Such were the famous Covenants, at one time enforced by civil penalties, and for which their adherents, under the name of Covenanters, fought and suffered in Scotland, between the Restoration and Revolution, maintaining to the last that both Covenants, notwithstanding certain rescissory acts of parliament, were still binding on the whole nation. At the Revolution, the two Covenants were set aside, and cannot be said to have now any practical effect in any part of the United Kingdom. As above stated, they have a place in the volume which comprehends the *Westminster Confession of Faith*, but for what reason, it is difficult to say; for the Church of Scotland does not make adherence to them obligatory on either clerical or lay members. Certain Scottish and Irish dissenters, however, still profess attachment to the Covenants, and on particular occasions renew their subscription of them. See CAMERONIANS. The obligations undertaken by the sovereign, and the modern acts of parliament abolishing religious tests on taking civil office, and admitting Roman Catholics, Nonconformists, and Jews to parliament, not to speak of public opinion, are totally at variance with the Covenants. It is customary in popular lectures on the Covenanters to overlook the fact, in compassion for their sufferings, that they contended for what is now quite adverse to the

principles of religious toleration. Yet, in so far as the manful struggle in which they were concerned helped to accelerate the Revolution, the history of the Covenanters must ever be associated with that of civil and religious liberty. W. C.

COVENT GARDEN (properly *Convent Garden*, from having been originally the garden of Westminster Abbey) is a square in London celebrated for its great market of fruit, vegetables, and flowers. In the 17th c., C. G. was a very fashionable quarter of the town—the residence of many eminent persons. The scene of one of Dryden's plays is laid here, and frequent allusions are made to the place in plays of Charles II.'s time. The market, now so famous, appears to have originated about 1656 in a few wooden sheds and stalls. C. G. is for a stranger one of the sights of London, and is seen to greatest advantage about three o'clock on a summer morning; Tuesday, Thursday, and Saturday being the principal days.

COVENTRY (Convent Town), a city, parliamentary and municipal borough, and manufacturing town in the north of Warwickshire, on the Sherbourne, an affluent of the Avon, 18½ miles east-south-east of Birmingham. It stands on a gentle eminence in a valley, with a ridge of hill on the south, and contains many old houses, with timbered fronts, projecting into narrow streets, and belonging to the 15th and 16th centuries. The modern part of C., however, is well, though not regularly built. The chief buildings are the churches, with imposing spires. St Michael's Church, built 1313—1395, is said to be the largest parish church in England, and is one of the noblest of the lighter Gothic structures. St Mary's Hall, built 1450, for the Guild, is one of the finest specimens of ornamental work in England, with grotesque carved oak roof, ancient tapestry, and great painted window. In the market-place formerly stood a rich hexagonal Gothic cross, 57 feet high, erected in the 16th c., in three stories, with exquisitely finished pillars, pinnacles, and niches, with statues of English kings and saints. Before the year 1760, the cross had fallen to decay, and in 1771, the remains of it were taken down and removed. The ancient walls, three miles in circuit round C., were demolished by Charles II. Pop. (1861) of municipal borough, 40,937. C. returns two members to parliament. The chief manufactures are ribbons and watches. There are large silk-dyeing works. C. is nearly in the centre, between the four great English ports, London, Bristol, Liverpool, and Hull, and has extensive canal communication with other parts of the country. It is a very ancient place. In 1044, Earl Leofric and his wife, Lady Godiva, founded here a magnificent Benedictine monastery. In memory of Godiva (q. v.), who is said to have ridden round the town naked, to free it from certain imposts laid on by her husband, curious and splendid processions are sometimes held in C. In the 15th c., religious mysteries or plays were often acted here by the Grey Friars before kings. Henry VIII. demolished the beautiful cathedral of C. Here occurred the famous meeting for the intended trial by battle between the Dukes of Norfolk and Hereford, immortalised in Shakspeare's *Richard II.* Two memorable parliaments were also held in the monastery of C. in the 15th century. The one contained no lawyers, while the other passed many attainders against the Duke of York, &c. In the 15th, 16th, and 17th centuries, C. was famous for woollens, broadcloths, caps, and blue thread bonnets. The Lammas Land lying around C., and comprising about 1100 acres, has been recently divided between the proprietors and the freemen, numbering (1862) 4193, in the proportion of about two-thirds to the

former, and one-third to the latter. C. was visited by the plague six times between 1350 and 1625. The phrase, 'to send to Coventry,' took its rise most probably from the derivation of the name C., and meant 'to send to a convent;' i.e., to shut out from society.

COVENTRY, SIR JOHN, has obtained a niche in English history from accidental circumstances. In the month of October 1670, he rose in parliament and asked a question relative to a measure before the House, which was taken as an unwarrantable reflection on the king's amours. Charles was furious, and sent some of his guards to watch in the streets where C. lived, and leave a mark upon him. C. was attacked one night, and had his nose cut to the bone. Parliament took notice of this atrocious outrage, and passed a bill known by the name of the COVENTRY ACT, making cutting and maiming a capital offence; but they had not courage sufficient to bring the king's bravoes to trial.

COVERDALE, MILES, an eminent English divine, was born in Yorkshire in 1487. He was educated at Cambridge by the Augustin friars, and becoming an Augustin monk, was ordained at Norwich. He appears, however, to have soon changed his religious opinions, and to have devoted himself earnestly to the work of the Reformation. Being abroad in 1532, he assisted Tyndale with his translation of the Scriptures, and three years afterwards appeared his own translation of the Bible, with a dedication by himself to Henry VIII. This was the first English Bible sanctioned by royal authority, as, indeed, it was the first complete translation of the Bible printed in the English language. The Psalms of this translation are those still used in the Book of Common Prayer. In 1538, C., with the consent of King Henry VIII., and with the permission of Francis I., went to Paris to superintend another English edition of the Scriptures, his reason for going to Paris being that paper and workmanship were there cheaper and better than in England. The inquisition, however, notwithstanding the royal licence of Francis, interfered, seized the whole impression, consisting of 2500 copies, and condemned them to the flames. But through the cupidity of one of their executive officers, who sold a considerable number of the heretical books to a haberdasher as waste paper, some copies were saved and brought to London along with the presses, types, &c., which had been employed in printing them. Several of the workmen also came over to London; and Grafton and Whitchurch, the noted printers of that day, were thus enabled to bring out in 1539, under C.'s superintendence, the *Great Bible*, commonly called *Cranmer's Bible*, on account of that prelate having written a preface to it. In 1551, C. was appointed to the see of Exeter, the duties of which high ecclesiastical office he discharged with great zeal, until the accession of Mary in 1553, when he was ejected, and thrown into prison, from which he was only released after two years' confinement, on the earnest intercession of the king of Denmark, whose interest was evoked by his chaplain, C.'s brother-in-law, and on the condition that he should leave the country. C. went to Denmark, and subsequently to Geneva, where he assisted in producing the *Geneva Translation of the Scriptures* (1557—1560). On the accession of Elizabeth, he returned to England, but certain notions concerning ecclesiastical ceremonies imbibed at Geneva operated against his preference in the church; and it was not until 1564 that he was collated to the rectory of St Magnus, London. Owing to age and infirmities,

he resigned this living in 1566, and died in about two years afterwards. C. was the author of several tracts designed to promote the Reformation, and made various translations from the works of the continental reformers. The tri-centenary of the issue of his Bible was celebrated throughout the English Church, October 4, 1835, and medals were struck in honour of the occasion.

COVERT WAY, or COVERED WAY, in Fortification, is a road or broad path outside the ditch of

Vertical Section of Defence-works.

a fortified place, between the counterscarp and the glacis. It is about 30 feet wide, and is sunk so far below the crest of the glacis, that soldiers standing upon it cannot be seen by the besiegers; hence the name of covert or hidden way. Sentinels, placed in the C. W., prevent all access of the enemy's spies to examine the ditch; and when musketeers mount on the banquette or raised platform on the side next the glacis, they can pour out a grazing fire on the enemy over the crest. The C. W. is broad enough to allow bodies of troops to form on it, either to act defensively or to make sorties; and to increase this accommodation, enlarged portions, called *places of arms*, are made at certain spots. In the annexed cut, representing a vertical section of the whole range of defence-works, from the rampart next the city to the glacis, the relation between the C. W. and the other works is clearly shewn. The *banquette* of the C. W. is here shewn to be about 3 feet high by 4 wide, and reached by a sloping ascent of 4 feet. A ground or horizontal plan of the C. W. is shewn in the wood-cut annexed to CURTAIN.

COVILHÃ, a town of Portugal in the province of Beira, about 40 miles west of Coimbra, picturesquely situated among the mountains of Estrella. It has a population of 7000, chiefly engaged in the manufacture of a brown cloth, worn all over Portugal, called saragoca. There are some sulphureous baths in the neighbourhood, recommended for nervous diseases.

COW. See OX, DAIRY.

Cow Parsnip Flower.

COW PARSNIP (*Heracleum*), a genus of plants of the natural order *Umbelliferae*, having petals bent

COW PLANT—COWLEY.

in at the middle, and flat compressed fruit. One species only is a native

Cow Parsnip Fruit.

*H. panaces*, which sometimes attains a height of 10 feet, and the root leaves are 3—5 feet long.

**COW PLANT** (*Gymnema lactiferum*), a perennial plant of the natural order *Asclepiadaceae*, a native of Ceylon; with erect stem, ovate leaves, and very short umbels; which has acquired a factitious celebrity from the statement made and often repeated that its milky juice is used as a substitute for milk, and that its leaves are boiled to supply the want of cream! But this, according to Sir J. E. Tennant, is altogether a mistake, and the name is derived merely from the appearance of the juice.

**COW TREE**, a name given to a number of species of tree of different natural orders, the bland milky juice of which is used instead of milk. They are all natives of tropical countries, and mostly belong to natural orders in which acidity is the general characteristic of the milky juice. Some of them belong to the natural order *Moraceae*, and are closely allied to the Fig; others to the natural order *Artocarpaceae*, one of which is the famous **PALO DE VACA** or **C. T.** of the Cordilleras and Caracas (*Galactodendron* referred to the genus *Brosimum*, see **BREAD-NUT**). Another is the **HVA-HVA** (*Tabernaemontana utilis*), a native of equatorial America, belonging to the natural order *Apocynaceae*. The **PALO DE VACA** grows in rocky situations, at an elevation in equatorial regions of about 3000 feet.

Cow Tree (*Galactodendron utile*), *utile*, now rather referred to the genus

*Brosimum*, see **BREAD-NUT**). Another is the **HVA-HVA** (*Tabernaemontana utilis*), a native of equatorial America, belonging to the natural order *Apocynaceae*.

The **PALO DE VACA** grows in rocky situations, at an elevation in equatorial regions of about 3000 feet.

Fruit of Cow Tree.

It is a lofty tree, with laurel-like leaves, 10—16 inches long, and very small flowers. For several months in the year, not a shower moistens its foliage, and its branches appear dead; but as soon as the trunk is pierced, there flows from it a copious

stream of sweet and nourishing milk. The milk flows most freely at sunrise. The natives are then to be seen hastening from all quarters with bowls to receive it. The milk has an agreeable odour and a viscosity which does not belong to the milk of animals; it becomes yellow in a short time, and thickens or forms a sort of cream at the surface, which gradually thickens into a cheesy consistency before it begins to putrefy. This milk is nutritious, and is much used by the negroes and Indians; but differs very materially in its composition from the milk of animals; more than one half being wax and fibrin; a little sugar, a salt of magnesia, and water, chiefly making up the rest.

The **HVA-HVA** also yields a copious milky juice, which is used in Demerara and elsewhere as a substitute for milk, and is very agreeable and nutritious.

**COW'AGE**, **COW'HAGE**, or **COW'ITCH**, consists of short, slender, brittle hairs, which grow on the outside of the pods of plants of the genus *Mucuna*, natives of the tropical parts of America and Asia. This genus belongs to the natural order *Leguminosae*, suborder *Papilionaceae*, and has a knotted, two-valved pod, divided by transverse partitions. The species are twining plants, shrubby or herbaceous, with leaves of three leaflets. That which yields most of the C. brought to Europe is *M. pruriens*, a native of the West Indies, with racemes of fine purple flowers, which have a disagreeable alliaceous smell, and pods about four inches long. *M. pruriens* of the East Indies, and *M. urens*, the Ox-eye Bean of the West Indies, yield C. of similar quality. The hairs readily stick in the skin, and cause intolerable itching. C. is used in medicine, acting mechanically in killing and expelling worms, particularly the species of *Ascaris* (q. v.). That it does not act on the inner surface of the intestinal canal, is supposed to be owing to the mucous secretion. It is generally administered in syrup, treacle, or honey.—Before the pods of C. plants are ripe, they are used as a vegetable like kidney-beans, and are very palatable.

**COW'BANE**. See **HEMLOCK**.

**COW'BERRY**. See **WHORTLEBERRY**.

**COW'BRIDGE**, a municipal and parliamentary borough in the south of Glamorganshire, on the Dŵl, 12 miles west of Cardiff. It chiefly consists of one long and wide street. It once had walls with three gates, built in the end of the 11th century. One of the gates, a Gothic structure, still remains. Pop. 1066. With Cardiff and Llantrissant, it returns one member to parliament.

**COWES**, WEST, a seaport and watering-place in the north corner of the Isle of Wight, on the west side of the mouth of the estuary of the Medina (here a third of a mile broad). It stands on a hill slope, and has a striking aspect from the sea. There are many elegant villas in the vicinity. C. has much trade, being the port of the Isle of Wight. It has daily steam communication with Southampton, from which it lies 10½ miles to the south-south-east, and with Portsmouth, from which it lies 11 miles to the west-south-west. At the angle formed by the Medina and the sea, is a small battery built by Henry VIII. C. is the head-quarters of the Royal Yacht Squadron and Club, who hold their annual regatta here. Many ships are built. Pop. 4786. In 1859, 2052 vessels, of 66,065 tons, entered and cleared the port.—EAST Cowes is situated on the east side of the mouth of the Medina, and 2 miles north-west of Osborne House, the marine residence of Queen Victoria.

**COWLEY**, ABRAHAM, was born in London in 1618. He was the son of a grocer, and was educated at Westminster School and Trinity College,

Cambridge. According to his own statement, he was made a poet by the perusal of Spenser, whose works were wont to lie in his mother's parlour. A volume of poems, entitled *Poetic Blossoms*, was published by him at the age of 15, and one of the pieces contained therein was written when he was 10 years old. At Cambridge he obtained distinction through the elegance of his translations; and while there, he composed the greater part of the *Davidis*, an epic in four books—a work which he never completed. He was attached to the court party, and, in consequence, was ejected from his college in 1633, after he had taken his degree of M.A. In 1646, he followed the queen to Paris, in which city he remained ten years; and on his return to England, being under suspicion, he was seized and bound in heavy securities for his future behaviour. In the same year, he published an edition of his poems, with a preface, in which certain passages appeared, supposed to have a political bearing, which were suppressed in subsequent editions. After the Restoration, he expected to obtain the mastership of the Savoy, but was disappointed. He subsequently obtained a lease of the queen's lands at Chertsey, in Surrey, whither he retired in 1665. He died in July 1667, in his 49th year, and was buried in Westminster Abbey, near Chancer and Spenser. In 1675, a monument was erected to his memory by the Duke of Buckingham.

Although almost forgotten now, the time was when C.'s poetry was considered equal to Shakspeare's or Spenser's. It certainly possesses merits of ingenuity and verbal brilliancy. He is often splendid, but it is the splendour of the rocket rather than of the glowworm or the star. His prose is more natural than his verse, and some of its passages reach a stately eloquence, reminding the reader of the magnificent prose of Milton.

COWLEY, HENRY RICHARD WELLESLEY, first Earl (his father being first Baron Cowley, better known as Sir Henry Wellesley), an English diplomatist of liberal opinions, was born in 1804. He early devoted himself to diplomatic pursuits. An attaché at Vienna in 1824, he was afterwards successively promoted to be secretary to the legation at Stuttgart, and to the embassy at Constantinople. Having acted as minister-plenipotentiary to Switzerland, and afterwards to Frankfurt, he was (1851) appointed minister to the Germanic Confederation, and in the following year he succeeded the Marquis of Normanby as ambassador at Paris. For this position he has displayed such eminent qualifications that he has ever since continued to hold the appointment, whether his party was in or out of office. Along with the Earl of Clarendon, he represented Great Britain at the Paris Congress of 1856; and it has been greatly owing to his tact and temper that the ill feeling that has occasionally oozed out since that time between the two countries has not resulted in more serious disagreement.

COW-PEN BIRD (*Molothrus pecoris*), also called Cow Bird, Cow Troopial, Cow Blackbird, Cow Bunting, &c., a bird nearly allied to the Baltimore Birds and Troopials, having a short, conical beak, and remarkable for its habit of depositing its eggs, like the cuckoo, in the nests of other birds. It is a native of North America, common in some of the southern states in winter, and migrating northward in spring. Great flocks are sometimes seen together. The C. B. is about seven inches in entire length, of glossy brownish black plumage. It derives its name from its frequenting cow-pens, to feed on the insects contained in, or attracted by the dung. It selects

for the reception of its eggs the nests of birds smaller than itself, and by an interesting provision of nature, its egg, which is not much larger than theirs, is hatched sooner, and theirs appear to be generally removed as added eggs.

COWPER, WILLIAM, an English poet, was born on the 26th November 1731, in the parsonage house of Great Berkhamstead. His father, who was chaplain to George II., married Ann, daughter of Roger Donne, Esq. of Ludham Hall, in Norfolk. This lady expired in childbirth in 1737, leaving two sons, William, the poet, and John. This event made a deep impression on C.'s mind; and the lines addressed to his mother's portrait have drawn more tears than any other poem in the English language.

C. was a delicate and sensitive child, and boyhood brought with it only deeper melancholy and depression. At the age of six he was placed at a considerable school, kept by a Dr Pitman, in Market Street, Hertfordshire. The period he spent here was very miserable, and laid the foundation of that settled gloom which oppressed him till death. It is to the remembrance of these wretched days that we are indebted for the fierce invective that burns in the somewhat one-sided *Tirocinium, or a Review of Schools*. C. completed his studies at Westminster School, and shortly after was articled to a Mr Chapman, an attorney in London.

After completing his three years' articles with Mr Chapman, C. went, in 1752, to reside in the Middle Temple. In 1754 he was called to the bar, but never practised. His father died in 1756, and left him a small patrimony. In 1759 he removed to the Inner Temple; and although at this period he expected to secure some legal appointment through the influence of his family, he hated law with a perfect hatred, and seldom opened a book that bore on his profession. Yet he was industrious enough: he scribbled poetry, read Homer, and, in conjunction with his brother, translated some of the books of the *Henriade*. Soon after his settlement in the Inner Temple, he was appointed a Commissioner of Bankrupts; but there is no reason to believe that he ever entered on the duties of his office. An influential relative now offered him the office of Clerk of the Journals of the House of Lords, which was accepted; but he, having to undergo an examination at the bar of the House, was seized with nervousness, and could not appear. At this period his misery was so great, that he meditated suicide, but fortunately failed to carry out his intentions for want of courage. In December 1763 he was removed to the house of Dr Cotton at St Albans—a prey to the deepest remorse.

C.'s pecuniary means had suffered considerably by the loss of his appointments, but his friends contrived to make up an income sufficient for his wants. After his removal from St Albans, he went to reside in the town of Huntingdon. Here he formed acquaintance with Mrs Unwin, the Mary of his poems—an acquaintance which ripened into the deepest friendship, and which subsisted till death. He went to reside with the Unwins, and enjoyed much tranquil happiness under that religious roof. When on a visit, in January 1773, to the Rev. Mr Newton, a friend of the Unwins, and a man of sincere piety, but, from the peculiar cast of his religious views, perhaps not the best physician to minister to a mind diseased, his malady returned. Mrs Unwin carefully tended him through the crisis of his delirium, and through his long and slow recovery. When convalescent, he betook himself to writing hymns along with Mr Newton, and to domesticating hares, with the particulars and little incidents of which amusement the world is pleasantly familiar. Mrs Unwin also suggested, as a subject suited to his

genius, *The Progress of Error*. C. set to work in December 1780, and by the following March had completed *Truth*, *Table-Talk*, *The Progress of Error*, and *Erpostulation*. Although the volume was completed in 1781, its publication was delayed till the following year.

In 1781, C. made the acquaintance of Lady Austen, who suggested to him *The Task*, urged him to translate *Homer*, and—what the world is perhaps still more grateful for—she related to him the history of John Gilpin. The story so seized C.'s fancy, that in the course of a single night he produced the poem which has tickled the midriffs of three generations. *The Task* was begun in the winter of 1783, and published in 1785. Its success was great, and C. began to be considered the greatest poet of his day. In 1784 he began the translation of *Homer*, which appeared in 1791. It was received with great applause. He had laboured hard, and had now to pay the penalty. The pen was the only weapon with which he could keep his constitutional malady at bay; but now, when seated at his desk, his genius would not answer the call. He began to hear again the voices and the whisperings which had afflicted him in earlier days. Mrs Unwin's faculties also became affected, and the two friends were groping in the same twilight, deepening for both into the darkness of death. They left Olney, and were received into the house of Mr Johnson, in Tuddenham, in Norfolk. Here Mrs Unwin died on the 17th December 1796. C. now fell into a state of utter dejection; in 1799, he was attacked by dropsy. He died on the 27th April 1800.

C. was a great innovator in English literature; he destroyed the sentimentalists led by Hayley, and the image-hunters headed by Darwin. His poetry is eminently healthy, natural, and unaffected. C. and Robert Burns we have to thank for bringing back nature to English poetry. Besides being a poet, C. was perhaps the most delightful letter-writer in the English language. Nothing can surpass the charm of his epistles—full of fun, gentle sarcasm, anecdote, acute remark, and a tender shadow of melancholy thrown over and toning down the whole. The best edition of C.'s works (accompanied by an admirable biography) is that of Southey, 15 vols. 12mo, Lond. 1837—1838.

**COWRY** (*Cypræa*), a genus of gasteropodous molluscs of the order *Pectinibranchiata*—the type of a family, *Cypræida*, to all of which the name C. is

Money Cowry.

often extended—having the margin of the mantle prolonged into a siphon, by which water is conveyed into the gill chamber, and a spiral convoluted shell, the spire visible in the young, but entirely concealed in the adult, and the outer lip then thickened and bent in. The aperture extends the whole length of the shell. The shells, called *Porcelain Shells* by the French and Germans, are almost entirely calcareous in their composition, are richly enamelled, and often very beautiful. They are most abundant, and attain their largest size in the seas of warm climates. Only a few very small species are found on the

British coasts. Some of the species are much prized by collectors of shells. The Money C. (*C. moneta*) is of commercial interest, from its general use as a substitute for coin in many parts of Asia and Africa. It is not of great beauty, is yellow or white, often with a yellow ring, about an inch long, and nearly as broad as long. It is found on the Indian coasts, and in particular abundance on those of the Maldivé Islands, and is one of their principal exports. In Bengal, 3200 cowries are reckoned equal to a rupee, so that a C. is about equal in value to one thirty-sixth of a farthing. Yet cowries to the value of 200,000 rupees are said to have been at one time imported annually into Bengal. Many tons of cowries are annually imported into Britain, to be used in trade with the west of Africa, and this importation began when it was in the slave-trade that they were employed.—To the family *Cypræida* belong the shells called *Poached Eggs* (*Ovulum*), the *Weaver's Shuttle Shell* (*Ovulum volca*), remarkable for its prolongation at both ends, &c. Fossils of this family are numerous in some strata, as in the *Bagshot Beds* (q. v.).

**COWSLIP** (*Primula veris*; see PRIMROSE), a common native of pastures in England and many other parts of Europe, although rare in Scotland, a delicate and modest little flower, a universal favourite, both for its beauty and its fragrance. The flowers are small, in an umbel at the top of the scape, the limb of the corolla short and concave. The flowers have sedative properties, and are sometimes used as an anodyne and anti-spasmodic. They are fermented with sugar to make *cowslip wine*, an agreeable and favourite soporific domestic medicine.—The name **VIRGINIAN COWSLIP** is given to the *Dodecatheon Meadia*, a perennial plant, also of the natural order *Primulaceæ*, a native of North America, with a stalk about 8 inches high, bearing an umbel of gracefully pendent lilac flowers, the petals reflexed over the calyx, the stamens and pistil long, and the anthers of a golden colour. It is very ornamental in the flower-border, flowering in the end of April or beginning of May.

Cowslip.

**COW-WHEAT** (*Mcclunpyrum*), a genus of plants of the natural order *Scrophulariaceæ*, having an oblong two-celled capsule, with a few seeds somewhat resembling grains of wheat. The species are natives of the temperate parts of the northern hemisphere, annual plants with opposite narrow leaves and yellow flowers, growing in woods, corn-fields, pastures, &c. Several are natives of England. They are said to be very fattening to cattle, and to give a yellow tinge and peculiar excellence to butter made from pastures in which they abound.

**COXE, WILLIAM**, a very industrious historical writer, was born in London, March 1747, and was educated at Cambridge. As tutor to the sons of several noblemen, he, at various times, spent many years on the continent, where he neglected no

opportunity of collecting information about the countries which he visited. The result appeared in many volumes of travels and history, all of which are characterised by close observation, care, and research; but the writing in general is far from sprightly. Among the best known of C.'s works is his *History of the House of Austria*, which is still a standard work. C. also wrote *History of the Kings of Spain of the House of Bourbon*, *Memoirs of the Duke of Marlborough*, *Memoirs of Sir Robert Walpole*, and *Memoirs of the Pelham Administration*, besides many contributions to our knowledge of the topography and social condition of several continental countries. C., who commenced his clerical life in 1771 as a curate at Denham, near Uxbridge, ended it as Archdeacon of Wilts, which appointment he obtained in 1805. He died June 1828. Several of his works have been published in Bohn's *Standard Library*.

COXIM, one of the head-waters of La Plata, rises in Matto Grosso, a frontier province of Brazil, towards Bolivia and Peru. After flowing first to the north-east, and then to the north-west, it enters the Taquari, itself a tributary of the Paragnay, in lat. 18° 24' S. The C. receives many affluents.

COYPU (*Myopotamus Coypu*), a rodent quadruped nearly allied to the beaver, with which it agrees in the number and character of its teeth, in its short limbs, in its feet having five toes each, the hinder feet webbed and the fore feet not webbed, and to a considerable extent in its habits; but from which it differs in the form of its skull, having a more elongated muzzle and a contracted palate, and in its

Coypu (*Myopotamus Coypu*).

slender tail resembling that of a mouse. It is the only known species of its genus, and inhabits great part of South America, on both sides of the Andes, burrowing in the banks of the rivers, and sometimes in forests near the sea-beach. It is very nearly equal in size to the beaver, has small ears, very long and stiff whiskers, and long hair mixed with dense and soft short hair, the upper parts beautifully pencilled with different shades of yellow, the sides and under parts lighter and more uniform in colour. The fur has become an important article of commerce, under the names of RACONDA (q. v.) and NUTRIA, the latter name signifying in Spanish an otter, having apparently been given to it through mistake, but being that chiefly in use in Britain.

CRAB, the popular name of all the crustaceans of the order *Decapoda* (the highest order of crustaceans, characterised by great concentration of the nervous system and corresponding general concentration, by five pair of thoracic limbs, and by having the gills enclosed in a special cavity on each side of

the thorax, covered by the carapace) and sub-order *Brachyoura* (characterised by the small size of the abdomen, which resembles a short tail curved under the thorax and appressed to it, all the most important viscera being included in the thorax), and extended also to some of the sub-order *Anomoura* (Purse-crabs, Hermit-crabs, &c., characterised by a condition of abdomen intermediate between that of the *Brachyoura* and that of the *Macroura*, or Long-tailed Decapod Crustaceans, such as the Lobster, Cray-fish, &c.). All the crabs, besides many other crustaceans, were comprehended in the Linnean genus *Cancer*; but the number of species is very great, and the *Brachyoura* alone are now arranged

Large edible Crab (*Cancer Pagurus*).

into many genera and even families. The different kinds of crabs differ very much in the form of the carapace (the back), which in some is orbicular or nearly so; in some, much broader than it is long; in others, longer than broad; in some, prolonged in front into a kind of beak, &c.; also in its smoothness, or roughness with hairs, tubercles, or spines; in the length of the legs, &c. The eyes are compound, with hexagonal facets, and are elevated on stalks, which are generally short, but sometimes considerably lengthened, and which have the power of motion, so as to turn the eye in different directions. The first pair of limbs are not used for locomotion, but exhibit in great perfection the characteristic claws or pincers (*chelae*) of the decapod crustaceans. Crabs are inhabitants of almost all seas; most of them, however, having their limbs formed for walking rather than for swimming, are found chiefly near the coast; some inhabiting comparatively deep water, and others abounding in those parts which are left by the receding tide, where they occur equally in the rock pools and among the moist sea-weeds. Some small kinds of crabs (*Pea Crabs*) are often found in the inside of mussels and other bivalve molluscs. Some crabs inhabit fresh water, particularly in the warmer parts of the world; and others, known as Land-crabs (q. v.), live among moist herbage, or burrow in sand or earth. Some have the last pair of limbs expanded at the extremity into a broad blade for swimming, and some have even all the four pair of limbs intended for locomotion thus expanded, and sometimes occur far out at sea. Some of the crabs, with very long legs, are known as Spider-crabs. Crabs moult or change their shell, not at fixed intervals or seasons, but according to the exigencies of their growth; the change being made with great frequency when they are very young, but rarely in advanced age; indeed, from the molluscs, and other animals sometimes found adhering to the carapace, it is inferred that the same covering is sometimes worn for a number of years.—The metamorphosis of crabs is noticed in the article CRUSTACEANS.—Crabs are interesting inmates of the aquarium, from their readiness in seizing food, their activity in tearing and eating it, their general habits, and, in particular, their pugnacity. The

number of specimens is apt, however, to be soon diminished by the stronger killing and eating the weaker.—Many kinds of crabs are used as articles of food in different parts of the world, as the Large Edible C. (*Cancer Pagurus*) and Small Edible C. (*Carcinus Maenas*) of the British shores. The latter is extremely common on all parts of the coast, but is not nearly so much esteemed as the former, which is much sought after, and is caught either in the holes of the rocks at low tide, or by means of a kind of trap, a basket which readily permits its entrance but not its escape, and which is baited with meat or animal garbage of some kind. In winter it seems to retire to deeper water. Its black claws and very broad carapace, arched at the sides, readily distinguish it from all other British species. It is sometimes nearly a foot in breadth. The claws of the Edible C. were formerly ground to powder and used as a medicine, having, however, no properties but those of carbonate of lime.

CRABBE, GEORGE, a late English popular poet, was born at Aldborough, in Suffolk, on the 24th December 1754. His father was a warehouse keeper, and collector of the salt-duties at Aldborough, and exerted himself to secure for his son a superior education. C. early exhibited a passion for all kinds of book-learning, with a decided bias towards poetry. After being tolerably grounded at school in mathematics and classics, he was, in his 14th year, apprenticed to a surgeon at Wickham Brook, near Bury St Edmunds; but he had no liking for the profession, and ultimately proceeded to London, where he arrived in 1780, with £3 in his pocket, to make a trial of literature. For a while he was very unfortunate. At last, when threatened with arrest for debt, he resolved to make his case known to Burke. He told Mr Lockhart, years after, 'the night after I delivered the letter at the door, I was in such a state of agitation that I walked Westminster Bridge backwards and forwards until daylight.' The great orator at once appointed an interview, looked over C.'s poetical compositions, suggested several alterations which were adopted, and finally took *The Library* and *The Village* to Mr Dodsley, by whom the first-named poem was published in 1781. C. went to reside at Beaconsfield with his generous and brilliant acquaintance, and while there met Fox, Sir Joshua Reynolds, and Lord Thurlow; the last of these invited the new celebrity to breakfast, and presented him with a bank-note for £100 at parting.

By the advice of Burke, C. entered into holy orders, and was ordained curate of his native place in 1782. Shortly after, he was appointed domestic chaplain to the Duke of Rutland, and took up his residence at Belvoir Castle. *The Village* appeared in 1783, and established the reputation of its author. Shortly after, Lord Thurlow presented him with two small livings in Dorsetshire; and now, finding himself above all fear of want, he married Miss Sarah Elmy, and entered into the enjoyment of the purest domestic happiness. In 1785, he left the castle, and took up his residence in the parsonage of Strathern; thereafter for many years he botanised, studied geology, wrote poems, saw—in hurried visits to London—the distinguished men of his time, and was courted by them, enjoying an uninterrupted course of happiness and honour.

*The Newspaper* appeared in 1785; in 1807, C. published *The Parish Register*; in 1810, *The Borough*; two years after, he produced his *Tales in Verse*; and in 1819, he gave to the world his *Tales of the Hall*. In 1813 his wife died, and shortly after he procured the living of Trowbridge, where for the remainder of his life he resided. In the autumn of 1822, he came to Edinburgh, and was

the guest of Sir Walter Scott. His health began to fail in 1828; he died on the 3d of February 1832, aged 78.

C. disdained all the luxuries of his art. He has no heroes with a Hyperion front, and no heroines radiant as Aurora. He worked with the delf, not with the porcelain of human clay. He concerns himself with wild smugglers, denizens of villages by the sea, full of ancient and fish-like smells; gypsies on the heath cooking the fowl purloined from the neighbouring barnyard, with tramps, vagabonds, and vagrants, and the inmates of the workhouse. On his page these unsavoury individuals live, carouse, curse, brawl, and die. He has pages stern as anything in *The Inferno*; many, droll as Hogarth's pictures; and one or two so sweet, and tender, and pathetic, that no man possessed of any sensibility can read them unmoved.

CRABETH, DIRK and WOUTER, the last surnamed the Elder, were two brothers, glass-painters, born (it is supposed) at Gouda in South Holland, and who flourished in the latter half of the 16th century. It seems Dirk visited France in his youth, whilst Wouter journeyed to Italy, where he studied the works of Raphael, as is evident from his productions. Wouter, it is said, surpassed his brother in drawing, grace, and clearness, while Dirk surpassed him again in colouring. They, however, were jealous of each other, and each concealed from the other the secrets of his processes. Their conjoint work in the church of St John at Gouda, is the masterpiece of the two brothers. Of the eleven painted windows in that church, seven are by Dirk, and four by Wouter. They were done between 1555 and 1571. Dirk died, it is believed, in 1601. It is unknown when Wouter died. The brothers were buried in the sanctuary they had so surpassingly illustrated.

CRACKED HEELS. From careless grooming, washing horses' legs and imperfectly drying them, permitting them to stand in accumulations of filth or exposed to draughts, the skin becomes inflamed, tender, itchy, thickened, and by and by cracked. An ichorous noisome discharge exudes, and lameness often results. In animals with round *gunny* legs, it is sometimes constitutional; underbred horses with rough hairy fetlocks present the majority of cases; white heels, being more delicate, are especially affected; whilst the hind limbs, exposed as they are to filth and cold, suffer most frequently. Cleanse carefully with tepid water; wash with a diluted solution of Goulard's Extract, or any other mild astringent; or dress occasionally with oxide of zinc ointment. Give, besides, a half-dose of physic, and a few mashies, carrots, swedes, or such laxative food, and where persistent, use diuretics (q. v.). When dry and irritable, poultice and apply glycerine before proceeding with astringents. In cold weather, and especially when the horse is beaten, interdiet washing the legs, except with tepid water, and enjoin careful drying.

CRA'CKLAN, a kind of chinaware, the glazing of which is purposely cracked in the kiln, as an ornament.

CRACOVIANNE (*krakowiak*), the national dance of the Polish peasantry around Cracow. It has a rather melancholy than lively melody in  $\frac{3}{4}$  time, and is accompanied by singing. The pair who lead off the dance often begin with only the music of their own voices, and are soon followed by others, and the charm of the dance consists much in the diverting movements by which they seem to chase and avoid each other. The Poles have a multitude of little ditties of two lines each, adapted to this music and dance, which generally contain some

allusion to natural phenomena, accompanied with some slight pleasantry.

**CRA-COW** (Pol. *Krakow*), recently the capital of a small Polish republic, and more anciently the capital of the kingdom of Poland, is a city situated on the left bank of the Vistula, where it becomes a navigable river, in a beautiful plain surrounded by an amphitheatre of gentle hills. Lat. 50° 4' N., long. 19° 52' E. Pop. about 38,000, of whom 13,000 are Jews. It contains 46 churches, 15 monasteries, 10 nunneries, and 7 Jewish synagogues. The ancient city of C. is a labyrinth of narrow, dark, and deserted streets, but contains many fine specimens of Gothic architecture in its churches and other edifices; and some handsome buildings are also to be seen in the more modern suburbs. The old walls have been converted into a promenade. In the midst of the houses rises the castle, a huge building of an imposing appearance. The cathedral contains the tombs of many of the Polish kings, and of some of the greatest men of the Polish nation. The university was founded in 1364, by Casimir the Great, whose design was carried into effect by Jagello and Hedwig in 1401. It was long the centre of light for Poland, but decayed under the influences of the Jesuits, till it ceased to exist. It was reorganised and reopened in 1817, and underwent important changes in 1833. It possesses a museum of natural history, a botanic garden, a library of more than 30,000 volumes, and many MSS. of great value in connection with Polish history. C. suffered terribly from a fire in 1850. Its manufactures are trilling, and its trade, at one time very extensive, is now very limited, and in the hands of the Jews, but is said to be reviving. C. is connected by railway with Vienna, Berlin, and Warsaw. Three miles west of the city is a vast tumulus to the memory of Kosciusko. It is composed of earth taken from all the patriotic battle-fields of Poland.

C. was founded by Krak, Prince of Poland, from whom it derives its name, about the year 700, became the capital of Poland in 1320, and continued to be so till 1609, when that honour was transferred to Warsaw by Sigismund III. It was taken by the Bohemians in 1039, by the Mongols in 1241, by the Swedes in 1655 and 1702, and by the Russians in 1768. On the third partition of Poland, in 1795, it was assigned to Austria. From 1809 to 1815 it formed part of the Duchy of Warsaw. The congress of Vienna established it as a republic, with a small territory containing about 140,000 inhabitants, under the protectorate of Russia, Prussia, and Austria. The territory bordered with that of each of these great powers. Internal dissensions between the nobles and the common people afforded a pretence for interference, and the sympathy shewn by the inhabitants of C. for the cause of Polish independence in 1830 and following years was made the ground of proceedings, which terminated in 1846 in the annexation of C. to the Austrian dominions, a measure alleged to be necessary for the security of the neighbouring states, but against which Britain and France protested. C. now forms part of the Austrian crown-land of Galicia. An extensive line of fortifications is being constructed around it by the Austrians, with numerous detached forts, and one immense fortress on a height commanding the city, whose outworks will extend over a space of about five miles. These works are intended as a barrier against the advance of Russia.

**CRAFT** is a general designation for lighters, hoys, barges, &c., employed in loading or unloading large ships. In the royal navy, the name *small C.* is sometimes given to vessels commanded by

lieutenants, such as cutters, schooners, gun-boats, &c. Also a term applied by seamen to any vessel whatever.

**CRAIG**, a local term given specially to those masses of shelly sand which have been used from very ancient times in agriculture to fertilise soils deficient in calcareous matter. Geologists have used it to characterise several groups of strata. See **CORALLINE CRAIG**, **MAMMALIFEROUS CRAIG**, **NORWICH CRAIG**, and **RED CRAIG**.

**CRAIG AND TAIL**, a term used to designate a peculiar hill conformation, in which a bold and precipitous front exists on one aspect of a hill, while the opposite is formed of a sloping declivity. Those who first observed this form of the surface, believed it was the effect of currents of water moving in the direction indicated by the C. and T.; but latterly there have been speculations calling in the aid of ice, though not excluding the presence of water also. Fine examples of this structure occur in and around Edinburgh, where the western current has left the bold 'Craig' facing the west and the 'Tail' sloping towards the east; as, for example, the Castle rock, precipitous and unapproachable on every side except to the east, where it has protected the shale and sandstone beds from erosion.

Castle Rock, Edinburgh.

The direction and progress of the current can easily be traced; rushing against the hard basalt of the Castle rock, it was turned aside, and continued its course eastward, hollowing out the Nor' Loch on the one side and the Cowgate valley on the other, until the influence of the rock being lost, and aided by the resistance of the Calton Hill and Salisbury Craigs, the currents again met in the valley at Holyrood, when the 'tail' entirely disappears.

**CRAIG, JOHN**, an eminent preacher of the Reformation, was born in Scotland about 1512. Having spent some time as a tutor in England, he returned to Scotland and entered the Dominican order, of which he had not long been a member when he fell under the suspicion of heresy, and was cast into prison. On his release, he travelled on the continent; and after some time was, through Cardinal Pole's influence, intrusted with the education of the novices in connection with the Dominican order at Bologna. While here, Calvin's *Institutes* fell in his way, and converted him to Protestant doctrines. Having openly avowed the change in his opinions, he was brought before the Inquisition, and sentenced to be burnt—a fate from which he was saved by the mob, on the death of Pope Paul IV., breaking open the prisons in Rome, and setting the prisoners at liberty. C. escaped to Vienna, and obtained some favour at the court of Maximilian II.; but the news of his being there reached Rome, and the Pope demanded his surrender as one condemned for heresy. The emperor, however, instead of complying with the request of his holiness, gave C. a safe-conduct out of Germany. He now returned to Scotland, and was appointed the colleague of John Knox in the parish church of Edinburgh. Thinking the marriage of Queen Mary and Bothwell contrary to the word of God, he, while holding this position, boldly refused to proclaim the ban. In 1572, C. was sent 'to illuminate the dark places' in

Forfarshire and Aberleenshire, and remained in the north until 1579, when he was appointed minister to King James VI. in Edinburgh. He now took a leading part in the affairs of the church, was the compiler of part of the Second Book of Discipline, and the writer of the National Covenant signed in 1580 by the king and his household. He was a man of great conscientiousness, and was not slow to oppose the proceedings of the court when he deemed them opposed to Scripture, and to speak wholesome but unpleasant truths to his majesty himself. He died December 1600.

CRAIG, THOMAS, author of the well-known *Treatise on the Feudal Law*, was born probably about 1538. What part of Scotland he was born in is not known. Educated first at St Andrews, he afterwards prosecuted his studies at Paris, and passed as an advocate at the Scottish bar in February 1563, and in that or the following year was appointed justice-depute to Arehibold Earl of Argyle, hereditary justice-general of Scotland. In literary pursuits, C. had distinguished himself above all his contemporaries, and while at the head of the criminal judicature of Scotland he did not neglect the *belles-lettres*, as was evidenced by an epithalamium on the queen's marriage with Darnley, and by a poem on the birth of James I. Besides his work on *Feudal Law*, C. wrote on the *Succession to the Throne of England*, in which he took a warm interest; a treatise on the union of Scotland and England, and one on *Homage*, vindicating Scotland from the charge of feudal dependence on England, which had been asserted by Hollinshed in his *Chronicles*, together with many poetical pieces. In the latter part of his life, C. acted as advocate for the Church of Scotland. He seems to have been high in favour with James VI., who wished to confer the honour of knighthood upon him; and when C. steadily refused, ordered that all persons should address him as if he really had accepted the honour. He died February 1608.

CRAIGLEITH STONE, a siliceous sandstone belonging to the carboniferous series, quarried at Craigleith, near Edinburgh, and largely used for building in that city, for which it is admirably adapted by its purity, durability, and the ease with which it can be wrought.

CRAIK, GEORGE LILLIE, is by birth a Scotchman. Born in Fifeshire in 1799, he was educated for the church at St Andrews University, but, preferring a literary career, he went to London in 1824. His first work of importance was the *Pursuit of Knowledge under Difficulties* (1831), forming part of the series of publications issued by the Society for the Diffusion of Useful Knowledge. He also contributed largely to the *Penny Cyclopaedia*. In 1839, C. became editor of the *Pictorial History of England*, some of the most valuable chapters of which were written by himself, and have since been enlarged and republished separately as independent works. Such are his *Sketches of the History of Literature and Learning in England from the Norman Conquest to the Present Time* (6 vols., 1844), and his *History of British Commerce from the Earliest Times* (3 vols., 1844). In 1849, C. was appointed to the chair of History and English Literature in Queen's College, Belfast, a situation which he still occupies. C. possesses an energetic and fruitful mind, his thinking is clear, his style accurate and pointed, and he is conscientious and careful in his statement of facts in no ordinary degree. Many of his slighter and more ephemeral works have contained suggestions in politics and social science which were both valuable and original, some of which were afterwards

appropriated by, or ascribed to, others. In the first class we may mention the idea of mutual citizenship; and in the second, that of the representation of minorities, which unquestionably originated with him. Between 1849—1852 appeared his *Romance of the Peerage*; in 1853, his *Outlines of the History of the English Language*, which has passed through three editions; and in 1857, his essays on *The English of Shakespeare*, a second edition of which was published about two years since.

CRAIL, a royal and parliamentary burgh and seaport in the 'East Neuk' of Fifeshire, 2 miles south-west of Fifeness, and 10 miles south-east of St Andrews. Pop. 1247. Along with St Andrews, East and West Anstruther, Cupar, Kiltrenny, and Pittenweem, it returns one member to parliament. C. was a town of some note in the middle ages, being then called Caryll. In 847 there was a skirmish with the Danes here, and at Fifeness there are still the traces of what is believed to have been a Danish encampment. There are traces of an old castle, in which David I. occasionally resided; of a priory college, and other adjuncts of an ecclesiastical establishment. The Established Church, though it has undergone many

Crail Church (before the restoration).

alterations, is still substantially the ancient structure, and the square tower, with the broach (q. v.) which springs from it, are in their original condition, and very perfect in form. It was after a sermon preached in this church by Knox in 1559, that his hearers rushed in an infuriated mob to St Andrews, and burnt the magnificent cathedral of the Episcopal metropolis. Archbishop Sharp was for some time minister of Crail. The harbour of C., though small, is safe; but there is a much more commodious site for a harbour in what is called Roome Bay, in the immediate neighbourhood, the desirableness of converting which into a harbour of refuge has often been urged on government. Could this improvement be effected, it is believed that C. would again become, as it was formerly, the great rendezvous for the herring-fishery. Even without this advantage, there has been a great revival in this branch of trade of late years, and fish is now cured to the value of £50,000 to £100,000 annually in the little fishing towns in this neighbourhood. Being a retired spot, with many traces of the well-being and good taste of earlier times still clinging to it, C. is eminently suited for a summer residence for sea-bathing purposes. Its bold coast offers pleasant rambles, and interesting excursions to the geologist

and botanist. The town is lighted with gas, possesses good shops and markets, a reading-room, lecture institute, &c.

**CRAKE** (*Crex*), a genus of birds of the rail family (*Rallidae*), differing from the true rails in having the bill shorter than the head and comparatively thick. The wings are also armed with a small concealed spine. The name is derived from the harsh call-note of the male. The best known species is the common CORN-CRAKE or LAND-RAIL (*C. pratensis*), the frequent call-note of which is heard from every field of corn or rye-grass in valleys and low grounds in the early part of summer, and is associated by almost every inhabitant of Britain with all that is pleasant in that pleasant season. The corn-crake is a very pretty bird, of a reddish-brown colour, marked with dark-brown in streaks along the middle of the feathers, lighter below; it has rather long legs and long toes; the tail is very short and pointed. It runs very swiftly, so as to be able sometimes to escape from a dog; but flies rather heavily, although it is a bird of passage, and is seen in Britain only in summer. It visits, in like manner, all the northern parts of Europe, and extends its migrations even to Iceland, spending the winter on the shores of the Mediterranean and in Africa.

Corn-Crake (*Crex pratensis*).

Its call-note may be so exactly imitated by passing the edge of the thumb-nail briskly along the points of the teeth of a small comb, that it can thus be decoyed within a short distance, although it is a very shy bird, and multitudes are familiar with its cry who never saw it in their lives. Its weight is ordinarily about six ounces. It is very highly esteemed for the table; and, according to Drayton, 'seldom comes but upon rich men's spits.' Two or three other species, very rare in Britain, but more common in the southern parts of Europe, are chiefly found in marshy grounds, and sometimes receive the name *SORA* (*Zapornia*). With them is ranked the *CAROLINA RAIL* or *SORA RAIL* (*C. Carolinus*) of North America, which spends its winters in the States near the Gulf of Mexico, but migrates northwards in summer, and is sometimes seen in vast numbers about marshes and the reedy margins of lakes and rivers, particularly in its migration southward in autumn. Its size is about equal to that of the corn-crake; and its colour is very similar, but with mingled short streaks of white. It is much esteemed for the table.

**CRA'MBÉ**, a genus of plants of the natural order (*Cruciferae*); having a pouch (*silicle*) of two unequal joints, of which the upper is globose and one-seeded, the lower abortive. The cotyledons (q. v.) are conduplicate. The species, which are not very numerous, are scattered over the world. One is a native of Britain, *C. maritima*, the well-known *SEA-KALE* (q. v.). Another, *C. Tartarica*, with much

divided leaves and a great fleshy root, a native of Hungary and other central parts of Europe and of Asia, is sometimes called *Tartar Bread*; and its root is eaten in the countries of which it is a native, either boiled, or more generally peeled and sliced with oil, vinegar, and salt.

**CRAMP**, an irregular, involuntary, and painful contraction of a voluntary muscle, without insensibility or other disturbance of the general system. C. is often the effect of cold, and has proved fatal to swimmers by attacking them suddenly when in the water. Otherwise it is a disease of little importance, and readily removed by warmth and friction, with regulated movement of the muscles affected. Cramps are a distressing symptom in cholera (q. v.), in which disease it has been proposed to treat them by applying a tight bandage or tourniquet (q. v.) to the affected limbs. See *SPASM*.

**CRAMP RINGS**, were rings which were supposed to cure cramp and the 'falling-sickness.' They are said to have originated as far back as the middle of the 11th c., in a ring presented by a pilgrim to Edward the Confessor, which, after that ruler's death, was preserved as a relic in Westminster Abbey, and was applied for the cure of epilepsy and cramp. Hence appears to have arisen the belief that rings blessed by English sovereigns were efficacious in such cases; and the custom of blessing for distribution large numbers of C. R. on Good Friday continued to exist down to the time of Queen Mary. The accomplished Lord Berners, ambassador to Spain in Henry VIII.'s time, writes from Saragossa to Cardinal Wolsey: 'If your grace remember me with some crampe ryngs ye shall doo a thing muche looked for; and I trust to bestow thaim well with Goddes grace.' The metal the rings were composed of was what formed the king's offering to the cross on Good Friday, usually either gold or silver. The superstitious belief in the curative property of C. R. made out of certain pieces of silver obtained in particular ways, still lingers in some of the less enlightened English counties.

**CRANACH**, *LUCAS*, a celebrated German painter, was born in the bishopric of Bamberg in the year 1472. Little is known of his early life, except that he was instructed in art by his father—that he visited Palestine in 1493 with the Elector Frederick the Wise of Saxony, who made him his court painter in 1504, at which period we find him in high reputation, especially noted for his facility. In 1508, the elector made him a grant of armorial bearings, having for crest a winged serpent. He made a journey into the Netherlands in 1509, and there drew a picture of Charles V.—the future emperor—then nine years old. C. seems to have acted as *factotum* at the court of the elector and his two successors, preparing for and directing the ceremonies and festivities, and knew besides how to follow other lucrative trades. In 1520 he bought an apothecary's business at Wittenberg, where he was also a bookseller and paper-maker, became councillor and chamberlain, and was twice chosen burgo-master of the town.

C. was closely bound up with the early reformers. He was the intimate friend of Luther, whose picture he several times painted. In 1530 he went to Augsburg to share the imprisonment of the elector, and returned with him to Saxony in 1552. C. died at Weimar, on the 16th October 1533, in the 81st year of his age, and was buried in the court church there. He had two sons, one of whom, Lucas, was known by the name of 'the younger Cranach,' an excellent colourist and portrait-painter.

C. has left behind him an unusually large number

of authentic pictures—indeed, he painted beyond his powers. He excelled in portraits, in painting animals, in fabulous and droll pieces, and was an excellent colourist: but failed in form, grace, and unity, and in the higher walks of art. His last and greatest work is an altar-piece in the church of Weimar—a mystical representation of the crucifixion. His peculiar humour is best seen in such pictures as his 'Samson and Delilah' and his Syrian scene containing 'Apollo and Diana.'

**CRANBERRY** (*Oxycoccus*), a genus of small evergreen shrubs of the natural order *Vaccineæ*, distinguished from the genus *Vaccinium* (see **WHORTLEBERRY**) by the wheel-shaped corolla, with segments rolled back and the filaments leaning to the pistil. The species are few, natives of

Cranberry (*Oxycoccus palustris*):

a, part of stem and branches, with roots, leaves, and flowers; b, a berry; c, transverse section of a berry.

the colder regions of the northern hemisphere. The fruit is acid, and is in great request for making tarts. The only British species is the Common C. (*O. palustris*, formerly *Vaccinium Oxycoccus*), a native also of the northern parts of Europe, Asia, and America. It grows in peaty bogs and marshy grounds, and is a small wiry shrub with creeping thread-like branches, and small oval leaves rolled back at the edges. The blossoms are small but beautiful, of a deep flesh colour. Large quantities of the fruit are collected in some places in the north of England, and in other countries, although the draining of bogs has now made it scarce where it was once plentiful. In Germany it is collected by means of a wooden comb, and preserved with sugar. In England, cranberries are often preserved in bottles closely corked or filled with pure water, in which they may be kept for a long time. They are an excellent addition to sea stores. Wine is made from them in Siberia, and a beverage made from them is sold in the streets of St Petersburg.—The AMERICAN C. (*O. macrocarpa*) is a much larger and more upright plant, with leaves much larger and less rolled back at the margin. The berries are also larger and of a brighter red. It is a native of North America, frequent in Canada, and as far south as Virginia, growing in bogs, and particularly in elevated situations and where the soil is sandy. The berries are collected by means of a rake. Large quantities of them are exported to Europe. Cranberries are imported into Britain from Russia and other parts of the continent. Both kinds may be cultivated in gardens, in a peat-soil kept very moist or round the margin of a pond, and the produce of a small space properly managed is so great, that it is surprising that a C. plot should

not be much more frequent.—The berries of the Red Whortleberry (*Vaccinium vitis idæea*) are sold under the name of cranberries in Aberdeen and other places, and are used in the same way.—A third species of C. (*O. erecta*, formerly *Vaccinium erythrocarpon*), a native of lofty mountains in Virginia and Carolina, is a shrub two feet high, and with a habit more like that of the whortleberries than of the other cranberries; it has a fruit remarkable for transparency and of exquisite flavour, and appears to deserve an attention and cultivation which it has not yet received.—The TASMANIAN C. is the fruit of *Astroloma humifusum*, a little shrub with trailing stems, leaves somewhat resembling those of juniper, and beautiful scarlet blossoms, which is found in all parts of Van Diemen's Land. It belongs to the natural order *Epacridaceæ*. The fruit is of a green or whitish colour, sometimes slightly red, about the size of a black currant, and consists of a viscid apple-flavoured pulp, enclosing a large seed.—*Styphelia ascendens*, a small prostrate Australian shrub of the same natural order, has a fruit very similar to this; and in New South Wales the name C. is likewise given to the red acid berries of *Lissanthe sapida*, a low evergreen shrub, with small white flowers, also belonging to *Epacridaceæ*.

**CRANBROOK**, a small town in the south of Kent, 30 miles south-west of Canterbury. It lies near the Crane, on an outlying ridge of the Hastings sand formation, and is the chief village of the Weald. Pop. 1652. It has a large hop business. It was once the centre of the clothing manufacture, introduced by the Flemings in the time of Edward III.; but this branch of industry has long since disappeared.

**CRANE**, a machine employed for the purpose of lifting weights. Cranes are of various kinds, but the most common consist of an upright revolving shaft, with a projecting arm or jib, having a fixed pulley at the extremity, over which is passed one end of the rope or chain to receive the weight, the other end being attached to a cylinder with wheel and pinion, by means of which the weight is raised to the required height. By the revolving motion of the upright portion, the load can be deposited on any spot within the sweep of the jib.

**CRANE** (*Grus*), a genus of birds of the order *Grallatores*, the type of the family *Gruidæ*. This

Crane (*Grus cinerea*).

family differs from herons, bitterns, storks, &c., in having the hind-toe placed higher on the leg than the front ones. It consists also of birds less addicted to marshy places, and which feed not only on animal, but, to a considerable extent, on vegetable food. They are all large birds, long legged, long necked,

and of powerful wing, although their wings are rounded and not elongated; and some of them performing great migrations, and flying at a prodigious height in the air. One of these is the COMMON C. (*G. cinerea*), which breeds in the northern parts of Europe and Asia, retiring in winter to tropical or sub-tropical regions. Flocks of cranes periodically pass over the southern and central countries of Europe, uttering their loud harsh cries in the air, and occasionally alighting to seek food in fields or marshes. The C., when standing, is about four feet in height; the prevailing colour is ash-gray, the face and throat nearly black, the wing primaries black. The tertial feathers of the wings are elongated, reaching beyond the ends of the primaries, and their webs are unconnected; they are varied and tipped with bluish-black, and are the well-known plumes once much used in ornamental head-dresses. The visits of the C. to Britain are now very rare, although in former times they were comparatively frequent. It feeds on roots, seeds, &c., as well as on worms, insects, reptiles, and even some of the smallest quadrupeds. It is much esteemed for the table.—There are several other species of Crane. The WHOOPING C. (*G. Americano*) is considerably larger than the common C., which it otherwise much resembles except in colour; its plumage, in its adult state, is pure white, the tips of the wings black. It spends the winter in the southern parts of North America. In summer it migrates far northwards, but rather in the interior than the eastern parts of the continent.—To the C. family belong also the Demoiselles (q. v.), with which, rather than with the true cranes, the Balearic Cranes or Balearicans are ranked.—Cranes use their bill as a dagger, and when wounded are dangerous to the eyes of a rash assailant.

**CRANE-FLY** (*Tipula*) a genus of dipterous (two-winged) insects of the family *Tipulidae*, to the whole of which the name C. is often extended, nearly allied to the Gnat family (*Culicidae*), which they

Crane-Fly (*Tipula oleracea*):

a, c, g; b, larva; c, pupa case as left by the insect, sticking out of the earth; d, perfect insect.

resemble in their beautifully feathered and tufted antennae, but from which they differ in having a comparatively short proboscis. The true crane-flies are also of comparatively large size. They have lanceolate spreading wings, and very long legs. One species (*T. oleracea*) is the well-known *Daddy* (or *Harry*, or *Peter*) *Long-legs*. This and other species abound in arable lands, gardens, meadows, &c., in summer; and their larvæ—remarkably tough

worms without legs, sometimes confounded with wire-worms by farmers—are extremely destructive to crops of various kinds, devouring the roots of corn and pasture grasses, potatoes, turnips, and almost all the plants ordinarily cultivated either in field or garden. Rolling of fields is useful in killing them; and soot, salt, and other applications are employed in gardens.

**CRANE'S-BILL.** See GERANIUM.

**CRANGANORE**, a maritime town of the district of Malabar on the west coast of Hindustan, stands at the mouth of a river of its own name, otherwise called the Aycotta. It is 19 miles to the north of Cochin, and 75 to the south of Calicut, being in lat. 10° 14' N., and long. 76° 18' E. At one time possessed by the Portuguese, it was taken from them by the Dutch about 1663; and after being purchased by the rajah of Travancore in 1789, and wrested from him by Tippoo Sultan in 1790, it was conceded by the latter to the British. But the more ancient history of the place is still more interesting, for here have existed from the 4th and 5th centuries respectively congregations of Jews and Christians.

**CRANGON.** See SHRIMP.

**CRANIUM.** See SKULL.

**CRANK**, in Machinery, is an arm or a bend on an axle or shaft, which may be driven by a connecting-rod or by the hand, its use being to convert

an alternating straight motion into a continuous revolution. A crank may have part of the shaft on both sides, so that one rod, S, may drive two wheels, W, W, as in the fig. There are two positions in a C. in which the connecting-rod exercises no power

whatever—viz., when the arm of the crank, C, is parallel to the connecting-rod, as in the fig., and again when the crank is at the opposite point of its course. A push or pull of the rod in such circumstances can only press the shaft against its bearings. The effect is greatest when the rod and the crank-arm are at right angles, and it decreases gradually on both sides of that position, until at the top and bottom it is reduced to nothing. In order to carry the C. over these *dead points*, as they are called, a fly-wheel is fixed on the shaft; this receives part of the force of the rod while at its best, acts as a reservoir, and by its stored-up momentum carries the shaft round when the rod is powerless.

**CRANMER**, THOMAS, one of the chief reformers of the English Church, and the first Protestant Archbishop of Canterbury, was born at Aslacton, in the county of Nottingham, on the 2d of July 1489. He was descended from an old Norman family, which is said to have come into England with William the Conqueror. In his 14th year, he went to Jesus College, Cambridge, of which he was elected a fellow in 1510. He devoted himself diligently to the study of the learned languages, and also to the study of Scripture. His mind seems to have been early interested in the writings of Erasmus, Luther, and Le Fevre, and especially in their interpretations of Scripture. In his 23d year, he married, and so lost his fellowship; but his wife dying about a year after marriage, he was restored to it by his college. In 1523, he took his degree of D.D., and was appointed lecturer on the theology. In 1528, during the prevalence of the sweating sickness in Cambridge, he retired with two pupils to Waltham Abbey: and Henry VIII., in company

with Gardiner and Fox, afterwards Bishops of Winchester and Hereford, happening to be in the neighbourhood, the event proved a turning-point in the life of Cranmer. The king was then seriously concerned about his divorce from Catharine of Aragon, and in conversation on the subject with Gardiner and Fox, Cranmer suggested that the question should be 'tried according to the word of God.' Fox having mentioned this suggestion to the king, Henry was greatly pleased, and 'swore by the mother of God, that man hath the right sow by the ear.' From this time, Henry never lost sight of Cranmer. He was asked to reduce his suggestion to writing, and to have it submitted to the European universities. After this he was appointed Archdeacon of Taunton, and one of the royal chaplains. He was also sent to Rome on a special embassy about the divorce, but met with little success. Subsequently, he was despatched to the Emperor on the same errand, and while in Germany, he married a second time, a niece of the German divine, Osiander. This took place in 1532; and shortly afterwards, on the death of Archbishop Warham, he was recalled to fill the vacant see. Under his auspices, Henry's divorce was speedily carried through, and C. married the king to Anne Boleyn, on the 28th May 1533. In Anne's subsequent disgrace, and again, in the affair of Anne of Cleves, the archbishop took a part not very creditable to him. His position was no doubt a difficult one; but his character was naturally pliable and timid, rather than resolved and consistent. The same spirit characterises the measures of religious reform which were promoted by him. On the one hand, he joined actively with Henry in restricting the power of the pope, and in suppressing the monasteries; but, on the other hand, he was no less active in persecuting men like Frith, Forrest, and others, who, on matters of religious faith, were disposed to advance further than himself or the king. He did what he could, however, to resist the reactionary movement which took place in 1539, and which is known by the institution of the 'Six Articles.' He was also instrumental in promoting the translation and circulation of the Scriptures. On Henry VIII.'s death, Cranmer was appointed one of the regents of the kingdom, and along with Latimer and others, largely contributed to the advance of the Protestant cause during the reign of Edward. He assisted in the compilation of the Service-book and the Articles of Religion. The latter are said to have been chiefly composed by him. He was also the author of four of the Homilies.

On the accession of Mary, he was committed to the Tower, along with Latimer and Ridley. In March 1554, they were removed to Oxford, and confined there in the common prison, called the Bocardo. Latimer and Ridley bore their cruel fate with magnanimous courage; but the spirit and principles of C. temporarily gave way under the severity of his sufferings. He was induced, in the hope of saving his life, to sign no fewer than six recantations; but his enemies were determined to be satisfied by nothing short of his death. On the 21st March 1556, he suffered martyrdom, as his fellow-reformers had done, opposite Balliol College. His courage returned at the end, and he died protesting his repentance for his unworthy weakness in changing his faith, and shewing an unexpected fortitude in the midst of the flames.

CRANNOGES, the name given in Ireland and in Scotland to the fortified islands in lakes which were in common use as dwelling-places and places of refuge among the Celtic inhabitants. The etymology of the word is uncertain, but it is believed to refer to the timber which was employed either in

the fortification of the island, or in the construction of the houses which were placed upon it.

The earliest notice of such lake-dwellings which has been observed, is in the pages of Herodotus (book v. chap. 16). Writing of the Persian invasion of Thrace and Macedonia under Darius—about 500 years before the Christian era, and less than 100 years before his own death—he relates how the satrap Megabazus, warring against the Pæonians, led certain tribes of them captive into Asia, but failed to conquer those who inhabited Lake Prasias. 'He sought, indeed,' says the historian, 'to subdue the dwellers upon the lake, but could not effect his purpose. Their manner of living is the following. Platforms, supported upon tall piles, stand in the middle of the lake, which are approached from the land by a single narrow bridge. At the first, the piles which bear up the platforms were fixed in their places by the whole body of the citizens; but since that time the custom which has prevailed about fixing them is this: They are brought from a hill called Orbelus, and every man drives in three for each wife that he marries. Now, the men have all many wives apiece, and this is the way in which they live. Each has his own hut, wherein he dwells, upon one of the platforms, and each has also a trap-door giving access to the lake beneath; and their wont is to tie their baby-children by the foot with a string, to save them from rolling into the water. They feed their horses and their other beasts upon fish, which abound in the lake to such a degree, that a man has only to open his trap-door, and to let down a basket by a rope into the water, and then to wait a very short time, when he draws it up quite full of them. The fish are of two kinds, which they call the paprax and the tilon.' The Lake Prasias of the Father of History seems to be the modern Lake Takinos, on the Strymon or Kara-sn, a river which, rising on the borders of Bulgaria, flows southward through Roumelia, and, after expanding its waters into a lake, falls into the Gulf of Contessa. The fish named by Herodotus have not been identified by naturalists; Lake Takinos abounds in carp, tench, and eels.

