholic Church, by which the pope, after scrutinising the life and services of a deceased person, pronounces him blessed. After this he may be worshipped in a specified portion of the church, and the act holds out the prospect of future canonisation, which entitles him to general worship in the church universal. B. was introduced in the 12th c. It may be regarded as an inferior degree of canonisation (q. v.).

BEATING AND WOUNDING, or simply *wounding*, is the name sometimes found in law-books for the offence of inflicting on another some dangerous hurt or wound; and it has been otherwise described as an aggravated species of Battery (q. v.). A still more aggravated and atrocious offence of this kind is explained in the category of offences against the criminal law of England under the term MAYHEM, which is a violently depriving another of the use of a member proper for his defence, such as an arm, a leg, a finger, an eye, a fore-tooth, and some others; but it is laid down quaintly enough, that the loss of one of the jaw-teeth, the ear, or the nose, is no mayhem in common law, because these members can be of no use in fighting.

The offences to which we have referred—viz., *battery, beating and wounding*, and *mayhem*—can, however, be best considered under the important and well-known term ASSAULT, which is indeed often used to express the above injuries, and which is implied in them all. The above offences, it will have been observed, all involve an actual attack on and injury to the person of the party assaulted. But there may be an assault without such actual hurt. This is a *common assault*, and hence, in criminal law, assaults are distinguished by their being *common* or *aggravated*. A common assault has been defined as an attempt or offer to do a corporal hurt to another, as by striking at another with a stick or weapon, or without a weapon, though the party striking misses his aim. The principle is, that it is sufficient, in order to constitute such an offence, that there has been such an exhibition of a violent and offensive *animus* as to shew at once the intention, and an attempt, to commit it. So, drawing a sword or bayonet, or even holding up a fist in a menacing manner, throwing a bottle or glass with intent to wound or strike, presenting a gun at a person who is within the distance to which the gun will carry,

pointing a pitchfork at a person who is within reach, or any other similar act, accompanied with such circumstances as denote at the time an intention, coupled with a present ability, of using actual violence against the person of another, will amount to an assault.—Russell on *Crimes and Misdemeanours*, vol. i. p. 750. It has even been laid down, that to present a pistol, purporting to be loaded, so near as to produce danger to life if the pistol had gone off, is an assault in point of law, although, in fact, the pistol was not loaded.

But no words, however provoking or irritating, can amount to an assault. On the other hand, the injury need not be effected directly with the hand of the person making the assault. Thus, there may be an assault by encouraging a dog to bite, by riding over a person with a horse, or by wilfully and violently driving a cart, &c., against the carriage of another person. Nor is it necessary that the assault should be immediate, as where a defendant threw a lighted squib into a market-place, which, being tossed from hand to hand by different persons, at last hit the plaintiff in the face, and put out his eye, it was adjudged that this was actionable. And the same has been held where a person wantonly pushed a drunken man against another, and thereby hurt him. A defendant put some cantharides into coffee, in order that a female might take it; and she did take it, and was made ill by it; and this was held to be an assault. It is also an assault, wilfully and of malice, to expose another to the inclemency of the weather; so is the taking indecent liberties with females without their consent, although they did not actually resist; and to such indecent liberties a very wide application has been given, even to the extent of holding a medical practitioner guilty of assault, who stripped a young girl of her clothes, on the pretence that he could not otherwise judge of her illness. Philanthropists and benevolent people will likewise be glad to be told, that not only does the striking that takes place at a *prize-fight* constitute an assault as between the combatants themselves, but all persons present in concert and co-operation at the odious proceeding are equally guilty. Again, an assault may be committed by unlawfully imprisoning or detaining the person of another; and by such detention is meant every confinement of the person, whether it be in a common prison or in a private house, or by a forcible detaining in the public streets. Numerous other cases could be stated, shewing how nicely and protectively the law on this subject has been elucidated; but the explanation we have given is sufficient for its popular illustration.

Generally, it may be laid down, that the essential thing is the *intention* with which the alleged act is done, so that no matter how violent or menacing the conduct of the accused may have appeared to be, nor even how serious the injury, if it can be shewn that the whole was unintentional or accidental and undesigned, there is no assault. It remains to be added on the subject of common assaults, that the party injured may proceed against the defendant by action and indictment for the same assault; and the court in which the action is brought will not compel him to make his election to pursue either the one or the other; for the punishment consequent upon the criminal prosecution, and the damages to the party in the civil action, are perfectly distinct in their natures; but by the 9 Geo. IV. c. 31, a conviction for a common assault may be had in a summary manner before two magistrates.

With respect to *aggravated* assaults, their special character arises from the great criminality of the

object intended to be effected. Thus, attempts to murder, or to do great bodily harm, to ravish, and to obstruct officers of the law in the execution of legal process, are all of the nature of aggravated assaults; as are also attempts to commit robbery, or any other felony. The remedy for an aggravated assault is usually by indictment preferred, the punishment in many cases being imprisonment with hard labour. In certain cases, the punishment is regulated by recent statutes: thus, by the 14 and 15 Vict. c. 11, ss. 1 and 6, it is enacted that persons unlawfully and maliciously assaulting an apprentice or servant, whereby the life of such person shall be endangered, or the health injured, shall be guilty of a misdemeanour, and on conviction shall be imprisoned, with or without hard labour, for any term not exceeding three years; and where the offence shall be against a young person under the age of 16 years, and shall amount in point of law to a felony, or to an attempt to commit a felony, or to an assault with intent to commit a felony, the guardians of the union or parish, or, where there are no guardians, the overseers of the parish, are authorised and required to prosecute, the costs of the prosecution being paid out of the common fund of such union or parish. Again, by an act passed in the same session, c. 19, s. 4, it is declared expedient to make further provision for the punishment of aggravated assaults, and it is therefore enacted, that if any person shall unlawfully and maliciously inflict upon any other person, either with or without any weapon or instrument, any grievous bodily harm, or unlawfully and maliciously cut, stab, or wound any other person, every such offender shall be guilty of a misdemeanour, and being convicted thereof, shall be liable, at the discretion of the court, to be imprisoned, with or without hard labour, for a like term of three years: provided, however, that nothing contained in the act shall be deemed or taken to repeal the 29th section of the 10 Geo. IV., c. 34, by which it is provided, that if any person shall unlawfully and maliciously assault, beat, or wound any person, so as thereby to endanger the life of such person, or so as thereby to inflict upon such person any grievous bodily harm, every such offender, being convicted thereof, shall be liable to be transported beyond the seas, for the term of seven years, or to be imprisoned with or without hard labour, in the common jail or house of correction, for any term not exceeding three years; and, if a male, to be once, twice, or thrice publicly or privately whipped, in addition to such imprisonment, if the court shall think fit. The only other statute we may here notice is an act also passed in the same session—viz., the 14 and 15 Vict. c. 100, s. 29—which provides that any person convicted of any indecent assault, or any assault occasioning actual bodily harm, shall be imprisoned for any term now warranted by law, with hard labour during the whole or any part of such imprisonment.

In Scotland, the principle of the law of assault, and of its aggravations, is very much the same as that above stated. In the Scotch system, it is laid down that it is of the utmost importance in all cases of actual assault to ascertain who struck the first blow, and the party who receives it will be excused for retaliating, if he do not exceed the just and fair measure of resentment. There, too, the highest of all aggravations is the assault with intent to murder. It is also an aggravation that the assault has been committed in pursuance of an old grudge, and on a principle of revenge; where, also, the offence has been accompanied with an intent to compel a rise of wages, or to deter from working at a certain rate, or in pursuance of a combination entered into for these illegal purposes. Another aggravation of the offence

in Scotland is its being committed by a child on its parent, by a husband on his wife, or by any person upon another within his own house, although the latter crime falls more strictly under the antiquated term of *Hamesucken* (q. v.). The remedy in Scotland is, as in England, by civil action of damages, and by a criminal prosecution, both being maintainable, and the latter usually at the suit of the Lord Advocate, as public prosecutor; but the private injured party may prosecute criminally should the Lord Advocate decline to do so. See, on the subject of this article generally, Russell's *Crimes and Misdemeanours*, in England, and Alison's *Principles of the Scotch Criminal Law*.

BEATING JUDGES, in the Scotch law, is the strange title of a strange offence, according to the enlightenment of the present age—namely, that of committing a personal assault on a judge; but the subject will be found, along with the corresponding law in England, sufficiently treated under JUDGES (q. v.).

BEATING THE BOUNDS is the popular expression in England for those periodical surveys or perambulations by which the ancient boundaries of parishes are preserved. The procedure, according to common custom, is in this wise: On Holy Thursday or Ascension Day, the clergyman of the parish, with the parochial officers and other parishioners, followed by the boys of the parish school, headed by their master, go in procession to the different parish boundaries, which boundaries the boys strike with peeled willow-wands that they bear in their hands, and hence the expression beating the bounds. The correct legal term is *Perambulation* (q. v.). See Brand's *Popular Antiquities*, vol. i. pp. 174, 175; Lyson's *Environs of London*, vol. ii. p. 146; Hone's *Every-day Book*, vol. i. p. 651; Steer's *Parish Law*, by Hodgson; and Toulmin Smith's *Parish Law*.

According to these and other old authorities, the beating was not confined to the above performance of the boys with their willow-wands; but where it was desired to preserve evidence of particular boundaries, the singular expedient was used of whipping the boys themselves on the spot, or one of them, who received a stated fee for the permitted castigation out of the parish funds—it being thought that the impression made on the memory of the whipped boy was calculated to have a beneficial effect on the preservation of his evidence. A similar ceremony appears anciently to have prevailed in Scotland, and for the same purpose. See Lord Stair's *Institutes of the Scotch Law*, book iv., title 43, s. 7, where it is stated that the boys were 'sharply whipped.'

BEATON, or BETHUNE, DAVID, Cardinal and Primate of Scotland, a zealous opponent of the Reformation in that country, descended from a celebrated French family, was a younger son of John Beaton of Balfour, Fifeshire. Born in 1494, he became, in October 1511, a student at the university of St Andrews, and afterwards studied theology and the canon and civil laws at Paris. Early entering the church, he was preferred by his uncle, James Beaton, Archbishop of Glasgow, to the rectory of Campsie, Stirlingshire. His tact and general abilities recommended him to the Duke of Albany, regent during the minority of James V., who, in 1519, appointed him resident for Scotland at the French court. In 1525, he took his seat in the Scots parliament as Abbot of Arbroath; his uncle, on being translated two years before to the archbishopric of St Andrews, having resigned to him that abbey, with the half of the rents. In 1528, B. was appointed Lord Privy Seal, and is said to have been the adviser of James V. in instituting the College of Justice or Court of Session in Scotland,

the idea of which was suggested by the constitution of the parliament of Paris. B. subsequently became Prothonotary Public, and was twice sent ambassador to France, to negotiate James's two marriages—first, with the French king's daughter, Princess Magdalen, who died six months after her nuptials; and secondly, with Mary, Duchess of Longueville, daughter of the Duke of Guise. The king's union with the latter he solemnised, in 1537, in the cathedral church of St Andrews. During his residence at the French court, he was admitted to all the privileges of a French citizen, and appointed by Francis I. Bishop of Mirepoix in Languedoc. After his return, he became coadjutor to his uncle in the see of St Andrews, and on 28th December 1538, on the recommendation of the king of France, was, by Pope Paul III., elevated to the dignity of a cardinal. On his uncle's death, in 1539, he succeeded him as Archbishop of St Andrews and Primate of Scotland, and soon commenced a furious persecution of the Reformers, already numerous and increasing. That he might be invested with supreme authority in all matters ecclesiastical, he obtained from the pope the appointment of *legatus a latere* in Scotland, and induced the king to institute a Court of Inquisition, to inquire after heretics in all parts of the kingdom. To maintain the French influence, and prevent all danger to the Roman Catholic Church in Scotland by a friendly connection with England, he contrived to frustrate a proposed meeting of King James with his uncle, Henry VIII., and even prevailed on the former to declare war against his royal relative. On the death of James, after the disastrous overthrow of the Scots at Solway Moss, December 14, 1542, B. produced a forged will of the late king, appointing himself, with three others, regents of the kingdom during the minority of the infant Queen Mary. The nobility, however, rejected the fictitious document, and elected the Earl of Arran regent, who then professed the reformed faith. The following month, B. was arrested and imprisoned, accused, among other charges, of a design to introduce French troops into Scotland, in order to stop the negotiations then in progress with Henry of England for a marriage between the young Prince of Wales, afterwards Edward VI., and the infant Queen of Scots. He was soon after liberated, and reconciled to the regent, whom he induced to abandon the English interest, and publicly to abjure the reformed religion. On the young queen's coronation in 1543, B. was again admitted of the council, and appointed Chancellor. He now renewed his persecution of the Reformers; and, in January 1546, accompanied by the regent, he made a diocesan visitation of the counties under his jurisdiction, and punished with the utmost severity all the Protestants he could find. At Perth, a number of persons, accused of heresy, were banished the city, others were imprisoned; three men were cruelly hanged, and one woman drowned, by his directions. During a Provincial Council of the clergy held at Edinburgh, at which he presided, he caused the celebrated evangelical preacher, George Wishart, to be apprehended, and conveyed to the castle of St Andrews, where he was burnt at the stake, B. and other prelates witnessing his sufferings from a window. A conspiracy having been formed against him, at the head of which were Norman Leslie and his brother, B. was assassinated in his own castle of St Andrews, 29th May 1546. Though endowed with great talents, B. possessed little learning. He is said, however, to have written *Memoirs of his Own Embassies*; a treatise on *St Peter's Supremacy*; and *Letters to Several Persons*, of which Dempster observes there are several copies

extant in the Imperial Library at Paris. Haughty, cruel, and intolerant, he was also licentious in the extreme. He had six natural children, three sons and three daughters—the latter married into families of distinction. One of his sons became a Protestant. His death was scarcely lamented by any party in the state.

BEATTIE, JAMES, poet and moral philosopher, was born, 25th October 1735, at Laurencekirk, Kincardineshire, Scotland. He studied at Marischal College, Aberdeen, where he acquired a high reputation as a classical scholar. In 1753, he was appointed one of the masters of the grammar-school in that city, and in 1760, Professor of Moral Philosophy in Marischal College. Ten years afterwards appeared B.'s famous *Essay on Truth*, which met with most extravagant success. It was intended as an antidote to Hume, whose penetrating scepticism had found its way into all the enlightened circles of Scotland, and alarmed the friends of revealed religion. Drs Reid and Campbell had previously attempted to refute the scepticism of the great historian, but, in the opinion of many, too deferentially. B., whose nature was poetically vehement, and whose zeal was consequently very ardent, assaulted Hume more violently, if not more powerfully, than his predecessors. The author himself naturally shared the popularity of his essay. He was introduced to George III., and solicited by dignitaries of the English Church to take orders; high preferments were also promised, which, however, he magnanimously refused, shrinking with delicacy from doing anything which might give his adversaries a chance of saying that he had written on behalf of religion for hire. It was thought for a time that B. had demonstrated 'the immutability of Truth,' and exposed the 'sophistry of scepticism;' but if we may judge from the neglect which has overtaken his treatise during the last fifty years, his achievements had been overestimated. B. was deficient in logical acumen and in extent of philosophic erudition, but his poetical fancy, pure enthusiasm, and pious intentions, recommended the essay to multitudes. In 1771, appeared the first part of *The Minstrel*, and in 1774, the second part. It is a delightful poem. Time has dealt gently with it, for it still retains the freshness of its youth. It overflows with a sweet poetic emotion, and is rich in picturesque descriptions, while the versification has a quiet fulness of melody. The author's gentle yet fervent spirit beats in every line. The poem describes 'the progress of a poetical genius born in a rude age, from the first dawning of fancy and reason, till that period at which he may be supposed capable of appearing in the world as a minstrel.' B. intended to have added a third part, but circumstances hindered him. In 1776, he published a series of essays on *Poetry, Music, &c.*; in 1783, *Dissertations Moral and Critical*; in 1786, *The Evidences of the Christian Religion briefly and plainly stated*; and in 1790—1793, *The Elements of Moral Science*; all of which works are written in a clear and elegant style, and with a high appreciation of whatever is beautiful and good. He died August 18, 1803. His life has been written by his friend, Sir William Forbes.

BEAUCAIRE, a well-built commercial town of France, situated on the right bank of the Rhone, in the department of Gard, opposite Tarascon, with which it is connected by a magnificent suspension bridge. Pop., exclusive of garrison, 9694. The harbour is commodious for vessels, which enter it by a canal communicating with the Mediterranean, and avoiding the sand-banks at the mouths of the Rhone. The main feature of B. is

its great fair, established, it is said, as early as the 12th c. It is held annually, beginning 22d July, and lasting six days. In former times, when this fair was free from duties, it was attended by merchants and manufacturers from almost all parts of Europe, from the Levant, and even from Persia and Armenia; and as the small town could not contain the vast concourse of traders, thousands of wooden huts and of tents were erected in the neighbouring valley. But the numerous imposts demanded since 1632, foreign wars, and the competition of Marseille, Lyon, and other large places, reduced the traffic of B., which sank still lower in the days of the Revolution. The fair, however, is still held in much repute, the number attending it being estimated at 100,000, and the amount of property changing hands at £240,000. The chief articles of commerce are silks, wines, oil, almonds, and other fruits, spices, drugs, leather, wool, and cotton. B. appears to have been known in ancient times as Ugerann, which, in the 7th c., was a place of importance in a military point of view.

BEAUCHAMP, ALPHONSE DE, a French historian and publicist, born at Monaco, 1767; died in Paris, June 4, 1832. He received his education in Paris, and entered the Sardinian military service. At the outbreak of the war with France, he refused to bear arms against his country, and obtained his discharge; but being suspected of treasonable designs, he was imprisoned for some months. After his liberation, he returned to Paris, where he took part against Robespierre; and on the establishment of the Directory, obtained a situation in the office of the minister of police, and had the surveillance of the press. Here he commenced his *Histoire de la Vendée et des Chouans* (3 vols., Par. 1806; 4th ed., 1820), for which Fouché supplied the materials. As this work displeased the Emperor, B. was banished to Rheims, but was recalled in 1811, and again received a subordinate appointment (on condition that he should publish nothing concerning his political contemporaries), which he lost in 1814. Under the Restoration, he received a pension (1820), and wrote for the *Moniteur*, the *Gazette de France*, and the *Biographie des Hommes Vivants*, edited by Michaud. The numerous historical writings of B. are interesting, but bear the impress of party-spirit; but in his *Histoire du Brésil* (Par. 1815), and *Histoire de la Conquête du Pérou* (Par. 1807), he found no opportunity of expressing his political partialities. Among his other works may be mentioned the *Histoire de la Campagne de 1814—1815* (2 vols., Par. 1818), the *Histoire de la Révolution du Piémont*, directed against De la Rosa (Par. 1823), and *Vie de Louis XVIII.* (Par. 1825). After the July revolution, he was employed on several legitimist journals; and the supposititious *Mémoires de Fouché* (4 vols., Par. 1828—1829) have, with good reason, been ascribed to Beauchamp.

BEAUFORT, an inland district of the west division of the Cape Colony, divided into 12 field-cometeies. It is chiefly used for pasturage, its oxen being, in seasons of abundant rain, decidedly the fattest in the colony. Its area is about 13,050 square miles; and its population, in 1849, was 7131. Its capital, of the same name, is on the Gamka, being 363 miles to the east of Cape Town, and 144 to the west of Graaffreinet.

BEAUFORT, CARDINAL, and Bishop of Winchester (born about 1370), was a natural son of John of Gaunt, Duke of Lancaster, and was half-brother to King Henry IV. He was educated in England and Germany, and in 1404 became Bishop of Winchester. He repeatedly filled the office of Lord Chancellor, and was involved in all the most important political

movements of his times. He was present at the Council of Constance, and voted for the election of Pope Martin V., by whom he was subsequently made a cardinal. When the cardinal's nephew, Henry V. of England, proposed to levy a new impost on the clergy, in order to raise money for carrying on the war against France, B. was the chief opponent of the measure; but nevertheless he lent the monarch, out of his own private purse, £28,000—an almost incredibly large sum in those days, and one which justifies the belief that he was the wealthiest subject of his time in all England. His service in this affair was soon recognised by the pope, who sent him as legate into Germany, there to organise a crusade against the followers of John Huss. This undertaking failed; and the cardinal, having expended, in levying an English army against France, the moneys granted from Rome for other purposes, now fell under papal displeasure. In 1431, B. conducted the young king, Henry VI., to France, to be crowned in Paris as king of France and England. Here he also endeavoured, but vainly, to reconcile the Duke of Bedford, Regent of France, with the offended Duke of Burgundy. Cardinal B. died at Winchester in 1447. His memory is stained by his suspected participation in the murder of his great political rival, the Duke of Gloucester, who headed the lay opposition to the despotism of ecclesiastical statesmen; and by the fact, that he presided over the tribunal which sentenced the Maid of Orleans to perish at the stake.

BEAUGENCY, an ancient town of France, in the department Loiret, and situated on the right bank of the Loire, 15 miles south-west of Orleans. B. was at one time surrounded by walls, flanked with towers and bastions, and defended by a strong castle, now ruined. In the history of the wars of France, B. occupies a conspicuous place. It was successively in the hands of the Huns, Saxons, Normans, and English, but it sustained most damage during the religious wars of the 16th c. B. manufactures woollens, leather, &c., and has a trade in wine, wool, and corn. Pop. 4000.

BEAUIHARNAIS, ALEXANDRE VICOMTE DE, born 1760, in the island of Martinique, served, under Marshal Rochambeau, in the American War of Independence. Afterwards, he went to France, but though well received by the French court, he embraced the popular cause. Elected deputy to the States-general by the nobility and the judiciary authorities of Blois, he was among the first of his order to fraternise with the *Tiers Etat*, or democratic party. On the night of August 4, 1789, he voted for the abolition of all privileges, and the political equality of all citizens. As a reward for his constancy to the cause of liberty, he was named Secretary of the National Assembly, and subsequently member of the military committee, but lost his popularity considerably by venturing to praise and defend the conduct of General Bouillé in the sanguinary suppression of the insurrection at Nancy. The manner in which he received the news of the flight of Louis XVI. exhibits a curious mixture of contempt and dignity. 'Gentlemen,' said he to the Assembly over which he presided, 'the king has just gone off; let us pass to the order of the day.' In 1793, he declined the office of Minister at War, and tendered his resignation as general of the Army of the Rhine, because it had been determined to exclude the nobility from the service. During the Reign of Terror, his enemies revived the report that he had participated in the surrender of Mentz, because he had remained idle with his troops for 15 days. In consequence of this accusation, he was called from his country residence

at Ferté-Imbault to Paris, where he was tried and sentenced to death by the revolutionary tribunal. He submitted to his fate with firmness, and died on the scaffold, July 23, 1794, aged 34 years. His widow, Josephine, married Napoleon Bonaparte, who adopted Eugène and Hortensia, son and daughter of Beauharnais. Hortensia was married to Louis Bonaparte, king of Holland, and became the mother of the present Emperor of the French.

BEAUHARNAIS, EUGÈNE DE, Viceroy of Italy during the reign of Napoleon I., and afterwards Duke of Leuchtenberg, and Prince of Eichstadt, was born September 3, 1781, and was the son of the Viscount Beauharnais. After his mother's marriage with Bonaparte, he accompanied him in his campaigns in Italy, and in the expedition to Egypt. He rapidly rose to the highest military rank; and in 1805, after the creation of the imperial throne, he was made a Prince of France and Viceroy of Italy. In 1806, he married the Princess Amalie Augusta of Bavaria, and not long afterwards was created Prince of Venice, and declared by Napoleon his adoptive son, and heir of the kingdom of Italy. Although his political power was much limited, he conducted himself in Italy with much prudence, energy, and moderation, and in all the various scenes of his life maintained an honourable and virtuous character. It is to be regretted, however, that he considered himself so entirely a vassal of Napoleon, and bound to carry out the often harsh decrees of the latter in regard to Italy. His military talents were great, and were displayed particularly in the Italian campaigns, in the wars against Austria, and in the retreat from Moscow, in which the preservation of the French army from total destruction was very much to be ascribed to the skill and resolution of the viceroy and of Ney. The victory of Lützen was decided by his conduct in that battle. Napoleon sent him from Dresden to Italy, which he ably defended, even after Austria had joined the coalition, and Murat had deserted the cause of the French Empire. After the fall of Napoleon, he entered into a convention with Count Bellegarde. In the affairs of the Hundred Days, he took no part; and in the treaty of Fontainebleau and Congress of Vienna, he was allowed to retain his possessions in the March of Ancona; and large sums were granted to him in compensation for his other Italian possessions, with which he purchased for his father-in-law the landgraviate of Leuchtenberg and principality of Eichstadt, and took his place as Duke of Leuchtenberg among the nobles of Bavaria. He died at Munich on the 21st February 1824.—His eldest son, Charles Augustus Napoleon, Duke of Leuchtenberg, married the Queen Donna Maria of Portugal on the 25th January 1835, but died on the 25th of March in the same year.—Another son, Max Eugène Joseph Napoleon, who succeeded his brother as Duke of Leuchtenberg, married the Grand Duchess Maria Nikolajewna, a daughter of the Emperor Nicholas of Russia; and his children bear the name of Romanowski, and are ranked among the members of the Russian imperial family. He died 1st November 1852, of disease of the lungs, consequent upon a scientific tour in the Ural. He was a zealous mineralogist, and left large collections, which are preserved at St Petersburg.

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE, a French poet, born in Paris, January 24, 1732; died May 17, 1799, was the son of a watchmaker, and was brought up to his father's trade. He soon displayed a remarkable taste for music, attained proficiency as a player on the harp and the guitar, and was appointed music-master to the daughters of Louis XV. This was the beginning of his course

of good-fortune. He acquired considerable property by marriage, and to dignify the somewhat ambiguous position in which his calling placed him, he devoted his talents to literature. His first play, *Eugénie* (1767), was successful, and was followed by *Les Deux Amis* (1770). Having become involved in lawsuits with Lablache and Götzman, he revenged himself on the latter—who was a member of the so-called *Parlement Maupeou*—by publishing his famous *Mémoires* (Paris, 1774), which united the bitterest satire with the sharpest logic, and gained for him a reputation that made even Voltaire uneasy, who could not bear a rival in his own department. Despite his wit, however, he lost his suit. His fame now rests on his two operas, *Le Barbier de Séville* (1775), and *Le Mariage de Figaro*. Of his later works, we may mention *Mes Six Époques*, in which he describes the perils through which he had passed in the first period of the Revolution. During the American War of Independence, he entered into a speculation for supplying arms, &c., by which he realised a considerable profit, but was a great loser by his expensive edition of Voltaire's works, and other speculations. The desire of gain and love of distinction were the leading motives which actuated Beaumarchais. His literary merits have been differently estimated. The most judicious critic of his writings and character is M. de Loménie, whose *B. and his Times* is full of interesting literary anecdote. An edition of B. was published at Paris in 1800.

BEAUMARIS, a seaport and chief town of Anglesea, North Wales, is situated on the west side of the picturesque Bay of B., near the north entrance to the Menai Strait, 3 miles north of Bangor, and 230 miles north-west of London. B. has the ivy-covered remains of a castle, erected by Edward I., and a free grammar-school, and is a favourite sea-bathing resort. The bay is a safe anchorage in stormy weather. B. unites with Amlwch, Holyhead, and Llangeffin in sending one member to parliament. It exports copper and other ores, slates, marble, &c. Pop. 2465. Vessels belonging to port, in 1857, 269; tons, 28,141. In 1858, 3403 vessels, of 455,884 tons, entered and cleared the port.

BEAUMONT, FRANCIS, poet and dramatist; **FLETCHER, JOHN**, poet and dramatist. These writers were so closely associated in their lives and labours, that their names have become indissolubly united.—Francis Beaumont, the third son of Sir Francis Beaumont, one of the justices of the Common Pleas, was born at Gracedieu, in Leicestershire, in 1586, ten years after Fletcher; and died in 1615, ten years before him. When ten years of age, he became a gentleman-commoner of Broadgate Hall (now Pembroke Hall), and in 1600 was admitted a member of the Inner Temple. Two years thereafter, he published certain translations from Ovid. When about nineteen years of age, he became the friend of Ben Jonson, and wrote commendatory verses to some of his dramas. At the theatre, which attracted to its service most of the intellect and wit of the time, he became acquainted with Fletcher, and drawn together, they lived in the same house till B.'s marriage in 1613. He married Ursula, daughter and coheir of Henry Isley of Sundry, in Kent, by whom he had two daughters. He died at the early age of thirty, and was interred in Westminster Abbey. Poetry seems to have run in the blood of the Beaumonts. Several members of B.'s immediate family wrote verses, and the elder brother of the dramatist, Sir John Beaumont, is said by the critics to have much improved our rhyme couplet.

John Fletcher was born in 1576. His father was a

clergyman, and appears to have inherited many of the honours of the church. He was for some time incumbent of Rye, in Sussex; thereafter, he was appointed Dean of Peterborough, and is said to have attended Queen Mary on the scaffold, and to have embittered her last hours with irrelevant exhortation. On his elevation to the see of London, he married a second time, and thereby procured the disfavour of the Virgin Queen. He died shortly after, some maintaining, of a queen's frown, others, of the immoderate use of tobacco. John F. entered Bennet College, Cambridge, on the 15th October 1591, where he acquired some reputation for classical erudition. It is uncertain how long he remained at the university, or whether he took a degree. The *Woman-hater*, produced in 1606—1607, is the earliest play of his which is known to exist. It is not known precisely in what circumstances F. passed his life. He asserts his independence in some verses introductory to *The Faithful Shepherdess*, published about 1610, yet he wrote more rapidly than most men then writing for bread. The last four years of his life produced eleven new plays—a swiftness surpassing that of Shakspeare himself. Tarrying in London, it is said, for a suit of new clothes, he caught the plague, and died. His death occurred in 1625, and he was buried in the church of St Saviour's. F. also could boast of poetic descent and connection. Dr Giles Fletcher, the bishop's younger brother, has been called 'an excellent poet'; and two sons of his, Giles and Phineas, distinguished themselves by their verses. The one wrote *Christ's Victory and Triumph*; the other, *The Purple Island*.

The works of B. and F. comprise in all fifty-two plays, a masque, and several minor poems; but it is difficult to allocate, in any satisfactory manner, the authorship of these. F., being the longer lived and more prolific writer, of course contributed the largest share. Rowley assisted F. in *The Maid of the Mill*. Some critics think that the hand of Shakspeare may be detected in *The Two Noble Kinsmen*, and not without some show of reason. There is a tone of music and a step of thunder in some of the passages to which no parallel could be found in any of the companion-dramas. Two plays left unfinished at F.'s death were completed by Shirley. Out of the fifty-two plays, B. is supposed to have had a share in the composition of seventeen, and only three out of that small number were, during F.'s lifetime, published as joint productions. Two of these—*Philaster*, and *The Maid's Tragedy*—are, with the exception of the great passages in *The Two Noble Kinsmen*, the glory of the collection. The question has been often discussed, why these plays are called by the name of B. and F., thus giving precedence to the younger and less voluminous writer. Mr Dyce thinks, that of the three plays published as joint productions during F.'s life, B. had either the greater share, or that, through feelings of natural courtesy, F. placed the name of his deceased associate before his own, and that future editors naturally followed the arrangement which they found to their hand. Mr Darling is inclined to give no reason at all, and ascribes the whole thing to accident. From all that can be gathered, it would appear that B. possessed the deeper and more thoughtful genius; F., the gayer and more idyllic. There is a strength as of granite rock in *The Maid's Tragedy*; there is a glad exuberant music, and a May-morning light and freshness, in *The Faithful Shepherdess*, which Milton did not disdain to accept as a model in the lyrical portions of *Comus*, and of which the *Endymion* of Keats is but an echo. In these plays, B. and F. are the cleverest, gayest gentlemen. They never sound the deep sea of passion; they disport themselves,

delphin-like, on its surface. They have no power of serious characterisation, and their numerous creations are seldom consistent; but they say the most clever, pleasant, and glancing things. Morally, little can be said in their praise. No audience of the present day could sit out the representation of their purest plays. Some of the impurest are almost beyond conception, yet there is always an air of good-breeding about them, and the filth is huddled in the most gentlemanly manner. It was a great intellectual period in which B. and F. lived; but Shakspeare stands above them and the rest of that dramatic brotherhood like Mont Blanc above the summits of the Lower Alps—conspicuous not only from his altitude, but from his purity.