The island-dwellings of Lake Prasias met with comparatively little attention until archaeologists, quite recently, found the remains of similar habitations in other parts of Europe. The first discovery was made in Ireland in 1839, by Mr W. R. Wilde, one of the secretaries of the Royal Irish Academy. The small lake of Lagore, near Dunshaughlin, in the county of Meath, having been drained, a circular mound, which had been an island in its waters, was observed to be thickly strewn with bones. As these were to be carted away for manure, it was found to be an artificial structure. Its circumference, measuring 520 feet, was formed by upright piles of oak about 7 feet long, mortised into oak-planks laid flat upon the marl and sand at the bottom of the lake. The upright piles were tied together by cross-beams, and the space which they enclosed was divided into compartments by oak-beams, some of which had grooves, so as to allow panels to be driven down between them. The compartments thus formed were filled with bones and black peaty earth. Portions of a second tier of upright piles were observed rising from the first tier. The bones were ascertained to be those of several varieties of oxen, of swine, deer, goats, sheep, dogs, foxes, horses, and asses. Along with them were found a vast number of weapons, ornaments, and utensils, fashioned of stone, bone, wood, bronze, and iron; such as swords, knives, spears, javelins, daggers, whetstones, querns (or hand-mills), beads, pins, brooches, combs, horse-trappings, shears, chains, axes, pots, and bowls. On reference to the ancient annals,

in which Ireland is so rich, it was seen that, in 848 A. D., a hostile Irish chief 'plundered the island of Loch Gabhor [as Lagore was then written], and afterwards burned it, so that it was level with the ground;' and that again, in 933 A. D., 'the island of Loch Gabhor was pulled down' by the piratical Norsemen.

Mr Wilde's discovery at Lagore was followed by other discoveries of the same kind elsewhere in Ireland, so that in 1857 the existence of about fifty C. had been ascertained; and every succeeding year has seen an increase of the number. They shew several varieties of construction. The island at Lagore is a type of the purely artificial crannoge. But most frequently the crannoge was partly natural. An islet just level with the water, was raised artificially a foot or two above it. An islet too small to be a convenient habitation, or too easy of landing to be a place of defence, had its area artificially enlarged, or its banks artificially strengthened, generally by piles or stockades, but occasionally by heaps of stones. The space thus enclosed is generally a circle of from 60 to 80 feet in diameter; but in some cases the enclosed space is larger, and of an oval shape. The piles are generally of oak, mostly young trees, from four to nine inches broad, still bearing marks of the hatchet; usually a single row has been considered enough, but there are instances of two, and even of three rows. It would seem that originally the piles had risen several feet above the water, and it has been supposed that they were interlaced with branches placed horizontally, so as

to form a screen or breastwork. The area within the stockade is sometimes wholly or partially covered with a layer of round logs, from four to six feet long, having stones, clay, or gravel above them. Fragments of oak-framing, with mortises and cheeks cut in them, have been found within the piles. In almost every instance, a few flat stones, apparently serving as a hearth, have been observed near the middle of the enclosure: in several C., two or three hearths have been met with. In some cases, a causeway leads from the island to the mainland; but in general the crannoge was to be reached only by boat, and scarcely any crannoge has been discovered without the remains of a primitive canoe, hollowed out of the trunk of an oak, being found beside it. In at least one crannoge, a pier or jetty projected from the island; it was a double row of piles and stretchers, running parallel to each other at a distance of about eight feet, and supporting a platform of logs. On almost every crannoge one or two querns, (q. v.) have been found, along with bones of oxen, deer, goats, and swine, horns of cattle, deer, sheep, and goats, boars' tusks, and sharpening stones: fragments of pottery, and articles of stone, bone, horn, wood, glass, copper, bronze, brass, and iron, are of somewhat rarer occurrence. Many of the C. had been submerged by the gradual rise of the lakes in which they stood, so that their existence only became known as the great drainage-works of late years reduced the waters to their old level.

The accompanying woodcut shews a section (on the scale of 1 inch to 20 feet) of the crannoge in

Ardakillin Lough, near Stokestown, in the county of Roscommon. The uppermost line marks the highest level of the waters of the lake; the middle line, the common winter level; the third line, the common summer level. The upper surface of the crannoge was formed of a layer of loose stones, surrounded by a wall, partly supported by piles. The stones rested on the natural clay, peat, and boulders of the island, in digging through which strata of ashes, bones, and logs of timber were met with. The stockades were of oak; the oblique or slanting stockade shewn in the woodcut represents a girde of sheet-piling which quite encircled the crannoge.

The woodcut on the following page gives a ground-plan (on the scale of 1 inch to 20 feet) of one of two C. in Drumaleague Lough, in the county of Leitrim. The circle within the ring of stockades is 60 feet in diameter; in some places there are two, and in others, three rows of stockades; and within this outer ring, there are groups of piles, some of them arranged apparently for some special purpose. The oblong space in the middle, marked A, is covered by a rude platform of round logs, chiefly of alder, from four to six feet in length; it was probably the floor of the log-house, which was the chief or only dwelling-place on the islet. B shews where the hearth stood—a collection of stones, still retaining traces of fire; C marks a heap of stiff clay; D, the root of a large tree nearly buried in the peat, the surface of the wood being bevelled off with a hatchet, so as to form a sort of table, under which was found a heap of bones, apparently of deer and swine.

The Irish annals, it has been seen, make mention of C. as early as the 9th c., and they figure in history down to the middle of the 17th century. The crannoge of Lough Lynch, in Antrim, is shewn as the birthplace of Colkitt, a chief who figured in Montrose's wars, and has found a place in one of Milton's sonnets. The crannoge of Roughan Lake, near Dungannon, was the last retreat of Sir Pheilm O'Neil in 1641. Two years later, there is record of an attempt to flood the crannoge of Loughinsholin, in the county of Londonderry, by turning a stream into the lake, and damming up its outlet. This attempt failed; but in 1645 the garrison were compelled by hunger to give the crannoge to the flames, and make their escape. In 1567, an agent of the English government, who was asked what were the castles of the O'Neil, wrote in reply: 'For castles, he trusteth no point thereunto for his safety, as appeareth by the razing of the strongest castles of all his countries; and that fortification that he only dependeth upon is in certain fresh-water lochs in his country, which from the sea there comes neither ship nor boat to approach them: it is thought that there, in the said fortified islands, lieth all his plate (which is much), and money, prisoners, and gages [i. e., hostages]; which islands have in wars heretofore been attempted, and now of late again by the lord-deputy there, Sir Harry Sydney, which for want of means for safe conduct upon the water hath not prevailed.'

While archæologists were still exploring the C. of Ireland, structures of a similar kind were

## CRANNOGES.

discovered in the heart of the European continent. The winter of 1853—1854 was one of the driest that had been seen in Switzerland, and the lakes

the mud around them, found heaps of primitive weapons, tools, and utensils, made of stone and bone. Closer examination satisfied him that

the piles had supported a platform; that on this platform huts had been raised; and that after being thus occupied, probably for centuries, the structure had been destroyed by fire. The discovery in the Lake of Zurich of these *Keltische Pfahlbauten* (Celtic pile-buildings), as Dr Keller called them—*habitations lacustres* (lake-dwellings), as other Swiss archaeologists have termed them—was followed almost immediately by the discovery of erections of the same kind in other lakes of Switzerland. No fewer than from 30 to 40 have been found in the upper and lower lakes of Constance; as many as 30 in the Lake of Geneva; more than 20 in the Lake of Neuchâtel; 10 in the Lake of Bieme; besides others in the deep peat-bogs which surround the hill of Chamblon, in the Vallée de l'Orbe, and in the lakes of Morat, Inkwyl near Soleure, Moosseedorf near Bern, Pfaffikon near Zurich, Wauwyl near Lucerne, and Nussbammen in the canton of Thurgau. The site chosen for these lake-dwellings was generally a sunny and sheltered bay, with a gently shelving bottom of mud or clay. The piles, from four to ten inches

Ground-plan of Crannoge in Drumaleague Lough.

sank to a lower level than was ever known before. The inhabitants of the village of Meilen, on the Lake of Zurich, took advantage of this unusual subsidence to reclaim a piece of land from the lake. As the work went on, a learned antiquary, Dr Ferdinand Keller, discovered the remains of rows of deeply driven piles, and, imbedded in

in diameter, were rudely fashioned of whatever wood was at hand, oak, fir, ash, beech, birch, cherry, or apple. They were driven in a depth of not less than six or seven feet of water, at a distance of from 100 to 300 feet from the shore. They were ranged generally from one to two feet apart, in the form of a narrow parallelogram, having its longest side in a

Crannoge restored.

line with the edge of the lake. At Wangen, on the lower lake of Constance, the piles, from 30,000 to 40,000 in number, extend about 700 paces in length, and about 120 in breadth. At Morges, on the Lake of Geneva, the piles stretch 1200 feet in length, by 120 feet in width, so that they would have supported a platform with an area of about 18,000 feet, sufficiently capacious, according to the calculations of

M. Frederic Troyon of Lausanne, to contain 316 huts, with a population of 1264 persons. The huts, it would seem, were for the most part circular in shape, measuring from 10 to 15 feet in diameter; they were of wattles, plastered with clay, masses of which hardened by fire, still bearing the marks of the wattles which it had received when wet and soft, have been recovered from the beds of the lakes.

In at least one instance, the remains of a bridge or gangway, leading from the platform to the shore, have been discovered. Many small boats, hollowed out of the trunks of trees, have been found; and one large vessel of the same kind, 50 feet long, and 3½ feet wide, has been observed at the bottom of the Lake of Biemme. The woodcut on the preceding page shews the *pfahlbauten*, as the Swiss archaeologists believe them to have been in their original state.

The lake-dwellings of Switzerland have obviously much more resemblance to those of Lake Prasias, described by Herodotus, than to the C. of Ireland. But the Swiss at the same time can shew examples of the Irish type. At Nidau Steinberg, in the Lake of Biemme, there is an artificial mound of stones, resting on horizontal planks, and encircled by a row of upright piles. It is now submerged, but when—as the Swiss believe—the lake stood at a lower level, it must have been an island. At Moringen, in the same lake, there is another pile-building, enclosing a mound of stones which has an area of about half an acre. A canoe which had been used in its construction lies with its load of stones at the bottom of the lake. Structures still more nearly resembling the Irish C. have been found in the lakes of Lukwyl, Nussbaumen, and Wauwyl.

History and tradition are alike silent as to the pile-buildings of the Swiss lakes. That they belong to a remote age, will readily be granted, even by those who may hesitate to accept 'the stone, bronze, and iron periods' on which the Swiss antiquary rests their claims to 'pre-historic' antiquity; or who may question the grounds on which the Swiss naturalist assigns them to the 15th c. before the Christian era. Of the remains found in them; many appear to be those of a rude people—such as spear-points, arrow-heads, axes, chisels, knives, and even small saws, of flint and stone; arrow-heads, daggers, hammers, bodkins, needles, pins, rings, bracelets, necklaces, of bone or horn. Articles of bronze, some of them richly ornamented, are at the same time of common occurrence; and swords and other objects of iron are met with in considerable numbers. Some of the Swiss archaeologists seem at one time to have thought that the piles surrounded by stone and bone implements shewed marks of greater age than the piles surrounded by bronze implements. It is now admitted, however, that both stone and bronze objects, and bronze and iron objects, are to be found in the same group of piles. It is to be remarked, too, that many of the objects of stone, bone, horn, bronze, and iron, are fashioned of the same shape, and for the same use, differing only in the substance of which they are made. Whoever the dwellers on the *pfahlbauten* were, their remains shew that they grew wheat and barley; that they ate the flesh of the ox, the goat, the sheep, and the pig; that among the beasts of the chase which they hunted down was the now extinct species of the aurochs (see BROS); that they had horses, dogs, and cats; that they had apples, pears, wild-plums, and wood-raspberries; that they baked pottery; that their women plied the distaff and knitted; that they made hempen mats; and that they wove linen cloths.

Hitherto, archaeologists knew of lake-dwellings as existing only in Ireland and Switzerland; but in 1857, Mr Joseph Robertson read a paper to the Society of Scottish Antiquaries, proving that they were to be found in almost every province of Scotland. He not only ascertained the existence of about 50 examples, but was able to shew from records that they were known in Scotland by the same name of C. which they received in Ireland. The resemblance between the Scottish and Irish types seems, indeed, to be complete. Every variety of structure observed

in the one country is to be found in the other, from the purely artificial island, framed of oak-beams, mortised together, to the natural island, artificially fortified or enlarged by girdles of oak-piles or ramparts of loose stones; from the island with a pier projecting from its side, to the island communicating with the mainland by a causeway. If there be any difference between the C. of the two countries, it is that the number of C. constructed altogether of stones is greater in Scotland than in Ireland—a difference which is readily explained by the difference in the physical circumstances of the two countries. Among the more remarkable of the Scotch C. is that in the loch of Forfar, which bears the name of St Margaret, the queen of King Malcolm Canmore, who died in 1097. It is chiefly natural, but has been strengthened by piles and stones, and the care taken to preserve this artificial barrier is attested by a record of the year 1508. Another crannoge—that of Lochindorb, in Moray—was visited by King Edward I. of England in 1303, about which time it was fortified by a castle of such mark that in 1336, King Edward III. of England led an army to its relief through the mountain-passes of Athol and Badenoch. A third crannoge—that of Loch Cannor or Kinord, in Aberdeenshire—appears in history in 1335, had King James IV. for its guest in 1506, and continued to be a place of strength until 1648, when the estates of parliament ordered its fortifications to be destroyed. It has an area of about an acre, and owes little or nothing to art beyond a rampart of stones and a row of piles. In the same lake there is another and much smaller crannoge, which is wholly artificial. Forty years after the dismantling of the crannoge of Loch Cannor, the crannoge of Lochan-Eilean, in Strathspye, is spoken of as 'useful to the country in time of troubles or wars, for the people put in their goods and children here, and it is easily defended.' Canoes hollowed out of the trunks of oaks have been found as well beside the Scotch, as beside the Irish crannoges. Bronze vessels, apparently for kitchen purposes, are also of frequent occurrence, but do not seem to be of a very ancient type. Deer's horns, boars' tusks, and the bones of domestic animals, have been discovered; and in one instance a stone hammer, and in another what seem to be pieces for some such game as draughts or backgammon, have been dug up.

Since 1857, the existence of lake-dwellings has been discovered in Savoy, in Upper Italy, in Hanover, in Prussia, and in Denmark. Less certain traces have been found in England, in draining a mere at Wretham Hall, near Thetford, in Norfolk. The savages of Borneo and New Guinea still live on the water, in huts perched upon platforms supported by piles; and wooden houses raised upon piles are common in Burmah and Siam, on the creeks and rivers of the Strait of Malacca, and it is believed elsewhere in Asia. A bas-relief from the palace of Sennacherib, engraved in Mr Layard's *Monuments of Nineveh*, represents what seem to be artificial islands, formed, it would seem, by wattling together the tall reeds of the marshes on the lower part of the Euphrates.

The C. of Ireland are described in the *Proceedings of the Royal Irish Academy*, vols. i., v., vii.; Mr Wilde's *Catalogue of the Museum of the Royal Irish Academy*; *The Archaeological Journal*, vols. iii., vi.; Mr Digby Wyatt's *Observations on the Early Habitations of the Irish* (Lond. 1858); *The Ulster Journal of Archaeology*, No. 26; *Proceedings of the Kilkenny Archaeological Society*, No. 27. The chief works on the lake-dwellings of Switzerland are Dr Ferdinand Keller's three papers on *Pfahlbauten*, and Dr L. Rutimeyer's *Untersuchung der Thierreste*

aus den Pfahlbauten, all published in the *Mittheilungen der Antiquarischen Gesellschaft in Zurich*, band ix., xii., xiii.; M. Frederic Troyon's *Habitations Lacustres de la Suisse* (Lausanne, 1857); his *Ossements et Antiquités du Lac de Moosedorf*, in the *Bibliothèque Universelle de Genève*, for May 1857; his *Détails of Discoveries at the Lake Habitations of Switzerland*, in the *Ulster Journal of Archaeology*, No. 29; MM. Alb. Jahn and J. Uhlmann's *Die Pfahlbau-Alterthümer von Moosedorf* (Bern, 1857); and M. A. Morlot's *Etudes Géologico-Archéologiques en Danemark et en Suisse*, in the *Bulletin de la Société Vaudoise des Sciences Naturelles*, t. vi. (Lausanne, 1860). The Scottish C. are described in the *Proceedings of the Society of Antiquaries of Scotland*, vol. iii. On the subject of pile-buildings generally, reference may be made to Mr W. M. Wylie's paper *On Lake-dwellings of the Early Periods*, in the *Archæologia*, vol. xxxviii. (Lond. 1860), and to papers in the *Gentleman's Magazine* for December 1860 and February 1861.

CRAPE, a thin fabric made of raw silk, which has been tightly twisted, without removing the viscous matter with which it is covered when spun by the worm. It is simply woven as a thin gauze, then dressed with a thick solution of gum, which in drying causes the threads partially to untwist, and thus gives a wrinkled and rough appearance to the fabric. It is usually dyed black, and used for mourning apparel.

CRAS-CROM, an ancient and rude instrument of agriculture in the Highlands, consisting, as its name in Gaelic imports, of a crooked stick shod with iron, with a small projecting bar to rest the foot upon.

CRA'SHAW, RICHARD, an English poet, whose devotional strains exhibit imagination of a high order, with great copiousness and beauty of language, was the son of a clergyman in the English Church, and was born in London, at what date is unknown. He was educated at the Charter-house, and at Cambridge, where he obtained a fellowship in 1637. He entered the church about 1641, it is said, and became an earnest and eloquent preacher; but in 1644 he was ejected from his fellowship by the parliament, for refusing to take the Covenant. He went to France, adopted the Roman Catholic faith, and suffered great pecuniary distress, until, through Cowley's influence, he was introduced to Queen Henrietta Maria, who recommended him to certain dignitaries of the church in Italy. He soon obtained a secretaryship to one of the cardinals at Rome, and was made a canon of the church of Loretto. In this office he died about 1650. In 1634, C. published a volume of Latin poems, in which appeared the famous line, sometimes attributed to Dryden and others, relative to the miracle of the water being turned into wine.

*'Nympha pudica Deum vidit et erubuit.'*

*'The modest water saw its God and blushed.'*

In 1646 appeared his *Steps to the Temple, The Delights of the Muses, and Carmen Deo Nostro*, in which there is much fervid poetry. C. greatly resembles George Herbert in his cast of thought, and is not inferior to him in richness of fancy, though we find in him more exaggeration and conceit.

CRASSULA CÆÆ, a natural order of exogenous plants, some of them shrubby, and some herbaceous, all remarkable for their succulency. About 300 species are known, among which are house-leeks, stone-crops, rose-root, &c. They are widely distributed over the world, but South Africa particularly abounds in them. Most of them grow in dry places, and derive their nourishment from the air rather than from the soil, their roots seeming

chiefly intended to fix them to the spot. Many of them are much cultivated in green-houses, more on account of their grotesque forms than for the beauty of their flowers. Some are refrigerant, and one or two are even used as food; others, on account of the tannin which they contain, are astringent; and some are acrid.

CRA'SSUS, the surname of several old Roman families, among which that of the Licinii was most remarkable.—CRASSUS (LUCIUS LICINIUS), born in 140 B.C., was the best orator of his age, and was as distinguished for his wit as for his rectitude in the capacity of proconsul. In 95 B.C. he was elected consul, along with Quintus Mucius Scaevola (who had been his colleague in all his previous offices). During their consulship was enacted the *Lex Licinia Mucia de Civibus regundis*, banishing from Rome all who had not the full rights of citizens. This embittered the feelings of foreigners toward Rome, and partly led to the Social War. As censor, C., in 92 B.C., closed all the schools of the rhetors—asserting that they had exercised a bad influence on the minds of young men. In consequence of the excitement attending a debate in the senate, C. died in 91 B.C.

CRASSUS, MARCUS LICINIUS, the triumvir, was born sometime before 115 B.C. His father and brother suffered death from the party of Marius, 81 B.C., and he himself—though young—was subjected to a jealous and dangerous surveillance. In 85 B.C., to escape from this, he went to Spain. He afterwards joined Sulla (83 B.C.), and distinguished himself in the battle against the Samnites at the gates of Rome. As praetor he crushed the Servile revolt, by the conquest of Spartacus at the battle of Lucania (71 B.C.), and in the following year was made consul with Pompey, a colleague whom he hated. On the other hand, Caesar valued the friendship of C., the most wealthy of Roman citizens. During his consulate, C. gave a feast to the people, which was spread on 10,000 tables, and distributed a provision of corn for three months. Plutarch estimates the wealth of C. as more than 7000 talents, and Pliny states that the lands of C. were worth 8000 talents. About 60 B.C., Caesar, Pompey, and C. entered into a private arrangement for their common benefit. This pacton is known as the first *triumvirate*. See CESAR. In 57 B.C., as consul with Pompey, he gained the province of Syria, and professed to make preparations of war against the Parthians; but the acquisition of more wealth seems to have been his main object, and this he effected by plundering the towns and temples in Syria. At length, however, he set out, but was misguided by a treacherous Arab, and utterly defeated at the river Bilecha by the Parthians. C. now retreated to the town of Carrhæ, intending to pass into Armenia; but was beguiled into a conference with the Parthian general, Surenus, and was slain at the appointed place of meeting. His questor, Cassius, with 500 cavalry, escaped into Syria; but the remaining Romans were scattered and made prisoners, or put to death.

CRATAEGUS, a genus of plants of the natural order *Rosacea*, sub-order *Pomea*, very nearly allied to *Mespilus* (Medlar) and *Pyrus* (Pear, Apple, &c.), but distinguished by the acute calycine segments, and by the round or oval fruit, closed at the apex, and concealing the upper end of the bony cells. The species are pretty numerous, natives of the temperate parts of the northern hemisphere, and in general have flowers in beautiful terminal corymbs. They are all large shrubs or small trees, more or less spiny, whence the name THORN has been very generally applied to them. The only native of Britain is

the common HAWTHORN (q. v.), (*C. oxyacantha*). Most of the species resemble it considerably in habit, size, form of leaf, &c. A number of them are now frequent in plantations and shrubberies in Britain, of which perhaps the most common is the COCK'S-SPUR THORN (*C. crus-galli*), a native of North America from Canada to Carolina. Its leaves are not lobed; its fruit rather larger than that of the hawthorn. The AZAROLE (*C. Azarolus*), a native of the south of Europe, and the ARONIA (*C. Aronia*), a native of the Levant, are occasionally cultivated for their fruit, which is about the size of the Siberian crab, and is used either for dessert or for pies. *C. Orientalis* (or *odoratissima*) and *C. lanceifolia* have also fruit of considerable size. The latter is much eaten in Armenia. *C. Mexicana* has a large fruit, like a small apple, but not eatable. It is, however, very ornamental. The wood of most of the species much resembles that of the hawthorn. It is common to graft the rarer species on the hawthorn.—*C. pyracantha* differs much in appearance from most of the genus; being a pretty evergreen shrub, with lanceolate crevate leaves, and rich clusters of red berries, which remain on it all winter; a native of rocky places in the south of Europe and the Caucasus. It is often employed in Britain as an ornamental covering for walls, and is known as the PYRACANTHA.

CRATER (Gr. a cup), the central cup-shaped cavity in the summit of a volcano (q. v.), through

Crater of Kilanea in the island of Hawaii, Pacific Ocean: Depth about 1500 feet; circumference about 2 miles.

which the lava, stones, scoria, &c., are for the most part ejected. These materials sometimes escape from immense rents in the sides of the volcano, as was the case in the famous eruption of Heela in 1783, when two enormous streams of lava poured from its side to the distance, the one of 40, the other of 50 miles. Nor are the volcanic materials, when they escape through a crater, always ejected through the old vent on the summit; some other portion of the mountain may yield more readily to the pressure from within, and thus one or more lateral craters be formed, which, however, increase in height from the accumulation of ejected materials, and eventually, if the eruption continues, overtop the former cone.

CRATINUS, a Greek comic poet, born about 519 B.C. Next to his younger contemporaries, Eupolis and Aristophanes, he is the most valuable representative of the Old Attic comedy. He changed its outward form considerably, and also sought to add to its vigour and power. Before his time, the number of actors had been indefinite; he limited them to three. He was the first to make comedy pungent and personal. The habits, manners, insti-

tutions—in fact, the whole public and private life of the Athenians—were considered by C. a legitimate mark for censorious satire. The greatest men did not escape. Pericles, for instance, was frequently and fiercely abused. C.'s style was very metaphorical and ingenious. Of his twenty-one comedies, nine of which obtained the first prize in the public competitions, we possess only some fragments. These have been collected by Meincke in his *Fragmenta Comicorum Græcorum* (Berlin, 1840).—There was also a younger CRATINUS, a contemporary of Plato, who belonged to the school of the Middle Comedy.

CRATIPPUS, a Peripatetic philosopher, was a native of Mitylene, and a contemporary of Cicero. He appears to have been held in the highest estimation by the great men of his age. Cicero calls him the prince of all the philosophers whom he had known. Pompey visited him after his defeat at Pharsalia, and received at his hands the consolations of philosophy; and Brutus went to Athens, to which city C. had latterly betaken himself, to listen to his prelections, even while making preparations to meet Octavius and Antony. Nothing that C. wrote has survived.

CRAYER, CASPAR DE, a Flemish historical and portrait painter, was born at Antwerp in 1582. He lived first at Brussels, and afterwards at Ghent, where he died in 1669. For the churches at Ghent he executed twenty-one altar-pieces. His works are to be found all through Flanders and Brabant. The galleries of Vienna and Munich also possess a few. Their main characteristics are vigour and boldness of design, and care and truthfulness in execution. Rubens was a great admirer of Crayer.

CRAYFISH, or CRAWFISH (*Astacus fluvialtilis*), a crustacean of the order Decapoda (see CRAB), sub-order *Macrourea* (i. e., long-tailed—characterised by the elongation of the abdomen, and its termination in a sort of fin composed of five pieces and expanded laterally); nearly allied to the lobster, from which, however, it differs in having the middle plate of the tail-fin transversely divided by a suture. It inhabits the rivers and streams of many parts of Europe, and is common in some of those of England, making burrows in clayey banks, and coming forth at night in search of food, which consists chiefly of molluscs, small fishes, larvæ of aquatic insects, and animal substances of almost any kind. It is esteemed for the table, and is readily attracted by a bait of decaying flesh or animal garbage, which being

Crayfish (*Astacus fluvialtilis*).

enclosed in a net or in a bundle of twigs, numbers of C. may be captured at a time.—Other species of C. abound in some of the warmer parts of the world.

**CRAYON** (Fr. a pencil). Though used in French, and occasionally in English, to designate pencils generally, including those made of lead, the word C. is more frequently applied, in England, to those small cylinders of charcoal, or of pipe-clay or chalk coloured with various pigments, which are used for drawing. Cohesiveness is given to the paste of which the cylinders are formed by means of gum, wax, soap, &c. C. drawings are often remarkable for the delicacy and softness with which objects are represented, but they are deficient in power. See **PENCIL, CHALK.**

**CREAM**, the butyrateous and richer portion of milk, which as lighter rises and settles on the surface. See **MILK.** The term C. is applied in a variety of ways, indicative of something superior in quality; as, *Cold Cream* (q. v.), and *Cream of the Valley*, a fine kind of English gin. The French, in referring to persons in the height of fashion, speak of *La crème de la crème*—The cream of cream.

**CREAM OF TARTAR** exists naturally in grape juice, but being insoluble in alcohol, it is gradually deposited, in the form of argol, as the sugar of the juice becomes converted into alcohol by fermentation. In the preparation of C. of T., the argol is dissolved in hot water, to which charcoal or fine clay is added, to take up the colouring matter; by boiling and filtering, a clear colourless solution is obtained, from which, on cooling, the C. of T. separates as crystals. Some of the crystals form at the bottom; others form a crust on the top, like cream, whence the name, cream of tartar. In chemical composition, it is the Bitartrate of Potash (KO.HO.T), and contains potash, water, and tartaric acid. It is readily soluble in hot water, though it takes 60 parts of cold water to dissolve one part of the cream of tartar. It has an acid taste, and gritty feel. When taken repeatedly in small doses of a scruple to a drachm, it acts as a refrigerant and diuretic; in doses of one to two drachms, it is useful as an aperient; and in larger doses of from two to three drachms, it acts as a purging agent, accompanied by flatulence and griping. *Imperial liquid* is prepared by dissolving about a drachm of C. of T. in a pint of boiling water, and adding a little lemon-peel and sugar to flavour it; when an agreeable refrigerant drink is obtained, which is highly serviceable in allaying thirst in feverish cases. C. of T. whey is obtained by adding two drachms of the salt to a pint of milk.

**CREASOTE**, or **KREASOTE**, is an artificial organic substance, generally obtained from the products of the destructive distillation of wood. It is procured incidentally as one of the constituents of wood-tar, from which it is separated by a tedious process. The principal supplies are obtained from Stockholm, Archangel, and America. In the pure condition, C. is a colourless oily liquid, with high refractive powers; but the commercial specimens are generally coloured yellow or light brown. It boils at 398° F.; does not readily inflame; but when set fire to, burns with a smoky flame. It has a hot burning taste, and is very poisonous to plants and animals. It has a great power of coagulating albumen, and hence may be employed with advantage in toothache; a drop placed on the exposed nerve coagulates the albuminous tissue, and destroys its vitality and sense of pain. The most important property possessed by C., however, is its antiseptic or preserving power over vegetable and animal organs and structures. Thus, ordinary meat treated with only one-hundredth of its weight of C., and exposed to the air, does not putrefy, but becomes hard and dry, and assumes the taste and odour of smoked meat. Again, timber treated with C. does not suffer from dry-rot or other disease; and thus C.,

in a crude form, is employed in the preservation of wood (q. v.). The crude pyrolygineous acid of commerce, which is often employed in the curing of hams, &c., owes part, at least, of its preserving powers to the presence of a trace of C., which leaves its characteristic odour so well known as obtained from the burning of wood for the smoking of hams, &c. When used medicinally, C. acts externally by destroying the cuticle; internally, in small doses of a drop or two, it is serviceable in arresting obstinate vomiting; whilst in large doses it produces nausea and severe vomiting, and, in many cases, fatal results.

**CREATINE**, or **KRE'ATINE** (Gr. *kreas*, flesh), was discovered in 1835 by Chevreul, but little was known about it till Liebig published his *Researches on the Chemistry of Food*, in 1847. From his investigations, and those of subsequent chemists—amongst whom we may especially name the late Dr William Gregory of Edinburgh—the following facts regarding its properties and occurrence have been established.

C. forms transparent, glistening crystals, belonging to the clinorhombic system, and usually occurring in groups, the character of which is exactly similar to that of sugar of lead. Although usually grouped among the basic bodies, it is neutral in its reaction. It dissolves in 74.4 parts of cold water, and in boiling water in such quantity that the solution on cooling solidifies into a mass of delicate needles. These crystals contain two atoms of water and one atom of anhydrous C., whose composition, according to Liebig, is represented by the formula  $C_5H_9N_3O_4$ . There is no direct chemical test for the detection of C., and the methods which have been employed to obtain it are too complicated for insertion in this article.

C. is constantly present in the juice both of voluntary and involuntary muscles. The quantity differs in the flesh of different kinds of animals, and even in different muscles of the same animal, but is always very small; and lean animals yield relatively more than fat ones. According to Liebig, the flesh of hens yields the largest amount, viz., 0.32 per cent., the average quantity from horse or ox flesh being 0.07 per cent. Gregory determined its amount in the flesh of various mammals, birds, and fishes; and Schlossberger found 0.067 per cent. in human flesh. It has likewise been detected in very small quantity in the blood of oxen, also in the liquor amnii of women who have died in advanced pregnancy, and it can usually be obtained from the urine, although it is doubtful whether it is a normal constituent of that fluid. It does not exist in the liver or kidneys, but has been found among the soluble constituents of the brain.

Although the view has been advocated that, from its occurrence in flesh, and from its large amount of nitrogen (32.06 per cent.), it must be an important nutritive agent, there are most decisive reasons for opposing this opinion, and for ranking it among the products of excretion; for, in the first place, if it could be employed with further advantage in the organism, it (or its near ally, creatinine) would not be allowed to escape by the kidneys; secondly, the readiness with which it may be converted into unquestionable products of excretion (as, for instance, into urea, by the action of heat and baryta water), proves its approximation more nearly to these substances, than to such bodies as albumen or fibrin; and thirdly, there is no instance of a tissue-forming food occurring in a crystalline form.

**CRÉATININE** is closely allied in its chemical and physiological relations to creatine. Liebig found that, when heated with a strong mineral acid, a solution of creatine no longer yields crystals of

that substance, but a new body of totally different chemical properties, to which he gave the name of creatinine. Its chemical composition is represented by the formula  $C_4H_8N_2O_2$ , and on comparing this formula with that for creatine, we see that the conversion of the latter into the former, by the action of mineral acids, depends upon the separation of the elements of water. Liebig shortly afterwards detected C. as a constituent of the muscular juice. In the latter fluid, it occurs in less quantity than creatine; while in the urine, where it is also found, it is the more abundant of the two. Traces of it have also been found in the blood and in the liquor amnii.

C. crystallises in oblique rhombic prisms, is a most decided alkaloïd, reacting strongly on vegetable colours, and having almost as caustic a taste as ammonia; it further differs from creatine in its far greater solubility in water, alcohol, and ether. There can be little doubt that C. takes its origin from creatine.

CRÉBILLON, PROSPER JOLYOT DE, a French dramatist, was born at Dijon in 1674. He was sent to Paris to study law, but ended by devoting himself wholly to poetical pursuits. His first piece, *La Mort des Enfants de Brutus*, was rejected by the actors; but the succeeding dramas of *Idoménée* (1705) and *Atrée* (1707) were successful. *Rhadamiste* (1711), a tragedy of the dismal kind, was reckoned C.'s masterpiece, and established his reputation. After producing some other pieces, C. fell into pecuniary difficulties and neglect, and for more than twenty years produced nothing. His talents were then called again into requisition by Madame de Pompadour, who wished to humble Voltaire. He received from the king a pension of 1000 francs, and completed the tragedy of *Catiline*, for which the king himself supplied all the properties. When 81 years old, C. wrote his tragedy *The Triumvirate*, and, still later, commenced, but did not finish, another called *Cleomède*. He died June 17, 1762, and Louis XV. erected a monument to his memory. C., in general, displays little skill in the conduct of his plots; the monologues of the speakers are too numerous and too long; but in the opinion of his countrymen he is surpassed, in 'the grandeur of his sentiments,' only by the author of the *Cid* and *Horace*. The best edition of C.'s works is that published by Didot (2 vols., Paris 1818).

CRÉBILLON, CLAUDE PROSPER JOLYOT DE, the younger, son of the dramatist, was born in Paris, February 14, 1707. In an age of licentious manners, he acquired popularity by a series of romances, remarkable chiefly for their violation of decency; the principal of which are *Le Sopha*, *Le Hazard du Coin du Feu*, *Les Egarements du Cœur et de l'Esprit*. His own moral character is described as correct, but his writings undoubtedly served to extend the influence of the immoralities which he described. C. died in Paris, April 12, 1777.

CRÉCY, or CRENSY, a small town of France, in the department of Somme, situated on the Maye, about 12 miles north of Abbeville. C. is chiefly celebrated on account of the brilliant victory obtained here, 26th August 1346, by Edward III., with 40,000 English soldiers, over a French army amounting, according to Froissart, to 100,000 men, under the command of the Count of Alençon. In this great battle, one of the most honourable to English prowess recorded in history, the flower of French chivalry was slain, as well as the kings of Bohemia and Majorca, who were fighting on the side of France. Altogether, about 30,000 of the French army bit the dust. In this battle the Black Prince, who greatly distinguished himself, gained his spurs;

and the crest of the slain Bohemian king, composed of three ostrich feathers, with the motto, *Ich Dien*, 'I serve,' was adopted by him in memory of the victory, and still continues to be borne by the Prince of Wales. C. is an ancient place, but its population now only amounts to 1300.

CRÉDENCE, a small table beside the altar or communion-table, on which the bread and wine are laid before being consecrated. In the Greek Church this is called the *Trapeza Prothesis*. Archbishop Laud was a great stickler for the C., and pleaded the authority of Bishop Andrews and other bishops for its use. There are credences in various Anglican churches; among others, in the Collegiate and St John's Churches, Manchester; and in the parish church at Ludlow, where they have been in use from time immemorial. Sometimes the place of the C. was supplied by a mere shelf across the fenestella (q. v.). The term was also used for a buffet, or sideboard, at which the meats were tasted in early times before being presented to the guests, as a precaution against poison. Hence the origin of the word, which is derived from the Ital. *credenzare*, to taste meats and drinks before they were offered to another, an ancient court practice, which was performed by the cup-bearers and carvers, who for this reason were called in Ger. *credenzer*. The getting up of credences or side-altars is one of those restitutions of old usages which has marked the Puseyite movement in England. See Pusey.

CRÉDENTIALS, papers or letters given to an ambassador, or other public minister, to a foreign court, in order to enable him to claim the confidence of the court to which he is sent.

CRÉDIT, in Political Economy, is one of many terms used in that science, of which it is said that we yet possess no scientific definition. This is the less to be regretted, as the practical meaning of the word is thoroughly known, so as to enable every one to understand what is meant, when economists speak of the extent to which C. is safe or proper, unsafe or improper, in this or that class of cases. We have come, perhaps, thus far towards an exact scientific notion of the nature of C., that while it serves the purpose of capital, it can only do so while there is capital ready to come and take its place if necessary. Credits which are not in this position—though they may happen to serve their turn, as a ship may sail some distance unwrecked without a steersman—do not accomplish the purpose of capital. The real power of C., properly resting on capital, is that it enables that capital to be devoted to more than one purpose. A bank is a great emporium of C.; that is to say, it consists of a certain amount of capital, which can be operated on by a whole community—not all at one time, but by individuals as occasion requires. Thus, a comparatively small stock of money can be made to do duty for carrying on numerous transactions. But it is indispensable for insuring a safe system of C. that money must be instantly available when wanted; and this principle applies not alone to banking, but to every species of transaction in which postponed payment is concerned. Unfortunately, this principle is too often set aside, and C. is grossly abused. The facts brought out in great bankruptcies generally teach the moral, that men who have every element of human wellbeing in their power, ruin themselves both in purse and fortune, by trying to make £30,000 do the work of £100,000. In many bankruptcies, too, there is a curious illustration of the power of C. as a representative of capital, in enabling men to keep up for a considerable time the appearance of being wealthy traders, though they never had a farthing they

could honestly call their own. In the few instances where such projects succeed, there is the kind of applause which is given to the successful winner in any game of chance; and it is naturally felt that if the successful are applauded, it is hard to condemn the unsuccessful; so that there is perhaps a dangerous leniency in public opinion towards speculators on credit.

In a modified shape, C. is a thing which, to all appearance, can never be abolished. There is scarcely a human being in a civilised country, who does not transact a piece of credit business almost every day of his life. The workman hired by the week, and paid at its end, gives his employer C. from Monday morning to Saturday evening. The same workman, when getting a coat made for himself, even although he engaged to pay ready money on delivery, gets C. from the tailor during the making. It is necessary to consider these things, because a course of C. is often so hurtful to people of the working-classes, by fastening ruinous obligations on them, that some people have proposed to abolish all C. where they are concerned, by rendering them free from all legal procedure for the recovery of debts. The answer to this is, that although it is practicable to relieve any class from obligations, and their legal enforcement, it is impossible in a trading country to suppress debt and credit. It is practicable, however, so far to modify the legal remedies against debtors of the poorer class, that there may not be, as there too often is, a temptation to traders to transact a special business, in holding out temptations to working-people to purchase on credit.

CREDIT, CASH. See CASH ACCOUNT.

CREDIT, LETTER OF. This is the term applied to accounts, usually in the form of a *letter*, addressed by one party to another, whereby the former requests the latter to pay a sum therein specified to the bearer of the letter, or some other third party named in it, and authorises him to reimburse himself for such payment, either by debiting it in account between the parties, or by drawing on the first party for the amount. This arrangement may take place between merchants or others, but in general it occurs between *bankers* residing in different places—as, for example, between a banker in Edinburgh and his correspondent in London; and it is designed for enabling a party who has money lodged at either place, to obtain the use of it at the other, without the risk or trouble of actually carrying it between the two cities. For this convenience a small charge is made by the bank issuing the letter, termed the exchange or commission. Sometimes the letter is addressed to *all* or *several* of the correspondents of the bank issuing it, in which case it is termed a *Circular Credit*; and any of them may pay the sum mentioned, or sums to account as desired, taking the holder's receipt, or his draft on the granter, in exchange; and the sums so paid are *indorsed* on the letter, to shew how far the credit has been used. If the party holding a circular letter can be properly introduced, even at a place where the granter has no correspondent, little difficulty will be experienced in obtaining money upon it; and the practice is to reimburse any one who has given the money, if within the amount of the credit. It will thus appear that the system is productive of much convenience to all parties who have occasion to travel, or transact business away from home, especially in foreign countries, where it might be difficult otherwise to make their way, except by carrying with them an unsafe amount of coin or other valuables.

Some bankers, having an extensive correspondence abroad, issue what are called *Circular Notes*, usually of the value of £10 or £20 each, which any of the granter's correspondents, or indeed any one else, may cash to the holder, on his 'indorsation;' but a third party must take his risk of its being questioned. For this kind of credit, the receiver at once reimburses the granter; whereas for the ordinary letter of C., he is only reimbursed when the drafts under it are advised to him, the holder continuing during the interval to raise interest on his money deposited for covering it. The circular-note plan was devised about 1770 by Mr Herries, the founder of the eminent London banking-house of Herries, Farquhar, and Company, who had originally been a continental merchant, and well knew the difficulties which travellers or traders then had to encounter in foreign countries. Although the system is now highly appreciated, it cost him no little trouble and perseverance to establish it in public estimation. See CIRCULAR NOTES.

CREDIT FONCIER, a peculiar method of borrowing money in France on the security of landed property. It was established by an edict of 28th February 1852. Its peculiarity is, that the repayment of the loan is by an annuity terminable at a certain date; the date and the amount of annuity being so calculated, that when the last payment is made, the loan and the interest on it will be extinguished. Another method of describing it is as a loan repayable by instalments. The transaction is precisely regulated by the edict, which prohibits an advance on more than a half of the value of the property pledged or hypothecated. Three several companies have been established by the French government, with the privilege and function of making such advances.

CREDITON, or KIRKTON, a borough in the middle of Devonshire, on the Creedy, a tributary of the Exe, 8 miles north-west of Exeter. It lies in a narrow vale between two steep hills. Pop. 3934. At C. was born the Anglo-Saxon Winfred, or St Boniface, who was the first to preach Christianity in Central Germany, founded the monastery of Fulda, and was Archbishop of Mentz. C. was the seat of a bishopric from 909 to 1050, when the sees of Devon and Cornwall were united and placed at Exeter. The chief manufactures were formerly woollens and serges, but now shoes. C. was much injured by fires in 1743 and 1769.

CRE'DITOR. See DEBTOR, BANKRUPT.

CRE'DO (Lat. *I believe*), a part of the service of the mass, beginning with the words, *Credo in unum Deum*.

CREDS AND CONFESSIONS are the names given to the authorised expressions of the doctrine of the church at large, or of the several main sections into which it is divided. Such statements of doctrine sprang up naturally in the course of the church's progress. As the simple truths taught by Christ in an unreflective and mostly concrete form became the subjects of thought, of argument, of controversy, they could not fail to receive a more defined intellectual expression, and to be drawn out into more precise dogmatic statements. Men's minds could not be exercised on subjects of such vast importance to them without this result; and the great creeds, as they rise in succession before us, and mark the climax of successive controversial epochs in the church, are nothing else than the varying expressions of the *Christian consciousness and reason*, in their efforts more completely to realise, comprehend, and express the originally simple elements of truth as they are re-ordered in Scripture. The study of the creeds would be nothing

else than the study of theology in its highest historical development—in its reflex settlements after the great agitations of Christian thought had run their course.

Corresponding to this view, we find that the creeds of Christendom grow in complexity, in elaborate analysis and inventiveness of doctrinal statement, as they succeed one another. The first are comparatively brief and simple in sense and form; the last are prolix and largely didactic. From the Apostles' Creed to the decrees of the Council of Trent, or the chapters of the Westminster Confession of Faith, there is a wide change, during which the Christian consciousness has grown from a childlike faith to a critical opinionativeness.

What has been called the *Apostles' Creed* is the earliest form of Christian creed that exists, unless we give the precedence to the baptismal formula at the close of St Matthew's Gospel, out of which many suppose the Apostles' Creed to have grown. There were in the early church differing forms of this primitive creed: that which is received and repeated in the service of the Church of England, has come to us through the Latin Church; and in several of its clauses, as, for instance, 'He descended into hell,' and again, 'The communion of saints,' is supposed to have been interpolated according to later notions. A great variety of opinions has been held as to the origin of this creed. The Roman Catholic Church has not only attributed it to the apostles directly, but professes to settle, on the authority of a spurious sermon of St Augustine, the clauses respectively contributed by the several apostles: 'Petrus dixit, Credo in Deum Patrem omnipotentem. Joannes dixit, Creatorem celi et terre. Jacobus dixit,' &c. The earliest account of its origin we have from Rufinus, a historical compiler and traditionalist of the 4th century. His statement is, that the apostles, when about to separate to preach the truth to different nations, agreed upon a 'form of sound words' which should express the sum of their common teaching. 'When met together, and filled with the Holy Ghost, they composed this compend of what they were to preach, each one contributing his share to the one composition, which they resolved to give as a rule of faith to those who should believe.' No great weight belongs to this testimony; Rufinus is no historical authority. It is not improbable in itself, however, that even in the age of the apostles some formula of belief existed. The exact form of the present creed cannot pretend to be so ancient by four hundred years, but a form not much different from it was in use long before. Irenæus, the scholar of Polycarp, the disciple of St John, when he repeats a creed not much unlike to the present, assures us that 'the church dispersed throughout the whole world had received this faith from the apostles and their disciples;' and Tertullian also affirms that a similar creed had been 'prevalent as a rule of faith in the church from the beginning of the gospel.' The same thing is proved by the creeds administered to the candidates for baptism in the 2d and 3d centuries. They correspond, with slight variations, to the Apostles' Creed. The true view of this formula of church belief, therefore, seems to be that which regards it as the Roman or Latin form of the creed which prevailed in all the early churches. It is not strictly apostolic—certainly not in the order of words derived through the Latin Church, in which it is now received and repeated; but it is substantially apostolic—fairly representative of the different elements of Christian faith as handed down from the apostles, and well claiming, therefore, the credence of the universal Christian church. Since the Reformation in England, it has been the

usage to exhibit the Apostles' Creed and Ten Commandments in legible characters on boards near the communion-table in churches, in order that they might be seen and repeated by the common people, who were unprovided with books.

The *Nicene*, or rather, the Niceno-Constantinopolitan Creed, is the next great expression of doctrinal truth that we meet with in the history of the church. It sprang out of the conflict, which had begun even in the 2d c., as to the dignity and character of Christ. From the beginning, Ebionitism had looked upon Christ as merely a Jewish teacher of distinction; Theodotus and Artemon openly taught such a doctrine in Rome towards the close of the 2d century. Others, on the contrary, taught a doctrine which identified Christ with God absolutely in such a manner as to destroy all distinction of persons in the Godhead. Monarchianism, as it was called, which held rigorously and formally to the unity of God, was the ruling principle of both doctrines, opposite as were the expressions it assumed in the two cases.

The controversy thus begun in the 2d, perpetuated itself in the 3d c., under various modifications. Paul of Samosata carried out the Unitarian tendency, which reduced Christ to the level of a mere man; Sabellius carried out the same tendency in the opposite direction, which made Christ not merely divine, of the same substance with the Father, but looked upon him as merely a manifestation of the Father, without any distinct personality. Sabellianism recognised a Trinity of manifestations, but not a Trinity of essences. God was one and all-comprehending, and the Son and the Spirit were merely names or expressions for the different modes in which He reveals himself. Sabellius flourished about the middle of the 3d c., and Paul of Samosata somewhat later. Arius, who was a presbyter of Alexandria, grew up in the midst of these heretical influences, and soon distinguished himself in the Alexandrian church for his advocacy of the doctrine that Christ, although in a true sense divine, or the Son of God, was yet not the very God. He denied that he was 'of the substance of God,' or 'without beginning;' he was only the highest of created beings, in a sense divine, but not the same in substance with the Father, nor equal with him in power and glory. Athanasius came forward as the opponent of Arius, and the contest between them raged keen and wide throughout the church.

The Council of Nicæa was summoned in 325 by Constantine, with the view of settling this controversy; and the Nicene Creed was the result. There were these three parties in the council—the Athanasians, or extreme orthodox party; the Eusebians, or middle party; and the Arians, or heretical party. The heretics were few in number, and possessed but little influence; but the Eusebians were a strong party, and for some time resisted certain expressions of the orthodox or Athanasians, which seemed to them extreme and unwarranted; but at length the Homöousians, as they were called, carried the day; and Christ was declared not merely to be of like substance (*homoiousios*), but of the same substance (*homoousios*) with the Father. At the later Council of Constantinople, the additional tenet of the divinity of the Spirit was added, and the creed completed in the form in which it is familiar to the English reader in the communion service in the Book of Common Prayer. In it we confess, as has been said, to the holy and undivided Trinity, and distinctly own the divinity of each person. We commemorate the creation of the world by 'God the Father Almighty;' we acknowledge Jesus Christ to be our 'Lord;' to have been 'begotten' from all eternity; to be 'of one substance with

the Father,' and with him Creator of all things; that 'for our salvation he came down from heaven, was made man, and suffered and died for us.' We commemorate his resurrection, ascension, and sitting at God's right hand; express our expectation of his second coming; and declare that 'his kingdom shall have no end.' We confess to God that He hath appointed baptism for the remission of sins, and given us leave 'to look for the resurrection of the dead' and 'the life of the world to come.'

The next remarkable monument of doctrinal truth in the church is what is called the *Athanasian Creed*, a product of the 5th c., much later than Athanasius himself, but representing, with great formal minuteness and fidelity, his doctrine of the Trinity, as apprehended and elaborated by the Western Church. See ATHANASIAN CREED.

The Apostles', the Nicene, the Athanasian, may be said to form the great catholic creeds of the church. After the time of the last-mentioned formula, there is no general symbol of faith that claims our attention till the period of the Reformation. Theology continued to be cultivated during the middle ages, and especially during the 12th and 13th centuries, with great assiduity. Scholasticism is nothing else than the vast expression of the intellectual labour bestowed upon this subject during these ages, when scarcely any other subject can be said to have engaged men's minds. It was characteristic of scholasticism, however, to work mainly upon the doctrinal *data* already adopted and authorised by the church, developing these data in endless sentences and commentaries. There was, withal, no real freedom of inquiry, nor life of speculation. But as soon as the eye of free criticism and argument was turned upon Scripture with the Reformation, new Creeds and Confessions began to spring up. On the one hand, Protestantism had to defend its position and its scriptural authority by appeal to its system of belief; and, on the other hand, the Church of Rome, after many delays, gave forth at the Council of Trent (1545—1563), a more extended and detailed statement of its doctrine than was to be found in any previous creeds. The *Decrees of Trent* are the fixed authoritative symbol or confession of faith of the Church of Rome.

Of the Protestant churches, the most notable confessions of faith are the Lutheran; the continental Calvinistic or Reformed; the Anglican, or Thirty-nine Articles of the Church of England; and the Puritan, or Westminster Confession of Faith.

The Lutherans call their standard books of faith and discipline, *Libri Symbolici Ecclesie Evangelice*; and reckon among them, besides the three catholic creeds, the Augsburg Confession (q. v.), the Apology for that confession by Melancthon, the Articles of Smalkald drawn up by Luther, Luther's Catechisms; and in some churches, the Formula of Concord, or the Book of Torgau.

Of the continental Calvinistic or Reformed Churches, there are numerous confessions, the principal of which are—1. The Helvetic Confessions—that of Basel, 1530, and Bullinger, *Expositio Simpliciter*, 1566; 2. The Tetrapolitan Confession, 1531; 3. The Gallic Confession, 1559; 4. The Palatine or Heidelberg Confession, 1575; 5. The Belgic Confession, 1559.

The *Thirty-nine Articles* of the Church of England have been already described. See ARTICLES. They were originally forty-two, and are supposed to have been chiefly composed by Cranmer. In 1571, they were revised and approved by convocation and parliament.

The Westminster *Confession of Faith* was the product of the great Puritan agitation of the 17th century. As soon as the Long Parliament assembled

in 1640, it set itself to consider the question of the reformation of religion. It carried resolution after resolution directed against the existing government of the Church of England; and at length, on the 23d of November 1641, it passed the famous Remonstrance, in which it proposed that, 'in order the better to effect the reformation in the church, there should be a general synod of grave, pious, learned, and judicious divines, who should consider all things necessary for the peace and good government of the church.' Out of this proposal sprang the Westminster Assembly, although the parliamentary ordinance actually summoning the Assembly was not issued till a year and a half later—viz., June 12, 1643. According to this ordinance, the Assembly was to consist of 121 clergymen, assisted by 10 lords and 20 commoners as lay assessors. Many of these appointed members, however, never took their seat in the Assembly. The bishops were prevented from doing so by a counter ordinance of the king.

Among the most notable divines who did assemble were Burgess, Calamy, Gataker, and Reynolds, and Gillespie, Henderson, Baillie, and Samuel Rutherford, the commissioners from Scotland, of the Presbyterian party; Goodwin, Nye, and Burroughs, of the Independent party; and Lightfoot and Coleman, with Selden, of the Erastians. The Presbyterians greatly predominated, and the acts of the Assembly bear throughout the stamp of Calvinistic Presbyterianism. It began its sittings in the autumn of 1643, and sat till the 22d February 1649, having lasted upwards of five years and a half. During this period it had met 1163 times.

The most important labours which it achieved were the Directory of Public Worship and the Confession of Faith. This latter document was completed in the third year of its existence (1646), and laid before parliament in the same year. It was approved by the General Assembly of the Church of Scotland in 1647, and again in 1690, on the renewed establishment of Presbyterianism after the Revolution.

The Confession of Faith, as it is the latest of the great Protestant creeds, so it is one of the most elaborate of them all. It extends to thirty-three chapters, beginning with *Holy Scripture*, and ending with *The Last Judgment*. Of its thirty-three chapters, twenty-one may be said to be distinctly doctrinal—the first nineteen and the last two. The others concern such subjects as *Christian Liberty*, *Religious Worship*, *Oaths and Vows*, the *Civil Magistrate*, the *Church*, the *Sacraments*, *Synods and Councils*. The tone of the doctrinal chapters is that of the later and formal Calvinism which spread from Holland among the English Puritans. The ecclesiastical spirit is Puritan-Presbyterian. 'God alone' is declared to be 'Lord of the conscience;' yet the 'publishing of opinions contrary to the light of nature, or to the known principles of Christianity,' is at the same time declared to be matter of censure by the church, and of punishment by the civil magistrate. In composition, the Confession is an able and comprehensive summary of theological truth, shewing great logical skill in the deduction of particular doctrines from certain main principles. The third chapter, *Of God's Eternal Decree*, may be said to be the key-note from which its most characteristic doctrines follow in immediate sequence and harmony. It is well deserving the attention of all students of theology, not only as a remarkable monument of Christian learning, but as the most representative expression of a great spiritual movement which has deeply tinged the national thought of Britain, and modified the course of its history.

It is issued, under authority, as a cheap duodecimo volume by printers in Edinburgh, for general use throughout Scotland. Incorporated in the volume is the text of the Covenants, but these are not esteemed part of the Confession. See COVENANTS.

**CREEK**, in Geography, is a small inlet on a low coast, and in rivers formed by the mouths of small streams. In America, the term *C.* is applied to small inland rivers.

**CREEPER** (*Certhia*), a genus of birds, the type of the family *Certhiidae*; having a longish, slender, arched, and pointed bill; a long, narrow, sharp-pointed tongue, jagged near its tip; the tail rather long, and the tips of the tail-feathers firm and pointed, extending beyond the webs. The feet are rather slender; the hinder toe about as long as the other toes. Of this conformation of feet and tail great use is made in climbing trees, the stiff feathers of the tail being employed for support. Although the family is large, it is doubtful if the genus contains more than one true species, the **COMMON C.** (*C. familiaris*), a bird found in all temperate parts of

Common Creeper (*Certhia familiaris*).

the northern hemisphere, wherever wood abounds. It is common in Britain, but is not so well known as many other birds, in consequence of its restless habits, its rapid movements, and prompt retirement to the opposite side of a tree or branch from a spectator. It searches for insects and their larvae in the crevices of the bark, and generally ascends from the root to near the top of a tree before it flies off to another tree or branch. It generally builds its nest in a hole of a decayed tree. It is one of the smallest of British birds, although considerably larger than the wren. Its note is monotonous, and often repeated. Its prevalent colour is reddish-brown above, different shades being beautifully intermingled, and speckled with white; the under parts white. In Scotland, it is frequently called *Bark-speeler* (Anglicè, Bark-climber).—The **WALL C.** (*Tichodroma muraria*) of the south of Europe, frequents walls and the faces of rocks; it has a more slender bill, and the tail-feathers are not pointed.

**CREEPS**, a miner's term for the depression which takes place on the surface from the removal of beds of coal beneath. Masses of the coal-seam, like huge pillars, are left by the miners for the support of the superincumbent strata; the pressure, however, of these beds is so great that, in course of time, the ceiling gradually sinks, or, as is more frequently the case, because of the ceiling consisting of hard rock,

the softer shale pavement rises, until the intervening spaces between the pillars, left by the removal of the coal, are filled up. A consequent depression takes place in the beds above, as also an alteration of the surface-level. But this being so gradual is seldom noticed, except when it is made evident from the accumulation of surface-water, or in districts where railways pass over the coal-fields.

**CREFELD**. See KREFELD.

**CREMA**, a town of Lombardy, Northern Italy, situated in a fine plain on the right bank of the Serio, 25 miles east-south-east of Milan. *C.* is an ancient place, having been founded by the Longobards in the 6th century. It suffered much during the wars of the Guelphs and Ghibelines. *C.* is well built, is surrounded by a wall and ditch, has an old castle and cathedral, and manufactures of silk and lace. Pop. 8500.

**CREMONA**, a city of Lombardy, Northern Italy, situated on the north bank of the Po, which is here crossed by a bridge, about 48 miles south-east of Milan. It is surrounded by walls with flanking towers and wet ditches, its circumference being nearly 5 miles. A canal uniting the Oglio and the Po passes through the city; and the latter river is navigable for large boats from this point to the sea. The streets of *C.* are wide and regular, and it has some fine buildings—the principal of which are the cathedral, built at different times, exhibiting various styles of architecture; the churches of San Margherita, Sant' Agostino, Santa Agata, and San Giorgio; the Palazzo Publico, Campo Santo, and the Torazzo or belfry—one of the loftiest and finest towers in Italy, being 396 feet high, and commanding magnificent views over the fertile plains of Milan. By means of the Po, *C.* carries on a considerable trade in the produce of the district; and it has manufactures of silk, cotton, earthenware, and chemicals. It was formerly greatly celebrated for its manufacture of violins, the most famous maker being Amati, who flourished in the beginning of the 18th century. Its musical strings were also in great repute, but now neither violins nor strings have more than ordinary excellence. Pop. 37,000. *C.* is the capital of a province of the same name, which has an extent of about 500 square miles, and a pop. of 204,000.

**CRENELLE**, sometimes used for a battlement, but more frequently for the embrasures in a battlement. The adjective *Crenellated* is in frequent use to signify that a building is supplied with crenelles. See BATTLEMENT.

**CRENELLE**, in Heraldry, embattled, is used to signify that any ordinary is drawn like the battlements of a wall.

**CRENIC ACID** is one of the constituents of vegetable mould, and is produced wherever leaves and other plant matter are decaying, especially in peat-bogs and marshes.

**CRÉOLE** (Span. *criollo*) is a word used in speaking of the inhabitants of South America and the West Indies. In its widest sense, it designates any individual born in the country, but of a race not native to it. Thus, a negro born in the country is sometimes called a *C.*, in opposition to one imported. It is usually applied, however, to persons born in the colony or country and of pure European blood, as distinguished from immigrant Europeans, and also from the offspring of mixed blood, such as mulattos and mestizos. Brazilian creoles call themselves also *Brasileiros*.

**CRESCENDO**, in Music, means a gradual increasing of sound, or changing from piano to forte

and fortissimo. It is marked thus , or with the abbreviation *cresc.* The swell of an organ, when well constructed, produces a most perfect crescendo.

**CRESCENT.** A representation of the half-moon with the horns turned upwards, called a C., is often used as an emblem of progress and success. It is generally spoken of as 'the arms' of the Turkish empire; but is more properly the emblem of the empire and people—not a very appropriate one in our day. It was, however, the emblem of the Greek before it became that of the Turkish rule; and at the present day, is frequently to be seen on churches in Moscow and elsewhere in Russia, generally surmounted with the cross, marking unquestionably the Byzantine origin of the Russian church.

**CRESCENT, TURKISH ORDER OF.** In 1799, after the battle of Aboukir, the Sultan Selim III. testified his gratitude to Nelson by sending him a C. richly adorned with diamonds. It was not intended as an order, but Nelson wore it on his coat, and on several occasions called himself the knight of the C. Selim was flattered by the value which the English admiral, already decorated with so many orders, seemed to attach to his gift; and it was this circumstance which determined him, in 1801, to found the Order of the Crescent. Mohammedans being forbidden in the Koran to carry such marks of distinction, the order is conferred only on Christians who have done service to the state. The second person on whom it was conferred was General Sebastiani, for his defence of Constantinople against the English fleet in 1807. The insurrection of the Janissaries suspended the efforts at Europeanising which Selim had begun, and when they were resumed by Mahmud, he instituted several other decorations. See **MEDJIDIE, ORDER OF.** There was an old order of the C., instituted at Angiers by René, Duke of Anjou, brother and heir of Louis III., king of Naples, in 1464. Its objects were those common to the religious military orders of those days, the honour of God, the defence of the church, the encouragement of noble actions, and the glory of the founder. The dukes of Anjou and kings of Sicily were sovereigns of the order. The badge was a C. of gold, on which was the word *Loz*, enamelled in red letters, the import being *Loz* (*laus*) or *Croissant*—Praise by Increasing. Like many other orders founded by the smaller sovereigns, the order of the C. did not survive the founder.

**CRESCENT, in Heraldry,** is used both as a bearing or charge, and as a difference, or mark of cadency. In the latter case, it designates the second son, and those that descend from him. See **CADENCY.**

**CRESCENT CITY,** a rising town in the north-west of the state of California, stands on the right bank of the Tuolumne, about twenty miles above the entrance of that river into the San Joaquin, itself a tributary of the Sacramento, which falls into the noble harbour of San Francisco. The Tuolumne is navigable for steam-boats to a distance of 10 miles above Crescent City.

**CRESCENTIA.** See **CALABASH TREE.**

**CRESENTINO,** a town of Piedmont, in the province of Vercelli, about 22 miles north-east of Turin. It is situated in a marshy district near the confluence of the Dora Baltea with the Po. From its plan, it would appear to have been an old Roman station. It has manufactures of silk and woollens. Pop. about 5000.

**CRESS,** a name given to many plants, of which the foliage has a pungent, mustard-like taste, and is used as a salad. It is sometimes more strictly confined to the genus *Lepidium*, a genus of the natural

order *Crucifera*, having small white flowers, and oblong or rounded laterally compressed pouches (silicles), with the cells one-seeded, and the valves keeled or winged on the back. The **COMMON C.**, or

**GARDEN C. (*L. Sativum*),** is an annual, a native of the East, frequently cultivated in our gardens, and used in a young state as a salad; being easily procured in a few weeks from the time of sowing, and, by the aid of a little artificial heat, even in winter. There is an esteemed variety with curled leaves. Like most of the other plants of similar pungent taste, particularly those of the order *Crucifera*, the garden C. is powerfully antiscorbutic. Still more pungent, and almost like pepper in taste, is its congener, **PEPPERWORT,**

***Dittander*, or Poor Man's Pepper (*L. latifolium*),** found in wet places near the sea in some parts of Britain, and occasionally used as a condiment by the poorer classes. It was once in high repute as a remedy for various diseases. **VIRGINIAN C. (*L. Virginicum*)** resembles the garden C. in its properties, and is eaten as a salad, and used as a diaphoretic medicine in North America and the West Indies. ***L. piscidium*,** a native of the South Sea Islands, is there used to stupefy fish; it is also one of the plants used by sailors for prevention or cure of scurvy. The name **WINTER C.** is given to species of the genus *Barbarea*, also cruciferous biennial or perennial plants, with racemes of yellow flowers, quadrangular pods, and lyrate or pinnate leaves. The Common Winter C. (*B. vulgaris*), formerly known as Herb St Barbara, is plentiful in moist pastures and hedge-banks in Britain, and throughout Europe and North America. It is occasionally cultivated as a winter salad; in Sweden it is used as a boiled vegetable. Its pungency is combined with some degree of bitterness. A double variety is common in flower-borders, and bears the name of **YELLOW ROCKET.** Very similar to this, and also occasionally cultivated, is the **Early Winter C.**, or **AMERICAN C. (*Barbarea praecox*),** a native also of Britain, the continent of Europe, and North America.

**BITTER C. (*Cardamine*)** is another cruciferous genus, with linear pods, and flowers sometimes of considerable beauty, as in the common Bitter C. or Cuckoo-flower (*C. pratensis*), also known by the name of **Lady's Smock**—a very common ornament of moist meadows

Cress (*Lepidium Sativum*):  
a, silicle.

Bitter Cress (*Cardamine amara*):  
a, silicle, opening.

in Britain, with white, bluish-coloured, or light purple flowers; the flowers of which are stimulant and diaphoretic, and had at one time a high reputation for the cure of epilepsy, particularly in children, and still retain a place in the pharmacopœias. The young leaves of this species, as well as of *C. amara*, a species with still more beautiful flowers, and *C. hirsuta*, a small flowered species, both British, are used as salads, but more generally in some continental countries than in Britain, being pungent with a little bitterness. The leaves of *C. amara* are brought to market in large quantities in Bohemia and Saxony. The juice of *C. pratensis* is much used as an anti-scorbutic in the north

Water-Cress (*Nasturtium officinale*).

of Europe, to counteract the effect of the constant use of salted meat and salted fish. **WATER-C.** (*Nasturtium officinale*) is a perennial aquatic cruciferous plant, much used both in England and on the continent of Europe as a spring salad. The genus *Nasturtium*, which contains a considerable number of species, has a spreading calyx, and a nearly cylindrical pod. *N. officinale* is a native of almost all parts of the world. The leaves have a pungent bitterish taste, with a little saltiness. They possess medicinal properties similar to those of **SCURVY-GRASS**. In favourable weather, they may be procured in winter as well as in spring, and may be frequently cut over during a season. The plant is cultivated to a considerable extent both in Germany and near London, in wide ditches, which are filled with slowly flowing and pure water. It grows best in clear shallow running water, with a bottom of sand or gravel. Mud is injurious both to its growth and to the flavour of its leaves. For **INDIAN-CRESS**, see **TROPEOLUM**.