BEAUMONT, GUSTAVE DE, a distinguished French publicist, born February 6, 1802, at Beaumont-la-Chartrre, in the department of Sarthe. He studied law, and was made procurator-substitute in the superior tribunal of the Seine, but lost this office after the July Revolution. In 1831, B. and Tocqueville were commissioned by the French government to study the prison-discipline of America. When B. returned to Paris, he received a place under government, but was soon deposed, as he refused to conduct the prosecution in the scandalous process against the Baroness de Feuchères. In 1840, he was elected deputy for the department Sarthe, and distinguished himself, as a member of the Opposition, by his information and readiness on all political questions. After the February Revolution, 1848, he was returned as member of the Legislative Assembly, and here maintained the character of a sincere but moderate republican. After the 2d December 1851, he was arrested and imprisoned for some time in the fortress of Mont Valérien. On regaining his liberty, he retired to his patrimonial estate, where he has since resided. B. is the grandson of Lafayette, and in 1836, married his cousin, the daughter of Georges Lafayette. The writings on which B.'s reputation is founded are—*Note sur le Système Pénitentiaire* (1831), *Du Système Pénitentiaire aux États-Unis et de son Application en France* (2 vols., 1832; partly by Tocqueville), *Marie ou l'Esclavage aux États-Unis* (2 vols., 1835), and *L'Irlande, Sociale, Politique, et Religieuse* (2 vols., 1839).—BEAUMONT-VASSY, EDOUARD VICOMTE DE, a relation of the former, has acquired a reputation as the writer of a romance, *Une Marquise d'autrefois* (1838), and some historical works, especially a *History of the European States since the Congress of Vienna* (vols. 1—4, Par. 1843—1847).

BEAUMONT (ELIE DE), JEAN BAPTISTE, Chief Engineer and Professor of Geology in the School of Mines at Paris, and in the *Collège de France*, was born at Canon, in the department Calvados, September 25, 1798. He has gained distinction, not merely as a practical geological investigator, but also as a clear and acute speculator. The theory which prevails regarding the elevation of mountain systems has been elaborated chiefly by him. His views of the separate periods of elevation, which he reckons as twelve, he has imparted to the world in several treatises. All later criticism has left the theory unshaken in its basis. The chief writings of B. are: *Coup d'Œil sur les Mines*, 1824; *Observations Géologiques sur les Différentes Formations dans le Système des Vosges*, 1829; *Extrait d'une Série de Recherches sur quelques-unes des Révolutions de la Surface du Globe*, 1835; and *Voyage Métallurgique en Angleterre* (2d ed., 1837—1839).

BEAUNE, capital of an arrondissement in the French department Côte d'Or, formerly included in the Duchy of Burgundy, is situated in a pleasant district on the river Bouzeois, about 23 miles

south-south-west of Dijon. The town is well built; has a fine parish church, Notre Dame, founded in 976 by Duke Henri of Burgundy; and a splendid hospital, founded in 1443 by Nicholas Rollin, Chancellor of Philip, Duke of Burgundy. There are several manufactories of serges, woollen cloth, and cutlery. A considerable trade is carried on in Burgundy and Champagne wines. B. gives its name to one of the best of the Burgundy wines. Pop. 9700.

BEAUNE, FLORIMOND, a distinguished mathematician, and friend of Descartes, was born in 1601, at Blois, in France, where he died in 1652. His labours and discoveries contributed greatly to the improvement of the modern analytical geometry first introduced by Descartes. Algebra was also enriched by B.'s showing that, in equations to the fourth degree, the limits of positive roots might be found from the coefficients. B. may be regarded as the proper founder of the Integral Calculus, as he first endeavoured to deduce the nature of curved lines from the properties of their tangents. The so-called 'B.'s Problem' (which has been completely solved only by Jean Bernoulli), still given in the Integral Calculus, was for his time new and remarkable, it turns also on the determination of the nature of a curved line from a property of its tangent. The only work of his we possess is *De Aequationum Limitibus Opuscula duo, et Notæ Breves*.

BEAUTY. See **ÆSTHETICS, ART.**

BEAUVAIS, an important manufacturing French town, capital of the department Oise. It is situated in the valley of the Thérain (a tributary to the Oise), about 41 miles north-north-west of Paris, and surrounded by rising woodlands. Formerly, B. was included in the old province, Ile de France. It is now the seat of government for the department, and the residence of a bishop, and contains a literary and economical society, a public library, a museum, &c. Among its several fine buildings, the most noteworthy is its uncompleted cathedral, the choir of which is the loftiest as well as one of the finest specimens of Gothic in France. The manufactures of B. include woollen cloths, shawls, carpets, Gobelin tapestry, &c. Pop. 12,567. B. is a very ancient town. It was included in the country of the powerful *Bellovacii*, in *Gallia Belgica*, and was known by the Romans as *Cæsaromagus*, afterwards as *Bellovacum*. In the middle ages, it was styled *Bolvacum*. In 550, and at other times, B. was desolated by the Normans. The *Jacquerie*, or Peasants' War, broke out in the neighbourhood of B., March 21, 1358. In 1443, B. was besieged by the English, who were repulsed by the heroic self-sacrifice of Jean Lignière. Again, in 1472, it was besieged by Charles the Bold of Burgundy, with an army of 80,000 men, when the women of B., under the leadership of the heroine Jeanne Lainé, surnamed La Hachette for her daring, displayed remarkable valour. The standard which the Burgundians had planted on the wall was torn down by Jeanne Lainé, and borne off by her in triumph. The banner is preserved in the town hall, and a procession, in which it is carried by young girls, annually commemorates the heroic deed. B. is the birthplace of the learned Dominican Vincent de Beauvais (Vincentius Bellovacensis).

BEAVER (*Castor Fiber*), a quadruped of the order *Glires*, or *Rodentia* (q. v.), valued for its fur, and for the peculiar substance called *Castoreum* (q. v.), which it yields, and also much noted for its instincts. Some naturalists regard the American B. as distinct from that of Europe and Asia; but the differences observable either in external or anatomical characters are very inconsiderable; and the opinion that a great difference exists in instincts

and habits, appears to have been too hastily adopted. If there is only one species of B., it is very widely distributed in the northern regions of the world, reaching in America almost as far south as the Gulf of Mexico. It once existed in the British islands, where, however, it has long been extinct; and it has become rare in Europe, in many parts of which it was once common. It has become rare also in the United States, disappearing before man; but is nowhere so abundant as in that wide region of lakes and rivers which lies to the north and west of the settled parts of North America. Considerable numbers of beavers are found on the banks of the Obi and other rivers of Siberia, and in Kamtchatka.

The incisors or cutting teeth of the B. are remarkably strong, and exhibit in the highest degree the distinctive character of the order to which it belongs—the front of hard enamel, which in the B. is of a bright orange colour; the back of the tooth formed of a softer substance, more easily worn down, so

Beaver

that a sharp, chisel-like edge is always preserved; the bulbs being also persistent, so that the teeth are continually growing, as by their employment in gnawing wood, they are continually being worn away. There are four flat molar teeth (or grinders) on each side in each jaw. Each foot has five toes: those of the fore-feet are short, and not connected by a web; those of the hind-feet are long, spreading out like the toes of a goose, and webbed to the nails. In accordance with this remarkable peculiarity, the B., in swimming, makes use of the hind-feet alone, the fore-feet remaining motionless and close to the body. Another character, to which nothing similar appears in any other rodent, is the large, horizontally flattened tail, which, except at the root, is not covered with hair, like the rest of the body, but with scales. The caudal vertebrae, however, do not exhibit a flattened form.

The B. is usually at least two feet in length, from the nose to the root of the tail; the tail is of an oval form, about ten inches in length, fully three inches in greatest breadth, and scarcely an inch in thickness. These dimensions are sometimes exceeded. The general form of the animal is thick and clumsy, thickest at the hips, and then narrowing abruptly, so that it seems to taper into the tail. The head is thick and broad, the nose obtuse, the eyes small, the ears short and rounded. The fur consists of two kinds of hair; the longer hair comparatively coarse, smooth, and glossy; the under coat dense, soft, and silky. The colour is generally chestnut, rarely black, spotted, or nearly white.

The B. is very aquatic in its mode of life, and it seldom wanders far from some lake or river. In consequence of its habits, it is also limited to wooded districts, and the northern range of the species is everywhere terminated by the limits of the wood upon the river-banks.

The food of the B. consists of the bark of trees and shrubs (birch, poplar, willow, &c.), and of the roots of water-lilies (*Nuphar luteum*) and other aquatic plants. In summer, it eats also berries, leaves, and various kinds of herbage. There is reason to think that it never, as has been supposed, kills or eats fish. Like some other rodents, it lays up stores of provisions for winter; but these, in the case of the B., consist chiefly of bark, or of branches, and even trunks of trees. Its extraordinary powers of gnawing are exerted to cut down trees of several inches in diameter, both for food, and for the construction of those houses and dams which have rendered it so much an object of admiration to mankind. A tree of 18 inches in diameter has been found thus cut down by beavers, although smaller ones are usually preferred; and when a tree of this size is cut, the branches only, and not the trunk, are employed in the architectural operations of the animals. These operations are very wonderful, although the statement, at one time commonly made, that beavers drive stakes into the ground, has no foundation in fact; and some of the other particulars which passed current along with it, were equally fabulous. The houses or lodges of beavers are grouped together near the edge of the water, the mud being scraped away from the front, so that there may be a sufficient depth of water there to allow free egress, even during the most severe frost. The winter stores of the animals, consisting of piles or heaps of wood, are also always under water, at such a depth that they cannot be locked up in ice. When the depth of water is not sufficient, the beavers construct a dam across the stream, by the side of which the lodge is placed; the dam is sometimes as much as 300 yards in length, convex towards the current, and most convex in the strongest currents, sometimes extending on both sides beyond the natural channel of the stream. The materials of which it is composed are sticks, roots, and branches, with stones, moss, grasses, and mud, strangely commingled, but in such a manner that the structure becomes absolutely water-tight. Branches of which the bark has been used for food, or taken off for winter provender, are very generally employed for building purposes. In their building, beavers interlace small branches with each other and with the larger; and a B. kept in confinement has been known to manifest this instinct, by interlacing branches with the bars of its cage, whilst it also filled the interstices with carrots, and other vegetables, given it for food, nicely bitten to the proper size, and packed in snow, to protect itself from the cold. B. dams are built with the sides inclining towards one another, so that although ten or twelve feet wide at bottom, they have a narrow top. The dams and houses are annually repaired, before winter comes on, the work being performed by night. 'In places,' says Hearne, 'which have been long frequented by beavers undisturbed, their dams, by frequent repairing, become a solid bank, capable of resisting a great force, both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among the branches.' A broad ditch is often dug all around the lodge, so deep that it cannot freeze to the bottom, and into it the beavers make the holes by which they go out and bring their food. The larger lodges are in the interior, about seven feet in diameter, and between two and three feet high. The top is formed of branches of trees, matted with mud, grass, moss, &c. The walls are very thick, and the whole structure not only secures much warmth, but is a sufficient protection from wolves, wolverines, and other beasts

of prey. Different apartments have often one common roof, but they have usually no internal communication. The sleeping-places of the animals are around the wall of their lodge, the centre being left free; they are formed merely of a little grass or tender bark of trees. A single house seldom contains more than ten or twelve beavers, but many such families are often congregated in one place. Beavers, both in a wild state and in confinement, are scrupulously cleanly in their habits.

Beavers often sit on the hind-feet and tail, and eat in this posture, holding up the food in their fore-paws. They also walk on the hind-feet, with support of the tail, when they carry materials to their buildings, except branches, which are dragged. They have considerable power in the tail, and not unfrequently flap it, which has given rise to an opinion, perhaps not altogether erroneous, that they use their tails for plastering their buildings, or beating and adjusting the mud which is employed in them.

Beavers do not usually eat in their lodges, but in holes or burrows in the bank of the river, the entrance to which is from beneath the water, and which thence proceed obliquely upwards, often to a distance of many feet. To these holes the beavers also flee when their lodge is broken up; and it is therefore a common practice of the B. hunters to break up the B. lodges, that they may take the animals in their holes or vaults. Beavers are also taken by nets and traps.

It is chiefly in winter that beavers congregate together. During summer, they wander about a little. The young are generally produced in April or May, from two to seven at a birth. Their eyes are open when they are born.

Single beavers are frequently met with, which live apart from all others of their species. All of these are males, which, it is supposed, have been conquered and driven away by others of their sex.

In the parts of North America where beavers have now become rare, they live mostly in burrows in the river-banks, like those which are still found in Europe. Circumstances prevent them from following out their gregarious tendencies. That the beavers of Europe and Asia construct lodges and dams, when they have opportunity of congregating in sufficient numbers, appears to be no less certain than that those of America do so.

Large glandular pouches, two in number, closely connected with the organs of reproduction, contain the substance called *Castoreum* (q. v.). Its uses in the animal economy are by no means well known; they are probably analogous to those of musk, civet, &c.; but its peculiar pungent odour is so attractive to beavers, that use is made of it as a bait for B. traps.

The B. is very easily tamed; but no wooden cage will keep one confined. Except in the extraordinary building instincts already noticed, the animal exhibits no remarkable sagacity.—The use of the B.'s fur for making hats is well known. See HAT. An act of the English parliament, in 1638, prohibiting the use of any other material for hat-making, contributed to the rapid diminution of the number of beavers in the parts of North America from which their skins were then obtained. During great part of the 18th, and the earlier part of the 19th c., the number of B. skins annually exported from America appears to have been not less than 200,000. It is now greatly diminished, but is still large. The flesh of the B. is much esteemed as an article of food by trappers and others who frequent the fur-countries, but it is very oily.

Fossil remains of beavers, apparently of the same species with that now existing, are found in the

deposits referred by geologists to the pliocene and pleistocene periods. Other remains are also found of a much larger animal of the B. kind, which must have existed in Europe and Asia along with the present species, but which seems to have become extinct before the historic period. They were different, however, not merely in size, but in other particulars so important, that Owen has constituted for the 'great B.' a distinct genus, *Trogontherium* (Gr., a chewing or gnawing beast).

Of existing animals, the most closely allied to the B. is the *Coypu* (q. v.), sometimes called the Chilean B. (*Myopotamus Coypus*), which yields the fur called *Racoonda* (q. v.).

BEA'VER. See HELMET.

BEA'VER WOOD. See MAGNOLIA.

BEBEERINE is one of the alkaloids, and is obtained from the greenheart bark or *bebeeru* of Demerara. It is used in medicine in place of quinine, which it resembles in properties, though it is not so powerful in its action as a tonic and febrifuge. The condition in which it is generally sent into market is as the sulphate of B., occurring in shining scales of a pretty brown colour, and soluble in water.

BEBEE'RU, BEEBEERU, or BIBI'RI. See GREENHEART.

BECCAFICO (*Sylvia hortensis*, or *Curruca hortensis*), a little bird of the family of the *Sylviadee*, or Warblers (q. v.), sometimes called the Petychaps, and sometimes the Garden Warbler, rather rare in Britain, but abundant in some of the more southern parts of Europe, and in great demand for the table in Italy, its flesh being regarded as of peculiar delicacy. It is a mere summer bird of passage, however, not only in Britain, but even in the south of Europe. The upper parts are mostly of a brown colour, the lower parts whitish. It is a bird of very pleasing song. B. is an Italian name, and is sometimes extended to other birds of the same family used for the table.

BECCAMOSCHINO (*Sylvia cisticola*), a little bird of the family of the Warblers, found in Italy, and remarkable for its nest, which resembles that of the tailor-birds, being usually placed in a bush of lengthened herbage, the leaves and stalks drawn together over it, and a flooring formed for it by leaves curved across below, and sewed together generally with some kind of vegetable fibres.

BECCARIA, CESARE BONESANA, a political and philanthropic writer, was born at Milan 1735 or 1738. The opinions of the French encyclopedists, especially those of Montesquieu, had the greatest influence in the formation of his principles and sentiments. The work which most favourably exhibits the character and genius of B. is his *Trattato dei Delitti e delle Pene* (Treatise on Crimes and Punishments), first published in 1764, in which he argues against the severities and abuses of criminal law, especially capital punishment and torture. The work was extremely popular, and was translated into several European languages. It is marked by eloquence, sensibility, and lively power of imagination. Kant unfairly accuses the author of an affected humanity, though it must be admitted that the German philosopher has exposed the invalidity of some of the arguments brought forward. On the whole, however, the work of B. is acknowledged to have done great good, and the subsequent reforms in the penal code of European nations have generally taken the direction he has pointed out. He was among the first to advocate the beneficial influence of education in lessening crime. This naturally brought upon him the hatred of the priesthood, who,

according to their usual formula of persecution, accused him of impiety; but their malice was frustrated by the efforts of Count Firmian, the Austrian governor of Lombardy, a man of liberal and enlightened sentiments. In 1768, B. was appointed Professor of Political Philosophy at Milan, and achieved great success as a lecturer. He died of apoplexy in November 1793. In the course of his life he published several works.

BEC-FIN, the common French name for different species of birds of the family of *Sylviadee*, or Warblers (q. v.). It is sometimes to be met with in English books.

BÊCHE-DE-MER, or TREPANG, an article of luxury among the Chinese, consisting of the dried bodies of several species of *Hootheria* (q. v.), or Sea-cucumber, which are found in great abundance in the shallow waters of lagoons, and on reefs, from the south-eastern coasts of Asia to New Holland. The traffic in B. is very extensive, and the Malays catch the animals, and prepare them in large quantities for the Chinese market. They are usually about 8 or 9 inches long, but some are 2 feet in length, and 7 or 8 inches in girth. They are often found nearly buried in the coral sand, their feathered tentacula alone floating above it. The larger ones are sometimes speared in shallow water; but most of them are taken by divers in depths of from 3 to 5 fathoms. An expert diver will bring up eight or ten at a time. They are split down one side, boiled, pressed flat with stones, dried in the sun, and afterwards in smoke, and packed in bags, in which state they are bought by the Chinese, and conveyed in junks to China. Fleets of Malay proas are employed in the search for this curious production of the sea. Macassar is the great staple-place of the trade, and from it above 8000 cwt. of B. are annually sent to China, the price varying, according to the kind and quality, from thirty shillings to twenty guineas per cwt. There is also a considerable export of B. from Manila. B. is extremely gelatinous, and is very much used by the Chinese as an ingredient in rich soups.

BECHER, JOHANN JOACHIM, author of the first theory of chemistry, was born at Speier in 1625. In his youth, he had many difficulties to contend with, but his zeal and perseverance overcame them all. He acquired an extensive knowledge of medicine, physics, chemistry, and even politics, and in 1660, was made a member of the Imperial Council at Vienna. While residing in this city, he assisted in establishing several manufactures, and drew up the plan of an East Indian commercial society, but unfortunately he fell into disgrace, and had to leave the city. He next went to Mainz, and subsequently lived in Munich, Würzburg, Haarlem, and finally London, where he died in 1682. He had many enemies, and was accused—not altogether unjustly—of charlatany. Nevertheless, he rendered important services to chemistry. His *Physica Subterranea* was the first attempt made to bring physics and chemistry into close relation; in these two he sought the causes of all the inorganic phenomena in the world. He at the same time began to construct a theory of chemistry, and also investigated the process of combustion. B. taught that every metal was composed of an earthy substance common to all metals; of a combustible principle also identical in all; and was differentiated from other metals only by the possession of a peculiar mercurial element; when a metal was heated, until it had changed its form, the mercurial substance was discharged, and nothing remained except metallic calx. Herein lies the first germ of Stahl's phlogistic theory, which obtained universal currency until the time of Lavoisier.

BECHUANS. See BEJUANS.

BECKER, GOTTFRIED WILHELM, a German author, born at Leipsic in 1778, entered the university of that city with the view of studying medicine, and having taken his doctor's degree in 1801, settled there as a practising physician and a writer of medical works, several of which reached many editions. The wars of the period led him, however, to turn his attention to history and modern languages, and he became well known by his contributions to periodicals, his series of popular histories, and his translations from the English, French, and Italian. In 1833, B. entirely relinquished practising medicine, and devoting himself to literature, became a fertile and admired contributor to many of its more popular branches. He died at Leipsic, 17th January 1854. He published several attractive volumes of travels in his own country, peculiarly adapted to the young, among which we may instance his *Tour to the Harz, Sketches of Southern Germany*, &c. His historical writings, which are not less numerous, chiefly narrate the events of his own time. Amongst them we may particularise *Andreas Hofer, Egypt as it Now is, The Fate of Spain in Modern Times*, &c. In light literature, also, he was very successful as a translator. All his works have been published at Leipsic.

BECKER, JOHN PHILIP, one of the most active Radical politicians of late years, was born, March 1809, at Frankenthal, in the Palatinate, and brought up as a brushmaker. The French revolution of July 1830 gave a political bias to his native tendencies, and he took an active part in the political agitations of the day, in consequence of which he was imprisoned; but in 1833 he was released, and exerted himself warmly on behalf of his brothers in opinion. In 1837, he settled in Switzerland, taking a part in several Radical publications, and organising, in 1838 and 1845, volunteer corps. In the autumn of 1847, he was summoned to the military bureau at Berne, and being chosen adjutant of Ochsenbein's division, fought against the Sonderbund with acknowledged bravery. Upon the failure of Hecker's attempt to revolutionise Baden in 1848, B., who had organised troops for his support, returned to Switzerland, to plan an expedition of German and Swiss auxiliaries, to support the cause of freedom in Rome and Sicily. Their movements being frustrated, he led his troops in the summer of 1849 into the Palatinate and the Duchy of Baden, where a rising had taken place, and acted a prominent part in many engagements. Subsequently, he settled in Geneva, and engaged successfully in commerce. A history of the revolution of 1849, in Southern Germany, has been published by him and Esselen. B. is a man of strong and hardy frame, and for prudence and decision, ranks high among the leaders of the revolutionary party.

BECKER, KARL FERDINAND, born at Leipsic in 1804, may be named with Kiesewetter and Winterfeld as one of the best German writers on the history of music, and also as an excellent composer for the organ, as is proved by his trios and other compositions well adapted to the genius of the instrument. Among his works may be mentioned: a *Choral-book*, or collection of psalm and hymn tunes (Leipsic, 1844); *Choral Melodies* for Spitta's Psalter and Harp, 1841; a *Catalogue* of his musical library, one of the most extensive in Germany; *On the Choral Collections of Various Christian Churches*, 1841; *The Choral Compositions of the 16th and 17th Centuries*, 1847; and *The Composers of the 19th Century*, 1849.

BECKER, KARL FERDINAND, one of the most distinguished German philologists, was born at

Liser, in the old electorate of Treves, in 1775. At first a teacher, he afterwards studied medicine, and ultimately settled as a practitioner at Offenbach. Here he educated his own children with such success that several families induced him to take charge of theirs, and thus his house was converted into an academy (1823), which he conducted till his death in 1849. This gave scope to his early predilection for linguistic studies, to which his scientific training led him to give a quite new direction. B. contemplates language as an *organism*, pervaded by strict logical laws. From this point of view, he wrote his *Deutsche Grammatik* (2d ed., 1842). He neglects too much the historical development of language, and thus, as might be expected, comes at times into conflict with the results of comparative philology; yet his work is valuable for its logical consequence, and for its leading idea of organism in language. Besides a *Schulgrammatik* (6th ed., 1846), which is an outline of his larger work, he published several other treatises on the German language.

BECKER, WILHELM ADOLF, a distinguished German author, was born at Dresden in 1796. Originally intended for commercial life, he soon abandoned a pursuit which he found uncongenial to his tastes, and devoted his time to the acquisition of learning. In 1816, he came to Leipsic, where he studied theology, and more particularly philology. In 1840, he travelled through Italy; and in 1842, was appointed Professor of Archæology at the university of Leipsic, where his lectures on the Latin authors were numerously attended. He died at Meissen, 30th September 1846. His lively fancy, aided by a thorough knowledge of the classic languages, enabled him to make quite a novel use of antiquity. In his *Charicles* (Leip. 1840), he ventured to reproduce the social life of old Greece; and in his *Gallus* (Leip. 1835), to give sketches of the Augustan age at Rome. The learning which he has contrived to stuff into his picturesque sentences is marvellous, not to speak of the quantity buried in his *excursus*, or disquisitions, which, in the English translation of the works by Metcalfe, are transferred from the text to the end of the volumes. Lockhart's *Valerius* is the only thing in English literature which corresponds to these compositions of the German author. B.'s treatise, *De Comicis Romanorum Fabulis* (Leip. 1837), is a valuable contribution to the history of Roman dramatic poetry. His most important work, in a scholastic point of view, is his *Hand-book of Roman Antiquities* (1843—1846), which, after his death, was continued by Marquardt.

BECKERATH, HERMANN VON, one of the most remarkable public characters of Germany, was born at Krefeld (in Prussia), December 1801. He sprang from a commercial family, and made a considerable fortune as a banker. But he gave himself also to pursuits of a more intellectual character, and especially to the studies of jurisprudence and politics. The accession of Frederick-William IV. to the throne roused B. to a sense of the political condition of his country, and he devoted himself to work out its constitutional freedom. In 1843, he was elected representative of his native town in the provincial diet, and continued for several years to take a prominent part in Prussian politics. He was a deputy in the National Assembly which sprang up in the eventful year 1848, and held its sittings at Frankfurt. His eloquence exercised considerable influence on this assembly. He was appointed minister of finance, and shortly after called to Berlin, to construct a cabinet; but in this he failed. His strictly constitutional advice was not apparently agreeable to the court, and he returned to Frankfurt. An advocate

for German unity, it was he who made use of the expression: 'This waiting for Austria is death to the union of Germany.' But zealous as he was for constitutional freedom and German unity, he refused his assent to any measure of a revolutionary tendency. When the retrograde movement set in, he resigned such posts as he held under government, but continued, as a member of the second Prussian chamber, a vigorous opposition to the Manteuffel ministry, which had deserted the cause of German unity, and returned to the old traditional politics of the court.

BECKET, THOMAS A', Archbishop of Canterbury, was the son of a merchant, and was born in London in 1119. The story which makes his mother a Saracen is charmingly romantic, but there are doubts if it has any historical basis. He studied theology at Oxford and Paris, and afterwards law at Bologna, and at Auxerre, in Burgundy. Having been recommended to Henry II. by Theobald, Archbishop of Canterbury, who had had experience of his abilities, B. was promoted to the office of high chancellor, and thus (according to Thierry) resuscitated the hopes of the English as the first native Englishman, since the Conquest, who had filled any high office. The sympathies of his countrymen gathered round him, for in him (it is alleged) they once more rose to honour and power. His duties as high chancellor were numerous and burdensome, but he discharged them vigorously. He was magnificently liberal in his hospitality. Henry himself did not live in a more sumptuous manner. As yet, B. seems to have regarded himself as a mere layman, though, in point of fact, he was a deacon, and to have considered the splendour of his household neither unlawful nor unbecoming; but in 1162, when he was created Archbishop of Canterbury (an office which, as it then involved the abbacy of the cathedral monastery, had never but twice before been held by any but a monk or canon-regular), a remarkable change became manifest in his whole deportment. He resigned the chancellorship, threw aside suddenly his luxurious and courtly habits, assumed an austere religious character, exhibited his liberality only in his 'charities,' and soon appeared as a zealous champion of the church against all aggressions by the king and the nobility. Several noblemen and laymen were excommunicated for their alienation of church property. Henry II., who, like all the Norman kings, endeavoured to keep the clergy in subordination to the state, convoked the nobility with the clergy to a council in 1164, at Clarendon (near Salisbury), where the so-called 'constitutions' (or laws relative to the respective powers of church and state) were adopted. To these, the primate, at first, declared he would never consent; but afterwards, through the efforts of the nobles, some of the bishops, and, finally, of the pope himself, he was induced to give his unwilling approbation. Henry now began to perceive that B.'s notions and his were utterly antagonistic, and clearly exhibited his hostility to the prelate, whereupon B. tried to leave the country. For this offence the king charged B. with breach of allegiance, in a parliament summoned at Northampton in 1164, confiscated his goods, and sequestered the revenues of his see. A claim was also made on him for not less than 44,000 marks, as the balance due by him to the crown when he ceased to be chancellor. B. appealed to the pope, and next day leaving Northampton in disguise, fled to France, where he spent two years in retirement at Pontigny, in Burgundy. The French monarch and the pope, however, now took up his cause. B. went to Rome, pleaded personally before his holiness, who reinstated him in the see of Canterbury. B. now returned to France, whence

he wrote angry letters to the English bishops, threatening them with excommunication. Several efforts were made to reconcile Henry and B., which, however, proved futile; but at length, in 1170, a formal agreement was come to at Fretville, on the borders of Touraine. The result was, that B. returned to England, entering Canterbury amid the rejoicings of the people, who were unquestionably proud of B., and regarded him—whether wisely or not is another question—as a shield from the oppressions of the nobility; but he soon manifested all his former boldness of opposition to royal authority. At last, it is said, the king, while in Normandy, expressed impatience that none of his followers would rid him of an insolent priest. The fatal suggestion was immediately understood, and carried into effect by four barons, who departed by separate ways for England. On the evening of the 29th December 1170, they entered the cathedral, and having failed in an attempt to drag him out of the church, there slew B. before the altar of St Benedict, in the north transept. Henry was compelled to make heavy concessions to avoid the ban of excommunication. The murderers, having repaired to Rome as penitents, were sent on a pilgrimage to Palestine; and, two years after his death, B. was canonised by Pope Alexander III., and the anniversary of his death was set apart as the yearly festival of St Thomas of Canterbury. In 1220, his bones were raised from the grave in the crypt where they had been hastily buried two days after his murder, and were by order of King Henry III. deposited in a splendid shrine, which for three centuries continued to be the object of one of the great pilgrimages of Christendom, and still lives in English literature in connection with Chaucer's *Canterbury Tales*. At the Reformation, Henry VIII. despoiled the shrine, erased B.'s name from the calendar, and caused his bones to be burnt and scattered to the winds. It is extremely difficult to estimate properly the character of Becket. We do not know what his ultimate aims were, whether, as some suppose, they were patriotic, i. e., *Saxon*, as opposed to *Norman*, or, as others believe, purely sacerdotal. At all events, the means he used for the attainment of them was a despotic and irresponsible ecclesiasticism. He admitted nothing done by churchmen to be secular, or within the jurisdiction of civil courts, not even murder or larceny. Fortunately, the Plantagenets were as dogged believers in their own powers and privileges as B. in those of the church; and by their obstinate good sense, England was ever kept in a state of wholesome jealousy of the pretensions of the Roman see. See Dr Giles's *Vita et Epistolæ S. Thomæ Cantuariensis* (6 vols. 8vo); Canon Morris's *Life of St Thomas Becket*; Canon Robertson's *Life of Becket*; Canon Stanley's *Historical Memorials of Canterbury*; J. G. Nichols's *Pilgrimages of Walsingham and Canterbury*.

BECKETTS, on shipboard, a general name for any large hooks, short pieces of rope, or wooden brackets, used for confining ropes, tackles, oars, or spars, in a convenient place.