**CRESSET** (Fr. *croisette*, diminutive of *croix*, cross), a name given to a great light on a beacon or watch-tower, to a lamp or torch, or a light fixed on a pole. The name owes its origin to the fact that formerly beacons were usually surmounted by a cross.

**CREST** (Lat. *crista*, a tuft, from *creresco*, to grow up). Though popularly regarded as the most important feature in heraldic emblems, the C., in the eyes of heralds, is an external adjunct to the shield, without which the bearing is complete, and which may consequently be altered without materially affecting its significance. Occupying the highest place on the helmet (see illustration), it is the member of the bearing by which the knight was commonly known in battle; and from this circumstance, it is to it that the term *cognizance* (from *cognosco*, to know) is properly given. Its claim to a classical origin is probably better than that of any other portion of coat armour. Jupiter Ammon is represented as having borne a ram's head on his helmet, and Mars the figure of a lion or a tiger. Alexander the Great, on the pretence that he was sprung from Jupiter, assumed the ram's head; and Julius Cæsar bore a star, to denote that he was descended from Venus. The helmet, as we see it represented on ancient

statues and gems, was frequently adorned with a crest. Sometimes it was of horse-hair; at other times a lion or other animal was placed on the helmet, either erect or couchant.

Newton, in his *Display of Heraldry*, says that the first C. to be met with in the monuments of English chivalry, is that on the great seal of Richard Cœur de Lion. The helmets in this instance, and in that of Roger de Quincey, Earl of Winchester, differ in form from those afterwards used, the C. occupying a much larger space.

Crests are said to have come into general use about the time of Henry III., and to have been used as marks of distinction by commanders in the holy wars, as they had formerly been by the Roman centurions. For lightness they were often made of stuffed leather, which was gilt, silvered over, or painted—a circumstance which explains their greater size than in later times, when they were made either of wood or metal. The earliest example of the wreath on which the C. is now invariably placed, is that on the monument of Sir John Harsieck. It consisted of two pieces of silk, of the colours of the armorial bearings of the wearer, twisted together by the lady who had chosen him for her knight. Though crests are now invariable appendages to shields, and many of them are appropriated to particular families by hereditary descent, they are believed to have been originally assumed at the pleasure of the wearers; and they are even now less strictly under the cognizance of the heralds than the devices on the shield, which must always be assigned by competent authority. Crests are so various that a classification of them is scarcely possible. The following is an abridgment of that given by Newton, who has written very fully on the subject in his *Display of Heraldry*. The most ancient class of crests he believes to have consisted of ferocious animals, which were regarded as figuratively representing the bearer and his pursuits. Secondly, they were devices assumed as memorials of feats of chivalry, and for the purpose of perpetuating traditions and family legends, either in addition to, or differing from, those represented on the shield. Thirdly, they served only to give a more prominent place to objects already represented on the shield. Fourthly, they commemorated religious vows, or expressed the religious or knightly aspirations of the bearer. Fifthly, they were mere whims, and were adopted for no very definite reason, and served no very definite purpose. As many of them belonged to persons not only unconnected by family, but of different names, they no longer served the purpose of distinction when separated from the shield. To this latter class belong the vast majority of modern crests assumed at the suggestion of seal-engravers and coach-painters.

The lion assumed by Richard I., during the crusade in the Holy Land, to express the bravery for which he was proverbial, was borne by Edward III., Henry VII., Edward VI., and James I.; and since that time has been recognised as the appropriate C. of the royal family of England. In early times, the same C. was not always borne even by the same person. Besides the lion, Edward III. occasionally bore a white raven crowned; and other monarchs made use of similar additions. Anciently, the nobility mostly bore plumes of feathers. But several of the Earls of Warwick, of the Beauchamp family—the last of whom died in 1445—bore for C. a bear with a rugged staff,

Helmet and Crest of Roger de Quincey, Earl of Winchester.

CRESTE—CRETACEOUS GROUP.

muzzled, collared, and chained, as it is still to be seen on signs (see woodcut). The origin of the wreath has been already mentioned. It is now represented as consisting of two stripes of gold or silver lace, twisted into a circular cord. Its tinctures are always those of the principal metal and colour of the arms. It is a rule in delineating the wreath, which is shewn edgewise above the shield, that the first coil shall be of metal, and the second of colour. Civic, triumphal, and other crowns were used as wreaths; and this practice is supposed to have given

rise to the use of coronets, out of which crests are sometimes represented as issuing, even in the case of persons who are not noble.

CRESTE, in Architecture, an ornamental finishing, either carved in stone, or of tiles running along the top of a wall, or the ridge of a roof. *Crest-tiles*, or, as they are corruptly called, *Cress-tiles*, or *Crease-tiles*, are frequently in the form either of

Crest-Tiles.

small battlements or Tudor flowers, as in the accompanying illustration from Exeter Cathedral. See Cors.

CRESTED, in Heraldry. When a cock or other bird has its comb of a different tincture from its body, it is said to be C. of such a tincture, naming the tincture.

CRESWICK, THOMAS, R.A., one of the best and most popular of recent English landscape-painters, was born at Sheffield, 1811. He early exhibited a taste for drawing, and in his 17th year removed to London, with a view to study the art as a profession. But already he had so far advanced, that two of his pictures were, during that year, admitted into the Royal Academy's exhibition. C. loved to paint the beautiful streams, and glens, and wooded dells of his native land; and these, which form the subject of his best paintings, are represented on his canvas with the very fidelity and freshness of nature itself. Among his greatest works are 'England,' 'London Road a Hundred Years Ago,' and the 'Wald of Kent.' His knowledge of aerial perspective was unsurpassed. C. also painted some admirable sea-side studies. He was elected an associate of the Royal Academy in 1842, and R.A. in 1851. C. was one of the artists to whom the arrangement of the Gallery of Modern Paintings at the Manchester Exhibition of 1857 was intrusted. [He died 1869.]

CRETACEOUS GROUP, or CHALK FORMATION, the upper strata of the Secondary series, immediately below the Tertiary beds, and resting on the Oolite. This group is separated from the Eocene Tertiary beds by a decided change in both the rocks and fossils. The Eocene strata rest unconformably upon the chalk; it is, however, more than

probable that a number of beds may yet be discovered to fill up the gap which apparently here exists in the sequence of the rocks.

The C. G. covers a large extent of surface in Europe and the east of Asia: beds of the period have also been noticed in North and South America. The typical strata occur in the south-east of England, and are connected with similar beds in the north of France and Germany, and in Denmark. Indeed, the bed of the German Ocean seems to be composed of rocks of this group, as is evidenced by the masses of chalk and flint thrown on the shores of Scotland after storms.

The strata of the group have been arranged in the following order. The maximum thickness of the divisions is given in feet.

		Feet.
UPPER	1. Maestricht, . . . . .	100
	2. Chalk with Flints, . . . . .	500
	3. Chalk without Flints, . . . . .	600
	4. Chalk Marl, . . . . .	100
LOWER	5. Upper Greensand, . . . . .	100
	6. Gault, . . . . .	150
	7. Lower Greensand, . . . . .	850
	8. Wealden beds, . . . . .	1300

1. The Maestricht beds (q. v.) consist of pisolitic limestones in the north of France, and of loose yellowish sandstones in Holland. 2. The chalk with flints is a great mass of pure white pulverulent limestone, usually too soft for a building-stone, but sometimes passing into a more solid state. It occurs in beds of great thickness, with the stratification often obscure, except when rendered distinct by interstratified layers of flint a few inches in thickness, occasionally in continuous beds, but oftener in nodules, and recurring at intervals from two to four feet distant from each other. Iron pyrites is found frequently in these beds in radiated nodules; it readily decomposes, and produces rusty stains on the rock. 3. Chalk without flints; this differs from the upper chalk only in the want of flints. 4. Chalk Marl; the white chalk, by the gradual admixture of argillaceous matter, becomes hardened, until it passes into a pale buff-coloured marl or argillaceous limestone, sometimes of sufficient compactness to be used as a building-stone. 5. Upper Greensand (see GREENSAND), composed of alternating layers of sands, clays, and limestones, occasionally, but not always, coloured with green particles of a chloritic mineral. 6. Gault (q. v.), a stiff dark clay, used for briekmaking, with many beautifully preserved shells. 7. Lower Greensand (q. v.), so like petrologically to the Upper Greensand, that when the intervening Gault is absent, it is impossible to separate them, except by their organic contents. The Spector Clay, a local Yorkshire bed of dark clay, is of the same age. 8. Wealden (q. v.), divided into the two groups, the Wealden clay and Hastings sand, consists of a great series of shales and sandstones, with scattered beds of lime and ironstone.

The most remarkable petrological characteristic of the group is the chalk, which exists in such abundance as to have given its name to the formation (Lat. *creta*, chalk). It is a white, soft, and pulverulent limestone, consisting almost entirely of carbonate of lime; the only foreign matter in any quantity being siliceous, which is aggregated together in an amorphous condition, in nodules or layers of flint. Occasional pebbles are also found, but they are extremely rare. Chalk was formerly supposed to be a chemical precipitate: the microscope has, however, shewn it to be composed of minute shells mixed with the broken fragments of larger ones; and, very recently, the use of an improved deep-sea sounding apparatus has revealed a sediment now accumulating in many places, which agrees in every

point, save solidity, with the chalk. When a piece of white chalk is rubbed down to powder with water, by means of a soft brush, and the powder examined by the microscope, it will be found that the greater portion consists of shells of the minute kinds of Foraminifera, mixed with the disintegrated prisms of Pinna or other large shells of like structure, the shells of Cytherina, a marine Entomostracan, and probably a few Diatoms. Deep-sea soundings have disclosed a formation precisely similar, as taking place at the present time. Of some gatherings obtained at a depth of two miles from the great Atlantic plateau, Professor Bailey says: 'I was greatly delighted to find that all these deep soundings are filled with microscopic shells; not a particle of sand or gravel exists in them. They are chiefly made up of perfect little calcareous shells (Foraminifera), and contain also a small number of siliceous shells (Diatomaceæ).' The occurrence of pebbles in the chalk can easily be accounted for, if we suppose them to have been floated in, attached to the roots of trees, or more probably to sea-weeds. It is more difficult to account for the origin of the flint. Professor Bailey found that some seas, especially in the Arctic regions, supplied an enormous quantity of the siliceous frustules of the Diatomaceæ, and spicules of sponges. That such organisms may have been converted into the flint nodules seems very probable, when we remember that many of the nodules have the external conformation of sponges, and shew occasionally also the internal structure. Mr Powerbank's microscopic examination of flint nodules, seems to lead to the conclusion that all flints are produced from the siliceous skeletons of organic beings. Chalk, then, seems to have been a deposit in very deep seas, far out of the reach of land-currents, which would certainly have brought with them argillaceous and arenaceous debris.

The C. G. is highly fossiliferous. The remains of plants are abundant in the fresh-water Wealden beds; amongst them have been found fragmentary portions of dicotyledons. If we except the microscopic Diatomaceæ, which are not unfrequent in the white chalk, vegetable remains are rare in the other members of the group. The various divisions of the animal kingdom are represented in the organic remains of the chalk, if we except the warm-blooded vertebrata, which have hitherto—if they existed—escaped notice. Foraminifera were enormously abundant in the seas, and active in the secretion of the soluble carbonate of lime, fixing it in their minute shells, which, after their death, as has been shewn, formed the principal material of the chalk. In the lower beds, Polyzoa have been found in great abundance on the continent. Echinoderms are in immense numbers, and beautifully preserved. Crustacea are occasionally found. Of mollusca, the Brachiopoda and Cephalopoda are especially abundant, both being pelagic types. Ctenoid and Cycloid fishes appear in this group for the first time, though yet in small numbers—the Placoids and Ganoids being still the predominant forms. Reptiles, though not so numerous as in the former period, were yet far from rare. For further details of the fossils, see DIATOMACEÆ, SIPHONIA, VENTRICULITES, FORAMINIFERA, TEREBRATULA, RHYNCONELLA, HIPPURITES, SCAPHITES, AMMONITES, HAMITES, DIADEMA, PYCRODUS, MOSOSAURUS, PLESIOSAURUS, ICHTHYOSAURUS, PTERODACTYLUS, &c.

CRETE. See CANDIA.

CRETINISM, from *crétin* (French), an idiot of the Alps, and this again probably from *chrétien*, a Christian, one who, from his state of fatuity, could not sin, and was viewed with some degree of religious respect. The name of C. is now applied in a more

general sense to idiocy, or defective mental development depending upon local causes, and associated with bodily deformity or arrested growth. C. is very often found in connection with Goitre (q. v.), in the lower Alpine valleys, not only of Switzerland and Italy, but of the Pyrenees, Syria, India, and China. In Europe, it is rarely met with at a higher elevation than 3000 feet, and haunts chiefly the valleys surrounded by high and steep walls of rock, which exclude the light, and limit the free circulation of air. Cretins are always pitiable, and frequently repulsive objects; they are generally dirty, shameless, and obscene; their appetite is commonly voracious; the mouth is large and open, the tongue often protruded, the eyes small, the nose flat and broad, the skull narrow and small in all its dimensions, the forehead retreating, the complexion cadaverous; in addition to which, the whole body is dwarfish, the hands and feet large, the limbs often rickety, the belly protuberant. The cause of C. is still imperfectly understood; the recent researches of Virchow tend to the conclusion that it is a physical degeneration, dependent on the reception of an undue amount of calcareous matter into the system; and this agrees with the general result of numerous observations previously made, as to the prevalence of goitre and C. in places where calcareous waters are alone accessible to the inhabitants. See GOITRE. Many attempts have been recently made to improve the condition of the cretin in childhood, by removing him from the locality of his birth, and by careful training; the institution founded by Dr Guggenbühl on the Abendberg (q. v.), near Interlaken in Switzerland, having been the prototype of many others on the continent, and of some in England and Scotland, for the education of Idiots (q. v.).

CREUSE, a river and a department in the centre of France. The river rises in the mountains on the southern border of the department of C., and flows in a generally north-north-west direction through that department, then in a north and westerly direction through Indre, and dividing the departments Vienne and Indre-Loire, falls into the Vienne, a tributary of the Loire, about 12 miles north of Châtellerault, after a course of about 150 miles.—The department to which the river gives its name lies in lat. 45° 39'—46° 26' N., and long. 1° 24'—2° 36' E. On an area of about 2200 square miles, it had a population, in 1856, of 278,889; a considerable decrease, as compared with 1851. Low mountains and chains of hills occupy the greater part of the land. The streams, with the exception of the C., are insignificant. The climate is moist and variable, and the soil thin and light in the southern hilly district, which is interspersed with stretches of heath and pasture, but better in the lowlands of the north-east. The products are rye, buckwheat, oats, and potatoes; but agriculture is backward, and the rearing of cattle forms the chief branch of rural industry. Large quantities of chestnuts and fruit are grown. The minerals are not important. The people of C. are but slightly educated, and use a coarse patois; but are generally industrious, and annually migrate in large numbers to find work in various parts of France. C. is divided into the arrondissements Aubusson, Bourgneuf, Boussac, Guéret, with Guéret for its capital.

CREUZER, GEORG FRIEDRICH, a learned German philologist, was born at Marburg, March 10, 1771, and studied there and at Jena. In 1802, he was appointed a professor at Marburg, and in 1804 obtained the chair of Philology and Ancient History at Heidelberg, which he occupied for 44 years in the worthiest manner. In 1848, he retired into private life, the infirmities of age having forced him

to renounce the fatigue of teaching. He died at Heidelberg, 15th February 1858.

C.'s whole life has been devoted to the study of antiquity. His first, and probably his greatest work, was *Synbolis und Mythologie der alten Völker, besonders der Griechen* (4 vols., Leip. 1810—1812). This treatise, which asserted the synbolical character of ancient mythologies, excited a lively controversy, in which Hermann and Voss appeared as the opponents of Creuzer. His next work in importance was a complete edition of the works of Plotinus (3 vols., Oxford, 1835). Along with G. H. Moser, C. edited several works of Cicero—*De Natura Deorum* (1818), *De Legibus* (1824), *De Republica* (1826), and *De Divinatione* (1828), &c. Between 1837 and 1848, he published a partial collection of his writings in 10 vols. (*Deutsche Schriften*. Leip. and Darms.), the last of which contains an autobiography of C. under the title *Aus dem Leben eines alten Professors*. He is also the writer of essays on archaeological topics too numerous to be mentioned. In 1854 appeared *Friderici Creuzeri Opuscula Selecta*.

CRÈVECOEUR (*Heart-breaker*), the name of a Dutch port in the province of North Brabant, on the left bank of the Mense, where this river receives the Dieze, about 4 miles north-north-west of Bois-le-Duc. It figures somewhat prominently in the wars of the Dutch and Spaniards.

CREVILLENTÉ, a town of Spain, in the province of Alicante, about 20 miles west-south-west of the city of that name. It is situated at the foot of the hills forming the boundary of Murcia, and has a population of about 7000, who are chiefly engaged in weaving and in agricultural pursuits.

CREW, of a ship, is a collective name for all the persons employed therein, but usually limited to designate non-commissioned officers and seamen only. In men of war, the entire C. are divided into five groups: 1. Subordinate and warrant officers; 2. Chief petty officers; 3. First-class working petty officers; 4. Second-class working petty officers; 5. All below the 4th group. In the very largest war-steamers now afloat, there are upwards of 80 different ranks, grades, or offices among the crew.

Besides the above classification of all the hands on board as members of one C., there are certain minor groups, each consisting of men employed in special work; such as the sailmaker's C., cooper's C., armourer's C., carpenter's C., cockswain's C., boatswain's C., &c.

In a merchant-ship, under the new Mercantile Marine Act, the master, before he starts on a voyage, must send a list of his C. to the customs' comptroller at the port of departure, and a similar list within forty-eight hours after his return. The masters of coasting-vessels, however, are required to do this only twice a year. Emigrant officers insist that ships to Australia shall have four seamen as C. to every 100 tons burden, and three to ships bound for America. In the large sea-going steamers, however, the number of hands is relatively greater, owing to the various duties relating to the machinery; a steamer of 1000 tons will have as many as 60 or 70 hands, if bound for a long voyage.

CREWE, a town in the south of Cheshire, forming a central station of five important railways, to which it owes its present importance. Pop. (1861) 8158, chiefly employed in the railway stations and foundries, and in the manufacturing and repairing of railway carriages and locomotives.

CREWKERNE, a town in the south-east of Somersetshire, in the fertile valley of the Parret and Isle, 10 miles south-south-west of Ilchester,

and surrounded by a wide amphitheatre of highly cultivated hills. Pop. 4498. The chief manufactures are sailcloth, sacking, hair-seating, webbing, and girths. Its weekly markets, and annual fair, which is held on September 4th, for sheep, cattle, and horses, are much frequented and well supplied. The word C. means 'hermitage of the cross.'

CRIBBAGE is a game with cards, played by two, three, or four persons, the whole pack being used. When three are engaged, each plays for himself; when four, they take sides. The value of the cards is the same as at whist; but there are no trumps. The number of cards dealt is usually five or six, the mode of playing the game varying slightly with the number of cards used. The points are scored on a board with holes for pegs, and 61 constitutes game. The terms used in the game are as follow: *Crib*, the cards laid out by each party, the points made by them being scored by the dealer. *Pairs* are two similar cards, as two aces or two kings; they reckon for two points, whether in hand or playing. *Pairs royal* are three similar cards, and reckon six points. *Double pairs royal* are four similar cards, and reckon twelve points. These various points are thus made: if your adversary plays a seven, and you another, a pair is made, which entitles you to two points; if he then play a third seven, he makes a pair royal, and marks six; and if you play a fourth seven, it constitutes a double pair royal, and entitles you to twelve points. *Fifteens*.—If any combination, whether of two or more cards, in your hand, or in play, make together fifteen, such as a ten and a five, a two, a five, and an eight, &c., you reckon two points. *Sequences* are three, four, or more successive cards, and reckon for an equal number of points; and in playing a sequence, it is of no consequence which card is played first; for instance, if your adversary plays an ace, and you a five, he a three, you a two, and he a four, he scores five for the sequence. *Flush* is when the cards are all of one suit, and reckons for as many points as there are cards. A knave of the same suit as the turn-up card counts for one in any hand. If a knave be turned up, it counts two for the dealer. For full directions for playing the game, see *Chambers's Information for the People*, article 'Indoor Amusements.'

CRIB-BITING is a bad habit met with especially in the lighter breeds of horses, and those spending a considerable amount of leisure in the stable. The act consists in the animal seizing with his teeth the manger, rack or any other such object, and taking in at the same time a deep inspiration, technically called *wind-sucking*. C. springs often from idle play, may be first indulged in during grooming, especially if the operation is conducted in the stall, and the animal be needlessly teased or tickled; is occasionally learned, apparently, by imitation from a neighbour; and in the first instance is frequently a symptom of some form of indigestion. Its indulgence may be suspected where the outer margins of the front teeth are worn and rugged, and will soon be proved by turning the animal loose where he can find suitable objects to lay hold of. It usually interferes with thriving and condition, and leads to attacks of indigestion. It can be prevented only by the use of a muzzle or throat-strap; but in those newly acquired cases resulting from gastric derangement, means must further be taken to remove the acidity or other such disorder.

CRICE'FUS. See HAMSTER.

CRICHTON, JAMES, surnamed the 'Admirable,' was a native of Scotland, where he was born in 1551, or, according to others, in 1560. His father,

Robert Crichton of Ellicock, in the county of Perth, was Lord Advocate of Scotland from 1561 to 1573. On the mother's side, C. was descended from the old Scottish kings, a circumstance of which he used to boast on the continent. He was educated at St Andrews University. Before he reached his 20th year, he had, it seems, 'run through the whole circle of the sciences,' mastered ten different languages, and perfected himself in every knightly accomplishment. Thus panoplied in a suit of intellectual armour, C. rode out into the world of letters, and challenged all and sundry to a learned encounter. If we can believe his biographers, the stripling left every adversary who entered the lists against him *hors de combat*. At Paris, Rome, Venice, Padua, Mantua, he achieved the most extraordinary victories in disputation on all branches of human knowledge, and excited universal amazement and applause. The beauty of his person and the elegance of his manners also made him a great favourite with the fair; while, as if to leave no excellence unattained, he vanquished, in a duel, the most famous gladiator in Europe. The Duke of Mantua, in whose city this perilous feat was performed, appointed him preceptor to his son, Vincentio di Gonzago, a dissolute and profligate youth. One night, during the carnival, C. was attacked in the streets of Mantua by half-a-dozen people in masks. He pushed them so hard that their leader pulled off his mask, and disclosed the features of the prince. With an excess of loyalty which proved his death, C. threw himself upon his knees, and begged Vincentio's pardon, at the same time presenting him with his sword. The heartless wretch plunged it into the body of his tutor. Thus perished, in the 22d year of his age, the 'Admirable Crichton.'

What measure of truth there may be in the hyperbolic eulogies of his biographers, it is impossible to determine, as C. left no writings by which they might have been judged.

**CRICKET** (of doubtful derivation), a well-known game, is of very ancient date. The author of the *Cricket Field*—one of the best manuals on the subject—believes it to be identical with 'Club-ball,' a game played in the 14th c.; it went originally by the name of 'handyn and handoute.' C. is a truly national English game. There is hardly a town, village, or school, that does not own its C. ground, and military authorities hold it in such estimation as a healthy recreation, that soldiers are encouraged to occupy their leisure time in its pursuit. Of late years, C. has been introduced largely into Scotland and Ireland, and is rapidly becoming naturalised all over the world. The requirements for carrying on the game are—1st, a piece of level turf an acre or two in extent; 2d, a sufficient number of players to form two sides of eleven each, for *double wicket*, and a lesser number for *single wicket*; 3d, for *double wicket* (the mode in which the game is usually played), two bats, two sets of wickets and bails, and a ball. When a match is to be played between two 'elevens,' the first thing to be done is to 'pitch' the wickets. *Wickets* consist of six wooden stumps, 27 inches high, and are placed in the ground in sets of three, at a distance of 22 yards apart. On the top of each set of stumps are placed two small pieces of wood, called *bails*. The rival sides next toss for first 'innings,' and the director of the side that is to go in first, places two of his men at the wickets as batters; while a bowler, wicket-keeper, long stop, and fielders (see accompanying illustration), are placed in their several positions by the director of the opposite side. When these arrangements are satisfactorily made, and the markers or scorers are at their post, the umpires take their places, and the game begins. It

may be well to mention here that the relative merits of rival sides are decided by the total number

Plan of Cricket-field, shewing positions of parties engaged at double wicket :

Names of parties indicated by the figures: \*\*, Batters; 1, Bowler; 2, Wicket-keeper; 3, Long-stop; 4, Short-slip; 5, Long-slip; 6, Point; 7, Cover-point; 8, Mid-wicket; 9, Long Field-off; 10, Long Field-on; 11, Leg; OO, Umpires; ††, Scorers. This is the usual placing of the field-men, but bowlers make such alterations as they deem best to oppose the batters.

of runs made by each eleven batters during two innings—the side whose players score the most being, of course, victorious.

We may further premise that the bowler's object is to direct his ball, by a swift movement of the arm, towards the opposite wickets, at which one of the batsmen stands, and, if possible, to strike down the stumps or knock off the bails; while the object of the batsman, on the other hand, is to protect his wickets from the bowler's attack, by either stopping the ball when it reaches him (blocking), or driving it out to the field. And much of the beauty of the game depends upon the precision with which the bowler can direct ball after ball in a straight line for the wickets, and the corresponding skill displayed by a good batsman in guarding them.

We will now suppose the two batsmen to be at their places, the bowler at his, ball in hand, and the other players arranged in theirs: at a signal from the umpire the bowler cries 'Play!' and immediately after, *delivers* his first ball. If the batsman misses the ball, and it passes the wicket, the wicket-keeper stops it, and returns it to the bowler, who delivers another ball, and so on. When the batsman strikes the ball fieldwards, he immediately runs to the opposite wicket, passing his companion batsman, who crosses to his, and so on, till the ball has been returned by a fielder to the wicket-keeper or bowler's hand. Thus, if the stroke be a long one, the striker may have time to run perhaps three times between the wickets before the ball is thrown up, when three 'runs' are accordingly placed at his name by the scorers, on their sheet. If, however, the bowler or wicket-keeper receives the ball, and touches the wickets with it, before the advancing batsman has reached his 'ground' or touches it with his bat, the striker is out, and another man takes his place. Besides, if a ball from a stroke of the bat be caught by one of the opposite party before it reaches the ground; or if in striking at a ball the striker hits down his wicket; or if he wilfully prevents a ball being caught, or strikes it twice; or if any part of his person stops a ball which would otherwise have hit his wicket, the striker is out. It frequently happens that two skilful batsmen guard their wickets so effectually, and score so many runs, to one particular style of

bowling, that a change either of the bowler, or style of bowling, is adopted by the other side. This change, say from swift to slow bowling, or *vice versa*, generally produces the required results, and leads to the speedy retirement of the hitherto fortunate batsmen.

The wicket-keeper's place is a very important one, his principal duty being to stop with his hands every ball the batsman misses, it being allowable to make runs (byes) for balls that elude his grasp. Behind him stands the long stop, who is always on the outlook for balls that escape the wicket-keeper. The fielders, who are posted in various parts of the ground, ought to possess quickness of eye and foot, and skill in picking up with either hand a ball that is running, and instantly throwing it to the wickets. They must also be well skilled in catching balls. Much depends on their judgment of distance between the point at which the ball is picked up, and the wickets, as misconception of this may lead to overthrowing the ball, or throwing it short, while the batsmen are profiting by the error, and scoring additional runs. Fielders usually throw the ball to the wicket-keeper, who returns it slowly to the bowler; this saves the hands of the latter from being unsteady by catching long balls.

At the end of every four bowls, the bowler, wicket-keeper, long-stop, and fielders, change places, and thus every four balls are delivered from alternate wickets; four balls constitute an 'over,' which it is the umpire's duty to reckon and announce.

We have said that each side is allowed *two* innings, but it sometimes happens that one side scores more runs in one innings than the other does in two; thus, A's side, we will suppose, goes in first, and its eleven men score 180; B's side then goes in, and scores, say, 80 the first innings, and 70 the next: in that case, A would be said to have won by an innings and 30 runs.

In England, there are many professional men who make a livelihood by playing matches with amateur clubs, and by instructing the latter in the art. The Marylebone and Surrey are, perhaps, the two most influential clubs in England; and for skill and science, it may safely be said, that the 'Eleven of all England,' and the 'United Eleven' (professionals), excel all other cricketers in the world. The attractions of C. seem to be fast spreading in all countries. In America, the game is played to a large extent, and with skill almost equalling that of English players. In 1859, America sent a challenge to England, who accepted it by sending her Eleven: this band of players competed with the principal transatlantic clubs, and returned to England covered with laurels. The best works on C. are *The Cricket Field* (Lond. Longmans), *Felic on the Bat*, and Lillywhite's *Guide to Cricketers* (Lond. Kent & Co.).

CRICKET (*Gryllus*; *Acheta* of some naturalists), a genus of orthopteron insects, of the section *Saltatoria* (in which the hinder legs are long, very strong, and formed for leaping), allied to locusts and grasshoppers, and the type of a family *Gryllidae* (or *Achetidae*). The wings are folded horizontally, and form, when closed, a slender thread-like acumination beyond the wing-covers (*elytra*). It is by the friction of the wing-covers against each other, and in virtue of a peculiarity of their structure, that the males produce the stridulous sound which makes these insects so well known. The antennae are long and thread-like, inserted between the eyes. The best known species is the HOUSE C. (*G. domesticus*), which is about an inch long, with antennae of almost an inch and a half, of a pale-yellowish colour, tingled with brown. It is widely distributed over Europe, particularly the south, and is common in Great Britain. Its very frequent abode is in

nooks and crevices of houses, and it sometimes burrows in the mortar; the neighbourhood of the fire is very attractive to it, particularly in winter; and its merry note has, accordingly, become associated with ideas of domestic comfort and cheerfulness. Without the heat of the fire, it becomes

House Cricket (*Gryllus domesticus*):  
a, eggs; b, young just hatched; c, full-grown larva; d, pupa;  
e, perfect insect.

dormant, or nearly so, in winter. It remains quiet during the day, but is lively and active at night, issuing forth to seek its food, which consists both of animal and vegetable substances. Bread-crumbs are very acceptable to it; and for the sake, apparently, both of food and warmth, it very much frequents bakehouses. The larvæ are wingless, the pupæ have mere rudimentary wings.—The FIELD C. (*G. campestris*) is larger, blackish, with the base of the wing-covers yellowish, feeds on herbs and roots, makes a louder noise than the House C., and is not unfrequent in some parts of England, but very rare in Scotland.—A species of C. (*G. megalcephalus*) found in Sicily, makes a noise loud enough to be heard at the distance of a mile.—The MOLE C. (*Gryllotalpa*) will be noticed in a separate article.

CRICKLADE, a town in the north of Wiltshire, 7 miles south-east of Cirencester, in a level country, on the right bank of the Isis, one of the sources of the Thames. C. was formerly a borough town, but at present what is called the borough of Cricklade, includes, besides C., the towns of Swindon, Highworth, Wootton Bassett, and upwards of 50 parishes or districts. C. was disfranchised in 1782, and the right of voting now belongs instead to the Hundreds of Cricklade, Staple, Highworth, and a few other places. Pop. of town, 1906. The ford of the Thames here was the frequent scene of contests in former times. The town was twice plundered by the Danes, first in 905, and again in 1016.

CRIEFF—including the burgh of barony of Crieff and the burgh of regality of Drummond—a town on the Earn, 17 miles west of Perth. It is beautifully situated on rising ground at the foot of the Grampians, and near the entrance by the *Sma' Glen* to the Scottish Highlands. It is the second town in the county. Pop. 3824. It has woollen manufactures, besides tanneries. The mild climate of C. makes it the resort of invalids in summer. It is now eminent for its schools. St Margaret's College was opened here in 1849, for the education of young ladies of the Episcopal communion. Near is the fine scenery of Glen Almond, with Trinity College,

opened in 1817, for students connected with the Scottish Episcopal church. Morrison's Academy—built at a cost of £6500, and endowed by Thomas Morrison, builder, Edinburgh, with £20,000—was opened in 1860. The railway to C. was opened in 1856. Since then C. has much improved. The greatest Scotch cattle-market stood here till 1770, when it was removed to Falkirk.

CRILLON, LOUIS DE BERTON DES BALBES, surnamed 'LE BRAVE,' was born at Murs in Provence, in 1541. Under Francis of Lorraine, Duke of Guise, then the model of military chivalry, he was trained for war, and at the age of 16, was accounted an accomplished soldier. In 1558, he gave the first public proof of his valour at the siege of Calais. Shortly after, he covered himself with glory at the capture of Guines. The whole army celebrated the praises of the young hero, who was introduced by Duke Francis in flattering terms to Henry II. As a reward of his numerous heroic deeds, he obtained a multitude of church benefices, which he intrusted to the care of learned clerks. In the religious wars of the 16th c., he fought against the Huguenots, and distinguished himself at the battles of Dreux, Jarnac, and Moncontour. He was likewise present at the battle of Lepanto, in 1571, and though wounded, was appointed to carry the news of the victory to the pope and the French king. In the atrocities of the St Bartholomew Massacre, C. had no part. In 1573, he took part in the siege of La Rochelle. In 1585, Henry III. made him knight of his Orders. He continued faithful to his sovereign in his struggle with the Catholic League. Henry IV. found in him a sincere friend and adviser. After the peace with Savoy, C. retired to Avignon, and, after the fashion of a true Catholic warrior, ended his days 'in the exercises of piety and penance,' December 2, 1615. The martial fire burned brightly in C., however, even in his last days; in proof of which, there is recorded the rather melodramatic story, that when listening at church one day to an account of the crucifixion, the old hero forgot himself, and brandishing his sword, cried out: 'Où çtais tu Crillon?' (Where wert thou, Crillon?)

CRIME, in its legal, as opposed to its moral or ethical sense, is an act done in violation of those duties for the breach of which the law has provided that the offender, in addition to repairing, if it be possible, the injury done to the individual, shall make satisfaction to the community. A private wrong, or civil injury, on the other hand, is an infringement on the rights of an individual merely, for which compensation to him is held, in law, to be a complete atonement. From this definition, which is that generally adopted by lawyers (Stephen's *Com.* iv. p. 77), it is obvious that legal criminality is not a permanent characteristic attaching to an action, but one fixed upon it arbitrarily, from considerations of expediency. Without changing its moral character, the same action may, and very often is, a C. in one country or in one generation, and no crime in another country or a succeeding generation. Malice, or evil intention, however, is in all cases essential to the character of C., for though there may be an immoral act which it is inexpedient to punish as a C., it can never be expedient to punish as a C. what is not an immoral act. But it is not necessary that the evil intention shall have had reference to the party injured. If the offender acted in defiance of social duty, and regardless of order, a C. has been committed, though it may not have been the particular C. which he intended. For example, it is murder if A kill B by mistake for C, unless the killing of C would have been justifiable, or excusable. The

law can take no cognizance of a bare intention, which has not ripened into any sort of act. How far attempts to commit C. are punishable, is always a question of difficulty. The general rule seems to be, that if such acts can be unequivocally connected with the criminal intention, they are punishable, though not to the same extent as the completed crime. Pupils under seven years of age, and insane persons, as being incapable of design or intention, are regarded in the eye of the law as incapable of C.; but questions as to the responsibility of persons labouring under partial insanity are often surrounded with practical difficulties, which are positively insoluble. The defence of *compulsion*, or *vis major*, as it is called by lawyers, if completely established in fact, is generally sufficient in law. See *COMPULSION*. The subjection of a servant to a master, or of a wife or child to a husband or parent, will be no defence for the commission of an act of the criminality of which the offender was aware, unless it amount to compulsion. Magistrates acting *bonâ fide*, and soldiers acting under their officers in the ordinary line of duty, are not liable to a criminal charge. Extreme want is no excuse for a C. in law, though it furnishes a ground for an application for mercy.

In the technical language of the law of England, the term *offence* has a wider signification than C., the latter including only such of the former as are punishable by *Indictment* (q. v.). Crimes are divided into *Misdemeanours* (q. v.) and *Felonies* (q. v.), the latter being a higher species of offence than the former.

CRIMEA (anciently, the Tauric Chersonese), a peninsula in the south of Russia, forming the greater part of the government of Taurida, in lat. 44° 44'—46° 5' N., long. 32° 30'—36° 35' E. It is united to the mainland only by the very narrow isthmus of Perekop, between the Black Sea and the Sea of Azof, and separated from the isle or peninsula of Taman, on the east, only by the narrow strait of Yenikalé. The C. is thus almost surrounded by water—on three sides, by the Black Sea, and on the fourth by the Sea of Azof; while a trench, 70 feet wide and 25 deep, across the isthmus of Perekop, cuts it off from the mainland. The C. is quadrilateral in shape, the four corners pointing to the four cardinal points in the compass; but a long narrow peninsula juts out on the east, which increases the extreme length of the territory from east to west to 190 miles, the breadth being 110 miles. The whole extent of the C. is between 8000 and 9000 square miles. The coast is very much broken and indented, particularly on the side of the Sea of Azof. The most easterly part of it is a mountainous peninsula, the seat of the ancient kingdom of Bosphorus. From the Strait of Yenikalé, through this minor peninsula and along the whole southern coast, a chain of mountains extends, which may be regarded as a continuation of one of the chains proceeding from Mount Caucasus. This southern district of the C. is very rich and beautiful. The mountains rise with steep slopes from the sea, whilst spurs and secondary chains extend northward, richly wooded, and with most beautiful intermediate valleys, gradually sinking into the uniform and desolate steppe which forms the northern and much greater part of the peninsula. The highest mountain is Tchaitirdagh, i. e., the Tent Mountain, *Mons Trapezus* of the ancients, which rises to a height of more than 5000 feet. It is a table-mountain, and has many great and deep chasms, in some of which the ice remains unmelted all the summer. The southern district of the C. is well cultivated, and is adorned by many country-seats of the Russian emperor and nobles, with parks and gardens surpassed by none in Europe. Tartar villages, mosques, and Greek convents are to

be seen in most picturesque situations amongst the woods and rocks, with many ruins of ancient fortresses. The vegetation may almost be called subtropical; olive groves are frequent; the vineyards yield excellent grapes, and some of them excellent wine; and even oranges are produced. Grain of various kinds is produced abundantly, and silk, wax, and honey. Much attention is bestowed upon horses, oxen, and sheep, in which no small part of the wealth of the country consists. The northern part of the C. is in every way a contrast to the south, being little else than one waste uniform steppe, destitute of water and of wood, with a soil generally very unfit for agriculture, and with numerous salt-lakes and salt-marshes, some of which dry up in summer, and which seem to indicate that it was recently covered by the sea. The air is infected by exhalations from these marshes, and from the *Siwash*, or *Putrid Sea*, which is a portion of the Sea of Azof, but is almost cut off from it by a narrow tongue of land called the Peninsula of Arabat. In the summer and autumn, a most offensive and powerful smell arises from the stagnant water, but the evaporation is often so complete that the *Siwash* is left dry, and horses can cross upon the hardened ground, where at other seasons vessels may sail. The capital of the C. is Simferopol (q. v.); the old Tartar capital is Baktshi-serai (q. v.), both situated in the interior. Sebastopol (q. v.) is situated in the south-west; Kaffa and Kertch are situated in the south-east; Perekop on the isthmus to which it gives its name, in the north. Through the gate of Perekop, great quantities of salt pass northward, the produce of the salt-lakes of the Crimea. The small river Alma, on whose banks the first battle was fought between the Russian troops and the French and English invading army (20th September 1854), falls into the Black Sea, where the picturesque southern district approaches the northern steppe.

The population of the C. amounts to about 200,000, about two-thirds of whom are Tartars; the remainder consist of Russians, Germans, Greeks, &c. The chief features in the early history of the C. are given under the head BOSPORUS (q. v.). The Tartars conquered the territory in the 13th c., and converted it into the khanat of Krim Tartary. The Genoese under these rulers planted flourishing colonies here, which were destroyed by the Turks, who came into possession of the country in the 15th century. Russia finally subjected the C. in 1783. See RUSSIA.

**CRIMEN REPETUNDARUM**, the crime of accepting a bribe by a judge. See BARATRY, JUDGE.

**CRIMINAL**, one who has been convicted of a crime. A person indicted for a criminal offence is often called a culprit in England; and when undergoing trial in the Court of Justiciary in Scotland, he is spoken of as the panel, a word which has a different signification in England. See PANEL.

**CRIMINAL CONVERSATION**. See ADULTERY.

**CRIMINAL COURTS**. See JUSTICIARY, COURT OF.

**CRIMINAL INFORMATION**. See INFORMATION.

**CRIMINAL LAW**. See CRIME, PROSECUTION, PUBLIC PROSECUTOR.

**CRIMP** is the name given to an agent for supplying ships with seamen, just before a voyage; he receives so much per head for his trouble. This offensive name is applied to these persons, because in general they make use of untruthful representations and other unfair means to entrap sailors into service. Crimps are numerous in all large seaports, and are usually in league with publicans and

prostitutes to deprive seamen of their wages. They also keep a sharp look-out for emigrants, and convey all who are simple enough to put faith in their statements to low lodging-houses in which they have an interest. The mere charge for lodging is often small, but the lodgers are cheated by provision-merchants and others who pay the C. a liberal commission on their custom. Fairly conducted, the C.'s business is no more objectionable than any other agency, and within recent years the system has been greatly improved by the operation of the 'Passengers' Act' and 'Mercantile Marine Act,' and especially by the appointment of registrars of seamen and government emigration agents.

**CRIMSON**. See RED.

**CRINAN CANAL**, THE, is an artificial water-communication 9 miles long, in the west of Argyleshire, between Loch Gilp, a branch of Loch Fyne, and Loch Crinan, in the Sound of Jura, at the head of the peninsula of Cantire. It was constructed to avoid the circuitous passage of 70 miles round the Mull of Cantire, on the route from Glasgow to Inverness by the Caledonian Canal. It is 24 feet broad, and 12 deep, has 15 locks, and admits vessels of 200 tons. It was excavated in the end of last century, and cost £183,000. After a continuance of heavy rain in February 1859, the three reservoirs supplying the canal with water (the highest being 800 feet above the canal) burst, and a torrent of water rushed down the mountain-slope, washed away part of the canal banks, and filled the canal with debris and stones for upwards of a mile. Government repaired the damage at the cost of £12,000. In the year ending April 1859, 1606 vessels passed through the canal, and the income was £2238, and the expenditure £2149.

**CRINED** (Lat. *crinis*, the hair), a term in Heraldry. When the hair of a man or woman, or the mane of a horse, differs in tincture from the rest of the charge, the object is said to be *crined*, of such a metal or colour.

**CRINGLES**, short pieces of rope, with each end spliced into the bolt rope of a sail; commonly confining an iron or brass ring or thimble. Smaller ropes are passed through them, to aid in managing the sails.

**CRINOIDEÆ** (Gr. lily-like), an order or family of radiate animals of the class *Echinodermata* (q. v.), of which the recent species are few, but the fossil species so very numerous as to constitute great tracts of the dry land as it now appears. The C. have a central disc, in which is contained the digestive cavity, with two orifices, and from which arise arms or rays, five in number, but soon subdividing, so as at first sight to appear more numerous, and again subdividing into lateral appendages, either fin-like or filamentous, the disc as well as the rays and their subdivisions formed of a calcareous jointed skeleton, clothed with a fleshy integument, of which the fin-like expansions are formed, and which is thicker than in star-fishes, and contains imbedded in it the innumerable ovaries. The joints are also extremely numerous, and the subdivision of the rays often very great. The disc is composed of calcareous pieces and fleshy integument like the rays, as is also a stalk on which the whole is usually supported; the base, it is supposed, being fixed, and the disc and rays expanding like a flower. It appears probable that many of the fossil C. were permanently fixed in this manner, and this is supposed to be the case with the species of *Pentacrinus* still existing, as the *P. caput Medusa*, or Medusa's Head of the West Indian seas; but others are fixed only when young, the disc and arms finally becoming detached from the stalk and moving freely in the

sea, swimming in a manner analogous to that of the medusa. This interesting fact was first discovered by Mr J. V. Thompson, who found in the sea near

Encrinurus.

Cork the stalked young of the *Comatula rosacea*, a small but very beautiful species, and the only species of the C. found in the British seas. See ENCRINURUS.

CRINOLINE (Fr., from Lat. *crinis*, hair) was the name originally given by the French *modistes* to a fabric made of horse hair, capable of great stiffness, and employed to distend women's attire; it is now applied in a general way to those structures of steel wire or hoops, by means of which women have recently attained such overwhelming dimensions. This fashion of expansion is not new. The first name we find given to it is the *fardingale*, introduced by Queen Elizabeth. Walpole, in his

Ladies in time of Queen Elizabeth, shewing how the Fardingale was worn.

fancy description of her, speaks of her 'enormous ruff and vaster fardingale.' The upper part of the body was encased in a curass of whalebone, which was united at the waist with the equally stiff fardingale of the same material, descending to the feet, without a single fold, in the form of a great bell. Gosson mentions the fardingale in 1596, in his *Pleasant Quippes for Upstart Newfangled Gentlewomen*. In the end of the reign of James I., this fashion gradually declined, and was further tamed down by Puritan feeling in the time of Charles I.

and Cromwell, till it quite disappeared. We next hear of it in 1711 as 'that startling novelty the hoop petticoat,' which differed from the fardingale in being gathered at the waist. Sir Roger de Coverley is made to say of his family pictures: 'You see, sir, my great-great-grandmother has on the new-fashioned petticoat, except that the modern is gathered at the waist; my grandmother appears as if she stood in a large drum, whereas the ladies now walk as if they were in a go-cart.' The 'large drum' was the old fardingale, and 'the new-fashioned petticoat' was the more modern hoop, over which, in Sir Roger's time, the dress was looped up round the body in front, and fell in loose folds behind. Hogarth, in his night-scene in 'Marriage à-la-Mode,' introduces on the floor a hoop of the time of George II.; and about 1744, hoops are mentioned as so extravagant, that a woman occupied the space of six men. An elongated, oval form also came into fashion, raised at each side to

A collapsed Hoop.

shew the high-heeled shoes, causing caricaturists to say that a lady looked like a donkey carrying its panniers. Facetious proposals were also made that coaches should have movable roofs, the ladies to be dropped in from the top by means of frames and pulleys. These hoops were of whalebone, with canvas over them, having capacious receptacles on each side for articles of convenience. In 1780, we find hoops of cane used, being advertised to 'outwear the best sort of whalebone.' About the year 1796, hoops had been discarded in private life, but were still the mode at court, and never had been seen in more full-blown enormity, continuing so to the time of George IV., when they were abolished by royal command.

We now come to the recent development of this fashion in our own day, which began with C. in its original and proper sense, first in the form of the inelegant 'bustle' in the upper part of the skirt, then the whole petticoat. Instead of the hair fabric, some used, for economy, cotton, thickly corded and starched. At length, about 1856, people were startled by the question: 'Have you heard that Miss So-and-so actually wears a hoop?' and it became apparent that the fashion of Queen Anne's time had returned upon us, only that the structure was somewhat lighter and more pliant; being usually composed of a series of horizontal small steel hoops, held together either by vertical bands, or by being sewed into a kind of petticoat. Unlike former times of hoops and fardingales, the fashion has descended even to maid-servants, so that where the dining-room is small, table-maids have been known to give warning, because they could not clear the space between the table and the fire; and the newspapers are continually announcing 'Accident from Crinoline,' or 'Lady burned to Death from Crinoline.' Nay, the newspapers from time to time inform us of such accidents as these: 'A publican's wife, passing through the cellar, unconsciously drew a stop-cock open with her crinolined dress, and spilt 14 gallons of the best Islay whisky;' or, more disastrous by far: 'A mill-girl was caught up in the machinery by her crinoline, and immediately killed.' The old-fashioned hoop had this advantage, that it descended as low as the dress; whereas the present hoop stops short of the skirt, and is discovered by its inelegant 'swagging' from side to side, as the wearer walks along. The *Spectator* dealt out much cutting, though playful raillery on the hoops of his day, but apparently with little effect; and

equally unavailing are the satires of *Punch* and other caricaturists of the present time against the hideous fashion of crinoline. It may, without exaggeration, be described as a social nuisance. Owing to its prevalence, church pews that formerly held seven are now let for six, and yet feel rather crowded. The hoops are sometimes made with a circumference of four, and even five yards.

**CRINUM**, a genus of bulbous-rooted plants of the natural order *Amaryllidaceæ*, having long tubular flowers, the segments of the perianth hooked at the apex, the stamens straight and inserted into the tube, and a three-celled capsule. It contains a considerable number of species, natives of different tropical and sub-tropical countries, generally with umbels of large and beautiful flowers, some of them amongst the most admired ornaments of our hot-houses. *C. amabile*, an Indian species, is much esteemed for its fragrance as well as its beauty, and flowers about four times a year. All the species require a rich open soil, plenty of room for their roots, and the frequent removal of suckers.—The bulbs of *C. Asiaticum* are powerfully emetic, and are used in some parts of the East in cases of poisoning.

**CRIS-CROSS ROW.** See **CHRIST-CROSS.**

**CRISIS** (Gr. a judgment, from *krino*, I judge), a name used by the ancient physicians to denote the rapid or sudden determination of an acute disease in the direction of convalescence or of death. It was opposed in signification to *lysis* (*lto*, I relax), which denoted the gradual subsidence of the symptoms noticed in most chronic, and in some acute diseases. The doctrine of crises was closely bound up with that of a *materies morbi*, or material of disease in the blood, which was presumed to be undergoing changes, during the whole course of the malady, tending to an evacuation of some kind from the system in the form of a critical discharge (*apostasis* or *abscess*), which, when observed, was supposed to contain the matter of disease in a state of *coction*, and to be the direct cause of the sudden relief of the patient. Thus, according to the character and seat of the critical discharge, it was common to speak of a C. by sweating, by diarrhoea, by expectoration, by urine, by parotid swellings, &c.; and no C. was considered regular that was not attended by some symptom of this kind. Another curious doctrine associated with that of crises, was the belief in certain days as ruling the beneficent or injurious, the complete or incomplete, character of a crisis. The seventh, fourteenth, and twentieth (according to some, the twenty-first) days of the disease were regarded as eminently critical; less so, but still favourably critical, were the third, fifth, eleventh, and seventeenth; the fourth day was the *indicator* of a complete C. on the seventh; the sixth day was the *tyrant*, notorious for unfavourable crises; the second, eighth, tenth, thirteenth, and rest were non-critical. Few physicians now attach much importance to critical days, but the doctrine of crises and of a *materies morbi*, is still taught, with various modifications, in our medical schools and text-books.

**CRISPIN**, a saint and martyr, was descended from a noble Roman family. About the middle of the 3d c., under the reign of Diocletian, he, along with his brother Crispianus, fled from Rome into Gaul, where he worked as a shoemaker in the town which is now called Soissons, and distinguished himself by his exertions for the spread of Christianity, as well as by his works of charity. According to the legend, his benevolence was so great that he even stole leather to make shoes for the poor! From this, charities done at the expense of others have been called Crispinades. In the year 287, he

and his brother suffered a most cruel martyrdom. Both brothers are commemorated on the 25th October. King Crispin, as he is called, is the universally recognised patron saint of shoemakers, and is represented with dramatic effect in the ceremonial processions of the 'gentle craft.' There is an amusing but scarce book about shoemakers, entitled *Crispin Anecdotes*.

**CRITHMUM.** See **SAMPHIRE.**

**CRŌA'TIA**, a kingdom forming part of the Austrian Empire. With Fiume and the Croatian *Litorale* or Maritime District, and the Croatian Military Border, it has an area of about 4200 square miles, and 608,426 inhabitants. It lies to the north-east of the Adriatic, and borders with Turkey and Hungary. C. is traversed by low chains of mountains, in the south proceeding from the Julian Alps, and in the north from the Carnic Alps. These mountains are generally covered with forests, and the chains are separated by very fertile valleys. The principal rivers are the Save and its affluent the Culpa, the Drave and its affluent the Mur. Some of the valleys, especially in the south, are quite shut in, so that many of the streams have to make their way through subterranean channels. The climate much resembles that of the neighbouring parts of Hungary, the more southern situation being counterbalanced by the greater elevation. The inhabitants are mostly of Slavonic race and language. The religion of C. is that of the Roman and Greek Churches. The Croats are warlike, but the name *Croats* is employed to designate light-cavalry regiments in the imperial army, in which Magyars and others are mingled with true Croats. Grain, chestnuts, wine, and gall-nuts are amongst the principal exports of Croatia. The keeping of cattle is neglected. The wood of the great forests, although much of it is admirably adapted for shipbuilding, is turned as yet to little account. The *Litorale* or coast district contains valuable marble quarries. The capital of C. is Agram (q. v.). C. with its *Litorale* and Slavonia (q. v.) form a crown-land, at the head of the administration of which is the Ban (q. v.) of Croatia.

C. was, in the earliest historic times, inhabited by the Pannonians, who were conquered by the Romans under Augustus, and the country made a province of Illyria. During the irruptions of the northern nations into the Roman empire, C. suffered a variety of vicissitudes. In 640, the Croats, Chrovats, or Horvats, migrated into it from the Carpathian Mountains, and gave it its present name. In the 14th c., having previously been in some measure incorporated with Hungary, C. was more completely united with that kingdom, and passed with it, in the beginning of the 16th c., to the Austrian House of Hapsburg. In the end of the 16th c., the Turks conquered a portion of it, now known as Turkish Croatia. The city of Fiume was declared in 1797 to be a constituent and integral part of the kingdom of Hungary; and after the termination of the French wars, Fiume remained united to Hungary till 1848. The Croats long entertained a feeling of hostility to the Magyars, which manifested itself in 1848 and 1849 in a manner very unfavourable to the cause of the Hungarian revolution; but recently this has greatly, if not altogether disappeared, through the effect of the foolish and faithless conduct of Austria towards both. See **MILITARY FRONTIERS.**

**CROCHET** (a French word signifying a hook), a species of handiwork, which may be described as an extensive system of looping, by means of hooks made for the purpose. You take a hook of a size proportioned to the fineness of the cotton

or wool employed, and begin by making a chain of loops. You then turn, and with your hook still in the last loop, begin the double process of catching the thread through each loop of the chain, and also through that in which your hook is, and thus form another chain attached to the first, and so on. This is called simple or plain crochet. Endless varieties of patterns may be formed, and lightness and elegance attained, by twisting the thread one or more times in taking up the loop, and open work is formed by passing one or more loops. This work may be made round by beginning with a very few loops, joining the first to the last, and then proceeding to take several loops through one, and so widening on. C. has this advantage over knitting, that by drawing the last loop, and leaving it wide, there is no fear of the work running down as happens when knitting-needles slip. Shades of the same colour, and varieties of colours in wool as well as in silk, are used for this work. In white cotton, C. can be made available, from large bed-quilts to delicate lace-like edgings. See numerous small books describing and giving patterns of crochet.

CROCKETS, in Gothic Architecture, are projecting leaves, flowers, or bunches of foliage, used to decorate the angles of spires, canopies, pinnacles, &c. The varieties of C. are innumerable, almost every kind of leaf and flower being copied for the purpose. The first illustration, from Parker,

Fig. 1.

Fig. 2.

is copied from Salisbury Cathedral. The other illustration represents a C. from St Alban's Abbey, of about 1240. C. only appear in pyramidal and curved lines, never in horizontal ones.

CROCODILE (*Crocodylus*), a genus of Saurian reptiles, the type of the family *Crocodylidae*; which some naturalists have erected into a distinct order of reptiles (*Loricata*), on account of the square bony plates with which their bodies are covered, instead of the scales of the other saurians—the greater solidity of the skull—the lungs not descending into the abdomen—and the approach which they make to mammalia and birds in the structure of the heart. The heart has two auricles and two ventricles; but a mixture of arterial and venous blood takes place at some distance from the heart, so that the hinder

part of the body receives an imperfectly aerated blood, which, however, is supposed to be further aerated in the surface of the peritonæum, two curious openings admitting the water, in which these animals ordinarily live, into the internal cavity of the abdomen. The *Crocodylidae* may be described as lizard-like in form, with a great gape, indicative of their characteristic voracity, and with the tail flattened at the sides, so as to become a powerful organ of propulsion in water. The fore-feet have five toes, the hind-feet four, the three inner ones only being armed with claws; the feet are more or less webbed. Each jaw has a single row of numerous large teeth, which are conical and directed backwards; planted in distinct sockets, and becoming hollowed at the base, to admit the crowns of the new and larger teeth which are to succeed them as the animal increases in size. Small ribs are attached to the vertebrae of the neck, which give it a peculiar stiffness, and make it difficult for the animal to turn; and persons pursued by crocodiles may therefore make their escape by rapid turning. The eggs of the *Crocodylidae* are hard, and small in comparison with the size ultimately attained by the animal itself. The females

of some, if not of all the species, guard their eggs, and take care of their young; although the eggs, buried in the sand or mud, are hatched by the heat of the sun alone. The *Crocodylidae* swallow stones, apparently to assist digestion. They prey on fishes and warm-blooded animals; most of them seem to prefer food in a state of incipient putrefaction, and they are even said to hide their prey, and to return to it when it has reached this state. Some of the larger kinds do not scruple to attack man.—All the *Crocodylidae* are large reptiles; they are found in fresh waters and estuaries in the warm parts of the world; none are found in Europe, nor, as far as is yet known, in Australia. They are divided into Gavials, Crocodiles, and Alligators (the latter including caymans).

—The true Crocodiles are found both in the Old World and the New. The muzzle is not slender and elongated, as in the gavials, but oblong and flattened; the teeth are very unequal in size, the long fourth teeth of the lower jaw fitting into notches of the upper, not into pits, as in alligators. To this genus belongs the C. of the Nile (*C. vulgaris*), which abounds also in many other rivers of Africa. It is of a bronzed green colour, speckled with brown, lighter beneath, and is sometimes 30 feet long. It often seizes human beings for its prey. In Park's *Travels*, an instance is recorded of a negro, one of his guides, who was thus seized in the Gambia, and escaped by thrusting his fingers into the crocodile's eyes. The ancient Egyptians held it sacred, and being exempted from all danger on the part of man, it became more bold and troublesome. The individuals particularly selected as the objects of idolatrous worship were tamed, and took part in religious processions. *Souchis* was the name of the deified individual, the C. god.—The DOUBLE-CRESTED or INDIAN C. (*C. biporcatus*), is very abundant in many parts of Asia, in rivers and estuaries, and is also dangerous to man. The smaller marsh C. (*C. palustris*), abundant in stagnant waters in the same regions, flees from man, and often seeks to hide itself in the mud, into which it thrusts at least its snout, then remaining contented, as if in perfect safety.

Crocodile's Tooth: Showing the hollow at the base in which the summit of the new tooth is sheathed.

Crocodiles often bury themselves in the mud in droughts, and so abide till rain falls.—The names C. and Alligator are often indiscriminately used in popular language.

CROC'US, a genus of plants of the natural order *Iridaceæ*. The species have much general similarity, and are natives chiefly of the south of Europe and of the East. Several have been described as British, but are rather naturalised than native. Saffron (q. v.) is the produce of *C. sativus*. Some of the species are much cultivated in gardens for the beauty of their flowers, particularly those which, as *C. vernus* and *C. luteus*, flower very early in spring. The saffron C. and some other species flower in autumn. The flowers of one or two species are fragrant. It is necessary frequently to take up C. roots and plant anew, on account of the manner in which the corms multiply. See CORM.

CROCUS OF ANTIMONY is the oxysulphide of Antimony (q. v.).

CROCUS OF MARS is the finely divided red oxide of iron.

CROË'SUS, the last king of Lydia, succeeded his father, Alyattes, in 560 B. C. He made the Greeks of Asia Minor his tributaries, and extended his kingdom eastward to the Halys. From his conquests, his mines, and the golden sand of the Pactolus, he accumulated so much treasure, that his wealth has become proverbial. He gave himself up to a life of pleasure and sumptuous extravagance, and is said to have deemed himself the happiest man in the world, and to have been displeased when Solon, on a visit to his court, told him that no man should be called happy till his death. He soon found how uncertain was a happiness such as his; for his beloved son Atys was killed while hunting, and there was left to him only one son, who was dumb; and having engaged in war with Cyrus, he was totally defeated, his kingdom conquered, and himself made prisoner, and condemned to be burnt (546). At the funeral pyre, his repeated exclamation of 'O Solon!' drew on him the attention of the conqueror, and the reason of it being known, his life was spared, and he was treated with great kindness. Cyrus gave him for a residence the city of Barené, near Ecbatana, and is said to have consulted him in his military undertakings, a statement which, if true, indicates that C. by no means lacked native ability. Herodotus informs us that he accompanied Cambyses, the son of Cyrus, to Egypt, and while there, incurred great danger by the boldness with which he condemned, on one occasion, the cruel conduct of the Persian king. The time of his death is unknown.

CROFT (Ang. Sax. *croft*), a piece of land connected with a humble kind of dwelling, whose inhabitant, the renter of the land, is called a crofter, and this method of letting small pieces of land, either for tillage or the rearing of cattle, is known as the crofting system. This kind of petty farming, of which there were at one time many examples in Scotland, more particularly in the Highlands, is now very generally given up as inexpedient. See AGRICULTURE, FARM, SPADE-HUSBANDRY.

CRO'IA, or CRO'JA, a town of Upper Albania, European Turkey, 45 miles south-east of Scutari. It is situated on a mountain spur, rising about 500 feet above the plain, and its strong position is defended by a castle. It is the chief town of the Mirdites, a nearly independent Roman Catholic people. Pop. 6000. The famous Scanderbeg was born here.

CROIX, STE. (or SANTA CRUZ), in English, *Holy Cross* or *Holyrood*, or, somewhat barbarously,

*St Cross*, an island, the most southerly and extensive of the Virgin group, is the principal Danish possession in the West Indies. With an area of about 100 square miles, it contains about 25,000 inhabitants, being generally cultivated like a garden.—St C. is also the name of a river, otherwise known as the Schoodie, and also as the Passamaquoddy, which falls into Passamaquoddy Bay, on the west side of the entrance of the Bay of Fundy. It is the boundary throughout between the state of Maine and the province of New Brunswick, having been so defined, from its mouth to its source, by the international treaty which recognised the independence of the United States. The St C. is about 55 miles long, its lowest 12 miles being navigable for large vessels.

CRO'KER, JOHN WILSON, an English politician and *littérateur* of considerable notoriety, was born at Galway, in Ireland, December 20, 1780. Having been educated at a school in Cork, and at Trinity College, Dublin, he entered Lincoln's Inn as a law-student in 1800, and was called to the Irish bar two years afterwards. His first literary attempt was a satire on the Irish stage, which exhibited much caustic cleverness. This was in 1803; and in 1805, he published another equally clever satire on the city of Dublin, entitled *An Intercepted Letter from Canton*. Both productions proved a great success, running through several editions. In 1807, he issued a treatise on the *State of Ireland, Past and Present*, which brought him into some notice, and, in the same year, he was elected member of parliament for Downpatrick. A warm defence in parliament, in 1809, of the Duke of York, charged with corrupt administration at the Horse Guards, helped C. in the same year to the office of Secretary to the Admiralty, a post which he held for twenty years. He was one of the founders of the *Quarterly Review*, and contributed many of the most violent party articles to its pages, as well as a large number of those bitterly personal and grossly abusive reviews which were wont to disfigure that periodical. As 'Rigby,' allowance being made for the satire, his character is not badly hit off by Disraeli, in *Coningsby*. In parliament, C. steadily opposed the Reform Bill in all its stages, and its enactment ended his parliamentary career; but on all questions relative to the promotion of the fine arts, he was much ahead of the great majority of the Commons. He took an active part in the establishment of the Athenæum Club, and rendered good service to literature by his annotated edition of Boswell's *Johnson*, and his publication of the *Suffolk Papers*, and Lord Hervey's *Memoirs of the Court of George II.* His *Stories from the History of England for Children*, supplied Scott with the idea of *Tales of a Grandfather*. C. died August 1857.

CROKER, T. CROFTON, a popular author and collector of Irish stories and legends, was born in Cork, January 15, 1798. He early devoted himself to the collection of legends and songs of the Irish peasantry; and, in 1824, he published his *Researches in the South of Ireland*, characterised by a happy blending of humour and sentiment, with archaeological learning. This work was followed by the *Fairy Legends and Traditions of the South of Ireland* (1825); *Legends of the Lakes* (1828); *Daniel O'Rourke*, a sort of Irish *Manchusen* (1828); *Barney Mahoney* (1832); *My Village* (1832); and *Popular Songs of Ireland* (1839). Of all these works, *Barney Mahoney* and *My Village* are the most original; the others partly consist of compilations; but all are marked by sound knowledge of their subjects, and a *con amore* style of writing. C. also edited *Memoirs of Joseph Holt, General of the Irish Rebels*,

a very interesting work, which was published in 1838. He devoted much time, and rendered considerable service, to archaeology, being member of many antiquarian societies. Through the influence of John Wilson Croker, a friend, but no relative, he, at the age of 21, obtained a clerkship in the Admiralty, where he rapidly rose until he had £800 per annum. He retired from the Admiralty in 1850, with a pension of £580, and died August 8, 1854.

**CROLY**, REV. DR GEORGE, an English poet, romance-writer, and preacher, of considerable reputation, was born at Dublin, about 1785, and educated at Trinity College there. He entered the English Church, and ultimately became Rector of St Stephen's, Walbrook, London. His first work was a poem, entitled *Paris* in 1815. From this time up to within a short period of his death, which took place November 24, 1860, his pen was almost incessantly at work—on satire, comedy, tragedy, romance, tales, biography, magazine articles, and the weightier matters of religion. Few subjects came amiss to him, and he exhibited considerable talent in the treatment of most that he touched upon. His best known work is the romance of *Sathaniel*. C. was also famous for his eloquence as a pulpit orator.

**CRO'MARTY**, a parliamentary burgh and seaport in the united counties of Ross and Cromarty, on a low peninsula between the Moray and Cromarty Firths, on the south side of the entrance into the latter, and 18 miles north-north-east of Inverness. It is irregularly built, and its older streets and lanes are in the homely Flemish architecture prevalent in the old towns of the north of Scotland. The harbour admits vessels of 400 tons, and the bay affords excellent anchorage for wind-bound vessels. Pop. 1988. It has manufactures of ropes, sacking, sailcloth, beer. The chief industry is the herring and white fisheries. C. has declined much since the rise, on the north side of Cromarty Firth, of Invergordon, which is more contiguous to the important districts of Easter and Wester Ross. C. unites with Kirkwall, Wick, Dingwall, Dornoch, and Tain, in returning a member to parliament. In the vicinity of C. are a lighthouse and coast-guard station, and within two miles are some caves, and an arch, called Macfarquhar's Bed, in the old red sandstone, which rises in some parts 250 feet. Near C. are remains of ancient chapels and camps. Hugh Miller, in whose memory a monument has been erected in the neighbourhood, was a native of Cromarty.

**CROMARTY FIRTH**, a landlocked inlet of the North Sea, on the north-east coast of Scotland, just north-west of the Moray Firth, and enclosed by parts of the counties of Cromarty and Ross. It forms a noble harbour, 18 miles long, running south-west, 3 to 5 miles broad, and 5 to 35 fathoms deep. It receives several rivers, the Conan, entering at its upper end, being 35 miles long. The entrance to C. F. is by a strait between two high wooded cliffs or headlands, the North and South Sutors of Cromarty, only 1½ mile across, with 12 to 30 fathoms of water, and with the Three Kings Reef, about half a mile off land. Near the Firth are the towns of Dingwall, Invergordon, and Cromarty. The largest fleet could ride safely sheltered in this fine sheet of water. In the old red sandstone, near the mouth of the Firth, Hugh Miller discovered the fossil fishes *Pterychthys*, *Ostolepis*, &c.

**CRO'MARTYSHIRE**, a county of the north of Scotland, intimately connected, geographically and politically, with Ross-shire, and consisting of ten detached portions in the interior, and along the northern borders of Ross-shire. Area, 344 square

miles, or under an eighth of Ross-shire. See ROSS AND CROMARTY SHIRES.

**CRO'MDALE**, a village on the east bank of the Spey, Inverness-shire, at which was fought the battle of C., May 1, 1690, between a small remnant of the adherents of the house of Stuart, who kept in arms after the death of Viscount Dundee, and the forces of King William, in which the latter were victorious. This encounter has been rendered famous by a song, entitled *The Haughs of Cromdale*, which, however, presents a lamentable confusion of historical events.

**CRO'MER**, a seaport and watering-place on the north coast of Norfolk, 21 miles north of Norwich. It stands on the top of one of the highest cliffs of the coast. Nearly all the old town, called Shipden, with one of the churches, was swept away by the sea about the year 1500. The sea is still gaining on the land, and some houses have been destroyed by it within present memory. In 1825, some cliffs, 200 feet high, fell into the sea. Seamen call C. Bay the Devil's Throat, from its dangers to navigation. Vessels have to load and unload on the open beach. C. has fisheries for crabs, lobsters, herrings, and mackerel. Pop. of parish, 1366.

**CRO'MLECH**, the name which has come to be generally used among archaeologists for a rude structure of two or more unhewn stones, placed erect in the earth, and supporting a larger stone, also unhewn, the whole forming an imperfect kind of chamber or enclosure. The etymology of the word C. does not seem to be ascertained, but it is believed to be Celtic, and to signify the 'bent,' 'bowing,' 'inclined,' or 'suspended' stone. When or where the term was first applied, seems also to be uncertain, but it would appear to have originated among antiquaries. The monuments which it has been employed to designate are known among the common people by other names, such as 'the giant's grave,' 'the giant's bed,' 'the giant's quoit,' 'the fairies' table,' 'the devil's table,' 'the raised stone,' 'the old wife's lift,' 'the hag's bed,' and the like. The name *dolmen*, a Celtic word, which is said to signify a stone table, is given to them in France. See *DOLMEN*; see, also, *SEPTULCHRAL MOUNDS*.

Cromlechs are found in England, Wales, Scotland, Ireland, the Channel Isles, France, Spain, Germany, Denmark, and some other countries of Europe; in Hindustan and elsewhere in Asia; and in America,

Cromlech.

They are generally without any enclosure; but occasionally they are fenced round with a ring of unhewn stones. In a good many instances, cromlechs have been discovered in the heart of earthen mounds or barrows. In such cases, the rude chamber or enclosure of the C. is found to contain sepulchral remains, such as skeletons or urns, together with weapons or ornaments generally of stone or bone, fragments of pottery, and bones of animals. Similar remains have been found in the chambers of cromlechs not known to have been at any time covered by barrows. These facts have led modern archaeologists to believe that the C. was a sepulchral monument. The theory of the older antiquaries,

that the C. was a druidical altar, is without any foundation in what has been recorded of the druidical worship by trustworthy writers. In Flanders, a C. containing Roman remains has been dug up in the middle of a Roman cemetery; and in a C. found under a barrow in Derbyshire, a skeleton and fragments of urns were discovered, along with Roman coins of the emperors Claudius Gothicus (268—270), Constantine the Great (306—337), Constantine the Younger (337—340), and Valentinian I. (364—375).

Among the more remarkable cromlechs in England are Kit's Coty House in Kent, Wayland Smith's Cave in Berkshire (commemorated by Sir Walter Scott in *Kenilworth*), and Chun Quoit in Cornwall. The weight of the flat stone in this last C. is estimated at about twenty tons. In the Marquis of Anglesey's park at Plas Newydd in Wales there are two cromlechs close beside each other: in the larger, five erect stones support a flat stone about twelve feet long, ten feet wide, and from three feet and a half to four feet and a half thick. Cromlechs are comparatively rare in Scotland. The best among the well-ascertained examples is perhaps that called 'The Auld Wife's Lift,' near Craigmaddan Castle, in the parish of Baldernock in Stirlingshire: the recumbent stone, a mass of basalt, is eighteen feet long, eleven feet wide, and six or seven feet thick, and the two stones which support it are of nearly the same size. It may be doubted if the partial elevation of the 'Witch's Stone' at Bonnington Mains, near Ratho, in the county of Edinburgh, has not been produced by natural causes. Among the Irish cromlechs, one of the most striking is that of Kiltarnan, about six miles from Dublin: the recumbent stone, which rests upon six blocks, is twenty-three feet and a half long, seventeen feet wide, and six feet and a half thick. A cromlech called 'The Broadstone,' in the county of Antrim, is surrounded by a circle of standing stones, or erect unheven pillars. A cromlech in the Phoenix Park, Dublin, was discovered in 1838 in removing a large barrow: specimens of the sepulchral remains found in it are shewn in the Museum of the Royal Irish Academy.

CROMPTON, SAMUEL, whose invention of the spinning-mule entitles him to rank as one of mankind's greatest benefactors, was born at Firwood, Bolton, Lancashire, December 3, 1753. Bolton, in those days, was nearly inaccessible, and so bleak and barren that agriculture was not followed further than to supply the wants of the population. All the farmers had looms in their houses, and their families were occupied in spinning and weaving. C.'s father, who was a small farmer, lived at the Hall-in-th'-Wood, a picturesque old mansion near Bolton. He died at an early age, leaving a wife, and a son (the subject of our memoir), and two daughters. Like his father, C. was brought up to the loom and the farm. His mother, a woman of great energy, perseverance, and stern independence, struggled hard to give him and her daughters the best education the district afforded. When he was old enough, he assisted her in the farm, and wove; going to Bolton at night to complete his education in mathematics, &c. At the age of 21, he was so much annoyed at the difficulties in getting yarn to weave, that he set to work to invent a spinning-machine which should produce better yarn than Hargreaves', one of which his mother possessed. For five years, he laboured to realise his idea, sitting up late at night to overcome the successive difficulties, and resuming his labour for daily bread early in the morning. At length he succeeded in framing a machine which produced yarn of such astonishing

fineness, that the house was beset by persons eager to know how such wonderful and desirable yarn could be made. He was rendered miserable. All kinds of devices were tried to gain admission; even ladders were placed against his windows. His machine was such that if a mechanic saw it, he could carry away the leading features of it. He could not leave the house for fear of his discovery being stolen from him. He had spent every farthing he had in the world upon its completion; he had no funds wherewith to have obtained a patent, and it is doubtful whether a patent would have altered his fate. When he was thus almost driven to desperation, one of the manufacturers went to him and persuaded him to disclose the invention to the trade, under the promise of a liberal subscription. Inexperienced in the world, he agreed to this. The machine was exhibited, but all that he got was about £60. This money was not paid to him at the time, but he had to travel for many miles round the country to collect it. Some refused to pay, though he shewed them their signatures. He set manfully to work with his machine, determined to make the best he could of his ill-luck. In the course of time, he saved money enough to begin manufacturing on a small scale, but not till his rivals had nearly 20 years' start of him in the business. Then his wife died, leaving him a large family. Efforts were made to obtain for him a national reward. Five thousand pounds was all he obtained, and he returned to Bolton almost broken-hearted. Misfortune upon misfortune overtook him till he died, June 26, 1827. Some idea may be formed of the vast services he has rendered to the world, and especially to his native land, by the fact, that his is by far the most used of all spinning-machines. In 1811, the number of spindles on C.'s principle was 4,600,000, while there were only 310,500 of Arkwright's, and 155,880 of Hargreaves'. At the present time, it is conjectured that there are 25,000,000 of C.'s spindles at work. Yet this great genius was never noticed by his king, and the appointments under the Factory Acts to which his descendants might have aspired, have been filled by the relatives or nominees of her Majesty's ministers. For a complete account of this great improver of the cotton manufacture, we refer to the *Life of Crompton*, by Mr G. French, 1860.

CROMWELL, OLIVER, was born at Huntingdon, April 25, 1599. His father was the younger son of Sir Henry Cromwell of Hinchinbrook, and a substantial country gentleman, not likely to have been a brewer, as some of Oliver's earlier biographers assert. By his mother, genealogists trace Oliver's descent from the royal House of Stuart. Of the boy Cromwell's early life, little or nothing is actually known. What is clearly ascertained is, that after having been at school in Huntingdon, he went to Cambridge, and entered himself of Sidney-Sussex College, April 23, 1616. He had but short time for study here, his father dying in the June of the year following, when he returned home to take the management of his father's affairs. The stories of his wild life about this time appear to have no better foundation than the calumnies of royalists. In August 1620, C. married the daughter of Sir James Bourchier, a gentleman of landed property in Essex, who had also a residence in London. This fact is pretty conclusive as to C.'s social position being much above what his enemies have described it. C. now became intimately associated with the Puritan party, among whom he was soon distinguished alike for his earnestness and sagacity. In 1628, having been elected by the borough of Huntingdon, C. made his first appearance in parliament. He had but time to make a short blunt speech about the encouragement of the

'preaching of flat popery at Paul's Cross' by the Bishop of Winchester, when the infatuated king unceremoniously despatched him and his fellow-commoners to their homes. C. returned to the fen-country, not much impressed in favour of king-craft by his visit to London; and for the next eleven years devoted himself assiduously to the pursuit of farming by the Black Ouse river and the Cam, first at Huntingdon, then at St Ives, and finally at Ely—making himself famous, not by political agitation, but by an effectual resistance to certain unjust schemes of the king in council for the drainage of the Fens. In 1640, he was sent to parliament as member for the town of Cambridge. His appearance at this time was by no means prepossessing. Sir Philip Warwick describes him in 'a plain cloth suit, which seemed to have been made by an ill country tailor; his linen was plain, and not very clean; and I remember a speck or two of blood upon his little hand, which was not much larger than his collar. His hat was without a hat-band; his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish; his voice sharp and untunable; and his eloquence full of fervour;' and courtly Sir Philip adds: 'It lessened much my reverence unto that great council, for this gentleman was very much hearkened unto.' When all hope of reconciliation between king and parliament failed, through the perfidy of the former, C. was among the first to offer of his substance to aid in defence of the state. In July 1642, he moved in parliament for permission to raise two companies of volunteers in Cambridge, having been careful to supply the necessary arms beforehand at his own cost. In the following month, C. seized the magazine in Cambridgeshire, and prevented the royalists from carrying off the plate (valued at £20,000) in the university there. As captain of a troop of horse, C. exhibited astonishing military genius; and against the men trained by himself—'Cromwell's Ironsides'—the battle-shock of the fiery Rupert, which at the beginning of the parliamentary struggle none else could withstand, spent itself in vain. Soon promoted to the rank of colonel, and then to that of lieutenant-general, C., in the fight of Wineby, on the bloody field of Marston (July 2, 1644), and in the second battle of Newbury (October 27, 1644), bore himself with distinguished bravery; but owing to the backwardness of his superiors, the results of these victories to the parliamentary cause were not so great as they might reasonably have been. C. thus complained in parliament of the backwardness of his superiors, Essex and Manchester: 'I do conceive if the army be not put into another method, and the war more vigorously prosecuted, the people can bear the war no longer, and will enforce you to a dishonourable peace.' Hereupon, the 'Self-denying Ordinance'—an act excluding members of the houses of parliament from holding command in the army—was passed; but C.'s services were considered of such importance to the common weal, that they were exceptionally retained. Of the new model army, Fairfax was appointed general, C. serving under him as lieutenant-general of the horse, and in this capacity he commanded the right wing of the parliamentary army at Naseby, June 1645, and acquitted himself so well there, that the king's forces were utterly ruined. The royalists in the west were now speedily reduced. Bristol was stormed; everywhere the royal cause was failing; and Charles himself, reduced to the last extremity, in May 1646 escaped from Oxford in disguise, and threw himself into the arms of the Scotch army at Newark (May 5, 1646), by whom he was shortly given up to the parliamentary commissioners. The source of the strife now fairly within

their grasp, the parliament and the army, in the former of which the Presbyterian, and in the latter the Independent, element predominated, became jealous of each other's power. With his usual sagacity, C. perceived that the advantage would be with that party who held possession of the king's person, and with ready decision he had him removed from the hands of the commissioners into those of the army, June 1647. Some of the leading Presbyterians were now turned out of parliament by the army, and Independency, with C. at its head, was gradually obtaining the ascendancy. The king still remained with the army, and with his usual duplicity, negotiated with both parties, not without hope that out of their mutual dissensions might arise advantage to himself. On the 11th November 1647, the king made his escape from Hampton Court. Two days after, he was in custody of Colonel Hammond in the Isle of Wight. At this time the country was in a critical condition. The Welsh had risen in insurrection, a Scotch army was bearing down from the north with hostile intent, and Rupert, to whom seventeen English ships had deserted, was threatening a descent from Holland, not to speak of the rampant royalism of Ireland. Prompt measures alone could prevent anarchy and inextricable confusion, and C. was not afraid to employ them. Pembroke had to surrender, and at Preston Moor the Scotch were utterly defeated. On the return of the army to London, the Presbyterians, who were still blindly temporising with the king, to the number of more than 100, were driven out (December 1648) by the process known in history as 'Pride's Purge.' Then that which C. thought could alone end the strife, happened. In January 1649, the king was tried, condemned, and executed. The abolition of the House of Lords followed speedily, and C. became a prominent member of the new Council of State; and in the army, though still only lieutenant-general, he had really much more influence than the commander-in-chief. The royalists being still strong and rebellious in Ireland, C. went thither in August, with the title of lord-lieutenant, and commander-in-chief of the army there; and ere nine months had passed, he had subdued the country so far, that it might be safely left to the keeping of his son-in-law, Ireton. C.'s measures for crushing the Irish rebels were indeed severe, and even sanguinary, but, nevertheless, peace and prosperity followed in a degree unknown before in the history of that unhappy country. Affairs in Scotland now claimed C.'s attention. Scotch commissioners had been negotiating with Charles II. at Breda, had urged him to come among them and take the Covenant, and they would crown him king over them at least, and do what force of arms could do to make him king of England also. Charles arrived in the north of Scotland on the 23d June 1650; three days thereafter, Cromwell—Presbyterian Fairfax having refused to fight against the Presbyterian Scotch—was appointed commander-in-chief of all the parliament forces. On the 15th of July, Charles Stuart had signed the Covenant, and was fully accepted as king. On the 3d September following, C. routed the Scotch army at Dunbar. Charles, with what force remained, and other accessions, afterwards marched southward, and had penetrated to Worcester, when C. came up with him, and utterly overthrew the royalists on the anniversary of the battle of Dunbar. This battle placed C. avowedly at the head of public affairs in England, and to write his biography from this time until his death, would be to write the history of the Commonwealth. The Long Parliament had now degenerated into the Rump—had become, in truth, an oligarchy, given to long and useless discussions about mere technicalities—intolerable to the country

alike for the extraordinary power it possessed, and for the weak, pusillanimous way in which it exercised it. C., therefore, dissolved the Rump, 20th April 1653, and henceforth he alone was ruler in England. He immediately summoned a parliament of 140 persons, 138 of whom assembled on the 4th July, but he found it necessary to dissolve it on the 12th December; its one great work having been the legal investiture of C. with the supreme power and the title of Lord Protector, a position upon which the principal foreign powers hastened to congratulate him. C. now acted in a very arbitrary manner, so far as his parliaments were concerned, calling them and dismissing them at pleasure; but his home policy, notwithstanding, was just and liberal towards the mass of the people, and conducive to the prosperity of the country; while his foreign policy was such as to secure England a position among nations more commanding than any she had ever occupied before. Under C.'s rule, swift retribution followed any indignity or injury to Englishmen, no matter by whom or where perpetrated; and religious persecutors on the continent, in terror, stayed their bloody swords on the stern summons of the Lord Protector. He died September 3, 1658, the anniversary of some of his most important victories. C. was buried in Westminster Abbey; but on the 30th January 1661 (the anniversary of the death of Charles I.) his grave, along with those of Ireton and Bradshaw, were broken open, the coffins dragged to Tyburn, where the mouldering bodies were hanged, and then thrown into a deep hole under the gallows, while their heads were set upon poles on the top of Westminster Hall. Such was the sacrilegious brutality of the king and clergy (for the deed was done by their authority) towards England's greatest ruler. It was long a fashion with historians, content to rely upon the calumnies and falsehoods of royalist writers, to represent C. as a monster of cruelty and hypocrisy—a man with a natural taste for blood, who made use of religious phraseology merely to subserve his own ambitious ends; but after the researches of Carlyle and Guizot, the eloquence of Macaulay, and the clear statement and sound sense of Forster, such a view can no longer be upheld. C.'s religion was no mere profession, it was the very essence of the man; by nature, he was not a blood-shedder, and when necessity demanded the grim exercise of the sword, he unsheathed it with reluctance. Never was a religious man less of a bigot; he would not, in so far as his iron will could effect his purpose, permit any one to be persecuted for religious opinions. He delivered Biddle, the founder of English Unitarianism, out of the hands of the Westminster divines. He would have even given the despised and persecuted Jews the right hand of citizenship. He grasped power, and dispensed with the formality of parliaments, only because he sought to promote, in the speediest possible manner, the prosperity, happiness, and glory of his native land.

CROMWELL, RICHARD, son of Oliver Cromwell, Lord Protector of England, was born at Huntingdon, October 4, 1626. In early life, he was noted chiefly for his indolence and love of pleasure, qualities that united him more closely to the cavaliers than to the party of earnest men of which his father was the chief. When Oliver attained the dignity of Lord Protector, he called his son from the obscurity of a country-house, and his field-sports, to have him elected for the counties of Monmouth and Southampton, appointed him First Lord of Trade and Navigation, and made him Chancellor of Oxford. In none of these capacities did Richard C. exhibit any aptitude; and his failure as Protector, to which high office

(being the eldest surviving son) he succeeded, on the death of his father, September 1658—was still more conspicuous. With a mediocre intellect, and no energy, hardly a friend in the army, and the first parliament he called against him, the result could not be otherwise than it was—his demission (April 1659)—little more than seven months after he had assumed the sceptre of the Commonwealth. He retired to Hampton Court, from whence parliamentary stinginess and pressing creditors soon drove him to the continent, where he resided for a considerable period. At length, returning to England, he had a house provided for him at Cheshunt, near London, where he resided in strict privacy until his death, in 1712.

CROMWELL, THOMAS, an eminent English statesman and ecclesiastical reformer, of the reign of Henry VIII., was born near London in very humble circumstances, his father being a blacksmith, about 1490. After receiving but a very meagre education, he went to the continent, and became clerk in a factory at Antwerp, where he devoted his spare time to the acquisition of languages, in which he became very proficient. In 1510, he went into Italy, where he appears to have resided until about 1517, when he returned to England; and, after some time, was received into the household of Wolsey. That prelate, speedily recognising his abilities, made him his solicitor and chief agent in all important business. As a member of the House of Commons, C. warmly and successfully defended the fallen minister, his master, against the bill of impeachment—proof enough that he was not the heartlessly ambitious man that his enemies have represented him. Henry, admiring his chivalry, and appreciating his talent, made him his own secretary; knighted him in 1531, and made him a privy-councillor. Honours rapidly flowed in upon him; partly in consequence, it is said, of his having suggested to Henry the desirableness of throwing off the papal yoke altogether—an idea which suited well with the king's impetuous nature—but chiefly, no doubt, on account of his great abilities. In 1534, he had become chief Secretary of State, and Master of the Rolls; in the following year, he was made Visitor-general of English Monasteries—which he afterwards suppressed in such fashion as to obtain for himself the designation of *Malleus Monachorum*—and keeper of the privy seal in 1536. In 1539—to pass over a variety of minor tokens of royal approbation—he had risen to be Earl of Essex—having had some thirty monastic manors and estates given to him to keep up the dignity of his title—and Lord Chamberlain of England. C. took the leading part in establishing the doctrines of the Reformation, though he seems to have done so less on religious than on political grounds. The destruction of the pope's authority, and the establishment of the supremacy of the king in England, were what he laboured to effect; and with this view, he promulgated the articles of the new faith, had English Bibles placed in the churches, and the youth of the nation taught the Creed, the Ten Commandments, and the Lord's Prayer; and ordered the removal of all images from the altar. In this matter of ecclesiastical polity, he has, says Mr Proude, in the third volume of his *History of England*, 'left the print of his individual genius stamped indelibly, while the metal was at white heat, into the constitution of the country. Wave after wave has rolled over his work. Romanism flowed back over it under Mary; Puritanism, under another even grander, Cromwell, overwhelmed it. But Romanism ebbed again, and Puritanism is dead, and the polity of the Church of England remains as it was left by its creator.' In all that concerned the state, in its vastest and most

complicated foreign relations, as well in the smallest matters of sanitary reform at home, C. took an active personal interest. But the stern, almost savage manner in which, in the carrying out of his policy, he disposed of all who opposed him, led to many and loud complaints, which damaged somewhat his popularity with the king. In order to retrieve his lost ground, he was zealous in promoting the marriage of Henry with Anne of Cleves, from whom, on account of her known Lutheran tendencies, he expected strong support. The success of his efforts in this matter proved the utter ruin of C., for the king, early conceiving a strong aversion to his unlovely queen, extended that dislike to the minister who had so strenuously promoted the marriage. Complaints against C. poured in thicker and faster, and the royal ear was not unwilling to listen now. Charges of malversation and treason were made, and he was arrested and thrown into prison (10th June 1540); a bill of attainder was quickly drawn up, and passed the two Houses of Parliament with little difficulty; and on the 28th July following, C. laid his head on the block on Tower Hill. A statesman of undoubted genius, he saw what was best for his country, and did it—not certainly in a way commending itself to the judgment of the present time—but, perhaps, among the best and only sure modes that could be devised in his age. He was undoubtedly unscrupulous, and very haughty towards the high; but the poor and weak found him easily accessible, and, when wronged, a warm defender; and though he was rapacious, the hungry had, nevertheless, to thank his generosity for many a meal.

**CRONSTADT** (Hungarian, *Brasso*), a town of Transylvania, romantically situated amid the East Carpathians, at an elevation of 2000 feet above the sea. Lat. 45° 36' N., long. 25° 33' E. It consists of an inner town, surrounded by walls, and of three pretty extensive suburbs, the population being about 30,000. The centre town, which dates from the 13th c., is well and regularly built, and contains some handsome buildings, the chief of which is a Gothic Protestant church, built in the 14th century. This part is almost exclusively inhabited by Saxons. The suburbs, surrounded with gardens and orchards, with here and there the hoary ruins of some old castle, or the sloping roofs of some modern villa, rising above the trees, have a pleasant and picturesque appearance. The suburbs are chiefly occupied by Wallachs and Magyars. Linens, cottons, coarse woollens, hosiery, paper, &c., are manufactured here in considerable quantities. C. was the first town in Transylvania where a printing-press was established, and the first issues from it were the *Augsburg Confession*, and the works of Luther.

**CRONSTADT**, a strongly fortified seaport, about 20 miles west of St Petersburg, on a narrow calcareous island of about five miles in length, at the narrowest part of the Gulf of Finland, and over against the mouth of the Neva. Lat. (of cathedral) 59° 59' 46" N., long. 29° 46' 38" E. C. is at once the greatest naval station and the most flourishing commercial port of Russia. It was founded by Peter the Great in 1710, the island having been taken from the Swedes by him in 1703. Its fortifications, which protect the approach to St Petersburg, have been an object of great attention to the Russian government. The batteries are very numerous, defending every part of the channel by which vessels can enter. They are all built of granite, and armed with the heaviest ordnance. The place, indeed, was considered by the British admiral who reconnoitred it during the Russian war of 1854—1855, so impregnable, that it would have been utter madness to make any attempt upon it. C., which is the seat

of the Russian Admiralty, has three harbours: the east, intended for vessels of war, and capable of accommodating 30 ships of the line; the middle harbour, where vessels are fitted up and repaired, and which is connected with the former by a broad canal; and the west or Merchant's Harbour, for the merchant-shipping, with capacity for 1000 vessels; all are admirably defended. Not only the trade of St Petersburg is conducted through this port, but that of a great part of the interior of Russia, which is connected with it by navigable rivers and canals. C. contains many well-built houses; the population in winter, when the place is almost deserted, amounts, with the garrison, to about 10,000, but in summer it is augmented to 40,000 or 50,000.

**CROOK**, belonging to musical instruments, such as the French-horn or trumpet, is a circular tube, which fits into the end of the instrument next the mouthpiece, for the purpose of making the pitch of the instrument suit the key of the music; the notes of the parts for these instruments being always written in the natural key of C, with the name of the key of the piece marked in letters.

**CROOK, SHEPHERD'S.** See PASTORAL STAFF.

**CROOKED ISLAND**, one of the Bahamas, contains 160 square miles, and about 1200 inhabitants. It lies to the south-east of Long Island, of which the north-west extremity forms nearly the middle point of the chain. In common with some others of the group, it is valuable chiefly for its salt. In the exportation of this article, C. I. appears to stand third in order, its share having, in 1851, amounted to 112,878 bushels. The Bahama Salines are all the more important from the fact, that, for the curing of fish, salt obtained by solar evaporation is preferred to that procured from mines.

**CROP**, or **OUT-CROP**, is the edge of a stratum where it rises to the surface, or, as the miners say, comes out to the day. The line of out-crop of a bed along a level surface is called its *strike*; it is described by its relation to one or other of the points of the compass.

**CRO'SIER**, a staff surmounted by a cross, which is carried before a bishop on solemn occasions. It is about five feet long, is generally made of tin, and is hollow. Crosiers are generally gilt, and are often richly ornamented. The C. differs entirely from the pastoral staff, with which it is often nevertheless confounded—the latter having a circular head, in the form of a crook. Subjoined is an illustration of Archbishop Warham's crosier (1520) from Canterbury Cathedral.

**CROSS.** The C. was a common instrument of capital punishment among the ancients; and the death of the C. was esteemed so dishonourable that only slaves and malefactors of the lowest class were subjected to it by the Romans. It was customary to proclaim the name and offence of the person crucified, or to affix a tablet (*album*) to the C., on which they were inscribed. Malefactors were sometimes fastened on a simple upright stake, and so left to die, or they were impaled upon it, and to this upright stake the Latin name *crux* was originally and more strictly applicable; but very generally a cross-piece (*patibulum*) was added to the stake, to which the arms of the criminal were tied, or to which his hands

were nailed. When the cross-piece was fastened at right angles below the summit of the upright stake, the C. was called *crux immissa*; when the cross-piece was fastened at right angles across the top of the upright stake, the C. was *crux commissa*; and when it was formed of two beams crossing one another obliquely, it was *crux decussata*. The C. was erected without the gates of towns, but in places of frequent resort. The person crucified often lived for days upon the cross. The death of Christ by crucifixion led Christians to regard the C. with peculiar feelings of reverence, and to make use of the sign of the C. as a holy and distinguishing sign. The custom of *crossing*, in honour and commemoration of Christ, can be traced back to the 3d century. The Emperor Constantine, after obtaining the victory over Maxentius, through the influence—as he believed—of the sign of the C., caused crosses to be set up in public places and upon public buildings; and the veneration of the C. increased, particularly after the *Invention of the C.*, or finding of the alleged true C. of Christ in Jerusalem by the Empress Helena. See **CROSS, INVENTION OF**. The desire for relics was gratified, and numberless portions of the true C. were given away, without its being diminished. Iconoclasts and others contended in vain against the prevalent worship of the C.; and the *crucifix* (q. v.), a C. with an image of the Saviour affixed to it, was honoured more than any other image. The sign of the C. is made not only by Roman Catholics, but by the members of the Eastern churches also; there are, however, distinctive differences in the manner in which it is made. It is admitted by the Lutherans as a commemorative sign of the atoning death of Christ, but by many Protestants is rejected as a human invention in worship, and as tending to superstition. It was very generally used during the middle ages, and still is among the less enlightened peasantry in some Roman Catholic countries as a sort of charm, or as affording some security, like an amulet, against all evil, and particularly against evil spirits and witchcraft.

It appears that the sign of the C. was in use as an emblem, having certain religious and mystic meanings attached to it, long before the Christian era; and the Spanish conquerors were astonished to find it an object of religious veneration among the natives of Central and South America. Be this as it may, it was early adopted as a symbol by Christians, with express reference to the central fact of their religion, and it has been extensively used as an ornament in Christian architecture, and in the ground-plan of churches (q. v.).

The C. of the Resurrection is opposed to the C. of the Passion, by ecclesiastical writers. It is a lance, headed by a C. instead of a pike, and carrying a banner upon which a C. is depicted. It is the C. held by the paschal lamb, and carried at the head of religious processions. The large C. always placed over the entrance of the main chancel of a church, was called the *rood*, or *holy rood*. A representation is here given of the top of one of these large ornamental crosses.

The forms given to crosses in art are endless; but the two leading types are the Latin C., or *crux immissa*, supposed to be that on which Christ suffered, and the Greek C., both of which are subject to many fantastic variations. The Greek C. forms the well-known C. of St George, which, adopted from the legends of that hero, was the national ensign of the English previous to the union with Scotland. The C. of St Andrew differed

entirely in form from the Latin or Greek cross. This C., or *crux decussata*, consisted of two shafts of equal length crossed diagonally at the middle, as in the annexed cut. According to the legend,

Greek Cross. Latin Cross. St Andrew's Cross.

this was the form of C. on which St Andrew, the national saint of Scotland, suffered martyrdom. As the Scottish ensign, it is now blended with the C. of St George in the Union Jack.

Many very beautiful crosses exist in England, upon the points of gables of churches, on grave-stones, and in other situations, as also in heraldry.

Among these, the C. most commonly seen is called the *C. crosslet*. In this figure, as seen in the annexed cut, the extremities are intersected, so as to make several small crosses. When employed in ecclesiastical architecture, the figure is usually carved in a florid or highly decorative style. When the C. crosslet is pointed at the lower extremity instead of being crossed, it is in heraldry said to be *fitched*, or *fitchée*. It is of frequent use in blazon.

*Sanctuary, Boundary, or Monumental Crosses*, as they are called, consist of an upright flat pillar or obelisk, covered with sculptured devices, and set in a socket level with the ground. Occasionally, they appear to have marked boundaries, but more frequently were monuments over the graves of heroes, kings, bishops, &c. In some instances, they probably marked the verge of a sanctuary. The older of these crosses are said to be Scandinavian or Danish, and such are known as *Runic Crosses*, the term *rune*

signifying a superstitious invocation. We are told that the island of Iona at one time possessed 360 crosses, but all are now destroyed or dispersed except one, called St Martin's Cross, standing in the grounds of the cathedral. It is a column of compact mica schist, 14 feet high, 18 inches broad, and 6 inches thick, and is fixed in a pedestal formed out of a massive block of red granite, about 3 feet high. In connection with certain ancient religious houses in Ireland, there were some very fine crosses of this kind; the most gigantic and impressive which still exists being that of St Luke's in the county of Louth.

St Martin's Cross, Iona.

*Memorial Crosses* are those which were erected in memory of some beloved object, or in commemoration of some event of local importance. In England,

there are some superb crosses of this kind; they are popularly called *Norman Crosses*. This species of C. resembled a Gothic turret set on the ground, or on a base of a few steps, and was decorated with niches for figures and pinnacles. The best known examples are those erected by Edward I. (1290) in memory of his queen, Eleanor; being placed on the spots where the body rested in its funereal progress to Westminster.

The crosses at Waltham, Cheapside, and Charing were of the number. Those at Cheapside and at Charing are destroyed, but the C. at Waltham, though now much decayed, remains as a testimonial of the affection and piety of the greatest of the Plantagenets. We present a sketch of this beautiful Norman cross, as restored.

Waltham Cross, restored.

*Town or Market Crosses* were erected as stands to preach from, or in commemoration of events regarding which it was deemed proper to evoke pious feelings. As these structures were incorporated with or surmounted by a crucifix, the term *cross* was so indelibly associated with them that it survived the religious character of the fabrics. 'The general intent of market-crosses was to excite public homage to the religion of Christ crucified, and to inspire men with a sense of morality and piety amidst the ordinary transactions of life.'—Milner's *History of Winchester*. The earliest examples of this

market revenues, or progress of taste, these town crosses assumed that imposing character which they latterly possessed. Of the larger ornamental crosses of this kind, there are some striking specimens in England. We may refer to that at Cheddar in Somersetshire, and that at Malmesbury in Wiltshire; both are open vaulted structures, with a commodious space beneath, as a refuge for poor market-folks during rain, and surmounted with a kind of Gothic turret. At Chichester, Bristol, and Winchester, the market-crosses, while similar in form, are of a higher architectural quality. See Britton's *Architectural Antiquities*. Adjoining St Paul's in London, stood Paul's C., a structure which we read of as early as 1259, in the reign of Henry III. It was essentially a town-preaching C., and is associated with some interesting occurrences in history. Before this C. the unfortunate Jane Shore was forced to do penance in the reign of Richard III., to whose malice she was made a victim. This event was followed by Dr Shawe's infamous sermon, attempting to bastardise the children of Edward, and eulogising Richard, who was present on the occasion. In front of this C. sat Cardinal Wolsey, to hear fulminations against Luther; and about ten years later, by order of Henry VIII., preachers here delivered sermons in favour of the Reformation. At this C., Queen Elizabeth attended to hear a thanksgiving sermon for the defeat of the Spanish Armada. Here, sermons continued to be delivered until 1643, when, with other so-called relics of popery, the C. incurred the displeasure of the Puritans, and was demolished by order of parliament. Whatever was the original form of Paul's C., it was in later times a plain pulpit-like fabric of wood, covered with lead, and, as seen by the adjoining cut, was provided with seats for an audience. This inoffensive and really useful preaching C., which we could wish had been spared, stood on the north side of the church, a little to the east of Cannon Alley.

Scotland offers no specimens of memorial or Norman crosses, though, perhaps, we should make an exception in favour of the Scott Monument, at Edinburgh, which is essentially a Norman C. of a gigantic order. See SCOTT, SIR WALTER. As regards the market-crosses of Scotland, they never attained to that elaborately ornate character which distinguishes such crosses as those of Chichester and Winchester. Yet the Scottish town-crosses had some distinguishing features. The more simple kind consisted of a shaft of stone, generally octangular in shape, and 12 or more feet in height. At top was an ornamental capital, which bore a dial and vane, or the figure of a unicorn. The shaft sprang from the top of a graduated flight of circular or octangular steps. A specimen of this species of C. is seen in the market-place of

St Paul's Cross.

kind consisted, probably, of tall crucifixes of wood, such as are still seen by the waysides in some continental countries. Afterwards, stone shafts would be substituted; and according to the increase of

Melrose. Another specimen, renovated and set in the quadrangle of the Chambers Institution, Peebles, is shewn in the annexed cut. The grander market C. consisted of a tall stone shaft, such as just described, but instead of steps, it sprang from the centre of an imposing sub-structure. This structure was circular, hexagonal, or octagonal, and from 10 to 16 feet high. The top formed a platform, which was surrounded with an ornamented stone

Peebles Cross.

parapet, and was reached by a stair inside. The sides of the building were decorated with pilasters, and bore various heraldic and other devices. Such were the crosses of Edinburgh, and such is the renovated C. of Aberdeen, the sides of which, however, are open. Losing their religious character, the Scottish market-crosses were employed for royal

Edinburgh Market-cross.

and civic proclamations, and as places where certain judicial writs were executed. The general removal of these ancient and interesting structures has been often matter of lamentation. The oldest C. of Edinburgh, which was the scene of a number of incidents connected with Scottish history, stood in the centre of the High Street, nearly opposite the entrance to the Parliament Square. It was removed in 1617, to make way for a royal pageant, the procession of James VI., on his first visit to Edinburgh after his removal to England. A new market-C. was then erected a short way further down the street, on the south side. We give a sketch of this C., which consisted of an octangular sub-structure 16 feet across, with a handsome stone shaft of about 20 feet in height; its removal in 1756, by the civic authorities, is indignantly referred to by Scott in his poem of *Marmion*. Since its removal, royal proclamations, &c., are made on the site, which for these and other purposes is technically the market-C. of Edinburgh. With a better appreciation of objects of archaeological interest than prevailed in the 18th c., the re-erection of the C. has been recently agitated. w. c.

**CROSS, in Heraldry.** If we assume the art of blazon to have originated in connection with the Crusades, it will not surprise us to find the symbol of the Christian faith so frequently introduced into the escutcheons of ancient and noble families everywhere in Europe. It is one of the honourable ordinaries, and, indeed, from its sacred character, is esteemed by heralds as the most honourable charge. Its form varies so much that Ménestrier counts 42 crosses; La Colombière, 72; and Guillim, 39. Most of the architectural crosses occur in heraldry, along with many others.

**CROSS, INVENTION OF THE,** the name given in the Roman Catholic Church to a festival which commemorates the finding of the alleged true C. of our Saviour, and which is celebrated on the 3d of May. The Empress Helena, the mother of Constantine the Great, out of a desire of visiting the holy places, undertook a journey to Palestine in 326, though she was then near eighty years of age; and being animated with a great desire of finding the C. on which our Saviour suffered, she was so well directed, it is said, in the search which she instituted, that the C. was found, and with it the crosses of the two thieves; but the title being found separate from

the C., a miracle readily determined which was the proper object of reverence. An order of friars, founded in honour of the Invention of the Cross, and carrying in their hand a staff, on the top of which was a C., received the name of *Croisiers* (Fr. *croix*, cross), corrupted into *Crouched* or *Crutched* Friars. They came to England in the 13th c., and had monasteries in London, Oxford, and Ryegate.—The festival of the *Elevation of the Cross* (14th September) commemorates its re-erection in Jerusalem by the Emperor Heraclius in 628, after it had been carried away by the Persians.

**CROSS, THE ORDER OF THE,** originally a spiritual order of knighthood, which sprang up in Palestine in the time of the Crusades, and was then called the *Bethlehemite Order*. After the commencement of the 13th c., the knights of this order adopted the monastic life, settling chiefly in Austria, Bohemia, Moravia, Poland, and Silesia. Pope Gregory IX. confirmed the order in 1328. Its principal seat is now in Bohemia, and its members generally hold ecclesiastical preferments or professorships in the university of Prague. They are distinguished by a C. of red satin, with a six-pointed star under it, and are sometimes called *Stelliferi*.

**CROSS, THE SOUTHERN,** the most conspicuous constellation in the southern hemisphere, situated near the Antarctic Circle, and therefore never visible to our latitude. It consists of four bright stars, to which the fancy, aided by Christian associations, readily gives the cruciform shape. The two brilliant stars which mark the summit and foot of the C. have nearly the same right ascension. The constellation, therefore, is almost perpendicular when passing the meridian, and these two stars act as pointers to the Antarctic pole.

**CROSS, VICTORIA.** The peculiarities of this decoration, which was instituted on the termination of the Crimean campaign in 1856, are, that it may be granted to a soldier of any rank, and for a single act of valour. The C. of the Legion of Honour, as was felt during the Crimean campaign, served a purpose in the French army which was served by none of our decorations, and it was in imitation of it that the Victoria C. was founded, with the inscription 'For Valour,' and which can be given to none but those who have performed, in presence of the enemy, some signal act of valour or devotion to their country. The general distribution of the crosses earned in the Crimean war took place in Hyde Park on the 26th June 1857. The recipients were 62 in number. The Victoria Cross is in the form of a Maltese Cross, formed from the cannon captured at Sebastopol. In the centre is the royal crown, surmounted by the lion, and below, on a scroll, the words, 'For Valour.' The ribbon is blue for the navy, and red for the army. On the clasp are two branches of laurel, and from it the cross hangs, supported by the initial 'V.' The decoration is accompanied by a pension of £10 a year.

Victoria Cross.

**CROSS BILL IN CHANCERY** is a suit brought by the defendant against the plaintiff in the original suit, for the purpose of setting up some

claim or defence which could not be maintained in the original suit.

**CROSSBILL** (*Loxia*), a genus of birds of the family *Fringillidae*, much resembling bullfinches, linnets, &c., except in the bill, which is altogether singular; the two mandibles—which are rather long, thick at the base, and much curved—crossing each other at the points, when the bill is closed. In different individuals, even of the same species, the upper and lower mandibles are found variously directed to the right and left. This conformation was rashly characterised by Buffon as ‘an error and defect in nature, and a useless deformity;’ whereas, it is an admirable adaptation to the wants and habits of the birds, and other peculiarities of their structure beautifully correspond with it—the bill being articulated to the head in such a manner that the mandibles are capable not merely of vertical

Crossbill (*Loxia curvirostra*).

but of lateral motion, and muscles of extraordinary power, in comparison with the size of the bird, being provided for moving them. The result of all this is, that the crossbills readily obtain their principal food, the seeds of firs and pines, by tearing up the cones. They bring the points of the mandibles together—which they can do so as to pick up a very small seed—and insert them into the cone, when a powerful lateral movement widens the opening quite sufficiently, and the tongue, which terminates in a singular movable scoop, formed of a bone articulated to the *os hyoides*, or ordinary bone of the tongue, is inserted to detach the seed. The power of the bill is such that it can be employed in its lateral movements to tear wood to pieces, and crossbills in confinement seem to take a mischievous pleasure in so employing it, and by this means, and pulling at wires, soon destroy any ordinary cage. An apple is cut to pieces almost in an instant, in order that its seeds may be reached; and flocks of these birds sometimes do great mischief in orchards. Only three species are known, all of which have been found in Britain, although only one, the common C. (*L. curvirostra*) is of frequent occurrence. It sometimes occurs in considerable numbers, but in most years is scarcely to be seen. It is a native of Europe, Asia, and North America, dwelling chiefly in pine forests, and extending as far north as they do, not dreading the coldest climates.

**CROSS-BOW.** See ARBALEST, ARCHERS AND ARCHERY.

**CROSS BREEDING.** See BREEDING.

**CROSS BUNS**, a small cake specially prepared for Good Friday, and in many towns of England cried about the streets on the morning of that day as ‘Hot-cross buns.’ *Bun*, means simply a round cake—properly, a lump, being from the same root as *union*, Ital. *bugno*, a bump or knob; allied is the Gael. *bonnach*, a cake, a *bannock*. Good-Friday buns

were appropriately marked with the cross, and hence the name. The origin of the practice is obscure. Most probably it is a relic of some heathen observance, to which the early church gave a Christian significance. At Chelsea, there were formerly two celebrated bun-houses, besieged on Good Friday from morning until night by hundreds of eager purchasers, but they have long since disappeared.

**CROSS CROSLET.** See Cross.

**CROSSE, ANDREW**, a remarkable experimenter on electricity, born at Pyn Court, in the Quantock Hills, Somersetshire, June 17, 1784, was educated at Bristol and Brasenose College, Oxford, and in 1805—1806, settled on his paternal estate, where he began to devote himself to the study of electricity. Happening on one occasion to examine a cavern near his residence, he found reason to conclude that the crystallisations on the walls and roof were partially, at least, the effect of the operation of this subtle agency. In 1807, he commenced experiments with the view of forming artificial crystals by electricity. He took home some of the water which dropped from the roof of the cave, and exposed it to the action of a voltaic battery for ten days, when he found crystals of carbonate of lime forming on the negative platinum wire. C.’s endeavours to form crystals of various sorts were very successful. After 30 years of quiet research, during which period he remained totally unknown to the learned world, he obtained no less than 24 minerals, crystals of quartz, arragonite, carbonates of lime, lead, and copper, besides more than 20 other artificial minerals. Explaining his discoveries at the meeting held by the British Association for the Advancement of Science, at Bristol in 1836, he received high praise from its most distinguished members. On this occasion, he also expressed his belief that every kind of mineral would yet be formed by the ingenuity of man. But his most startling discovery occurred a few months after. While experimenting with some highly caustic solutions, out of contact with atmospheric air, there appeared, as if gradually growing from specks between the poles of the voltaic circuit, certain animals of the genus *acarus*. C. never affirmed that he had developed animal life out of inorganic elements, but simply that under certain physical conditions he could make acari appear, and not otherwise. The ‘discovery’ made a great noise at the time. The possibility of the fact was, of course, denied by all these persons who ‘take the high *priori* road,’ and have made up their minds as to what facts alone are possible; but Faraday declared that he had seen, during the same year, similar appearances in his own electrical experiments. C. was accused of ‘impiety,’ and of being ‘a reviler of our holy religion,’ and although a very pious man, was actually compelled to defend himself against such pitiable charges. It is humiliating to state that, in spite of his defence, various honours to which he was justly entitled, were lost to C. in consequence of his discovery. C. also invented a method of purifying sea-water by electricity, improved wines, spirits, and cider by the same process, and showed that it might be usefully applied to vegetation. He died July 6, 1855. An excellent memoir of him was published by his widow (1857).

**CROSS-EXAMINATION.** The examination of a witness by the party against whom he was adduced. In England, the following are the principal rules affecting C. : 1. The witness may be cross-examined on the whole case, and not merely on the points on which he had been examined in chief. 2. Leading questions may be put in cross-examination. 3. Irrelevant questions may often be put, but if

for the mere purpose of impeaching the witness's credit, they are inadmissible. 4. For the purpose of impeaching the character of the witness, he may always be asked whether he has been guilty of a crime, but he is not always bound to answer. 5. Evidence may be brought to contradict the answer given on C., on relevant facts, but not on irrelevant, unless the irrelevant fact be the conviction of the witness of a felony or misdemeanour. 6. A witness may be cross-examined as to any previous statement made by him relative to the trial (except matter of mere opinion as to the merits of the case), and evidence may afterwards be brought to contradict him. See EVIDENCE.

**CROSSOPODIA**, a genus of annelids determined from markings on the surface of Silurian slates. Nothing exhibiting structure has been observed—the surface of the slate is not even darkened by the organisms, which the markings shew to have been nereid-like worms of some six inches in length. The extraordinary length, 'probably many yards,' which was ascribed to this animal, has been shewn by Alexander Bryson to be founded on a confusion of the body with the track formed by the passage of the creature through a crisp rather than a slimy mud, the track having been filled up with dry blown dust, which gives it an appearance and structure different from those of the surrounding matter.

**CROTALARIA** (Gr. *krotalon*, a rattle), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, deriving its name from the inflated pods in which the seeds rattle when ripe. The species are numerous; annual, perennial, and shrubby plants, natives of the warm parts of the world. Many of them have long, straight, slender stems and branches, and some of these yield valuable fibre, particularly *C. juncea*, the **SUNN** (q. v.), or **Sunn Hemp** of India, an annual species, the fibre of which is now an important article of commerce. **JUBBULPORE HEMP**, also an important fibre, and regarded as stronger than **Sunn**, is the produce of *C. tenuifolia*, a perennial species about nine feet high, a native of the south of India, which, when growing in abundant space, throws out many branches; but when sown thick, grows with little branching. *C. Burhia*, which naturally grows in very arid places, is also cultivated in **Sinde** for its fibre; and that of *C. retusa* is employed in the **Madras** presidency. *C. juncea* is also often sown in India, to be used in a young state for feeding cattle.

**CROTALIDÆ**, a family of venomous serpents, agreeing with *Viperidæ* in their general form and appearance; in their large head, which is broad behind and has a short muzzle; in their short tail; and in having long fangs in the front of the upper jaw, which is destitute of other teeth; but differing from them in having a large pit—the use of which is not known—on each side of the face between the nostril and the eye; and in having the tail terminated by a sort of horny spine or by a rattle. Many of the most dangerous serpents of the warm parts of Asia and America belong to this family, which receives its name from the rattlesnakes (q. v.) (Gr. *crotalus*, a rattle) of America, and contains also the genera *Trigonocephalus*, *Craspedocephalus*, *Lachesis*, &c.

**CROTCH**, **WILLIAM**, a distinguished musical composer, was born at **Norwich** in 1775. His musical genius was quite as precocious as that of the great **Mozart**. When little more than three years old, it is said that he could play *God save the King* almost throughout with chords, and the accuracy of his ear was such that he could detect in a moment what note was struck, and in what key the music was composed. When only 22, C.'s abilities were so

much appreciated that he was appointed Professor of Music in **Oxford University**, the degree of Doctor of Music being conferred upon him. In 1822, he obtained the principalship of the **Royal Academy of Music**. C. composed a large number of pieces for the organ and piano, as well as many vocal pieces. He was author of *Elements of Musical Composition and Thorough Bass*, and *Styles of Music of all Ages*, 3 vols. He died December 29, 1847.

**CROTCHET**. See **NOTATION, MUSICAL**.

**CROTON**, a genus of plants of the natural order *Euphorbiaceæ*, having male and female flowers generally on the same plant; the male flowers with five petals; the female flowers with three styles, which are either forked or divided into many branches; the capsules 3-celled, with one seed in each cell. The species are numerous, mostly tropical or subtropical trees or shrubs, a few herbaceous. Some of them possess in a very high degree the acrid properties so characteristic of the order to which they belong. Among these, the most important is the **PURGING C.** (*C. Tiglium*), a small tree, a native of **India** and the more easterly tropical parts of **Asia**. The leaves are extremely acrid; the wood in a fresh state is a drastic, and in a dried state, a more mild purgative; and the seeds (*C. Seeds*, or *Tilly Seeds*) are an extremely powerful drastic purgative, formerly much employed in **Europe**, but latterly disused on account of violence and uncertainty of action, although still valuable as yielding **C. OIL** (q. v.). They are oval, or oval-oblong, about the size of field-beans. So great is their acridity, that dangerous effects have ensued from working for some hours with packages of them. The oil is obtained mostly by expression, and partly by treating the cake with alcohol.—The wood and seeds of *C. Pavana* are employed in some parts of the **East** in the same way as those of *C. Tiglium*; and the wood is supposed to be the *Lignum Pavane* or *Pavane* of commerce. Other species possess similar properties.—Very different are the properties of the species which yield **Casearilla** (q. v.) and **Copalche** (q. v.) barks, to which a great resemblance exists in the barks of a number of species, natives chiefly of **America**.—Other species are still more aromatic, and some delightfully fragrant, containing in great abundance a thickish balsamic sap. The sap of *C. gratissimus* is much employed as a perfume and cosmetic at the **Cape of Good Hope**; that of *C. originifolium* is used in the **West Indies** as a substitute for **Balsam of Copaiva**; that of *C. balsamiferum*, also **West Indian**, furnishes *Eau de Mantes* by distillation; and the balsamic sap of some **South American** species is dried and used as incense.

**CROTON A'QUEDUCT**. See **AQUEDUCT**.

**CROTON OIL** is of an unctuous consistence, and varies in colour from a pale yellow to a dark reddish-brown or deep sherry colour. It is not miscible with water, but dissolves in alcohol and in ether. It has an acrid taste, and an unpleasant but characteristic odour, and is a powerful purgative, one drop of the pure oil being a sufficient dose. When rubbed upon the skin, it produces rubefaction and pustular eruption, and thereby tends to relieve some affections of the internal organs. It is used either by itself in the unmixt state, or diluted with olive oil, soap liniment, alcohol, &c. It is not to be employed except with caution.

**CROTON RIVER**. See **NEW YORK**.

**CROTOPHAGA** (Gr. tick-eater), a genus of birds of the order *Scansores*, or **Climbers**, allied to **trogons** and **toucans**, and of which some of the species are known by the names **ANI** and **KEEL-**

BIRD, the former from their cry, the latter from the high, blade-like ridge which surmounts the short, much compressed, arched bill. The tail is fan-shaped. *C. Ani*, often called the SAVANNA BLACK-BIRD, is common in the West Indies and warm

Savanna Blackbird (*Crotophaga Ani*).

parts of America, inhabiting savannas and open pastures, particularly those which are occupied by cattle or horses, and feeding chiefly on insects, partly also on berries. It uses the sharp ridge of the bill in opening out earth, dung, &c., in search of insect prey. It often perches on the backs of horses or cattle, to feed on ticks, and may be seen clinging to a cow's tail; the important service which it renders being apparently well appreciated.

CROUP, a severe and fatal disease of infants, known from a remote period, but first scientifically described by Dr Francis Home in 1765, as a suffocative affection of the breathing, depending upon the formation of a false membrane or fibrinous deposit on the mucous membrane of the windpipe or Larynx (q. v.). It is proper to remark that the inflammatory disease described by Home has been frequently confounded with a purely spasmodic affection of the larynx, the asthma of Millar, or *laryngismus stridulus* of Dr Mason Good; and also with Diphtheria (q. v.), in which a false membrane is formed on the pharynx and palate, as well as in the larynx. C., in the more restricted sense, begins with symptoms resembling Catarrh (q. v.), but differing in the greater degree of feverishness and hoarseness. In a short time, the respiration becomes difficult and noisy; a very peculiar hissing sound is heard accompanying the drawing of each breath; the cough is harsh and brassy; the countenance is injected, the expression very feverish and anxious, the voice entirely lost, or very much altered. This state is soon followed by one of suffocation, unless the little patient is relieved by expectoration, which, however, frequently takes place in the midst of vomiting or coughing, a quantity of membranous shreds being brought up from the windpipe along with glairy mucus, and sometimes streaks of blood. In the worst cases, the spasms of ineffectual coughing, and the constantly increasing obstruction to the breathing, are most painful to witness; and a period of tossing, extreme suffering, and anxiety is succeeded either by gradual insensibility, or by convulsions, which are very soon followed by death. True C. is rarely seen after the age of puberty, and is rather uncommon before the termination of the first year of life. It may occur, however, at any age, and has essentially the same characters as are above described. It is supposed to be due in some measure to Endemic (q. v.), and partly also

to Epidemic (q. v.) causes. It is most common in cold and moist climates and seasons, and in low-lying, but exposed situations. The variations in its prevalence, however, are by no means fully explained. The treatment of C. requires to be very active and decided, and yet free from rashness. In cases of highly inflammatory type, and in robust children, it may be proper to take blood from the arm, or to place one or more leeches (according to the age of the child) over the top of the breast-bone. An emetic should also be given as soon as possible, composed of a full dose of tartar-emetic or of ipecacuanha, or both together. Some prefer sulphate of copper given in repeated doses: in America, a preference is given to alum and honey mixed into a paste, and given in teaspoonful doses. The emetic may be repeated, if necessary, every two or three hours, and the child should at intervals be placed in the warm bath. It needs hardly be added that medical advice should be procured without a moment's delay, whenever it is within reach, for the disease is one of extreme danger, and almost all the most effective remedies require experienced hands for their safe administration. In extreme cases, Tracheotomy (q. v.) has been resorted to with success.

CROW (*Corvus*), a genus of birds, the type of the family *Corvidæ* (q. v.). The largest species of this genus is the Raven (q. v.). The Rook (q. v.) also belongs to it. Besides these and the Jackdaw (q. v.), there are two other species found in Britain, the COMMON or CARRION C. (*C. corone*), and the ROYSTON C. or HOODED C. (*C. cornix*). They differ from one another chiefly in colour, the Carrion C. being black, the Hooded C. gray, with black head, throat, wings, and tail. The Hooded C. is also rather larger than the Carrion C., which, in size, nearly agrees with the rook, but which may readily be distinguished from that species by having the base of the bill and the upper part of the throat not naked and rough, but closely feathered. The name Hooded C. is derived from the appearance of the black head, contrasted with the gray body, but in some parts of Scotland is, without any show of reason, popularly transferred to the Carrion C., under the form *Hoody*. Both of these species have habits much more resembling those of the raven than of the rook; they seldom or never associate in flocks, and not only prefer carrion to worms, insects, or vegetable food, but watch and attack very weak animals, such as young lambs. On this account, a premium is in many places given for their destruction, and gamekeepers relentlessly pursue them on account of their robbing nests, from which they take either the eggs or the helpless young. Their own nests are built in trees, or if these are not to be found, among high rocks. They both occasionally frequent the sea-coast, feeding on shell-fish, &c. Both are widely distributed over Europe and the northern parts of Asia.—The C. of North America (*C. americanus*) is very similar to the Carrion C., but rather smaller, and, after the breeding season is over, congregates into great flocks: it is also partially migratory, great numbers from the more northerly parts moving to the south on the approach of winter. Its habits are otherwise intermediate between those of the Carrion C. and the rook.—The FISH C. (*C. ossifragus*) frequents the coasts and southern rivers of the United States, feeding chiefly on fish, which it catches with great dexterity. It also sometimes assails gulls, and compels them to disgorge their prey.—The JABBERING C. (*C. Jamaicensis*) of the Blue Mountains of Jamaica is remarkable for the resemblance of its voice to human speech, which some of the other species of this genus, as the raven, it is well known,

can be taught to imitate. Sir J. E. Tennent gives an interesting account of the small glossy C. of Ceylon (*C. splendens*), which frequents the towns, feeding on offal, and boldly entering rooms through open windows, to snatch some morsel from the dinner-table. Habits of pilfering are more or less prevalent among the different species of crow. The accompanying cut of the heads of the raven (fig. 1) and the rook (fig. 2) illustrates well the

prevalent characters of the bill in this genus, shewing also in the raven the bristles which, as in most of the species, surround its base, but which are wanting in the rook; and contrasting the greater strength of neck, head, and bill which belongs to the more carnivorous as compared with the more frugivorous species.—The RED-LEGGED C. is the CHOUGH (q. v.).—The name CARRION C. is given in America to the BLACK VULTURE. See VULTURE.—The PIPING C. of New South Wales is a BARITAH (q. v.).

**CROWBERRY, or CRAKEBERRY** (*Empetrum nigrum*), a small procumbent shrub, of the natural order *Empetraceæ*, a native of the northern parts of the world, abundant in the moors of Scotland and the north of England. The order consists of a few heath-like shrubs, which, however, are regarded as having a botanical affinity to *Euphorbiaceæ* (Spurges, &c.), with small unisexual flowers in the axils of the leaves, the fruit a small berry seated in the persistent calyx. The berries of the C. are nearly black, surround the branches in crowded clusters, and each contain 6–9 bony seeds and a watery acidulous juice, which is sometimes felt to be not unrefreshing; but they are generally little esteemed. A fermented or vinous liquor is prepared from them in some northern countries. They are a favourite food of game. *E. rubrum*, a native of the vicinity of Cape Horn, differs little from the northern plant, except in having red berries. The berries of the Canari-heira (*Corema alba*) are employed in Portugal for

Crowberry :  
b, fruit cut open; c, flower.

the preparation of an acidulous liquor, which is used as a drink in fevers.

**CROWFOOT.** See **RANUNCULUS.**

**CROWLAND, or CROYLAND**, an ancient town in the south of Lincolnshire, on the Welland, in a low flat district in the Fens, 48 miles south-south-east of Lincoln. There once existed here a large abbey, built about 1200, and there still exist the remains of a church founded by King Ethelwald in 716. At the confluence of the Welland and the Nene, there is a curious triangular bridge, built probably in the 14th c. on the site of an older one erected about 860. Ingulfus, the historian, was abbot of Croyland. Pop. 2466.

**CROWN** (Lat. *corona*, Wel. *crwn*, and Gael. *crùn*, round). Crowns were originally garlands of leaves; and in this form they have probably been used as an ornament for the head by almost every people. They were much used by both the classical nations on joyous and on solemn occasions. Among the Greeks, the C. (*stephanos*) was sometimes used as an emblem of office, as in the case of the archons; sometimes as an ornament for the heads of the victors in the public games; and sometimes as a mark of distinction for citizens who had merited well of their country. Crowns of the latter class were made at first of twigs of laurel, but latterly of gold. The Romans made use of crowns to a greater extent than the Greeks, chiefly as rewards for valour. The most highly prized was the *Corona obsidionalis*, which was bestowed by a beleaguered garrison or army on the general who rescued them. It was made of grass or wild-flowers, gathered from the place which had been enclosed by the enemy. Next in order was the *Civic C.*, a garland of oak-leaves and acorns, which was given as a reward to any soldier who had saved the life of a Roman citizen in battle. For the soldier who wore it, a place next to the senators was reserved at the public spectacles, and both the senate and the assemblage rose up on his entrance.

Corona Muralis.

Civic Crown.

Not only he, but his father and paternal grandfather were free from all public burdens; and the person whose life he had saved was bound ever after to shew him the duty which a son owes to a father. The civic C. is sometimes used in heraldry.

Another of the Roman crowns was the *Corona muralis*, which was bestowed on him who first scaled the wall of a besieged city. It was a golden ring surmounted with turrets or battlements. It is often used in modern heraldry.

The *Corona triumphalis*, which was of three kinds, was bestowed upon a general when he obtained a triumph.

But there was a totally different class of crowns, which were not honorary, but emblematical, and which were not regulated by law, like the former ones, but by custom. Of these, the most important were: 1. The *Corona sacerdotalis*, worn by the priests and bystanders when engaged in sacrifice, with the exception of the *pontifex maximus*. It was sometimes of olive leaves, sometimes of ears of corn, and sometimes of gold. 2. *Corona funebris* or

*sepulchralis*, with which the dead was crowned, a custom which prevailed both among the Greeks and Romans. A law of the Twelve Tables provided that if any one had been crowned while living, the C. should be placed on his head when carried out to burial. Crowns were also placed on the bier, and scattered from the windows under which the procession passed. In Greece, these crowns were commonly of parsley. 3. *Corona convivialis*. The custom of wearing wreaths on festive occasions, which, like most of the Roman customs, was derived from Greece, is supposed to have originated in the habit of tying a woollen fillet round the head, to mitigate the effects of intoxication. As luxury increased, they were made of such flowers and shrubs as were supposed to prevent intoxication, roses, violets, myrtle, ivy, and even parsley. 4. *Corona nuptialis*, or bridal-wreath, made of flowers plucked by the bride herself, and not bought, which was of bad omen. Amongst the Romans, it was made of verbena. 5. *Corona natalitia*, a chaplet suspended over the door of the vestibule in which a child was born.

Several other classical crowns are mentioned in the very elaborate article on the subject in Smith's *Dictionary*, to which we have been indebted for much of the preceding information.

As the emblem of sovereignty in modern Europe, the C. was borrowed rather from the Diadem (q. v.), than the crowns of antiquity. This decoration was originally Oriental. Alexander the Great adopted it from the kings of Persia; and Antony assumed it during his luxurious intercourse with Cleopatra. According to some, its adoption for the gods originated in the fillet, which was assigned to Bacchus for the purpose mentioned as that which led to the use of the convivial crown. In modern states, crowns were of very various forms, till heralds devised a regular series of them to mark the various gradations of sovereignty, from that of the emperor down to what are now called the coronets of counts and barons. The pope also had his triple crown. See *TIARA*. So entirely was the C. regarded as the symbol of sovereignty, that the word came often to be used as synonymous with the monarchy—a sense in which we still speak of the C. of England, and the domains and possessions of the crown.

The crowns of kings and emperors are closed above, whilst the coronet of a noble is merely an open circlet surrounding the head; hence, to *close the C.* has been the ambition of princes desirous of shaking off the authority of feudal superiors, and assuming a complete sovereignty.

The royal C. of Great Britain is a circle of gold enriched with stones and pearls, and heightened with four crosses pattée, and four fleurs-de-lis alternately. From these rise four arch-diadems, adorned with pearls, which close under a mound, ensigned with a cross pattée. The C. used at the coronation of Queen Victoria was adorned in accordance with the taste of the present time.

The coronet of the Prince of Wales is a circle of gold, set round with crosses pattée and fleurs-de-lis, but has only one arch, decorated with pearls, surmounted with a mound and cross, and bordered with ermine. In addition to his coronet, the Prince of Wales has a cognizance consisting of three ostrich feathers, argent, quilled or, enfiled with a prince's coronet of the last, with an escrol azure, whereon are the German words *Ich dien* (I serve). For the traditional origin of this badge, see *WALES, PRINCE OF*.

The younger sons and brothers of the sovereign wear as coronet a circle of gold, bordered ermine, heightened with fleurs-de-lis, crosses pattée, and strawberry leaves alternately. Nephews of the

blood-royal have strawberry leaves on their coronets, where the sons and brothers have fleurs-de-lis. Princesses-royal have a circle of gold, bordered with ermine, and heightened with crosses pattée, fleurs-de-lis, and strawberry leaves alternately. For the coronets of the different orders of nobility, see their *titles*.

THE CROWN is a term often employed to signify the state, and the matters under control of the executive authority. Thus, in the interests of the state there are C. ministers, C. lawyers, C. officers, C. lands, &c.—the term, in no instance, having any special connection with the sovereign personally. In Scotland, certain high crimes are technically called Pleas of the Crown. These are four in number—murder, robbery, rape, and wilful fire-raising—and fall within the jurisdiction of the High Court of Justiciary. Likewise, in Scotland, there is a functionary styled C. agent. He is a practising law-agent or solicitor, who, under the Lord Advocate and his deputed, takes charge of criminal proceedings. His duty is to receive from the procurators-fiscal of the different counties the precognitions which they have taken, and to lay these precognitions before the lawyers for the crown, that they may determine whether there is ground sufficient to call for a prosecution. He also expedes indictments and criminal letters, and otherwise discharges the duties of an agent in preparing and assisting in the conduct of trials before the High Court of Justiciary, which are generally superintended or conducted by the Solicitor-general. The appointment of the C. A. is with the Lord Advocate, and ceases with the administration.

**CROWN DEBTS.** It is a prerogative of the crown to take precedence of all other creditors, and in England, to recover its debts by a summary process called an *extent*. By 33 Henry VIII. c. 39, this preference is given over all creditors who have not obtained judgment for their debts before the commencement of the crown's process; and the act 6 Anne, c. 26, extended the law of England in this respect to Scotland. The rule in Scotland, however, was limited to movable or personal property, and the crown has no privilege over a subject in a competition for heritage. It obtains, however, as opposed to the landlord's Hypothec (q. v.). Mercantile sequestration has no effect against the crown. The sanctuary of Holyrood House affords no protection to the king's debtor. See *EXTENT, EXCHEQUER*.