BECKFORD, WILLIAM, the only legitimate son of Alderman Beckford, was born in 1760. When he was about nine years of age, his father died, and he inherited the larger portion of an enormous property, consisting for the main part of estates in Jamaica, and of the estate of Fonthill, in Wiltshire. His annual revenue is said to have exceeded £100,000. Young B. evinced unusual intellectual precocity; for in 1780 he printed a satirical essay, entitled *Biographical Memoirs of Extraordinary Painters*, in which he does not spare living artists, and assails the cant of criticism with the polished weapon of

his wit. In 1778 he visited the continent, and met Voltaire at Paris. Two years thereafter, he started on his first great continental tour, and spent twelve months in rambling through Flanders, Germany, and Italy. In 1782 he made a second visit to Italy, and in 1787 he wandered through Portugal and Spain. In 1783 he married the Lady Margaret Gordon, daughter of Charles, fourth Earl of Aboyne; and in the following year he entered parliament as one of the members for Wells. In the same year he published *Vathek* in French. B. informs us that he wrote this tale, as it now stands, at twenty-two years of age, and that it was composed at one sitting. 'It took me,' he says, 'three days and two nights of hard labour. I never took off my clothes the whole time. This severe application made me very ill.' Immediately on its publication, *Vathek* was translated into English; B. professes never to have known the translator, but thought his work well done. In 1790 he sat for Hindon; in 1794 he accepted the Chiltern Hundreds, and again left England. He fixed his residence in Portugal, purchased an estate, and busied himself in the erection of the 'paradise' which Byron commemorated in *Childe Harold*. Tormented by unrest, he returned to England; and in 1801 the splendid furniture of Fonthill was sold by auction, and the next year his valuable collection of pictures was disposed of in London. These dispersions were no sooner made than he began a new collection of books, pictures, furniture, curiosities, and proceeded to erect a new building at Fonthill, the most prominent feature of which was a tower above 260 feet high. B. resided at Fonthill till 1822, when in one of those strange vagaries of feeling, of which his life was so full, he sold the estate and house, with all its rare and far-gathered contents, to Colonel Farquhar for £350,000. Soon after, the great tower, which had been raised on an insecure foundation, came to the ground. On the sale of Fonthill, B. removed to Bath, and immediately proceeded to erect another lofty building, the plan of which also included a tower, but this time not more than 100 feet high. While residing there, he did not mingle in Bath society, and the most improbable stories concerning the rich and morose genius in their neighbourhood were circulated among the citizens, and were believed by them. During all his life, B. was a hard-working student, and was devoured by a passion for books. Some of his purchases were perfectly imperial in their way. He bought Gibbon's library at Lausanne, to amuse himself when he happened to be in that neighbourhood. He went there; read in the fierce way that he wrote, three days and two nights at a sitting; grew weary of his purchase; and handed it over to his physician, Dr Schell. Up till 1834 he had published nothing since *Vathek*, but in that year the literary silence of half a century was broken by the appearance of a series of letters, entitled *Italy, with Sketches of Spain and Portugal*, in two volumes. In the same year he republished his *Memoirs of Extraordinary Painters*; and in 1835 he issued another volume, entitled *Recollections of an Excursion to the Monasteries of Alcobaca and Batalha*, made in June 1794. From the period of this last publication till his death, which took place on the 2d of May 1841, he lived in the deepest retirement.

It, since the publication of his Arabian tale, has been a power in English literature. His wit, his sarcasm, his power of graphic description, may be seen in his journal and letters; and his higher faculties of imaginative conception and delineation reign in the unmatched passages that shadow forth in gloom and glory the 'Hall of Eblis.'

BECKMANN, JOHANN, a German author, known by his works on natural history and agriculture, was born at Hoya, in Hanover, June 4, 1739. After spending some time in the study of theology, he directed his attention to the physical sciences, and especially to their economical applications. After holding, for about two years, a professorship of physics and natural history in St. Petersburg, he made a tour through Sweden, where he gained an acquaintance with the working of mines, and received for some time instructions from Linnæus. In 1766 he was appointed professor of philosophy, and in 1770 ordinary professor of political economy at Göttingen, where he died, February 4, 1811. He was the first German author who wrote on agriculture in a scientific style. Among his works may be mentioned: *Principles of German Agriculture* (6th ed. 1806), *Introduction to Technology* (5th ed. 1809), *Introduction to the Science of Commerce* (1789), and *Contributions to the History of Inventions* (1780—1805). This last-mentioned work has been translated into English with some abridgment.

BECQUEREL, ANTOINE CÉSAR, a distinguished French physicist, was born 7th March 1788, at Chatillon-sur-Loire, in the department of Loiret. In 1808, he entered the French army as an officer of engineers, and served with distinction in Spain under Marshal Suchet. He took part in the sieges of Tortosa, Tarragona, Valencia, and other places. On his return to France, he was appointed inspector of the *Ecole Polytechnique*; in 1814, he went through the campaign of France; and at the peace of 1815, retired from the service, that he might pursue his scientific studies with greater advantage. In 1819, he published a volume of geological and mineralogical researches, after which, his attention was principally devoted to electricity and magnetism. While studying the physical properties of yellow amber, B. had occasion to make experiments on the liberation of electricity by pressure. This led him to investigate the laws by which the phenomena of liberation are governed in chemical action. The result of his inquiries was the overthrow of Volta's theory of contact, and the construction, by him, of the first constant pile. He next discovered a very simple method of determining the internal temperature of human and animal bodies without sensibly injuring them, and by numerous physiological applications, demonstrated, that when a muscle contracts, there is a development of heat. B. is besides one of the creators of electro-chemistry. His labours in this branch of science opened for him, in 1829, the door of the *Académie des Sciences*. Since 1828, he had begun to apply electro-chemistry in the reproduction of mineral substances, and in the treatment by the humid way of silver, lead, and copper ores; and in 1837 the Royal Society of London recognised his great merits by awarding to him the Copley Medal. Among the other works of this eminent savant may be specified his researches on the electric conductivity of metals, on galvanometers, on the electric properties of tourmaline, on atmospheric electricity, &c. In 1847, he was chosen a member of the Council-general of the Loiret, where his scientific knowledge was found to be extremely useful. He is professor and administrator of the Museum of Natural History.

His principal works are—*Traité de l'Electricité et du Magnétisme*, 1834—1840; *Traité d'Electrochimie*; *Traité de Physique considérée dans ses Rapports avec la Chimie et les Sciences Naturelles*, 1844; *Traité de Physique Terrestre et de Météorologie*, 1847.

BECSKEREK NAGY, or GREAT BECSKEREK, a town of Hungary, in the county of Torontal, situated on the left bank of the Bega, about 45

miles south-west of Temesvar, with which place it is connected by canal. B. N. is an important market-town, and has a population of about 15,000.

BED (with some variations in spelling, the word is common to all Germanic languages), an article of household furniture on which to sleep. Beds have been, and are of various forms, almost every country having its own kind of bed. In ancient times in Palestine, the B. seems to have been a simple kind of couch for reclining on during the day, and sleeping on at night, and readily removable from place to place, as is referred to in different parts of Scripture. About the heat of the day, Ishbesheth lay on his B. at noon (2 Sam. iv. 5). In receiving visitors, the king bowed himself upon the bed (1 Kings i. 47). Jesus saith, 'Take up thy B., and go unto thine house' (Mat. ix. 6). Yet, in these early times, beds or couches must, in some instances, have been highly ornamented; thus, 'I have decked my B. with coverings of tapestry, with carved works, with fine linen of Egypt' (Prov. vii. 16). The ancient Greeks had an elegant kind of beds in the form of open couches; they rested on a framework with posts; their mattresses were stuffed with wool or feathers; and they had coverings of a costly nature. The Romans had latterly beds of great richness and magnificence. They were of two kinds—the *lectus tricliniaris*, or couch for reclining upon at meals; and the *lectus cubicularis*, or B. placed in bed-chambers for sleeping in during the night. In eastern countries, at the present day, beds are for the most part simple couches or mattresses, which can be easily rolled up and carried away. In India, these couches are called *charpays*. It will be understood that, in hot climates, few bed-clothes are used—in general, there being only a single sheet employed; care is taken, however, to use mosquito-curtains, without which rest would be impracticable. See MOSQUITO.

Throughout the continent of Europe, beds are of the open couch form, suitable in width for one person. They consist of a frame or bedstead, less or more ornamental, bearing one or two hair or wool mattresses; they are often provided with curtains, which depend from the ceiling of the room. In French hotels, such beds, neatly done up, are seen in sitting-rooms. In Germany, there is a common practice of placing large flat bags of down above the other coverings of beds, for the sake of warmth; and sometimes a bed of down altogether supplies the place of blankets. Throughout America, the beds are usually of the French, or open couch, form. The simplest kind of B. yet invented—except, indeed, the Oriental rug spread on the floor—is one frequently to be seen in America. The bedstead consists of a folding tressel, constructed with canvas on the principle of a camp-stool, with a movable head-board at one end to retain the pillow. With a hair-mattress, a pillow, and the necessary coverings laid on it, this makes one of the most comfortable beds imaginable. Its great advantage consists in its being easily folded up and put away in small space. In some of the hotels in the United States, when the arrival of guests exceeds the ordinary accommodation, a number of tressel-beds can be improvised in a few minutes in one of the large halls.

To prevent the falling of dust on the face, the Romans, in some instances, used canopies (*aulææ*) over their beds; in no country but England, however, has the canopied bedstead been thoroughly perfected and naturalised. The English four-posted B., or B. proper, is a gigantic piece of furniture, to which all persons aspire; and when tastefully fitted up, it offers that degree of comfort and seclusion which is characteristic of the domestic habits of the

people. Like most English beds, it is made of sufficient size to accommodate two persons—the husband and wife—and is hence known as the family-bed. The dimensions of a good family B. are as follows: lying part, 6 feet 6 inches in length, by 5 feet 2 inches in breadth; height from the floor, 2 feet 9 inches; height of the posts from the floor to the top of the cornice, 9 feet. The roof or canopy is supported by the four posts, which are of mahogany, finely turned and carved. On rods along the cornice, hang curtains, which can be drawn around the sides and foot. The top stands towards the wall, so that the B. can be approached on the two sides. The curtains are composed of silk or worsted damask; in old times, they were of tapestry. With a spring-mattress below, and a wool-mattress above, the B. is complete, all but the blankets, sheets, bolster, and pillows. Ticks with feathers, laid on a hair-mattress, are also common. Fully equipped, a B., as just described, costs from £50 to £80. The great B. at Ware, in Hertfordshire, is one of the curiosities

Bed of Ware.

of England, and is referred to in the *Twelfth Night* of Shakspeare: 'Although the sheet were big enough for the Bed of Ware in England.' This famous B., which is still seen in one of the inns at Ware, measures twelve feet square, and is said to be capable of holding a dozen persons.

Latterly, a species of B. has been introduced into England, called the Elizabethan Bed. In point of size, it resembles the four-poster, but it has only two tall posts, with a canopy and curtains at the head, leaving more than half of the B. exposed. The tent-B. is an inferior kind of four-poster; it has a semi-circular light frame roof, and light calico curtains. A more novel variety of bedsteads are these made of iron or brass, formed like open couches, and adapted for cottages in summer, but not likely to come generally into use. The cold and humid climate of the British islands, independently of the habits of the people, has greatly influenced the form of the B.; for although it may be more wholesome to sleep without than with curtains, it will be difficult to introduce the practice of doing so, particularly during the winter and spring months. In the humbler class of rural cottages in Scotland, there still lingers the old custom of sleeping in wooden bedsteads with sliding doors. This box variety of B. is considered as unfavourable to ventilation, but it is the only kind of sleeping-place which is endurable where there are damp earthen floors and imperfect ceilings. Its use is disappearing in the progress of cottage improvement.

In old times in England, beds were formed with straw instead of wool, hair, or feathers, as at present; hence the phrase of a 'lady in the straw,' signifying that she is being confined. By the

humbler classes in the rural districts, straw is still used for beds, and also ticks stuffed with chaff. According to an old superstition, no person could die calmly on a B. of feathers of game birds.

For invalids, there have been invented air-beds and water-beds, which are now in use, and justly appreciated. See AIR-BED, also WATER-BED.

BED, or STRATUM, is a layer of sedimentary rock of similar materials, and of some thickness, cohering together so as to be quarried and thickened in single blocks. Beds are often composed of many fine laminae or plates. The laminae are the results of intermissions in the supply of materials, produced by such causes as the ebb and flow of the tide, river-floods, or the more or less turbid state of the water under which they were deposited. When the intervals between the supply of materials were short, the numerous laminae closely adhere, and form a bed cut off from the superior deposit, by the occurrence of a longer interval, during which the bed became consolidated more or less before the next was deposited. When the lamination is obscure, or not distinct from the stratification, it would seem to indicate that the materials had been supplied without any intermission.

BED OF JUSTICE (Fr. *lit de justice*), literally, the seat or throne occupied by the French monarch when he was present at the deliberations of parliament. Historically, a B. of J. signified a solemn session, in which the king was present, to overrule the decisions of parliament, and to enforce the acceptance of edicts or ordinances which it had previously rejected. The theory of the old French constitution was, that the authority of parliament was derived solely from the crown: consequently, when the king, the source of authority, was present, that which was delegated ceased. Acknowledging such a principle, the parliament was logically incapable of resisting any demand that the king in a B. of J. might make, and decrees promulgated during a sitting of this kind were held to be of more authority than ordinary decisions of parliament. Monarchs were not slow to take advantage of this power to overawe any parliament that exhibited signs of independence. The last B. of J. was held by Louis XVI. at Versailles in September 1787.

BEDA, or BEDE (surnamed, on account of his learning, piety, and talents, VENERABLE), the greatest name in the ancient literature of Britain, and probably the most distinguished scholar in the world of his age, was born about the year 673 A.D. The exact spot of his birth is a point in dispute among antiquaries, but is commonly believed to have been in what is now the parish of Monkton, near Wearmouth, in Durham. In his seventh year he entered the neighbouring monastery of St Peter, at Wearmouth, where he remained for 13 years, and was educated under the care of the Abbot Benedict Biscop, and his successor, Ceolfrid. His religious instructor was the monk Trumheret; his music-master, John, chief-singer (*archicantor*) in St Peter's Church, Rome, who had been called to England by the Abbot Benedict. After these studies at Wearmouth, B. removed to the twin-monastery of St Paul at Gyrum (now written Jarrow), founded in 682; here he took deacon's orders in his nineteenth year, and was ordained priest in his thirtieth, by John of Beverley, then bishop of Hexham. In the shelter of his quiet and sacred retreat, while the tempest of barbaric strife raged without, and the hearts of all men in England were torn by sanguinary passions, B. now began earnestly to consecrate his life to such literature as was possible in those days, including Latin and Greek, and at least

some acquaintance with Hebrew, medicine, astronomy, and prosody. He wrote homilies, lives of saints, hymns, epigrams, works on chronology and grammar, and comments on the books of the Old and New Testament. His calm and gentle spirit, the humanising character of his pursuits, and the holiness of his life, present a striking contrast to the violence and slaughter which prevailed in the whole island. To none is the beautiful language of Scripture more applicable—'a light shining in a dark place.' When labouring under disease, and near the close of his life, he engaged in a translation of St John's Gospel into Anglo-Saxon, and dictated his version to his pupils. He died May 26, 735, and was buried in the monastery of Jarrow; long afterwards (in the middle of the 11th c.), his bones were removed to Durham. His most valuable work is the *Historia Ecclesiastica Gentis Anglorum*, an ecclesiastical history of England, in five books, to which we are indebted for almost all our information on the ancient history of England down to 731 A.D. B. gained the materials for this work partly from Roman writers, but chiefly from native chronicles and biographies, records, and public documents, and oral and written communications from his contemporaries. King Alfred translated it into Anglo-Saxon. In chronology, the labours of B. were important, as he first introduced the Dionysian reckoning of dates in his work, *De Sex Aetotibus Mundi*, which served as a basis for most of the medieval chroniclers of leading events in the world's history. Among the editions of B.'s History may be noticed: the first, published at Strasburg about 1500; a much better edition, by Smith (Cambridge, 1722); one not less valuable, by Stevenson (Lond. 1838); another, by the late Dr Hussey (Oxf. 1846); a fourth in the *Monumenta Historica Britannica* (Lond. 1848); and that included by Dr Giles in his edition of the whole works of B., with an English translation of the historical parts (6 vols., Lond. 1843—1844). Entire editions of B.'s writings have been published in Paris (1544—1554), Basel (1563), and Cologne (1612 and 1688). English versions of his *Ecclesiastical History* were published by Stapleton, in 1565; by Stevens, in 1723; by Hurst, in 1814; by Wileock, in 1818; and by Giles, in 1840. See Gehle's *De Bedæ Venerabilis Vita et Scriptis* (Leyden, 1838); Wright's *Biographia Britannica Litteraria*, vol. i. (Lond. 1843); Surtees's *History of Durham*, vol. ii., pp. 2—6, 66—69.

BÉDARIEUX, a town of France, department of Herault, situated on the river Orb, well built, and second to none of its size in industry. Pop. 9170, who are engaged in the manufacture of fine and coarse cloths, stuffs, cotton and woollen stockings, hats, paper, oil, soap, leather, &c.

BEDCHAMBER, LORDS OF THE, officers in the British royal household, twelve in number, who, in the reign of a king, wait in turn upon the sovereign's person. They are under the groom of the stole, who attends his majesty only on state occasions. There are also thirteen grooms of the B., who take their turns of attendance. The salary of the groom of the stole is £2000; of the lords of the B., £1000; and of the grooms, £500 a year. These offices in the reign of a queen are performed by ladies. Corresponding to the groom of the stole is the mistress of the robes, and to the grooms of the B. are B. women. At present (1855), Her Majesty has eleven ladies, and extra ladies of the B., and eight B. women. These offices, which are in the royal nomination, are objects of high ambition, from the access they give to the person of the sovereign, and are for the most part filled by 'the prime nobility of England.' They are not usually vacated on a

change of ministry, and Sir Robert Peel's departure from the usual etiquette on this point, in 1839, excited no small commotion.

BEDDOES, THOMAS, a physician of remarkable talents, and a popular writer on chemistry, physics, physiology, disease, &c., was born at Shiffnall, in Shropshire, 1760. In his studies at Oxford and Edinburgh, he distinguished himself by his knowledge of ancient and modern languages—the modern he acquired without the aid of a teacher—and by his varied attainments in botany, mineralogy, geology, chemistry, &c. In Edinburgh he attracted the notice of Dr Cullen, who employed him to add notes to Bergman's *Physical and Chemical Essays*. In 1785, he published a translation of Bergman's *Essays on Elective Attractions*, with valuable original notes. In 1787, he was appointed to the chemical lectureship in the university of Oxford. Here his lectures became exceedingly popular; but his unconcealed sympathies with the French revolutionary party in England, appear to have rendered his post so uncomfortable that he resigned it in 1792, and retired into the country. While in retirement, he wrote his work *On the Nature of Demonstrative Evidence, with an Explanation of Certain Difficulties occurring in the Elements of Geometry*, which was intended to shew that mathematical reasoning proceeds entirely on the evidence afforded by the senses, and that geometry is based on experiment. Several patriotic pamphlets followed, and the *History of Isaac Jenkins*, in which he laid down, in a popular style, rules of sobriety, health, &c., for the benefit of the working-classes. Of this work, 40,000 copies were sold in a short time. In 1798, after having spent considerable time in studying the use of artificial or medicated gases in the cure of diseases, especially consumption, aided by his father-in-law, Mr Edgeworth, and pecuniarily assisted by his friend, Thomas Wedgwood, he opened a pneumatic hospital at Bristol. This institution did not succeed in its main object, which was to shew that all diseases being, as B. maintained, referrible to an undue proportion or deficiency of some elementary principle in the human organism, could be cured by breathing a medicated atmosphere; and B., whose zeal had abated, retired from it about a year before his death, in 1808. The only results of the enterprise were several works by B. on the application of medicated air to diseases, and the introduction to the world of Davy (afterwards Sir Humphry), who was the superintendent of the institution. Sir Humphry Davy says of B.: 'He had talents which would have exalted him to the pinnacle of philosophical eminence, if they had been applied with discretion.' A life of B. was published in 1811 by Dr Stock.

BEDDOES, LOVELL THOMAS, eldest son of Dr Thomas B., and of Anna, third daughter of Richard Lovell Edgeworth, of Edgeworthstown, Ireland, sister of Maria Edgeworth, the distinguished novelist, was born at Rodney Place, Clifton, on the 20th July 1803. In 1809 Dr Beddoes died, leaving his son to the guardianship of Mr Davies Giddy, who, under his after-name of Sir Davies Gilbert, became the president of the Royal Society. By this gentleman, young B. was placed at the Bath grammar school; from thence, in 1817, he removed to the Charter House; and in May 1820, he entered as a commoner at Pembroke College, Oxford. In 1821 he published the *Improvisatore*. On this, his earliest poetic offspring, he looked with no favour at a later period, and was wont to hunt after stray copies in the libraries of his friends, and to disembowel them mercilessly when he effected a capture. In 1822 he published *The Bride's Tragedy*, which

achieved for its author a great reputation. In 1824, he went to Göttingen to study medicine, and from this time forth continued to live in Germany and Switzerland, with occasional visits to England. While engaged at Frankfort (1847) in dissecting, he received a slight wound, which was the means of infusing a noxious virus into his system. His health now began to fail. In 1848 he went to Basel, where he fell from his horse, and injured his leg. An amputation following, he died on the 26th January 1849, and was buried in the cemetery of the hospital.

During his wanderings in Germany, B. was engaged at intervals in the composition of a drama entitled *Death's Jest-book*. This work, together with his other manuscripts, consisting chiefly of poetry, he, on his death-bed, confided to the care of a friend in England, desiring him to use his discretion as to their publication. In consequence, in 1851, his poetical works, with a memoir attached, appeared in two volumes. The merits of these dramatic fragments are quite peculiar. The author exhibits no power of characterisation, no ability in the conduct of a story; and, on the other hand, the crush of thought and image, the tone of music, and the depth of colour, are quite wonderful. Mr B. never could have become a dramatist, and of this, during his later years, he seems to have become aware. His works pall with splendour, and are monotonous by very richness. They are like a wilderness where nature has been allowed to pour herself forth in all her waste and tropical excess, unrestrained by a pruning hand, and unpierced by any path.

BEDEAU, MARIE ALPHONSE, a distinguished French general, was born at Vertou, near Nantes, August 1804. In 1817 he entered the military school of La Flèche; in 1820, St Cyr; and in 1825 received a commission in the army. In the Belgian campaign of 1831—1832, he was aide-de-camp to General Gérard, and attracted notice at the siege of Antwerp. In 1836 he was sent to Algeria, as commandant of a battalion of the Foreign Legion. Here he acquired his great military reputation. He took part in most of the military operations by which the dominion of France was established over the natives, and rose to the rank of general of brigade. In 1847, he was for a short time governor of Algeria, but was superseded by the Duc d'Anmale.

When the revolution of February broke out, B., who was in Paris on leave of absence, was commissioned by Marshal Bugeaud to suppress the insurrection. This he found it impossible to do, but his conduct on the occasion has been severely blamed. By the Provisional Government he was appointed Minister of War, an office, however, which he immediately changed for the command of the city of Paris. On the formation of the Constituent Assembly, he was named vice-president, and always voted with the republican party. Along with Cavaignac, Lamoricière, and others, he was arrested on the 2d December 1851, and went into exile. B. was a Roman Catholic, and the fervour of his convictions gave rise to the groundless rumour that he had entered into holy orders. He died in 1863.

BEDEGUAR, a remarkable gall (q.v.), often found on the branches of various species of rose, particularly of the sweet-brier, upon which account it is sometimes called Sweet-brier Sponge. It is produced sometimes by *Cynips rosæ*, sometimes by other species of gall insect. It is usually of a roundish shape, often an inch or more in diameter; its nucleus is spongy and fibrous, containing numerous cells, in each of which is a small larva; externally it is shaggy, being covered with moss-like branching

fibres, which are at first green, afterwards purple or red. It was formerly in some repute as a diuretic and as a remedy for stone; it has more recently been recommended as a vermifuge, and as a cure for toothache.

BEDELL, WILLIAM, one of the best prelates that have adorned the English Church, was born at Black Notley, Essex, in 1570. He was educated at Emmanuel College, Cambridge, and after his ordination, officiated as a clergyman for several years at Bury St Edmunds. In 1604, he accompanied Sir Henry Wotton as his chaplain to Venice. There he resided eight years, deeply engaged in study, and honoured by the friendship of many distinguished men, in particular of Father Paul Sarpi, then engaged in the composition of his celebrated *History of the Council of Trent*. While residing here, he translated the English *Common Prayer Book* into Italian, which was highly appreciated by many of the Venetian clergy. On his return home, he resumed his pastoral duties at Bury, where he lived for some time in such retirement, that when his friend Diodati came to England, he inquired in vain for the admirable B., whose merits were so well known at Venice. He had given up hopes of finding him, when one day he encountered him in the streets of London. In 1615, B. was presented to the living of Horingsheath, in Suffolk, where he remained twelve years. His retired life and his Calvinistic theology long hindered the recognition of his merits. At length, in 1627, he was unanimously elected provost of Trinity College, Dublin, to which the fame of his learning and piety had extended. He refused to undertake the charge till positively commanded by the king. At the end of two years, he was promoted to the united bishoprics of Kilmore and Ardlagh, the latter of which he resigned in the following year, 1630. He immediately set himself to reform the crying abuses that prevailed in his diocese, and with so happy a combination of wisdom, firmness, and charity, that even his enemies were constrained to do homage to his virtues. Among his other remarkable acts, he removed his lay-chancellor, and took upon himself the ancient episcopal jurisdiction of hearing and deciding causes. The chancellor obtained a decree against him in Chancery, with costs, but was so impressed with the superiority of the bishop's services to his own, that he dropped his claim, and even appointed a surrogate, with orders to pay implicit obedience to the authority of the bishop. The translation of the Old Testament into Irish was accomplished under B.'s direction (the New had been already translated), as well as of some of the homilies of Chrysostom and Leo on the reading of the Scriptures. On the breaking out of the rebellion in 1641, his popularity for some time saved his family from violence, his being the only English house in the county of Cavan that was spared. At length, on his refusal to dismiss his flock, he was seized, and imprisoned in the castle of Cloughboughter. Thence he was removed to the house of a Protestant clergyman, where he continued to minister officially till his death, at the end of a few weeks, February 7, 1612, in the seventy-first year of his age. The rebels followed his body to the grave in the churchyard of Kilmore. Besides some other works, B. translated the last two books of Father Paul's *History*. His life was written by Burnet.

BEDFORD (Saxon, *Bedanford*, town of the ford), the chief town of Bedfordshire, is situated on the Ouse (which is navigable thence to the sea, a distance of 74 miles), about 63 miles north-north-west of London by rail, and in the midst of a broad expanse of rich pasture, wheat, and barley lands.

The town is clean and well paved, but the drainage is very defective. The number of charitable and educational institutions is remarkable. These are mostly due to Sir W. Harpur, alderman of London, in 1561, who founded a free school in B., and endowed it with 13 acres of land near the town. The enormous increase in the value of the property (from £150 to £14,000 or upwards a year) enables the trustees to maintain a free grammar school, commercial, preparatory, girls', and infant schools, a hospital for poor children, and 65 alms-houses, besides expending considerable sums of money in marriage-portions, apprentice-fees, donations, &c. Much of the charity is under the control of popularly elected trustees. The social effects of so extensive a system of eleemosynary aid are found to be deeply injurious, and the time wasted in public and private debates on the distribution of the funds is almost incredible. Party-spirit divides the inhabitants into the 'B-born' and the 'squatters,' or recent settlers, who are regarded by the more intolerant of the old inhabitants as intruders on their native preserves. The 'educational' and 'eleemosynary' factions also divide the government of the charity—the latter being an overwhelming majority. Parliament has more than once been called in to regulate the distribution of the charity, which, notwithstanding its extent, owing to former bad management, is in debt. The only important manufacture of B. is that of iron goods, especially agricultural implements. Lace-making and straw-plaiting employ many poor women and children. A considerable traffic in malt, timber, coals, and iron is maintained with Lynn Regis, by means of the Ouse. B. is of great antiquity, and is mentioned in the Saxon Chronicle under the name of Bedcanford, as the scene of a battle between the Britons and Saxons in 571. The Danes burnt it in 1010. Afterwards its old castle, said to be built by Edward the Elder, is frequently mentioned in history; there being, as Camden says, 'no storm of civil war that did not burst upon it' as long as it stood. B. has returned two members to parliament since 1295. Pop. 11,693. John Bunyan was born near Bedford. He dreamed his immortal dream in B. jail, and ministered to the Baptist congregation in Mill Lane from 1671 to his death in 1688. The inhabitants still hold his memory in deep veneration, and some relics of him are preserved. (1871—pop. 16,849.)

BEDFORD, DUKE OF. There have been two distinct dukedoms of B. That to be noticed here existed in the person of John Plantagenet, Regent of France, and third son of Henry IV. of England, who was born about 1359. During his father's lifetime, he was governor of Berwick-upon-Tweed, and warden of the Scottish marches. In 1414, the second year of his brother's reign, he was created Duke of B.; and he was made commander-in-chief of the forces in England while Henry V. was carrying on the war in France. After the death of Henry V. (1422), B., in accordance with the dying wish of the king, left the affairs of England in the hands of his brother Gloucester, and went to France to look after the interests of the infant prince, his nephew. The regency of France, in compliance with a request of his deceased brother, he offered to the Duke of Burgundy, who refused it; he then assumed it himself, but not without consulting Burgundy as to the best method of carrying out the treaty of Troyes, by which Charles VI. declared Henry V. next heir to the French crown. On the death of Charles VI., a few months after Henry V., B. had his nephew proclaimed king of France and England, as Henry VI. In the wars with the dauphin which followed, B. displayed great generalship, and defeated the

French in several battles—most disastrously at Verceil, in 1424. But, in consequence of the rather parsimonious way in which men and money were doled out to him from England, and the withdrawal of the forces of the Duke of Burgundy, he was unable to take full advantage of his victories. The appearance of Joan of Arc, notwithstanding the utmost energy of B., was followed by disaster to the English arms; and in 1435, B. was mortified by the treaty of peace negotiated at Rouen between Charles VII. and the Duke of Burgundy, which effectually ruined English interests in France. The death of the regent, which took place September 19, 1435, fourteen days before the ratification of the treaty, was mainly, if not altogether, occasioned by his anxiety and vexation on account of the union thus formed. B., who was a patron of letters, purchased and removed to London the Royal Library of Paris, consisting of 900 volumes. For the present family of B., see RUSSELL.

BEDFORD LEVEL, an extensive tract of flat land on the east coast of England, embracing nearly all the marshy district called the Fens. It extends inland around the Wash into the six counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk, and has an area of about 400,000 acres. Its inland boundary forms a horse-shoe of high lands, and reaches the towns of Brandon, Milton—3 miles north-north-east of Cambridge—Earith, Peterborough, and Bolingbroke. It is divided into three parts—the north level, between the rivers Welland and Nene; the middle, between the Nene and the Old Bedford River; and the south, extending to Stoke, Feltwell, and Mildenhall. It is intersected by many artificial channels, as well as by the lower parts of the rivers Nene, Cam, Ouse (Great and Little), Welland, Glen, Lark, and Stoke. It receives the waters of the whole or parts of nine counties. The substratum of the Fens is a stiff clay, called gault, a never tertiary deposit, on which rest earth, vegetable matter, silt, and water. This district seems to have been a great forest at the time of the invasion of the Romans, who cut the forest down; formed great embankments, to exclude the tide; and rendered the tract for a time a fertile inhabited region. The Emperor Severus, in the 3d c., made roads through it, one of which is now covered with two to five feet of water. In the 13th c., violent incursions of the sea stopped the outflow of the rivers, and it became a morass. The practicability of draining this extensive region seems to have been thought of as early as 1436, and many partial attempts were made after this. The first effectual effort was in 1634, when Francis, Earl of Bedford, after whom the district was thenceforth called, obtained, along with 13 others, a charter to drain the level, on condition of receiving 95,000 acres of the reclaimed land. The work was partially accomplished in 3 years, at the expense of £100,000; but was pronounced by the government to be inadequate. Charles I. tried to get the work, with a greatly increased premium, into his own hands; but the civil war stopped further progress. In 1649, parliament confirmed William, Earl of Bedford, in the rights granted to his father; and after a fresh outlay of £300,000, the contract was fulfilled. In 1688, a corporation was formed for the management of the level, which still exists. But only within the last 30 years has the drainage been rendered thoroughly efficient, by means of large and small drains and embankments. Although at great expense, a large tract of country has been redeemed from water, and is now converted into fertile pasture, grain, flax, and cole-seed lands. In some parts of the district, the annual increase of property is now equal to the purchase-money paid

for it 60 years ago. Steam-engines and wind-mills are now used to pump the water into the artificial channels.

BEDFORDSHIRE, a midland county of England, bounded N.E. by Huntingdon; E. by Cambridge; S.E. and S. by Hertford; S.W. and W. by Buckingham; and N.W. by Northampton. It stands 37th of the 40 English counties in size, and 36th in population. Extreme length, 31 miles; breadth, 25. Area, 463 square miles, five-sixths being arable, meadow, and pasture lands. The general surface is level, with gentle undulations. In the south, a range of chalk-hills, branching from the Chilterns, crosses B. in a north-east direction from Dunstable, and another parallel range runs from Ampthill to near the junction of the Ivel with the Ouse. Between the latter ridge and the north-west part of the county, where the land is also somewhat hilly, lies the corn vale of Bedford. No hill in B. much exceeds 900 feet in height. The chief rivers are the Ouse (running through the centre of the county, 17 miles in a direct line, but 45 by its windings), navigable to Bedford; and its tributary, the Ivel, navigable to Shefford. By these rivers, B. communicates with the counties of Cambridge, Huntingdon, and Norfolk. The south and south-east parts of the county consist of chalk, and the north and north-west of oolitic strata. Freestone is quarried, as well as chalk or clunch, to be burnt for lime. The soil varies greatly. In the south of the county, it is chalk thinly covered with earth, and fit only for sheep-walks; but three-fourths of the county is clay, which is very stiff between the Ivel and Ouse. A rich gravelly loam exists along the rivers. In the vale of Bedford, the soil is chiefly rich clay and deep loam; and to the north, the clay is stiff, poor, and wet. There are extensive market-gardens, especially on the rich deep loams. The chief crops are wheat and beans on the clayey land, barley and turnips on the chalk and sandy soil. B. is the most exclusively agricultural county in England. The principal proprietors are the Duke of Bedford, the Marquises of Tavistock and Bute, Earl de Grey, Lords Holland, Carteret, and St John. Little trade or manufacture exists in the county. Lace-making and straw-plaiting—for which Dunstable is celebrated—are the only branches of industry practised to any extent, and they are carried on almost entirely by women. B. is divided into 9 hundreds, and contains 10 market-towns, 124 parishes, and 6 poor-law unions. In 1851, pop. 124,478; schools, 227, with 13,003 scholars; places of worship, 327 (Church of England, 133; Methodists, 96; Baptists, 55). Two members of parliament are returned for the county of B., and two for the town of Bedford. Many British and Roman antiquities exist in B., as well as the ruins of several monasteries, and some fine relics of Anglo-Saxon, Early English, and Norman architecture among the parish churches. Three Roman ways once crossed the county, and several earthwork camps still remain.

BEDLAM, a popular corruption of Bethlehem, the name of a hospital for lunatics, in St George's Fields, London. It was originally founded in Bishopsgate Street Without, in 1246, by Simon Fitz-Mary, one of the sheriffs of London, as 'a priory of canons with brethren and sisters.' When the religious houses were suppressed by Henry VIII., the one in Bishopsgate Street fell into the possession of the corporation of London, who converted it into an asylum for 50 or 60 insane persons. In the year 1675, the hospital was taken down, and a new one, affording accommodation for about 150 patients, was erected in Moorfields, at a cost of about £17,000. In 1814, the hospital was again pulled

down, and the patients transferred to a new hospital in St George's Fields, erected for 198 patients; but in 1838 extended so as to accommodate 166 more. The building, with its grounds, now covers an area of 14 acres, and is lacking in nothing likely to insure the comfort or promote the recovery of patients. In former times, the management of B. was deplorable. The patients were exhibited to the public, like wild beasts in cages, at so much per head, and were treated and made sport of by visitors, as if they had been animals in a menagerie. The funds of the hospital not being sufficient to meet the expenditure, partially convalescent patients, with badges affixed to their arms, and known as Tom-o-Bedlams, or 'Bedlam Beggars,' were turned out to wander and beg in the streets. Edgar, in Shakspeare's *Lear*, assumes the character of one of these. This practice, however, appears to have been stopped before 1675; an advertisement in the *London Gazette* of that date, from the governors of B., cautions the public against giving alms to vagrants representing themselves as from the hospital, no permission to beg being at that time given to patients. Now, the moral and physical management of the patients is so excellent, that annually more than one half of their number are returned as cured.

BEDMAR, ALFONSO DE CUEVA, MARQUIS DE, was born in 1572. He has won an enduring notoriety on account of his daring and unscrupulous plot for the destruction of Venice, to which city he had been appointed ambassador from the court of Spain in 1607. It was a difficult office to fill, for Venice and Spain cherished most unfriendly feelings towards each other. B. probably conceived that he was acting a patriotic and justifiable part, in taking advantage of his position to play the spy and conspirator; but whether or not, his scheme was contrived with admirable ingenuity. He first leagued himself secretly with the Duke of Ossuna, viceroy of Naples, and Don Pedro of Toledo, governor of Milan, whom he made his confidants and coadjutors. He then purchased the services of a large number of foreign mercenaries, and scattered them through the city, to prevent suspicion. Ossuna furnished him with a band of semi-pirates, who were to enter the Venetian fleet, corrupt the sailors, and hinder operations in any way they could. The conspirators were to set fire to the arsenal of the republic, and seize all the important posts. At this precise moment, the Milanese troops were to appear at the extremity of the mainland, and those sailors who had been seduced from their allegiance were to convey them rapidly over to Venice. A Spanish fleet was to creep up the Adriatic, in order to assist if necessary. The city was then to be plundered and destroyed. The day chosen was that on which the doge wedded the Adriatic, when all Venice was intent on beholding the august ceremony. Fortunately, the night before the crime was to have been perpetrated, one of the conspirators betrayed the whole. Several persons were executed; but curiously enough, B., the arch-delinquent, was only dismissed. This has excited the scepticism of many writers as to the truth of the accusation; but the evidence in favour of the historic reality of the plot is generally held to be incontestable. The event forms the subject of Otway's popular and pathetic play, *Venice Preserved*. B. now went to Flanders, where he became president of the council, and, in 1622, was made a cardinal by the pope. He then went to Rome, and finally returned to Spain as Bishop of Oviedo, where he died in 1655. He is said to have been the author of a pamphlet published in 1612, directed against the liberties of Venice. It is entitled *Squittino della Liberta Veneta*.

BEDOS DE CELLOS, DON JEAN FRANÇOIS, a

Benedictine monk of the congregation of St Maur, and the most learned and practical master of the art of organ-building in the 18th c., whose work on the art is to the present day of the greatest importance. He was born about 1714 at Chau, and entered his order in 1726 at Toulouse, where he built several large and superior church-organs. He was elected a member of the Academy of Sciences in 1758; in 1770, he completed for the Academy his great work, *L'Art du Facteur d'Orgues*, in 4 vols., large folio, with 137 copperplates, beautifully executed. This work has never been translated into English, but the greater part of it has been translated into German. B. de C. died in 1797.

BEDSTRAW (*Galium*), a genus of plants belonging to the natural order *Rubiaceæ* (q. v.), and distinguished by a small wheel-shaped calyx, and a dry two-lobed fruit, each lobe containing a single seed. The leaves, as in the rest of the order, are whorled, and the flowers minute; but in many of the species the panicles are so large and many-flowered that they are amongst the ornaments of the banks and other situations in which they grow. The species are very numerous, natives chiefly of the colder parts of the northern hemisphere, or of mountainous regions within or near the tropics. About 16 species are found in Britain, some of them very common weeds. Amongst these is the **YELLOW B.** (*G. verum*)—sometimes called **CHEESE RENNET**, because it has the property of curdling milk, and is used for that purpose—a small plant with linear deflexed leaves and dense panicles of bright yellow flowers, very abundant on dry banks. The flowering tops, boiled in

Yellow Bedstraw (*Galium verum*).

a, top of stem, shewing leaves and flowers; b, c, two views of a flower.

alum, afford a dye of a bright yellow colour, much used in Iceland; and the Highlanders of Scotland have long been accustomed to employ the roots, and especially the bark of them, for dyeing yarn red. They are said to yield a red colour fully equal to that of madder, and the cultivation of the plant has been attempted in England. The roots of other species of the same genus possess similar properties.

as those of *G. tinctorium*, a species abundant in low marshy grounds in Canada; and those of *G. septentrionale*, another North American species, used by some of the Indian tribes. Like madder, they possess the property of imparting a red colour to the bones and milk of animals which feed upon them. Medicinal virtues have been ascribed to some of the species, as *G. rigidum* and *G. Mollugo*, which have been extolled as useful in epilepsy.—The roasted seeds of some, as *G. Aparine*, the troublesome *Goose-grass*, or *Cleavers*, of our hedges—remarkable for the hooked prickles of its stem, leaves, and fruit—have been recommended as a substitute for coffee; but it does not appear that they contain any principle analogous to caffeine. This plant is a native of the northern parts equally of Europe, Asia, and America. Its expressed juice is in some countries a popular remedy for cutaneous disorders.—The roots of *G. tuberosum* are farinaceous, and it is cultivated in China for food.—The name B. is supposed to be derived from the ancient employment of some of the species, the herbage of which is soft and fine, for strewing beds.

BEDUINS (Arabic, *Belawi*, i. e., 'dwellers in the desert') are Arabs who lead a nomadic life, and are generally regarded, according to tradition, as the descendants of Ishmael, and the aborigines of Arabia. The most ancient notices found in Scripture agree, in their descriptions of the manners and customs of the B., with the facts of the present time. As nomads, the Beduin Arabs have no united history, but only a collection of genealogies. They have but seldom appeared as a united people, taking a prominent part in the world's politics, and have never been entirely held in subjection by any foreign power. The desert of Arabia, especially the plateau of Nedjid, is their central place of abode; but, even in ancient times, they had spread themselves over the deserts of Egypt and Syria; and in later times, after the decay of ancient civilisation, they entered Syria, Mesopotamia, and Chaldaea. The conquest of Northern Africa, in the 7th c., opened up to them still vaster tracts, and they soon extended themselves over the Great Desert to the shores of the Atlantic Ocean. At present, they are to be found scattered over an immense breadth of territory—viz.,

Beduins stripping a traveller.

from the western boundary of Persia to the Atlantic, and from the mountains of Kurdistan to the negro countries of Sudan. In the cultivated lands of Mesopotamia, Chaldaea, the Syrian confines, Barbary, Nubia, and the north of Sudan, the Arabs are found intermingled with other nations; but in the deserts they have maintained their distinct character and independence. The characteristics of the B., as herdsmen and robbers in the desert, are intimately connected with the nature of their habitation. Their abstinent, precarious, and often solitary mode of life, makes them disposed to exercise mutual hospitality; but their independence, love of liberty, and other good qualities, are associated with violent passions and an infamous love of plunder, which is utterly reckless of the rights of property. They are generally well-made men, lean, sinewy, and active; but, on account of frequent hardships and privations, are commonly below middle stature. Their senses, especially sight, are keen, and their carriage is free and independent. The nose is commonly aquiline, the face rather lengthened, and the eyes are well shaped and expressive of both daring and cunning. In

complexion, they have various shades of brown. With the exception of certain tribes in Syria, all the B. are professedly Mohammedans, but by no means strict in the observance of their religious rites and duties. Their *Marabouts* (q. v.)—a class of ascetics—take the place of priests, and exercise considerable influence in all social and public affairs. As the Arabs have no settled government or policy, religious traditions and customs form the only bond of order and union among them. Though their intellectual powers are naturally good, they are miserably destitute of solid knowledge. Their endless tales and poetical effusions shew a wonderful activity of imagination and an oriental love of hyperbole. The relation of the sexes to each other is less constrained than among the settled peoples of the East, and a substitute for polygamy is found in a frequent interchange of wives. Their favourite pastimes are the chase, ball-play, dancing, songs, stories, and the *dolce far niente* (pleasant laziness) of drinking coffee and smoking narghiles. Their diet is principally derived from their herds, but includes a few vegetables, and even locusts and lizards. Honey is also a principal

luxury with all classes, and, moreover, one which has a religious sanction, for it was indulged in by Mohammed himself, who makes copious mention of it in the Koran. They manufacture their own woollen clothing, which consists of the *haikh*—a long, wide garment fastened on the head, and descending to the feet—and the *burnoose*, a large mantle. Only superior men wear breeches and linen or cotton shirts. The hair of the head is shaven, but the beard is a favourite object of cultivation. The political condition of the B. may be styled patriarchal. One or more families, the males of which bear the title of *sheik*, form the core of a tribe, and along with the marabouts, or priests, constitute a kind of aristocracy. Out of their number, the superior *sheik*, or *kaid*, is elected, who rules in patriarchal style over the whole tribe. This general sketch of the B. applies chiefly to the true nomads, or 'dwellers in the desert,' and is subject to several modifications with regard to tribes located in Barbary, Syria, and Mesopotamia, who practise agriculture, and dwell in houses.

BEDWIN, GREAT, a town of Wiltshire, on the Kennet and Avon Canal, and the Great Western Railway, 69 miles west-by-south of London. Pop. 2193. A fierce but indecisive battle occurred here in 674, between the kings of Mercia and Wessex. St Mary's Church was built in the beginning of the 14th c., and is constructed of flint, except the piers, arches, and dressings, which are of freestone. Jane Seymour, one of the queens of Henry VIII., and Dr Willis, an eminent physician of the 17th c., were born here. In the end of last century, the remains of a Roman villa were discovered, including tessere, bricks, a tessellated pavement, a huge leaden cistern, and the foundations of baths.

BEE, the common name of a very large family of insects, of the order *Hymenoptera* (q. v.), belonging to the section of that order called *Aculeata*, in which the females are furnished not with an ovipositor, but (usually) with a sting. Bees were all included by Linnæus in the genus *Apis* (Lat. for B.), but are now divided into many genera; and the name *Anthophila* (Gr. flower-loving) or *Melifera* (Lat. honey-bearing) is given to the family which they constitute. All bees in a perfect state feed exclusively or chiefly on saccharine juices, particularly the nectar or honey of flowers; and the ordinary food of their young, in the larva state, is the pollen of flowers, or a paste, often called B.-bread, composed of pollen and honey. They evidently perform a very important part in the economy of nature, in the fertilisation of flowers, which depends upon the contact of particles of the pollen with the stigma; and, as if to secure this object more perfectly, in their search for honey and pollen, they usually—some have perhaps too hastily said always—pass from flower to flower of the same kind, and not to flowers of different kinds indiscriminately. They abound in almost all parts of the world, but particularly in the warmer parts of it. Not fewer than 250 species are known as natives of Britain.

To enable them to reach their liquid food at the bottom of the tubes of flowers, and in the little receptacles in which it is produced, bees have certain parts of the mouth—the *maxille* and *labium* (see INSECTS), or lower jaws and lower lip, with their feelers (*palpi*)—elongated into a sort of proboscis; and the *ligula* is elongated, sometimes, as in the common Hive B., assuming the form of a filament, is capable of extension and retraction, and is folded up when not in use. This is the organ sometimes called the tongue of bees, although the name cannot be regarded as very appropriate, it being a part of the labium or lower lip. The other elongated parts

of the mouth serve as a sort of sheath for this organ, when it is folded up. It is not tubular, and employed in the manner of suction, as was at one time supposed, but is generally more or less hairy, so that the honey adheres to it as it is rolled and moved about, and is conveyed up through the mouth into the honey-bag, sometimes called the first stomach, an appropriate receptacle, in which it apparently undergoes some change—without, however, being subjected to any process analogous to digestion, and is ready to be given forth again by the mouth, according to the habits of those species of bees which are social, as food for the members of the community that remain at home in the nest, or to be stored up in cells for future provision. See HONEY. But the mouth of bees is also adapted for cutting and tearing, and to this purpose their mandibles or upper jaws are especially appropriated. Of these, some of them, as the common Humble B. (q. v.), make use to open their way into the tubes of flowers which are so deep and narrow that they cannot otherwise reach the nectar at the bottom. Others make use of their mandibles to cut out portions of leaves, or of the petals of flowers, to form or line their nests; the common Hive B. uses them in working with wax, in feeding larvæ with pollen, in cleaning out cells, in tearing to pieces old combs, in combats, and in all the great variety of purposes for which organs of prehension are required. But it is not by means of any of the organs connected with the mouth that bees collect and carry to their nests the supplies of pollen needful for their young. The feathered hairs with which their bodies are partially clothed, and particularly those with which their legs are furnished, serve for the purpose of collecting the pollen, which adheres to them, and it is brushed into a hollow on the outer surface of the first joint of the tarsus of each of the hinder pair of legs, this joint being therefore very large, compressed, and of a square or triangular form—a conformation to which nothing similar is found in any other family of insects. It is also worthy of observation, that in the social species of bees, the males and the queens, which are never to be employed in collecting pollen, do not exhibit this conformation adapted to it, but only the sexually imperfect females, commonly called neuters or workers.

Bees, like other hymenopterous insects, are extremely well provided with organs of sight, and evidently possess that sense in very great perfection. In the front of the head, they have two large eyes, the surface of each consisting of many hexagonal plates, which perhaps may not unaptly be likened to the object-glasses of so many telescopes; and the faculty which these insects certainly possess, of returning in a direct line to their hive or nest, from the utmost distance of their wanderings, has been with greatest probability ascribed to their power of sight. But besides these large eyes, they have, like the rest of the hymenopterous order, three small eyes on the very top of the head, which are supposed to be intended to give a defensive vision upwards from the cups of flowers.—They are evidently, however, possessed of organs which enable them to guide their movements in the dark as accurately as in the full light of day, at least within the nest or hive; and this power is generally ascribed to the *antenne* (q. v.), which are sometimes supposed to be not merely delicate organs of touch, but also organs of hearing, or of some special sense unknown to us. It is certain that the social bees have some means of communicating with each other by means of their antennæ; and that they avail themselves of these organs both for their ordinary operations, for recognition of each other, and for what may be called the conduct

of the affairs of the hive. There can be no doubt that bees possess in a very high degree the sense of smell; and their possession of the senses of taste and hearing is almost equally unquestionable, whatever difficulty there may be in determining the particular organs of the latter sense.—The wings of bees, like those of other hymenopterous insects, are four in number; thin and membranaceous; the hinder pair always smaller than the others; and in flight, attached to them by a number of small hooks, so that the four wings move as if they were two.

The sting of bees is a very remarkable organ. It consists of two long darts, with a protecting sheath. A venom bag is connected with it, and powerful muscles for its propulsion. The wound appears to be first made by the sheath, along which the poison

Bee Sting, highly magnified.

A, sting of bee; S, sheath of sting; F, end of sting, greatly magnified, showing six barbs curved upwards; B, glands for secreting poison; C, ducts through which it flows to D, where it is kept ready for use; O, circular dilatation to prevent sting being thrust too far out of sheath.

passes by a groove; and the darts thrust out afterwards in succession, deepen the wound. The darts are each furnished with a number of barbs, which render it so difficult to withdraw them quickly, that bees often lose their lives by the injury which they sustain in the effort.—The males are destitute of sting.

The great family of bees is divided into two principal sections called *Andrenetæ* and *Apiariæ*, or *Andrenidæ* and *Apidæ*; the latter names, however, being sometimes employed in senses more restricted. In the first of these sections, the *ligula* is comparatively short and broad; in the second, it is lengthened, and has the form of a filament. All the *Andrenetæ* live solitarily, as well as several subdivisions of the *Apiariæ*. These solitary bees do not lay up stores for their own winter subsistence; but they display very wonderful and various instincts in the habitations which they construct and the provision which they make for their young. There are among them males and perfect females only, and no neuters. The work of preparing nests and providing food for the young seems, in all of the species, to be performed exclusively by the females. *Colletes succincta*, a common British species of the *Andrenetæ*, affords an example of a mode of nest-making, which, with various modifications, is common to many species of that section. The parent B. excavates a cylindrical hole in the earth, usually horizontal, to the depth of about two inches, in a dry bank or a wall of stones and earth. The sides of this hole are compacted by

means of a sort of gelatinous liquid, secreted by the insect, and it is occupied with cells, formed of a transparent and delicate membrane, the substance of which is the same secretion in a dried state. The cells are thimble-shaped, fitting into each other, a little space being left at the furthest end of each for the reception of an egg and a little paste of pollen and honey. The last cell being completed, and its proper contents deposited in it, the mouth of the whole is carefully stopped up with earth.—Some of the solitary bees, possessing great strength of mandibles, excavate their nests in old wood. *Xylocopa violacea*, one of the *Apiariæ*, not uncommon in some parts of Europe, makes a tunnel not less than twelve or fifteen inches long, and half an inch wide, which is divided into ten or twelve cells; an egg with store of pollen and honey is deposited in each compartment, and as the lowest egg is hatched first, a second orifice is provided at that part of the tunnel, through which each of the young ones in succession comes forth to the light of day, each larva, as it is about to change into the pupa state, placing itself with its head downwards in the cell.—Numerous species of solitary bees excavate their tunnel-shaped nests in the soft pith of decayed briars or brambles, of the particles of which they also form their cells.—Some species of *Megachile*, *Osmia*, &c., line them and divide them into cells with portions of leaves or of the petals of flowers. See LEAF-CUTTER BEE. Some of the solitary bees make their nests, not in the earth, but in cavities of decaying trees, or other such situations, where they construct their cells without the same necessity of excavation; but some of them, by a very admirable instinct, surround their nest with down collected from the leaves of plants, an excellent non-conductor of heat, so that a nearly uniform temperature is maintained in situations in which the changes would otherwise be great and rapid. Some bees make their little nests in old oak-galls, and there are species which appropriate empty snail-shells to that use.—Some species of the genus *Megachile* build their nests of a sort of mason-work of grains of sand glued together with their viscid saliva. The nest of *M. muraria*, thus constructed, is so hard as not to be easily penetrated by a knife, and very much resembles a splash of mud upon a wall.

The social bees live in communities like those of ants, which also, like theirs, consist of males, females, and neuters—these last being females with ovaries imperfectly developed, and characterised by peculiarities of form and structure, as well as of instinct and employments, remarkably different from those of the perfect females. The social bees are conveniently divided into Humble Bees (q. v.) and Honey Bees, of the latter of which the common Hive B. (see the next section of this article) may be regarded as the type. Before proceeding to a more particular account of the Hive B., it may be proper to remark that the species of Honey B. (the restricted genus *Apis*) are not few, and that they are natives of the warm parts of the Old World; the Hive bees (*Apis mellifica*) which now abound in some parts of America, and which have become naturalised in the forests to a considerable distance beyond the abodes of civilised men, being the progeny of those which were conveyed from Europe. The Hive B. is said not to have been found to the west of the Mississippi before 1797, but in fourteen years it had advanced 600 miles further in that direction. The different species of Honey B. in a wild state generally make their nests in hollow trees, or among the branches of trees, sometimes under ledges or in clefts of rocks; and their stores of honey are not only sought after by man, but afford food to

numerous animals, some of which equally delight to prey upon their larvæ. The B. was amongst the ancient Egyptians the hieroglyphical emblem of royalty. The B. domesticated or cultivated in Egypt, is not, however, our common Hive B., but another species called *Apis fasciata*; and in Italy and Greece a species called *A. Ligustica* is employed, which has been recently introduced into England, and is now domesticated at the B.-house of the Apiarian Society, Muswell Hill, near London. These species differ little from the common Hive B., and their honey is very similar; but that of some species is considerably different. *A. unicolor*, of Madagascar and the Isle of France, yields an esteemed honey of a green colour. It is domesticated, or is the object of human care and attention there, as are also *A. Indica* in some parts of India, and *A. Adansonii* in Senegal. We regret that our limits do not permit us to give a particular account of any of these species.—The genus *Melipona* is nearly allied to *Apis*. The species are natives of South America, and their honey is extremely sweet and agreeable, but very liquid, and apt to ferment. They make their nests in the cavities or on the tops of trees.

The Hive Bee.—Natural History.—The instincts and social economy of the HIVE B. (*Apis mellifica*) have been studied with great attention both in ancient and modern times, and discoveries—than which, perhaps, nature presents nothing more interesting and wonderful—have rewarded the patient observations of Huber and others who have devoted themselves to this subject. *Apiarian societies* have been formed for the purpose of prosecuting this single branch of natural history, and of promoting successful apiculture, or the economical keeping of bees.

The Hive B. is probably not a native of Britain, and may even have been brought to Europe from the East. Its communities seem ordinarily to number from 10,000 to 60,000 individuals, and there appears no reason to think that the care bestowed upon the insect by man, or the *hives* which he has provided for it, have made any important difference in this respect. One member of each community is a perfect female—the queen or mother B.; from 600 to 2000 at certain seasons are males; and the remainder are *neuters* or workers, the real nature of which has been explained in the previous part of this article.

The workers have a body about half an inch in length, and about one-sixth of an inch in greatest breadth, at the upper part of the abdomen. The antennæ are twelve-jointed, and terminate in a knob. The abdomen consists of six joints or rings, and under the scaly coverings of the four middle ones are situated the *wax-pockets* or organs for the secretion of wax. The extremity of the abdomen is provided with a sting, which is straight. The basal joint of the hind tarsi is dilated to form a pollen-basket, and the legs are well provided with hairs for collecting the pollen and brushing it into this receptacle.—The males or *drones*, so called from the peculiar noise which they make in their flight, are much larger than the neuters, and thicker in proportion. The antennæ have an additional joint. The eyes are remarkably large, and meet upon the crown.—The perfect females are considerably longer than either the workers or males; they are also distinguished by the yellow tint of the under part of the body, and very remarkably differ from all the other inmates of the hive in the shortness of their wings, which, instead of reaching to the extremity of the abdomen, leave some of its rings uncovered.—Neither males nor queens have wax-pockets, nor have they pollen-

baskets. Their legs also are less hairy. The sting of the queen B. is curved. The mandibles both of the males and perfect females are notched or

Bees.

1, queen; 2, drone; 3, neuter.

toothed beneath the tip, which those of the workers are not.—It will be seen from this brief description that the sexes differ so widely as to appear, if the contrary were not well known, insects of different species; but still more remarkable is the difference between the females and the workers when we consider that it is all to be ascribed to the different forms of the cells in which the eggs are hatched and the young bees reared, and to the different kinds of food with which they are supplied. All doubt upon this point is removed by the interesting discovery of Schirach, that when a hive is deprived of its queen, the bees provide themselves with another, if there are eggs or very young larvae in the cells appropriated to the breeding of workers; proceeding immediately to transform, for this purpose, one of these cells, and sacrificing, without scruple, the eggs or larvae in the cells adjoining that selected for transformation and enlargement. These are facts well ascertained, but of which science has yet been unable to give any explanation.

The greater part of the life of the queen or mother B. is spent in laying eggs for the increase of the population of the hive; and this increase goes on at a rapid rate, as the queen not infrequently lays 300 eggs in a day. The number, however, varies greatly. In cold weather it is very small, but the invariable presence of brood in different stages, in a well-stocked hive, proves that some eggs are laid even in winter. During the later spring months the number is very great; many practical apiarians considering that as many as 1000, or even 2000, are deposited daily. The community, however, is not destined to an indefinite increase; but in certain circumstances, *swarming* takes place, and new colonies are founded.

The impregnation of the queen takes place in the air, and usually within a few days after she herself has emerged from the cell. It is the only occasion of her ever leaving the hive, except that of swarming, and there is no repetition of it during her whole life. The question has therefore been asked, why there are so many males in a B. community; but no very satisfactory answer has been given to it. The males are not known to fulfil any other purpose than that of the propagation of their species; and after the swarming season is over, the greater part of them are ruthlessly massacred by the workers, as if in dread of their consuming too much of the common store. The greater part of the workers themselves are supposed scarcely to live for a year; the duration of the life of queen bees is often more than three years.

The queen B., when about to begin to lay eggs, is the object of great attention on the part of the workers, and so continues. She moves about in the hive, attended by a sort of retinue of about ten or fifteen workers, by some of which she is frequently supplied with honey. But the name of queen B. appears to have originated in a mistaken notion that something analogous to a monarchy subsists in the B.-hive; and imagination being permitted very free scope, many things have been invested with a false colouring derived from this analogy. The queen or mother B. appears to be the object of particular regard, as indispensable to the objects for which the B. community subsists, and to which the instincts of all its members are variously directed. She moves about, depositing her eggs in the cells which the workers have prepared, and they are ready to take charge of each egg from the moment that it is deposited. Her employment requires that she should be fed with food collected by others, and many of the workers are in like manner supplied with food whilst busy within the hive, as well as the larvæ in the cells; but there is no evidence whatever of anything like authority exercised by the queen, or, indeed, of any superiority of one over another in the whole multitude.

The queen B. at first lays eggs which give birth to workers, and afterwards there takes place a laying of eggs which become drones. With unerring instinct, she places each egg in the kind of cell appropriate to it; whilst also, at the proper time, cells of the proper kind are prepared beforehand by the workers, the drones' cells being larger than the workers' cells. The cells in which future queens are to be reared are very unlike all the others, but the eggs differ in no respect from those deposited in workers' cells. It is a curious circumstance, that queens, of which the fecundation has been prevented till they are considerably older than usual, lay only drone eggs. It occasionally also happens that some of the worker bees lay eggs, and these invariably produce drones.

The eggs of bees are of a long shape and bluish-white colour, about one-twelfth of an inch in length. They are hatched in about three days. The larvæ are little worm-like creatures, having no feet, and lying coiled up like a ring: they are diligently fed

is speedily cleaned out, and prepared for the reception of another egg or of honey. The fine silken envelope of the pupa, however, remains attached to the cell, of which the capacity thus becomes gradually smaller, until the cells of old combs are too small to receive eggs, and can be used for honey alone, a fact of which the importance in relation to the economical management of bees is obvious.—The spinneret, by means of which the larva spins the cocoon, is a small organ connected with the mouth.—The food with which the larvæ are supplied is a mixture of pollen, honey, and water, with the addition, possibly, of some secretion from the stomachs of the working bees, in which it is prepared. It varies a little, according to the age and kind of the larva, and the peculiarities of that given to young queens appear to be indispensable to their fitness for their future functions. Pollen is constantly found stored up in the cells of the hive, and is often called B.-bread. Most people have met with such cells in honey-comb, and have observed the bitter and peculiar taste of the contents.