**CROWN IMPERIAL.** See *FRITILLARY*.

**CROWN LANDS.** The demesne lands of the crown are now contracted within narrow limits, having been almost entirely granted away to subjects. King William III. so impoverished the crown in this manner, that an act was passed, 1 Anne, c. 7, s. 5, the effect of which and of subsequent statutes is, that all grants or leases from the crown of royal manors, or other possessions connected with land, for a period exceeding 31 years, are void. At a much earlier period (1455, c. 41), a Scottish statute had rendered the consent of parliament necessary to the alienation of the property of the crown; but neither it, nor the subsequent statutes, which were passed with a similar object, succeeded in checking the practice. The superintendence of such property as still belongs to the crown is now vested in commissioners appointed for the purpose, called the Commissioners of Woods, Forests, and Land Revenues. See *WOODS AND FORESTS*.

**CROWN POINT,** a post village in the state of New York, on the west side of Lake Champlain, about 75 miles north of Albany. Being within the

basin of the St Lawrence, it formed part of French Canada. With the view of bridling the English on the south, it was made the site of a fort famous in the American war, but of which the ruins only now remain. The immediate neighbourhood is now a township of about 2500 inhabitants.

**CROWN SOLICITOR**, the solicitor to the Treasury, who, in state prosecutions in England, acts as solicitor for the crown in preparing the prosecution. In Ireland, there are crown solicitors attached to each circuit, whose duties correspond in some degree to those of the Procurators-fiscal (q. v.) and Crown Agent in Scotland. See **CROWN**. In England, there are no analogous officers, and prosecutions are consequently conducted by solicitors appointed either by the parish, or by private parties bound over by the magistrates to prosecute. But in cases of great importance to the public, such as unusual or monstrous crimes, it is of frequent occurrence that the Solicitor to the Treasury takes charge of the case and instructs counsel.

**CROWN-WORK**, in Fortification, is formed to strengthen a weak front, or to occupy ground which might facilitate the enemy's operations. It consists of two faces inclined to each other at an angle, with a bastion in the middle, and half-bastions at the two ends; and it is connected with the main body

of the work by two long sides. One form of C. is shown in the annexed cut, where RNMPS is the C., in front of and protecting the ravelin O. Both of these works are entirely beyond the main ditch of the place, but each has also a ditch of its own.

**CROW'S-FEET**, in Siege Operations. See **CALTHROP**.

**CROW-STONE**, the top stone of the gable-end of a building. See **CORBIE STEPS**.

**CROYDON** (Fr. *croie dunc*, chalk-hill), a town in the north-east of Surrey, on the London and Brighton Railway, 10½ miles south of London Bridge. It lies on the edge of the chalk and plastic clay, near the Banstead Downs, at the source of the Wandlc. The chief street, a mile long, forms part of the main road to Brighton. The principal trade is in corn. The October fair is also noted for walnuts. Pop. 10,260. The Archbishops of Canterbury had a palace here till 1750. This palace is now a factory, and the summer seat of the archbishops is now at Addington, 4 miles east of Croydon. Near C., Roman gold coins have been found, and here also is a cluster of 25 tumuli, and a circular camp with a double moat. C. has numerous springs. About a mile from C., is Addiscombe

House, at one time the residence of the first Earl of Liverpool, but purchased by the East India Company in 1809. When enlarged by other buildings, it became a Military Academy, at which cadets were educated for the Artillery and Engineer services of the Company. At a later date, the Infantry cadets also received their professional education there. In 1858, when the government of India was transferred from the Company to the Crown, Addiscombe Academy was transferred in like manner. It is now called the Royal India Military College. It was in 1860 divided into two portions, a 'Senior or Scientific Department,' and a 'Junior or Infantry Department,' both open to officers intended for the India service. C. has one of the finest Gothic churches in the county.

**'CROZET ISLANDS**, a volcanic group to the south of the Indian Ocean, lie between Kerguelen's Land on the east and Prince Edward's Islands on the west, about midway between Patagonia and New Zealand. The most easterly link of the chain is in lat. 46° 27' S., and long. 52° 14' E.

**CRUCIAN** (*Cyprinus carassius*), a fish of the same genus with the Carp (q. v.) from which it differs in the want of barbules at the mouth, in the much greater depth of body, and in the almost square tail. It attains a considerable size. It inhabits lakes, ponds, and slowly flowing rivers, in the north of Europe and of Asia. It is called *Karussa* in Sweden. It exists in the Thames, although rare, and is called the *German Carp*, but has perhaps been introduced. It is an excellent article of food. The introduction of the C. into some of the waters of the northern parts of Britain seems particularly desirable.

Crucible.

**CRUCIBLES** are vessels employed for the heating and fusing of glass, metallic ores, &c., and are generally made of materials capable of resisting high temperatures, such as fire-clay, black-lead, porcelain, platinum, and silver.

**CRUCIFERÆ** (Lat. cross-carrying), an important natural order of exogenous plants, including about 1600 known species, and corresponding with the class *Tetradynamia* of the Linnæan system. See **BOTANY**. The flowers have a calyx of four sepals, which fall off after flowering; and a corolla of four petals, which are placed in the form of a cross—whence the name C.—and alternate with the sepals. There are six stamens; four long ones in opposite pairs, and two short ones between the pairs of long ones. The ovary is superior, and there are two stigmas. The fruit is either long and podlike (a *silique*), or a short and roundish *pouch* (*silicula*); one-celled, or (usually) spuriously two-celled, by the parietal placentæ (see **PLACENTA**) meeting in the middle, and forming a kind of Dissepiment (q. v.); and contains either one seed, or many in a single row. Linnæus divided his class *Tetradynamia* into the orders *Siliquosa* and *Siliculosa*, according to the form of the fruit, and these may also be regarded as forming sub-orders of this natural order; but another division has more recently been adopted, founded on the character of the Cotyledons (q. v.), and the manner in which the radicle is folded upon them (cotyledons *accumbent*, *incumbent*, or *conduplicate*). The general character of the order is antiscorbatic and stimulant, with more or less acidity. It contains many plants extensively cultivated for the food of man and of domestic animals, or valuable in medicine, as Kale (Cabbage, Cauliflower, Broccoli, Colewort, &c.), Turnip, Rape, Radish, Cress, Horseradish, Scurvy Grass, Mustard, Sea-kale, Gold of

Pleasure, &c. The dye-stuff called Wood is produced by a plant of this order. It includes also a number of garden-flowers highly esteemed for their beauty and fragrance, as Wallflower, Stock, Rocket, &c. The pungency and acidity of the C. seems to depend on a volatile oil, or on different volatile oils of very similar character, present in very various degree in different species, or in the same species under different circumstances, and in different parts of the same plant. This diversity is very well illustrated in the common turnip; in the different qualities of the root, as to sweetness and acidity, in different soils or seasons, and in the difference between the flesh and the rind. The seeds of the C. contain a fixed oil, which is extracted from some (Rape, Colza, in Europe; *Myagrum sativum* and *Erysimum perfoliatum* in Japan), to be used as a lamp-oil and in the arts, and the oil-cake is valuable for feeding cattle. The plants of this order belong mostly to the temperate parts of the world, and particularly abound in Europe. Comparatively few are found within the tropics.

CRUCIFIX (Lat. *crux*, the cross, and *figo*, I fix), a cross with the effigy of Christ fixed to it. The principal C. in Roman Catholic churches stands in the centre of the high-altar. It overtops the tapers, and is only removed at the elevation of the host. In well-appointed churches, the altar crucifix is generally either of gold or silver. Crucifixes are used in Lutheran churches, and in Prussia they are often made of Berlin iron. The C. first began to take the place of the plain cross in the time of Constantine, but it was never publicly acknowledged by the Greek Church, and did not come into general use in the East till towards the

end of the 8th century. It was not till the Carolingian age that it became general in the Latin Church. On the earlier crucifixes, Christ is represented as alive, with open eyes, and generally clad, and fastened with four, not three nails. We offer a representation of an ancient form of C., with the body of Christ clothed, and four nails as fastenings, also the glory or

nimbus round the head.—Fairholt's *Dictionary of Terms of Art*. In later times, all these circumstances varied. Christ was often represented as dead, naked, except a cloth round the loins, and fastened with three nails; i. e., the two feet fastened together by one nail. The earlier artists usually represented the figure of Christ as haggard, and his countenance as sorrowful in the last degree; but laterly the custom was introduced of representing him as the ideal of human beauty, and of rapturing into his countenance an expression of rapture and heavenly joy. See Cross.

CRUDEN, ALEXANDER, was born at Aberdeen, 31st May 1700, and educated at Marischal College, with a view to the church, but having exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release, he left

Aberdeen, and after spending several years as a tutor, settled in London in 1732, first as a corrector of the press, and afterwards as a bookseller. In 1737, appeared his *Complete Concordance of the Holy Scriptures of the Old and New Testament*, a really great work, which has laid divines especially under deep obligations to the laborious author. The book was dedicated to Queen Caroline, who graciously promised to 'remember him,' but unfortunately died a few days after. C. now relapsed into insanity, and his friends were obliged to remove him to a private asylum, where he appears to have been harshly treated. On his recovery, he published an account of his sufferings. For the next fifteen years he acted as a corrector of the press, but, in 1753, he had again to be put under restraint, but only for a few days. C. now believed himself divinely commissioned to reform the manners of the world, and styled himself Alexander, the *Corrector*. He went about the country exhorting the people to keep holy the Sabbath day, &c. He also petitioned the king for the honour of knighthood, and the parliament to constitute him by act, 'the Corrector of the People,' hoping by such honours to influence the people more effectually. Several other foolish things were done by C. in the course of his life, but he also performed many virtuous and benevolent actions, which shed a pleasing light over his melancholy career. C. died at Islington, November 1, 1770. There have been many editions and abridgments of C.'s Concordance published both in Britain and America. One of the best known is that of Chalmers (London, 1812; 10th ed. 1824).

CRUIKSHANK, GEORGE, the most celebrated of living English caricaturists, was born in London about 1792. His father was a native of Aberdeenshire, and the son of a person who had fought for Prince Charles Stuart at Culloden. C. at first thought of the stage as a profession; but some of his sketches having come under the notice of a publisher, he was induced to engage in the illustration of children's books and songs. When about twenty years of age, a publication, called *The Scourge*, afforded scope for the display of his satiric genius, and from that time forth he has continued to pursue with remarkable success this his true vein. His illustrations for Mr William Hone's political squibs and pamphlets attracted much attention, and sent some of them through no less than fifty editions. But these political caricatures, many of which were personal, were not altogether to C.'s taste. Nor, indeed, in this narrow party field did he find verge enough for the full exhibition of his rich fund of humour and depth of moral sarcasm. He consequently abandoned this style about 1824. In *Points of Humour*, and the designs for *Grimm's German Tales*, *Tom Thumb*, *Peter Schlemihl*, *Punch and Judy*, *My Sketch-book*, *Boz*, *Oliver Twist*, and the *Comic Almanac*, his comic genius first found ample manifestation; while in his *Sunday in London*, his *Gin-shop*, *The Upas Tree*, and especially *The Bottle*, he shewed himself a moral teacher possessed of a grim Hogarthian earnestness and force. *The Bottle* consisted of a series of eight large-sized plates representing the various stages in a drunkard's career; and through the instrumentality of the temperance societies, as well as on account of its own merits, the work has had an enormous circulation. Latterly, C. has devoted himself to oil-painting; and in his pictures, 'Dressing for the Day,' 'A Runaway Knock,' 'Tam O'Shanter,' and 'Disturbing the Congregation,' he combines humour and artistic skill. It is pleasant to add regarding a man of true genius, that his personal character has gained for him the respect and affection

of all who know him—'in wit a man, simplicity a child.'

**CRUISER** is a small war-vessel, employed chiefly in watching an enemy by sailing about in a suspected latitude, or in any other defined portion of sea.

**CRUTHNE'** (Lat. *Cruithnii*, *Cruthini*), the name given, from the 6th to the 9th c., to a people who inhabited the southern half of the county of Antrim, and the greater part of the county of Down, and at one time established themselves also in the county of Meath, in Ireland. They were otherwise called Dalaradians, and their country, Dalaradia. Their name of C. is supposed to be derived from the Celtic *cruit*, colour, and to have been applied to them because they painted or tattooed their skins. It is the name by which the Irish called the Picts of Britain, of whom, indeed, the Irish C. are believed to have been a branch. See DALARADIA and PICTS.

**CRUIVES AND ZAIRES** are contrivances erected upon rivers in Scotland for the purpose of catching salmon. They are of great antiquity, and consisted of a 'kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the mode of capturing salmon being similar to those employed by bag and stake nets,' the earliest statute now in force, the 11th of the first parliament of James I. (1424), being entitled, 'Of Cruives, Zaires, and Satterdaies Slop.' This act is interpreted by 1477, c. 73, 'Anent cruives,' and both acts refer to an 'old statute made by King David,' requiring that 'ilk beck of the foresaidis cruives be three inch wide.' The existing arrangement, by which the stakes or hecks which prevent the passage of the larger fish must be so far apart as to permit the young salmon or fry to pass through freely, is thus as old as the time of the great founder of our Scottish monasteries and cathedrals. The Saturday's slop or opening is effected by drawing up the hecks to the height of an ell from the bottom of the river, in which position they must remain from Saturday evening at sunset till Monday morning at sunrise. C. and Z. are prohibited in those parts of a river in which the tide ebbs and flows, and it is proposed to abolish them entirely by a bill now (1861) before parliament. See SALMON-FISHING, STAKE-NETS.

**CRUSA'DES** is the name given to the religious wars carried on during the middle ages between the Christian nations of the West and the Mohammedans. The first of these was undertaken simply to vindicate the *right* of Christian pilgrims to visit the Holy Sepulchre. On the conquest of Palestine, however, the *object* of the C. changed, or at least enlarged, and the efforts of the subsequent crusaders were directed to the rescue of the whole land from the Saracens, who had repossessed themselves of it. From an early period in the history of the Church, it was considered a pious act to make a pilgrimage to the Holy Sepulchre, and to visit the various spots which the Saviour had consecrated by his presence. When Palestine was conquered by the Arabs in the 7th c., that fierce but generous people respected the religious spirit of the pilgrims, and allowed them to build a church and a hospital in Jerusalem. Under the Fatimides of Egypt, who conquered Syria about 980 A.D., the position both of the native Christian residents and of the pilgrims became less favourable; but the subjugation of the country, in 1065, by brutal hordes of Seljuk Turks from the Caucasus rendered it intolerable. These barbarians, but recently converted to Mohammedanism, were nearly as ignorant of the Koran as of the Scriptures. They hardly knew their fellow-religionists, and are said to have wreaked

their vengeance on the Mussulmans of Syria, as well as on the Christians. The news of their atrocities produced a deep sensation over the whole of Christendom. The first to take alarm were, naturally enough, the Byzantine monarchs. In 1073, the Greek emperor, Manuel VII., sent to supplicate the assistance of the great pope, Gregory VII., against the Turks, accompanying his petition with many expressions of profound respect for his Holiness and the Latin Church. Gregory—who beheld in the supplication of Manuel a grand opportunity for realising the Catholic unity of Christendom—cordially responded; but circumstances prevented him from ever carrying the vast designs which he entertained into execution, and the idea of a crusade died gradually away. It was, however, revived by his successor, Urban II., an able and humane man, whose sympathies were kindled by the burning zeal of Peter the Hermit, a native of Amiens, in France, who had made a pilgrimage to the Holy Land, witnessed the cruelties perpetrated by the Turks, and was now traversing Europe, preaching everywhere to crowds in the open air, and producing the most extraordinary enthusiasm by his impassioned descriptions of how pilgrims were murdered, robbed, or beaten, how shrines and holy places were desecrated, and how nothing but greed restrained the ruffian Turks (who made the Christians pay heavy taxes for their visits to Jerusalem) from destroying the Holy Sepulchre, and extirpating every vestige of Christianity in the land. As soon as the feelings of Europe had been sufficiently heated, Urban openly took up the question. Two councils were held in 1095. At the second, held at Clermont, in France, a crusade was definitely resolved on. The pope himself delivered a stirring address to a vast multitude of clergy and laymen, and as he proceeded, the pent-up emotions of the crowd hurst forth, and cries of *Deus vult* (God wills it) rose simultaneously from the whole audience. These words, *Deus vult*, by the injunction of Urban, were made the war-cry of the enterprise, and every one that embarked in it wore, as a badge, the sign of the cross; hence the name *Crusade* (Fr. *croisade*, from Lat. *cruz*, a cross).

*First Crusade.*—From all parts of Europe, thousands upon thousands hurried at the summons of the pope to engage in the holy war. 'The most distant islands and savage countries,' says William of Malmesbury, 'were inspired with this ardent passion. The Welshman left his hunting, the Scotchman his fellowship with vermin, the Dane his drinking-party, the Norwegian his raw fish.' It is said that in the spring of 1096 not less than 6,000,000 souls were in motion towards Palestine. This, however, must be a huge exaggeration. What we do know positively is, that previous to the setting out of the great hosts of European chivalry, four armies—if disorderly and anarchic multitudes, the mere dregs and refuse of Christendom, deserve that name—amounting in all to 275,000 persons, had departed for Palestine. The first consisted of 20,000 foot, and was commanded by a Burgundian gentleman, Walter the Pennyless. It marched through Hungary, but was cut to pieces by the natives of Bulgaria, only a few, among whom was Walter himself, escaping to Constantinople. The second, consisting of 40,000 men, women, and children, was led by Peter the Hermit. It followed the same route as its predecessor, and reached Constantinople greatly reduced. Here the two united, crossed the Bosphorus, and were utterly defeated by the Turks at Nice, the capital of Bithynia. A third expedition of a similar kind, composed of 15,000 Germans, led by a priest named Gottschalk, was slaughtered or dispersed in Hungary; which also proved the grave of the *fourth*, a terrible horde,

consisting of about 200,000 wretches from France, England, Flanders, and Lorraine, who had swept along through Germany, committing horrible ravages, especially against the Jews, whom they murdered without mercy. Now, however, the real crusaders made their appearance: the gentry, the yeomanry, and the serfs of feudal Europe, under chiefs of the first rank and renown. Six armies appeared in the field, marching separately, and at considerable intervals of time. Their respective leaders were Godfrey of Bouillon, Duke of Lorraine; Hugh the Great, Count of Vermandois, and brother of Philippe, king of France; Robert Curthose, Duke of Normandy, the son of William the Conqueror; Count Robert of Flanders; Bohemond, Prince of Tarentum, son of the famous Guiscard, under whom was Tancred, the favourite hero of all the historians of the crusade; and lastly, Count Raymond of Toulouse. The place of rendezvous was Constantinople. The Greek emperor, Alexius, afraid that so magnificent a host—there were in all not less than 600,000 men, exclusive of women and priests—might be induced to conquer lands for *themselves*, cajoled all the leaders, excepting Tancred and Count Raymond—into solemnly acknowledging themselves his liegemen. After some time spent in feasting, the crusaders crossed into Asia Minor (accompanied by the unfortunate Peter the Hermit). Here their first step was the siege and capture of Nice, the capital of Sultan Soliman, 24th June 1097. This monarch was also defeated by Bohemond, Tancred, and Godfrey, at Dorylaeum. Baldwin, brother of Godfrey, now crossed into Mesopotamia, where he obtained the principality of Edessa. After some time, the crusaders reached Syria, and laid siege to Antioch. For seven months the city held out, and the ranks of the besiegers were fearfully thinned by famine and disease. Many even brave warriors lost heart, and began to desert. Melancholy to relate, among the list of cowards was the poor enthusiast who had planned the enterprise. Peter was actually several miles on his way home when he was overtaken by the soldiers of Tancred, and brought back to undergo a public reprimand. At length, on the 3d of June 1098, Antioch was taken, and the inhabitants were massacred by the infuriated crusaders, who were in their turn besieged by an army of 200,000 Mohammedans sent by the Persian sultan. Once more famine and pestilence did their deadly work. Multitudes also deserted, and escaping over the walls, carried the news of the sad condition of the Christians back to Europe. But again victory crowned the efforts of the besieged. On the 28th June 1098, the Mohammedans were utterly routed, and the way to Jerusalem opened. It was on a bright summer morning (1099) that 40,000 crusaders, the miserable remnant of that vast array which two years before had laid siege to Nice, obtained their first glimpse of Jerusalem. The emotion was intense, the scene sublime. On the 15th of July, after a siege of rather more than five weeks, the grand object of the expedition was realised. Jerusalem was delivered from the hands of the infidel. Eight days after the capture of the city, Godfrey of Bouillon was unanimously elected king of Jerusalem. His kingdom, at first comprising little more than the mere city of Jerusalem, was gradually extended by conquest until it included the whole of Palestine. A language resembling Norman French was established, a code of feudal laws drawn up—Jerusalem was erected into a patriarchate, and Bethlehem into a bishopric. The best part of Asia Minor was restored to the Greek empire, while Bohemond became Prince of Antioch. For nearly fifty years, the three Latin principalities or kingdoms of the East—Edessa, Antioch, and

Jerusalem—not only maintained themselves against the attacks of the Mohammedans of Egypt and Syria, but greatly increased in size, power, and wealth. At Jerusalem were founded the two famous orders of the Knights Hospitallers of St John and the Knights Templars.

*Second Crusade.*—In 1144, the principality of Edessa was conquered by the Emir of Mosul, and the Christians slaughtered. His son, Nouredin, advanced to destroy the Latin kingdoms of Syria and Palestine. Europe once more trembled with excitement. A second crusade was preached by the famous St Bernard, Abbot of Clairvaux, in Champagne; and early in 1147 two enormous armies, under the command of Louis VII., king of France, and Conrad III., emperor of Germany, marched for the Holy Land. Their united numbers were estimated at 1,200,000 fighting-men. The expedition, nevertheless, proved a total failure. The Greek emperor, Manuel Comnenus, was hostile; and through the treachery of his emissaries, the army of Conrad was all but destroyed by the Turks near Iconium, while that of Louis was wrecked in the defiles of the Pisidian mountains. After a vain attempt to reduce Damascus, the relics of this mighty host returned to Europe.

*Third Crusade.*—The death-blow, however, to the kingdom of Jerusalem, and the power of the crusaders, was given, not by Nouredin, but by Salah-Eddin, commonly called Saladin, a young Kurdish chief, who had made himself sultan of Egypt, and who aspired to the presidency of the Mohammedan world. He invaded Palestine, took town after town, and finally, in October 1187, compelled Jerusalem itself to capitulate, after a siege of fourteen days. The news of this led to a third crusade, the chiefs of which were Frederick I. (Barbarossa), emperor of Germany, Philippe Auguste, king of France, and Richard *Cœur-de-Lion*, king of England. Barbarossa took the field first in the spring of 1189, but accidentally lost his life by fever caught from bathing in the Orontes. His army, much reduced, joined the forces of the other two monarchs before Acre, which important city was immediately besieged. In vain did Saladin attempt to relieve the defenders; and after a beleaguering of twenty-three months, the place surrendered. But the crusaders were not united among themselves. Philippe soon after returned to France; and Richard, after accomplishing prodigies of valour, which excited the admiration of the Saracens, concluded a treaty with Saladin, by which 'the people of the West were to be at liberty to make pilgrimages to Jerusalem, exempt from the taxes which the Saracen princes had in former times imposed.' This, as has been previously noticed, was *all* that had been claimed by the *first* crusaders. On the 25th of October 1192, Richard set sail for Europe.

*Fourth Crusade.*—Crusading unfortunately now became a constituent of the papal policy; and in 1203 a fourth expedition was determined upon by Pope Innocent III., although the condition of the Christians was by no means such as to call for it. It assembled at Venice; but how entirely secular crusading had become, will be seen from the fact, that the army never went to Palestine at all, but preferred to take possession of the Byzantine empire. The leader of this host of *pseudo-crusaders*, Baldwin, Count of Flanders, was seated on the throne of the East in 1204, where he and his successors maintained themselves for fifty-six years.

*Fifth Crusade.*—This was commanded by Frederick II., emperor of Germany. It began in 1228, and terminated in a treaty between that monarch and the sultan of Egypt, by which Palestine was ceded to Frederick, who, after being crowned king

of Jerusalem, returned to Europe, leaving his new possessions in a state of tranquillity.

*Sixth Crusade.*—In 1244, a new race of Turks burst into Syria, and once more the Holy Land fell into the hands of these ferocious barbarians. Jerusalem was burned and pillaged. In 1249, Louis IX. of France (St Louis) headed a crusade against them, but was utterly defeated, and taken prisoner by the sultan of Egypt. By the payment of a large ransom he obtained his liberty, and that of the other prisoners. On his return to Europe, he was regarded as a sort of martyr in the cause of Christ.

*Seventh Crusade.*—This also was primarily undertaken by St Louis, but he having died at Tunis in 1270, on his way to Palestine, Prince Edward of England, afterwards Edward I., who had originally intended to place himself under the command of St Louis, marched direct for Palestine, where his rank and reputation in arms gathered round him all who were willing to fight for the cross. Nothing of consequence, however, was accomplished; and Edward soon returned to England, the last of the crusaders. Acre, Antioch, and Tripoli still continued in the possession of the Christians, and were defended for some time by the Templars and other military knights; but in 1291 Acre capitulated, the other towns soon followed its example, and the knights were glad to quit the country, and disperse themselves over Europe in quest of new employment, leaving Palestine in the undisturbed possession of the Saracens.

*Effects of the Crusades.*—While we cannot help deploring the enormous expenditure of human life which the C. occasioned, it is impossible to overlook the fact that they indirectly exercised a most beneficial influence on modern society. They secured for humanity certain advantages which it is difficult to see could have been otherwise obtained. M. Guizot, in his *Lectures on European Civilisation*, endeavours to shew their design and function in the destinies of Christendom. 'To the first chroniclers,' he says, 'and consequently to the first crusaders, of whom they are but the expression, Mohammedans are objects only of hatred: it is evident that those who speak of them do not know them. The historians of the later crusades speak quite differently: it is clear that they look upon them no longer as monsters; that they have to a certain extent entered into their ideas; that they have lived with them; and that relations, and even a sort of sympathy, have been established between them.' Thus the minds of both, but particularly of the crusaders, were partly delivered from those prejudices which are the offspring of ignorance. 'A step was taken towards the enfranchisement of the human mind.' Secondly, the crusaders were brought into contact with two civilisations, richer and more advanced than their own—the Greek and the Saracenic; and it is beyond all question that they were mightily struck with the wealth and comparative refinement of the East. Thirdly, the close relationship between the chief laymen of the West and the church, occasioned by the C., enabled the former 'to inspect more narrowly the policy and motives of the papal court.' The result was very disastrous to that spirit of veneration and belief on which the church lives, and in many cases an extraordinary freedom of judgment and hardihood of opinion were induced—such as Europe had never before dreamed of. Fourthly, great social changes were brought about. A commerce between the East and West sprang up, and towns—the early homes of liberty in Europe—began to grow great and powerful. The C., indeed, 'gave maritime commerce the strongest impulse it had ever received.' The united effect of these things, again, in predisposing the minds of men for

a reformation in religion, has often been noticed. Other causes undoubtedly co-operated, and in a more direct and decisive manner, but the influence of the C. in procuring an audience for Luther, cannot be overlooked by the philosophic historian.

CRUSCA, ACADEMIA DELLA. See ACADEMY.

CRUSHERS, or BRUISERS, are implements used for reducing to small fragments corn, beans, linseed, oil-cake, and other similar hard food of horses, oxen, or hogs, in order that it may be more thoroughly subjected to the action of the gastric juice, and that no part of it may pass through the animal undigested. Seeds which enter the stomach with their husk or outer pellicle unbroken, often resist its powers, so that they contribute nothing to nourishment; and this is the case to a very large extent with corn given to old horses; but mastication is never so perfect, however good may be the condition of an animal's teeth, that the previous crushing of hard food will not be found useful. C. are of different kinds, and those intended for oil-cake are somewhat different from those suitable for grain; but the essential part generally consists of toothed, grooved, or otherwise roughened cylinders, revolving so as to bruise the food either against each other, or against a fixed plate of similar roughness.—CLOD-CRUSHER is the name of an agricultural implement, which may be generally described as a toothed or roughened roller; and will be found noticed, with its uses, in the article ROLLER.

CRUST OF THE EARTH. It being generally believed by geologists that the interior of our globe is in a state of fusion from heat, they have given the name of crust of the earth to the external solid covering. Man has been able to penetrate but a short way into the crust, and he cannot safely reason on his observations made at or near the surface, regarding the condition of the crust to a greater depth than a few miles, at the most ten—all beyond is little more than guess-work. The materials of the crust are not thrown confusedly together, but distinct mineral masses are found to occupy definite spaces, or to exhibit a certain order of arrangement. All these may be classified in reference either to their origin, which is Aqueous (see AQUEOUS ROCKS) or Igneous (q. v.); or to their relative age, as Primary (q. v.), Secondary (q. v.), and Tertiary (q. v.).

CRUSTA'CEANS (*Crustacea*), a class of articulated animals, agreeing with insects, arachnida, and myriapoda in having articulated limbs; but differing from them in important respects, and particularly from all of them in the adaptation of the organs of respiration to an aquatic life, even those of them which live on land being generally inhabitants of damp places, and breathing by a kind of gills. Some of the lowest and minute aquatic C., indeed, are not provided with gills; but the aëration of the blood is supposed to take place through the surface of the body.

The C. derive their name from the hard armour which in most of them covers the whole body, forming for it that sort of framework which is sometimes, not very correctly, called an external skeleton; and which, in those of highest organisation, is very complex in its structure, and contains a large amount of calcareous matter—carbonate and phosphate of lime, so that it is in its substance intermediate between shell and bone—whilst in many of the lower and smaller kinds it consists principally of *chitin*, and corresponds more nearly in its nature with the integuments of insects. The body of a crustacean is composed of rings (see ARRICULATA), generally twenty-one in number, and the

crustaceous covering corresponds with it in this respect; the rings, alike of the body and its armour, being in some cases very distinct, whilst in others some of them in a great measure coalesce or are consolidated together, of which the thorax of a crab affords an excellent example. The first seven rings are regarded as forming the head; the next seven, the thorax; and the remainder the abdomen, corresponding with the head, thorax, and abdomen of insects. The crustaceous covering is considered as a peculiar epidermis, having beneath it a true skin, from which it is an inorganic exudation; and, like the epidermis, it is cast off from time to time, that its place may be supplied anew, as the growth of the animal requires more room for the internal soft parts. In this *moulting*, or casting of the shell, the animal divests itself of its covering not in separate parts, but in one piece, including the coverings of the limbs, and even of the antennae, although the membranes which connect the hard plates are split and torn. A period of apparent sickness precedes and agitation accompanies the process; and the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be much more easily extricated from their hard coverings. The loss of a limb, which sometimes takes place on such an occasion, and is otherwise a frequent occurrence, is easily repaired, for a new one grows in its stead; but it is a curious circumstance that in order to this reproduction, the limb must be broken off at a particular joint, the second from the body, thus leaving only a short stump; and when a limb is broken elsewhere, the animal itself exercises the remarkable power of throwing it off by this joint.

The principal organ of locomotion in many C., as in the lobster, shrimp, &c., is the abdomen, terminating in fan-like appendages; by bending the abdomen suddenly down under the thorax, they dart backwards in the water. The limbs—which are connected with the thoracic rings—are, in some, organs of swimming; those of others are used for walking at the bottom of the water or on dry ground. Some have what are called *false legs* or *pro-legs* attached to the abdomen, often very different from the thoracic legs. The legs of some are fitted for burrowing. The first pair of legs is not unfrequently transformed into a pair of powerful claws or pincers—the last joint but one being prolonged so as to oppose the last joint, which becomes attached as to the side of it; and these are used for seizing and tearing food. The limbs of the first thoracic rings are, in many C., organs still more intimately connected with the mouth, and have received the name of foot-jaws, the transition from the true mandibles and maxillae to the organs of locomotion being often very gradual. The mouth of some small parasitic C. is, however, formed for sucking, and not for tearing and masticating food. The digestive organs are very simple in all; there is a short but capacious gullet, a large stomach, and a straight and simple intestinal tube. The pyloric region of the stomach, however, is furnished with a remarkable apparatus of hard tubercles or sharp teeth for grinding or tearing food, supplementary to the external organs of the mouth. Almost all of the C. feed on animal food, and they are very voracious. A few feed on vegetable food. The nervous system of C. agrees generally with that of insects, and exhibits many gradations of division and concentration. C., in general, appear to possess all the five senses. Their eyes are either simple (stemmatic), aggregate (consisting of several stemmata under a common cornea), or compound. The compound eyes are often on foot-stalks. The gills are variously placed; in the internal cavity, under the *carapace*—the enlargement of the plate of a single ring, which

covers the thoracic rings in crabs, &c.; on the thoracic limbs; on the abdominal or false legs, &c. The heart is always in the middle line of the body, is of various form, and distributes the blood by a number of trunks through the system; but the blood returns to venous *sinuses*, from which, and not from the heart, it is sent into the gills, and it is not until after its aëration in the gills that it comes to the heart again; not, however, without being mixed with venous blood which has not undergone the same aëration. The sexes are distinct in most of the C.; and they are all oviparous. A sort of incubation of the eggs takes place, in order to which they are carried under the abdomen or under the thorax of the female, attached to the false legs or to some of the thoracic appendages. It has recently been

Transformations of the Crab:

1, young crab, or *zoea*, magnified; 2, young crab, in a more advanced stage, magnified; 3, young crab, in a more advanced stage, natural size; 4, young crab, when it has assumed its more perfect form, magnified; 5, young crab, when it has assumed its more perfect form, natural size.

discovered, contrary to former belief, that C.—or at least many of them—undergo metamorphoses; and the curious creatures known by the name *Zoea* have been found to be the young of crabs.

The greater number of C. are marine: some inhabit fresh waters, running or stagnant; comparatively few are terrestrial.

Cuvier divided C. into two sections, *Malacostraca* and *Entomostraca*: the former section containing the orders *Decapoda*, *Stomatopoda*, *Lamodipoda*, *Amphipoda*, and *Isopoda*; the latter the *Branchiopoda* and *Pacilopoda*. Another division has been more recently proposed by Müne Edwards, and very generally adopted into *Xyphosura* (the genus *Limulus* alone), having a mouth destitute of jaws, and for which legs perform the office of jaws; *Maxillosa*, or Masticating C.; and *Edentata*, or Suctorial Crustaceans.

CRUYS, CORNELIS, the founder of Russian maritime power, was born June 14, 1657. He was a rear-admiral in the Dutch service when Czar Peter the Great, noticing his abilities, persuaded him to go to Moscow. There he arrived October 15, 1698, was received with great splendour, and soon appointed vice-admiral. His services to Russia were of various kinds: to him it owed its first dockyards, canals, and charts, the organisation of its navy, and its victories over Sweden and Turkey in 1708—1710. After a short period of disgrace, C. was received back to favour. He died in 1727, possessor of an imperial domain in Kexholm, and owner of the island Birken in Finland. It is in memory of him the white flag with the blue cross (Dutch, *kruis*) still floats from the Russian men-of-war.

**CRYOLITE** is a double fluoride of aluminium and sodium ( $\text{NaF}, \text{Al}_2\text{F}_6$ ), and is important as a source of the metal Aluminium (q. v.).

**CRYOPHORUS** (Gr. *kryos*, cold, and *phero*, I carry) is an instrument consisting of a glass tube with a bulb at both ends. A little water is present in one of the bulbs, and when the second bulb, containing only water-vapour, is placed in a freezing mixture, the vapour condenses, which causes more vapour to rise from the water in the first bulb. The result of this vaporation from the first bulb is the abstraction of much heat, and ultimately the remaining water passes into a frozen state.

**CRYPT** (Gr. *krypto*, I hide), a vault under a church, either entirely or partly under ground. Crypts do not generally extend beyond the limits of the choir or chancel, and they are often of much smaller dimensions. Crypts were formerly used as chapels, and provided with altars and the other furniture requisite for the celebration of religious services; and they were also very frequently used as places of sepulture. It sometimes happens that

Crypt of York Cathedral.

a new church has been erected over the C. belonging to the old one. One of the largest crypts in England is that under Canterbury Cathedral; but there are few finer specimens of the C. anywhere than that under Glasgow Cathedral, which has been recently freed from rubbish and restored. Crypts seem to have originated in the customs of the early Christian ages. The tombs of the martyrs were first used as churches; and then churches were built above them.

**CRYPTOGAMOUS PLANTS** (Gr. *kryptos*, concealed, and *game*, marriage) are those which have no true flowers, and no known male or female organs of fructification, and whose seeds, called *spores*, consist only of a single cell, and contain no embryo, but germinate indifferently from any point; and which Jussieu therefore designated *Acotyledonous Plants* (q. v.). The name C. P. was invented by Linnæus, and the *Cryptogamia* form a class of his sexual system, very distinct from all the rest. See **BOTANY**. Many C. P. have no leaves; some have not even a root, and those which are lowest in organisation consist only of a single cell. Many are parasitic. Many look as if dead in a dry atmosphere, and are revived by rain. They are the lowest in organisation of the vegetable kingdom, and are divided into *Filices* (Ferns), *Marsilaceæ*, *Lycopodiaceæ* (Club-mosses), *Equisetaceæ* (Horse-tails), *Musci* (Mosses), *Hepaticæ*, *Lichens*, *Fungi*, *Characeæ*, and *Algae*.

**CRYPTOGRAPHY**, the art of secret writing, more commonly called the art of writing in cipher (from Arabic *sifr*, void), has been in use from an early date in correspondence between diplomatists

and others engaged in important affairs requiring secrecy. In modern times, it has been the subject of learned care to Lord Bacon, the ingenious Marquis of Worcester, Dr Wallis, Bishop Wilkins, Thicknesse, Falconer, Blair, &c. In our own history, it has at no time been in greater requisition than during the civil war, and among the politicians of the 17th century. And even now, when there is happily less need for mystery among our statesmen, the need for a perfectly undecipherable mode of secret communication has again had to be looked for, in order that information may pass by the electric telegraph without being understood by the officials in connection with the apparatus.

One of the most simple methods of C. is to use, instead of each letter of the alphabet, a certain other letter at a regular interval in advance of it in that series. Such was a mode of secret writing used by Julius Caesar. As a variety upon this plan, the alphabet is used invertedly—*z* for *a*, *y* for *b*, *x* for *c*, and so on. Or, while the first seven letters are represented by the second seven, the next six may be represented by the last six. And many other variations may be adopted. But for all modes like these, there are modes of decipherment far from difficult. It is only necessary, in general, to bear in mind certain peculiarities of the language presumed to be used. Say it is the English. We readily remember that *e* is the most frequent letter; that *ea* and *ou* are the double vowels which most frequently occur; that the consonants most common at the ends of words are *r*, *s*, and *t*; &c. We also know how a single letter must be either the pronoun *I* or the article *a*; how *an*, *at*, and *on*, are the most common words in two letters; how *the* and *and* are the most frequent words in three letters; &c. By taking advantage of these few obvious principles, a tolerably skilled decipherer will read almost any such piece of cryptographic writing in five minutes. The *Times* newspaper often gives, in its advertising columns, correspondence on delicate subjects, even assignments for elopements, written in this manner, the writers of which are of course little aware how open their secrets thus become to society.

Politicians and important personages conducting affairs of difficulty became long ago sensible of the necessity of using ciphers of greater abstruseness. The celebrated letter of Charles I. to the Earl of Glamorgan, in which he made some condemning concessions (elsewhere denied) to the Catholics of Ireland, was composed in an alphabet of 24 short strokes variously situated upon a line. Other letters by the same monarch are to appearance a mere series of numbers of two and three figures, divided by semicolons. In such cases, it was necessary that the two parties in the correspondence should have previously concerted what words each number was to represent. Bacon devised what he thought a not easily penetrable cipher, in which he employed only *a* and *b*, arranging each of these, in groups of five, in such collocations as to represent all the 24 letters. Thus, *aabab ababa babba* conveyed the word *Fly*. The great philosopher thought that preconcertment would here be necessary; but in reality any clever modern decipherer would have found no difficulty in reading any long letter composed in such a manner. The unfortunate Earl of Argyle, when preparing his expedition against the tyrannical government of James II., used a mode of secret writing which consisted in setting down the words at certain intervals, which he afterwards filled up with other words, making on the whole something intelligible, but indifferent. In our day, such a mode would not have been found proof against the ingenuity of those who have studied the means of decipherment.

There are many other modes of secret writing, which it does not seem necessary to detail, as the art has become little more than a matter of curiosity. One of the ablest and amplest treatments of the subject is an article by Dr William Blair in *Rees's Cyclopædia*. See also *Chambers's Journal*, No. 506 (Second Series), under 'Secrets Exposed,' and Nos. 87 and 115, under 'Cryptographs.'

CRYSTAL ISLANDS. See CORAL ISLANDS.

CRYSTALLINE ROCKS, a name given to all rocks having a crystalline structure. They are found belonging to every division of the crust of the earth, but are especially abundant in the most ancient azoic rocks; the greater proportion of intruded igneous rocks also possess this structure. When attempting in the laboratory to produce crystals, it is known that the building material must exist in a fluid condition, and this is obtained either by heating to fusion or by solution. It has been asserted that all C. R. have been produced under similar circumstances; and no one can doubt that lavas and more ancient rocks having a similar origin, have assumed this structure while solidifying from a condition of igneous fusion, while rock-salt is as certainly obtained from a saturated solution of salt. There are, however, many rocks, such as some fossiliferous limestones, in which this structure occurs, where it is not possible to conceive of their being in either condition. It is known that crystallisation takes place in solid material, as in the axles of railway carriages, or in the crystals of pyrites in the chalk, where the iron has been gathered from the surrounding material while in a solid state. We know not what is the force that induces such a change in solid materials: it may be called metamorphic or molecular action, but these are names that mean nothing, and simply hide our ignorance. That such a force, inducing crystalline structure in amorphous masses, has been and is now at work on the solid strata of the earth, cannot be doubted.

CRYSTALLOGRAPHY. A crystal is a piece of matter that, by the action of molecular forces, has assumed a definite geometrical form of some kind, with plane faces. There is a great variety of crystalline forms, each form being characteristic of one or more substances; and C. is the science which classifies the forms and shows the relations that subsist among them. The great majority of substances are capable of undergoing the process of crystallisation, the exceptions being principally complex organic substances which tend to assume a globular or spherical form approaching that of organised structures. The most favourable condition for the crystallisation of any substance is from its solution in water or other liquid. A liquid usually dissolves more of a salt when warm than when cold; and when a warm saturated solution is allowed to cool, a portion of the salt deposits itself in crystals. This process is that which is generally followed in the crystallisation of saline substances. A second process resorted to in the case of the metals, such as bismuth, antimony, &c., and sulphur, is to fuse the material in a vessel, and when it is cooled down, so as partially to solidify the mass, the crust is broken through, and the liquid still remaining is poured off, when a net-work of crystals is obtained. A third method is to vaporise the substance, which on condensation resolves itself into crystals. Examples of this class are the formation of snow crystals from the water-vapour in the atmosphere, and the minute black crystals of iodine obtained by allowing its vapour to condense in a cold vessel or on a cold surface.

Many circumstances affect the crystallising power

of substances. Thus, water may be cooled down below its freezing or crystallising point (32° F.), provided it be kept perfectly still, without becoming solid; but on subsequent agitation, it instantly crystallises. Similarly, a hot saturated solution of sulphate of soda, or glauber salt, if cooled down in a still place, does not crystallise, but immediately does so when the liquid is agitated, or a fragment of any solid substance is introduced into it. The size of the crystals obtainable from any fluid depends much on the rate of cooling, and the state of commotion of the liquid. The more slowly the solution cools down, and the more quietly the process of crystallisation is allowed to proceed, the larger are the crystals obtained; whilst, when the liquid is rapidly cooled, and agitation is kept up, the crystals are comparatively small, and generally not completely formed. The reason of this will be at once apparent, for a large crystal is constructed of a multitude of smaller crystals, built up regularly so as to constitute a compound crystal of the same form as the more minute crystalline atoms; and when a liquid is cooled slowly in a state of rest, only a few minute crystals are produced at first, and these are gradually built round on all sides by successive layers, till large, well-defined crystals are the result; while, when the liquid is rapidly lowered in temperature, and especially when agitation is kept up, numerous minute crystals are formed at once, and do not adhere together. In either case, the liquid from which the crystals have separated is called the *mother-liquor*, and is a saturated solution of the salt.

The external forms of crystals amount to several thousands, but they may all be regarded as belonging to six different systems.

The regular system (otherwise called the cubic, octohedral, tessular, spheroidal, or equi-axed system) is characterised by having three axes or straight lines passing through the same point, of equal lengths, and placed at right angles to each other. The best illustration of this system is the cube or hexahedron (fig. 1), which has six square faces or planes, and the three equal axes (printed in bold lines) terminate in the centre of each of the square faces. The planes or squares are symmetrically arranged, so that each is perpendicular to one axis, and parallel to the other two. The crystals have each six square faces, with twelve equal edges, and eight equal angles. Examples of

Fig. 1.

Fig. 2.

substance which crystallise in the form of the cube or hexahedron, are—common iron pyrites ( $\text{FeS}_2$ ), common salt, or the chloride of sodium ( $\text{NaCl}$ ), fluor spar ( $\text{CaF}$ ), galena, or the sulphuret of lead ( $\text{PbS}$ ), and the metals gold, silver, platinum, and copper. Another important crystalline form belonging to the regular system is the octohedron (fig. 2), where the terminations of the axes are in the angles of the crystals, as represented in the figure by the bold lines. It has eight faces, all of which are equilateral triangles, and twelve edges, with six angles, each of which has four faces. The diamond ( $\text{C}$ ), alum, zinc-blende ( $\text{ZnS}$ ), sal ammonia C. ( $\text{NH}_4\text{Cl}$ ), magnetic iron ore ( $\text{Fe}_3\text{O}_4$ ), fluor spar ( $\text{CaF}$ ), and

chrome iron ore, are examples. There are various secondary forms belonging to this system, derivable from the cube and octohedron, such as the rhombic dodecahedron (fig. 3), which has twelve faces, and is the form in which the garnet crystallises.

Fig. 3.

The square prismatic system (known as the pyramidal, tetragonal, or quadratic system) has three axes placed at right angles to each other, of which two are of equal length, but the third may be longer or shorter. To this belong the right square prism (fig. 4), in which the lateral axes terminate in the centre of each side face, and the perpendicular axis, is longer than the two lateral axes; and the right square-based octohedron (fig. 5), which resembles two pyramids placed

Fig. 4.

Fig. 5.

base to base, and having eight faces, which form isosceles triangles. Examples of substances which crystallise in this system are—yellow prussiate of potash, native binoxide of tin, zircon, apophyllite, calomel, &c.

The right prismatic system (otherwise known as the right rhomboidal, or rectangular prismatic system) is characterised by having three axes, all of unequal or different lengths, but placed at right angles to each other. The right rhombic prism (fig. 6),

Fig. 6.

Fig. 7.

and the right rhombic-based octohedron (fig. 7), are forms included in this class, and examples of materials which crystallise in this form are—sulphur, arsenical iron pyrites, nitrate of potash, sulphate of potash, sulphate of baryta (heavy spar), topaz, arragonite, &c.

The oblique prismatic system (oblique rhomboidal, or rectangular prismatic) has three axes, which may

Fig. 8.

Fig. 9.

be all of unequal lengths, two of which are placed at right angles to each other, whilst the third axis is so inclined as to be perpendicular to one of

the two axes, and oblique to the other. To this belong the oblique rhombic prism (fig. 8), and the oblique rhombic-based octohedron (fig. 9). Many salts crystallise in this form, such as green vitriol (sulphate of iron), borax, sulphate of soda, carbonate of soda, phosphate of soda, realgar (native bisulphuret of arsenic), &c.

The doubly oblique prismatic system has three axes of unequal length, which intersect obliquely with each other. The forms are very irregular, which render them very puzzling to make out satisfactorily. Nitrate of bismuth, sulphate of copper, sulphate of manganese, quadroxalate of potash, and pyrotartaric acid, are examples.

The rhombohedral, or the regular hexagonal system, is known by the presence of four axes, three of which are in the same plane, and inclined to each other at an angle of 60°, whilst the remaining fourth axis is perpendicular to the three. To this belong

Fig. 10.

Fig. 11.

the regular six-sided prism (fig. 10), and the rhombohedron (fig. 11). Examples of this system are—calcareous spar, ice, quartz or rock crystal, nitrate of soda, beryl, arsenic, antimony, and apatite.

CRYSTALLOMANCY, a mode of divination by means of transparent bodies, at one time very popular. A precious stone, crystal globe, or other transparent object, was employed, but a beryl was deemed most effective. In using it, the operator first muttered over it certain formulas of prayer, and then gave it into the hands of a youth or virgin—none others were pure enough to discern its revelations—who beheld in it the information required. Sometimes the desiderated facts were conveyed by means of written characters on the crystal; sometimes the spirits invoked appeared in the crystal to answer the questions asked.

CSA'BA, a town of Hungary, 7 miles south-south-west of Bekes. It is well built; some of the houses are even very elegant. Pop. 23,100, with a trade in grain, wine, and cattle. The women are also noted for their skill in making sacks and mattresses.

CSANA'D, the name of two towns in Hungary, both situated on the Marós, the one with a population of 5000 or 6000, and the other with a population of 8000, who are engaged in agricultural pursuits.

CSAT, or CSATH, a market-town of Hungary, near the Theiss, and about 15 miles south-east of Miskolcz. Pop. 6000.

CSOMA DE KÖRÖS, ALEXANDER, a Hungarian scholar and traveller, whose name in his own language is written Köröse Csoma Sandor, was born about 1790 at Körös in Transylvania, and educated first at the college of Nagy-Enyed, and subsequently at Göttingen, where he devoted himself with great zeal to the study of the Oriental tongues. The dream and inspiration of his boyhood was the hope of one day discovering the original home of his Magyar ancestors; and as he grew up, it became the single thought and passion of his life. In 1820, he set out on his visionary pilgrimage. After a year's interval, his friends got a letter from him, dated Teheran, in which he expressed his conviction that the object of his search would speedily be

obtained. Leaving Teheran, he wandered north-east through Little Bokhara, and at length reached Tibet, where he spent about four years (1827—1830) in the Buddhist monastery of Kanam, studying Tibetan. He soon discovered that there was little connection between that language and his native one, but still he hoped to make use of his researches, and set out for Calcutta. Here he learned, to his dismay, that the literature of Tibet was simply a translation from the Sanscrit—a language he might easily have acquired a knowledge of at home. His whole labour seemed to have been in vain. Fortunately for C., the library of the Asiatic Society of Bengal contained upwards of 1000 volumes in Tibetan which no one could catalogue. C. undertook and successfully executed the task. By the great Anglo-Indian scholars, Prinsep, Wilson, and others, he was very generously treated. He next prepared, at the expense of the government, a Tibetan grammar and dictionary (Calcutta, 1834), which was the first really accurate and valuable European work on the subject. It is still a standard treatise, and has been the guide of all good scholars since. C. wrote many articles on Tibetan literature in the *Asiatic Researches*, but still haunted, as of old, by the hope of discovering the early home of the Magyars, he once more set out on an expedition to the western confines of China, but died on the 11th April 1842, at Dorjeeling, a sanitary station for the British troops in Sikkim, 318 miles north of Calcutta.

**CSONGRAD**, a market-town of Hungary, situated on a neck of land at the confluence of the Theiss and the Körös, 70 miles south-east of Pesth. The inhabitants, 12,600 in number, are chiefly engaged in the rearing of cattle, and the cultivation of the vine.

**Ctenoid FISHES**, an order of fishes, according to a classification proposed by Agassiz (see **FISHES**), characterised by *ctenoid* scales, i. e., imbricated scales, generally rounded or ovoid, with teeth or sharp projections on their hinder margin. The name is from the Greek *kteis* (gen. *ktenos*), a comb. The scales of C. F. are horny or bony and unenamelled. There are sometimes numerous rows

Ctenoid Scales.

of teeth or little spines, sometimes only one row, the rows successively wearing off as new ones are formed in the enlargement of the scale. Living C. F. are numerous, fossil ones comparatively few. Perches, flounders, and turbot may be mentioned as examples.

**CTESIBIUS**, a Greek who lived about 250 years B. C., was born at Alexandria, and was famous for his inventions in mechanics. We owe to him and his pupil Hero Alexandrinus, the pump, the bent siphon, and also the discovery of the elastic force of air, and its application as a motive power.

**CTESIPHON**, now Al-Madain, was a city of Assyria, on the eastern bank of the Tigris, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. Its ruins still attest its former magnificence.

**CUBA**, the largest and most westerly of the Antilles (q. v.), and the most important of the transmarine possessions of Spain, lies between the Caribbean Sea on the S., and the Gulf of Mexico, Gulf of Florida, and Bahama Channel on the N., being nearly equidistant from the peninsulas of Yucatan and Florida, and the islands of Hayti and Jamaica. It stretches in N. lat. from 19° 50' to 23° 9', and in W. long. from 74° 8' to 84° 58', measuring fully 750 miles in extreme length, and little more than 40 in average breadth, with an area of fully 30,000 square miles. C., though chiefly of primary formation, must yet have had its structure modified by volcanic action, for limestone is found high among the mountains, and earthquakes are still frequent. Besides rocky reefs and muddy shallows, which beset about two-thirds of the coast, dependent islets, of which Los Pinos on the south is the most considerable, are very numerous. In many localities, however, the sea is deep to the very shore, offering many excellent havens, and those, too, situated on the busiest thoroughfares of the western hemisphere. Not to mention the ports of lesser note, such as Matanzas, Santiago, &c., the *Havana* (in English, the *Harbour*) may claim, alike in position, and entrance, and commodiousness, to be one of the most eligible in existence. Beginning from the south-east, the Copper Mountains run nearly the length of the island, culminating at an altitude of 6890 feet. With so lofty a watershed on so scanty a width, the rivers are necessarily small, so that very few of them are navigable even at their mouths. But such as they are, they flow all the year round, for every month yields its own supply; and thus they are constantly available for purposes of irrigation. At the Havana, the annual rainfall is said to be 90·66 inches, much more than double of that in the opposite parts of Florida. With regard to atmospheric tendencies in general, C. is superior to most of the West India Islands. Hurricanes are understood to be less frequent and less violent, at least on the land; and the climate, more especially amid the elevated grounds of the interior, is at once pleasanter and more salubrious. With the exception of the central range of mountains, the country is more or less level, its spreading plains and swelling valleys being interspersed with lagoons and marshes. The cultivated portions of the lower tracts—a small part of the whole—produce abundantly maize, rice, yams, bananas, sugar, coffee, tobacco, cotton, cocoa, and indigo; while the uncultivated districts of the same rear countless herds of cattle. For wheat and flour, which have no place in native husbandry, the colony is indebted to the mother-country through a monopoly, which most unfavourably affects both the price and the quality. The elevated regions of the Copper Mountains, besides teeming with the metal from which they derive their name, and here and there producing gold, silver, and iron, are covered with dense forests, in which, besides ship-building timber, palms, the plantain, and the mahogany are conspicuous. In addition to Havana, the capital, C. contains 22 cities and towns, with 204 villages and hamlets. Many of these places communicate with each other by railways, of which the oldest dates from 1838. Of most of these works, Havana is the common terminus, being joined even with Batabano on the south or opposite side of the island without the aid of a tunnel.

In 1850, the population numbered 564,698 whites, 216,176 free people of colour, and 662,587 slaves, together with an unenumerated supplement of eastern coolies. Each of these classes demands separate remark. With the exception of a few foreigners,

whose presence is tolerated merely under security for good-behaviour, the whites may be divided into old Spaniards and Spanish creoles. The former engross all the offices and favours in the gift of the government; and the latter conduct most of the agriculture and commerce of the island, being in this connection the main supporters of all 'internal improvements.' Representing, in some measure, all the generations of immigrants from the days of Columbus, the Spanish creoles, vastly outnumbering the old Spaniards, form a great and growing majority of the inhabitants of European blood. In 1855, only 9000 white children, being clearly under a tenth of the full tale, were attending school. The condition of the negro, not merely in C., but through Spanish and Portuguese America generally, does not render its possessor an outcast. Men of colour are permitted to serve in the colonial militia, and the foremost literary character in the island is, or at least in 1855 was, a mulatto poet. Even the slaves themselves are not destitute of legal rights. They may, if they can, buy their liberty, being entitled to secure even partial exemptions from their toil in return for partial payments of their value; and, meanwhile, their domestic relations are recognised, and their corporal punishments restricted to five-and-twenty lashes. That such legal rights, however, must often be a dead-letter, one may safely infer from the fundamental fact, that many, perhaps most, of the slaves are wrongfully held in servitude. Under a treaty with England, to enforce which a court of mixed commission sits at the Havana, Spain has long been bound to abolish the slave-trade; but neither the court nor the treaty has availed much, on account of the interested connivance of the local authorities. Nor are the national rulers themselves above the suspicion of complicity in this organised piracy. As regards the eastern coolies, the immigration from Asia is fully as hideous as that from Africa. It is well known to be, too often, equally involuntary in its origin; it inevitably encounters, for a longer period, the horrors of the middle passage; and lastly, it is apt to result in the collusive sale of such of its apprentices as may not have been worked to death during their term of indenture. The aboriginal population of C. has been exterminated by the sword, the scourge, and the blood-hound.

In 1492, this Queen of the Antilles was discovered by Columbus during his first voyage. He called the island *Juana*, and Velasquez afterwards named it *Fernandina*, but neither supplanted the native name *Cuba*. In 1511, the island began to be permanently colonised, becoming, within ten years, the base of all the various operations against Mexico. While, in the first quarter of the present century, every continental portion of Spanish America established its independence, C. remaining, like Porto Rico, faithful to the mother-country, largely profited by the intestine broils of the revolted provinces, for, when the old Spaniards were expelled in mass from the mainland, many of them naturally took refuge in the still loyal islands, enriching them with their capital, and energy, and skill. C. has long been coveted by other nations. In 1762, the Havana was captured by a British armament, but was restored in the following year. During the present age, the island has been an object of cupidity to the United States—a cupidity checked more powerfully by jealousy on the part of France and England than by Spain's own resources; and, in fact, it has been twice attacked—in 1850 and 1851—by individual Americans without success. They were commanded by a Spaniard of the name of Lopez, who, being taken prisoner, was executed as a traitor.

The government is understood to be thoroughly corrupt in all its departments. It seems to be as costly, too, as it is worthless. The taxation, according to an apparently authentic statement, is estimated to be equivalent to 2½ per cent. on a collective valuation of 800,000,000 dollars, the actual burden reaching £4,000,000 sterling. The army ranges between 13,000 and 28,000 men; while the navy consists of 4 frigates, 15 steam-ships, and 32 small-craft. The imports, without reckoning the illicit cargoes of 'live-stock' from Africa, are salted fish, bread-stuffs, and manufactured goods; and the exports consist mainly of sugar, coffee, tobacco, wax, cotton, cocoa, indigo, molasses, and rum. Excepting the importation of slaves, which is almost exclusively carried on by some of the 'free' states of the American Union, this external trade, in both its branches, is carried on with Spain, the United States, Germany, England, France, &c.—the first two countries being nearly on a par as to value, and either of them being vastly ahead of any of the others. Ever since the epoch of the general peace in 1815, the material prosperity of C. has rapidly advanced. Between the year last mentioned and 1827, the customs of the Havana swelled from 1,725,963 dollars to 4,383,262 dollars. Between 1827, again, and 1850, the exports had more than doubled in amount, having grown from 13,111,416 dollars, to 26,684,602 dollars. In 1855 they amounted to £7,395,600. Such progress, so exceptional in a Spanish community of recent times, has been, in a great measure, owing to extrinsic events. Among these, the most prominent have been the independence of Hayti, the emancipation of the blacks in the British West Indies, and the abolition in England of those differential duties which had operated as a premium on colonial production.

CUBA'GUA, an island in the Caribbean Sea, off the north-east coast of Venezuela in South America, is situated in the department of Maturin, between Margarita and the mainland, about 30 miles north of the town of Cumana.

CUBE, a solid with six square faces, each of which is parallel to the one opposite to it. It is a form of frequent occurrence in nature, especially among crystals. See CRYSTALLOGRAPHY. In arithmetic, the C. of a number is the product of its multiplication three times by itself. This use of the term arises from the circumstance that the solid contents of a C. may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a C. be a line of 4 inches, its solid contents are equal to 64 cubic inches. Conversely, the C. root of a number is that number which, multiplied three times by itself, produces the first number. See DOUBLING THE CUBE.

CUBEES, or CUBE PEPPER, the dried berries of *Cubeba officinalis* and other species of *Cubeba*, a genus of climbing shrubs of the natural order *Piperaceæ*, very closely allied to the true peppers, but distinguished at once by the contraction and elongation of the berries at the base, so that they appear to be stalked, upon which account C. are sometimes called *Piper caudatum*, or tailed pepper. *Cubeba officinalis* is a native of Penang, Java, New Guinea, &c., and is said to be extensively cultivated in some parts of Java. Its spikes are solitary, opposite to the leaves, and usually produce about fifty berries, which are globular, and when dried, have much resemblance to black pepper, except in their lighter colour, and the stalk with which they are furnished. *Cubeba canina*, a native of the Sunda and Molucca Islands, is supposed also to yield part of the C. of commerce, and the berries of *C. Wallichii*

possess similar properties. C. are less pungent, and more pleasantly aromatic than black pepper; they are used in the East as a condiment, but in Europe chiefly for medicinal purposes; they act as a stimulant, and are sometimes found useful in cases of indigestion, also in chronic catarrhs, and in many affections of the mucous membrane, particularly those of the urino-genital system. C. contain a principle called *Cubebene*, analogous to that contained in pepper (*piperine*). C. appear to have been known in Europe from ancient times. In 1305, Edward I. granted to the corporation of London the power of levying a toll of one farthing on every pound of C. passing over London Bridge.

**CUBIC EQUATIONS.** A cubic equation containing but one unknown quantity, is one in which the highest exponent of the quantity in any term is 3. Every such equation can be reduced to the general form  $x^3 + px + q = a$ , in which the coefficient of  $x^3$  is 1, and that of  $x^2$  is zero. Every cubic equation of this form has three roots, all of which may be real, or one only may be real, and the other two imaginary. The roots will all be real, when  $p$  is essentially negative, and  $\frac{p^3}{27} > \frac{q^2}{4}$  numerically. One root only will be real when  $p$  is essentially positive, or when it is negative, and  $\frac{p^3}{27} < \frac{q^2}{4}$  numerically. If  $p$  is essentially negative, and  $\frac{p^3}{27} = \frac{q^2}{4}$ , two of the roots are equal. When one of the roots only is real, the equation may be solved by the following formula, known as Cardan's formula:

$$x = \sqrt[3]{-\frac{q}{2} + \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}} + \sqrt[3]{-\frac{q}{2} - \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}}.$$

When the roots are all real, this formula fails to give their values. Methods of solving C. E. are to be found in most books on trigonometry and algebra. They are all troublesome. The reader will find the theory of their solution admirably discussed in Young's *Theory of Equations*. See also EQUATIONS.

**CUBICAL NITRE** is a commercial name applied to the nitrate of soda ( $\text{NaONO}_2$ ). See SODA.

**CUBIT** (Lat. *cubitus*), a measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle-finger. The C. of the Romans was about  $17\frac{1}{2}$  inches, and that of the Hebrews 22 inches, but its length is now generally stated at 18 English inches.

**CUCKING-STOOL.** See DUCKING-STOOL.

**CUCKOO** (*Cuculus*), a genus of birds of the order of Climbers (q. v.); the type of a family, *Cuculidae*, which contains a large number of species, mostly confined to the warmer regions of the globe, although some of them are summer visitants of cold climates. The beak is compressed and slightly arched, and the tail long and rounded, the wings rather long, the tarsi short, two toes directed forwards, and two backwards, the outer hind-toe capable of being brought half round to the front. The feet are thus adapted for grasping and moving about upon branches, rather than for climbing, and the long tail is much used by many of the species for balancing the body, as they hop from branch to branch in the thick tropical woods which they frequent. The name C. is derived from the note of the male of the Common C. (*Cuculus canorus*), which, although monotonous, is always heard with pleasure, being associated with all that is delightful in returning spring. A similar name is given to the bird in many languages. The C. is a very widely diffused bird; it is found in India and

in Africa, and migrates northwards in summer, even to Lapland and Kamtchatka. It appears in Britain in April, and all except the young birds are believed to migrate southwards again before the middle of August. It frequents both cultivated districts and

Common Cuckoo (*Cuculus canorus*).

moors. There is no pairing or continued attachment of the male and female, and the female generally, if not always, lays her eggs in the nest of some other smaller bird, usually one egg in a nest, leaving the egg to be hatched and the young one to be fed by the proper owners of the nest. The egg of the C. is very small for so large a bird, about equal in size to that of the skylark; but the young one soon acquires size and strength enough to eject from the nest any eggs which may remain in it, or unfortunate young birds, the true offspring of its foster-parents, and it seems restless and uneasy till this is accomplished. It works itself under them, and then jerks them out by a motion of its rump. Its back at this early age exhibits a peculiar depression between the shoulders, so that an egg or a young bird can easily be got to lie upon it; but this depression soon disappears, and along with it the singular instinct with which it is supposed to be connected. The hedge-sparrow, the yellow-hammer, the pied wagtail, and the meadow pipit, are among the birds most frequently selected by the C. as its substitutes in incubation and the care of its young.—Among the *Cuculidae* of North America, one of the most interesting is the Yellow-billed American C., sometimes called from its note the *Cow-cow*, or *Cow-bird* (*Coccyzus Americanus*), which, in its summer migrations, visits all parts of the country from Louisiana to Labrador. It is among the rarest of British birds, but several instances are recorded of its occurrence in the British islands. It does not lay its eggs in the nests of other-birds, but builds and hatches for itself—exhibiting, however, a remarkable peculiarity in laying its eggs at such long intervals, that a very evident difference of age appears among the young in the same nest.