The combs of a bee-hive are parallel to each other, forming vertical strata of about an inch in thickness, and distant about half an inch from each other. The cells are therefore nearly horizontal, having a slight and somewhat variable dip towards the centre of each comb. The central comb is generally first begun, and next after it those next to it on each side. Circumstances frequently cause some departure from this uniform and symmetrical plan, which, however, still remains obvious. Each comb consists of two sets of cells, one on each side; and it may be mentioned as an illustration of the wonderful industry of bees, and the results of their combined labours, that a piece of comb, 14 inches long by 7 inches wide, and containing about 4000 cells, has been frequently constructed in 24 hours. The greater part of the comb usually consists of the kind of cells fitted for breeding workers, a smaller part of it of the larger or drone cells. After the principal breeding-season is over, the cells of some parts of the comb are often elongated for the reception of honey; and sometimes comb of greater thickness, or with unusually long cells, is constructed for that purpose alone, in which case the mouths of the cells are inclined upwards, more than is usual with the ordinary brood cells. When a cell has been completely filled with honey, its mouth is *sealed* or covered with wax.

It is impossible to look at a piece of comb taken from a B.-hive, without admiring, not only its beauty, but the perfect regularity of the size, form, and arrangement of the cells; and the more carefully that it is examined, the more must it be admired. For in it are practically solved, by an instinct which can only be referred to the infinite wisdom of the Creator, some problems difficult to human science, particularly in the combination of the greatest economy of materials and of space, with the most perfect convenience and the greatest strength. It appears even at a glance, that the cells are hexagonal or six-sided, the hexagons perfectly regular, and in this way there are no interstices between the cells. Now, the mathematician knows that there are only three regular figures, that is, figures of which all the sides and angles are equal, bounded by straight lines, with which a space can be perfectly filled up in this way—the equilateral triangle, the square, and the hexagon; and of these the hexagon is at once the most suitable for the larva of the B. in its form, and the strongest in its nearest approach to the circle. The circular form itself would have left large interstices. But this is not all: the same wisdom which has given the solitary bees, already noticed, their instinct to surround their nest with a cottony substance, which

Egg, Larva, and Pupa of Hive Bee.

a, egg, and very young larva; b, young larva coiled up at the bottom of the cell; c, larva when ready to undergo metamorphosis; d, pupa.

by the working bees, until, in about five days, when large enough nearly to fill the cell, they refuse food, upon which the attendant bees seal up the cell with wax, and the larva, spinning itself a fine silken envelope or cocoon, is transformed into a pupa; and about the eighteenth day—or, in the case of drones, the twenty-fourth day—from the deposition of the egg, the young B., in its perfect state, breaks the covering, and issues from the cell. It is caressed and supplied with food by the attendant bees, and is believed not to try its wings until the following day. The cell from which a young B. has issued

serves as a non-conductor of heat, has directed the hive B. to the constant adoption of a mode of constructing its combs, which adds greatly to the strength they would have possessed with the same amount of materials, if the cells had been merely regular hexagonal prisms, and the partition in the

Pyramidal bottoms
of Cells.

middle of the comb, between the cells of the one side of it, and those of the other, therefore a simple plane. It is so far from being so, that when carefully examined, it appears, if the expression may be used, the most ingenious part of the whole structure. It is composed of a multitude of little rhombs, or four-sided figures, with equal and parallel sides, and two obtuse and two acute angles, the obtuse angles being invariably angles of $109^{\circ} 28'$, and the acute angles of $70^{\circ} 32'$, agreeing precisely with the results of mathematical analysis, applied to the difficult question of the form of the facets of a three-sided pyramid, which should terminate a six-sided prism, so as to combine the greatest economy of materials with the greatest strength. On looking at a piece of empty honey-comb, placed between the eye and the light, we readily perceive that the cells are not opposite to each other, cell to cell; but that the point of meeting of three sides of three cells, on one side, is opposite to the centre of a cell on the other side—a circumstance which of itself we cannot but regard as calculated greatly to increase the strength of the whole fabric. It follows also from this, that the terminating pyramids of the cells on the one side do not interfere with the form of the cells on the other side, but the three rhombic facets, which terminate each cell, belong likewise to three distinct cells on the opposite side of the comb.

The only departure from perfect regularity in the form of the cells, is in the transition from the smaller or workers' cells to the larger or drones' cells, which, when it takes place, is managed with great simplicity and beauty of contrivance. Our limits, however, do not permit us to enter further into this subject.

The material of which the cells are built is chiefly wax (q. v., and see BEES-WAX), which is at first of a white colour, but becomes brownish-yellow with age, and in very old combs, almost black. Although wax exists as a vegetable product, yet bees-wax is now known to be produced by a chemistry which is carried on in the bodies of bees; and it has been found that they produce wax and build combs when supplied only with honey or saccharine substances. The *wax-pockets* in the abdomen of working-bees have been already referred to. The bees which are about to proceed to wax-making, suspend themselves in clusters in the hive, attaching themselves to each other by means of hooks with which their feet are provided; and whilst they remain motionless in this position, the wax appears to be formed, in small scales, which they afterwards take in their mouths and curiously work up with a secretion from the mouth itself, passing the wax, in the form of a minute riband, through the mouth, first in one direction and then in the opposite one, and finally depositing it in its proper place for the foundation of the comb. One B. always begins the comb alone, the rest, in gradually increasing numbers, proceed in accordance with what has been already done. The bees which elaborate and deposit the wax, do not, however, construct the cells, which is done by others, partly at least by a process of excavation in

the wax deposited. It is supposed by many naturalists, that some of the working-bees are exclusively wax-workers, some nurses, &c.; but others think that there is only one class of working-bees, all ready for any kind of work according to circumstances.

But wax, although the chief, is not the only material of the combs. *Propolis* (q. v.) is also employed in small bands to give greater strength to the cells, the mouths of which are surrounded with it, and made thicker than their walls. This substance, which is obtained by bees from the viscid buds of trees, is also employed for more firmly attaching the combs to the hive, for closing up apertures in the hive, for covering up obnoxious substances, intruding slugs, &c., which are too large to be removed, and for a variety of similar purposes.

It has been already stated that queen-bees are hatched and reared in cells different from the rest. They are, indeed, very different, being vertical and not horizontal in their position—not hexagonal, but rather oval in form—and much larger than the other cells, even in proportion to the size of the animal that is to inhabit them: they are generally placed on the edge of a comb, and when they have served their purpose, are partially removed, so that during winter they resemble acorn-cups in appearance.

Two queens cannot exist in the community together. There is implanted in them the most deadly rivalry; and the mother-B., if permitted, would even tear open every queen cell of which the inmate has nearly approached maturity, and inflict death by her sting. One of those wonderful instincts, however, with which bees are endowed, counteracts this at those times when, upon account of the increased numbers of the community, and in order to the formation of new colonies, it is requisite that it should be counteracted. The workers throng around the queen, hem her in, and prevent the execution of her purpose. The cell of the young queen is also carefully guarded, and she is not permitted to leave it. At such times peculiar sounds, produced probably by the action of the wings, are emitted both by the actual queen under restraint in her movements, and by the young one in the cell, which may be heard by an ear applied to the outside of the hive, and are familiar to B. cultivators as one of the surest signs of swarming. The queen now becomes restless; her agitation communicates itself to those around her, and extends through the hive; the ordinary work of the community is in great part neglected; fewer bees than usual are seen to leave or return to the hive; and at last the queen-B. rushes forth, preceded and followed by crowds which press and throng upon each other, form a buzzing cloud in the air, and very generally settle upon a bush in the neighbourhood, where they soon congregate closely together, hanging by their claws in a dense cluster. Sometimes they rise up in the air, and fly off at once to a considerable distance, apparently to some previously selected place in the thick top of a tree—in the chimney or roof of a house, where they happen to find an aperture—or in some such situation. More frequently, they settle not far from the hive which they have left, often on some very humble plant, or even on the grass, and soon rise again. It is the care of the cultivator to prevent this by providing them immediately with a suitable habitation in a new hive, invitingly placed above them, or into which he puts the swarm after they have congregated closely together as above described. It sometimes happens that bees hurry out of their hive without their queen, in which case they do not in general congregate so closely together

where they settle, and soon return to the hive again. Swarming generally takes place in a fine day; and when the bees seem on the very point of coming off, a cloud passing over the sun is enough to retard it. Bad weather occasionally not only retards but prevents it, the young queens being at last killed in their cells.—When the first swarm of the season has left the hive with the old queen, as is usually, if not always the case, the imprisoned young queen is set at liberty; and if the B. community is a large and prosperous one, other young queens also come forth from their cells, and leave the hive with successive swarms, the number of which depends upon the climate, the season, &c. In Britain, it is not uncommon for a B.-hive to send off three swarms in a summer, the first being almost always the largest, and not infrequently itself sending off a swarm before the season is over.

Bees left without a queen, and with no means of supplying the want, appear to feel themselves out off from the very purpose of their existence; the labours of the community are relinquished, and its members are dispersed and die. It has already, however, been stated, that bees left without a queen can provide themselves with one, by transforming and enlarging a worker's cell which contains an egg or very young larva. This process is sometimes carried on as if by several distinct parties, in different parts of the hive at once; and as if aware that time will be gained, the bees generally prefer cells containing larvæ of two or three days old to those containing eggs.

Bees become partially torpid during cold weather, consuming much less food than they would otherwise require. They are readily aroused from this state, however, as may at any time be proved by tapping on a B.-hive, when it will be found that the temperature of the interior of the hive rises rapidly. Respiration is considerably lessened in the state of partial torpidity, and the temperature rises when it is resumed. The respiration of bees takes place by air-tubes or *trachea* (see INSECTS), and is very active when the insect is in a state of activity. The respiratory movements are easily seen in looking at a bee. The consumption of oxygen by this process might be expected soon to reduce the atmosphere within a hive to a state in which it could no longer support animal life; but in summer, when respiration is active and the hive populous, a constant circulation of air is maintained by the insects themselves, some of which are employed in a rapid vibration of their wings for this purpose. A greater or smaller number of them, according to circumstances, may frequently be seen thus engaged in fanning the air at the mouth of a bee-hive.

It may well be deemed an extraordinary fact, that among the enemies of bees are to be reckoned certain species of moth, which, notwithstanding the danger of the stings of the bees, enter the hives and deposit their eggs. After the eggs are hatched, the larvæ feed upon the combs. Mice sometimes eat their way into the hives in winter, and destroy and plunder unmolested.

Bees are sometimes very destructive to each other in their combats, as when one B. community is assailed by others for the purpose of plunder. To this the weaker communities are liable, particularly when flowers are few, and bees are awakened to full activity in the warm days of early spring. The narrower that the entrances of bee-hives are at this season, at least of the less populous hives, the less likely is the B. owner to suffer loss from this cause, as the narrow entrance is more easily defended even against very numerous invaders.

Management of Bees.—We do not think it necessary to enter largely into the subject of *Apiculture*—the cultivation or management of bees.

It is, of course, necessary that the *apiary* or stock of B.-hives should be situated in a neighbourhood where flowers sufficiently abound for the supply of honey. It is, however, by no means certain to what distance bees roam. Some authors mention one mile as the probable distance; but the opinion has apparently been hazarded on mere conjecture, and there seem to be good reasons for supposing that a much greater distance might more correctly be named. But whatever distance bees may be capable of travelling in quest of honey, it is undoubtedly of great importance that they should have good feeding-ground in the immediate neighbourhood of the apiary; and in many parts of the world, the practice prevails of removing them from place to place, according to the season, in order that advantage may be taken of the greatest abundance of flowers. Thus in the south of Scotland, B.-hives are very frequently removed to heath-covered tracts in the beginning of August, and remain there till the heath is out of flower; and this affords in many parts of the country the most plentiful honey-harvest, although in other parts, especially where white clover abounds, the greatest quantity of honey is obtained earlier in summer. The difference between *Heather Honey* and *Flower Honey* is well known in Edinburgh. No small number of B.-hives from that city and its immediate vicinity are annually conveyed for a few weeks to the Pentland Hills. The conveyance of bees 'to the heather' is generally accomplished either by a handbarrow or a spring-cart of easy motion, so that the combs may not be displaced by shaking; and the mouth of the hive is carefully closed with a plate of perforated zinc, or other contrivance for keeping in the bees and permitting circulation of air. Fifty or one hundred B.-hives may often be seen collected in one place, and under the care of one person, during the heather-season.—In Egypt, far greater numbers of hives (of *Apis fasciata*) are often kept in a single vessel on the Nile, and are conveyed from place to place on the river, according to the succession of flowers in the different districts. A somewhat similar practice prevails on the Rhone; and the transporting of bees (*Apis Ligustica*) from pasture to pasture has been usual in Greece, in Asia Minor, and in Persia, from remote antiquity.

As to the form of B.-hives, and the material of which they should be made, there are great differences both of opinion and practice. Glass hives, and hives with glass-windows, which can be covered at pleasure with wooden slides, are employed by those who wish to observe the movements and habits of bees; but for profitable purposes, wood and straw are in Britain the only materials in common use. A simple and useful form of a capped hive is shewn in the accompanying illustration. For the material of a hive, wood has the advantage over straw in its greater neatness and durability; but there is a disadvantage in the greater likelihood that, unless shaded from the sun, portions of the comb may be so much melted as to fall in hot weather. In some parts of Europe, cylindrical cork-hives are much used, made by removing the wood of a portion of the cork-tree, and leaving the bark uninjured; and hives of earthenware are common in Greece and Turkey. The form of hives is of little consequence; but it is important that the owner should have facilities for giving increased room both above and below the stock-hive: increased room above is required for the reception of pure honey-comb unmixed with brood, and the capability of adding to the hive below, by raising it up an additional story, is often requisite to prevent swarming, which

is incompatible with the collection of a large store of surplus honey.

Bees require attention at the time of swarming,

Simple form of Bee-hive,
With cap removed to shew glass top.

that they may not fly away and be lost. They require also to be fed during winter, when, on account of a bad season, the lateness of the swarm, or other cause, they have not enough of honey to support them. A common rule is, that the weight of the contents of the hive must be at least twenty pounds, that the bees may survive the winter without being fed; and even in this case a supply of food for a short time in spring promotes the activity of the bees, and their summer prosperity. The food ordinarily supplied to bees is either the coarser kind of honey, or sugar and water. Strong ale and sugar boiled are also frequently given as food. The practice has very largely prevailed in Britain and elsewhere, of killing bees by fumes of sulphur, in order to take from them their honey in the end of autumn, a portion only of the increase of the stock being kept through the winter. This practice still has its advocates; but many now take only what they can by top boxes or *supers*, or by cutting out combs, preserving all hives which are not so light that there is no good hope of their surviving the winter. It may be doubted if, in almost any part of the country, the number of bees kept is so great as nearly to exhaust the floral resources, and in all probability this may yet become a much greater source of wealth than it is in Britain.

When honey is to be taken from bees, the person doing it must be carefully protected from their stings by gloves, veil, &c. It is best done during the heat of a fine day, when the bees more readily leave the combs of the *super* that is taken away, and return to their hive. A little gentle tapping generally causes them to leave the combs, and a feather is used for brushing off these which are slow to do so. The smoke of the common Puff-ball (q. v.) causes them to fall down in a stupefaction from which they speedily recover, and its use is very convenient. It is gathered and dried for the purpose. Chloroform is also sometimes used for the same purpose, but the effect is apt to be fatal, unless care is taken to choose the morning of a fine day, so that the stupified bees may have time to recover in the air and sunshine.

Bees are much less apt to sting when swarming

than at other times, and in general all the necessary operations are performed without gloves or veil, and with perfect safety. The sting of a B. is to many persons a thing of no great consequence, although, in some, it causes great local inflammation and swelling, and general derangement of health. The application of a little ammonia usually relieves the pain, or an onion or shallot cut through the middle may be applied, and has the same effect.

The apiary should, if possible, be in a sheltered place, and where it enjoys a good amount of sunshine. The hives are very generally placed at small distances in the open ground, but some B.-keepers protect them by a shed. In the former case, each hive is usually covered with a straw-hood in winter, to keep away the rain, as damp is particularly injurious to bees. For the avoidance of damp, and to prevent the bees from coming in contact with the ground when they hang in a great cluster at the door of the hive—as they often do before swarming, when the weather is hot, and the hive very populous—each hive is raised to a height of at least fifteen or eighteen inches from the ground.

BEES, LAW RELATING TO. B. are stated by Blackstone to be wild by nature (*feræ nature*), but when hived and reclaimed, are regarded in the nature of *property* belonging to the person on whose ground or soil they have swarmed; and in support of this doctrine, he refers to the Charter of the Forest, 9 Henry III. c. 13, which allows every free-man to be entitled to the honey found within his own woods. The qualified property which may be thus held in B. continues while the swarm remains on the soil; and in the event of flight, so long as the owner can pursue it. Indeed, so clearly are they considered in law to be of the nature of property, that it has been decided in England that B. may be the subject of larceny (q. v.).

The same appears to be the Scotch law. Mr Erskine, who may be described as the Scottish Blackstone, founding on the Roman law, lays down that, when B. have abandoned their hive, not being observed and followed, they are understood to have recovered their original liberty; and if they light on the grounds of another, and are enclosed by him in a new hive, they become his property. See PROPERTY, OWNERSHIP, GROUND, SOIL.

BEE, HUMBLE. See HUMBLE BEE.

BEECH (*Fagus*), a genus of trees of the natural order *Cupulifera* (q. v.). The male catkins are almost globose, stalked, their flowers consisting of a bell-shaped 5-6-cleft perianth and 8-15 stamens. The female flowers, which grow on the same trees, consist chiefly of a germen with three awl-shaped styles, and are situated two or rarely three together within a stalked involucre, which bears on its outer surface many fleshy threads. This involucre, after the flowering is over, closes and forms a husk resembling a sort of capsule, which when ripe opens in four valves, is externally covered with soft spines, and encloses one or two (rarely three) triangular nuts, which bear the name of *Beechnuts*.—The species are not numerous; all of them are forest-trees of great beauty.—The COMMON B. (*F. sylvatica*) forms whole forests in many parts of Europe. It grows to a height of 100-120 feet, and a diameter of 4 feet; and particularly when standing alone becomes a very ornamental tree with far-spreading branches, which often droop gracefully almost to the ground. It has thin, ovate, obscurely toothed leaves, finely ciliated on their margins. Its bark is smooth, often of a whitish colour; and it is remarkable for the frequency with which hard wooden knobs—abortive branches—occur in its bark. Grass does not grow readily under the shade of the B., but

in *B.* woods may sometimes be found rare plants almost peculiar to such situations. The *B.* thrives best in light soils; and does not send its roots deep

Common Beech.

into the ground, but rather horizontally under the surface. The wood is more or less of a reddish-brown colour, as the tree has grown in a dense forest, or has been freely exposed to sun and air. It is very hard and solid, but brittle; and when exposed to the open air, very liable to rot and to be eaten by worms. It is therefore not adapted to the purposes of the house-carpenter; but when kept always under water, it is very durable, and is accordingly employed in the erection of mills, and for weirs, sluices, &c. It is also employed for many purposes by cabinet-makers and turners. It is very much used in France for making the *sabots* or wooden shoes of the peasantry, being preferred for this purpose to every other wood except walnut, on account of its property of not absorbing water. It is one of the best kinds of firewood in Europe. Its

Common Beech.

a, part of a branchlet with leaves and catkins, reduced; *b*, a single male flower; *c*, a single female flower.

ashes yield much potash and of excellent quality. The raspings of the wood are used in the preparation of vinegar. See VINEGAR and PYROLIGNEOUS ACID. The bark is sometimes employed for tanning when oak-bark is scarce. The *B.* bears lopping well, and is often planted for hedges; and it is a curious fact,

that when it is prevented from attaining a tree-like size, and is kept closely pruned, the withered leaves remain on the branches all winter, which is not the case in other circumstances. In some countries, as Dauphiny and Switzerland, the leaves of the *B.* are collected in autumn before they have been much frost-bitten, and are used for making beds or mattresses.—Beechmast, when fresh, has a sweet taste, like that of a walnut. It contains in large quantity a bland fixed oil, along with a starchy farina, a little sugar, and an astringent substance. A volatile, narcotic, poisonous principle, called *Fagine*, is also found in it, but more in the rind than in the kernel; and when not only the smooth leathery outer rind, but also the thin brown inner pellicle have been removed, it is wholesome food. It is, however, more generally used for feeding swine, poultry, &c., and is much employed in France and other parts of Europe for the manufacture of *Beech Oil*, which, when expressed without the application of heat, and well clarified, has an agreeable taste, is fit for use as food, and keeps long without becoming rancid. When less pure, it is used for lamps and in the arts. The oil-cake which remains is good food for poultry, for swine, and even for oxen, but is injurious to horses. Many manufacturers of cocoa adulterate it with beechmast, first depriving the cocoa of its oil, which they sell separately as cocoa-butter, and trusting to the oil of the *B.* for supplying its place.—*B.* forests anciently abounded in England, and great herds of swine were fed in them. The *B.* is not, in general, found in Europe north of lat. 59°, although it occurs two degrees further north in the Scandinavian peninsula. It is found in the temperate parts of Asia and in North America; the WHITE *B.* of that country being generally regarded as the same species, a very common tree in some parts of the United States. In gardens and pleasure-grounds a variety is very frequently to be seen, of which the leaves have a blood-red colour. The same colour appears also in some degree in the leaves of the RED *B.* of North America (*F. ferruginea*), which is distinguished by elongate-ovate, coarsely serrated, and much acuminate leaves. It forms extensive forests in the North-eastern States and the adjoining British possessions; and its wood, which is of a somewhat red or rusty colour, is more valued than that of the White *B.*—Two species of *B.* are found on the mountains of Java; four are natives of the more elevated parts of the south of New Zealand; several belong to the south of South America. The genus is, in fact, more characteristic of the colder latitudes of the southern than of the northern hemisphere. *F. betuloides* (also known as *F. Forsteri*) is the 'myrtle-tree' of the mountains of Tasmania—a very large tree with evergreen leathery leaves, in form much resembling those of the birch, although the general habit of the tree agrees with that of other beeches. The same species is the evergreen *B.* of Terra del Fuego, where it forms forests of which the dark green foliage contrasts strikingly in winter with the dazzling snow. There can be little doubt that it will soon become a favourite and common ornamental tree in Britain. The wood is too heavy and brittle for masts, but makes tolerable planks, and is carried to the treeless Falkland Islands for roofing houses. *F. Antarctica* ascends higher on the mountains about the Strait of Magellan. It has deciduous leaves, and much resembles the common *B.*—*F. procera* grows in the Andes of Chili, and attains a majestic size. It is a valuable timber-tree.

BEECH-DROPS. See CANCER ROOT.

BEECHER, the name of a celebrated American family of preachers and litterateurs.

LYMAN *B.* was born at Newhaven, Connecticut,

U. S., October 1775; studied divinity under the well-known American theologian Dwight; and obtained a church at East Hampton, Long Island, in 1798. He afterwards removed to Litchfield, Connecticut, and from thence, in 1826, to Boston. In 1832, he was appointed president of the Lane Theological Seminary at Cincinnati, and to the charge of the second Presbyterian church in that city. In 1842 he returned to Boston, where he has since resided. He has written on 'temperance,' very warmly against slavery, on theology, &c. His collected works, in 3 vols., revised by himself, have been published at Boston. Three of his sons—EDWARD, CHARLES, and HENRY WARD—are also ministers, and have written extensively on religious subjects.

HENRY WARD B., the best known, was born at Litchfield, Connecticut, in 1813, and after graduating at Amherst College, Connecticut, he studied theology under his father at Lane Seminary. After ten years' pastorship of two churches in the state of Indiana, he removed to Plymouth Church, Brooklyn, New York, 'an organisation of Orthodox Congregational believers,' where he still remains. He is said to have the largest congregation in the United States, and his popularity as a public lecturer is great. He is editor of the *New York Independent*, a paper devoting itself chiefly to religious and social subjects. He is a strenuous and eloquent opponent of slavery. He has published several works, the most popular of which are, *Lectures to Young Men* (Boston, 1850), which have gone through many editions; and *Life Thoughts* (Boston, 1858), of which 25,000 copies were sold in a few months.

CATHERINE B., eldest daughter of Lyman B., was born at East Hampton, Long Island, in 1800. From 1822—1832, she was principal of a female seminary at Hartford, Connecticut, and afterwards of a similar institution at Cincinnati. She is a fertile and popular writer, chiefly on subjects coming within the sphere of her own sex, but also on physiology, theology, mental and moral philosophy, &c.

HARRIET B. See STOWE, H. B.

BEECHEY, SIR WILLIAM, R.A., an English portrait-painter of high reputation, was born at Burford, Oxfordshire, December 12, 1753. He entered the Royal Academy as a pupil in 1772, and devoted himself chiefly to portrait-painting, in which he was so successful, that in 1793 he was chosen portrait-painter to Queen Charlotte, of whom he painted a full length. In the same year he was elected an associate of the Royal Academy; and in 1798, he received the honour of knighthood, and was made a Royal Academician for his picture of the Review of the 3d and 10th Dragoons in Hyde Park by George III. (accompanied by the Prince of Wales and Duke of York), which is reckoned B.'s greatest work. B. now received the patronage of the royal family—most of the members of which sat to him—as well as that of the court nobility. Among his portraits are those of Lord Nelson (preserved in the Clothier's Hall, London), Sir William Hamilton, Lord St Vincent (in Fishmonger's Hall), Lord Cornwallis, John Kemble, and Mrs Siddons. B. is not a portrait-painter of first rank, but his portraits are generally characterised by easy attitude and naturalness of expression. He retired from his profession in 1836, and died at Hampstead in January 1839.

BEECHEY, FREDERICK WILLIAM, son of Sir William B., the portrait-painter, was born in London, February 17, 1796. He entered the navy when he was ten years of age, and at the age of fifteen was present in an engagement off the coast of Madagascar, in which three French frigates were captured. In 1818, he took part under Franklin in a scientific

voyage of discovery to the north pole, of which the results were published by order of the Admiralty (1843). For the services he rendered with his pencil during this voyage, B. received a grant of £200 from parliament. In 1819, he was engaged in another arctic expedition under Sir Edward Parry; and in 1821, rendered other important services to science by his exploration of part of the north coast of Africa, of which the results were published in 1828. After being appointed commander, Captain B., in 1825, received a commission to proceed by the Pacific Ocean and Behring's Strait to the Polar Sea, in order to communicate, if possible, with Franklin, who was to make the journey overland from North America. The explorers did not meet, although at one time they were within 150 miles of each other. He returned in 1828, having been two years and a half away, and in 1831 published a narrative of his voyage, which was afterwards followed by an account of the botany and zoology of the Arctic regions. Port Clarence and Port Grantley, to the south-east of Cape Prince of Wales, a considerable tributary of the Godavery, and occupies a table-land about 2400 feet above the sea, and about 100 feet above the adjacent country. Though B. was formerly a place of grandeur and importance, yet it is at present remarkable chiefly for its manufactures in a compound metal made up of twenty-four parts of tin to one of copper.

BEE'DER, the capital of a district of the same name in the Nizam's territories. It is about 75 miles to the north-west of Hyderabad, being in lat. 17° 53' N., and long 77° 36' E. It stands near the right bank of the Manjera, a considerable tributary of the Godavery, and occupies a table-land about 2400 feet above the sea, and about 100 feet above the adjacent country. Though B. was formerly a place of grandeur and importance, yet it is at present remarkable chiefly for its manufactures in a compound metal made up of twenty-four parts of tin to one of copper.

BEE-EATER (*Merops*), a genus of birds of the order *Insectores* and tribe *Fissirostres*; the type of a family, *Meropidae*, nearly allied to that of the Kingfishers. The birds of the B. family have rather long slightly arched beaks, and long pointed wings: they are mostly of a green colour; resemble swallows in flight; and, like them, prey on insects, but chiefly on bees, wasps, and other hymenopterous insects. Their skin is very thick. The species

Common Bee-eater (*Merops apiaster*).

of the genus *Merops* are numerous in Africa and Asia; none are known in America; two are European, one of which, the Common B. (*M. apiaster*), is common in the south of Europe

as a summer bird of passage. It is a very rare bird in Britain. It is mentioned by Aristotle, under the name *Merops*, as very destructive to bees. It seizes them on the wing, and also often watches near their hives, and at the mouths of wasps' nests. It breeds in holes, which it excavates in the banks of rivers. 'When the young are partly fledged, but not yet fit to fly, they creep to the mouth of their holes, where they seem to enjoy the happy summer light and genial sunshine; but on the least alarm, they trundle stern foremost into their inner chambers, where they lie concealed until tranquillity again prevails.' In the banks of the Don and Volga, the excavations made by the flocks of bee-eaters are so numerous, that the bank in many places resembles a honey-comb. Livingstone describes the banks of the Leeba, in South Africa, as perforated in a similar manner. The Hottentots watch the flight of the bee-eaters, that they may be guided to the nests of bees.

BEEF. See FOOD, ANIMAL.

BEEF-EATER, a term now applied jocularly to certain functionaries belonging to the Yeomen of the Guard (q. v.), who, ever since the time of Henry VII., have formed part of the train of royalty, attending the sovereign at royal banquets and other state occasions. They have maintained the same costume, with a slight alteration made in 1858, for nearly four centuries; and this costume has had much to do with their attractiveness to sight-seers. The origin of the term is a case of what Dr Latham calls 'words of foreign simulating a vernacular origin.' It was originally *beaufetier* or *buffetier* (Fr.), one who attends the *buffet* or side-board. Similar instances of false etymology, arising from resemblance in sound, are seen in *Shot-over* (a hill near Oxford), from *Chateau Vert*; *sparrow-grass*, from *asparagus*; *ancient*, for *ensign*; *dog-cheap*, from the old English *god-kepe*, i. e., *good-cheap*, meaning a *good bargain*; &c.

BEEF-EATER (*Buphaga*), a genus of birds, of the order *Inessores*, tribe *Conirostres*, to which the name Ox-pecker is also and more correctly given. The beef-eaters have short bills, square at the base, and rather swollen towards the point. They are accustomed to sit upon the backs of buffaloes, camels, and other large animals, and to feed upon the larvae of gaddies, which they find in their hides. They are exclusively African. One of the species is the Buffalo Bird of South Africa. Livingstone mentions that the sight of the bird being much more acute than that of the buffalo, it is much more easily alarmed by the approach of danger; but the buffaloes always begin to look about them when the birds rise from their backs.

BEEF-TEA is a light and pleasant article of diet, obtained from the flesh of the ox. It is generally prepared by placing the meat (as lean as possible) in cold water, which is gradually heated, and then allowed to *simmer* for two hours or so; but the best method appears to be to commence by chopping the meat small, adding the cold water, and rapidly heating so as to bring it to boil. A little salt is then added, to suit the taste. Either process, by commencing with cold water, succeeds in dissolving out of the meat the savoury natural juices which it contains to the extent of about one-eighth of its weight. Occasionally, hard-toasted bread, in fragments, is added to the tea just before being partaken of, which imparts to it some of the nutritious qualities of the bread. In using the B., the bread may or may not be eaten. The popular notion is, that the B. contains all the nourishing constituents of the entire amount of meat employed in its preparation; but this

is erroneous, as much nutritious matter is resident in the seven-eighths of the original meat, left as residuary fleshy fibre, though the latter will no doubt prove of difficult digestion. The chemical constituents of B. are *gelatine*; *albuminous matter*; *kreatine*, a substance resembling *theine*, the essential principle of tea and coffee; *extractive matters* (*osmazome*), to which the tea owes most of its odour and flavour, besides a part of its nutritious qualities; *lactic acid*; *salts*; a *little fat*; *saccharine matter*, and *water*. B. is highly palatable, and from its very easy digestion, it is recommended to invalids and convalescents. Mutton, treated in a similar manner, yields a broth or tea which is not so easily digested, and is hurtful to persons of weak stomach, especially if the fat be not skimmed off from the liquid. A knuckle of veal affords a similar broth or tea; but it is not so light as B., and, moreover, gelatinises on cooling. A broth or tea prepared from a young chicken is, of all decoctions of animal matter, the most readily digested, and is specially suitable for invalids, where great irritability of the stomach exists.

BEEF-WOOD. See CASUARINA.

BEEHIVE-HOUSE, a name generally given to certain dome-shaped buildings in Ireland, which are believed to be among the oldest architectural remains in that country. They are round edifices, of no great size or height, built without cement, of long thin stones arranged in horizontal layers, the one slightly overlapping the other, and so gradually converging until they meet at the top. The doorway, which is square-headed, is somewhat narrower at the top than at the bottom, as in Egyptian architecture. Beehive-houses are of two kinds—single or clustered. The former are generally found beside ancient oratories, and are supposed to have been the dwelling-places of the priests; the latter, which are often underground, shew two or more live-shaped chambers, connected by a passage or gallery, or opening from a larger central apartment, which is also live-shaped. Irish antiquaries refer the beehive-houses generally to the period before the Anglo-Norman invasion of the island, in the 12th c., and claim for some of them an antiquity as high as the 7th and 8th c. Ruins of single beehive-houses are found in the Western Isles of Scotland; and some of the 'Picts' houses,' or 'earth-houses,' of the east coast, seem to resemble the subterranean aggregated beehive-houses of Ireland.

BEE'ZEBUB (i. e. 'the god of flies'). Under this name the people of Ekron, in Philistia, worshipped their god Baal (q. v.) or Bel. The Greeks also had their 'Zeus Apomyios' or 'Myiagros'—'the disperser of flies.' As the heathen deities were all regarded as demons by the Jews, the name Beelzebub became, in course of time, commonly applied to the chief of evil spirits, and in this sense it is employed in the Gospels. The more correct reading of the word, as given by the Evangelists, is BEEZEBUL—an opprobrious change of name, making it signify 'god of dung,' to mark the low and grovelling character of the demon. See BAAL.

BEER, derived from the German *Bier* (see ALE), is the term applied to a fermented liquid which has not undergone the process of distillation. It may be prepared from many varieties of vegetable matter, but in Britain the raw material operated upon is generally barley, although pease, beans, wheat, &c., might be employed. In other countries, B. is often prepared from other sources, to which allusion is made at the close of this article. The process followed in the manufacture of B. is divided into two parts—viz., *malting* and *brewing*; and so distinct are these, that very often the malting proceeds

in a building at some distance from that in which the brewing is conducted, and in many cases the malting is superintended and accomplished by a *maltster*, as his particular and only branch of trade, the malt thus prepared being afterwards purchased by the brewer.

The variety of barley preferred for the preparation of the finer kinds of B. is the *chevalier*; but other varieties are extensively used. See **BARLEY**.

The process of malting, or the conversion of barley into malt, is accomplished in four successive steps. 1st. *Steeping* of the barley, which consists in

Fig. 1.

introducing the grain into a large wooden or stone cistern, *a* (fig. 1), and adding thereto as much water as will cover it. On being thus treated for twenty-four hours, the grains of barley absorb the water, and the contents of the cistern, near the top, even begin to feel dry. The barley swells up much, so as to increase considerably in bulk, and the Excise officers, if they choose, can gauge or measure the grain at this stage, and charge by the bulk thus indicated. The amount of water which barley takes up in the steeping, affords good evidence of the excellence of the grain for brewing. Thus, the better kinds of barley, on the average, take up sufficient water to increase their weight by one half. Occasionally, however, the increase is not more than a tenth. The time during which the grain lies in the steeping-cistern is about 40 hours, when the excess of water is drained off; but a regulation exists that the cistern cannot have a second charge of barley till four days have elapsed after the introduction of the first charge. 2d, *Couching*.—The grain is thrown out of the steeping-cistern in a heap on the floor, *b*. At this stage, the barley is soft, and when pressed between the fingers, it is readily bruised. It lies in the couch or heap for 26 hours or so, and during that time, it rises in temperature about 10° F., and gives out some of its extra water. This *sweating*, as it is called, is the result of the partial germination or growth of the barley; and little rootlets or fibrils of the radicle, and a primitive stem (plumula or acrospire), begin to form and present themselves. As the temperature rises, the radicles lengthen rapidly, and means are then taken to check the germination. 3d, *Flooring*.—The heated barley is spread by the workmen with spades on the floor to the depth of about 15 inches at first, *cc*. It is repeatedly turned and respread over a larger area, with a thickness of layer decreasing to 6 inches. At this stage, the radicles have attained their greatest length. 4th, *Kiln-drying*.—The half-germinated barley is now introduced into a kiln (fig. 2), on the perforated floor of which it is spread. The apartment beneath the kiln-room is fitted up with stoves or choffers, *A*, which evolve much heat; and this, rising and passing through the slits or perforations in the floor of the kiln, *B*, necessarily

dries any moist barley laid thereon, and the steam escapes at the roof, *C*. The heat which the barley is subjected to in the kiln is, at the commencement, 90° F., but this gradually is raised to about 150° F. While drying, the radicles—called *cornings*

Fig. 2.

or *cummings*—break off from the grain, and are afterwards removed by a wire-sieve. The colour which the barley assumes as it becomes dry malt in the kiln is determined by the heat to which it is subjected, the higher temperature yielding the darker-coloured malt. *Pale* and *amber coloured malt* are used in the brewing of the lighter varieties of B.—such as bitter-B., table-B., and small-B.; whilst a darker kind of malt is used in sweet ale, and a very dark malt in the preparation of porter. During the conversion of barley into malt, a loss of material occurs. Thus, 100 parts of barley yield 80 parts of malt; but as the 100 parts of barley contain 12 of water, it follows that there are present only 88 parts of dry matter, and these yield 80 parts of dry malt, giving a loss of 8 per cent. of the original weight of the barley. While there is a decrease in weight, there is an increase in bulk, 100 measures of barley becoming 101 to 109 measures of malt. Certain chemical changes likewise occur as the barley is

BEER.

transformed into malt, which may be noticed from the following table:

	Composition of	
	Barley.	Malt.
Hordein (q. v.), . . .	55	12
Starch,	32	56
Sugar,	5	15
Gluten,	3	1
Gum,	4	15
Resin,	1	1
	100	100

The principal chemical change is, therefore, the transformation of much hordein (a form of starch) into starch, gum, and sugar. The mechanical condition of the contents of the grain is also altered; the grain is now of a fine mealy nature, and is readily broken between the fingers, when the flour in the interior is found to be soft and distinctly sweet to taste.

The *brewing* of the malt comprehends no less than six stages. 1st, *Grinding the malt*, which may be accomplished in several ways: either by placing the malt between two revolving horizontal circular stones, such as are employed in flour-grinding; or passing the malt through a mill like a large coffee-mill; or bruising it between revolving steel rollers. The last plan is the best, as it is desirable that the grinding should not be too perfect, which would give a fine flour, readily becoming pasty on the addition of water. When coarsely bruised, however, the water can find its way into all parts of the grain, and thoroughly soak it. 2d, *Mashing the bruised malt*.—This operation is conducted in a large tun (fig. 3), built up of wooden staves, and surrounded by hoops—somewhat similar in construction to an ordinary domestic churn. Water, which has been previously heated in a copper, is allowed to run into the comparatively cold mash-tun, while the bruised malt at the same time

Fig. 3.

descends by the hopper, *ab*: the water thereby becoming reduced to 160° F., or slightly below that temperature. The whole is then thoroughly agitated by long poles, *g*, worked by the hand or by machinery, *def*, till every particle of the malt is brought into contact with the water. The result is that the malt absorbs the water in part, and a very active change begins to take place. In the malt, there is developed a substance called *diastase* (q. v.), which reacts on the starch of the malted barley, and changes it into the variety of sugar called grape-sugar. See SUGAR. So rapidly does this transformation of starch into sugar occur, that almost immediately on the mixing of the water with the bruised malt, the liquid assumes a sweet taste. In the space of half an hour the temperature of the mash-tun will be found to have decreased to about 140° F.; and then a second quantity of water, at a heat of 190° F., is run in, so as to raise the temperature to about 167° F., which degree of heat is found to be the best for enabling the diastase to act most powerfully in transforming the starch into sugar. After two to three hours' action upon the malt, the water, which is now very sweet to the taste, is drawn off into a large vessel called the *underback*, and fresh water, at a temperature of about 190° F., is admitted to the tun, and

allowed to soak the malt still remaining there. This part of the process is styled the *second mash*; and as the water is at a higher temperature than in the *first mash*, much of the residuary matter in the malt is changed into sugar, and dissolved. After some hours, the liquid from the second mash is drawn off, and added to that of the first mash already in the underback; and a third quantity of water, at a still higher temperature, about 200° F., is run in upon the malt, which dissolves out all the remaining portions of any value, and leaves the husk skin of the grain and other insoluble matters. The liquid from the *third mash* is not strong enough to be in general mixed with the other solutions in the underback, and is either employed in brewing small-B., or is again heated and used in treating new bruised malt.

In order that the brewer may be enabled to prepare the same variety of B. day after day, it is requisite that the liquid in the underback, and which is now called the *sweet-worts*, should be of a definite strength; and to determine this, an instrument called a saccharometer, a form of *areometer* (q. v.), is used, which enables the brewer to determine the strength of the sweet-worts, and, if necessary, to add some of the liquid from the third mash, to reduce the strength of that in the underback.

In the drawing off of the several worts from the

mash-tun, advantage is taken of a finely perforated false bottom of plate-iron, which lies about a foot above the true bottom of the tun, and the liquids being drained away through the perforations in the false bottom, the insoluble husk and other matters are left behind. The material left on the false bottom, called *grains* or *druff*, is used for feeding cattle.

3d, *Boiling of the worts with hops*.—When reduced to the proper strength, the worts are pumped up from the underback into a covered-in boiler or copper, AA (fig. 4), and being mixed with hops, are raised to the boiling-point, and kept in a state of ebullition for some time. During the boiling, it is necessary to keep the hops and other sediment from settling at the lower part of the boiler near the fire, DD, and for that purpose, a sort of rake with teeth, BB, turned by a wheel (C) above, is kept turning round, which tends to hold the sediment in mechanical suspension. To economise heat, it is customary to have a tank fitted to the upper part of the boiler in which water or the worts can be heated. The

Fig. 4.

hops which are obtained from Kent and Sussex are the strongest, and are employed in the brewing of porter, while the Worcester hop is milder, and is preferred for ale. The hops are useful in the brewing of B. in imparting to the liquor a volatile fragrant aromatic oil, a bitter resin, and a little tannin. The quantity of hops required to be added depends much on the kind of B. which it is intended to brew. The stronger the B. is to be, and above all, the more bitterness is required, the more hops must be added to the boiler. In common ale or B., the quantity of hops does not exceed 2 lb. to the quarter of malt; whilst in bitter-B., and especially that intended for foreign countries, the amount of hops is 8 lb. and upwards. Besides imparting to the worts the active constituents of the hop, the boiling operation serves other important ends. In the sweet-worts, there is a considerable quantity of nitrogenous matter, which

is very liable to pass into decomposition, and which, were it to do so, would destroy the beer. During

Fig. 5.

the boiling, the excess of this nitrogenous matter separates as a flaky and stringy solid, called by the brewer *mucilage*. The boiling is continued till the hops have yielded their aromatic and bitter principles, and till the liquid has been concentrated to the extent required by the brewer, and then the whole is run into the *hop-back*, a form of cistern which has a false bottom composed of perforated iron plates (fig. 5), admitting of the liquid worts percolating through, while all the mucilage and other solid matters are retained on the upper surface of this metallic sieve. 4th, *Cooling the worts*.—As the liquor drains through the false bottom of the hop-back, it is run on to the *cooler* or *refrigerator* (fig. 6), which, in size and appearance, resembles the ordinary wooden floor of a large room. The planks are so closely connected together that the liquid cannot run through, and a wooden ledge, B, runs round the sides of the room, which is also tight. The hot worts, which are spread to the depth of a few inches over the floor, are very rapidly cooled down, by allowing a free current of cold air to pass over the top of the liquid, and often by having a series of fans, CC, revolving rapidly immediately above the liquid, so as to cause a more speedy removal of the heated air loaded with steam, and the substitution of cold air. Occasionally, the brewer is at the expense of having a coil of metal pipe, A, placed up and down the floor of the cooler, through which metal pipe cold water is allowed to run at the time the hot worts are being cooled down. By these means the worts are very soon reduced to a temperature of about 60° F. This step in the process of brewing is a very important one, as, if the cooling is not conducted with the greatest rapidity, the sugar in the worts

Fig. 6.

will become partially converted into acetic acid, or, as it is termed, *foxing* occurs, which communicates bad properties to the worts, and ultimately produces a beer with an unpleasant taste and flavour.—5th, *Fermenting the worts*.—When the

liquid has been cooled down to 55°–60° F., it is conveyed to the fermenting tun, where it is mixed with the yeast (q. v.), and the process of fermentation proceeds. The tun or vat is formed of strong wooden staves, and is either circular or square. The latter form has recently been introduced, and appears to be preferred by some brewers. The yeast is added in varying quantity, according to the strength of the worts, but the more common amount is one gallon to every 100 gallons of the worts. Very soon after the yeast is mixed with the worts, the whole contents of the tun begin to pass into a state of commotion, much gas is evolved, and this, tending to escape, causes a *frothing* on the surface of the liquid termed the *rocks*, from the irregular mountainous appearance of the masses of froth piled on each other. The colour of the froth at this period indicates the quality of the beer. Thus, if the froth appears of a yellowish-white or yellow tint, the operation is going on satisfactorily; but if the colour darkens to a brownish-yellow or a light brown, it is considered a bad sign, and the beer is spoiled as a first-class beverage. The chemical changes which occur during the process of fermentation (q. v.) are due to the action of the particles of yeast on the sugar or saccharine matter. This action proceeds most satisfactorily at a temperature of 72° F., and care is taken in the brewing of the finer varieties of beer, such as India pale ale and bitter-beer, that the temperature never exceeds 72° F. The grape-sugar which is present in the worts as they are introduced into the fermenting tun, is composed of carbon, hydrogen, and oxygen in the proportion C_{12}, H_{14}, O_{14} ; and when the yeast acts upon it, a greater or less proportion of it is converted into alcohol, carbonic acid, and water. Thus, one atom of sugar, $C_{12}H_{14}O_{14}$, is converted into 2 atoms of alcohol ($C_2H_6O_2$) = $C_8H_{12}O_8$; 4 atoms of carbonic acid (CO_2) = C_4O_8 ; and 2 atoms of water (HO) = H_2O_2 ; which, when added together, give the atom of sugar, $C_{12}H_{14}O_{14}$. The carbonic acid tending to escape, causes the frothing or rocks, and the alcohol and water are left in the fermenting tun. During the progress of the fermentation, a considerable amount of new yeast is formed, which gets entangled in the froth; and when the operation slackens, and the frothy head begins to fall, the upper yeast is skimmed off. This process of the conversion of the sugar of the worts into alcohol or spirit, is termed attenuation (Lat. *temis*, thin); and the degree to which the change is carried depends on the kind of B., and the market it is to be sent to. In sweet ale or B., the attenuation is not allowed to proceed far, and much sugar is left in the beer. Bitter-B., however, is attenuated to a greater degree, and consequently there is less saccharine matter left in it; while in India pale ale, and other beers intended to be sent great distances, the attenuation must be carried on much further, else the liquor would not be preserved during its transit to many parts of the globe. 6th, *Clearing and storing*.—The B., when properly fermented, is placed in casks like hogsheads, called *rounds*, where the remaining traces of fermentation proceed, and the B. ceases to appear thick or drumly, and becomes clear; when it is pumped up into store-casks of great size, or at once placed in the casks in which it is sent into market. During the storing of the B., an extra quantity of hops is often added, to increase the bitterness and pungency.

The principal constituents of the various kinds of B. are water, alcohol, sugar, gum, gluten, and the bitter extractive matter of the hop. The amount of alcohol varies: in small-B., it is only about 1 per cent.; in ale, the stronger kinds of B., and porter

for home consumption, 5 to 7 per cent.; in East India pale ale, 10 per cent. In B. intended to be forwarded to California from Britain, the attenuation is carried so far, that there is more than 10 per cent. of alcohol, and the B. is then called *dry*.

B. is adulterated in many ways. Burned sugar (caramel) is added to give colour; coeculus indicus, to supply an intoxicating agent which will give an appearance of strength to the B.; quassia, to impart bitterness in place of hops; grains of paradise and Cayenne pepper, to communicate pungency; coriander and caraway seeds, to yield flavour; liquorice, treacle, and honey, to supply colour and consistence. To stale-beer there is sometimes added green vitriol (sulphate of iron), or alun and common salt, which, when agitated with the B., communicate a fine cauliflower head. It is unnecessary to state that such admixtures are never made in any extensive brewing establishment with respectable connections.

For the home-brewing of B., many recipes have been published, and one of the best is that given by Mr Donovan in the *Cabinet Cyclopaedia*. The apparatus he suggests is of the roughest description, and comparatively inexpensive. A porter-barrel forms the mash-tun; the upper end being taken out, perforated with a gimlet, and lowered into the barrel to near the bottom, where it is supported about a couple of inches from the true bottom, and constitutes the false bottom through which the liquid drains from the bruised malt. A hole is made in the side of the barrel, near the bottom, and between the true and false bottoms, which can be plugged up with a spigot when not required to let the liquor run off. A second porter-barrel will be useful as an underback and fermenting tun. An ordinary household boiler, or a large common tin-plate one, will answer the purpose of boiling the worts. The mash-tun is first well scalded with hot water, and then is supplied with 15 gallons of boiling water and 5 gallons of cold water at 60° F. 2½ bushels of first-class bruised pale malt are shaken in, and well stirred through the water, the top of the barrel being in greater part closed with a thick cloth. In an hour or so, the liquid which is in the tun will be clear when allowed to run out at the spigot-hole; and immediately after it ceases to run, about 20 gallons of nearly boiling water are run over the half-exhausted malt, and this carries off all the soluble matters, yielding altogether about 23 gallons of sweet-worts. These are placed in the copper, 3¼ lb. of the best mild hops are added, and boiled for 20 minutes. The liquor is then strained through a fine sieve into the fermenting tun; and when it has cooled down to below a blood-heat (98° F.), a quart of yeast is added, and the fermentation allowed to proceed. When the frothy head begins to droop, the upper yeast is skimmed off, the liquor put in a cask, bunged up, and allowed to clear for a fortnight, when it will be ready for use.

The foregoing remarks on the manufacture of B. apply to all the varieties of B., ale, and porter (q. v.), brewed and used in Britain. The liquor may differ in strength, from difference in the quantity of water, or in colour, from the malt being more or less charred in the kiln-drying. There are, however, many other varieties of beer. In South America, the Indians prepared and drank a B. obtained from Indian corn, and called *chica* or maize B., long before the Spanish conquest. The process followed in making *chica* is similar to that of B.-brewing in Britain. The maize is moistened with water, allowed partially to germinate, and dried in the sun. The maize malt so prepared is bruised, treated with warm water, and set aside till the fermentation is over. The *chica* or maize B. has a yellow colour, and a pleasant acid taste. In the valleys of the Sierra, the maize malt is chewed

between the teeth of the Indians and their households, and the chewed morsel incorporated with the saliva is put in jars with hot water, when the fermentation proceeds more rapidly than before, and a more highly-prized B. is obtained. The chieca is also made from barley, rice, pease, manioc, pine-apples, and grapes. The Crim Tatars prepare a B. from millet-seed, called *bouca* or millet-beer. The same seed is used in Sikkim, on the southern slopes of the Lower Himalaya, and yields B. there called *murwa*. The Arabians, Abyssinians, and many African tribes, employ *teff*, or the seeds of *Poa Abyssinica*, and millet-seed, as sources of beer. The Russians prepare a B. from rye called *quass* or *rye-beer*. The Tatars ferment milk into *koumiss* or milk-beer. The Arabians use the milk to yield their *leban*, and the Turks to produce their *yaourt*. In the north of Scotland, the Orkneys, and some parts of Ireland, buttermilk, or *sour-milk*, is allowed to stand till fermentation begins, and an intoxicating liquor results. The South-sea islanders prepare a B. from the root of *Macropiper methysticum*, or the intoxicating *long pepper*, which is called *Ava* (q. v.).

The successful brewing of B. depends much on the kind of water employed. The water which is found most suitable contains much common salt, sulphate of lime, and carbonate of lime, in a state of solution. The waters employed in the most extensive breweries contain at least 60 grains of earthy salts dissolved in each imperial gallon. Great care must be taken to select water which not only has the proper amount of saline ingredients, but at the same time is free from organic matter either of animal or vegetable origin. Water containing such is liable to the decomposition and putrefaction of its constituents, and by contamination, causes the B. prepared by means of it to be more liable to go wrong in the brewing, and to possess ultimately an unpleasant taste.

The employment of B., especially of that variety known as Bitter-B., has recently rapidly advanced in public estimation as a beverage and article of diet. Bitter-B. acts as a tonic and slight stimulant, and in many cases it is recommended by medical men to convalescents in place of wine. Some statistics regarding the consumption of the different kinds of B., and other kindred beverages, will be found under the head of FERMENTED LIQUORS.

BEER ACTS. The 11 Geo. IV. and 1 William IV. c. 61, the 4 and 5 William IV. c. 85, and the 3 and 4 Vict. c. 61, amended by the 11 and 12 Vict. c. 49, s. 2, are commonly so called; to which may be added the 18 and 19 Vict. c. 118, restricting the time for the sale of beer on Sundays and holidays. By the first three of these acts (all relating to England), every householder assessed to the poor-rates, in any parish or place (and not being a sheriff's officer, or officer employed to execute judicial process), may, without any licence from the magistrates, apply for and obtain an Excise licence, to enable him to sell beer and cider, by retail, at some house situate within such parish or place, and specified in such licence. But in order to obtain such licence, the applicant must produce an overseer's certificate that he is the real resident, holder, and occupier of such house, and rated to the poor-rate in a certain amount; and must enter into a bond with one sufficient surety, in the penal sum of £20, or two sufficient sureties in the penal sum of £10 each, for the payment of such penalties as he may incur under the acts; and if he is also desirous for permission that the liquor should be drunk on the premises, he must, moreover, annually deposit with the commissioners of Excise (now the Board of Inland Revenue), or other person authorised to grant the licence, a certificate 'of good character,' signed

by six rated inhabitants of the parish, of whom none shall be maltsters, common brewers, or licensed publicans, or owners of licensed public-houses. But such certificate is not necessary when the house to be licensed is situate in London or Westminster, or within the *bills of mortality* (q. v.); or within any city or town corporate, or within one mile from the place used at the last parliamentary election, where the population of such city or town exceeds five thousand; and no licence, on the other hand, may be granted, even upon certificate, to sell in any such city or town (whatever the population), unless the house to be licensed is of the value of £10 per annum. It is, moreover, required that every person obtaining a licence shall paint conspicuously over the door of his premises, in such form and manner as the acts specify, his Christian name and surname at full length, and the words 'licensed to sell beer (or cider) by retail,' with the addition of 'to be drunk on the premises,' or 'not to be drunk on the premises,' as the case may be. Penalties are also imposed on every retailer of beer or cider who shall transgress, or allow to be transgressed, any of the conditions of his licence; and the penalties are generally recoverable before two justices. The licence to sell beer is confined to that particular privilege; and persons, under cover of it, attempting to sell wines or spirits, are not only liable in a heavy penalty, but may be deprived of their beer licence. On the other hand, a licence to sell wines and spirits cannot be granted unless the party applying for it has previously obtained a beer licence.

Subsequent legislation may be thus explained: The latest governing act is the 18 and 19 Vict. c. 118; that act repeals *in toto* the previous one of the 17 and 18 Vict. c. 79. But the object of the latter is stated in its preamble to be to extend the benefits of the 11 and 12 Vict. c. 49, which at first sight might be imagined also to be repealed by the 18 and 19 Vict. But it is not so; the 11 and 12 Vict. remains in force, and it is only its extension by the 17 and 18 Vict., which has been repealed, so that the 18 and 19 Vict. and the 11 and 12 Vict. must, as regards the sale of beer on Sundays and holidays, be read together. The law thus enacted is as follows: No beer or other liquor mentioned in these acts can be sold on Sundays or holidays before half-past twelve in the afternoon of Sunday, or until the conclusion of morning divine service in the principal church or place of worship of the district. From that time until three o'clock, beer or other liquors can be sold to the public. Between the hours of three and five, all beer-shops or other places where beer and other liquors may be sold, must be closed. They may be reopened at five, and remain so open till eleven o'clock the same (Sunday or other holiday) night, after which they must be closed, and not reopened again till four o'clock on Monday morning.

The place where beer is exclusively sold is called a *beer-house*, differing in this respect from an *ale-house*, which means a place where other liquors as well as beer are retailed. The term *public-house* applies to both.

The sale of beers or ales in Scotland is regulated by the 41 Geo. III. c. 55, the 48 Geo. III. c. 113, the 9 Geo. IV. c. 58, and the 16 and 17 Vict. c. 67, commonly called the 'Forbes Mackenzie Act,' according to the regulations of which licences are at present (1860) granted. By the form of licence thereby prescribed, no liquors of any kind can be sold on Sunday in any inn, hotel, or other public-house, except to lodgers and *bond-fide* travellers—an expression that has caused some difficulty in construction. Various devices have been attempted, in order to evade the stringency of the

latter provision, the most successful of which has been the plan of forming clubs with a nominal entrance-fee, where the members have stores of their own, from which they can be supplied in the club-house.*

BEER, J. MEYER. See MEYERBEER.

BEERHOO'M, or BIRHOO'M, a district in the presidency of Bengal, with an area of 4370 square miles, and a population of 1,040,876. It extends between N. lat. 23° 32' and 24° 40', and between E. long. 86° 25' and 88° 30'. Though part of B. is within 80 miles from Calcutta, yet little is known concerning it. The inhabitants are represented as generally a rude race, and there appear to be hardly any places worthy of the name of towns.

BEER-MONEY is a peculiar payment to private soldiers in the English army. It was established in the year 1800, at the suggestion of the Duke of York, and consisted of one penny per day for troops when on home-service, as a substitute for an issue of beer and spirits. It still continues as an addition to the daily pay; and something in the mode of keeping military accounts induces the authorities to allow it to figure as a separate item, instead of being consolidated with the other elements of the soldier's pay—for which, see PAY.

BEERSHEBA, or BIR-ES-SEBA ('well of the oath,' or 'well of the seven'), so called because here Abraham entered into an alliance with Abimelech, king of Gerar, which he ratified with an oath and a gift of seven ewe lambs. B. was situated on the southern border of Palestine, about 52 miles southwest from Jerusalem, and formed the limit in that direction of the Israelitish dominion. It was one of the most ancient as well as one of the most interesting places in sacred record. While Abraham resided at this place, he received the command to sacrifice Isaac, whose residence it also was. Esau was robbed of his birthright and blessing here, and here Jacob sacrificed to God before departing into Egypt; the sons of Sammel were made judges here, and it was from hence that Elijah was forced to flee into the desert from Jezebel's wrath. After the captivity, B. was occupied for some time by the Jews, and in the 4th c. A.D., it was a Roman garrison. Afterwards, the Crusaders are said to have fortified it, and to have regarded it as a place of importance. Two circular wells of fine pure water—the largest being 44 feet deep to the surface of the water, and 12½ feet in diameter—and a heap of ruins about half a mile long and a quarter broad, remain to mark the place where B. once was.

BEE'SHA, a genus of grasses with the habit and most of the characters of bamboos, but remarkable for the fleshy pericarp which encloses the seed, forming a sort of berry. The species are few, natives of the East Indies.

BEES-WAX is principally obtained from the ordinary bee-hive, where it is elaborated by the workers. See BEE. For some time, it was matter of dispute whether the bees really manufactured the wax from other ingredients in their food, or if they performed the simple task of carrying the wax ready made from the plant to the hive. It appears now to be definitely settled, that while, in ordinary circumstances, bees may derive part of the wax from plants, yet, when they are fed entirely upon pure sugar, they continue to elaborate

wax, and to build up the walls and partitions of the honey-comb. The wax procured from British hives is considered the purest and best, but the smallness of the amount necessitates the importation of comparatively large quantities from North America, Brazil, Singapore, Ceylon, Gambia, and Mogadore. British B. is naturally of a yellow colour, whilst that procured from foreign countries is darker in tint; and in the case of the wax from Brazil, which is yielded by a species of black bee living under ground, the colour is a dark mahogany, and the material is soft and tenacious. In the separation of the honey from the wax, the honey-comb is subjected to pressure, which squeezes out most of the honey; the residual comb is then treated with water, and heated, with constant stirring, till the wax melts, when the whole is passed through hair-bags. The wax is received in a vessel of cold water, where it is at the same time washed, and cooled down till it solidifies, as a thick cake, on the surface of the water. For many purposes, it is necessary to bleach the wax, and the common method is to obtain it in thin sheets or ribbons, by melting it under water, and pouring it upon horizontal wooden cylinders, which are kept revolving half immersed in water in a perforated vessel. The sheets or ribbons of wax so obtained are laid out upon a field with a southern aspect, and being repeatedly watered, are subjected to the joint action of the sun's rays, the ozone of the air, and moisture. In a short time, the wax loses its yellow tint, and becomes white. Attempts have been made to perform the bleaching more expeditiously by employing chlorine, bleaching-powder, and other chemical agents. The only process which appears not to injure the wax is to melt it, and for every pound add two ounces of pulverised nitrate of soda, and one ounce oil of vitriol, diluted previously with eight ounces of water. While the latter is gradually poured in, heat is applied, and the whole mixture swells up, necessitating the employment of a capacious vessel. On cooling, the wax gathers on the surface, and being repeatedly treated with hot water, to wash away impurities, is finally allowed to solidify in a cake.

Purified B. has a density of 960 to 966, and is therefore lighter than water, which is taken as 1000. In thin slices, it is translucent, and is tasteless, odourless, and colourless. At 32° F., it is hard, brittle, and solid. When heated to 85°–90° F., it softens, and can then be kneaded between the fingers like moist dough or putty, and at 145° F. it fuses, and becomes a true liquid. It is insoluble in water, and is partly soluble in boiling alcohol, and partly not. The alcoholic solution, which takes up about 80 to 90 per cent. of the wax, contains principally a substance called *cerine*, which separates in crystals as the solution cools, and *ceroleine*, which remains dissolved in the cold alcohol. The matter which resists the solvent action of the alcohol is a substance called *myricine*. B. is largely used in the manufacture of wax-candles and tapers; and though it has recently been very much excluded from the manufacture of ordinary candles, from the readiness with which first-class composite candles can be made indirectly from tallow, yet it is often used as one of the ingredients in composite candles to impart hardness to the manufactured article. The very large candles used in Roman Catholic countries for church-services, are always made of wax alone.