**CUCUMBER** (*Cucumis*), a genus of plants of the natural order *Cucurbitaceae*. The COMMON C. (*C. sativus*), distinguished by heart-shaped, acuminately pentangular leaves, which are rough with hairs approaching to bristles, and oblong fruit, is a native of the middle and south of Asia, and has been cultivated from the earliest times. Its fruit forms an important article of food in its native regions, the south of Europe, &c., and an esteemed delicacy in colder countries, where it is produced by the aid of artificial heat. Many varieties are in cultivation, with fruit from four inches to two feet long, rough, smooth, &c. Young cucumbers are much used for pickling, and are called *gherkins*. The C. is cultivated in fields even in the south of England, for the supply of the London market; but in the northern parts of Britain, the aid of a hot-bed is required

even to produce fruit fit for pickling. The *C.* requires a sunny situation, and a free rich soil.—To this genus belong other species valued for their edible fruit. *C. Anguria* is a West Indian species, with fruit about as large as a pullet's egg, much esteemed as an ingredient in soups. The SNAKE *C.* (*C. flexuosus*) grows to a great length, and is similar in quality to the common cucumber. *C. serotinus* is cultivated in Turkey, *C. macrocarpus* in Brazil; the CONOMON (*C. conomon*) is much cultivated in Japan. The Melon (*C. melo*), Water Melon (*C. citrullus*), Chate (*C. chate*), and Kankoor (*C. utilissimus*), are noticed in the article MELON; the species yielding colocynth, in the article COLOCYNTH.—The DUDAİM (*C. dudaim*) is very generally cultivated in gardens in the East for the fragrance of its fruit, which, however, is almost tasteless. It is supposed that this plant is sometimes meant in the Old Testament, where the English version has *mandrake*.—The SPURTING *C.*, SQUIRTING *C.*, or WILD *C.*, which yields the drug called *Elaterium* (q. v.), belongs to an allied genus.

CUCURBITACEÆ, a natural order of exogenous plants, consisting chiefly of herbaceous plants, natives of the warmer regions of the globe, having succulent stems which climb by means of lateral tendrils. There are some shrubby species. The fruit (*pepo*) is peculiar; it is more or less succulent, has a thick fleshy rind, and the seed bearing parietal placentæ either surrounding a central cavity, or sending prolongations inwards. The seeds are flat and ovate, embedded in a sort of pulp, which is either dry or juicy.—This order contains about 300 species, very many of which yield fruits much used for food in warm climates, and some of them are cultivated in colder regions as articles of luxury. The fruit of some attains a very large size. To this order belong the Cucumber, Melon, Gourd (of many kinds), Pumpkin, Squash, Vegetable Marrow, Bottle Gourd, &c. The young shoots and leaves of many species are also used as potherbs; and the roots of some abound in a bland fecula, and are edible, as those of *Momordica dioica* and *Bryonia umbellata*, East Indian plants. Yet acridity is a prevailing characteristic of which the Spirting Cucumber (see ELATERIUM) of the south of Europe, and the Common BRYONY (q. v.) are examples. These are not without their use in medicine, but still more important is the COLOCYNTH (q. v.).—Among the more interesting species of this order is *Hodgsonia heteroclita*, a gigantic species, which is found in the Himalaya Mountains, ascending to an elevation of 5000 feet. The seeds of some *C.* are used as almonds, and yield oil by expression, as those of *Telfairia pedata*, an African plant. *Bryonia dioica* is the only British species, and does not extend to Scotland.

CUDBEAR, a dyestuff similar to Archil (q. v.) and Litmus (q. v.), and obtained in the same manner from lichens by the action of ammoniacal liquids. It is chiefly employed as a purple-dye for woollen yarn, but the colour is rather fugitive. The name *C.*, or *C. LICHEN*, is often appropriated to one particular species of lichen, *Lecanora tartarea*, which is abundant on rocks in the Highlands of Scotland and in the Alpine and northern districts of Europe, and from which the dyestuff *C.* is usually obtained by maceration for ten or twelve days in urine with water and chalk. The name is a corruption of *Cuthbert*, and is derived from that of Dr Cuthbert Gordon, under whose management the manufacture of this dyestuff was begun in Leith about the year 1777, by Mr Macintosh of Glasgow. The species of the genus *Lecanora* are crustaceous lichens, with a flat uniform thallus, and unstalked shields. *L.*

*tartarea* forms a thick, granulated, and tartareous grayish-white crust, with scattered yellowish-brown

Cudbear (*Lecanora tartarea*).

shields. It is sometimes called *White Swedish Moss*, being largely imported from Sweden.

CUDDALORE, the chief town in the southern division of Arcot (q. v.), is one of the few seaports on the Coromandel, or east coast of Hindustan. It is situated on the estuary of the Southern Pennaur, a considerable tributary of the Bay of Bengal, being in lat. 11° 43' N., and long. 79° 50' E. It is 15 miles to the south of Pondicherry, and 100 to the south of Madras. Though the river itself is beset by a bar, which admits only vessels of moderate size, yet there is good anchorage off-shore at the distance of a mile and a half. The site is not more than 5 feet above high-water mark; but notwithstanding this apparently insalubrious position, the climate is said to be peculiarly healthy. *C.* was at one time a place of great strength; and in that respect it was frequently an object of contention in the wars which, during the latter half of the 18th c., so long desolated this neighbourhood. In 1758, it was taken by the French from the English, who had held it for 77 years; and, after various intermediate vicissitudes, it was finally ceded to its original possessors in 1783.

CUDDAPAH, a native town with a military cantonment in the presidency of Madras, from which it lies about 140 miles to the north-west. It stands, at the height of 507 feet above the sea, near the right or south bank of the Northern Pennaur, which flows into the Bay of Bengal. Lat. 14° 32' N., and long. 78° 52' E. The native town itself claims notice merely as the capital of the district of its own name; and the military cantonment, pleasantly overhanging the Bogawanka, an auxiliary of the Pennaur, contains barracks for Europeans, and spacious lines for sepoy.

CUDDAPAH, the district mentioned in the preceding article, extends in lat. from 13° 12' to 16° 19' N. and in long. from 77° 52' to 79° 48' E., containing 12,970 square miles, and 1,451,921 inhabitants. Sloping towards the Bay of Bengal, the country ranges, in its general elevation above the sea, between 1182 and 450 feet. *C.* is traversed in its length from north to south by numerous parallel ridges, which constitute a part of the Eastern Ghauts—some of the peaks rising 3500 feet above the sea level. The maximum, mean, and minimum temperatures are said to be respectively 98°, 81°, and 65° F. In the hot season, the climate is understood to be peculiarly prejudicial to European constitutions. The most striking feature in the physical character of the district is the remains of diamond mines, now abandoned, and probably exhausted, situated about seven miles from the capital. *C.* was ceded to Britain in 1800; and in 1846 it was the scene of serious disturbances,

occasioned by an unwise interference on the part of government with the prescriptive titles to landed property.

**CUDDY** was a name first applied in East India trading ships to a cabin under the poop, where the men messed and slept. The same name was afterwards given to the only cabin in very small vessels, and sometimes to the cooking-room.

**CUDWEED**, the popular name of many species of plants of the genera *Gnaphalium*, *Filago*, and *Antennaria*, belonging to the natural order *Compositæ*, sub-order *Corymbifera*, the stems and leaves of which are more or less covered with a whitish cottony down; and the heads of flowers consist, in great part, of dry involueral scales, and may be kept for a long time without undergoing much apparent change, so that they may be reckoned among *Everlasting Flowers* (q. v.). The cudweeds are small plants of very unpretending appearance, some of them common in Britain. *Antennaria dioica* is very frequent in dry mountain pastures. It is sometimes called *Cat's-foot*. Its heads of flowers, from the appearance of which it derives this name, were formerly official, and were employed as an astringent in pectoral diseases.

**CUDWORTH, RALPH, D.D.**, an illustrious English divine, was born in 1617 at Aller, in Somersetshire, and admitted pensioner of Emmanuel College, Cambridge, in 1630, where he took his degree of M.A., and became an eminent tutor. About 1641 he was presented to the rectory of North Cadbury, in Somersetshire; and in 1644, upon taking his degree of B.D., maintained two theses, in which can be discerned the germs of his *Intellectual System*. In the same year he was appointed master of Clare Hall, Cambridge, and in 1645, regius professor of Hebrew; after which he began to apply himself assiduously to the study of Jewish antiquities. In 1651, he took his degree of D.D.; in 1654, he was chosen master of Christ's College; in 1662, appointed to the vicarage of Ashwell; and in 1678, installed prebendary of Gloucester. He died at Christ's College, July 26, 1688.

*C.'s magnum opus*, entitled *The True Intellectual System of the Universe*, was published in 1678. It is a work of great learning, acuteness, and loftiness of thought; but some, at the time, fancied that C. exhibited too much impartiality in stating the atheistic arguments. Dryden said 'that he raised such strong objections against the being of a God and Providence, that many thought he had not answered them.' Lord Shaftesbury and Bayle were of this opinion also. The accusation of impartiality—a rare offence in those contentious days—is not likely to lessen our admiration of Cudworth. The philosophy to which he was attached was that of Plato, and, in consequence, he estimated highly the writings of the Alexandrian school, to which his own bear some resemblance. The obloquy to which his adventurous studies exposed him, does not seem to have greatly affected him. Besides *The Intellectual System*, C. left in MS. *A Treatise concerning Eternal and Immutable Morality*, which was published by Dr Chandler, Bishop of Durham, in 1731; and forms, or was intended to form, the second part of *The Intellectual System*; also a discourse *On Liberty and Necessity*, *On Moral Good and Evil*, a discourse *On the Creation of the World and the Immortality of the Soul*, &c. These MSS. are now in the British Museum.

**CUENCA**, a city of Spain, at the confluence of the Jucar and Hucar, about midway between Valencia and Madrid. It is romantically situated on a rocky eminence, 3400 feet above the level of the sea, and is surrounded by hills. It appears to

have derived its name (Lat. *concha*, a shell) from its position and appearance. Ford says it is 'indeed a hill-girt shell.' The town is of Moorish origin. The streets are narrow and crooked. The chief buildings are the cathedral, the bishop's palace, and a fine bridge over the Jucar (erected in 1523), connecting the city with the convent of San Pablo. C. was once celebrated for arts, literature, and industry, but its glory has now quite departed. It suffered much during the Peninsular campaign. Pop. 6000.—C. gives name to a mountainous well-watered province, yielding excellent timber, honey, wine, and grain, with good pasture, and various minerals, including iron, coal, copper, and silver. Area about 12,000 miles. Pop. (1837) 230,000.

**CUENCA**, a city of Ecuador, in South America, stands on a wide plain or table-land, 8610 feet above the level of the sea. It is 85 miles south-south-west of Quito, the capital of the republic; in lat. 1° S., its proximity to the equator, however, being largely neutralised, with regard to climate, by its altitude. Pop. estimated at 20,000. It possesses a cathedral and a university.

**CUEVA DE VE'RA**, a town of Spain, in the province of Granada, 42 miles north-east of Almeria. It is situated on a plain on the right bank of the Almanzor, near its entrance into the Mediterranean. It is generally well built, and its streets regular. The principal edifices are an old Moorish castle, and the parish church in the Doric style. C. has manufactures of hardware, earthenware, and of wine and oil; and a large number of persons are employed in mines in the vicinity. Pop. 10,000.

**CUICHUNCHULLI** (*Ionidium parviflorum*), a Peruvian plant of the natural order *Violaceæ*, half-shrubby, with minute leaves, possessing very active emetic and purgative properties, and said to be a certain remedy for *Elephantiasis tuberculata*, a reputation which, if even partially well founded, ought to recommend it to the particular attention of the benevolent and humane. Other species of *Ionidium* share the same name, properties, and reputation. One of them was formerly supposed to yield ipecacuanha, and its root is still known as White Ipecacuanha. See IPECACUANHA.

**CUIRA'SS**, as its name (Fr. *cuir*, leather) implies, was originally a jerkin, or garment of leather for soldiers, so thick and strong as to be pistol-proof, and even musket-proof. The name was afterwards applied to a portion of armour made of metal, consisting of a back-plate and breast-plate hooked or buckled together; with a piece jointed to the back called a *culet* or *gardé de reins*.

**CUIRASSIERS**, in the time of Queen Mary, were heavy horsemen wearing body-armour over buff-coats. They carried swords and pistols, and the reins were strengthened with iron chains. In modern armies, the name is often given to the heaviest cavalry. Napoleon's twelve regiments of C. attracted much attention during his wars. The first rank of Russian C. are armed with lances. The only C. in the British army (wearing the cuirass) are the Life Guards (red) and Horse Guards (blue); and in these the cuirass is now regarded rather as a matter of show than of use.

**CUISSARTS**, among ancient armour, were worn by troopers. They consisted of small strips of iron-plate laid horizontally over each other round the thigh (Fr. *cuisse*), and riveted together.

**CUJACIUS**, properly, **JACQUES DE CUJAS**, or **CUJES**, one of the most distinguished jurists of the 16th c., born in 1522, was the son of a tanner of Toulouse. After studying law, he was appointed teacher of the same at Cahors (1554), and in the

following year, by the recommendation of the Chancellor L'Hopital, gained the chair of law in the university of Bourges. In 1557, he became a professor at Valence. After several changes, he returned to Bourges in 1577, where he resided till his death, October 4, 1590.

His great reputation as a jurist was founded on his study of original MSS. of the Roman laws, and on his classical treatment of these authorities. He had in his library 500 MSS. on Roman law, and by his emendations contributed greatly to remove the obscurities of jurisprudence. A complete collection of his works was edited by Fabrot (10 vols., Par. 1653), and has since been republished frequently. Uhl has edited separately C.'s *Animalversiones et Observationes*. C.'s daughter made herself notorious by her immoralities. See Spangenberg's *C. und seine Zeitgenossen* (Leip. 1822).

CULDEES, or KELDEES (Celt. *Ceile De*; Lat. *Colidei, Culdei, Calledi, Keldei, Keledi*), the name given in the British islands to an ancient order of ecclesiastics. The word seems to be of Celtic origin, and in the Irish language signifies an 'attendant of God.' Giraldus Cambrensis, writing towards the end of the 12th c., when the order still flourished, interprets the name in one place by the Latin word *celicola*, i. e., 'worshipper of heaven;' and in another by *celibs*, i. e., 'single,' or 'unmarried.' Boece and Buchanan, in the 16th c., translate it *cultores Dei*, i. e., 'worshippers of God.'

There is some uncertainty as to the first appearance of the order. There is no trace of it in the works of Adamnan, of Bede, of Alcuin, or of any other ecclesiastical historian of the 8th or 9th century. An abbot and bishop of the north of Ireland, who compiled a metrical calendar of Irish saints about the year 800, was known in his own time as 'Ængus the Ceile-De.' But it has been questioned whether the title was not used rather to denote his great personal piety, than to describe his ecclesiastical character. The Four Masters, again, in their *Annals of Ireland*, compiled about the year 1636, record certain great wonders wrought by a Ceile-De in the year 806. But no such event is recorded in the ancient chronicles from which the Four Masters compiled their work, and Irish antiquaries think that the passage must therefore be rejected as apocryphal. But in Irish annals of undoubted authority, it is chronicled that, in the year 919, 'a Ceile-De came across the sea westward to establish laws in Ireland;' in other words, as Irish archaeologists conjecture, to bring the Irish into conformity with the rule for canons which had been enacted in 816, at the council of Aix-la-Chapelle. The Annals of Ulster record that, in 920, Armagh was plundered by Godfrey, son of Ivor, the Dane, but that he spared the oratories with the C. and the sick. The C. of Armagh, who thus appear in the beginning of the 10th c., survived till the beginning of the 17th century. Archbishop Usher, who died in 1655, writes that they continued until within his own memory. They were secular priests or canons, about twelve in number, living in community, under the rule of a prior, who—after the beginning of the 13th c., when the metropolitan cathedral of St Patrick was remodelled after the English fashion—officiated as precentor, his C. being the clerks or choir. The antiphony or service-book, with the musical notation, from which they sang, is still preserved in the library of Trinity College, Dublin; and its calendar records the deaths of several of their number, one of them so lately as the year 1574. The prior seems generally to have been a pluralist, it having been formally ruled in 1448, after an appeal to Rome, 'that the priory of the college of secular priests, commonly called Culdees, being a

simple office, and without cure of souls, is not incompatible with a benefice.' The C. of Armagh, dissolved after the Reformation in 1541, were resuscitated for a brief space in 1627. Their old possessions—among which were seven town-lands containing 1423 acres, seven rectories, and four vicarages—were, in 1634, bestowed upon the vicars choral of the cathedral, who still enjoy them.

There were at least seven other houses of C. in Ireland, viz., at Clonmacnois, Clondalkin, Devenish, Clones, Popull, Monanincha, and Sligo.

If tradition could be trusted, the first appearance of C. in Scotland should be placed about the middle of the 9th century. A leaf of the Register of St Andrews, written about 1130, relates that Brude, the son of Dergard, the last king of the Picts (who ceased to reign about 843), gave the island, since called St Serf's Inch, in Lochleven, to God, St Servan, and the Culdee hermits serving God there. They were governed by an abbot; and about the year 1093, during the rule of Abbot Ronan, they gave up their island to the Bishop of St Andrews, on condition that he should find them in food and raiment. They had grants of lands or immunities from all the kings of the Scots who reigned between 1039 and 1153, the roll of these royal benefactors being headed by the renowned Macbeth (1039—1056) and his wife Gruoch, the daughter of Bodhe. They had a grant of a church from each of the three bishops who ruled the see of St Andrews between 1040 and 1093; and about 1120, they had a grant of lands from one of the sons of King Malcolm Canmore and St Margaret—Ethelred, Earl of Fife, and hereditary lay-abbot of the Culdee monastery of Dunkeld. A few years afterwards, the Bishop of St Andrews gives their island, and all their possessions, including their church vestments and their books, to the newly founded Canons Regular of St Andrews, in order that a priory of that rule might supplant the old abbey of C. in St Serf's Inch. About 1140, the bishop's grant was enforced by a charter from King David, in which it was ordered that such of the C. as chose to live canonically and peacefully under the new canons should remain in the island. 'If any one of them refuse so to do,' says the king, 'my will is, and I command, that he be expelled from the island.' We hear no more of the Culdee hermits of Lochleven. The Canons Regular who came in their place continued till the Reformation, and we are indebted to one of their priors, Andrew Wyntoun, who died about 1429, for a valuable metrical Chronicle of Scotland. A catalogue of the books of the Culdee abbey, when it was bestowed upon the Canons Regular of St Andrews, about 1140, has been preserved. The number of volumes was not quite twenty. They were—a Pastoral, a Gradual, a Missal, some of the works of Origen, the Sentences of St Bernard (who was still living), a Treatise on the Sacraments, in three parts, a part of the Bible, a Lectionary, the Acts of the Apostles, the Gospels, the works of Prosper, the books of Proverbs, Ecclesiastes, and Canticles, a Gloss on the Canticles, a work called *Interpretationes Dictionum*, a Collection of Sentences, a Commentary on Genesis, and a Treatise on the Exceptions from Ecclesiastical Rules.

The C. of St Andrews were of more importance, and not perhaps of less antiquity, than those of Lochleven. The death of an abbot of St Andrews is chronicled by the Irish annals in 747. It is not said that he was a Culdee; but in 944, when Constantine, the king of Scots, exchanged his crown for a monk's cowl, it is recorded that he became 'abbot of the Culdees of St Andrews.' No more is heard of them till about the middle of the 12th century. A priory of Canons Regular had now

been planted beside them, and from its records we learn that in the church of St Andrew, such as it then was, there were thirteen C., holding their office by hereditary tenure, and 'living rather according to their own pleasure and the traditions of men, than after the rules of the holy fathers;' that some few things of little importance they possessed in common; that the rest, including what was of most value, they held as their private property, each enjoying what he got from relatives and kinsmen, or from the benevolence granted on the tenure of pure friendship, or otherwise; that after they became C., they were forbidden to have their wives in their houses, or any other women of whom evil suspicion could arise; that the altar of St Andrew was left without a minister, nor was mass celebrated there except on the rare occasion of a visit from the king or the bishop, for the C. said their own office after their own way in a corner of the church. The attempt to supplant the C. by Canons Regular, which had succeeded at Lochleven, was repeated at St Andrews, but failed. The C. kept their own church—St Mary's, or the Kirk of the Hleugh—and had a voice along with the Canons Regular in the election of the bishop. Their abbot disappears about the middle of the 11th c.; and soon afterwards their 'prior' exchanges that title for the name of 'provost.' Their distinctive character was gradually passing away; before the end of the 14th c. they lose their share in the election of the bishop; their name of Culdee is heard no more; their church, about the same time, takes the name of the King's Chapel-royal; and henceforth there remains nothing to distinguish them from the secular priests of other collegiate churches.

The C. of the church of St Mary at Monymusk, in Aberdeenshire, appear to have been founded by the Bishop of St Andrews towards the end of the 11th century. In the beginning of the 13th c. they are found making claim to be regarded as Canons Regular. The claim was resisted by the Bishop of St Andrews, and in 1211, after an appeal to Rome, the dispute was settled by a compromise, which provided that there should be thirteen C. at Monymusk, of whom one—to be chosen by the bishop from a list of three presented by the other C.—should be the master or prior; that they should have a refectory, a common dormitory, and an oratory, but no cemetery; that they should not adopt the monastic or canonical life or rule without leave of the bishop; and that when he came to Monymusk, he should be received by the C. in solemn procession. Before this agreement is 50 years old, the name of C. disappears from Monymusk, and their house is recognised as a priory of Canons Regular.

C. are found at Abernethy, in Strathearn, about 1120. In the end of that century, their possessions appear to have been divided between their hereditary lay-abbot (the founder of the noble family of Abernethy) and the prior and C. by whom the burden of the ecclesiastical offices was borne. In 1273, they were transformed into Canons Regular. The same partition of the Culdee revenues which appears at Abernethy, is found also at Brechin. A layman, who is abbot only in name, inherits a large share of the Culdee patrimony, and transmits it to his descendants, who soon lose even the name of abbot. The prior and his C., meanwhile, are absorbed into the chapter of the new bishopric, founded at Brechin by King David I., about 1145; in less than a hundred years, the name of C. disappears, and the chapter is one wholly of secular canons. The same silent change of C. into secular canons, which took place at Brechin during the 13th c., took place also at Dunblane, at

Dunkeld, at Lismore, at Rosmarky, and at Dornoch. C. are found in the bishop's chapter at each of these places in the 12th c.; they disappear before the end of the 13th c., leaving the chapter one of secular canons. At Dunkeld, as at Brechin and at Abernethy, great part of the Culdee revenues was held by a lay-abbot, whose office was of such mark as to be hereditary in the royal family. The father of 'the gracious Duncan,' and the son of St Margaret, were Culdee abbots. If a tradition of the 16th c. can be received as authority for what passed in the 12th c., the C. of Dunkeld were married, like the priests of the Greek Church, but lived apart from their wives during their period of service at the altar.

C. are found holding land at Monifeith, near Dundee, about 1200; and there was a lay-abbot of Monifeith; but there is nothing to shew whether he was or was not a Culdee. The C. of Muthill, in Strathearn, appear with their prior in charters of the beginning of the 13th century. Nothing more is known of them. Jocelin of Furnes, in his *Life of St Kentigern*, or Mungo, written about the year 1180, relates that the disciples of that saint at Glasgow, in the 6th c., had all things in common, but lived each in his own hut, whence they were called 'solitary clerks,' and more commonly 'Culdees.' C. appear as one of the ecclesiastical fraternities of Iona in the year 1164; and the faint vestiges of a circular building (about 15 feet in diameter) called 'Cothan Cuilidich,' or the Culdee's cell, are still shewn in the island.

Only one or two traces of C. have been observed in England. The canons of St Peter's, at York, were called C. in the reign of Æthelstan (924—931); and a charter of Æthelred, in the year 1005, speaks of the canons of the English cathedrals generally as *cultores clerici*. The term is of doubtful import, and the charter itself is not beyond suspicion.

Of the C. in Wales, we have only one notice. Giraldus Cambrensis, writing about 1190, describes the island of Bardsey, on the coast of Caernarvon, as inhabited by 'most devout monks, called celibates or Culdees.'

Such is a concise recapitulation of all that is certainly known of the Culdees. Before their history was ascertained, opinions were held regarding them which now find few if any supporters among archaeologists. It was believed that they were our first teachers of Christianity; that they came from the East before corruption had yet overspread the church; that they took the Scripture for their sole rule of faith; that they lived under a form of church-government approaching to Presbyterian parity; that they rejected prelacy, transubstantiation, the invocation of saints, the veneration of relics, image-worship, and the celibacy of the clergy; and that they kept their simple worship and pure doctrines undefiled to the last, and were suppressed only by force and fraud, when the Roman Catholic Church triumphed over their older and better creed. For all this, it is now clearly seen that there is no foundation. There is no reason to suppose that the C. differed in any material point of faith, discipline, or ritual from the other clergy of the British islands and Western Christendom. Their name was their only peculiarity.

The best account of the Irish C. is given in a dissertation by the Rev. Dr Reeves, in the *Proceedings of the Royal Irish Academy* for 1860. The best account of the Scottish C. is given in Mr Grub's *Ecclesiastical History of Scotland*, vol. i. pp. 226—243 (Aberd. 1861). The opinions formerly held regarding the Scottish C. will be found in Selden's preface to the *Decem Historiæ Anglicanæ Scriptores*, reprinted in his *Opera*, vol. ii. pp. 1129—1146; Sir J. Dalrymple's *Collections concerning the Scottish*

*History* (Edin. 1705); and the late Rev. Dr Jamieson's *Historical Account of the Ancient Culdees* (Edin. 1811). The opinions of these writers are controverted in Bishop Lloyd's *Historical Account of Church Government*, chap. vii.; Goodall's *Preliminary Dissertation*, and Bishop Russell's *Supplement*, prefixed to Keith's *Catalogue of Scottish Bishops* (Edin. 1824); Pinkerton's *Inquiry into the Early History of Scotland*, vol. ii. pp. 270—273 (edit. 1814); and Chalmers's *Caledonia*, vol. i. pp. 434—439 (Lond. 1807). On the subject of the C. generally, reference may be made to Lanigan's *Ecclesiastical History of Ireland*, vol. iv. pp. 290—317; and to the dissertation by J. van Hecke in the *Acta Sanctorum Octobris*, vol. viii. (Brussels, 1853).

**CULENBORG, CU'LEMBORG, or KUPLENBURG**, a commune and town of the Netherlands, situated on the left bank of the river Leek, 10 miles north-west-by-west of Tiel. The city is surrounded by walls and fosses, and contains a Reformed, a Lutheran, a Roman Catholic, and a Jansenist church, a small synagogue, and a fine orphan-house. It has a daily steam-boat intercourse with Rotterdam. C. has several factories of various kinds. In olden times, the 'Dominion of Culeborg' formed a county by itself, and its independence, both of the Roman empire and the States of Holland, secured it the singular privilege of offering an asylum to fugitives from Holland for debt. Pop. 5104.

**CULIACAN**, a town of the Mexican confederation, stands on a river of its own name, which, flowing towards the south-west, enters the Gulf of California near its mouth. It occupies a fertile tract in the department of Sinaloa, being about 90 miles to the south-east of the city so called. It is estimated to contain 7000 inhabitants.

**CULILAWAN BARK**, also called **CLOVE BARK**, a valuable aromatic bark, the product of the *Cinnamomum Cullilawan*, a tree of the same genus with the Cinnamon (q. v.) tree, growing in the Molucca Islands. It comes to market in pieces of various length, almost flat, thick, fibrous, covered with a white epidermis, reddish-yellow inside, and has an odour resembling that of nutmeg and cloves, and a pungent taste. It is useful in cases of indigestion, diarrhoea, &c.—Another variety of C. B. is believed to be the produce of *Cinnamomum xanthoneurum*; and a very similar bark, called **SINTOC BARK**, is obtained from *C. Sintoc*.

**CULLEN**, a royal, parliamentary, and municipal burgh and seaport in the north of Banffshire, 12 miles west-north-west of Banff. It is built on the west slope of an eminence overlooking the sea, and at the mouth of the Cullen Burn. Population of municipal burgh, 3165. A third of the inhabitants of the town are engaged in the cod, ling, haddock, skate, herring and salmon fisheries. C. contributes with Elgin, Banff, Peterhead, Inverury, and Kintore in returning one member to parliament. The chief exports are cured fish, oats, potatoes. Some linen is made. The Marquis of Montrose burned C. in 1645.

**CULLEN, WILLIAM**, a well-known physician of the last century, and one of the most celebrated professors of medicine in the universities of Edinburgh and Glasgow, was born at Hamilton, in Lanarkshire, on the 15th day of April 1710. His father was factor to the Duke of Hamilton, and was possessed of a little landed property in the parish of Bothwell; he appears to have brought up two of his sons to the learned professions, and to have himself received a legal education. William C. received the first part of his education at the grammar-school of Hamilton, and afterwards began his medical studies in Glasgow by an apprenticeship, and by attending literary classes in the university. At this time

(about 1727), it does not appear that there was any systematic medical teaching in Glasgow University, though the medical school of Edinburgh was just rising to the height of its fame, under the auspices of the first Monro. C.'s master in the art, however, Mr John Paisley, was a liberal and enlightened man, having a valuable library, of which the pupil may be presumed to have made good use. In 1729, having completed for the time his medical education, he was appointed surgeon to a merchant-ship, trading to the West Indies; and from this time till 1734, he was actively engaged in learning his profession practically in various situations, but without accepting any permanent responsibility. He next spent two additional winter-sessions in Edinburgh in the regular study of medicine, and was one of the founders of that important Students' Association—since called the Royal Medical Society—the object of which was, and is, the advancement of the medical knowledge of the members by periodical discussions on subjects of interest connected with medical study. In 1736, he commenced practice at Hamilton, and very soon was largely employed, having secured from the first the influence and friendship of the Duke of Hamilton and of other persons of distinction. Soon after, he became acquainted with William Hunter, afterwards the celebrated anatomist and obstetric professor, and brother of the still more celebrated John Hunter. See **HUNTER, JOHN and WILLIAM**. The three years passed by Hunter under Cullen's roof formed the beginning of a life-long friendship, although after Hunter went to London, it is probable that they never again met. In 1740, C. took the degree of Doctor of Medicine in the university of Glasgow; in 1741, he entered into partnership with a surgeon, with the view of confining himself to a physician's practice; in 1744, he responded to the invitation of a number of families in Glasgow, and took a house in that city, an object which it is probable he had in view some years before, but which he was prevented from carrying out by the friendship and liberal patronage of the Duke of Hamilton, who died in 1743. Various circumstances indicate that during the seven years passed in practice in Hamilton, C. was diligently preparing, not only for the practice, but also for the teaching, of his profession; and accordingly, he had no sooner settled in Glasgow, than we find him engaged in giving a course of lectures, in regard to which his correspondence with William Hunter sufficiently shews that it was successful, and deserved success. Up to this period, though professorships of medicine, and of anatomy with botany, existed in the university, no lectures were delivered in either medicine or botany; and it seems certain that to C. that university owes the real commencement of its medical school; for in one or two years succeeding 1746, he made arrangements with the several professors to lecture on the theory and practice of physic, on botany and the materia medica, and finally on chemistry, being assisted in these last departments by Mr John Curriek, who also acted as assistant to the professor of anatomy. In botany, C. seems to have lectured in Latin, but in the other departments he adopted the English language as the vehicle of expression, an innovation of great importance, which permitted him to adopt a more familiar style of lecturing than had hitherto been in use. One of his original hearers records that 'in the physic class, Dr Cullen never read lectures, but only used notes; in the chemistry, he sometimes read, but very seldom.'<sup>\*</sup>

He was supported by the university by votes

<sup>\*</sup> Thomson's *Life of Cullen*, vol. i. p. 25.

amounting to £136 for the chemical laboratory, and £20 annually for keeping it in repair. As a chemist, he does not appear to have made any notable discovery; but he imbued the minds of his pupils with large and liberal views of a science then very imperfectly studied, and was beyond all doubt the means of raising up the great reputation of Dr Black, by turning his thoughts to the subject of Latent Heat, which he prosecuted so successfully by a series of conclusive and most original experiments. In 1751, after somewhat prolonged negotiations, C. was placed, through the influence of the Duke of Argyll, for the first time in his rightful position as a professor in the university of Glasgow, in room of Dr Johnstone, the Professor of Medicine. But by this time it had begun to be apparent that an opening both for teaching and practice existed in Edinburgh, and Lord Kames, whose knowledge both of general science and of Edinburgh society placed him in a favourable position for judging of the chances of success, made several attempts to attract the rising and ambitious Glasgow professor to the metropolis; in which design, however, he was not successful till four years afterwards, when C. was elected by the town-council joint Professor of Chemistry with Dr Plummer, who had fallen into bad health, and who died about a year afterwards. In 1757, his ever-active mind found a new direction in adding to his duties as Professor of Chemistry the teaching of Clinical Medicine in the Royal Infirmary, a duty up to this period performed by Dr Rutherford only, the Professor of Medicine and Botany. The clear-sightedness and practical sagacity which he brought to this work at once fixed his position as a teacher and as a physician. Probably, also, the fact of his having to give bedside instruction at this period opposed itself to the natural tendency of his mind to give everything a systematic form, and weeded his method of practice of an immense quantity of the scholastic rubbish which appears prominently in all the medical learning of that age. He became a decided favourite with the students, and not less so with his patients; and in 1760 was applied to by the former to undertake the lectures on materia medica, in consequence of the death of Dr Alston during the session. This duty he performed so well, that his lectures were surreptitiously printed from the notes of a pupil, and had a considerable circulation. On the resignation of Dr Rutherford, it was reasonably expected that C. would have been transferred from the chemical chair to that of the Practice of Physic, for which he had shewn so decided an aptitude; but personal views interfered, and Dr John Gregory was appointed to the practical chair. In 1766, C. was, however, placed in the chair of Institutes of Medicine, vacant by the death of Dr Whytt; and Black, now the greatest chemical discoverer of the age, was brought to Edinburgh from Glasgow to fill C.'s place as Professor of Chemistry. In 1773, C. was at last transferred to the chair of the Practice of Physic, the duties of which he had for some years performed alternately with Dr Gregory, the latter taking part in return alternately with C. in the lectures on the Theory or Institutes of Medicine.

The rest of Dr C.'s biography is simply a record of continued success as a teacher and a practitioner. His popularity with his students, and even his scientific reputation at one time threatened to be seriously diminished by the brief but noisy episode of the Brunonian system (see BROWN, JOHN, M.D.). In 1778, C. became the proprietor of Ormiston Hill, a small but prettily situated property about eight miles west of Edinburgh, where he passed as much time as his professional duties would allow in improving his little estate, and renewing his long-dormant

knowledge of, and love for, rural affairs. 'I have got upon my hobby,' he writes to a friend; 'my amusement is a little farm, and a little pleasure-ground. . . . I have done a great deal, but it is all levelling work; other people cannot know what earth has been moved, but I have had some amusement in the turning of every shovelful.' It was a becoming end to a life of usefulness. He had here the leisure and the enjoyment of life which were required to wean him from the too exclusive pursuit of his profession; and while his love of science never chilled, and was even made subservient to the adornment of the retreat of his old age, he was somewhat withdrawn from the heat and the strife of the world into the purer air of domestic retirement. C. died on the 5th February 1790, having nearly completed his 79th year, and having been actively engaged in teaching and consulting practice till within a few months of his death. His most important works are—the *First Lines of the Practice of Physic* (Edin. 1777); *Synopsis Nosologiae Methodicae*, 1785; *Institutions of Medicine*, 1777; *A Treatise of the Materia Medica*, 1789. Their characteristics are great clearness of expression, with remarkable soundness of judgment and common sense, rather than striking originality, or a rapid advance into new regions of thought. But he was eminently the man for his time, which was distracted and confused by a host of baseless theories, and by many of those 'false facts' which C. himself said were more numerous than even false theories. Amid this farrago, he sought his way towards the truth with remarkable impartiality, and infinite candour as regards the opinions of others. His fame as one of the greatest of teachers has survived the memory of his professional success, and even the credit of his far-famed systematic Nosology. His writings have been collected, in 2 vols. 8vo, by Dr John Thomson (Edin. 1827), by whom also a Life was commenced, the first volume of which was published in 1832. This biography was continued by his son, and finally completed in a second volume by Dr Craigie, in 1859.

CULLODEN, or DRUMMOSSIE MOOR, a desolate level tableland, now partly cultivated, in the north-east of Inverness-shire, six miles east-north-east of Inverness, near the Moray Firth. It is memorable as the scene of the total defeat, on 16th April 1746, of the Highland army under Prince Charles Stuart by the royal troops under the Duke of Cumberland, and the extinction of the hopes of the House of Stuart to regain the English crown. Green mounds and a monumental cairn mark the spots where the battle was fiercest, and where many of the slain lie buried.

CULM, in Botany, the peculiar cylindrical hollow and jointed stem of Grasses (q. v.).

CULM, a popular name of Anthracite (q. v.), in very general use in some parts of England, and occurring in many scientific works. In some districts of South Wales, the C., obtained from the pits in a broken and crumbling condition, is used as fuel, being made up into balls, with one-third of its bulk of wet viscid clay. It burns without flame, producing a strong and steady heat, well adapted for cooking.

CULMINATION, an astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (*culmen*) of its course; hence the name. The sun culminates at mid-day, or twelve o'clock, apparent solar time—which seldom agrees exactly with mean time, as shewn by a watch or clock. The full moon culminates at midnight. The time of C. of a fixed star is always exactly midway between the times of its rising and

setting; in the case of the sun, moon, and planets, it is only nearly so.

**CULPA** (Lat. fault, crime, blame). By the Roman jurists, *C.* was recognised as existing in three degrees: *C. lata*, gross carelessness or omission, which was regarded as equivalent to *dole*; *C. levis*, that degree of negligence into which a person attentive to his own affairs may be supposed occasionally to fall; and *C. levissima*, that still more slight degree of negligence which is in some degree incident to human nature, and may be fallen into by even the most prudent and sharp-sighted. Where a contract contemplates the mutual benefit of both parties, the middle degree of diligence is all that either is bound to exercise, and the neglect of this is *C. levis*, or *C.* simply. Where one party only is benefited, he is bound to exercise the utmost diligence, the neglect of which is *C. levissima*, whilst the other party has done enough if he avoids *C. lata*, or gross and excessive negligence. These distinctions of the Roman law have been adopted by the law of Scotland.

**CULPABLE HOMICIDE.** See **HOMICIDE** and **MURDER**.

**CULPRIT**, in English law, is a prisoner accused, but not tried. After trial, if not acquitted, he becomes a convict.

**CULROSS**, a parliamentary and municipal burgh and seaport in a detached part of Perthshire, on the north shore of the Firth of Forth, 6 miles west of Dunfermline, and 22 north-north-west of Edinburgh. It is a place of great antiquity. As early as the 6th c., it was the seat of the monastery of St Serf, who afterwards became the patron saint of the town, where his yearly festival was kept till about the close of the 15th century. Angus the Kellee, an Irish martyrologist, who wrote about 800 A. D., describes it as lying in Strathearn, between the Ochils and the Sea of Gindan, i. e., the Firth of Forth. It stands on the face of a hill rising from the shore. The parish church preserves some remains of the conventual church of a Cistercian abbey, founded in 1217, on a commanding site in the higher part of the town. Close beside it is the fine old residence of C. Abbey, founded by the Bruces of Carnock and Kinloss about the end of the 16th c., remodelled about the middle of the 17th c., and towards the end of the 18th occupied by the father of the late Lord Dundonald, who here made experiments in extracting tar from coal for preserving ships' bottoms, and gas for illuminating purposes. At the east end of the town are the ruins of a chapel, built about the beginning of the 16th c., in honour of St Kentigern or Mungo, who is said to have been born here about the year 500, and to have been here educated by St Serf. *C.* has various charitable institutions, and carries on some damask weaving. In the 16th c. it was famous for the manufacture of salt and the export of coal, as well as for the manufacture of iron 'girdles' for baking oat-cakes. Pop. 605. It returns one member to parliament with Stirling, Dunfermline, Inverkeithing, and South Queensferry. From James VI.'s time, up till the beginning of this century, coal-mines were worked here far under the Firth of Forth.

**CULTIVATED PLANTS**—those plants which, either for their usefulness or their beauty, have been to some considerable extent, and not merely as objects of curiosity, cultivated by man—belong to natural orders widely different from each other, and scattered throughout almost all parts of the vegetable kingdom. The prevalence of particular qualities in particular natural orders, indeed, causes us to find groups of *C. P.* in some of them, as the *Cerealia*

or corn-plants among grasses; but with these are botanically associated other species—usually far more numerous—to which no great value has ever been attached, or which are objects of interest to the botanist alone. It may be that, in some instances, the original preference of certain species was accidental, and that their present superiority over certain others is merely owing to the improvements effected by cultivation; but we are no more entitled to assume that this has been ordinarily the case, than that man has in his selection exhausted, or nearly exhausted, the resources of nature. Some plants are known to have been cultivated from the most remote historic ages; some have but recently become the objects of human care, which yet are deservedly esteemed; and, in some instances—e. g., sea-kale—these have not been introduced from regions newly explored, but are natives of the very countries which have been the seats of ancient civilisation. Probably, in the earliest ages, plants useful for food alone were cultivated, and of these only a few kinds, as is still the case among savage tribes; it may perhaps be doubted whether plants yielding fibre for clothing and cordage, or plants from which alcoholic beverages or narcotics could be procured, were most likely next to engage attention.—Of *C. P.*, plants affording articles of human food are certainly the most important, as well as the most numerous class. See **FOOD**. Next to these may be ranked plants yielding **FIBRE** (q. v.). Other important classes of *C. P.* are those yielding alcoholic beverages, all of which, however, are also to be ranked among the plants yielding food (see **FERMENTED LIQUORS**); those yielding tea, coffee, cocoa, and other similar beverages, containing *Caffine* (q. v.), or some analogous principle; those yielding **Narcotics** (q. v.), as tobacco and opium, some of which are and some are not cultivated also for other purposes; those yielding **Dye-stuffs** (q. v.); those yielding **medicines** (see **OFFICIAL PLANTS**); those yielding fixed oils (see **OIL-PLANTS**), some of which are to be reckoned among plants valuable for food, on account of the use of their oils as articles of food, whilst they are also valuable on other accounts; those yielding **Fodder** (q. v.) for cattle; those yielding **timber** (see **TIMBER TREES**); those employed for **Hedges** (q. v.), &c. There are also many miscellaneous useful products of plants, and useful purposes to which they are applicable. Among the former are resins, turpentine, essential oils, gum, caoutchouc, gutta-percha, bark for tanning, &c.; among the latter, the thatching of roofs, basket-making, and the supply of food necessary for useful insects, which leads to the cultivation of the white mulberry as the food of the silkworm, and of the cochineal cactus or nopal as the food of the cochineal insect. Many plants highly valued for their usefulness are still scarcely or not at all cultivated: this is the case particularly with many that yield medicines, for which the whole demand is not too great to be easily supplied by the plants growing wild, and with timber trees, the plantation of which only takes place in countries of very advanced civilisation. The number of plants cultivated for their usefulness is continually increasing, as well as of those cultivated for their beauty. The cultivation of flowers and ornamental shrubs and trees, although unquestionably less ancient than that of some of the plants most necessary for the supply of urgent wants, nevertheless dates from a remote antiquity, and has always existed in every country entitled in any measure to the credit of civilisation. Some *C. P.* have from a very early period been very widely diffused, as has particularly been the case with some of the corn-plants; but others have been confined to particular regions

through no necessity of climatic adaptation, but rather from want of intercourse among nations. Thus, some of the finest ornaments of our green-houses and gardens, recently introduced into Europe, have been diligently cultivated from time immemorial in China and Japan, in which countries also many useful plants are cultivated still almost unknown in other parts of the world. The cultivation of useful aquatic plants is practised in China to a degree unapproached in any other country.

The changes produced by cultivation present an interesting and difficult subject to the student of vegetable physiology. Increase of luxuriance and size is a result which might have been expected from abundant nutriment and favourable circumstances of growth; but the determination of the strength of the plant in its vegetation to particular parts, and their greater proportionate increase, is a more remarkable phenomenon, although of common occurrence, as is also the considerable modification of juices and qualities. To these effects of cultivation, perpetuated in the progeny of the plants, and increased from one generation to another, we owe many of the most useful varieties of cultivated plants. Our cabbages, turnips, carrots, &c., differ very much from the wild plants of the same species; there is little, for example, that is eatable or nutritious in the root of a wild turnip, and the acidity occasionally to be observed even in cultivation exists in it to a much greater degree. Wild celery is poisonous, or almost so. How far the effects of cultivation can be extended, is a question not yet decided in general, nor with reference to particular species.

**CULTIVATION.** The term includes all operations for preparing the soil for those crops which man specially selects for his use. The spade, the hoe, and the plough, have been the primary implements of C. among all nations as far back as their civilisation can be traced. All these effect much the same end. By their means the soil is stirred and inverted, which keeps under the vegetation that is supplanted, and loosens the soil to admit of the roots of the sown plants to run through it. The harrow or rake, on the other hand, is employed to smooth the surface and cover the seed. To allow of the C. of the crops when they are growing, in many cases the seeds are planted or sown in rows. Cereals, for instance, are, with this view, often sown with a *drill* in rows from six to nine inches apart; and the narrow rows are either cultivated by the *hand* or *horse hoe*. Again, turnips, potatoes, and other green crops are sown at wider intervals, from 24 to 30 inches, and are cultivated during their growth by horse-hoes of various descriptions. The implements used in C. will be best treated under their special names, and under the different crops the peculiarities of their cultivation will be considered. A few general principles, however, which ought to be kept in view in the C. of all crops, may be here stated.

The soil, in the first place, should be as completely inverted as possible, since it is an important object to smother or bury the surface-plants, and permit them to decay within the soil and yield food for the plants to be sown. In the second place, it should be rendered as loose and comminuted as possible; for earth in this state both allows an excess of water to pass through it more easily, and it also retains a larger supply within it for the wants of vegetation when the weather is dry. Land that is tilled in autumn may be left open, rough, and cloddy, as the frost of winter will loosen and pulverise it by spring. In a dry and warm climate, the desired state of the soil is secured by abundant ploughing, rolling, and other opera-

tions. In a wet and moist climate, these must be more sparingly resorted to, as a moderately rough mould facilitates the draining away of excessive rains, and prevents the soil from becoming consolidated by such excess.

**CULTIVATOR**, a farm implement. See GRUBBER.

**CULTRIROSTRÉS** (Lat. knife-billed or plough-share-billed), a tribe of birds of the order *Grallatores*; distinguished by a long, thick, stout, and generally pointed and trenchant bill, and containing Cranes, Herons, Bitterns, Storks, Adjutants, &c.

**CULVERIN**, among the earlier forms of cannon, was a very long gun. It was generally an 18-pounder, weighing 50 cwt.; the *deni-C.* was a 9-pounder, weighing 30 cwt. A C. of especially large dimensions is still in existence at Dover Castle, where it is known by the name of Queen Elizabeth's Pocket Pistol.

**CULVERT** is the name given to an arched channel of masonry for the conveyance of water underground.

**CUMÆ**, an ancient city on the coast of Campania, founded conjointly by colonists from Chalcis in Eubœa, and from Cymæ in Asia Minor. According to Strabo, it was the earliest of all the Greek settlements either in Italy or Sicily, but the precise date of its foundation is a matter of dispute. It soon attained to wealth and power, built several harbours or port-towns of its own, kept a tolerably large fleet, extended its influence over the native tribes of the neighbouring territories, planted a colony at Neapolis (Naples), and for 200 years (700—500 B.C.) was indisputably the most important and civilised city in Southern Italy. Subsequently, it was repeatedly but unsuccessfully attacked by the Etruscans and Umbrians. In 474 B.C., its ally, Hieron, king of Syracuse, defeated the combined fleets of the Etruscans and Carthaginians, who had attacked it by sea. Yet there can be no doubt that these conflicts both lessened its resources and weakened its influence, for in 420 B.C., the Samnites conquered the city, murdered or enslaved the most of the citizens, and forcibly married their wives and daughters. A Samnite colony was now established in C., which rapidly degenerated into a second-rate Campanian town. In 338 B.C., it was admitted to the Roman franchise, and from this period steadily adhered to the fortunes of Rome. In the second Punic war, Hannibal tried to capture it, but was repulsed by Sempronius Gracchus. Towards the close of the republic, it became the municipal capital of the district in which the Roman nobles had their villas and sea-coast residences. It continued to exist as a 'quiet' place down to the close of the Roman empire, but re-assumed a momentary importance during the wars of Belisarius and Narses. Its strong fortress, garrisoned by the Goths, was the last place in Italy that held out against the Byzantine army. Few remains of the ancient city exist.—C. is famous as the residence of the Sibyl (q. v.), whose cave—a vast subterranean grotto hewn out of the eastern side of the rock on which stood the citadel—is described by Justin Martyr, who visited it. It was destroyed by Narses in a vain attempt to undermine the fortress.

**CUMANA**, the oldest European city in the new world, having been built by Diego Castellon in 1521, and originally named New Toledo. It is in the province of Venezuela, South America, and stands, at the mouth of the Manzanares, on the Gulf of Cariaco, a long and narrow arm of the Caribbean Sea. Lat. 10° 30' N., and long. 64° 15' W. Though it was almost entirely destroyed by an earthquake

in 1853, yet it is said still to number, including several suburbs, 8000 inhabitants. It has a good roadstead, which is commanded by a fort on an adjacent height. It has but few edifices of any note, for the houses, in order to guard against the evil already mentioned, are generally low built. It carries on a tolerably large export trade in cattle, smoked meat, salt-fish, cocoa, and other provisions.

CUMANA, the department of which the above-mentioned city is the capital, forms the most easterly section of the northern coast of the republic, touching the Orinoco on the south, and meeting Caracas on the west. Besides the capital, it comprises the city of Barcelona, and the towns of Cariaco, Carapano, Aragua, and El Pao.

CUMBERLAND, the north-westmost county of England, bounded N. by Scotland and the Solway Firth, W. by the Irish Sea, S. by Lancashire, E. by Westmoreland, Durham, and Northumberland. It is 11th in size of the English counties; greatest length, 74 miles; greatest average breadth, 22; 75 miles of coast; area, 1523 square miles;  $\frac{2}{3}$  being cultivated, and  $\frac{1}{3}$  in mountain and lake. The surface is mountainous in the south-west and east; the middle consists of hills, valleys, and elevated ridges; and the north and north-west districts, including the vale of Carlisle, are low, flat, or gently undulated. The mountains in the south-west are high, rugged, and sterile, with deep and narrow valleys, lakes, rivers, waterfalls, and woodlands. The chief mountains are Sea Fell Pike, 3166 feet; Sea Fell, 3100; Helvellyn, 3055; Skiddaw, 3022. From the latter are seen the German Ocean and the Irish Sea. The Pennine chain, the great backbone of the north of England, skirts the north-east border of C., and rises in Cross Fell, 2901 feet. C. has 15 lakes, the largest one, Ulleswater, being 9 miles by 1. Six of the chief waterfalls are 60 to 156 feet high. The chief rivers are the Eden, running 35 miles north-west into the Solway Firth; the Esk, running south into the same; and the Derwent, which collects the water of six lakes and several tarns, and runs 33 miles north-west and north into the Irish Sea. The great west or Carlisle and Lancaster railway route from Edinburgh to London, crosses the north-east part of Cumberland.

The Lake district, or nearly the south-west half of C., consists of Silurian slates, with protrusions of granite and trap rocks, and with new red sandstone along the coast south of St Bees Head. In the north is a semicircular strip of carboniferous limestone; then follow strips of coal strata and Permian rocks; then the new red sandstone plain of Carlisle, with carboniferous limestone on the north-east, including a trap-dike 30 miles long, parallel to and on the east side of the Eden, and crossing to the west near Ainstable. C. abounds in mineral wealth—silver, copper, lead, iron, plumbago, gypsum, limestone, coal, slates, marbles, marl, and several of the more rare minerals.

In the mountainous parts, the climate is cold, wet, and variable, especially from July to October; on the coast, it is mild. There is a fall of 50 inches of rain annually at Whitehaven, and of 65 at Keswick; while at some places among the mountains the fall sometimes reaches 100 inches. Half of the cultivated soil consists of dry loam. Much of the subsoil is wet clay. The chief crops are wheat, barley, oats, turnips, and potatoes. There are many small dairies. Many sheep and cattle are reared in the mountains. The estates are generally small, and farmed by the owners, or held under the lords of the manors by customary tenure. Many of the small or peasant proprietors have had their lands in their families for centuries, and have a high spirit of independence.

There are manufactures of woollens—much being domestic—cottons, linen, earthenware, and glass. C. is divided into five wards or hundreds, 104 parishes, and nine poor-law unions. The chief towns are Carlisle, Cockermouth, Whitehaven, Workington, Maryport, Wigton, Penrith, Keswick, Egremont. In 1851, pop. 195,492; 563 schools, with 25,493 scholars; 389 churches (161 being Episcopal and 136 Wesleyan Methodist). C. returns nine members to parliament—four for the county, two for Carlisle, two for Cockermouth, and one for Whitehaven. C. formed part of Cumbria (q. v.). Many Roman relics have been found, such as altars, inscriptions, coins, instruments, utensils. During Saxon times, it was under Danish law. Hemy III. united it to England. For three centuries before the union of England and Scotland, C. was the constant scene of war and devastation, from incursions of the English and Scotch into this, a debatable tract between the two kingdoms. It was again devastated in the civil wars of the 17th c., and in 1715 and 1745. C. had formerly several monasteries and hospitals; and on the borders, many towers or peel houses; and it has still some old Norman and Gothic churches.

CUMBERLAND, a river, rises in Kentucky, United States, and after a course of 600 miles, of which the lower half is navigable for vessels of 400 tons, enters the Ohio at Smithland from the left, a few miles above the point where the Tennessee also joins the Ohio from the same side.

CUMBERLAND, DR RICHARD, was born in London, July 13, 1632. Educated at St Paul's School and at Cambridge, he was appointed to the rectory of Brampton, Northamptonshire, in 1658; and in 1667, to the living of All Hallows, Stamford. About 1692, the bishopric of Peterborough was bestowed upon him, its occupant, prior to the Revolution, having refused to take the new oath. C. was a man of great acquirements and piety. He was the author of several works, but he is now chiefly remembered on account of his *Inquiry into the Laws of Nature* (published in Latin, but afterwards translated), a production of substantial merit, issued in reply to the moral and political works of Hobbes; and his *Essay on Jewish Weights and Measures*. As an instance of his great application and his insatiable thirst for knowledge, it is mentioned that he learned Coptic after the age of 83. He died October 9, 1718.

CUMBERLAND, RICHARD, a dramatic writer and essayist, was born on the 19th February 1732, in the lodge of Trinity College, Cambridge. He was the great-grandson of the Bishop of Peterborough, and grandson, by the mother's side, of Dr Richard Bentley. He was placed at the public schools of Bury St Edmunds and Westminster, and at the age of 14, was entered at Trinity College, Cambridge, where he took his degree in his 18th year, and two years after was elected fellow. It was C.'s intention to enter the church, but on being appointed private secretary to the Earl of Halifax, he relinquished all views of entering the sacred profession. When, in 1760, his patron became Lord-lieutenant of Ireland, C. removed to that kingdom. Passing through several subordinate offices, he was appointed secretary to the Board of Trade, and held that office till 1782, when the Board was suppressed. Having obtained a compensation allowance, C. retired to Tunbridge Wells. Here he devoted himself to literature, and wrote farces, tragedies, comedies, pamphlets, essays, and novels. Many of his comedies were successful at the time of their appearance, although they have not kept possession of the stage. C. is best known to fame as an essayist, and as a translator from the Greek poets. His memoirs were

published in 1806, and he died, after a few days' illness, on the 7th May 1811.

**CUMBERLAND ISLAND** forms a large, but somewhat indefinite portion, of that coast of Davis Strait which lies between Hudson's Strait and Lancaster's Sound.

**CUMBERLAND PRESBYTERIANS**, a religious denomination which sprang up in 1810 in the state of Kentucky, in North America, in consequence of a dispute between the presbytery of Cumberland in that state, and the Kentucky Synod of the Presbyterian Church in America, concerning the ordination of persons who had not passed through the usual educational curriculum, but whose services the presbytery regarded as demanded for the ministry by the exigencies of the times. It now reckons more than 1200 congregations and about 100,000 members. Its doctrines and government agree with those of the other branches of the Presbyterian Church, except that the doctrine of universal redemption is held, and the predestination of sin denied.

**CUMBRAYS, or GREAT AND LITTLE CUMBRAY**, two small isles in the Firth of Clyde, between Bute Isle and Ayrshire, and included in the county of Bute. They consist of old red sandstone, with trap-dikes intersecting it. Great Cumbray lies three miles east of Bute, is  $3\frac{1}{2}$  miles long by two broad, has a population of 1266, contains Millport and Newton villages, and is a great summer resort of the inhabitants of Glasgow. Little Cumbray lies nearly a mile to the south of Great Cumbray, is one mile long by half a mile broad, and rises 780 feet, it contains many caves excavated by the sea in the stratified rocks.

**CUMBRÉ, LA**, the Spanish for top or height, is one of the principal passes across the Andes, on the high road between Santiago in Chili and Mendoza in the Argentine Republic. The altitude of its crest is 12,451 feet, fully one half more than the elevation of the pass of the Great St Bernard in the Alps. The lat. and long. are  $33^{\circ}$  S. and  $70^{\circ}$  20' W.

**CUMBRIA**, an ancient British principality, comprising Cumberland in England, and that part of Scotland which is now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, and Dumfries. It was governed by its own kings—who had their seat at Dumbarton, Glasgow, and elsewhere—until about the middle of the 10th c., when it became a tributary principality held of the king of the English, by the heir of the king of the Scots. See the article **BRETS AND SCOTS**.

**CUMBRIAN MOUNTAINS**, a great knot of mountains, nearly 50 miles in length and breadth, in the north-west of England, occupying part of Cumberland, Westmoreland, and Lancashire. This tract, the English Lake district, has much of the physical character of Wales, and being unsurpassed in the British Isles for picturesqueness and beauty, it is much frequented by tourists. The central and southern parts consist of Silurian, granite, and trap rocks, rising in lofty rugged mountains, which enclose deep valleys and large lakes. There are 25 mountain-tops upwards of 1500 feet high, including Sca Fell Pike, 3166 feet; Sea Fell, 3100; Helvellyn, 3055; and Skiddaw, 3022. Four passes cross these mountains at the height of from 1100 to 1250 feet. The deep valleys between the mountains contain 14 lakes, 1 to 10 miles long. The largest of the lakes are Windermere, Ulleswater, Conistone Water, Bassenthwaite Water, and Derwentwater. A semi-circular strip of carboniferous limestone skirts the north of the Silurian tract. On the higher C. M.,

snow lies six or eight months in the year, but on the neighbouring coasts rarely above a few days. Many eminent persons have resided among the lakes, the beauty of which has inspired some of the finest writings of Wordsworth, Coleridge, Southey, Professor Wilson, De Quincy, Arnold, and Harriet Martineau.

**CUMIANA**, a town of Piedmont, 7 miles north of Piacerolo, near the right bank of the Gisola. Pop. 5700.

**CUMMIN, or CUMIN** (*Cuminum*), a genus of plants of the natural order *Umbellifera*, containing only one known species (*C. cyminum*), a native of Egypt and the neighbouring countries; an annual, with branched stem, much divided thread-like leaves, general and partial involucre resembling the leaves, umbels of small white or pink flowers, and fruit about two lines long. The fruit (seeds) has an odour resembling that of caraway, but stronger and less pleasant. It is employed as a

*Cuminum cyminum*:  
a, fruit; b, section of fruit.

carminative in many parts of the world; in Germany, it is often put into bread; in Holland, sometimes into cheese. It is also used in medicine, particularly with resin for discutient plasters, but its use is now chiefly confined to veterinary practice. It contains a peculiar volatile oil (*Oil of Cummin*). *C.* is cultivated in the south and middle of Europe, India, &c. *C.* seed is brought to Britain mostly from Sicily and Malta.—The fruit of *Lagocchia cuminaloides*, another umbelliferous plant, a native of the Levant, is similar in its qualities and uses to that of cummin. The **BLACK C.** of the ancients is believed to be a species of *Nigella* (q. v.). Both are perhaps included in the name *C.* in Scripture.

**CUMMING, REV. DR JOHN**, a popular preacher of the day, was born in Aberdeenshire, 10th November 1810, educated at King's College, Aberdeen, where he took his degree of M.A. in 1827, and, in 1833, was ordained to the Scotch Church, Crown Court, Covent Garden, London, where he still officiates. His popularity as a preacher is very great, especially among 'fashionable' circles. In 1837, *C.* made his first prominent appearance in public in connection with the Voluntary controversy between Drs Wardlaw and Chalmers. His views were strongly in favour of establishments. Since then he has figured prominently on the platform, particularly as the 'champion' of the anti-popey class of Protestants. But the chief source of his popularity is his gift of apocalyptic interpretation. His exposition of the Book of Revelation is not very

convincing to men who are moderately impressed with the grandeur, complexity, and mystery of the Divine Providence; but it is greatly relished, and greedily swallowed by that large portion of the community who love to see all things, even the 'oracles of God,' presented under melodramatic aspects.

C.'s works are very voluminous: the chief are *Voices of the Night, Voices of the Day, Voices of the Dead, Apocalyptic Sketches, and Expository Readings in the Old and New Testament.*

CUMNOCK, OLD, a town in the south-east of Ayrshire, on the left bank of Lugar Water, and on the Glasgow and Dumfries Railway, 16 miles east of Ayr, in the middle of the district of Kyle. Pop. of town, 2395; of parish, 3777. It was once famous for the manufacture of wooden snuff-boxes, with 'invisible wooden hinges,' 2500 to 3500 being made yearly, but this business has for many years been almost wholly in the hands of the Mauchline manufacturers. Around Old C. there is an abundant supply of good coal, and of rich iron ore. It has also manufactures of reaping and thrashing-machines, and other agricultural implements. New Cumnock is a village 5 miles south of Old C., amid the high lands in the upper part of Kyle district. Pop. of parish, 2759. Near New Cumnock are found ironstone, antimony, smiths' and canal coal, and plumbago.

CUMYNN, CUMMING, or COMYNN, a family which rose to great power and eminence in England and Scotland. It took its name from the town of Comines, near Lille, on the frontier between France and Belgium. While one branch remained there, and in 1445, gave birth, in its old chateau, to the historian Philippe de Comines (q. v.), another followed the banners of William of Normandy to the conquest of England. In 1069, the Conqueror sent Robert of Comines, or Comynn, with 700 horse to reduce the yet unsubdued provinces of the north. He seized Durham, but had not held it for 48 hours, when the people suddenly rose against him, and he perished in the flames of the bishop's palace. His nephew, William, became Chancellor of Scotland about 1133, and nine years later, all but possessed himself of the see of Durham. The chancellor's nephew, Richard, inherited the English possessions of his family, and acquired lands in Scotland. By his marriage with Hexilda, Countess of Athol, the granddaughter of Donald Bane, king of the Scots, he had a son William, who, about 1210, became Earl of Buchan by marrying the Celtic heiress of that great northern earldom. By this marriage, he was father of Alexander, Earl of Buchan, who, by marrying a daughter of Roger de Quenci, Earl of Winchester, acquired the high office of Constable of Scotland, with great estates in Galloway, Fife, and the Lothians. By a previous marriage with a wife whose name has not been ascertained, William C. was father of Richard—whose son John became Lord of Badenoch—and of Walter, who by marriage became Earl of Monteith. By other marriages, the family obtained, for a time, the earldom of Angus and the earldom of Athol, so that, by the middle of the 13th c., there were in Scotland 4 earls, 1 lord, and 32 belted knights of the name of Cumynn. Within 70 years, this great house was so utterly overthrown that, in the words of a contemporary chronicle, 'there was no memorial left of it in the land, save the orisons of the monks of Deer' (a monastery founded by William C., Earl of Buchan, in 1219). The Cumyns perished in the memorable revolution which placed Bruce on the throne of Scotland. Their chief, the Lord of Badenoch, had, in 1291, been an unsuccessful competitor for the

crown, as a descendant, through king Donald Bane, of the old Celtic dynasty. His son, Red John C., was one of the three wardens of Scotland, and distinguished himself by his gallant resistance to the English. He fell under Bruce's dagger, before the altar of the Franciscan friars at Dumfries, in 1306; and his kindred went down, one after another, in the struggle to avenge him. John C., Earl of Buchan, was defeated by Bruce in a pitched battle, near Inverury, in 1308, when his earldom was wasted with such relentless severity, that—we are told by the poet who sang the victories of Bruce—for sixty years afterwards, men mourned the desolation of Buchan. Such of the Cumyns as escaped the sword, found refuge, with their wives and children, in England, where, although they were so poor as to be dependants on the bounty of the English court, they married into the best families, so that, in the words of Mr Riddel, 'their blood at this day circulates through all that is noble in the sister kingdom, including the numerous and royal descendants of King Henry IV.' The Earl of Shrewsbury seems to be the representative of the Lord of Badenoch, who was the head of the race.

CUNAXA, a place in Babylonia, on the eastern bank of the Euphrates, about forty-five miles north from Babylon, noted for the battle fought there (401 B.C.) between Cyrus the Younger and his brother Artaxerxes Mnemon, in which the former was killed.

CUNDINAMA'CA, the central department of New Granada, or at least of what lately existed under that name, comprises the provinces of Mariquita, Neiva, and Bogota. It occupies large portions of the basins of the Magdalena and the Cauca, having an estimated area of 350,000 square miles. The population, of which we can only guess the amount, appears to be equally divided between whites, aborigines, and half-breeds. Within the province of Bogota stands the city of the same name, once the capital of Colombia, and still the capital, at least nominally, of New Granada. Pop. 517,648. C. derives its name from an old American goddess, and before the conquest of the land by the Spaniards was one of the chief regions of native civilisation. There are still to be met with here, ruins of old buildings, broken statues of the gods, and other monuments of a worship that has wholly passed away.

CUNEIFORM, Cuneatic, Wedge-shaped, Arrow-headed, (Fr. *Tête-à-clou*, Ger. *Keilförmig*), are terms for a certain form of writing, of which the component parts may be said to resemble either a wedge, the barb of an arrow, or a nail. It was used for monumental records, and was either hewn or carved in rocks and sculptures, or impressed on tiles and bricks. The first date that can be assigned to it is about 2000 B.C., and it seems to have died out shortly before or after the reign of Alexander the Great. It appears to have been employed first in Assyria and Media, and to have thence spread over the whole of that vast portion of Asia which formed the Persian monarchy under the Achemenide. For nearly 2000 years after its extinction its very existence was forgotten. Although the immense ruins found all over that ancient kingdom, and principally those of splendid palaces and tombs, which, at a distance of about 12 miles from Shiraz, designate the site of ancient Persepolis, had at all times attracted the attention of Eastern travellers, still no one seems to have dreamed that those strange wedges which completely covered some of them could have any meaning. It was Garcia de Sylva Figueroa, ambassador of Philip III.

of Spain, who, on a visit to Persepolis in 1618, first became possessed with the firm conviction that these signs must be inscriptions in some lost writing and, perhaps, language, and had a line of them copied. Amongst subsequent travellers whose attention was attracted to the subject, Chardin, after his return to Europe in 1674, published three complete groups of cuneiforms, copied by himself at Persepolis, together with a comparatively long and minute account of the mysterious character. He likewise declared it to be 'writing and no hieroglyphs: the rest, however, will always be unknown.' Michaux, a French botanist, sent, in 1782, an entire altar, found at Bagdad, to Paris, covered with inscriptions, and bearing a large wedge—evidently an object of worship—on its top. Ever since, the materials for the investigation of a subject, the high importance of which by that time was fully recognised, have been rapidly accumulating. Sir H. Jones, Ker Porter, Robert Stewart, Sir W. Ouseley, Bellino, Dr Schultz—up to Rich and Botta, Flandin, Rouet, Layard, Oppert, and, above all, Rawlinson, each in his turn brought back more or less valuable materials from his eastern travels; and, naturally enough, those explorers are among the foremost to engage in the study of the records they had brought to light.