BEEET (*Beta*), a genus of plants of the natural order *Chenopodiaceae* (q. v.), distinguished by a 5-cleft perianth, five stamens inserted on a fleshy ring surrounding the ovary, and the fruit adhering to the calyx, and collected in clusters of two or three. The species are not numerous; they are

* It is remarkable that the Forbes Mackenzie Act does not expressly repeal, and, in fact, does not recite or make mention of the 11 and 12 Vict. c. 49, by which spirits and other liquors may be sold in Scotland on Sunday after half-past twelve, or at and after the conclusion of morning-service. But this latter act, of course, must be held to be superseded by the former.

mostly biennials, with smooth, ovate, stalked root-leaves, and tall, leafy, flowering-stems. They are natives of the temperate parts of the Old World. The Common B. (*B. vulgaris*) is a native of the shores of the Mediterranean, but is now in very general cultivation both in fields and gardens, chiefly for the sake of its large succulent and generally carrot-shaped roots, which are used as food both for man and for cattle, and from which also sugar is largely extracted on the continent of Europe. Beet-roots may be substituted for malt, when deprived of the greater part of their juice by pressure. The variety chiefly cultivated in gardens is known as RED B., from the colour of the root, which also more or less appears in the leaves and leaf-stalks. The subvarieties are very numerous. In some, the root is rather turnip-shaped than carrot-shaped, and the size and colour also vary much, some being of a deep blood-red, or even almost blackish colour, both externally and internally; and others of a much lighter red, and internally, even white. It forms a favourite pickle, and is also very agreeable as a boiled vegetable when properly dressed. The seed is sown so late in spring, that the plants may not produce flowering stems the first year, which, when it occurs, renders the root fibrous and useless.—MANGOLD-WURZEL (q. v.), so valuable as a field-crop for food of cattle, is, in general, regarded as merely a larger and coarser variety of the common B., in which the red colour is comparatively little exhibited, although some botanists have, on very slender grounds, endeavoured to erect it into a distinct species.—The WHITE B. of our gardens (*B. cicla* of some botanists) is now also generally supposed to be a mere variety of the common B., with little or no red in its roots or leaves, and a comparatively slender root. It is cultivated for the sake of its leaves, which are used in the same manner as spinach, and form an excellent substitute for it, especially in the beginning of spring. The leaf-stalks and midribs (*chards*) of the leaves, especially of a variety in which these parts are unusually developed, are also dressed for the table.—SEA-B. (*B. maritima*) grows wild upon the shores of Britain, and differs from the common B. in its perennial root, its partly prostrate stems, and other characters. The leaves are used for food in Ireland, as are also those of *B. Bengalensis* in the East Indies.

BEE-FLY (*Anthomyia Betae*), an insect which infests crops of mangold-wurzel, and other kinds of beet, depositing its eggs on the leaves, the soft parts of which the larvæ devour, causing them to assume a blistered appearance, and when numerous, injuring the health of the plants. It is a two-winged insect (see DIPTERA), of the great family *Muscidae*, of which the common house-fly may be regarded as the type, and belongs to a genus of which more than 100 British species are known, the larvæ of some of which are well known as feeding upon the roots of cabbages, turnips, &c. See CABBAGE-FLY, TURNIP-FLY, and POTATO-FLY. It is not so large as the common house-fly.

BEETHOVEN, LUDWIG VAN, the unrivalled composer, whose works have made a new epoch in the development of music, was born at Bonn, December 17, 1770, and died in Vienna, March 26, 1827. His father, a tenor-singer in the elector's chapel at Bonn, began to cultivate the genius of his son when only five years of age. He next placed him under the court-organist, Van Eden, and shortly after under the composer Neefe. In his eighth year he created astonishment by his performance on the violin; when only eleven, he played the music in Bach's *Wohltemperirtes Klavier*; and in his thirteenth

year he published, at Manheim, a volume of variations on a march, songs, and sonatas. In 1792, he was sent to Vienna by his patron, the Elector of Cologne, to enjoy the instructions of Haydn, who first made him acquainted with the works of Händel. He also studied composition under Albrechtsberger. There he soon attracted notice by his extraordinary ability as an extempore player of fantasias, and also by some compositions, which, however, did not escape the censure of critics. He became so much attached to Vienna, that, after his patron's death in 1801, he determined to remain, and declined an invitation to England. In 1809, when another offer tempted him to leave Vienna, several friends of music, with the Archduke Rudolf at their head, raised a subscription to provide for the composer a pension sufficient to retain him. At Vienna, therefore, he stayed during the remainder of his life, secluded from the world, of which he knew as little as it knew of him; and in later years, still more isolated from society by a defect of hearing, which gradually became confirmed into entire deafness. In this sad inviolable solitude, he produced his new symphonies, his sublime overtures, his quintetts and quartetts, so full of profound conceptions and mysterious revelations of the highest harmonies, and his pianoforte sonatas, which express, sometimes, a peculiar train of feelings, at other times appear to represent his own recluse character. Shut out in a large measure from the ordinary pleasures of life, ignorant of the sweetness of married life, and able to enjoy only in a slender measure social intercourse, he retired for compensation into the world of his own imagination, and brought forth from its deep resources those treasures of harmony which, though at first received with a shy astonishment rather than a cordial admiration, are now ranked among the works of art which cannot die. These new forms and original creations, which display B.'s majestic powers in music, were only gradually developed; in his early productions, he submitted to established forms of composition.

The works of B. may be divided into three classes, or may be assigned to three distinct periods of his intellectual development. All the works of his first period, though important, show the influence of his teacher Haydn, or of his more highly esteemed model, Mozart. This period of composition may be said to extend to his 16th orchestral work, including, besides several pianoforte sonatas, trios for pianoforte and for stringed instruments. All these early works display the highest cultivation of the forms and principles of art previously established in the Viennese school of music.—The second period of B.'s artistic life, in which his genius was completely self-reliant, extends from the 16th to the 80th work. This was certainly the most productive and brilliant part of his career. To it belong his greatest creations, his magnificent and powerful orchestral works—symphonies, overtures, &c.—all of which display the highest qualities of imaginative composition. Besides the great orchestral works, it includes many sonatas for pianoforte, and various compositions of chamber-music—septetts, quintetts, quartetts, trios, serenades, &c. In dramatic composition, B. produced only one opera, but this was *Fidelio*, the first truly German musical work of a dramatic character. This was the result of great study, and, as it is now given, is the reconstruction of an earlier composition. Other dramatic pieces are—the overture, interludes, and melodramatic music in Goethe's *Epigone*, and the instrumental music and choruses in the *Ruins of Athens*.—In the third and last period of B.'s career we find those two gigantic works, the *Missæ Solemnis in D Minor*, and the ninth symphony (D minor) with chorus. These works transcend

all common laws and forms, and belong to the highest sphere of art. Their deep mysteries can be apprehended only by those who have deep emotions and profound technical knowledge of music. Other works of this last class approach those just mentioned, though they do not reach the same elevation. But all are alike in passing far beyond the ordinary traditional forms of art. All are pervaded by an impulse as of inspiration. Among these works may be mentioned, the great quartets for bow-instruments (mostly published after the death of B.), the grand overtures—works 115 and 124—and several sonatas for pianoforte, especially that in B \flat major.

The life of B. has been written by Schlosser (Prag, 1828), Ries, Wegeler, Schindler (Münster, 1845), and Moscheles (2 vols., Lond. 1841).

BEEBLE, a name popularly applied to many kinds of coleopterous insects. It is never extended to insects of any other order, and it is sometimes used in works on natural history as a common name for all coleopterous insects; but this makes it to include many kinds to which it is not popularly applied, as fireflies, lady-birds, weevils, cantharides, &c. It is also employed by some authors in a more restricted sense, as a designation of the insects forming the large tribe *Scarabæides*; but the restriction, equally with the extension, is an interference with the popular use of the English word, of which, however, the limits are very uncertain. To frame an article, with strict regard to that popular use, and at the same time to science, would not be easy, nor would it be profitable, as the assemblage of kinds would be not only large, but very miscellaneous. We think it better to refer to the article **COLEOPTERA**, and to the articles **SCARABÆIDES**, **BOMBARDIER BEETLE**, **STAG BEETLE**, **BURNING BEETLE**, **GOLIATH BEETLE**, **ROSE BEETLE**, &c. The name **BLACK BEETLE** is often given to the **COCKROACH** (q. v.). See also **BLAPS**.

BEEBLE-STONES, the name given by the lapidaries of Edinburgh to hard nodules of clay ironstone, found abundantly in a low cliff, composed of shale, at Newhaven, or strewed upon the beach in that neighbourhood. They take a beautiful polish, and have been employed to make letter-weights and other ornamental articles. The name was given in consequence of the supposed origin of the fossil which is of most frequent occurrence as the nucleus of the nodules, which, however, is not a fossil beetle, but a coprolite (q. v.). Some of the nodules contain a fossil fish, and some a fossil of vegetable origin.

BEEBLING is a finishing mechanical process applied originally to linen shirting, and afterwards to cotton shirting, in imitation of linen, to give the cloth a hard and wiry look, by flattening the yarn irregularly in an angled manner. This is done by the rising and falling of upright wooden stampers, placed close together in a row, with their square butts resting on a roller over which the cloth passes under them, doubled in a particular way so as to give the yarn an angled appearance when struck. The stampers are worked by the rotation of a horizontal shaft, acting with tapets, like the cylinder of a barrel-organ.

Linen weft is likewise beetled, but by hand-hammering, on a large flat stone, with a wooden mallet, to soften the yarn for easiness of working it, or 'getting it on,' in the language of the craft, in weaving. Beetling is likewise a process in flax-dressing, to separate the woody from the flexible fibres of the plant. See **FLAX-DRESSING**.

BEEBLE-ROOT SUGAR. See **SUGAR**. The sugar obtained from the beet is similar to cane-sugar, but inferior in sweetening power. Beet-root contains on an average about 10 per cent. of saccharine matter

(sugar-cane, 18 per cent.); of the varieties, the white Schleswic beet is the richest. To obtain the sugar, the roots, after being washed, are first rasped down by machines, so as to tear up the cells. The pulp is then put into bags, and the juice is squeezed out by presses. The juice is next treated with lime or sulphuric acid, to clarify it, and also filtered till no deposit is formed; after which it is boiled in large boilers to concentrate it. When it has attained a certain density (25° Beaumé), it is poured through flannel, and is now a dark-coloured sirup, which, in order to yield pure sugar, must be deprived of its colouring-matter and mucilage. This is effected by filtering it through animal charcoal or bone-black. The filtered juice is now treated with lime-water beat up with a little white of egg to a lather, till it is slightly alkaline, and is then further concentrated by boiling in copper pans, care being taken to stir and scum it all the while. When sufficiently concentrated, it is put into vessels, and allowed to stand several days in a warm room to crystallise; the uncrystallised part, or molasses, is then drained off, and what remains is raw sugar. This is still further refined by again dissolving and treating it with albumen and blood. In separating the crystallised from the uncrystallised part, centrifugal machines are now much used. Another improvement is the vacuum-pan, which allows the juice to be boiled down without burning. The molasses drained off from beet-root sugar has a disagreeable taste, and cannot be used for sweetening, like cane molasses.

About the middle of the 18th c., Marggraf, an apothecary in Berlin, drew attention to the sugar contained in beet-root; but Achard, the Prussian chemist, was the first who was tolerably successful in extracting it. Still, as only 2 or 3 per cent. of sugar was obtained, the product did not pay the cost, until Napoleon's continental system raised the price of sugar, and gave rise to improved methods of manufacturing it. Even after the fall of Napoleon, protective duties kept alive this manufacture in France; and when numerous improvements of method had raised the percentage of sugar realised to about 5 lb. from 100 lb. of beet, it took a fresh start (about 1825) in France and Belgium, was revived in Germany, and spread even to Russia. The falling off of the customs' duties on the import of colonial sugar obliged the German governments to impose a small duty on beet-sugar, which checked the manufacture for a time; but owing to the protective measures of the Zollverein, it is now more flourishing than ever, though it is not disputed that its prosperity is that of a hot-house plant, and is purchased at a loss. In McCulloch's *Commercial Dictionary*, the produce of beet-root sugar, on the continent of Europe, in 1853, is estimated at 230,000 tons, that of cane-sugar for the same year being 1,250,000 tons.

BEEFFANA, a corruption of *Epiphania* (Epiphany), is the name given in Italy to a singular custom prevailing on Three Kings' Day (see **BEAN KING'S FESTIVAL**), or Twelfth Night (q. v.). According to tradition, the B. was an old woman who, being busy cleaning the house when the three wise men of the East passed by on their way to offer their treasures to the infant Saviour, excused herself for not going out to see them on the ground that she would have an opportunity of doing so when they returned. They, however, went home by another way; and the B., not knowing this, has ever since been watching for their return. She is supposed to take a great interest in children, who on Twelfth Night are put earlier to bed, and a stocking of each is hung before the fire. Shortly, the cry '*Ecco la B.*' is raised; and the children, who have not gone to sleep, dart out of bed, and seize their stockings, in which each finds a

present bearing some proportion in value to his conduct during the year. If any one has been conspicuously ill behaved, he finds his stocking full of ashes—the method the B. takes of expressing her disapprobation. It was also customary in Italy, on Twelfth Night, to carry an effigy called the B. in procession through the streets amid great rejoicings; but this, which was probably the relic of the celebration of a middle-age 'mystery,' has fallen greatly into disuse. The word is also used to awe naughty children.

BEFFROI, or BELFRY, was the name of a tower used in the military sieges of ancient and mediæval times. When a town was to be besieged, a movable tower, as high as the walls, was brought near it; and this tower was the beffroi. Its use is more than once spoken of by Cæsar in his account of his campaigns in Gaul. Froissart describes, with his usual spirit, a B. employed at the siege of the castle of Breteuil in 1356. At the siege of Jerusalem by the Crusaders, a B. was carried in pieces, put together just beyond bow-shot, and then pushed

Beffroi, or Breaching Tower.—From Grese's *Military Antiquities*.

on wheels to a proper position. The object of such towers was to cover the approach of troops. Sometimes they were pushed on by pressure, sometimes by capstans and ropes. The highest were on six or eight wheels, and had as many as twelve or fifteen stories or stages; but it was usual to limit the height to three or four stages. They were often covered with raw hides, to protect them from the flames of boiling grease and oil directed against them by the besieged; and there was a hinged drawbridge at the top, to let down upon the parapet of the wall, to aid in landing. The lower stage frequently had a ram (see BATTERING RAM); while the others were crowded with archers, arbalesters, and slingers; or there were bowmen on all the stages except the top, which had a storming or boarding party. During the wars under Charles I., the royalists made a B. to aid in the besieging of a town or castle in Herefordshire; it was higher than the defence-works, and was provided with loopholes, a bridge, &c.; but the Roundheads

captured it before it could be applied to use. Ducange thinks that the name of belfry (q. v.) given to a bell-tower, was derived from the warlike machine called the beffroi or belfry.

BEG, or BEY, a Turkish title, rather vague in its import, and commonly given to superior military officers, ship-captains, and distinguished foreigners. More strictly, it applies to the governor of a small district, who bears a horse-tail as a sign of his rank. The governor of Tunis has this title.—'Beglerbeg,' or, more correctly, Beilerbegi ('lord of lords'), is the title given to the governor of a province who bears three horse-tails as his badge of honour, and has authority over several begs, agas, &c. This superior title belongs to the governors of Rumelia, Anatolia, and Syria.

BEGAS, KARI, court-painter to the king of Prussia, professor and member of the Academy of Art in Berlin, was born there in 1794. He had been destined for the law, but early manifested a love for

art, and while at Bonn, received his first lessons in painting from Philippart. In 1811, he proceeded to Paris, and there spent eighteen months in the studio of the celebrated Gros. In 1815, Frederick-William III., on the occasion of his visit to Paris, bought a large original painting by B., 'Job surrounded by his Friends,' and gave him two commissions for different churches in Berlin. This led to his moving thither in 1818, and to his subsequently residing in Italy at the king's expense. On his return to Berlin in 1825, he painted a great many biblical subjects for churches, as well as other pictures. He died 23d November 1854. There are frescoes of colossal size by him in the new church of Sacrow, near Potsdam. He is especially distinguished for the animation and individuality of his portraits, and has painted for the king a gallery of celebrated authors and artists, including Humboldt, Schelling, &c. Several of his *genre* paintings have been rendered familiar by repeated engravings; and his works, in general, are eminent for expression, rich colouring, and a peculiarly clear *chiaro oscuro*.

BEGGAR, a person who solicits charitable aid from the public at large. The word is supposed to have some connection with the fraternity known as Beghards. See BEGUIN. The actual begging or solicitation of temporal aid became, however, so conspicuous a feature among these mendicant orders, that the term originally applied to their sacred duties seems at a very early period to have acquired its modern vulgar acceptance. There is no class of men who have had their lot and condition so varied by ethnical and social conditions as beggars. In a civilised industrious country, the B., to have any chance of relief, must manage to get it believed, whether it be true or false, that he is on the verge of want, and requires the solicited alms to keep him from starvation. Among oriental nations, on the other hand, beggars have often been a potent class, who may be rather considered as endowed with the privilege of taxing their fellow-creatures, than as objects of compassion. It has sometimes been supposed that a residue of this feeling of superiority characterises the mental physiology even of the mendicant of civilisation, and that, abject as he seems, he considers himself to some extent a privileged person, entitled to support from his fellows, without being amenable to the slavish drudgery by which the working-classes live. In Europe, during the middle ages, those doctrines of Christianity which are intended to teach us to abjure selfishness and worldly-mindedness, were exaggerated into a profession of total abstraction from worldly cares and pursuits. Hence arose the large body of religionists who, as hermits or members of the mendicant orders, lived on the contributions of others. In later times, the mendicant orders became the proudest and the richest of the clergy; but while the chiefs lived in affluence, the practices of the lower adherents fostered throughout Europe a system of mendicancy very inimical to civilisation and industrial progress. In Great Britain its evil results have been long felt, in the inveterate establishment of practices naturally out of harmony with the independent, industrious character of the British people. Ever since the Reformation, the British laws have had a death-struggle with the B.; but neither by the kindness of a liberal poor-law, nor by the severity of a merciless criminal code, have they been able to suppress him. When a country provides, as Britain does, that no one shall be permitted to starve, it would naturally be expected that the springs of miscellaneous charity would be dried. But it is not so, and it is indeed often plausibly urged, that entirely to supersede all acts of kindly generosity between man and man,

through rigid legal provisions, must lower the standard of human character, by depriving it of all opportunity for the exercise of the generous emotions. It is clear that, in the light of political economy, promiscuous charity is the most costly and most corrupting way of administering relief to indigence. No one will maintain that the idle B. on the street deserves such a luxurious table as the industrious mechanic cannot afford to himself. But, at the same time, no one who drops a coin in a beggar's hat can say how many others may be deposited there during the day, and whether the B. is merely drawing a wretched pittance, or deriving a good income. Begging being a trade, it is not always those who are the poorest, but those who are the most expert, who will practise it to the best results. The great object is to seize on and appropriate any characteristic calculated, whether permanently or temporarily, to excite compassion. Hence periods of general distress are often the harvest of the B., and his trade rises and falls in an inverse ratio with that of the working community. Times of prosperity are not favourable to him, because he is then told that there is plenty of work for him. But when workmen are dismissed in thousands, and their families turned on the road to seek alms, the professional beggars, by their superior skill and experience, will be sure to draw the prizes in the distribution. Many surprising statements have been made of the large incomes made by skilful professional beggars, especially in London. The most remarkable anecdotes on the subject will be found in Grose's *Olio*, whence they have often been repeated. Attempts have been made, but with questionable success, to set forth an average statement of the earnings in different departments of the B. trade. A good deal of information of this kind will be found in the *Report of the Constabulary Force Commission of 1839* (see p. 60, et seq.). It does not appear, however, that this trade is, like others, dependent on the law of supply and demand. The B. generally is so constitutionally, whether from hereditary or other physical causes. He has a loathing, even to horror, of steady systematic labour, and he will rather submit to all the hardships and privations of the wanderer's lot, than endure this dreaded evil.

BEGGARS, THE LAW OF ENGLAND RELATING TO, is regulated by the 5 Geo. IV. c. 83 (amended in regard to other points by the 1 and 2 Vict. c. 38). By the third section of the 5 Geo. IV. it is enacted that every person wandering abroad, or placing him or her self in any public place, street, highway, court, or passage, to beg or gather alms, or causing or procuring, or encouraging any child or children so to do, shall be deemed *an idle and disorderly person*; and it shall be lawful for any justice of the peace to commit such offender to the house of correction, there to be kept for any time not exceeding one calendar month. And by section 4, it is further provided that any person so convicted, and offending in the same way again, shall be deemed *a rogue and a vagabond*, and may be punished by being committed to the house of correction for three months, with hard labour; and by the same section, every person wandering abroad and endeavouring, by the exposure of wounds or deformities, to obtain or gather alms, and every person going about as a gatherer or collector of alms, or endeavouring to procure charitable contributions of any nature or kind under any false or fraudulent pretence, shall be deemed *a rogue and vagabond*, and be punishable as before mentioned. By section 15, however, of the same act, the visiting justices of any county jail, house of correction, or other prison, may grant certificates to persons

discharged, to receive alms on their route to their places of settlement; but if such persons shall act in a manner contrary to the directions or provisions of their certificates, or shall loiter upon their route, or shall deviate therefrom, they shall be deemed rogues and vagabonds, and punished accordingly; and section 16 enacts that no justice of the peace, mayor, or other magistrate, shall grant such a certificate, or for any purpose whatever, to persons other than those entitled thereto under the 43 Geo. III. c. 61, that is, by sections 1, 2, and 3 to soldiers, sailors, and mariners, and the wives of soldiers; and by section 4, it is provided that certificates or passes from the Admiralty or War-office to discharged sailors, soldiers, or marines, or to the families of sailors, soldiers, or marines serving abroad, or lately deceased, to carry them to their respective homes, shall have the same effect as certificates allowed by sections 1, 2, and 3.

The attempt or purpose to obtain money or alms by means of shows or entertainments on the streets of London, is also an offence under the Metropolitan Police Act, 2 and 3 Vict. c. 47, s. 54 (No. 14), and punishable by a fine of forty shillings.

In the Scotch law, there are many severe statutes of the Scotch Parliament against beggars and vagabonds, all of which, along with the proclamations of the Scotch Privy Council on the same subject, are renewed and ratified by the act 1698, c. 21, which forms the existing Scotch law in regard to beggars. The Scotch Poor-law Amendment Act, 8 and 9 Vict. c. 83, contains no provision on the subject. Anciently, in Scotland, legal permission to beg was given to certain sick and infirm poor persons, and in the reign of James V., a system of *tokens* for the same purpose was established.—See *Burn's Justice of the Peace*, vol. vi.; *Charnock's Police Guide*, *Dunlop's Parochial Law of Scotland*, *Lorimer's Hand-book of the Scotch Law*, and the works and authorities referred to in these publications.

BEGGAR-MY-NEIGHBOUR, a game at cards usually played by two persons, between whom the cards are divided. Holding their cards with the backs upwards, the players lay down a card alternately, until an honour is played, which is paid for by the adversary—four cards for an ace, three for a king, two for a queen, and one for a knave; such payment being made, the winner lifts the trick. If, however, an honour should be laid down during the payment, then the opposite party must pay for that in the same way; and so on, till a payment is made without an honour. The game is played chiefly by children.

BEGHARMI, or **BAGIRMI**, a country in Central Africa, bounded on the N. by Lake Tsad; on the W. by the Shari, or Great River, which divides it from the kingdom of Bornou; and on the E. by the Waday kingdom. It extends southward to about lat. 10° N. Its greatest length is about 240 miles, and its breadth 150. The whole of B. Proper is flat, with a slight inclination towards the north—its general elevation being about 1000 feet above the level of the sea. The outlying provinces in the south-east are slightly mountainous. B. has three considerable rivers flowing through and along its borders—the Bénuwé, Logon, and Shari; the last of which, augmented by the Logon, is upwards of 600 yards across at Melé. There is, in general, however, the utmost scarcity of water in the country, and the inhabitants guard their wells with jealous care. The soil is partly composed of sand, and partly of lime, and produces the grain and fruit common to countries of Central Africa. Worms and ants are very destructive to the crops. The ants appear to be a perfect pest. Dr Barth describes them as eating through

his matting and carpeting, and he had the utmost difficulty in preserving his goods from entire destruction by them. The total population is about a million and a half. From the numerous deserted villages with which the traveller constantly meets, the population would appear to have been much greater at one time. Mohammedanism has been introduced among them, but many are still pagans, and all are grossly superstitious. The only industrial arts are weaving and dyeing. Physically, they are a fine race of people, superior to the tribes around them, the women being especially handsome. The men are subject to a peculiar disease in the little toe, called 'mukárdam.' It seems to be caused by a worm, which eats the toe away. One in ten of the male population are said to have lost their little toes through this cause. The sultan is absolute in his own dominions, and several smaller states are tributary to him; and he, in his turn, is tributary to the more powerful ruler of Bornou. The fighting-force of the kingdom is about 13,000 men. Masena (q. v.), the capital, has a circumference of about 7 miles.—*Barth's Travels in Central Africa*.

BEGKOS, or **BEIKOS**, a large village of Anatolia, on the Bosphorus, 8 miles north-north-east of Scutari, said to be the locality of the contest between Pollux and Amycus, in which the latter was killed. See **ARGONAUTS**. At the commencement of the Crimean war, the Allied fleets anchored in B. Bay, prior to their entering the Black Sea in January 1854.

BEGLERBEG. See **BEG**.

BEGONIA'CEÆ, a natural order of exogenous plants, the place of which in the system is doubtful, but is supposed by Lindley to be near *Cucurbitaceæ* (q. v.). The B. are herbaceous or suffruticose plants, with alternate leaves, which are oblique at the base, and have large dry stipules. The flowers are in cymes, unisexual, the perianth coloured, with four unequal divisions in the male flowers, and five or eight in the female; the stamens are numerous; the fruit is membranous, winged, 3-celled, bursting by slits at the base, the seeds minute.—The order contains about 160 known species, all of which have pink flowers. They are almost all tropical plants, and some of them are often to be seen in British hot-houses; but a small species of *Begonia* ascends the Himalaya to at least 11,500 feet, often growing on the trunks of trees. The leaves of the *Begonias* have a reddish tinge. The leaves and young stems are succulent and acid, and those of *B. Malabarica*, *B. tuberosa*, and other species, are used as pot-herbs, or in tarts. The juicy stalks of a large species found in Sikkim, at an elevation of five or six thousand feet, are mentioned by Dr Hooker as employed to make a pleasant acid sauce. This, and the small Himalayan species already mentioned, would probably succeed in the climate of Britain. The roots of some are used in their native countries as astringents, and some of the Mexican species are used as drastic purgatives.

BEG-SHEHR, a fresh-water lake of Asia Minor, Karamania, 44 miles south-west of Koniye, presumed to be the ancient *Caraltis*. It is about 20 miles long, and from 5 to 10 miles broad. It contains many islands, and discharges itself by a river of the same name into Lake Soglah. On its east and north shores are the towns of Begshehr and Kereli, the old *Caraltis*, which issued imperial coins, and which is also supposed to have occupied the site of Pamphylia.

BEGTASHI, a religious order in the Ottoman empire, which had its origin in the 14th c. The name is believed to be derived from that of a

celebrated dervise, Hadji Begtash, to whom also the order appears to owe its institution. The members use secret signs and pass-words as means of recognition, in the same way as is done by the masonic orders, some of them indeed appearing to be identical with those of freemasonry. Although numbering many thousands of influential persons in its ranks, the society does not appear to exercise any material influence in the religion or politics of Turkey.

BEGUINES, BEGUINÆ, or BEGUTÆ, the name of the earliest of all lay societies of women united for pious purposes. The reason of their origin is not quite certain, but it is usually attributed—in part, at least—to the disproportion in the numbers of men and women which was occasioned by the Crusades. These wars had robbed Christendom of thousands of its most vigorous sons, and left multitudes of widows and maidens, to whom life had henceforth something of a solemn and sorrowful aspect, and who therefore betook themselves, in earnest and affectionate piety, to the charities and duties of religion. The origin of the word is doubtful. The popular tradition of Brabant since the 17th c., that a St Begga, daughter of Pepin, and sister of St Gertrude, founded, in 696, the first sisterhood of B. at Namur, has no historical basis. Hallmann has also shewn that the supposed oldest document of the B. (1065), giving an account of their establishment at Vilvorde, near Brussels, is unauthentic. The most probable account is, that a priest named Lambert le Bègue, or Le Bèghe, i. e., the Stammerer, about the year 1180, founded, in Liege, a society of pious women, who were called by his name. The B. were not restricted by vows, nor did they follow the rules of any order, but were united under a *supérieure* for the exercise of piety and benevolence, and lived generally in separate small cottages, which, collectively, formed the *Beguinagium*, or '*vineyard*,' as it was scripturally termed. Their establishments were often enriched by liberal donations. A church, a hospital, and a house of reception or common entertainment, generally belonged to every community of Beguines. The sisters were distinguished from the rest of the laity only by their diligence and devotedness, piety, modesty, and zeal for the purity of youthful education. Societies of B. flourished greatly during the 12th and 13th centuries, when they spread themselves over France and Germany. Among the most important were those in Hamburg, Lübeck, Regensburg, Magdeburg, Leipsic, Goslar, Rochlitz, and Görlitz. As the pietists of the middle ages, the B. were often subjected to persecution by the mendicant orders of friars; but, on account of their practical usefulness, were sheltered by the pope and councils as well as by secular authorities. In the 13th and 14th centuries, the B. became united with the persecuted spiritualists among the Franciscans (*Fratricelles*), and with the sect of the 'Brethren and Sisters of the Free Spirit.' Hence arose certain heresies, which, of course, occasioned interference on the part of the Inquisition; and on account of certain immoralities, a synod held at Fritzlur required that all candidates must be forty years old before they could enter a society of Beguines. These sisterhoods maintained their position in Germany and the Netherlands longer than in other countries. In Holland, they existed at the close of the 18th c.; and in the present day we find here and there so-called *Beguinen-häuser* (Beguine-houses) in Germany; but they are now nothing more than almshouses for poor spinsters. At Ghent, there is still a celebrated institution of B., numbering as many as 600 sisters, besides 200 *locataires*, or occasional inmates. Their houses form a kind of distinct little town, called the Bèguinage, which,

though environed by a wall, is open to the visits of strangers. Living here a life of retirement and piety, the B., in their simple dark dresses, go out as nurses to the hospital, and perform other acts of kindness among the poor. As above stated, they are under no monastic vow, but having attached themselves to the sisterhood, it is their boast that none is known to have quitted it. There are houses of B. also at Antwerp, Mechlin, and Bruges; and in 1854, one was established in France, at Castelnaudry, in the department of Ande.

BEGHARDS (Ger. *beghren*, to seek with importunity). Societies of laymen styling themselves B., first appeared in Germany, the Netherlands, and the south of France in the beginning of the 13th c., and were known in Italy as *Beachi* and *Bocasoti*; but they never obtained the reputation enjoyed by the Beguine sisterhood. Towards the end of the 13th c., they were commonly stigmatised as *bons garçons*, *boni pueri*, 'ministers' men,' 'bedesmen,' 'pietists,' 'vagabonds'—contemptuous titles, which expressed the low estimation in which they were held. On account of heretics of all sorts retreating into these half-spiritual communities, they were subjected to severe persecutions after 1367, and were gradually dispersed, or joined the orders of Dominicans and Franciscans. In the Netherlands, where they had preserved a better character than elsewhere, they maintained their ground longer, and were protected by Pope Innocent IV. (1245), in Brussels by Cardinal Hugo (1254), and in Liege by Pope Urban IV. (1261); but their communities disappeared in the 14th c.—See Mosheim, *De Beghards et Beguinibus* (Leip. 1790), and Hallmann's *Geschichte des Ursprungs der Bely. Beghinen* (History of the Origin of Beguines in Belgium), Berlin, 1843.

BEHAIM, MARTIN, a famous cosmographer, descended from a Bohemian family which settled in Nuremberg after the middle of the 13th c., and still flourishes there. B. was born in Nuremberg in 1430 (or, more probably, in 1436). He early entered into mercantile life, and went to Venice (1457), and to Mechlin, Antwerp, and Vienna (1477—1479), in pursuit of trade. In 1480, he was induced to go to Portugal, where he soon acquired a reputation as a skillful maker of maps. From 1484 to 1485, he accompanied the Portuguese navigator, Diego Cam, in a voyage of discovery along the west coast of Africa, and sailed as far as the mouth of the Zaire or Congo river, in lat. 22° S., which was 19½° further than had ever been previously reached. In 1486, B. sailed to Fayal, one of the Azore islands, where a Flemish colony had settled. Here he married the daughter of Jobst von Küster, governor of the colony. In 1490, he left Fayal, and returned to his native city, Nuremberg, where he resided from 1491 to 1493. During this stay, he constructed a large globe, principally from the writings of Ptolemy, Pliny, Strabo, Marco Polo, and Sir John Mandeville. It is still preserved by the family of B. in Nuremberg, and is a valuable record of the progress of discovery, though it indicates that B.'s geographical knowledge did not at that period extend beyond Japan on the east, and the Cape Verd Islands on the west. After travelling through Flanders and France, B. again resided in Fayal from 1494 to 1506, and then removed to Lisbon, where he died, July 29, 1509. The services rendered by B. to geographical discovery and the science of navigation were considerable, though, according to the latest investigations, there is no support for the theory that B. was the discoverer of America, or even that Columbus and Magelhaen were indebted to B. for guidance with regard to their discoveries. B. left

no works behind him except his maps and charts.—Murr's *Diplomatische Geschichte des Ritters von B.* (Nürm. 1778; 2d Aufl., 1801); and A. von Humboldt's *Examen Critique de l'Histoire de la Géographie du Nouveau Continent*, vol. i. (Par. 1826).