Shrouded in comparative mystery though certain portions of these characters and the language they represent still be, it is highly interesting and instructive to notice the opinions first entertained of them by the wise and learned in Europe. In the Transactions of the Royal Society of June 1693, they first appeared from a copy made by Flowers, and they are held to be 'the ancient writing of the Gaures or Gebres, or a kind of *blesnes*'—an expression no less unintelligible than the subject it tries to explain. Thomas Hyde, the eminent Orientalist, declared them, in his learned work on the religion of the ancient Persians, which appeared in 1700, to be nothing more or less than idle fancies of the architect, who endeavoured to shew how many different characters a certain peculiar stroke in different combinations could furnish, and reproved the authors of all those 'so-called Persepolitan inscriptions' very strongly for having misled so many wise men, and taken up so much of his own precious time. Witte, in Rostock, saw in them the destructive work of generations upon generations of *worms*. Generally, they were pronounced to be talismanic signs, mysterious formulæ of priests, astrological symbols, charms, which, if properly read and used, would open immense vaults full of gold and pearls—an opinion widely diffused among the native *savans*. The next step was to see in them a species of revealed digital language, such as the Almighty had first used to Adam. Lichtenstein read in some of them certain passages from the Koran, written in Cufic, the ancient Arabic character; in others, a record of Tamerlane; and was only surprised that others should not have found this, the easiest and clearest reading, long before him. Kæmpfer was not quite sure whether they were Chinese or Hebrew characters. That they were Runes, Oghams, Samaritan, Greek characters, were some of the soberest explanations.

It was Karstén Niebuhr who first shewed the way, to the more sensible portion of the learned, out of this labyrinth of absurdities. Without attempting to read the character itself, he first of all established three distinct cuneiform alphabets instead of one, the letters of which seemed to outnumber those of all other languages together. The threefold inscriptions found at Persepolis he thus took to be transcripts of the same text in three alphabets, in a hitherto unknown language. Tychsen of Rostock

(1798), and Münter of Copenhagen (1800), affirmed and further developed this conjecture. The latter went so far as to divide the characters and inscriptions into alphabetical, syllabic, and monogrammatical, and to assume two different languages—Zend for inscriptions of a religious, Pehlvi for those of a political character. The real and final discovery, however, is due to Grotefend of Hanover, and dates from 1802. On the 7th of September of that year, he laid the first cuneiform alphabet, with its equivalents, before the Academy of Göttingen—strangely enough, in the very same sitting in which Heyne gave an account of the first reading of hieroglyphs. The process by which Grotefend arrived at that wonderful result is so supremely interesting, that we cannot omit to sketch it briefly. He fixed upon a Persepolitan inscription of what was called the first class, and counted in it thirty promiscuously recurring groups or combinations of cuneiforms. These groups he concluded to be letters, and not words, as a syllabarium of thirty words could not be thought of in any language. Then, again, a certain oblique wedge, evidently a sign of division, which stood after three, four, five, up to eight or nine such groups or letters, must shew the beginning or end, not of a phrase, but of a word. Tychsen and Münter had already pointed out a certain combination of seven characters as signifying the royal title. Grotefend adopted this opinion. The word occurred here and there in the text, and after the first words of most of the inscriptions, twice; the second time with an appendage, which he concluded to be the termination of the genitive plural, and he translated these two words, without regard to their phonetic value, 'King of Kings.' He then, in comparing the words preceding the royal titles in two tablets, found them repeated in what he assumed to be a filial relation; thus: There were three distinct groups, words, or names, which we will call X, D, and H, and this is how they occurred: 1, X, King of Kings, son of D, King of Kings; 2, D, King of Kings, son of H; but the 3, H, was not followed by the word King, H, therefore, must have been the founder of the dynasty. Now the names themselves had to be found. Grotefend, unlike his predecessors, had no recourse to philology, but to archaeology and history. The inscriptions in question were by that time proved to belong to the Achaemenian dynasty, founded by Hystaspes = group H. He was followed by Darius, 'King of Kings, son of Hystaspes,' or Darius Hystaspes = group D; he, again, by Xerxes, King of Kings, son of Darius, King of Kings = group X—and the problem was solved. It could not have been Cyrus and Cambyses, as the groups did not begin with the same signs (C); nor Cyrus and Artaxerxes, the first being too short for the group, the second too long—it could only be Darius, Xerxes, Hystaspes—of course, in the orthography of their, not of our time; and wherever in these names the same letters recurred, they were expressed by the same combinations of signs. A further proof of the correctness of the reading was furnished by a vase in Venice, bearing a cuneiform and a hieroglyphical inscription, which were both read at the same time independently: 'Xerxes.' Innumerable difficulties, however, remained, and remain up to this moment. Grotefend had, after all, only read—and not altogether correctly—three names, which did not contain more than twelve letters—the rest being mere conjecture—and there were many more in this alphabet. The two other alphabets, with an infinite variety of letters, had hardly been properly approached yet. Moreover, the discovery of Grotefend was in itself so startling, so extraordinary and bold, that no one ventured to follow it up for the next 20 years, when

H. Martin found the grammatical flexions of the plural and genitive case. We cannot now specify his further discoveries, or those of Rask, Burnouf, Lassen, Westergaard, Beer, Jacquet, and others who followed; we will only say, that they mostly secured for themselves fame and name by rectifying or fixing one or two letters. The last and greatest of investigators of this first alphabet is Rawlinson, who not only first copied, but also read, the gigantic Behistun inscription—containing more than 1000 lines—of which more anon.

We now proceed to give what may be called the results of the investigations of the cuneiform character in general, up to this present moment; but we must warn the reader beforehand, that though much has been done, more remains to be done, and that a few years may change the whole aspect of cuneiform studies.

Cuneiform writing, as we said before, was used for monumental records only, a cursive writing—from right to left—being used for records of minor importance. The inscriptions are mostly found in three parallel columns or tablets, and are then translations of each other in different alphabets and languages, called respectively Persian, Median, and Assyrian; the Achaemenian Kings being obliged to make their decrees intelligible to the three principal nations under their sway, as in our days the Shah of Persia would use the Persian, Turkish, and Arabic languages, in order that he might be understood in Bagdad and Teheran.

The first of the three, the Persian—first, in so far as it always holds the place of honour—consists of 39 to 44 letters, and is the most recent of the three, the most ancient being the Assyrian. It is distinguished by the oblique stroke which divides its words. Its letters are composed of not more than five strokes or wedges placed side by side horizontally or perpendicularly, or both, never—with one exception—crossing each other. The language is pronounced by all investigators (save Gobineau), to be as near Sanscrit as possible, although not so refined, and to be the mother-language of modern Persian. It is only twice found by itself; all the other inscriptions are trilingual. The time of its use is confined to the years 570–370 B.C. The oldest instance of its employment is an inscription of Cyrus the Great at Pasargadae; the most recent, that of Artaxerxes Ochus at Persepolis. The most important is that of Darius Hytaspis, in the great inscription of Behistun, which contains, besides genealogical records, a description of the extent of his power, the leading incidents of his reign, prayers to Ormuzd and the angels, and reference to the building of the palaces—the last two subjects generally forming the only contents of the other Persian inscriptions. The inscription of Artaxerxes Ochus is important, in so far as it traces his origin to the Achaemenidae, through Arsames, grandfather of Darius. Most of these inscriptions occur at Persepolis, Behistun, Naksh-i-Rustam, and Hamadan.

The second kind is called the Median, because it takes the second place in the trilingual inscriptions, under the conquering Persians, but over the conquered Assyrians, and as the Medes stood somewhat in that relation to these two nations, that name was selected. Another name, 'Seythic,' has been proposed, or, by way of compromise, 'Medo-Seythic,' and the language—supposed to have been spoken by those innumerable Tartaro-Finnic tribes which occupied the centre of Asia—has been pronounced to be a Turanian dialect. But the process of constructing out of such slender elements as Samojed and Ostiak words, a so-called 'Seythic,' is somewhat similar to the attempt of reconstructing Sanscrit

from some detached and very doubtful French and English words. These inscriptions never occur by themselves (one instance again excepted), and being translations of the Persian records, about ninety names have been ascertained, and an alphabet of about 100 characters—combinations of a syllabic nature—has been established. The principal investigators of this character are Westergaard, De Saulcy, Hincks, Norris, and Oppert. Gobineau holds the language to be Huzvareh, a mixture of Iranian and Semitic.

The third and most important is the Assyrian portion of the cuneiforms. The trilingual records gave the first clue to the deciphering of this character; but many original, more than a thousand years older, documents have since been found in Babylon, Nineveh, and other places near the Euphrates and Tigris, and even in Egypt. About 400 different signs have been distinguished on slabs, cylinders, barrels, prisms, of a phonetic, syllabic, and ideographic nature. Proper names are preceded by monograms, which give the same help to their readings as cartouches in hieroglyphics. Of those 400 signs, however, hardly one-tenth are known for certain. Proper names were found varied to about five times, and the characters themselves are both homophonous (same sound expressed by various signs) and polyphonous (same sign with various sounds). Five and more dialects have been distinguished in the language, which is decidedly Semitic (Gobineau takes it to be simply Arabic); and these dialects are supposed to have belonged either to different tribes or subsequent periods. It is this alphabet about which the greatest uncertainty and confusion prevail, for endless subdivisions, and even certain assumed grammatical forms, do not constitute a certainty. There is, however, a hope of its eventually being fully deciphered. A few years ago, the Asiatic Society submitted a cylinder of Tig-lath-Pileser to four prominent investigators of the subject, and they independently read it nearly alike, with exception of the proper names, where they widely differed. As a proof of the enormous importance of this character for history, grammar, law, mythology, archeology, and antiquities generally, we will name some of the records of which Rawlinson, a few years ago, proposed the publication (now in progress): Chaldaean Legends (2000–1500 B.C.); Bricks from Kilehserrat, of the early Kings of Assur (1273–1100), in a character approaching the cursive; Annals of Tig-lath-Pileser I. (1120 B.C.); Annals of Sardanapalus, of Shamas, father to the biblical Pul, of the biblical Pul and Semiramis, his wife, of Sargon, Sennacherib, Assur-bani-Pal, son of Esarhaddon; Cylinder of Nebuchadnezzar; Cylinders containing the notice of Belshazzar, &c.; besides syllabaries, vocabularies, mathematical and astronomical tablets, calendars and registers, and more than 1000 mythological tablets. Nay, if the Pirs-Nimrud really stands on the foundations of the old tower of Babel, we might in the bricks excavated at these very foundations read the language spoken at the time 'when the whole earth was of one speech.'

As to the origin of the character, we will briefly state, in conclusion, that nothing certain is known, or is likely to be known for some time. It is not unlikely, however, that it was hieroglyphic, although neither the fishes nor the bees, which these letters are supposed to have been originally, seem to have more in their favour than the worms, which were said to be their unconscious authors. The following is the opinion of Rawlinson on this point: 'That the employment of the cuneiform character originated in Assyria, while the system of writing to which it was adapted was borrowed from Egypt,

will hardly admit of question. Whether the cuneiform letters, in their primitive shapes, were intended like the hieroglyphs to represent actual objects, and were afterwards degraded to their present forms; or whether the point of departure was from the Hieratic, or perhaps the Demotic character, the first change from a picture to a sign having thus taken place before Assyria formed her alphabet, I will not undertake to decide; but the whole structure of the Assyrian graphic system evidently betrays an Egyptian origin. The alphabet is partly ideographic and partly phonetic, and the phonetic signs are in some cases syllabic, and in others literal. Where a sign represents a syllable, I conjecture that the syllable in question may have been the specific name of the object which the sign was supposed to depict; whilst in cases where a single alphabetical power appertains to the sign, it would seem as if that power had been the dominant sound in the name of the object.\*

In order to give the reader some idea of the appearance of the cuneiform character, we subjoin the name of Darius (Dariyavas, Tariyavaus), written in the Persian, Scythic, and Assyrian alphabets:

Persian.

𐎠 𐎡 𐎢 𐎣 𐎤 𐎥 𐎦 𐎧 𐎨 𐎩 𐎪 𐎫 𐎬 𐎭 𐎮 𐎯 𐎰 𐎱 𐎲 𐎳 𐎴 𐎵 𐎶 𐎷 𐎸 𐎹 𐎺 𐎻 𐎼 𐎽 𐎾 𐎿

Scythic.

𐎠 𐎡 𐎢 𐎣 𐎤 𐎥 𐎦 𐎧 𐎨 𐎩 𐎪 𐎫 𐎬 𐎭 𐎮 𐎯 𐎰 𐎱 𐎲 𐎳 𐎴 𐎵 𐎶 𐎷 𐎸 𐎹 𐎺 𐎻 𐎼 𐎽 𐎾 𐎿

Assyrian.

For fuller information on this subject, see Rawlinson, *The Persian Cuneiform Inscription at Behistan deciphered and translated*, &c. (Journal As. Soc., 1846, &c.); Grotefend, *Erläuterungen der Keilinschriften aus Behistan* (Göttingen, 1854); Lassen u. Westergaard, *Über die Keilinschriften der ersten und zweiten Gattung* (Bonn, 1845); Hincks, *On the First and Second Kinds of Persepolitan Writing* (Transact. Roy. Ir. Soc., 1846); Norris, *Memoir on the Scythic Version of the Behistan Inscription* (Journ. As. Soc., 1853); Rawlinson, *A Commentary on the Cuneiform Inscriptions of Babylon and Assyria* (Lond. 1850); Oppert, *Études Assyriennes* (Journal Asiatique, Paris, 1857); Rénan, *Critique*, &c. (Journ. d. Sav., Paris, 1859).

CUNNINGHAM, ALLAN, poet and *littérateur*, was born in 1785, at Blackwood, in Dumfriesshire. The circumstances of his parents were humble. At the age of 11, C. was taken from school, and apprenticed to a stone-mason. He worked faithfully at his calling; but his spare time, and his evenings, were given to song and the collection of traditions. He first appeared in print as a contributor to Cronk's *Remains of Nithsdale and Galloway Song*. These contributions, purporting to be ancient ballads, were entirely the composition of the ingenious and ambitious stone-cutter. The publication gained him the acquaintance of Hogg and Sir Walter Scott. With the latter, 'Honest Allan' was always a prodigious favourite. On his removal to London, he became one of the best known writers for the *London Magazine*. He subsequently obtained a situation in Chantrey's studio as foreman, or confidential manager, and this office he held till his death. During his career, he wielded an indefatigable pen. He wrote novels, poems, and a drama. His principal prose works, apart from his fictitious narratives, are *Lives of the*

*Painters, a Life of Burns, and a Life of Sir David Wilkie*. His death took place in London on the 29th of October 1842. As a Scotch poet, he ranks, perhaps, after James Hogg. His songs, although disfigured by false taste, mannerism, and a superabundance of ornament, have true lyrical impulse and movement.

CUNNINGHAM, PETER, a *littérateur* of some note, son of Allan Cunningham the poet (q. v.), was born at Pimlico in 1816. Since 1834, he has held a government situation. His chief writings are the *Handbook of London, the Life of Drummond of Hawthornden, the Handbook to Westminster Abbey, the Life of Isaac Jones, Modern London, &c.* He has, besides, edited Johnson's *Lives of the Poets*, and the works of Oliver Goldsmith, the *Songs of England and Scotland*, and the *Letters of Horace Walpole*. C. has also contributed extensively to *Fraser's Magazine, the Athenæum, Household Words, &c.*

CUNNINGHAMIA, a genus of trees of the natural order *Conifera*, nearly allied in botanical characters to the true pines and firs, but in foliage having considerable resemblance to the Araucarias. *C. Sinenais* is an evergreen tree, with narrow ovato-lanceolate, stiff, and sharp-pointed leaves, common in many parts of China, but too tender for the climate of Britain.

CUP, DIVINATION BY, a mode of foretelling events, practised by the ancient Egyptians, and still prevailing in some of the rural districts of England and Scotland. One of the eastern methods consisted in throwing in small pieces of gold or silver leaf into a C. of water, in which also were placed precious stones, with certain characters engraved upon them. The infernal powers were then invoked, and returned answer, either in an intelligible voice, by signs on the surface of the water, or by a representation in the C. of the person inquired about. By the modern method, a person's fortune is foretold by the disposition of the sediment in his tea-cup after pouring out the last of the liquid. Few people now, however, even among the most ignorant of those who practise and are practised upon by C. divination, have implicit faith in the utterance of the oracle.

CUPAR-ANGUS, a town on the borders of Perthshire and Forfarshire, and partly in both, is situated on the left bank of the Isla, a tributary of the Tay, 12½ miles east by north from Perth, and 16 miles west-north-west from Dundee. It lies between the Grampian and Sidlaw Hills, in the centre of the Valley of Strathmore, and from its position in this valley it is popularly called 'the capital o' the How.' Pop. in 1861, 2024. It has extensive linen manufactures, with a considerable traffic in timber. Near the town are the remains of two Roman camps, on one of which stand the ruins of a monastery, built in 1164 by Malcolm IV., and destroyed at the Reformation. Recent excavations have exhumed numerous richly carved tombstones in the grave-yard contiguous to the parish church, evidently those that had marked the graves of the ancient dignitaries of the monastery, and which had been covered up by the ruins of the decaying edifice. The abbey revenue in 1562 was £1238, 14s. 9d. in money, and 182 chalders of victual. The classic hill of Dunsinane is situated about five miles to the south-west of C., and the dilapidated castle of the 'bold Pitcur,' who fell in the battle of Killiecrankie, in 1689, is within a distance of two miles.

CUPAR-FIFE, a royal, parliamentary, and municipal burgh, and the county town of Fifeshire,

near the middle of the peninsula of Fife, on the Eden, 9 miles from its mouth, 32½ miles north of Edinburgh, and 14½ south of Dundee. It lies in a beautiful vale, stretching east and west, with a range of hills on the south, and a fertile country, with wooded eminences, on the north. It consists chiefly of two streets at right angles to each other. Pop. of town, 4005. The chief manufactures are coarse linens, bricks, and earthenware. It contributes, with St Andrews, East and West Anstruther, Crail, Kilrenny, and Pittenweem, to return one member to parliament. A fortress of the Macduffs, thanes of Fife, once stood on a mound called the Castle Hill, at the east end of the town. In former times, religious shows, mysteries, or moralities, were acted on a green esplanade in front of the castle, still called the Play-field. There also was acted the *Three Estates*, a celebrated satire on the priesthood, which hastened the religious revolution, and was written by Sir David Lindsay, whose estate of the Mount was near the town.

CUP'EL. See CUPELLATION.

CUPELLATION is the process of the separation of one metal from another (as lead from silver) by the use of a CUPEL highly heated in a muffle furnace. See ASSAY.

CUPID, one of the gods of the classic mythology, whose name in Latin signifies *Desire*. The genealogy of this meddlesome divinity is rather confused. Sometimes he is represented as the son of Vulcan and Venus, or of Mars and Venus, while at other times the mythologists seem at a loss to name his father, and make him spring from the sea-foam, like Venus herself. As among the Greeks, the myth of Eros gave birth to numerous *Erotos* or Loves, so at Rome, also, that of C. originated a legion of Cupids, who all possessed the same attributes as their prototype. Every one knows what these were: the bow, arrows, quiver, and wings. Often a bandage covered the eyes. The appearance was that of a chubby child, or youth with a malicious smile. His darts could pierce the fish at the bottom of the sea, the birds in the air, and the gods in Olympus. The immensity of space was his home, but like his mother, he specially loved the flowery thickets of Cyprus.

CUPOLA (Ital., from the root of *cup*), a spherical vault, or concave ceiling, on the top of a building. Cupolas are hemispherical, or of any other curve, and often consist of glass, so as to form a window in the roof. See DOME.

CUPPING is the application of cups, from which the air has been exhausted, to the skin, with the object of causing congestion or excessive fulness of the cutaneous blood-vessels; and if it should be thought desirable to withdraw some blood, the skin may be cut or scarified, and the exhausted cups applied over the incisions, to favour its flow.

C. has been a part of surgical practice from the earliest times, and instruments for performing it have been found in use among the least civilised nations. Of old, the cups were either small horns, open at both ends, from which the air was withdrawn by suction at the narrow extremity, or glasses of various shapes, with a small hole in the bottom of each. This hole was plugged with wax, the air exhausted by heat, and when the operator wished to remove them, he withdrew the plug, and allowed the air to enter. The modern cups are of glass, with round or oval mouths, and closed bottoms. Some have small sockets for holding cotton wick in their interior.

The principal improvements have been in the methods of incising the skin. This used to be

effected by a common lancet or narrow knife, with a short blade and convex edge, set in a long elastic handle, which the operator struck rapidly with his finger, so as to drive the blade 26 or 30 times into the skin.

This was so tedious an operation, that a number of similar blades were used at once. These are contained in a box, which has slits pierced in it corresponding to the number of blades; the latter can be caused to emerge at these slits by turning a handle, or more rapidly by setting free a spring, which causes them to revolve suddenly, and in doing so protrude at the slits more or less, according to the will of the operator. The operation is thus performed: The scarificator, glasses, torch, spirits of wine, and a lighted candle are placed ready at hand; the part is sponged with hot water, so as to cause an increased flow of blood into it, then dried with a warm towel; the torch, previously saturated with the spirits of wine and lighted, is held for an instant in one of the glasses, which is now clapped on to the skin. The number of glasses depends on the quantity of blood it is thought desirable to abstract; each one will probably withdraw from three to five ounces. When the skin under the glass has become red and swollen, the cupper removes it, applies the scarificator, and as rapidly as possible again exhausts the air from the glass, and claps it on again. The blood will now flow into it; and when enough has been taken, the glass is removed, and some lint applied to the wounds. This apparently simple proceeding requires considerable skill, so that C. is practised as a separate profession in large towns, and the medical boards of the public services require that candidates for their appointments should produce a certificate of having received special instruction in the art. The difficulties consist in regulating the depth of the cuts, for should they be either too deep or too shallow, the blood will not flow. If the glasses be completely exhausted of air, their rims hurt the patient, and the blood will not flow, and it has happened that arteries or large veins have been wounded by ignorant operators.

There are many modifications of the ordinary C. apparatus, but all on the same principle.

*Dry C.* is simply applying the cups as described, but not wounding the skin. The ancients had a high opinion of this method, as they believed the 'noxious humours' were drawn forth of the body into the cups; and it need scarcely be added that extempore cups may be found in tumblers, finger-glasses, or any air-tight vessel with a smooth rim.

CUPULE (*Cupula*), in Botany, a sort of cup formed by a number of cohering bracts, and surrounding the fruit or the base of the fruit in certain plants; as the oak, in which it is the cup of the acorn, and the hazel, in which it is the husk of the nut.

CUPULIFERÆ (i. e., cupule-bearing), or CORYLACEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of temperate climates. The leaves are alternate and furnished with stipules. The male flowers, and sometimes also the female flowers, are disposed in catkins (and this order is regarded by many botanists as a sub-order of AMENTACEÆ, q. v.); the stamens are 5—20, inserted into the base of scales or of a membranous perianth; the ovary is crowned by the rudiments of a persistent perianth, and surrounded by a Cupule (q. v.) of various figure; there are several cells and ovules, but the greater part of the ovules are abortive; the fruit is a 1-celled nut, more or less enclosed in the cupule; the seed is usually

solitary; the embryo large, with fleshy cotyledons and minute superior radicle.—This order contains many of the most important trees of Europe and America, including all the different kinds of Oak, Beech, Chestnut, and Hazel, the Hornbeam, &c. Many species are also natives of tropical countries, but they are there only found at considerable elevations.

**CUR** (Welsh *cor*, a dwarf, anything small; *cor-aron*, a small river; *coryi*, a small dog), a name sometimes applied indiscriminately to small dogs of any kind not highly valued, and in this way often particularly appropriated to dogs of mongrel breed, but also used by naturalists as the common designation of many races, of which the Terriers (q. v.) may be considered as the type; all of them of small size, and exhibiting in a high degree the capacity for domestication, along with activity and sagacity. These races are distributed over all parts of the world, and differ very considerably from each other, and are found domesticated even among very rude and savage tribes. The Pariah dog of India is reckoned among them, and exists in that country both in a wild and in a domesticated state; its body is more lank than that of the cur races of Europe, a character which is also in some measure exhibited by the dogs that haunt the streets of towns in Turkey, Persia, &c. The curs may, not improbably, have been the first domesticated dogs.

**CURACA'O, ISLANDS OF**, are Dutch possessions in the West Indies, situated near the northern shore of Venezuela, in the Caribbean Sea. They consist of Curaçao, Bonaire, Aruba, and Little Curaçao. Entire pop. in 1859, 31,741, of which about 10,000 are slaves. Chief town, Willemstad, on the island of Curaçao, one of the handsomest towns in the West Indies. Pop. about 8000. These islands depend upon rain for water. The coasts, on the whole, are difficult of access, the principal bay being that of St Anna, on which Willemstad stands. The soil in many places is arid and unproductive. Among the exports of C., may be noticed maize, beans, and other kinds of pulse, cattle, salt, and mortar. C. chiefly owes its prosperity to its commerce with the neighbouring islands and coasts. In 1827, it became a free harbour. The island was discovered by Spain in 1527, taken from that country by the Dutch in 1634, conquered by the English in 1807, and restored to Holland in 1815.

**CURAÇO'A** is a well-known and esteemed liqueur, made either from the small oranges called C. oranges, or from orange-peel, by digesting in sweetened spirits, along with a little cinnamon, and often a little mace or cloves. The spirits used are generally reduced to about 56 under proof, and contain about 3½ pounds of sugar per gallon. C. is often coloured by digesting in it for a week or ten days a little powdered Brazil wood, and mellowing the colour by means of burned sugar.

**CURACA'O ORANGES**, small oranges which have fallen from the tree long before maturity. They have properties similar to those of orange-peel, but are more bitter and acrid, and are used for the same purposes.

**CURARI, OURARI, WOORALI, or WOO-RARA**, a celebrated poison used by some tribes of South American Indians for poisoning their arrows. It is by means of this poison that the small arrows shot from the Blowpipe (q. v.) become so deadly. The nature and source of this poison remained long unknown, the Indians being very unwilling to reveal the secret, which seems, however, to have been at

last obtained from them by Sir Robert Schonburgk, and it is now regarded as pretty certain that the principal ingredient is the juice of the *Strychnos toxifera*, a tree or shrub of the same genus with that which yields nux vomica. See *STRYCHNOS*. It has a climbing stem, thickly covered with long spreading reddish hairs; rough, ovate, pointed leaves, and large, round fruit. The poison, when introduced into the blood, acts on the nervous system, and produces paralysis, with convulsive movements, and death ensues. It is supposed to be the most powerful sedative in nature. Artificial respiration is the most efficacious means of preventing its effects. It has been proposed to employ it in the cure of lockjaw and hydrophobia, and it has recently been asserted, as the result of experiment, that it can be very beneficially employed in the former disease. Like snake-poison, it is comparatively inert when taken into the stomach. See *WOORALI*.

**CURASSOW, or HO'CCO** (*Craz*), a genus of large, gallinaceous birds of the family *Cracidae*, having a strong bill surrounded at the base with a skin—sometimes brightly coloured—in which the nostrils are pierced, and the head adorned with a crest of feathers curled forward, which can be raised and depressed at pleasure. The species, which are not numerous, are natives of the forests of the warm parts of America. They congregate in flocks, and although they live much among the branches of trees, their habits greatly resemble those of domestic poultry. They are very unsuspecting of danger, until taught by severe experience; and are easily domesticated. The best known species (*C. Alector*) is about the size of a turkey, its plumage

Galeated Curassow.

is almost entirely black. It is abundant in the forests of Guiana. Its flesh is very good eating. It is kept in poultry-yards in South America, and was introduced into Holland at the close of last century, where it seemed completely acclimated, but the stock was lost amidst the troubles which ensued on the French Revolution.

**CURATE**, literally, one who has the cure (Lat. *cura*, care) of souls, in which sense it is used in the Church of England Prayer-book, 'all bishops and curates.' It is, however, generally used to denote the humblest degree in the Church of England. A C., in this sense, is a minister employed by the incumbent of a church (rector or vicar), either as assistant to him in the same church, or else in a chapel of ease within the parish belonging to the mother church. He must be licensed and admitted by the bishop of the diocese, or by

an ordinary having episcopal jurisdiction, who also usually appoints his salary. Any C. that has no fixed estate in his curacy, not being instituted and inducted, may be removed at pleasure by the bishop or incumbent. But there are *perpetual* curates as well as temporary, who are appointed where tithes are inappropriate and no vicarage was ever endowed: these are not removable, and the impropriators are obliged to maintain them. In general, the salaries of curates, certainly the hardest-worked, and not the least devoted of the English clergy, are shamefully small, and reform in this matter is urgently required.

**CURATOR TO A MINOR.** See **GUARDIAN.**

**CURB** (in horses) consists of strain of the straight ligament which runs down the back of the hock; is most common in animals with straight small hocks and that conformation known as *sickle hams*; whilst like other strains it occurs from sudden and violent exertion, often proceeding in the lighter breeds from leaping or galloping in heavy ground, and in the heavier, from the effort of keeping back a load whilst going down a steep incline. Swelling appears on the inner and back part of the joint, generally causing lameness, which is most apparent in trotting, and, in slight cases, usually wears off after the animal has been out for ten minutes. Fomentations must first be used to allay the irritation and inflammation; when heat and tenderness disappear, cold applications will be advisable; when, after ten days, the enlargement still continues, a blister may be necessary; whilst, from the first, all work must be forbidden.

**CURCAS.** See **PHYSIC NUT.**

**CURCULIO.** See **WEEVIL.**

**CURCUMA** (Arab. *kurkum*), a genus of plants of the natural order *Scitamineæ*, having the tube of the corolla gradually enlarged upwards, and the limb two-lipped, each lip three-parted. The species are stemless plants, with palmate tuberous roots, natives of the East Indies. The dried roots of some are the Zedoary (q. v.) of the shops; the roots of others yield Turmeric (q. v.); and some yield a kind of Arrow-root (q. v.). The same species often yields both arrow-root and turmeric, the former being obtained from the young roots, the latter from the old.—*C. Amada* is called **MANGO GINGER**. Its root when fresh has the smell of a mango, and in its qualities resembles ginger. It is a native of Bengal.

**CURFEW** (Fr. *couvre-feu*, cover fire). To William the Conqueror is ascribed the introduction of the C. bell into England, the object of which was to warn the people to cover up their fires, and retire to rest. The time for ringing these bells was sunset in summer, and about eight o'clock in winter; and certain penalties were imposed upon those who did not attend to the signal. The practice of ringing the C. bell, however, appears to have prevailed throughout Europe long before the era of the Norman Conquest, its object being the laudable one of preventing fires, which, owing to houses being chiefly composed of wood, were then both frequent and destructive. The custom of ringing the C. bell at eight or nine o'clock, is still continued in many parts of England, though its original significance is of course lost.

**CURIA MURIA ISLANDS.** See **KOORIA MOORIA ISLANDS.**

**CURISCHES HAFF.** See **KURISCHES HAFF.**

**CURLEW** (*Numenius*), a genus of birds of the order *Trallatores*, and of the same family (*Scelopocidæ*) with the snipe, woodcock, avocet, stilt, godwit, &c. The bill is long, slender, curved, and

compressed; the face and head are feathered; the legs are slender, and part of the *tibia* is naked as well as the shank; the tail is short, and the folded wings extend about as far as the tail. The Common C. (*N. arquata*), the *W'haup* of the Scotch, is a bird of wide geographic distribution, being found

Common Curlew (*Numenius arquata*).

in tropical, temperate, and arctic regions of the Old World and in Australia. It is common in Britain, frequenting the sea-shores in winter, and elevated moors in summer. Its peculiar cry or whistle is among the well-known characteristics of many upland scenes. It feeds on worms, molluscs, and insects. Its long bill enables it to seek its food in marshy or boggy ground. It builds a slight nest of leaves or other dry materials, in some tuft of rushes or among long grass or heath, in which four eggs are laid. The C. is good eating.—The **WHIMBREL** (*N. phaeopus*) is a smaller species of C., much resembling the Common Curlew. It is also very widely distributed in the Old World; it frequently occurs on the shores of Britain, but seems to breed only in the most northerly moors. North America has several species of C., some of which extend their summer migrations to very northerly regions. The **ESQUIMAUX C.** (*N. borealis*) is sometimes seen migrating in dense flocks.

**CURLING**, a sport on the ice common in Scotland, where it is played by all classes of people in winter. Frozen-over lakes and rivers answer for the purpose, but under the auspices of C. clubs, artificial shallow ponds are maintained for the sake of this popular national sport, and these *bonspiels*, or set matches, are contested with immense spirit. The sport is regulated by a body of rules issued by a central association called the Caledonian Curling Club, which has grand matches in which hundreds are engaged at least once, if possible, every winter. The remarkable and pleasing peculiarity of C. is, that it produces for the time a thorough mingling of ranks—peers, peasants, clergymen, farmers, country gentlemen, and tradesmen, all mingling hilariously and familiarly for the occasion. The sport belongs more particularly to the south-western division of Scotland. Latterly, it has migrated to England, Canada, and other countries where Scotsmen can find ice of sufficient strength and keenness. C. is played with flattish round stones, about nine inches in diameter, prepared by stone-hewers, each stone weighing from 30 to 45 lbs. Each of the players has a pair. The stones are provided with handles, to enable the player to hurl them on the ice with the proper degree of force. As at bowls, the stones are hurled to an assigned point or mark. The game is as follows: Sides are made up, usually consisting of four against four, with a director styled *skip* for each; after which a certain length of ice, of from 30 to 40 yards in length, and 8 or 9

CURRACH—CURRANT.

feet across, is chosen. This is called the *rink*. Certain marks are then made at each end of the rink, consisting of several concentric rings, called *broughs*, and a centre, called the *tee*. A certain number is

game, usually 31, and the keenness displayed by rival sides in competing for victory, is perhaps without a parallel in any other pastime whatever. One on each side plays alternately. The chief

The Rink.

object of the player is to hurl his stone along the ice, towards the tee, with proper strength and precision; and on the skill displayed by the players in placing their own stones in favourable positions, or in driving rival stones out of favourable positions, depends nearly all the interest of the game. At a certain distance from each of the tees, a score—the *hog-score*—is drawn across the ice; and any stone not driven beyond this mark, counts nothing, and is laid aside. In country places, a dinner composed of 'beef and greens,' the well-known curler's fare, generally concludes the day's diversion, which, taking place when out-door labour is suspended, is felt to be no encroachment on rural occupations. For laws and regulations of C., and general remarks on the game, see *Chambers's Information for the People*, article 'Out-of-Door Amusements,' No. 95.

**CURRACH, COURACH, or CO'RACLE** (Celt. *corug, curach*; Lat. *curuca, carrocium, carabus*), the name given in the British islands to a canoe or boat, made of a slender frame of wood, covered with skins. Skiffs of this sort, as well as canoes hollowed out of the trunks of oaks, were in use among the Britons in the earliest times of which we have record. Julius Caesar, who built some of them after the British model, tells us that the keel and gunwales were of light wood, and the sides of wicker, covered with hides. Similar descriptions of the C. are given by Pliny, Lucan, Solinus, Festus Avienus, Sidonius Apollinaris, and others. The first occurrence of the name seems to be in Gildas, who wrote in the 6th c.; he speaks of the C. as in use among the Scots and the Picts. A long voyage in the North Sea, made in a C., during the same century, by one of the companions of St Columba, is commemorated by Adamnan, who died in 704.

Modern Coracle.

In 878, three Irish missionaries sailed in a C. from Ireland to Cornwall; the voyage occupied seven days; and the size of the C. is indicated by the remark that it was one of two skins and a half. An old life of St Patrick speaks of a C. 'of one skin, with neither helm nor oar.' The C. of a larger size had a mast and sail. The C. still continues to be used on the Severn, and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last C. known to have been used in Scotland is in the museum at Elgin.

It was employed on the Spey, towards the end of last century. Shaw, whose *History of Moray* was published in 1775, when the C. had become rare, thus describes it: 'It is in shape oval,

near three feet broad, and four long; a small keel runs from the head to the stern; a few ribs are placed across the keel, and a ring of pliable wood around the lip of the machine. The whole is covered with the rough hide of an ox or a horse; the seat is in the middle; it carries but one person, or, if a second goes into it to be wafted over a river, he stands behind the rower, leaning on his shoulders. In floating timber, a rope is fixed to the float, and the rower holds it in one hand, and with the other manages the paddle. He keeps the float in deep water, and brings it to shore when he will. In returning home, he carries the machine on his shoulders, or on a horse.' One who figures in the *Dunciad*—Aaron Hill the poet—by showing the Strathspey Highlanders how to make their timber into a navigable raft, hastened the disappearance of the C. from Scotland. A description of the C., as still used in Ireland, will be found in the *Ulster Journal of Archaeology*, vol. 1 p. 32. A boat of bison skin, essentially the same with the British coracle, is in use among some of the Indians of North America.

**CURRAN, JOHN PHILPOT**, a celebrated legal and parliamentary orator, born at Newmarket in the county of Cork, Ireland, July 24, 1750; was educated at Trinity College, Dublin; and in 1773, having resolved to adopt the law as a profession, went to London and entered himself at the Middle Temple. Two years after, he was called to the Irish bar, where his humorous, flowery, and sarcastic speech secured him immediate success, which his attractive social qualities did much to extend. In 1782, he obtained a seat in the Irish parliament as member for Kilbeggan, his general policy being in unison with that of Mr Grattan and the few other liberal members who were then in the House. In debate, C. was usually charged with the reply to opponents, for which important duty his ready speech and cutting retort admirably qualified him. But his sarcasm led him into several duels, in which fortunately little harm was done on either side. In 1788, he was in favour of the formation of Irish volunteers; and in subsequent years, he was constant and eloquent in his appeals to government to adopt a different policy towards Ireland, as that which it was pursuing was likely to drive the people to rebellion. Government gave no heed, and the rebellion of 1798 was the consequence. C. had retired from parliament before the Union, of which he was a warm opponent. He was appointed Master of the Rolls in Ireland in 1806, an office he held until 1813, when he resigned. He died in London, October 14, 1817. C. is best remembered for his wit and gaiety, of which many excellent examples are preserved in the various Memoirs, Recollections, &c., of him which have been published.

**CURRANT**, a name originally belonging to a small kind of grape (see CURRANTS), and transferred,

in consequence of the similar size of the fruit, to many species of the genus *Ribes*, the most important and almost the only genus of the natural order *Grossulariaceæ*. The species known as *currants* are destitute of spines, and have the flowers in racemes: the spiny species are known by the name GOOSEBERRY (q. v.). Among the fruit shrubs most generally cultivated in our gardens is the RED C. (*R. rubrum*), *Grosseille* of the French, a native of woods and thickets in the south of Europe, found also in some parts of Asia and of North America, perhaps rather a naturalised than a truly native plant in Britain. It has long been cultivated, although it does not appear that it had a place in the gardens of the ancient Greeks or Romans. The berries, besides being used for dessert, and to a much greater extent for pies, and for making jelly, are used also for making an agreeable and refreshing beverage, called in France *Eau de Grosseilles* (made of the juice of the fruit, water and sugar, strained, and iced), and a well-known fermented liquor called *Currant Wine* (q. v.).—The WHITE C. is a mere variety of the Red, the result of cultivation, with fruit less acid, and more fit for dessert, generally also rather larger. There are many sub-varieties, and many intermediate shades of colour. Both the Red and the White Currants are either trained as standard bushes, or against walls, the latter treatment producing larger and finer fruit, and both are sometimes trained on a north wall, to retard their ripening till after the ordinary season. They grow readily, like the shrubs of this genus in general, from cuttings.—The BLACK C. (*R. nigrum*), *Cassis* of the French, grows in moist woods, and on the banks of streams in Europe and the north of Asia. The fruit is much larger than the Red C., and cultivation has lately produced varieties remarkable for size. There is a variety found in Russia with yellow berries. The Black C. is not so much cultivated in Germany and Holland as the Red, and is comparatively neglected even in England, but is to be found in almost every garden in Scotland. The jelly and preserve made from it are very useful for sore throats, as is also *Black C. Vinegar*, made in the same manner as Raspberry Vinegar. In Russia, the berries are gathered in large quantities in the woods, and dried in ovens, to be used in pies. They are tonic, and also slightly diuretic and sudorific. A liqueur, called *Liqueur de Cassis*, is prepared in France from the Black C., the manufacture of which has recently acquired a great importance in the Côte d'Or and neighbouring departments. The town of Dijon contains more than thirty manufactories, and produced, in 1859, not less than 220,000 gallons of this liqueur, the wholesale price of which—of the best quality—is equal to 2s. 9d. per quart. Large tracts of land are planted with the Black C. to supply the liqueur manufactories. It has very reasonably been suggested that the experiment of the introduction of this manufacture should be made in Scotland, and even in the Hebrides and Shetland Islands, where the Black C. perhaps grows as luxuriantly, and bears fruit as abundantly as in any part of the world.—Many other species of C., producing berries somewhat similar to those of the species so extensively cultivated, and some of them probably deserving of attention and cultivation, are found in temperate and cold climates in almost all parts of the world. One with beautiful red berries, larger than the largest English Red C., occurs on the Himalaya at an elevation of 13,000 feet.—The RED-FLOWERED C. (*R. sanguineum*), now so common as an ornamental bush in shrubberies, and trained on walls, producing in April a profusion of deep-red flowers in large drooping racemes, is a native of the north-west of America,

and was introduced into Britain in 1826. Its bluish-black, mucilaginous, insipid berries are not, as is popularly believed, poisonous.—The GOLDEN C. (*R. aureum*), also a very ornamental shrub, from the same regions, has a tubular calyx and long golden yellow flowers. Its fruit, which is either yellow or black, and of fine flavour, is not freely produced in Britain.—The name NATIVE C., or AUSTRALIAN C., is given in Australia to the berries of different shrubs, particularly the white berries of *Leucopogon Richei*, of the natural order *Epacridaceæ* (q. v.). The French naturalist Riche, who was attached to D'Entrecasteaux's expedition, mainly supported himself on these berries for three days, when he had been lost by his companions. Other fruits bearing the same name are produced by species of *Coprosma* (nat. ord. *Cinchonaceæ*), but they are very inferior.

CURRENT WINE is made of the juice of red or white currants, to which is added about one pint of water for every four pints of berries employed. About a pound and a half of sugar is afterwards added to each pint of the liquor, a little spirits being generally also added, before it is set aside to ferment. A larger quantity of sugar is sometimes employed, and no water, and a stronger and sweeter C. W. is thus produced. Fermentation requires several weeks, and the wine is not fit for use for at least some months afterwards. Black C. W. is made in the same way from black currants, but the fruit is put on the fire in as small a quantity of water as possible, and heated to the boiling-point before it is bruised. C. W., well made, may fairly challenge comparison with many products of the grape.

CURRENTS, a small kind of raisin (*Passula minores*), are the dried red or blue berries of a small-fruited seedless variety of the common vine, which is cultivated in the East, and especially in Greece. The name is derived from the city of Corinth, in the neighbourhood of which they were first cultivated. They are very small, round, with a thin skin, without seeds, and very sweet. Those brought from the island of Zante are most esteemed. They are much used by bakers and cooks, entering into the composition of many kinds of cakes, puddings, &c. They are a principal article of export from Greece, and the failure of the crop is severely felt in that country; whilst an increase of the price of C. is regarded as a disagreeable occurrence by the housewives of Britain. C. are simply dried in the sun, on the ground, and then packed into barrels. In a few districts of Greece, a very sweet oily wine, called currant wine, is made from currants.

CURRENCY means originally the capacity of being current, or, as Johnson defines it, 'the power of passing from hand to hand.' It is applied in practice to the thing that is so current, and generally to whatever, by being current among any nation or class of persons, serves as the money with which they buy commodities or pay their debts. It is necessary to be content with a practical explanation, without venturing on a scientific definition of the term, because, among the many disputed points in political economy, there is none productive of more exciting controversy than the proper regulation of the C.; and as the advocate of each theory is apt to define the term in the manner best suited to serve his own ultimate conclusions, his adversaries generally deny that his definition is sound. Whether correctly or not, it is applied in practice to everything that is received for payment. It differs from the word money, in its general acceptation, in as far as it expresses only that which passes as money at some time or place referred to. The leading question among political economists regarding C. is, how far it should be

restrained. The most effectual method of restraining it is by confining it to the precious metals. If it were law that none but a gold C. should be used in any country, and if, at the same time, there were no effort to tamper with this gold C., and give it an artificial value, the C. of that country would keep its value all the world over, because it has been paid for in commodities, and will be sold again whenever it is in excess of the needs of those who use it. But for this very reason, it is a very expensive C., and therefore, ever since man's ingenuity was turned to trade, methods have been devised for superseding gold or the other precious metals by something cheaper. Unless, however, law or custom intervenes to give it efficiency, this cheaper material will only be worth its own intrinsic value. A five-pound Bank of England note is worth so little in its intrinsic value as a picture upon thin paper, that such a value can hardly be expressed. It derives its power as C. from the obligation it fixes on a great rich corporation to make good its professed amount to the holder. We thus pass from a purely bullion C. to the next step of restraint, which is generally called a mixed currency. Here some maintain that no note should be issued unless the banker or other person issuing it has in his possession as much bullion as will pay it. Others say it is sufficient that he is bound to pay its amount in bullion on demand without his actually possessing the bullion throughout the whole period of the C. of the note. A third party, again, are for a C. entirely free of a metallic basis; they hold that naturally paper-money, passing from hand to hand, will represent transactions, and will therefore come in the end to be made good in some shape or other; and they further hold, that if some losses should thus occur, these will be more than compensated by the rapid increase of trade and enterprise, caused by a free trade in C., as it is termed—that is to say, by every man issuing his own notes or promises to pay to whoever will take them. This last and extreme class of 'currency doctors,' as they have been termed, have lately been losing influence, and disappearing from the contest. Through a succession of practical measures, reached with considerable caution, the English have come to a mixed C., resting on a compromise between the two classes of mixed C. above referred to. In the theory of the measures brought to completion under Sir Robert Peel in 1844, it is admitted that, to a certain extent, a C. can be based on transactions and the property of those concerned in them, but that a limit must be drawn, to prevent the power of creating such a C. from running to excess, by the issue of notes which cannot be immediately made good by those who issue them. Accordingly, the several banks in existence were allowed to continue their note circulation, but they were permitted to increase it only on the condition of having bullion in their coffers to pay the additional notes issued by them. A C. which is not bullion, and is not worth its nominal value in bullion, is called a 'depreciated currency.' Before the resumption of cash payments, the notes of the Bank of England had sunk to be worth but 16s. in the pound, as compared with gold. A depreciated C. may be created by a government calling notes or any other form of money a legal standard, and issuing a greater quantity of them than the real transactions of the country and the property passing from hand to hand require; or it may be created by private persons acting under laws by which the right of issuing a C. is not duly limited. This faculty which a C. has of being depreciated without being repudiated, is the real source of danger in all proposals for an unfettered C., or a free trade in the issue of money. If the

bank-notes for which bullion cannot be immediately obtained were repudiated, there might be a natural check on over-issues; but it is their nature, on account of the difficulty of getting bullion for them, or the chance that it may never be got, that they pass at a discount or reduction of their value. Hence such a C. would be ever shifting; there would be no permanent standard, and the person incurring a debt before a depreciation which he pays afterwards would, in reality, be paying his creditor a dividend only. A depreciated C., however, is useful for small transactions. In the silver C. of this country, a pound is worth little more than four-fifths of a sovereign. If a person due £100 could pay it in silver, he would get off with a dividend of from 16s. to 18s. in the pound; but by law, silver is not a legal tender for more than 40s. The copper C. is so far below its real value, that it has not been thought worth while to give it a permanent weight—pence and halfpence have just been issued little more than half the weight of those of former mintages; but they are only used as a medium for small sums, and the royal stamp is sufficient to establish a reliance on them.

CURRENTS. See GULF STREAM, TIDES.

CURRIE, DR JAMES, best known for his valuable edition of Burns's works, long the basis of all subsequent editions, was born in Dumfriesshire, May 31, 1756. He was at first educated for a mercantile life, but afterwards studied medicine at Edinburgh University; and settling in Liverpool in 1781, soon obtained a good practice. He contributed some excellent papers to medical journals, but his chief work in connection with his profession was, *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Febrile Disease*, the recommendations in which work have been followed with much success. The edition of Burns (introduced by a criticism on his writings), which he undertook solely for the benefit of the widow and children of the poet, was published in 1800, and realised £1400. C. died August 31, 1805.

CURRY-COMB. A kind of scraper used for dressing horses. It consists of a number of iron plates notched on one edge to form rough teeth. These plates are fastened in parallel lines to an iron back, to which a handle is attached, and the horse is 'curried' by scrubbing with the teeth.

CURRYING. See LEATHER.

CURRY POWDER, or CURRY PASTE, is a compound of turmeric and various spices; it is used to a large extent in India and elsewhere as a seasoning for a variety of dishes. One of the best receipts for the compounding of C. P. is, turmeric powder, 6 oz.; coriander seed powder, 8 oz.; black pepper, 4 oz.; fenugreek, 2 oz.; ginger, 2 oz.; cayenne pepper,  $\frac{1}{2}$  oz.; cummin seed,  $\frac{1}{2}$  oz. Another process is to mix turmeric powder, 5 oz.; coriander seed powder, 3 oz.; black pepper, 1 oz.; ginger, 1 oz.; cayenne pepper, 1 oz.; scorched mustard, 2 oz.; mace, 2 drachms. And a third variety is obtained from turmeric powder, 8 oz.; coriander seed powder, 4 oz.; black pepper, 1 oz.; cayenne pepper, 1 oz.; scorched mustard,  $\frac{1}{2}$  oz.; mace, 1 drachm; cinnamon, 1 drachm; cardamoms, 2 drachms.

CURSE OF SCOTLAND, a term applied to the *nine of diamonds* in a pack of playing cards. Much uncertainty prevails respecting the origin of this phrase. The most probable explanation is, that it refers to the detestation entertained in Scotland towards John Dalrymple, first Earl of Stair, on account of his concern in the Massacre of Glencoe, and for which he had to resign office, 1695. The heraldic bearing of this personage was 'or, on a

saltire azure, nine lozenges of the field.' These nine lozenges resemble the nine of diamonds, and hence the popular phrase, the curse of Scotland.

**CURSING.** See INCANTATION, SWEARING.

**CURTAIN**, in Fortification, is the portion of rampart or wall between two bastions or two gates. In a regular siege, to batter down the C. is one of the main operations depended on; and many of the external works constructed by the defenders are intended to frustrate, or at least embarrass, this operation. In the annexed cut, which shews a ground-plan of some of the elements of a regular fortification, FF' is the *curtain*; HAEF, a *bastion*. The component parts of the bastion are thus designated: AH and AE, two *faces*; EF and GH, two *flanks*; A, the *salient*; FG, the *gorge*; and H and E, the *shoulders*. *mn* is the *rampart*; *no*, the

*parapet* on the rampart; QPQ', the *ditch*; NO, the *covert-way*; RWR', the *glacis*; KLL', a *ravelin*.

**CURTIUS, MERTUS** or **MERTUS**, a noble Roman youth who (according to tradition) heroically sacrificed his life for the welfare of his country, 362 B.C. A chasm, it is said, had opened in the forum or market-place in Rome, and the soothsayers predicted that some great calamity would happen if there were not thrown into the chasm the best wealth of the state. While it was proposed to consult the oracles, and determine what this best wealth could be, C. appeared on horseback and in full armour, and exclaimed: 'Rome has no greater riches than courage and arms.' He then rode over the precipice into the chasm, which immediately closed over him.

**CURTIVS, RUFUS QUINTUS**, a Roman historian, author of the work *De Rebus Gestis Alexandri Magni*, in ten books, of which the first two have been lost, and the text of the remainder has come down to us in a damaged condition. Great differences of opinion have existed with regard to the time in which C. wrote, for his name is first mentioned by writers after the 12th century. Some critics have supposed that C. lived in the reign of Augustus; others, that he wrote in the 2d c., or under Constantine or Theodosius; while some regard the work ascribed to C. as a composition of the 13th century. The most probable opinion is that he flourished in the time of Vespasian. The value of the work is as dubious as its authorship. C. had a very inaccurate knowledge of geography, chronology, military tactics, astronomy, and historic criticism; hence his work is far from being reliable as a whole. The style, though declamatory, is on the whole pure and elegant. The first edition of C.'s history was published at Venice about 1471.

Among modern editions may be mentioned Mützell's (Berlin, 1841) and Zumpt's (Brunswick, 1849).

**CURVATURE.** The C. of a plane curve at a point is its tendency to depart from a tangent to the curve at that point. In the circle, this tendency is the same throughout, for the curve is perfectly symmetrical round its centre; in other words, the C. of a circle is constant. In different circles, the C. is inversely as the radius —i. e., it diminishes as the radius increases. The reciprocal of the radius is accordingly assumed as the measure of C. of a circle. A straight line, which has no C., may be considered part of a circle whose radius equals infinity as the measure of the reciprocal of infinity, measures the C., and is = 0. The annexed fig. shews how the circle of smaller radius bends more rapidly away from the tangent than that of larger radius.

The constancy of C. in the circle suggests an absolute measure of C. at any point in any other curve; for whatever be the C. at that point, we can always find a circle of the same curvature. The radius of the circle which has the same C. at any point in a curve as the curve itself at that point, is called the radius of C. of the curve for that point; and the circle itself is called the *osculating circle*. If we know the radius of C. of a curve at different points, we can compare its C. at those points. We have thus the means also of comparing degrees of C. in different curves.

The problem of measuring the C. of a curve at any point is the same, then, with that of finding its radius of curvature. In some simple cases, as in the conic sections, this may be done geometrically; it is usually necessary, however, to employ the calculus. If the curve be referred to rectangular co-ordinates, and *x, y* be a point in it, then it can

be shewn that radius of C. =  $\frac{\left(1 + \frac{dy^2}{dx^2}\right)^{\frac{3}{2}}}{d^2y}{dx^2}$ . If the

curved line, instead of being plane, twists in space, it is called a curve of double curvature. See CONTACT and OSCULATING CIRCLE.

**CURVE** means, in common language, a crooked line that departs gradually from the straight direction; in mathematics, however, it is usually restricted to lines that follow some law in their change of direction. Thus, the law of the circle is, that all points of it are equally distant from a fixed point, called the centre. The law of a plane curve is generally expressed by an equation between the co-ordinates of any point in it referred to a fixed point. See CO-ORDINATES. When the equation of a curve contains only powers of *x* and *y*, the curve is algebraic; when the equation contains other functions, logarithms, for instance, of *x* and *y*, the curve is called transcendental. The cycloid, e.g., is a transcendental curve.

There are also curves, like the spiral, that do not continue in one plane; these are called curves of double curvature. To express the law of such a curve requires three co-ordinates and two equations.—Curves are said to be of the first, second, third, &c., order, according as their equations involve the first, second, third powers of *x* or *y*. The circle,

ellipse, parabola, and hyperbola are of the second order of curves. There is only one line of the first order, namely, the straight line, which is also reckoned among the curves.—The higher geometry investigates the amount of curvature of curves, their length, the surface they enclose, &c.

The number of curves that might be drawn is of course infinite. A large number have received names, and are objects of great interest to the mathematician—in some cases, for their beauty, in others, for their remarkable properties. Among the most interesting are the following: 1, circle; 2, ellipse; 3, hyperbola; 4, parabola; 5, cissoid of Diocles; 6, conchoid of Nicomedes; 7, lemniscata; 8, cycloid; 9, harmonic curve; 10, trefoil; 11, the witch; 12, cardioid; 13, curves of circular functions—e. g., curve of sines; 14, the logarithmic curve; 15, the spiral of Archimedes; 16, the catenary; 17, the tractory; 18, the tractrix; 19, the ovals of Cassini; 20, the reciprocal spiral.

**CURVES, ANTICLINAL AND SYNCLINAL**, are terms applied to the elevations or depressions in undulating strata. The ridge-wave is called the anticlinal curve, and the top of the ridge is known

as the anticlinal axis; whilst the trough is the synclinal curve, and the bottom of the trough the synclinal axis. In the annexed section of the Jura Mountains, three anticlinal and two synclinal axes are seen.

**CURZO'LA** (ancient, *Corcyræ Nigra*, so called from the sombre colour of its pine forests), an island of the Adriatic, forming a part of the Austrian crown-land of Dalmatia, in lat. 42° 57' N., long. 17° E. It has a length of about 25 miles, with an average breadth of 4 miles. It is well covered with wood, which on the south coast grows down to the water-edge. The woods furnish ship-timber, a considerable quantity of wine is raised, and the fisheries of the coast are productive. The population numbers altogether 6500, about 2000 of whom are located in the town of C., at the north-east extremity of the island.

**CUSCUS.** See LEMON GRASS.

**CUSCUTACEÆ.** See DODDER.

**CUSHAT.** See PIGEON.

**CUSP** (Lat. *cuspis*, the point) is a point in a curve at which its two branches have a common tangent. If we conceive a curve to be generated by a moving point, then a C. is where the point suddenly stops and returns for a time in the same general direction as that in which it was moving when it reached the C. point. Cusps are of two kinds: 1, when the two branches, AB, AC, have their convexities turned in the same direction with

respect to the common tangent at the C. point, as in fig. 1; 2, when they have their convexities turned

Fig. 1.

Fig. 2.

in opposite directions to the common tangent at the C. point, as in fig. 2.

**CUSP**, in Architecture, is the point formed by the meeting of two small arches, or foils, in foil arches (q. v.), or tracery. Cusps often terminate in rich bosses of flowers and leaves.

Cusp.

**CUSSO, KOSSO**, or **CABOTZ** (*Brayera anthelmintica*, or *Hagenia Abyssinica*), a small Abyssinian tree of the natural order *Rosaceæ*, sub-order *Spiraceæ*, the dried flowers of which have been long used in Abyssinia as an anthelmintic, and have been found so efficacious in the removal of

Cusso:

A, a branch, with leaves and flowers; B, a flower seen laterally; C, a female flower; a, b, c, d, e, the five outer segments of the calyx.

tape-worm, that they are now a much valued medicine in Europe. The flowers are simply dried, in order to be ready for the market; they have an aromatic, but not very agreeable smell, and are administered in the form of an infusion.

**CUSTARD**, a composition of milk or cream, eggs, &c., sweetened with sugar, and flavoured according to taste. Custards are of various kinds, such as plain, baked, lemon, orange, almond, coffee custards, &c. For a plain C., the following is a recipe as given by M. Soyer: Mix a pint of boiling milk with two ounces of sugar and the thin yellow peel of half a lemon; then take four eggs, beat well in a basin, and add gradually the milk, &c. (not too hot); pass the mixture through a colander, and, having filled the custard cups with it, place them over the fire in a stew-pan, containing about one inch of hot water, and leave them here until sufficiently set (about twelve minutes is the time required). With this as a basis, a variety of custards are produced by

the simple addition of flavouring ingredients, as almonds, orange-peel, &c.

**CUSTARD APPLE**, the name commonly given in the West Indies and other tropical countries to the fruits of certain species of *Anona*, a genus of trees of the natural order *Anonaceæ* (q. v.). Some of the fruits of this genus are among the most delicious produced in tropical countries, as the Cherimoyer (q. v.), and even the common C. A. (*A. reticulata*), which is regarded as a native of America, but is now very common throughout the East Indies, the variety cultivated in the Eastern Archipelago being very superior even to the West Indian. The C. A. is a large, dark-brown, roundish fruit, sometimes from its size and appearance called Bullock's Heart in the West Indies; the tree is of considerable size. Some other American species of *Anona* are sometimes called custard apples,

Custard Apple (*Anona triloba*).

and two or three which are natives of Western Africa. To this genus also belong the Sweet-sop, the Sour-sop, the Pinana or Pinha, all of them tropical American fruits, and the ALLIGATOR APPLE of the West Indies (*A. palustris*), a fruit of pleasant taste, but regarded as dangerously narcotic.

**CUSTODY.** See IMPRISONMENT.

**CUSTOM**, in English Law. This is either general or particular. The principal doctrines relating to general customs have been stated under COMMON LAW. Of particular customs, it may be remarked that, in order to establish them as law, they must be proved by verdict of a jury, except the C. of the city of London, which is proved by certificate by the lord mayor, aldermen, and recorder. A particular C. must, like a general C., be established as in force for a time whereof the memory of man runneth not to the contrary. See COMMON LAW. A C. must have been uninterrupted as regards right, though the exercise of it may have been disused; it must have been held without objection, and be unopposed to other customs; it must be not unreasonable nor uncertain in operation.

**CUSTOMARY FREEHOLD**, in English Law, a species of estate which, in all practical respects, is identical with Copyhold (q. v.), but in

which the tenure is expressed to be according to the custom of the manor, without adding the words 'at the will of the lord.'

**CUSTOM HOUSE**, the office at a seaport where the customs duties (see next article) are paid, vessels entered and cleared, &c. The several custom houses in the United Kingdom have each a separate establishment of officers, according to the extent of the trade in the port to which it belongs, and the consequent exigencies of the service. The whole are, however, under the control of the Commissioners of Customs. The salaries of the various offices, and other details of the service, will be found in Parkinson's *Under Government*; Bell and Daldy, 1859.

**CUSTOMS DUTIES**, the portion of the revenue of the United Kingdom derived from a tax on imports. The origin of the term is connected with the long conflict between the crown and parliament as to the right of taxation. To meet the claims made by the House of Commons of the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exportation and on importation to which the crown had acquired a right by *custom*, and after the power of parliament over this branch of taxation had been fully established, it retained its old name. This tax, after the excise came in force, was always applicable distinctively to goods changing place. There were customs not only upon things leaving and things coming to the British dominions, but also upon commodities transferred from one part to another. In Scotland, the duty on commodities imported into any town from a foreign country was called the great custom; and the duty charged by a burghal corporation on commodities coming from the country districts within its walls was called the small or petty customs. At present, the term C. D. applies solely to the tax levied on commodities imported from abroad, thus facilitating a convenient division of the sources of the British revenue into the Customs and the Inland Revenue, the latter including all other taxes.

The tax on imports was of old a simple percentage, familiarly known to the readers of English history as 'tonnage and poundage,' from the method in which it was adjusted to heavy and light goods. Subsequently, however, the notion prevailed that the C. D. might not only be a source of revenue, but an instrument for furthering the various theories about protecting this trade and discouraging that, which prevailed from time to time. When it was held as an established principle, with regard to any trade, that the customs should be adjusted in such a manner as either to aid or to impede it, the regulations regarding that trade alone would have complexity enough for a whole code of customs laws, the object of which was mere revenue. The more complex the arrangements, the more open were they to the machinations of the smuggler or defrauder, and consequently regulation had to be added to regulation, till the whole became a chaos. In some instances, the duties were such as to act as a prohibition to importation; in others, merely as a heavy increase on the price. In either case, there would be relaxations in favour of the produce of our own colonies, and perhaps of some favoured country with which we had a treaty of reciprocity. Then, to encourage our own trade and manufactures, it was considered politic to allow goods to be imported for exportation abroad, or to be imported for the purpose of being worked up into a manufacture, and there would be a difference between the extent of encouragement granted to that manufacture, if it were for home consumption

or for exportation. The method in which such relaxation was accomplished was at first by charging the duty on the importation, and afterwards repaying it by what was called a 'drawback;' and this was subsequently accomplished in an easier method for the importer, by allowing him to 'bond' the goods in the government warehouses until the duty was paid, or the conditions which dispensed with it fulfilled. See WAREHOUSING SYSTEM.

In the year 1825, the laws of the British customs were consolidated into eleven acts of parliament—the fruit of the exertions of the late Mr Deacon Hume. It will give a conception of the confused and cumbersome condition into which the system had merged, to note that the number of acts repealed on the occasion of the consolidation was 413, and it was afterwards discovered that several had been omitted. There was still a long list of C. D., many of them intended for purposes beyond the mere collection of revenue; but the free-trade legislation of 1846 cleared away a great mass of this burden on the commerce of the country, and almost every year has contributed to the abbreviation of the list of duties or Tariff (q. v.). Thus simplified and reduced, the C. D. supply an enormous amount of revenue. The total receipts of the British revenue for the year 1860 were £71,967,494, 11s. 9d., and to this amount the customs contributed £23,032,394, 16s. 3d.

The defects which, according to the doctrines now prevalent in this country, are to be avoided in a code of customs, are—1. The prohibition or discouragement of the importation of useful commodities; 2. Encouragement to the smuggler; and 3. Loss of revenue by raising the duty to the height which discourages importation. Under the first head, see ANTI-CORN-LAW LEAGUE, CORN LAWS, and FREE-TRADE. The second is connected with the view that on stimulants the duty cannot be too high, even though it should greatly impede their importation—the duty on tobacco is, in some instances, as high as 900 per cent. on the value of the article. But then, if the smuggling trade be encouraged, the stimulant is not only obtained without any contribution to the revenue, but the people become demoralised, and trained to crime. Under the third head, a memorable example is furnished by the sugar-duties of France, which were so high that the native agriculturists could make sugar from beet-root a little cheaper than the duty-paid foreign sugar. Hence the article was dear, for had it not been for the height of the duty, it would not have been worth while to make it at home, and at the same time there arose little or no revenue from it.

The collection and general management of the C. D., which used to be divided among several boards, is now under one great central department of the government in London. It consists of a chairman, deputy-chairman, four commissioners, a secretary, an assistant-secretary, and a staff of subordinate officers.

**CUSTOS ROTULORUM** (Lat. keeper of the *rotuli* or rolls), one of the justices of the peace of a county appointed by the crown to keep the county records.