BEHEADING. See CAPITAL PUNISHMENT.

BEHISTU'N, or BISUTU'N (Lat. *Bagistanus*; Persian, *Baghistan*, Place of Gardens), a ruined town of the Persian province of Irak-Ajemi, 21 miles east of Kirmanshah, lat. 34° 18' N., long. 47° 30' E. B. is chiefly celebrated for a remarkable mountain, which on one side rises almost perpendicularly to the height of 1700 feet, and which was in ancient times sacred to Jupiter or to Ormuzd. According to Diodorus, Semiramis, on her march from Babylon to Ecbatana, in Media Magna, encamped near this rock, and having cut away and polished the lower part of it, had her own likeness and those of a hundred of her guards engraved on it. She further, according to the same historian, caused the following inscription in Assyrian letters to be cut in the rock: 'Semiramis having piled up one upon the other the trapping of the beasts of burden which accompanied her, ascended by these means from the plain to the top of the rock.' No trace of these inscriptions

is now to be found, and Sir Henry Rawlinson accounts for their absence by the supposition that they were destroyed 'by Khusrâv Parvîz when he was preparing to form of this long scarp'd surface the back wall of his palace.' Diodorus also mentions that Alexander the Great, on his way to Ecbatana from Susa, visited Behistun. But the rock is especially interesting for its cuneiform inscriptions (q. v.), which within recent years have been successfully deciphered by Sir H. Rawlinson. The principal inscription of B., executed by the command of Darius, is on the north extremity of the rock, at an elevation of 300 feet from the ground, where it could not have been engraved without the aid of scaffolding, and can now only be reached by the adventurous antiquary at considerable risk to his life. The labour of polishing the face of the rock, so as to fit it to receive the inscriptions, must have been very great. In places where the stone was defective, pieces were fitted in and fastened with molten lead with such extreme nicety, that only a careful scrutiny can detect the artifice. 'But the real wonder of the work,' says Sir H. Rawlinson, 'consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequalled in the world. After

Rock Inscriptions at Behistun.

the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on, to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. This varnish is of infinitely greater hardness than the limestone rock beneath it.' Washed down in some places by the rain of twenty-three centuries, it lies in consistent flakes like thin layers of lava on the foot-ledge; in others, where time has honey-combed the rock beneath, it adheres to the broken surface, still showing with sufficient distinctness the forms of the characters. The inscriptions—which are in the three forms of cuneiform writing, Persian, Babylonian, and Median—set forth the hereditary right of Darius to the throne of Persia, tracing his genealogy, through eight generations, up to Achaemenes; they then enumerate the provinces of his empire, and recount his triumphs

over the various rebels who rose against him during the first four years of his reign. The monarch himself is represented on the tablet with a bow in hand, and his foot upon the prostrate figure of a man, while nine rebels, chained together by the neck, stand humbly before him; behind him are two of his own warriors, and above him, another figure [see cut]. The Persian inscriptions which Sir H. Rawlinson has translated are contained in the five main columns numbered in cut 1, 2, 3, 4, 5. The first column contains 19 paragraphs, and 96 lines. Each paragraph after the first, which commences, 'I am Darius the Great King,' begins with, 'Says Darius the King.' The second column has the same number of lines in 16 paragraphs; the third, 92 lines and 14 paragraphs; the fourth has also 92 lines and 18 paragraphs; and the fifth, which appears to be a supplementary column, 35 lines. With the exception

of the first paragraph on the first column, all begin with, 'Says Darius the King.' The second, fourth, and fifth columns are much injured. Sir H. Rawlinson fixes the epoch of the sculpture at 516—515 B. C. See *Journal of Asiatic Society*, vol. x.

BEHME, JACOB. See BÖHME.

BEHN, APHARA, or APHRA, a licentious poetess and novelist of the reign of Charles II., the date of whose birth is unknown, was the daughter of Mr Johnson, a gentleman who, through his aristocratic connections, obtained the appointment of governor of Surinam. He died on his passage out, but the daughter pursued her journey, and resided at Surinam for some considerable time. Here she made the acquaintance of the celebrated slave Oronoko, who afterwards became the subject of one of her novels, and of a tragedy by Southern. Returning to England, she married Mr Behn, a merchant of Dutch extraction, was presented at court, where her personal appearance and vivacious freedom of manners pleased the 'Merry Monarch,' who deputed her to watch events in Flanders. She accordingly went to Antwerp, where she succeeded in discovering the intention of the Dutch to sail up the Thames and Medway, and communicated the secret to the English court; which, however, took no notice of the information, a slight which caused the fair agent to throw up state politics in disgust. On her return to England, she became intimate with all the profligate wits as well as the more staid scholars and poets of the time, and devoted herself to literature. Her numerous plays, poems, tales, letters, &c., are disfigured alike by general impurity of tone and indecency of language; and, in point of intellectual ability, none of her works appear deserving of the high praise lavished on them by Dryden, Cotton, Southern, and others. She died in 1689.

BEHRING, VITUS, the discoverer of the strait called after his name, was a native of Denmark, and entered as captain the newly formed navy of Peter the Great. From the ability and daring he had displayed in the wars with Sweden, he was appointed to conduct an expedition of discovery in the Sea of Kamtchatka. Sailing, in 1728, from a port on the east of Kamtchatka, he followed the coast northward until he believed, from the westward trending of the land, that he had reached the north-east point of Asia. It is now, however, believed that the cape which B. rounded was to the south of the real East Cape (in lat. 66°), and that he never actually reached the strait to which he has given his name. After some years spent in explorations on the coasts of Kamtchatka, Okhotsk, and the north of Siberia, he sailed in 1741 from Okhotsk towards the American continent, and sighting land about 58½° N. lat., he followed the coast northward for some distance; but sickness and storms obliged him to return, and being wrecked on the desert island of Awatska, since called Behring's Island, he died there, 8th December 1741. The previous year, he had founded the present settlement of Petropaulovski, in the Bay of Awatska.

BEHRING'S STRAIT separates Asia from America, and connects the Pacific with the Arctic Ocean. The proof that the two continents were not connected was given by the voyage of a Cossack named Deschnew, who, in 1648, sailed from a harbour in Siberia, in the Polar Ocean, into the Sea of Kamtchatka. But the whole voyage was long regarded by Europeans as a fable, until Behring's (q. v.) expedition in 1728. The strait has since been explored by Cook and Beechy. The narrowest part is near 66° lat., between East Cape in Asia, and Cape Prince of Wales in

America. The distance between the two capes, in a direction from north-west to south-east, is nearly 50 miles; about midway are three uninhabited islands. The greatest depth, some 30 fathoms, is towards the middle, and the water is shallower towards the American coast than the Asiatic. A very old Japanese map in the British Museum shews the leading features of this strait very accurately.—BEHRING'S SEA, a part of the North Pacific Ocean, commonly known as the Sea of Kamtchatka, bounded W. by Kamtchatka, E. by Russian America, S. by the Aleutian Islands, and N. by Behring's Strait. There are several islands in this sea, and fogs prevail constantly; but owing to the shallowness of the strait, there are no icebergs of magnitude to be met with.—BEHRING'S ISLAND, the most westerly of the Aleutian Islands in lat. 55° 22' N., long. 166° E. It has an area of 30 square miles, and is noteworthy as the place where Behring, the discoverer, was wrecked and died in 1741.

BELLA'N, a pass and town in the northern extremity of Syria, on the east shore of the Gulf of Iscanderoon. The pass of B. runs from south-west to north-east, between the mountain-ranges of Rhosus and Amanus, and is the common route from Cilicia into Syria. It is one of the two Amaian passes, supposed to be the lower one, mentioned by Cicero as capable of easy defence on account of their narrowness. There seems to be no doubt that, in the war between Darius and Alexander, the B. Pass was an important consideration to both commanders, but historians and geographers appear to be at variance as to the precise advantage taken of it in the struggle. The town of B. is situated near the summit-level of the pass, at an elevation of 1584 feet above the Mediterranean Sea. It has a population of about 5000, many of whom are wealthy, and is much esteemed for its salubrity and fine water, which is supplied by numerous aqueducts. Between the north-western foot of the pass and the sea, are caves and springs, supposed to be the site of the ancient Myriandrus. B. was the scene of a battle between the Egyptians and Turks in 1832, when the latter were defeated.

BEIRA, a Portuguese province, bounded N. by the provinces of Minho and Tras-os-Montes; S. by Estremadura and Alemtejo; E. by Spain; and W. by the Atlantic Ocean. It has an area of about 9800 square miles, and a population of 1,181,968. The surface is mountainous, and the soil on the plains sandy, and generally far from fertile. The mountain-slopes afford good pasturage for sheep and cattle. The products are corn, wine, oil, flax, and various kinds of fruit, and considerable attention is paid to the rearing of bees. Sea-salt is obtained at the coast. The river Douro waters the whole of its northern, and the Tagus, a portion of its southern, boundary. The Mondego and Vouga flow through its centre. Iron, coal, and marble are wrought in small quantity. There is little done in manufactures. The inhabitants are an industrious race of people. In 1835, the province was divided into Upper and Lower Beira, the former having Viséu and the latter Castel Branco for its capital.

BEIRAM, or BAIRAM, a Mohammedan festival somewhat analogous to Easter. It commences immediately after the fast of Ramadan, or Ramazan, which corresponds to Lent. Being one of the only two feasts the Moslems have in the year, it is looked forward to with great interest, the zest being enhanced by the previous abstinence. Its advent is announced at Constantinople by the discharge of artillery, the beating of drums, and blowing of trumpets. Properly, it should terminate in one day,

but the Moslems in the capital think it no offence to their abstemious prophet to carry the festivities over two days; while in other parts of Turkey and Persia, they are often protracted a week or more. Dances, music, processions, &c., in which the women are permitted greater indulgence than usual, form prominent features of the feast; and at this time the different orders of the empire pay homage to the sultan. Seventy days after, the Moslems celebrate their only other feast ('the festival of the sacrifices'), called the *lesser B.*, which is the day appointed by the Mecca pilgrims for slaying the victims, and was instituted in commemoration of the offering up of Isaac by Abraham. The lesser B. usually lasts three days, but it is not celebrated with anything like the pomp of the other. During the continuance of each of the festivals, only one religious service takes place. The Mohammedan year being the lunar one of 354 days, in the course of thirty-three years the festivals run through all the seasons.

BEIT is an Arabic word, signifying house, abode, or place, the equivalent of which in Hebrew is *Beth*. Thus, in the former language, we have *Beit-al-Harâm*, 'the house of the sanctuary,' or 'the sacred house;' and in the latter, *Beth-el*, 'house of God;' *Beth-any*, 'place of dates;' *Beth-abara*, 'place of fords,' &c.

BEIT-EL-FA'KIH (House of the Saint), a town of Tehama, on the Red Sea. Being the frontier town of the Egyptian government, it has a considerable trade in coffee, wax, gum, &c., which articles are exchanged for Indian piece goods and British shawls. It has a population of about 8000, and a citadel of some strength. The houses are built partly of mud and partly of brick, and roofed with branches of the date-tree. It is described by travellers as the hottest town in Tehama.

BEITULLAH (Arab., House of God), the spacious building or temple at Mecca, which contains the Kaaba. See MECCA and KAABA.

BEJA (the *Pax Julia* of the ancients), a town in the province of Alentejo, Portugal, 36 miles south-west of Evora, with a population of 5300. It is fortified, its walls being flanked by 40 towers, has a castle and a cathedral, and manufactories of leather and earthenwares.

BEJAN, or BA'JAN, the name of the first or 'freshman' class in some at least of the Scotch, and of old in many continental universities. The word is believed to be derived from the French *bee-jaune*, or yellow neb, a term used to designate a nestling or unfledged bird. The levying of *bejaunia*, or payments for 'first-footing' by students on entering college, was forbidden by the statutes of the university of Orleans in 1365, and of the university of Toulouse in 1401. The election of an *Abbas Bejanorum*, or 'Abbot of the Greenhorns,' was prohibited by the statutes of the university of Paris in 1493. In the university of Vienna, the *bejan* was called *beanus*, a word of the same meaning, and no doubt of the same origin.

BEJAPUR, a deserted city in the presidency of Bombay, lat. 16° 50' N., and long. 75° 48' E. It is situated to the south-east of Bombay, Poonah, and Satara, at the respective distances of 245, 170, and 130 miles, being on an affluent of the Kistna or Krishna, which flows into the Bay of Bengal, and nearly touching the west border of the Nizam's territories. B. was for centuries the flourishing capital of a powerful kingdom, falling therewith under various dynasties in succession, Hindu and Mussulman, till, in 1686, it was captured by Aurungzebe. Thus stripped of its independence, B. speedily sank into the shadow of a mighty name, passing, during the early part of the 18th c., into the hands of the Mahrattas. On the overthrow of

the Peishwa in 1818, it was assigned by the British to the dependent Rajah of Satara; being resumed, however, by the donors on the extinction of the reigning family in 1848. Now that a gradual decay has done its worst, B., as its own mausoleum, presents a contrast perhaps unequalled in the world. Lofty walls of hewn stone, still entire, with an imposing background of cupolas and minarets, enclose the silent and desolate fragments of a city which is said to have contained 100,000 dwellings, and to have been divided into quarters that measured their circuit by leagues. With the exception of an ancient temple, the sole relic of aboriginal domination, the ruins are of Mohammedan origin, such as beautiful mosques, colossal tombs, and a fort of more than 6 miles in circuit, with an inner citadel. In addition to the architectural remains, one of the wonders of the place is, perhaps, the largest piece of brass ordnance in existence, cast at Ahmednuggur, where the mould may still be seen. Latterly, all these monuments of the instability of human grandeur have been carefully preserved, both the Rajah of Satara and the British government having done everything to prevent further decay and dilapidation.

BEKAA, the Cœle-Syria of the ancients, the 'Plain of Lebanon' of the Old Testament, and El Bekaa (the Valley) of the natives of Syria, is enclosed between the parallel ranges of Lebanon and Anti-Lebanon, which mountains it divides, and extends about 90 mdes from north to south, its greatest width being about 12 miles. It is the most rich and beautiful plain in Syria; but although the soil is good, and water abundant from the numerous mountain-springs, a very small portion of it is cultivated. It is very much frequented by the Arabs, who bring down their young horses in the spring-time to graze on the plain.

BEKE, CHARLES TRISTONE, a modern English traveller in Abyssinia, was born in London, October 10, 1800; received a commercial education; afterwards studied law in Lincoln's Inn, and devoted a great part of his attention to ancient history, philology, and ethnography. The results of these studies first appeared in his work, *Origines Biblicæ*, or researches in primeval history, vol. i., Lond. 1834. His historical and geographical studies of the East, led B. to consider the great importance of Abyssinia for intercourse with Central Africa; but his proposals to undertake an exploring journey were declined by the government and by several learned societies. Supported only by private individuals, he determined to proceed to Abyssinia; and joining there the party led by Major Harris, he distinguished himself by the exploration of Godsheen and the countries lying to the south, which were previously almost entirely unknown in Europe. The results of these researches appeared partly in several journals, and in *Abyssinia, a Statement of Facts*, &c. (2d ed., Lond. 1846). Having returned to Europe, he excited the attention of geographers by his publications: the *Essay on the Nile and its Tributaries*, (Lond. 1847); in *The Sources of the Nile in the Mountains of the Moon* (1848); *On the Sources of the Nile* (1849); and by his *Mémoire Justificatif en Réhabilitation des Pères Pæz et Lolo* (Paris, 1848). He became involved in a controversy with M. d'Abbadie by a *Letter to M. Daussey* (1849), and *An Inquiry into A. d'Abbadie's Journey to Kaffa* (1850), in which he attempted to shew that this said journey for discovery of the Nile's sources (1843—1844) was a mere fiction. Besides many essays on ethnography and geography, B. has published a treatise *On the Geographical Distribution of Languages in Abyssinia* (Edin. 1849).

BEKES, or **BEKESVAR**, a town of Hungary, capital of the county of the same name, and situated at the confluence of the Black and White Körös. Pop. 18,000, who do a trade in cattle, corn, and honey.

BEKKER, **IMMANUEL**, a German philologist, distinguished by his recensions of the texts of Greek and Roman classics, was born in Berlin, 1785; studied in Halle, 1803—1807, and was the most eminent pupil of F. A. Wolf. Afterwards, he was engaged at Paris on the *Corpus Inscriptionum Græcarum*. The results of his researches in the libraries of Italy (1817—1819) appear in his *Anecdota Græca* (3 vols., Berlin, 1814—1821), and his numerous recensions of texts derived solely from MSS., and independently of printed editions. The writers included in these recensions are Plato, the Attic orators, Aristotle, Sextus Empiricus, Thucydides, Theognis, Aristophanes, Pothius, the Scholia on the *Iliad*, &c. (He died July 1871.)

BEL AND **THE DRAGON**, an apocryphal book of the Old Testament. It does not seem to have been accepted as inspired by the Jewish Church, nor is there any proof that a Hebrew or Chaldee version of the story ever existed. Jerome considered it a 'fable,' an opinion in which most modern readers will coincide. It is, nevertheless, read for edification both in the Roman Catholic and Anglo-Catholic churches: in the former, on Ash Wednesday; in the latter, on the 23d of November. According to Jahn, the aim of the writer was 'to warn against the sin of idolatry some of his brethren who had embraced Egyptian superstitions.'

BELA, the name of four Hungarian kings of the family of Arpad.—**B. I.** (1061—1063) energetically suppressed the last attempt to restore heathenism, and by the introduction of a fixed standard of measures, weights, and coinage, virtually founded the commerce of Hungary. He was also the first to introduce the representative system into the diet, by appointing, in lieu of the collective nobility, two nobles only from each of the different counties.—**B. II.**, surnamed 'the Blind,' 1131—1141, was entirely under the guidance of his bloodthirsty spouse, Helena, and after her decease, drank himself to death.—**B. III.**, 1174—1196. Educated in Constantinople, he introduced Byzantine customs and culture into his own country, which was certainly favourable to its social development, though, on the other hand, his evident devotion to the Greek emperor Emmanuel threatened its political independence.—**B. IV.**, 1235—1270, son of that Andreas from whom the nobles extorted the 'Golden Bull,' Hungary's Magna Charta. His chief aim was to humble the nobility, and restore the royal power to its former proportions; and he thus roused a spirit of universal discontent, which led to a party among the nobles calling in the Austrian duke, Frederick II., to their aid; but, in the year 1236, he was conquered by B., and forced to pay tribute. Before long, however, the king had to seek a refuge with his discomfited foe; for the Mongols, who invaded Hungary in 1241, defeated him on the Sajó, and put him to flight. It was only after robbing him of all the treasure he had managed to save, and extorting from him three of his counties, that Frederick II. granted the royal fugitive a shelter in Austria, where he remained till the Mongols, having heard of the death of their khan, left the country they had devastated. B. now made it his special care, by rebuilding the destroyed villages, and inviting new settlers thither, to do away with the tokens of that terrible invasion; and he so far succeeded as to be able, in 1246, to repay Frederick's inhospitality by defeating him at Vienna, and to repulse a second attempt at

Mongolian invasion. He died in 1270, his last years having been embittered by an attempt at rebellion on the part of his son Stephen.

BELAYING, one of the many modes of fastening ropes on shipboard. It is effected by winding a rope, generally a part of the running rigging, round a piece of wood called a cleat or a kevel, or else round a belaying-pin, which is an ashen staff from twelve to sixteen inches in length.

BELBEY'S (ancient *Bubastis Agyria*), a town of 5000 inhabitants, situated on the east arm of the Nile, Lower Egypt, and 28 miles north-north-east of Cairo. It is enclosed by earthen ramparts, has numerous mosques, and is one of the stations on the route from Cairo to Suez, and from Egypt to Syria.

BELCHER, **SIR EDWARD**, a distinguished English naval officer, born in 1793, entered the navy in 1812 as a first-class volunteer, was soon made a midshipman, and in 1816 took part in the bombardment of Algiers. In 1825, B. was appointed assistant-surveyor to the expedition about to explore Behring's Strait under Captain Beechey; in 1829, he was raised to the rank of commander. 1836 saw him in command of the *Sulphur*, commissioned to explore the western coasts of America and the Indies. He was absent six years, in which time he had sailed round the world. During this voyage he rendered important services in the Canton river to Lord Gough, whose successes over the Chinese were greatly due to B.'s soundings and reconnaissances pushed into the interior. On his return, he published a narrative of the voyage; and in 1843, in consideration of his services, he was made a post-captain, and knighted. After being employed on surveying service in the East Indies, he was, in 1852, appointed to the command of the expedition sent out by government to search for Sir John Franklin. B. has published several other works besides the one already mentioned, including *The Last of the Arctic Voyages* (Lond. 1855); *Narrative of a Voyage to the East Indies* in 1843—1848; and *Horace Edward Brenton*, a novel (Lond. 1856).

BELCHITÉ, a town of Spain, in the province of Saragossa, about 22 miles south-south-east of the city of that name, celebrated as the place where, in June 18, 1809, the French, under Suchet, completely routed the Spanish under General Blake, capturing all their guns, 10 in number, with a loss of only 40 men.

BELEM, a town of Portugal, on the right bank of the Tagus, 2 miles south-west of Lisbon, of which it may be said to form a fashionable suburb. It has an iron foundry, a custom-house, and quarantine establishment, a tower defending the entrance of the river. It is historically interesting as the place from whence Vasco de Gama set sail on his voyage of oriental discovery. It was taken in November 1807 by the French, the royal family of Portugal embarking from its quay for Brazil as they entered. In 1833 it was occupied by Don Pedro's troops.

BELEM, or **PARA'**, a city of Brazil, on the right bank of the Para, the most southerly arm of the estuary of the Amazon. See **PARA**.

BELEMNITES (Gr. *belemnion*, a dart or arrow), an interesting genus of fossil cephalopodous *Mollusca*, the type of a family called *Belemnitidae*, to the whole of which the name B. is very generally extended, closely allied to the *Sepiadae*, or Cuttle (q. v.) family. No recent species of B. is known: fossil species are very numerous, and are found in all the oolitic and cretaceous strata, from the lowest lias to the upper chalk, some of which are filled with myriads of their

remains. These remains are generally those of the shell alone, which is now known to have been an internal shell, entirely included within the body of the animal, like that of the cuttle. The shell, as

Belemnites pistiliformis.

seen in the most perfect specimens, is double, consisting of a conical chambered portion (the *phragmocone*), inserted into a longer, solid, somewhat conical or tapering, and pointed sheath. The space between the phragmocone and sheath is occupied either with radiating fibres or conical layers. The chambers of the shell are connected by a tube (*siphuncle*), so that the animal probably had the power of ascending and descending rapidly in the water. Its arms are known, from some singularly perfect specimens, to have been furnished with horny hooks; and these it probably fixed upon a fish, and descended with its prey to the bottom, like the hooked calamaries (q. v.) of the present seas. Remains of an ink-bag, like that of the cuttle, have been found in the last and largest chambers of the B.; but remains of this chamber, which must have contained all the viscera of the animal, are very rarely preserved, the shell having been very thin at this part. The part most commonly found, and generally known by the name of belemnite, is the solid *muco*, or point into which the sheath was prolonged behind the chambered shell. These have received such popular names as *Thunder-balls*, *Petrified Fingers*, *Spectre-candles*, *Picks*, *Thunder-stones*, &c., from their form, or from the notions entertained of their nature and origin. B. appear to have been of very different sizes; in some of the largest, the mere *muco* is 20 inches long, and the entire animal, with its arms outstretched, must have been several feet in length.

BELFAST, the chief town of the county of Antrim and province of Ulster in Ireland. This great seaport stands at the embouchure of the Lagan, at the head of Belfast Lough, 12 miles from the Irish Sea, 101 north of Dublin, 36 north-east of Armagh, 130 south-west of Glasgow, and 150 north-west of Liverpool. The site is chiefly on an alluvial deposit not more than 6 feet above the sea-level, and reclaimed from the marshes of the Lagan. On the land-side, it is picturesquely bounded by the ridges of Divis (1567 feet high), and Cave Hill (1185 feet). The general aspect of B. is indicative of life and prosperity, exhibiting all the trade and manufacture of Glasgow and Manchester, with far less of their smoke and dirt. Many of the streets, especially in the White Linen Hall quarter, are well built and spacious. The mercantile quarter lies chiefly near the extensive and well-built quays. The manufactories are mostly on the rising-ground on the north and west of the town. Numerous villas sprinkle the northern shores of the bay, as well as the elevated suburb of Malone to the south. The chief public buildings are—Queen's College, a beautiful structure in the Tudor style, opened in 1849, with a revenue of £7000 from the consolidated fund; Royal Academical Institution, incorporated in 1810, affiliated to the London University, and comprising an elementary and collegiate department, and a school of design; Museum, Linen Hall, Commercial and Corn Exchanges, churches, and banks. The fine Botanic Gardens of the Natural History Society occupy 17 acres. B. is the chief seat of the trade and manufactures of Ireland, and is second only to

Dublin as an Irish port. The staple manufactures are linen and cotton. The linen manufacture dates from 1637. Cotton-spinning by machinery dates from 1777, and linen from 1806. In 1858, there were in the town and suburbs 33 steam-spinning mills, employing 32,000 hands, while the number of such mills in all Ireland was 76. There is a Royal Society in B. to promote the growth of flax in Ireland. The other chief branches of industry are linen and cotton weaving, bleaching, dyeing, calico-printing, and iron founding. There are many flour and oil mills, chemical works, breweries, ship-building, rope and sail-cloth yards. The inland trade is carried on by the Lagan, a canal, and three railways. The B. harbour improvements have, since 1831, cost £450,000; yet vessels drawing much above 15 feet of water have to discharge part of their cargoes at Garnoye on the Lough, 4 miles below Belfast. The chief exports are linen and cotton goods, grain, yarn, flax, tow, cattle, and provisions. In 1850, the imports were valued at £6,938,328, having doubled in 15 years, and the exports at £4,633,062. The registered shipping, in 1857, was 490 vessels, 85,377 tons. In 1858, 8420 vessels, of 1,293,399 tons, entered and cleared the port. The most important branch of commerce is the Channel trade, about 40 steamers plying regularly between B. and the chief ports of England and Scotland, besides Dublin and Derry. The foreign trade is also great. Pop., 1821, 37,000; 1851, 100,300. B. is governed by a corporation of 10 aldermen—one being mayor—and 30 councillors. It returns 2 members to parliament. B. was destroyed by Edward Bruce in the 14th c., but became an important town since 1604, receiving a charter in 1611. In the great civil war, the inhabitants at first joined the parliament, but afterwards became royalists. In reward of their loyalty to William III., the 'regium donum,' at first £1200 a year, was granted to the Presbyterian Synod of Ulster. (1871—pop. 174,394.)

BELFORT, or BEFORT, a town of France, in the department of the Haut Rhin. It is situated at the southern base of the Vosges, on the left bank of the Savoureuse, and is a fortress of the

1st class, having been fortified by the celebrated Vauban. B. has a superior tribunal, a commercial court, a board of customs, and public library. Pop., exclusive of garrison, 5284. Iron, paper, hats, printed calicoes, &c., are manufactured at B., which is the entrepôt of a great part of the French trade with Lorraine, Germany, and Switzerland. B. was ceded to France by Austria in 1648. Prior to that time, it was a place of little strength. B. was invested by the allies in January 1814.

BELFRY (Fr. *beffroi*), a word of doubtful origin; a bell-tower, or turret, usually forming part of a church, but sometimes detached from it—as at Evesham and Berkeley, in England, and still more frequently in Italy. See CAMPANILE. Where a church was built in a deep glen, the belfry was perched on a neighbouring height, as at St Feve and elsewhere in Cornwall, and at Ardchah and Aldbar in Scotland. At this last place, the bell was hung upon a tree, as was common enough in Scotland at the close of the 17th c. Where the B. consists of a mere turret, it is often called a *bell-gable* or *bell-cot*, and is always placed on the west end of the church; a smaller one being sometimes placed at the east end, which is for the sanctus bell, for which reason it is placed over the altar. Municipal belfries are more common on the continent than in this country. When the burghs began to rise into importance after the 12th c., they asserted their right to have bells to call the burghers together for

council or for action. Thus detached bellries arose in the heart of towns. At a later date, they often became part of the *maison de ville*, or town-house, as

Belfry or Bell-gable, Idbury, Oxfordshire

at Glasgow and Aberdeen, in this country; at St Quentin and Donai, in France; and at Brussels, in Belgium.

BELGÆ, the name given by Cæsar to the warlike tribes which in his time occupied that one of the great divisions of Gallia which embraced part of the basin of the Seine, the basin of the Somme, of the Scheldt, of the Maas, and of the Moselle, which itself belongs to the basin of the Rhine. Their country was level, containing no mountains of any height, except the Vosges in the south. The name seems to have originally designated several powerful tribes inhabiting the basin of the Seine, and to have been afterwards used by Cæsar as a general

821

appellation for all the peoples north of that river. These B. were, in all probability, chiefly of Celtic origin, but within their territories were to be found both pure and mixed Germans.

When South Britain was invaded by Cæsar, he found that B. from the opposite shores of Gaul had preceded him, and were settled in Kent and Sussex, having driven the aborigines into the interior. The B. in Britain resisted for nearly a century the Roman power, but were finally forced to yield to it. Cæsar regarded them as German, but they rather seem to have belonged to the Celtic portion of the Gallie Belgæ. Certainly, none of the names of their three chief towns are Germanic. *Aque Solis* (Bath) is Latin; *Ischalis* and *Venta* (Leicester and Winchester), British.

BELGAUM, the chief city of a district of the same name in the presidency of Bombay, situated to the east of the dividing ridge of the West Ghauts, at a height of about 2500 feet above the sea. Its lat. is 15° 50' N., and long. 74° 36' E., its distance to the north-west of Dharwar being 42 miles. B. possesses a fort, which, in 1818, was taken from the Peshwa by the British. Under its new masters, the place has made considerable progress. It has a superior institution for the education of native youths, which is supported at once by the neighbouring princes, the British government, and private individuals. This seminary, in 1853, was attended by more than 50 pupils of all grades. In 1848, the citizens spontaneously subscribed a considerable sum for the complete reconstruction of their roads and lanes—a liberality which, besides drawing forth a supplementary grant of public money, roused the emulation of adjacent towns and villages. B. is one of the principal military stations of the presidency, and as such it was, in 1857, the scene of plotting, if not of mutiny, in common with Kolapore, Poonah, Satara, &c. The district of B. contains 5405 square miles, and 1,025,882 inhabitants.

BELGIOJOSO, a town of Lombardy, North Italy, pleasantly situated in a fruitful plain between the Po and the Olona, 9 miles east of Pavia. It has a fine aqueduct and castle, in which Francis I. spent the night previous to the disastrous battle of Pavia, in which he was made prisoner. The Austrian general Gyalai made B. his head-quarters after his defeat at Magenta, June 4—5, 1859. Pop. 3000.