**CÜSTRIN.** See KÜSTRIN.

**CUTCH**, a protected principality under the presidency of Bombay, stretches along the gulf of its own name and the Indian Ocean between Guzerat and Sinde. It extends in N. lat. from 22° 45' to 24° 40', and in E. long. from 68° 26' to 71° 45', containing, in something of a triangular form with the maritime line as a base, an area of 15,364 square miles, and a population of rather more than half a million. It is divided naturally into C. Proper and

the Runn of Cutch.—1. C. Proper, consisting of 6764 square miles, and numbering nearly all the inhabitants, is the belt on the sea-shore, touching Sinde, of which it may be regarded as a physical continuation, on the north-west, and being separated by a detached portion of the Runn from Guzerat on the south-east. While the southern edge of this belt is merely a sandy desert, the northern section, traversed lengthwise by two parallel ranges of hills, presents, amid much sterility, many fertile tracts, which yield cotton, rice, &c., and feed a large stock of horses, kine, buffaloes, and camels. The grand defect of the country is the scarcity of water. Hence the crops occasionally fail from the scantiness of irrigation; and at this moment, in March 1861, this region is said to be suffering more severely than almost any other in India from a nearly general famine. Timber is scarce, for the growth in the mountains is chiefly brushwood. Here and there, however, decayed trunks of great size, more particularly on the southern ridge, indicate the former existence of noble forests. The mineral productions are coal, iron, and alum. The traces of volcanic action are numerous. Earthquakes also have recently occurred; one of which, in July 1819, besides shaking every fortification to its foundations, and destroying several hundreds of people, threw up an enormous mound of earth and sand many miles in extent, and simultaneously submerged an adjacent district of corresponding size. The annual revenue of the state amounts to £73,842; and the military force consists exclusively of a body of irregular cavalry. The ruler is styled the Rao; and the feudatory chieftains under him are about 200.—2. Runn of C.—subdivided into two parts, the smaller, of 1600 square miles, on the east, and the larger, of 7000 square miles, on the north—is merely an amphibious desert, being, in a great measure, hard ground during the dry season, and then, in turn, a sort of shallow lake formed by the heavy rains and pent-up tides of the south-west monsoon. It is supposed to have been originally a permanent inlet of the ocean, and to have had its level raised by some such convulsion of nature as that which marked the year 1819. The periodical disappearance of the waters leaves behind it one continuous crust of salt. This dreary waste, however, is not without its elevated spots, the islets, doubtless, of a remoter era. But, with the exception of herds of asses and clouds of flies, animal life appears to be nearly unknown.

**CUTHBERT**, ST. OF DURHAM, one of the three great saints of England in the middle ages, the other two being St Edmund of Edmundsbury, and St Thomas-à-Becket of Canterbury. St C. was born about 635. Neither his birthplace nor his parentage has been ascertained; but a legend, which was long generally believed, told that he was born in Ireland, and drew his lineage from one of the petty kings of that country. When the light of record first falls upon him, he is a shepherd boy in the kingdom of Northumbria, which then stretched northwards to the Forth. In 651, while watching his flock by night on the heights of Lauderdale, he believes that he sees the heavens open, and a company of angels descend upon the earth, and again ascend to heaven, carrying with them the soul of St Aidan, the pious Bishop of Lindisfarne, or Holy Island. The vision determines him to become a monk, and in the same year he enters the monastery of Melrose, of which St Boisil was then provost or prior, and St Eata, abbot. When the latter removed to the newly-founded monastery of Ripon, St C. accompanied him, and was appointed to the office of superintendent of the guests. In 661, St Boisil died of the plague, which then ravaged Britain,

and St C. was chosen to succeed him as provost or prior of Melrose. While in this office, he distinguished himself by his assiduity in visiting the neighbouring villages, and especially the remoter mountain hamlets, sometimes on horseback, but oftener on foot, and labouring by his teaching and example to reclaim the people from the superstitious or pagan rites into which they had fallen. After a few years spent in this way, he left Melrose for the island monastery of Lindisfarne, of which he became provost or prior, his old master, St Eata, being abbot. Longing for an austerer life even than the monastic, he quitted Lindisfarne in 676, to become an anchorite, or solitary recluse, in a hut which he built with his own hands on Farne Island. Here, in 684, he was visited by Ecgfrid, king of Northumbria, Truaine, ex-bishop of the Picts, and other great men of the north, who came at the request of the synod of Twyford to entreat that he would accept the bishopric of Hexham. He reluctantly complies with their wishes, but his heart is still with his Northumbrian islands. He exchanges the see of Hexham for that of Lindisfarne, and still thirsting after solitude, at the end of two years he resigns his bishopric, and returns to his hut in Farne Island. Here he died on the 20th of March 687. The anniversary of his death was a great festival in the English Church, which commemorated also the 4th of September, as the anniversary of the day on which his body was translated to Durham. The influence which St C. exercised upon his age seems to have been due chiefly to his fervent piety and extraordinary asceticism. The gift of a persuasive tongue was ascribed to him, and he would seem to have had skill and prudence in the management of affairs, but nowhere is there any trace of his learning.

The fame of St C. had been great during his life; it became far greater after his death. Churches were dedicated to him throughout all the wide country between the Trent and Mersey on the south, and the Forth and Clyde on the north. When his tomb was opened at the end of eleven years, it was believed that his body was found incorrupt, and so, for more than 800 years, it was believed still to continue. It remained at Lindisfarne till 875, when the monks, bearing it on their shoulders, fled inland from the fury of the Danes. After many wanderings through the south of Scotland and the north of England, it found a resting-place at Chester-le-Street in 882. It was transferred to Ripon in 995, and in the same year it was removed to Durham. Here, enclosed in a costly shrine, and believed to work daily miracles, it remained till the Reformation, when it was buried under the pavement of the cathedral. The grave was opened in 1827, when a coffin, ascertained to have been made in 1541—when the body was committed to the earth—was found to enclose another, which there was reason to suppose had been made in 1104; and this again enclosed a third, which answered the description of one made in 698, when the saint was raised from his first grave. This innermost case contained, not, indeed, the incorruptible body of St C., but his skeleton, still entire, wrapped in five robes of embroidered silk. Fragments of these, and of the episcopal vestments, together with a comb and other relics, found beside the bones, are to be seen in the cathedral library. The asceticism which distinguished St C. in life, long lingered round his tomb. Until the Reformation, no woman was suffered to approach his shrine; the cross of blue marble still remains in the cathedral floor which marked the limits beyond which female footsteps were forbidden to pass, under pain of instant and signal punishment from the offended saint. His wrath, it was believed,

was equally prompt to avenge every injury to the honour or possessions of his church. It was told that William the Conqueror, anxious to see the incorrupt body of the saint, ordered the shrine to be broken up; but scarcely had a stroke been struck, when such sickness and terror fell upon the king, that he rushed from the cathedral, and, mounting his horse, never drew bridle till he had crossed the Tees. A cloth, said to have been used by St C. in celebrating mass, was fashioned into a standard, which was believed to insure victory to the army in whose ranks it was carried. Flodden was only one of many fields in which the defeat of the Scots was ascribed to the banner of St Cuthbert. It hung beside his shrine until the Reformation, when it is said to have been burnt by Calvin's sister, the wife of the first Protestant dean of the cathedral.

The life of St C. was twice written by the Venerable Bede—briefly in vigorous hexameters in his *Liber de Miraculis Sancti Cuthberti Episcopi*; at greater length, in prose, in his *Liber de Vita et Miraculis Sancti Cuthberti Lindisfarnensis Episcopi*. In this latter work, he made use of an earlier life by a monk of Lindisfarne, which is still preserved. Besides these lives—all of which have been printed more than once—and what is told of St C. in Bede's *Historia Ecclesiastica Gentis Anglorum*, the chief ancient authorities are the *Historia Translationis S. Cuthberti*, published by the Bollandists in the *Acta Sanctorum, mens. Martii*, vol. iii.; the *Libellus de Exordio Dunhelmensis Ecclesie* by Symeon of Durham; the *Libellus de Nativitate S. Cuthberti de Historiis Hybernensium excerptus*, and the *Libellus de Admirandis B. Cuthberti Virtutibus*, by Reginald of Durham, both published by the Surtees Society. There are two modern memoirs of St C.—the late Rev. James Raine's *St Cuthbert* (Durham, 1828), and the Very Rev. Monsignor C. Eyre's *History of St Cuthbert* (Lond. 1849).

CUTHBERT, a disciple of the Venerable Bede in the monastery of Jarrow, of which he himself was afterwards abbot, was present at the death of his master in 735, and has left a beautiful and touching relation of the event in a letter to his fellow-disciple, Cuthwine. It has been often printed; the best editions are those in Twysden's *Decem Scriptores* (Lond. 1652), and in Stevenson's edition of Bede's *Historia Ecclesiastica* (Lond. 1838).

CUTHBERT OF CANTERBURY, a native of the kingdom of Mercia, became Bishop of Hereford in 736, and Archbishop of Canterbury in 740. He died in 758. An instructive letter was addressed to him by St Boniface (or Winfrid) on the ecclesiastical abuses of the age. It has been printed more than once, and will be found in the appendix to the late Professor Hussey's edition of Bede's *Historia Ecclesiastica* (Oxon. 1846).

CUTHBERT'S BEADS, *St.* See BEADS.

CUTICLE. See SKIN.

CUTLASS is a sword about 3 feet long, broad and straight, with a japed hilt. Outlasses are mostly used by sailors in the navy, when boarding and taking possession of the enemy's ships.

CUTLERY, the general name for all kinds of cutting instruments, such as knives, forks, scissors, razors, &c. The workman who makes these is called a cutler; the sword-maker, a sword-cutler; but the manufacturer of workmen's tools is called a 'tool-maker,' or a 'steel toy-maker,' not a cutler. In Birmingham, for example, such implements as hammers, chisels, pincers, hatchets, &c., are technically called toys.

Shells, flints, and other sharp-edged stones formed

the rudest and most ancient cutting instruments, and the earliest traces of human existence upon our island and elsewhere, are associated with stone 'celts' and other weapons and cutting implements. These were followed by bronze weapons and implements, which were in use among the Romans for some purposes up to about the time of the Christian era, bronze surgical instruments having been found at Pompeii. This bronze, like steel, could be made soft for working into shape, and then hardened, but by the opposite means used for hardening and softening of steel, bronze being softened by sudden cooling from a red heat, and hardened by slow cooling. Some cities in Spain and the north of Italy acquired a high reputation for the manufacture of cutting instruments, more particularly swords, during the middle ages, when the chivalry of the period sought the best equipments. Latterly, all countries have been outstripped by England as regards tastefulness, excellence, and cheapness in cutlery. In this kind of manufacture, the lead is taken by Sheffield, which had gained a name for its *whittles* as early as the reign of Richard I. Why, with their ingenuity, taste, and skill in the arts, neither the French nor Belgians succeed in their C., would be difficult to explain. Certain it is that their C. is comparatively inferior as regards temper and finish, while their apparent incapability of making the delicate hinges and springs of clasp-knives has provoked repeated remark. At the same time, it is to be allowed that foreign C. is rapidly improving, particularly in table-knives, on which a few years have made a great difference in France. In the manufacture of American axes, Canada has made most marvellous advances, its produce as respects this article excelling that of England.

Good *table-knives* are made of steel and iron welded together; the tang, which goes into the handle, and the shoulder, are of iron, and the blade of steel. The tang and shoulder are forged from bar-iron, and the blade from shear or cast steel. Knife-blades, razor-blades, and other small articles, are usually forged into their required shape while still attached to the bar, which serves for the workmen to hold them by, and is called the 'porter.' When the bar becomes too short, it is grasped in a pair of tongs held close by a ring which clamps them by sliding up their conical handles. Two men are employed in forging such work, which is said to be 'two-handed.' The principal workman, or 'fireman,' uses a small hammer of 2 to 4 lbs. weight, while the 'hammerman' wields the sledge-hammer, weighing from 10 to 15 lbs. The 'fireman,' who attends the heating as well as the anvil-work, directs the hammerman, whose blows merely follow those of the small directing hammer of the fireman. In *drawing down* or *reducing* a bar both in length and width, the flat face of the hammer is used; but when the length or breadth alone is to be extended, only the 'pane' or narrow edge of the hammer. The concavity of razor-blades is made by hammering the blade on a small round-faced anvil; the notch or 'nail-hole' of a penknife is struck by means of a chisel of the required form. Superior work, such as razor-blades, are *smithed* after forging—that is, beaten upon an anvil, to condense the metal as much as possible—and slightly ground or *scooped* on a rough stone, to finish the shaping, and remove the 'scale' or black oxidised surface, which would interfere with the colour of the tempering. Common knives are made entirely of iron, and the difference of price arises not merely from the difference of cost of the material, but from the greater facility of working. It should also be understood that, in many articles composed of steel welded to iron, the saving of steel is not the only advantage, for steel being more

brittle than wrought iron, it is very desirable, in all articles subject to a transverse breaking strain or to concussion, that every part except the cutting or working edge should be of iron. Thus, a hatchet made entirely of steel would be far less durable than one of iron with a welded steel cutting-edge. A table-knife with a steel tang would be weaker than one with an iron tang. Hammers should only be *faced* with steel, &c.

The great usefulness of steel for all kinds of implements used for cutting or exposed to wearing friction, depends upon its property of acquiring a high degree of hardness when heated and suddenly cooled, and of then being capable of softening again in various degrees by reheating moderately. See TEMPERING OF STEEL.

Table-forks are forged rudely into the shape of the tang and shank, first as though but a single thick prong were required; the part for the prongs is then beaten out, and a stamping-die is brought down upon it, which forms the prongs, with a thin film of steel between them; this is cut out by a cutting-die. Then they are softened and filed up, again hardened, and tempered, and ground, to smooth and finish. The dry-grinding of forks, needles, &c., is a very deleterious trade, on account of the particles of steel which enter the nostrils of the workmen, and produce most painful irritation, followed by a peculiar disease called 'grinders' asthma,' which is said to shorten life so seriously that few dry-grinders, exposed to the steel dust, reach forty years of age. Many remedies have been proposed for this. A magnetic mouthpiece was invented; but the workmen would not wear it, on account of its novelty, its grotesque appearance, the trouble of cleaning it, and the belief that if their trade were made more healthy, greater numbers would enter it, and wages would be reduced. A revolving fan, which sets in motion a current of air, that is carried by a pipe to the outside of the building, has been used, but the introduction of this has met with much opposition from the workmen. The use of wet stones would, of course, entirely obviate the evil, but they are not applicable to many kinds of work, especially that which is ground before hardening, as the stone wears away very rapidly under these circumstances.

Penknives and other pocket-knives are the work of many hands. Besides the blades, there are the separate pieces of the spring, the handle, rivets, &c., the making of each of which is a distinct trade. All these pieces are finally fitted and put together by the finisher; a good two-bladed knife passes through his hands from 70 to 100 times. The difference in the amount of labour bestowed on the best and the commonest C. is very remarkable, and the difference of price is of course proportionate. Scissors are sold as low as 2½d. per dozen pairs, table-knives and forks at 1s. 10d. per dozen pairs, razors at 1s. 6d. per dozen.

CUTTACK ('Royal Residence'), the capital of a district of its own name, in the sub-presidency of Bengal, stands immediately below the bifurcation of the Mahanuddee, thus occupying the very apex of the delta of that river. The advantage, however, of this position, in a political and commercial point of view, seems to be in a measure neutralised by the cost of providing against the encroachments of the bordering streams. With an estimated population of 40,000, the city has no pretensions to architectural beauty. It has very little trade; and its manufactures are principally shoes and brass cooking-vessels. C. is 220 miles south-west of Calcutta, in lat. 20° 25' N., and long. 85° 55' E.

CUTTACK, the district, lies on the north-west

## CUTTER—CUTTLE-FISH.

coast of the Bay of Bengal, extending in N. lat. from 19° 40' to 21° 45', and in E. long. from 85° S' to 87° 31'; area, 7635 square miles. The population has been officially stated at 2,127,555. The Mahanuddee is the main river, its delta being wholly comprised within the district. Among the natural features of the country, the most remarkable is the Chilka Lake, which is, for many miles, separated from the sea by a strip of sand not more than 300 yards wide. Next to the capital, the chief towns, reckoning from the south, are Pooree, with its temples of Juggernaut, at the mouth of the most southerly arm of the Mahanuddee; Kanarak, or the Black Pagoda, about twenty miles further to the north; and Balasore, which gives its name to a roadstead stretching along the coast as far as the Hooghly. Among seamen, this maritime tract is generally distinguished as Orissa. The trade of the district is inconsiderable. Iron ore is said to be found.

**CUTTER** is a name given to two kinds of small vessels. The cutters used by yachtsmen, smugglers, and revenue cruisers, and which are built with especial reference to speed, have a single mast, and a straight running bowsprit that can be run in on board occasionally. They are much like sloops in rig, but have larger sails. Such small vessels occasionally venture on long voyages. In 1857, the *Charter Oak*, a C. of 23 tons, crossed the Atlantic from New York

Cutter.

to Liverpool; and, in 1858, the *Christopher Columbus*, a C. of 45 tons, with a crew of only two boys, besides the owner, performed the same voyage in 45 days. The cutters belonging to ships of war are clincher-built boats, from about 24 to 28 feet in length, employed for various purposes; they weigh from 10 cwt. to 24 cwt. each. Two such cutters are supplied to every ship of war, except those of the smallest kinds.

**CUTTINGS** are branches or portions of branches of trees or shrubs, employed to produce new plants, by the insertion of the lower end into the earth. By care, and in the most favourable circumstances, almost any tree or shrub may be propagated by C., but some only with great difficulty, and soft-wooded trees or shrubs most easily. Nothing is more easy than to propagate willows, fuchsias, currants, gooseberries, &c., in this way; but many other plants, commonly propagated by C., require greater attention on the part of the gardener, warmth, a uniform damp atmosphere, and shade. Some kinds of apple are occasionally propagated by C., and in warmer climates than that of Britain, this mode of propagation is found suitable for a greater

number of kinds. C. are most advantageously taken from branches of which the wood is young, yet at least a year old. The top is generally cut off, and not much more left above ground than is inserted into it. Care must be taken in planting C. not to use such force as to strip off the bark. Some herbaceous plants are propagated by C., which, in pinks and carnations, are called *pipings*.

**CUTTLE-FISH** (*Sepia* and *Sepiadae*), a genus and family of cephalopodous molluscs of the order *Dibranchiata*. See CEPHALOPODA. The body is oblong and depressed, sac-like, with two narrow lateral fins of similar substance with the mantle. There is an internal shell lodged in a sac on the back part of the mantle, somewhat oval and blade-shaped, being comparatively thick near the anterior end, where it is terminated by a sharp point affixed, as it were, to its general outline; the whole shell is light and porous; it is formed of thin plates with intervening spaces divided by innumerable partitions; and consists chiefly of carbonate of lime with a little gelatinous and other animal matter, which is most abundant in the *phragmocone*, or internal harder part of the shell, where also the laminae and partitions are closer than in the outer part. The eyes are very large, and the head is furnished with eight arms, each of which has four rows of suckers, and two long tentacles expanded and furnished with suckers on one side at the extremity. The

Cuttle-fish.

**COMMON C.** (*Sepia officinalis*) is abundant on the British coasts. Its skin is smooth, whitish, and dotted with red. It attains the length of a foot or more. It is one of the pests of fishermen; often, along with calamaries, partially devouring the fish which have been caught in their nets. In Scotland, the fishermen call it the O fish. It is not itself easily caught, being very active in making its escape by swimming, and also promptly throwing out its ink to darken the water around it. It is sometimes cast upon the shore, but far more frequently its bone, which is used for making pounce, tooth-powder, &c., for forming moulds for small silver castings, for polishing, and for other purposes in the arts; and was formerly often used in medicine as a corrective of acidity in the stomach, for which purpose, however, it is no better adapted than any other form of carbonate of lime. The ink of the C. furnishes the valuable pigment called *Sepia* (q. v.), which is said by some chemists to contain a peculiar animal principle called *Melanine* (Gr. *melas*, black), and is wonderfully indestructible. Dr Buckland indeed found the pigment remaining in fossil molluscs akin

Cuttle-fish Bone.

to the C. to be fit for use, and to make excellent sepia, notwithstanding all the unreckoned ages that had elapsed from the time of its secretion by the living organisms.—The eggs of the C. are not unfrequently cast ashore, clustered together like grapes, and are known to the frequenters of the coast as *Sea-grapes*.—The flesh of the C. was

esteemed by the ancients. A receipt for making a C. sausage will be found in Athenæus.—Numerous species of C. inhabit different seas.

CUVIER, GEORGES CHRÉTIEN LÉOPOLD DAGOBERT, BARON, was born August 23, 1769, at Mömpelgard, a town then belonging to Würtemberg, but now to France. His father was an officer in a Swiss regiment. Having made rapid progress in learning at the Mömpelgard gymnasium, C. entered, in 1784, the Karlsakademie at Stuttgart. Here, in the midst of various studies, he retained that predilection for natural history which he had displayed when only twelve years old. The restricted means of his parents, however, compelled him, in 1788, to take a situation as private tutor in the family of Comte d'Hérey, who resided near Fécamp, in Normandy. Here C. lived for six years, quietly but ceaselessly pursuing his studies in natural history. An acquaintance accidentally formed between him and the Abbé Tessier (noted as a writer on agriculture), was the cause of C.'s obtaining an introduction to Geoffroy St Hilaire and other eminent Parisian savans. Startled by the novelty and comprehensiveness of his views on zoology, Geoffroy St Hilaire urged him to come to Paris, which he did, and, in 1795, was appointed professor in the Ecole Centrale of the Panthéon. Soon after this appointment, C. was made assistant to Mertrud, the teacher in comparative anatomy at the Jardin des Plantes, and now he began to form that collection in natural history which ultimately became the largest in Europe. In 1796, he was made a member of the National Institute; in 1800, he succeeded Daubenton in the Collège de France; and, in 1802, was made perpetual Secretary of the Institute. He gradually rose in the estimation of the Emperor, and, in 1808, was commissioned to superintend the institution of academies in the new territories attached to France. Shortly before the fall of Napoleon, C. was admitted into the Council of State. The Restoration did not deprive him of his honours, but added to them; he was made Chancellor of the University of Paris, and, henceforward, received from time to time new rewards for his services to science. After a visit to England (1818), where he was received with great honours, he was, in 1819, admitted into the cabinet by Louis XVIII., and, in 1826, was made Grand Officer of the Legion of Honour; but his decided opposition to the royal measures for restricting the freedom of the press, lost him the favour of Charles X. Under Louis Philippe, he was made a peer of France in 1831, and in the following year was nominated Minister of the Interior, when he was suddenly attacked with paralysis, of which he died, May 13, 1832.

It is difficult, in our narrow compass, to give a summary of the merits of C., so various were his attainments, so great was his success in so many departments. He laid the foundation of the now universally recognised method of classification in Zoology (q. v.), and raised comparative anatomy (which until his time had been merely a heap of unconnected details) to the dignity of a science. After a long series of patient observations on numerous animals, especially the hitherto little-known order of mollusca, he published (1801—1805) his *Leçons d'Anatomie Comparée*, which was completed by the *Mémoire pour servir à l'Histoire de l'Anatomie des Mollusques* (1816). With admirable sagacity, he applied the principles of his Comparative Osteology to the remains of fossil vertebrate animals, and thus opened a field of investigation in which numerous explorers have since successfully laboured. His *Recherches sur les Ossements Fossiles des Quadrupèdes* (1821—1824) is a mine of infor-

mation in natural history, and affords the strongest arguments in favour of the theory of a progressive series of animals, advancing from the most simple to the most complex forms of organisation. C.'s rare faculty of expressing scientific truths in a popular and elegant style, was displayed in his celebrated *Discours sur les Révolutions de la Surface du Globe et sur les Changements qu'elles ont produits dans le Règne Animal* (latest edition, Paris, 1851). This discourse was published as an introduction to the above-named *Recherches sur les Ossements Fossiles*. In concert with Valenciennes, C., in 1828, commenced a *Natural History of Fishes*, which was founded on the largest ichthyological collection ever made by an individual. It was continued by Valenciennes. Lastly, we may notice the eulogies delivered by C. (and published in the *Recueil d'Eloges Historiques*, 1819), as valuable contributions to the history of science.

In public life, C. was as remarkable for activity as in the quiet work of the study. He never blindly surrendered himself to any party, but at all times gave proof of an honest, sagacious, and resolute character. In his plans for the extension and improvement of national education, he was zealous and indefatigable, as also in his efforts for the welfare of the Protestant Church in France, of which he was a member.—Mrs R. Lee's *Memoirs of Baron C.* (Lond. 1833); Pasquier's *Eloge de C.* (Paris, 1833).

CUXHA'VEN, a town of Germany, situated on the left or southern bank of the Elbe, just where it is lost in the German Ocean. It is about 60 miles distant from Hamburg, to which free city it belongs. C. is a small place, but of importance as the port from whence the Hamburg steamers ply when in winter the Elbe is frozen over. The harbour affords good shelter, and is much resorted to by vessels waiting for favourable winds. Pilots for the Elbe are taken in here. Pop. 1200.

CUYA'BA, capital of Matto Grosso, the largest and most westerly province of Brazil, occupies pretty nearly the centre of South America, being in lat. 15° 36' S., and long. 56° W. It stands on the left bank of a river of the same name, and is estimated to contain about 10,000 inhabitants. Its comarea, which numbers 25,000 inhabitants, has yielded gold and diamonds since 1719. In addition to these precious commodities, C. sends to Rio, the principal seaport of the country, large quantities of hides and ipecaeuhanha by caravans of 200 or 300 mules each. The chief edifices of the city are its three churches, an hospital, a school of philosophy, and the public buildings of the province.

CUYP, or KUYP, JACOB GERRITSE, commonly called the Old C., was born at Dordrecht in 1575. Jacob C.'s representation of cows and sheep, hattles and encampments, are clever, but his fame rests principally upon his excellent portraits. His colouring is warm and transparent: his manner, free and spirited. C. died in 1650.—AELBERT CUYP, Jacob's son, was also born at Dordrecht, in 1605. He excelled in the painting of cattle grazing or reposing, moonlights, wintry landscapes, still waters with ships, horse-markets, hunts, camps, and cavalry-fights. During his lifetime and long after, Aelbert's pictures, although in many respects equal to those of Claude, were held in little estimation. Opinion, however, has now changed regarding them. One of his still waters, which was sold in 1777 for 416 guilders (£34, 13s. 4d.), brought 12,720 guilders (£1060) in 1844. England is particularly rich in his works. He died at Dordrecht, 1691.—BENJAMIN CUYP, a nephew of Aelbert, lived at Dordrecht, and painted biblical pieces in Rembrandt's style, and

familiar scenes of country-life. His best works are in the manner of Teniers. His sea-shores have less repute. The dates of his birth and death are unknown, but, from the multitude of his pictures, it is conjectured that he lived to a great age.

CUZCO, the name of a city, a province, and a department in Pern. I. C., the city, was originally the capital of the Incas (in the language of the Incas, says Garcilasso, C. signifies 'naval') and the centre of an empire, which, besides the territory of the existing republic, comprised Bolivia, most of Ecuador, and portions also of Chili and the Argentine Confederation; and is still, next to Lima, the most populous city in the state, containing fully 47,500 inhabitants. It stands on the Gnatanaí, one of the remotest headwaters of the Amazon, in lat. 13° 31' S., and long. 72° 2' W., occupying the eastern extremity of that section of the Andes which is known as the Knot of Cuzco. Notwithstanding its aboriginal name, C., with the exception of some neighbouring ruins, part of which, perhaps, carry one back beyond the era of the Incas, is really of Spanish origin, being built in the form of a square, and presenting many handsome edifices. It is about 200 miles to the north-north-east of Arequipa, having its maritime outlet in Islay, the port of that city. The manufactures of the place are cottons, woollens, embroidery, and jewellery.—2. The province, otherwise styled the Cereado, embraces nothing beyond the city itself but the suburb of San Jeronimo.—3. The department, subdivided into 11 provinces, lies wholly in the sierra or Andine region of the country, having the coast on the west, and the montana, or Transandine territory, on the east. It numbered, in 1853, 346,211 inhabitants, being considerably more populous than any other department. It stretches in S. lat. from 13° to 15°, and in W. long. from 70° to 73°, with an area of about 45,000 square miles. In addition to C. itself, it has the towns of Abancay and Urubamba.

CYAMUS BALÆNARUM. See WHALE LICE.

CYANIC ACID is a compound of cyanogen (q. v.) and oxygen along with water, and is represented by the symbol  $C_2NO_2HO$ , or  $CyO_2HO$ .

CYANITE, KYANITE (Gr. *kyanos*, blue), DISTHENE, or SAPPARE, a mineral composed of alumina and silica. It often occurs crystallised, and generally in broad prisms. It is sometimes colourless, red, yellow, &c., but frequently of a fine sky-blue, slightly tinged with violet; it is transparent, and sometimes beautifully opalescent. It occurs chiefly in mica-slate, tale-slate, and granite; is found in different parts of Europe, Asia, and America, and in several places in Scotland. It is sometimes used as a gem.

CYANOGEN ( $C_2N$  or  $Cy$ ) is a compound organic salt radical, which is mainly interesting as being the principal component of hydrocyanic or prussic acid. It is most easily prepared by heating the cyanide of mercury ( $HgCy$ ) or the cyanide of silver ( $AgCy$ ) in a tube, when the C. is evolved as a gas at ordinary temperatures, but can be condensed by cold and pressure into a thin, colourless liquid, which freezes at  $-30^\circ F$ . Gaseous C. has a specific gravity of 1806 (air = 1000), is inflammable, and burns in air or in oxygen with a characteristic purple or rose tint; is soluble in water to the extent of 4 to 5 volumes of the gas in 1 of water. It combines with metals, such as potassium, to form a class of important cyanides, as the cyanide of potassium. See POTASSIUM, HYDROCYANIC ACID, &c.

CYANOHYDRIC ACID. See HYDROCYANIC ACID.

CYANOSIS (Gr. *kyanos*, blue), lividity of complexion, with fulness of the capillaries and minute veins, especially of the face and lips. A name characteristically applied to the colour in certain cases of congenital disease or malformation of the heart. See HEART, DISEASE AND MALFORMATION OF.

CYANOTYPE PROCESSES, in Photography, are those in which the compound radical cyanogen is employed; they were discovered by Sir John Herschel, and depend for their successful practice on the reduction of a persalt of iron to the state of protosalt, by the action of light, in the presence of organic matter.

Good paper is immersed in a solution of ammonio-citrate of iron of the strength of 40 grains to 1 ounce of water; it is then dried, and exposed—at any convenient time during a fortnight—under a negative, when a picture of a pale brown tint becomes faintly visible upon a yellow ground; it is then brushed over with a solution of ferrocyanide of potassium (yellow prussiate of potash), which develops the picture of a deep blue tint; and this may be further deepened by immersion in a solution of carbonate of soda, which has the effect, at the same time, of removing the unaltered ammonio-citrate, and permanently fixing the picture. Similar results may be obtained by employing ferridcyanide of potassium (red prussiate of potash), or a mixture of the ferridcyanide and ammonio-citrate, in which latter case the paper is sensitive as soon as treated with the mixed solutions, and must therefore be dried in the dark. To fix the picture, it is only necessary to wash with water. A subsequent treatment with a weak solution of proto-nitrate of mercury, has the effect of apparently removing the whole of the picture. If the mercury salt, however, be perfectly washed away, and the picture dried, and ironed with a very hot iron, it is speedily reproduced in all its vigour.

CYANURIC ACID is an organic acid allied to cyanic acid, and having the formula  $C_6N_4O_3, 3HO$ , or  $Cy_3O_3, 3HO$ . It is obtained by heating urea to expel ammonia, or by the destructive distillation of uric acid.

CYATHEA, a genus of Ferns (q. v.), of the sub-order *Polypodiaceæ*, containing many species, natives of tropical and sub-tropical regions, both of the Old and of the New World. They are tree-ferns, and some of them have lofty stems and gigantic fronds; they are generally also characterised by great gracefulness and beauty. *C. arborea*, sometimes designated the Common Tree-fern, is a native of the West Indies, Brazil, &c. The fronds are bipinnate, the pinnales deeply pinnatifid. The roots of *C. medullaris*, a species found in New Zealand, contain much starch, and are baked and used as food.

CYATHOPHYLLUM, a genus of fossil stony corals, with a simple or branched polyparium, internally lamellated, the lamella having a quadripartite arrangement. The older portions are cut off by transverse 'tables' or septa, and the base of the stem is often supported by root-like processes. This genus was especially abundant in the Devonian measures, 36 species having been described from them. It made its first appearance in the Silurian seas, and perished at the close of the carboniferous epoch.

CYBELE. See VESTA.

CYCADACEÆ, or CYCADEÆ, a natural order of exogenous plants, consisting of small trees and shrubs, somewhat resembling palms in their general appearance, but much more nearly allied to *Conifere* (pines, firs, &c.) in their botanical characters; C. being one of the few orders placed by Lindley along with *Conifere* in his class of *Gymnogens* (q. v.). The

stems are generally simple, and either cylindrical or short and spheroidal; sometimes they are branched by successive forkings; they are much marked with scars of leaf-stalks; they consist internally of a mass of pith traversed by woody bundles, and rings of woody matter. The leaves are large and pinnated, and unfold by unrolling, like the fronds of ferns. This curious and beautiful order contains about fifty known species, natives of tropical and sub-tropical countries. None are found in Europe. They all have a mucilaginous nauseous juice, but with this there is often much starch, which being separated, forms a wholesome article of food. A kind of sago is made in Japan from the cellular substance which occupies the interior of the stem of *Cycas revoluta*, in the Eastern Peninsula from *C. pectinata*, and in the Moluccas from *C. circinalis*. From these species, which are trees 30—40 feet high, there exudes a transparent gum, resembling tragacanth in its properties. Their nuts are also eaten, after being fermented and roasted. The large seeds of *Dion edule* afford a kind of Arrow-root in Mexico; and a starchy substance, sometimes called Arrow-root, and sometimes Sago, is obtained from *Zamia pumila* and other dwarf species in the West Indies. Caffer Bread (q. v.) belongs to this order.—Fossil *C.* are numerous, and occur in some of the oolitic and other strata in England.

**CYCHLA**, a genus of fishes of the family *Chromide* (included by Cuvier in the *Labridae*, or Wrasse family), of which many species occur in the rivers of tropical America. They have small and crowded teeth, forming a large band. Some of them are reckoned among the finest fishes for the table in Brazil and Guiana. They are also remarkable for the beauty and brilliancy of their colours. Some of them are large, and some small. Allied to this genus is *Chromis*, of which one species, *C. Niloticus*, the Egyptian *Corjaina* of the ancients, inhabits the Nile, and is reckoned the best fish in Egypt. It attains the length of two feet.

**CYCLADES**. See ARCHIPELAGO and GREECE.

**CYCLAMEN**, a genus of plants of the natural order *Primulacea*, having a wheel-shaped corolla,

*Cyclamen Europæum* :  
a, the whole plant; b, the fruit.

with a long reflexed limb, and flower-stalks twisted spirally downwards after flowering. The species are herbaceous perennials, not numerous, and chiefly natives of the south of Europe. They have

turnip-like, partly subterranean stems, which are very acrid, but nevertheless are greedily eaten by swine, and the plants are accordingly often designated **SOWBREAD**. They are drastic and emmenagogue. A very stimulant ointment is prepared from them, which externally applied by friction, expels intestinal worms from children. Several of the species are frequent in our flower-gardens, on account of the beauty and fragrance of their flowers, which have the additional charm of being produced early in spring. One species only, *C. hederifolium*, has a very doubtful claim to a place in the flora of Britain.—The active properties of the species of *C.* have recently been found to depend upon a peculiar principle called *Cyclamine*, which produces effects on the animal system similar to those of Curari (q. v.).

**CYCLE** (Gr.), which means simply circle, is a term used in Chronology to denote an interval of time in which certain phenomena always recur in the same order. Cycles have chiefly arisen from the periods of revolution of the earth and other celestial bodies not being commensurable. One unit of time is the day of 24 hours, being the period of revolution of the earth round its axis. But neither the year—the period of the earth round the sun—nor the month—the period of the moon round the earth—can be measured by days, or even by hours, so exactly as not to leave fractions. Cycles have been invented to swallow up these fractions of time in whole numbers expressing days, in such a way that after a certain number of revolutions of the body whose period has been put against that of the earth on her axis, the body shall at last occupy the same place in the heavens and calendar as it did when the *C.* commenced. Of the numerous cycles or periods of this kind that have been invented, the more important are noticed under their specific names. See INDICITION, SOLAR CYCLE, METONIC CYCLE, JULIAN PERIOD, GOLDEN NUMBER, &c.

**CYCLOBRANCHIATA** (Gr. circle-gilled), an order of gasteropodous molluscs, in which the gills usually form a series of lamellae, surrounding the body between the foot and the mantle. To this order belong the univalve *Patellidae*, or Limpets, and the multivalve *Chitonidae*, or Chitons.

**CYCLOID** (Gr. circle-like). If a circle roll along a straight line on its own plane, a point on the circumference describes a curve which is called a cycloid. The curve is one of the most interesting we know in respect both of its geometrical properties and connection with dynamics. One of its most interesting properties is this: The time of a body's descending from rest from any point in the arc of an inverted *C.* to the lowest point is the same, from whatever point of the curve the body begins to descend. This is sometimes expressed by saying that the *C.* is the *isochronous* (Gr. equal-time) curve. The body having reached the lowest point, will, through the impetus received in the fall, ascend the opposite branch of the curve to a height equal to that from which it fell, losing velocity in its ascent by the same degrees as those by which it acquired it in its descent, and it will employ precisely the same time in ascending as it did in descending. It is clear that if a surface could be procured that would be

The Cycloid.

perfectly smooth and hard, the *C.* would thus present a solution of the perpetual motion. The curve was discovered by Galileo in 1615. The line *AB*, which is called the

base of the cycloid, is equal to the circumference of the generating circle; and CD, which is the axis of the cycloid, is equal to the diameter. In any position EPF of the generating circle, AE is equal to the arc EP; AQ, the absciss, = AE - QE = arc EP - sine of EP; and PQ, the ordinate, = 1 - cosine of EP.

**CYCLOID FISHES**, an order of fishes, according to the classification proposed by Agassiz, having *cycloid* scales (Gr. *kyclos*, a circle)—scales formed of concentric layers, not covered with enamel, and not spinous on the margins. Cycloid scales are generally imbricated, but are sometimes placed side by side without overlapping. Very many of the existing fishes are of the cycloid order, and fossil C. F. are numerous in the more recent strata from the chalk upwards, but they first appear in the chalk.

**CYCLONES**. See **STORMS**.

**CYCLOPEAN ARCHITECTURE**, or **MASONRY**, the name which has come to be generally used for a wall of large irregular stones, unhewn and uncemented. The term originated in Greece, where structures of this kind were fabled to have been the work of the Cyclopes, or one-eyed giants. The walls of Tiryns, near Naphia—alluded to by Homer—are an example of the ruder style of Cyclopean masonry. They are of irregular unshapen stones, from 6 to 9 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep; the interstices are filled up by small stones, but no mortar is used. The walls of Mycenæ and of Epirus are examples of more advanced C. A.: here, the blocks, although irregular in size and shape, are fitted carefully to each other, shewing close joints and a smooth surface. These structures are now commonly believed to have been reared by the Pelasgi (q. v.), probably more than a thousand years before the Christian era. They are found not only in Greece, but in Italy and Asia Minor.

The next stage of Cyclopean masonry shews an approach to horizontal courses, as in the walls of several towns in Greece, and of some in Etruria. Lastly, the name of Cyclopean work is applied, but perhaps not quite accurately, to a kind of masonry which obtained among the Etruscans (q. v.), where the blocks are both squared and laid in horizontal courses, but are not cemented. In some cases—as in the walls of Cosa, in Tuscany, believed to have been first a Pelasgian, and then an Etruscan city—the lower part is of irregular polygonal blocks, the upper part of squared stones in horizontal courses. In at least one instance—a wall in the Peloponnesus—a foundation of excellent ashlar is surmounted by irregular polygonal blocks of the usual Cyclopean type.

Masonry, partaking more or less fully of the Cyclopean character, is to be found in Persopolis, and elsewhere in Asia, in several parts of Western Europe, and in some parts of America. The walls of Cuzco, and the ruins of what is called the house of Manco Capac, on an island in the lake of Titicaca, in Peru, are interesting examples of the C. A. of the New World. Instances of Cyclopean work on a smaller scale are to be found in the British Islands, in the walls of the primitive 'duns' or hill-forts, or in the 'cashels' or precincts of early religious houses. Among Irish examples may be mentioned the Grianan of Ailech, in the county of Donegal; Staigue Fort, in the county of Kerry; Dun Angus, on one of the Isles of Arran, on the west coast of Galway; the Giant's Sconce, near Coleraine; and the Rock of Cashel. Among Scotch instances may be named the Laws, in the parish of Monifieth, not far from Dundee, and the ruins on St Columkille's Island, near Migsted, in Skye. In

the Bibliothèque Mazarine at Paris, there is an interesting set of models of the Cyclopean buildings of Greece and Italy, by M. Petit-Radel, the author of *Recherches sur les Monumens Cyclopiens*.

**CYCLOPEDIA**. See **ENCYCLOPÆDIA**.

**CYCLOPÉS** (Gr. *kuklopes*, 'the round-eyed'), in Greek mythology, are of three kinds. 1. The Homeric C., a wild, lawless, gigantic race inhabiting the sea coasts of Sicily, the most prominent of whom is Polyphemus (q. v.). Although Homer does not directly call them one-eyed, yet he expressly terms Polyphemus such, and the later poets attribute his peculiarity to the rest. 2. The three C. mentioned by Hesiod, Brontes, Stereopes, and Arges, each having one eye in the middle of his forehead; these were sons of Uranus and Gæa, belonged to the race of Titans, and forged thunderbolts for Zeus. Hurlled into Tartarus by their father, but delivered by their mother, they helped Kronos to usurp the government of heaven. Kronos, however, in his turn, threw them back to Tartarus, from which they were again released by Zeus, whose servants they now became. Finally, they were slain by Apollo, because they forged the thunderbolt with which Zeus killed Asclepius. Later tradition placed their workshop in Mount Etna, or in the volcanoes of Lemnos and Lipari, and made them the slaves of Hephestus. 3. The C. mentioned by Strabo, as a people who had come from Thrace or Lycia to Argolis, and were distinguished for their skill as builders. Their distinctions are known as the Cyclopean walls, and many of them still exist in parts of Greece and Italy. The statement of Strabo is quite untrustworthy. More probably the so-called Cyclopean walls were built by some ancient race, perhaps the Pelasgi (q. v.), at a period long anterior to the historical civilisations of Greece and Rome.

**CYCLOPS**, a genus of minute entomostracous crustaceans of the order *Branchiopoda* (q. v.), having a soft and rather gelatinous body divided into two portions, one consisting of the head and thorax,

*Cyclops Vulgaris*:  
a, young; b, b, egg bags.

the other forming the tail. There is only one eye, situated in the middle of the forehead, and generally of a bright crimson colour, sparkling like a gem when the animal is viewed through a microscope. The species of C. are numerous; they inhabit both the sea and fresh waters, generally residing among or upon aquatic plants. They are extremely active, and dart about with great rapidity.

**CYCLOPTERUS**. See **LUMP FISH**, and **SUCKING FISH**.

**CYCLORAMA**, a series of views, which, being wound round cylinders, are made to pass in consecutive order before the spectator, so as to produce the effect of motion on his part, as the banks of a river are seen from a steam-boat, or the country from a railway.

**CYCLO'SIS** (Gr. circulation), the name employed to designate certain still very imperfectly understood movements of the contents of cells in plants. As they have been observed in plants of the most different natural orders, it is not unreasonably presumed that they prevail throughout the whole vegetable kingdom, and characterise the active life of all vegetable cells.

**CYDONIA.** See QUINCE.

**CY'GNET**, a young swan.—**CYGNET-ROYAL**, in Heraldry, a swan gorged with a dual coronet, having a chain thereunto affixed, and reflexed over its back.

**CYGNUS.** See SWAN.

**CYGNUS** (Lat. the Swan), a constellation in the northern hemisphere, between Lyra and Cassiopeia. Several stars in this constellation have received the particular attention of astronomers. See STARS, FIXED.

**CYLINDER** (Gr. *kylindo*, to roll) is the name of a genus of geometrical solid figures, of which there may be endless species. The most common kind of C. is that which is generated by the revolution of a rectangular parallelogram about one of its sides, which line is called the axis of the cylinder. But in order to embrace all varieties of cylinders, we must generalise the mode of generation. A C., then, is a solid generated by a line which moves parallel to itself while one end traces upon a plane any curve whatever. When the position of the generating line is at right angles to the plane, the C. is *right*; when not, it is *oblique*. If the curve traced is a circle, and the line perpendicular to the plane, the C. is a *right circular C.*, &c. In all cases, the content of the C. is found by multiplying the number of square units in the base by the number of linear units in the altitude, which is the perpendicular distance between the two ends. The area of the convex surface is equal to a rectangular parallelogram whose base is the circumference of the end, and its height the length of the generating line. To this must be added the areas of the two ends, to get the whole surface of the cylinder.

**CYMA** (Lat.), in Architecture, a moulding consisting of a hollow and round conjoined. When

hollow in the upper part, it is termed C. recta; when hollow in the lower part, it was called C. reversa.

**CYMA'TIUM.** See ENTABLATURE.

**CYMBALS** are military instruments of percussion, which, when struck one against the other, produce a loud harsh sound of no fixed pitch. The best C. are those made in Turkey and in China. Attempts to discover and imitate the composition of the metal have all failed. The notes in music for this instrument are all placed on the same line or space, in rhythmical succession. C., although military instruments, are now much used in the orchestra by modern composers.

**CYMBEL**, an organ stop of the mixture species, consisting of three ranks of pipes. Also a stop found in very old continental organs, consisting of a machine like a star placed high up on the front of the organ, on which were hung small bells, which sounded when the star was moved round on its centre by a current of air from the organ.

**CYME**, in Botany, a common form of Centrifugal (q. v.) inflorescence, in which the rachis or floral axis disappears by separating into irregular

Example of a Cyme.

branches, and these are short and corymbose. It is of very general occurrence in the *Caryophyllaceæ*. Examples may be seen also in the common elder, different species of *Viburnum*, &c. The *verticillasters* of the *Labiata* are small cymes in the axils of opposite leaves, assuming nearly the appearance of whorls.

**CYMRU.** See CELTIC NATIONS.

**CYNA'CHÉ** (Gr. *kuôn*, a dog, and *anchō*, I suffocate), a term applied to the severer forms of sore throat. See THROAT, DISEASES OF.

**CYNA'CHUM**, a genus of plants of the natural order *Asclepiadaceæ*, having a wheel-shaped corolla, and a lobed or cleft corona. *C. Monspeliacum*—a herbaceous twining plant, with roundish, heart-shaped, stalked leaves, a native of the shores of the Mediterranean—yields the drug called *Montpellier Scammony*, a violent purgative, and not much used. *C. ovalifolium* is a native of Penang, and its sap yields caoutchouc of excellent quality.

**CYNAROC'EPHALÆ.** See COMPOSITÆ.

**CY'NICS**, the name applied to a sect of Greek philosophers, who were distinguished mainly for their morose and snarling ethics. For a knowledge of their peculiar opinions, see articles ANTISTHÈNES, DIOGENES, MENIPPUS, &c.

**CY'NIPS.** See GALL-FLY.

**CYNODON**, a genus of grasses, having digitate or racemose spikes, with spikelets on one side, glumes nearly equal, boat-shaped, and containing one floret, which has two awnless paleæ, the fruit coated with the hardened paleæ. The most important species is *C. dactylon*, a grass very widely diffused, being the principal fodder grass and best pasture grass of India, where it is the principal covering of many thousands of square miles, and is known by the names of *Dhob*, *Doorba*, &c., and also

common in the south of Europe. In Britain, it is rare, being found only on the sandy shores of Cornwall. Its creeping roots, and those of its congener, *C. lineare*, have medicinal virtues, and are sometimes used as a substitute for sarsaparilla.

**CYNOMORIUM**, a genus of plants of the curious parasitic natural order *Rhizanthaceæ* (q. v.). *C. coccineum*, a plant of a strange fungus-like appearance, is found in the islands of Malta and Gozo, most abundantly on a particular rock in Gozo. It was long known as *Fungus Melitensis*, and enjoyed the highest reputation as a styptic, besides being used as an astringent in dysentery and other maladies. So high a value was set upon this plant, that the knights of Malta took it under their particular care as one of their choicest possessions; it was carefully gathered and deposited in a government office, from which the grand-master sent it to friendly sovereigns, and to the hospitals of the island. A keeper of the rock which produces the plant is still appointed, and his salary appears in the public accounts of Malta.

**CYNOSURE** (Gr. *kyinosoura*, the tail of the dog; *Ursa Minor*, the Little Bear) is the constellation of which the pole star is the principal star. Milton's lines—

Where perhaps some beauty lies,  
The Cynosure of neighbouring eyes.—*Allegra*.—

have made the word popular; the metaphor is grounded on *Ursa Minor* being the constellation towards which the others look, as it were, and round which they wheel.

**CYNOSURUS**. See DOG'S-TAIL GRASS.

**CYPERACEÆ**, or **CARIOPEÆ**, sometimes popularly called **SEDGES**, a natural order of plants, akin to Grasses, but having generally a triangular stem, which is without joints, or almost so, and often leafless. The leaves are sometimes sheathing, but their sheaths are always entire, not split, as in the grasses. The flowers, which are hermaphrodite in some, and unisexual in others, consist of a scale-like *glume*, under which lie the organs of fructification, the pistils alone being frequently enclosed in a separate urn-shaped covering; the place of the perianth is sometimes supplied by a few bristles. The stamens are 1—12 in number, the anthers erect: the ovary is one-seeded, the style single, trifid or bifid; the fruit a small crustaceous or bony nut, the embryo lenticular, and enclosed within the base of the albumen. Plants of this order, which contains fully 2000 known species, occur in all zones; some of the genera, as *Carex* (q. v.), abounding in the colder, some, as *Cyperus* (q. v.), in the warmer parts of the world. Many of them are plants of very humble growth, some, as Bulrushes, Papyrus, &c., comparatively large, but none rival in size the bamboos and other gigantic grasses. Most of them grow in marshy and moist places, but a few in sunny dry places. Their stems and leaves are in general very deficient in succulence, and in most of them, also very rough, so that they are eaten by domesticated cattle only when in a very young state, and rather from necessity than from choice, and are regarded by farmers as mere weeds. See **CAREX**, **CYPERUS**, and **SCRIPUS**. Some of the uses of plants of this order are noticed in the articles **BULRUSH**, **COTTON-GRASS**, and **PAPYRUS**.

**CYPERUS**, a genus of plants of the natural order *Cyperaceæ*, distinguished by hermaphrodite flowers and compound spikelets of numerous two-rowed glumes including no bristles or scales. It contains a great number of species, chiefly tropical, and gradually decreasing in number towards the

colder parts of the globe. Only two are found in England, and these are very rare. Many of the species have tubers or corms, which in some are mucilaginous and nutritious; in others, contain also a bitter principle, and possess medicinal qualities. Of the latter class is *C. longus*, or Sweet C., one of the species which have been found in England, common in ditches and wet meadows in some parts of Europe, the rhizome of which has an odour of violets, and is astringent, tonic, and stomachic. It has been employed in medicine from very ancient times; but is now more used in perfumery. Some of the Indian species are also used medicinally and in perfumery in their native country, as well as species of kindred genera. Of those with esculent tubers, the most important is *C. esculentus*, sometimes called Rush-nut, a native of the south of Europe and north of Africa, which is cultivated to a considerable extent in Egypt, Italy, Spain, Portugal, and the south of France. The root of this plant throws out creeping branches, at the end of which form farinaceous tubers of the size of a hazel-nut, which are called Earth Almonds (*Amande de terre*) by the French. They have a sweetish taste, and are used like almonds for the dessert, and also for making *Orgat* (q. v.). They are said to possess not only nutritive, but restorative and stimulant properties. Of late, they have become a considerable article of commerce, upon account of the bland fixed oil which they yield, and are chiefly exported from Spain and Portugal to Holland. They contain about 16 per cent. of oil. The roots of this plant and its allies are the only roots known to contain much oil. The tubers of *C. bulbosus* or *Jemenicus* are eaten in India, either roasted or boiled, or are dried in the sun and made into bread; but their small size makes them troublesome of collection and preparation. Those of *C. geminatus* are also eaten. The tubers of some species of *Scirpus* (q. v.) resemble in quality those of the esculent species of cyperus. The fibre of *C. textilis* is so strong that it is employed in India for making mats.

**CYPRÆA**. See **COWRY**.

**CY PRÈS**, doctrine of, in English Law. As the law forbids the giving of an estate tail to the son of an unborn son of a living person, after a life-estate given to such unborn son, and would regard such estate tail as void, the courts, when such a gift is made in a will, apply the doctrine of C. P., and endeavour, as near as possible, to carry out the testator's wish, by giving to the unborn son of the living person an estate tail, instead of for life, and so enabling his son to succeed if the entail be not barred. See **ESTATE TAIL**. So, also, when a charity cannot reasonably be administered precisely as directed by the testator, the court will, by the

*Cyperus esculentus*:  
a, whole plant; b, cluster of spikelets; c, a single flower.

doctrine of C. P., administer it as near as possible to his directions.

CYPRESS (*Cupressus*), a genus of plants of the order *Conifera*, the species of which are evergreen trees or shrubs, with small generally appressed and imbricated leaves, and with almost globular cones, the scales of which bear numerous hard seeds. The best known species is the COMMON C. (*C. sempervirens*), a native of the Levant, the north of Africa, and the south of Europe, and sometimes met with in England. It is a tree of no great height, with quadrangular twigs. The leaves are

Branch and Fruit of Cypress (*Cupressus sempervirens*).

dark-green, and the tree has, therefore, a sombre aspect, and from very early times has been an emblem of mourning; the Greeks and Romans put its twigs in the coffins of the dead, they used it to indicate the house of mourning, and planted it about burial-grounds, as is still the custom in the East. The wood of the C. is yellow or reddish, and has a pleasant smell. It is very hard, compact, and durable; the ancients reckoned it indestructible; and the resin which it contains gives it the property of resisting for a long time the action of water. It is not liable to the attacks of insects, and was formerly much esteemed for the purposes of the cabinet-maker. Some believe that the C. is the true cedar-wood of Scripture, and it has also been supposed that it is *Gopher wood*. Specimens of this wood are in existence in museums, which are known to be several thousands of years old. The doors of St Peter's at Rome, made of C., lasted from the time of Constantine the Great to that of Pope Eugene IV., above 1100 years, and were perfectly sound when at last removed, that brazen ones might be substituted. Medicinal virtues were formerly ascribed both to the wood and seeds of the C., and the balsamic exhalations of the tree were reckoned very salutary in diseases of the chest.—Several other species of C. are natives of temperate and warm climates in different parts of the world. There are many species, the principal of which are the Portugal C. or Cedar of Goa (*C. Lusitanica*), a native of Goa naturalised in Portugal; *C. thurifera*, a native of Mexico, which exudes a resin used in that country for incense; *C. torulosa*, a native of the Himalaya, and which has been grown successfully in Britain; *C. funebris*, lately introduced into Britain from China; the White C. or White Cedar of North America (*C. thyoides*). The Deciduous C. or Virginian C. (*Taxodium distichum*, or *Schubertia disticha*) is now regarded as belonging to a different

genus, and attaining a height of 120 feet, and found in the cypress swamps of Delaware and elsewhere.

CYPRIAN, THASCUS CÆCILIUS, an illustrious father of the African Church, was born in Carthage about the beginning of the 3d century. He belonged to a respectable family, and was a distinguished teacher of rhetoric before his conversion to Christianity, which took place 216 A. D. His benevolence secured for him a high degree of popularity, and his piety no less veneration, in consequence of which he was made bishop of his native city in less than three years. In 250, he fled into the desert, to avoid the persecution of Decius. Here he remained a whole year, but not in idleness. The same prudence, energy, and activity that he had always displayed, were now shewn in that extensive correspondence which he carried on with his clergy on ecclesiastical matters. On his return to Carthage in 251, he suppressed, but with moderation, the rising controversy regarding the *Lapsed* (q. v.), or Christians who, during the time of trial, had apostatised. C.'s views regarding the proper dignity of the Bishop of Rome have frequently been mistaken: he, indeed, recognised the Roman bishop as the successor of Peter, and as the representative of the unity of the church; but he asserted that the pre-eminence of the Roman see was confined to the earliest times, and that, in later times, other bishops, or successors of the apostles, had dignities equal to that of the successors of Peter. He therefore firmly opposed the supremacy asserted by the Roman bishop, Stephanus, in the question of baptism by heretics. In the persecution under Valerian, 257, C. was banished to Curubis; but having returned to Carthage in the following year, he was there beheaded. C. was both a learned and eloquent divine, but he was even more conspicuous for his dignified, moderate, and wise conduct. His knowledge of human nature enabled him to exercise a wide influence over the African Church; and his correspondence, from which the best idea of his character is obtained, gives us an interesting picture of the times in which he lived. His writings—less crabbed and rhetorical than those of his teacher, Tertullian—contain, besides 51 *Epistole*, or official letters, several important treatises, among which may be mentioned the *De Unitate Ecclesie Catholice*, the *De Lapsis*, the *De Disciplina et Habitu Virginum*, the *De Gratia Dei*, and the *De Idolorum Vanitate*. The best editions of C.'s complete works are that of Fell, Bishop of Oxford (1652), and that of Baluzzi (Paris, 1726). C.'s life was written by his friend Pontius.

CYPRINIDÆ, a family of malacopterous fishes, having a small mouth, the jaws almost toothless, but the pharynx or hinder part of the mouth furnished with teeth; the body generally covered with scales, the gill-rays few, and no adipose fin (like the second dorsal fin of the trout or salmon). The genera and species are numerous. All the C. are fresh-water fishes. They are found in the lakes and rivers of almost all parts of the world. To this order belong the Carp (*Cyprinus*), Tench, Bleak, Bream, Barbel, Minnow, Gold Fish, Roach, Loach, &c. Many of the species are much esteemed for the table. The fecundity of the C. is great.

CYPRINODONTIDÆ, a family of malacopterous fishes, allied to *Cyprinidæ*, with which they were formerly ranked, but differing from them in having the jaws more protractile and toothed. Some of them are American, some Asiatic; some inhabit fresh, and some salt water. To this order belong some interesting and curious fishes, particularly the Anableps (q. v.), remarkable for the conformation of its eyes. The species of the genus *Orestias* are

found in the lakes of the Andes, at a great elevation above the sea, and are highly esteemed for the table.

CYPRIS, a genus of minute entomostracous crustaceans of the order *Branchiopoda* (q. v.), having the body enclosed in a shell of two horny pieces, somewhat resembling that of a bivalve mollusc. The antennæ and feet are beautifully feathered with long fringed bristles, by means of which these animals swim with much vivacity. They abound in every pool of stagnant water. Their horny shells are very abundant in a fossil state in the Wealden rocks of England, in the limestone of the carboniferous series, &c.

CYPRUS (Anc. Gr. *Kypros*, Mod. Gr. *Kypris*, Fr. *Chypre*, Ital. *Cipro*), an island situated south of Asia Minor, in that portion of the Mediterranean called the Levant. C. was anciently divided into many small kingdoms. It was originally possessed by the Phœnicians, from whom it passed to the Greeks, and subsequently to the Egyptians and Persians. After the victories of Alexander, it declared for Macedon. It next became a portion of the Græco-Egyptian kingdom of the Ptolemies, then of the Roman and Byzantine empires. The Arabs conquered it 648 A. D.; in 1191, it was taken by Richard Cœur-de-Lion, who ceded it to the Templars. After several vicissitudes, it came into the possession of the Venetians, from whom it was finally conquered by the Turks in 1571.

C. lies in lat. 35° N., long. 32° 20'—34° 40' E., its greatest length from Baffa, in the south-west, to Cape Andrea, in the north-east, being about 140 miles; and its greatest breadth, between Cape Gatto and Cape Kormachiti, about 60. The total area is 1000 square leagues; and its population in 1858, 180,000. A range of mountains—the Stavro Vuno and Santa Croce (ancient *Olympus*)—the sides of which are very bold and rugged, runs through the whole length of the island, attaining an elevation of more than 7000 feet above the sea. Three-fifths of the island is mountainous. Of these one-fifth has splendid forests of oak interspersed with walnut-trees, and would furnish large supplies of sulphur, pit-coal, and metals of various kinds, under intelligent management; while two-fifths is adapted for vine and olive culture, and the growth of fruit-trees generally. 'The remaining two-fifths is composed of magnificent plains, and extensive open country, which, though wanting in rivers and streams, are still very productive in cereals.' The soil is exceedingly fertile, yielding all kinds of grain, together with tobacco, flax, cotton, madder, sesame, &c.; other products are wool, cotton, and silk. Of the latter, two crops are obtained in the year. C. has also two valuable salt-pits. Its great want is water. The few springs dry up in the summer, and not a drop of rain falls during seven months in the year. The climate is on the whole very healthy; the diseases, 'both with regard to their frequency and their character, do not relatively reach three-fifths of the amount of disease in Europe, or even in Italy.' Agriculture and manufactures are alike in a backward state; the Greek Christians, who compose the bulk of the population, being indolent and spiritless, through fear of the dominant Turks, who are ignorant and fanatical. The former, however, have an unenviable reputation for double-dealing. The revenue amounts to 14,000,000 piastres (£116,666), while the total disbursements for government, &c., amount only to 1,000,000 piastres (£8333), so that the possession of C. is a clear annual gain of £108,000 to the sultan. The shipping of the island is trifling, comprising only from 5 to 10 vessels, of 50 to 100 tons, and from 30

to 80 smaller boats. The imports in 1858 amounted to £57,939, and the exports to £131,110. The chief towns of C. are Nicosia, the capital and seat of the Turkish government; Famagosta. Larnica, the residence of the European consuls; and Limassol.—*Report of British Consul, 1858.*

CYPSELUS. See SWIFT.

CYR, ST, the name of several places in France, the most important of which is St C., in the department of Seine-et-Oise, about 3 miles west of Versailles. Pop. 1000. The village owes its origin to an educational institution for the daughters of nobles of fourth descent on the father's side, founded here in 1686 by Louis XIV., on the suggestion of Madame de Maintenon. There were about 250 pupils, for whom Racine wrote his tragedies of *Esther* and *Athalie*. Madame de Maintenon died here, and was buried in the choir of the church. The institution was suppressed at the Revolution. The buildings were at first converted into a military hospital, and in 1803 into a military school by Napoleon for the education of some 300 officers, about 140 of whom leave annually.

CYRENAÏC SCHOOL. See ARISTIPPUS.

CYRENAÏCA, the name of the district whose capital was Cyrene (q. v.). At one period, it nominally stretched from Carthage to Egypt, and extended inland as far south as the oasis of Fezzan; but a great portion of this territory was occupied by the subject Libyan tribes, and not by the Greek colonists, who were confined chiefly to the plateau of Barca, with the subjacent coast. This portion of C. was, and still is one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the south sheltering the land from the scorching blasts of the Sahara, and cool sea-winds fanning it on the north. From the central plateau, whose breadth is about 80 miles, the land slopes down in verdant terraces to the Mediterranean. These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of C. mentioned by ancient writers are corn, oil, wine, honey, fruits of all kinds, cucumbers, truffles, cabbage; flowers yielding the richest perfumes; and a rare plant called *silphium* (still abundant), from which was obtained the gum-resin, greatly esteemed for medicinal purposes. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts.

The chief cities of C. were Cyrene, Teucheira (afterwards called Arsinoë), Hesperides (afterwards called Berenice), Barca, and Apollonia. To each of these five cities (whence in the time of the Ptolemies C. was named Pentapolis and Pentapolitana Regia), a certain amount of territory was attached. This favoured their individual independence; and the consequence was that the dynasty of Battus, who led the first Greek colony to Cyrene (q. v.), exercised very little influence over C. in general. After passing into the hands of the Egyptians and Romans, C. became a portion of the Byzantine empire. In 616 A. D., it was conquered by the Persian Chosroes, and in 647 was overrun by the Arabs. Ancient C. nearly corresponds with modern Barca (q. v.).

CYRENÉ, the capital of Cyrenaica (q. v.), was founded, 631 B. C., by a colony of Spartans under Battus, whose dynasty lasted for nearly two centuries. During this period, it made rapid advances. On the death of Arceusilus IV., the last of the Battidae, about 450 B. C., a republic was established, but the political condition of the city under the new government was far from prosperous. Party contests raged, until at last it fell into the hands of the Romans. During its prosperity, C. carried on a great commerce with Greece and Egypt, and to a

less extent with Carthage. Its extensive ruins still attest its former magnificence. C. was the birth-place of the philosophers Aristippus, Anniceris, and Carneades, the poet Callimachus, the astronomer Eratosthenes, and the rhetorician Syncsius, who afterwards became Bishop of Apollonia.

CYRIL, Sr, Bishop of Alexandria, was one of the most energetic, but least amiable of the Church Fathers. The date of his birth is not known. He was educated by the fanatical monks of Nitria, with whom he lived for five years, and who probably inspired him with that fiery, intolerant, and ignorant zeal which characterised him through life. Subsequently, he went to Alexandria, where he became a presbyter, and on the death of his uncle, Theophilus, 412 A. D., obtained the episcopal see. He had now full scope to exhibit his arrogance, vindictive jealousy, and priestly zeal. The Alexandrian Jews, who were numerous and wealthy, were the first to feel the fierceness of his pious wrath. Some Christian blood having been shed by them in a city tumult, C. put himself at the head of a rabble of zealots, attacked the Jewish quarter of Alexandria, destroyed the houses, and banished the inhabitants. Orestes, the prefect of Egypt, having drawn up an accusation against C., was attacked in the streets by 500 monks, who had come up from the deserts of Nitria, at the call of their old companion, eager for the work of destruction. One of these monks having fallen in the skirmish, his corpse was carried in procession to the High Church of Alexandria, where C. delivered a sanguinary discourse, gave the dead monk the name of *Thaumasius*, and pronounced him a martyr and a saint. But perhaps the most barbarous deed with which this persecutor of heretics and heathens had to do, was the murder of the heathen maiden Hypatia (q. v.), the daughter of the mathematician Theon. Theodoret gravely accuses him of instigating the Alexandrian populace to this horrid act; and unfortunately there is nothing in C.'s character to make us doubt the truth of the accusation. But the most important historic event in his career, was his controversy with Nestorius (q. v.). All the worst features of his disposition appeared in this broil. In the midst of unquietudes, which he himself had largely occasioned, he died 444 A. D. C.'s numerous writings consist of commentaries, treatises, homilies, epistles, &c. The best edition was published by Aubert (7 vols., Paris, 1638).

CYRIL, Sr, Bishop of Jerusalem, an eminent Church Father, was born at Jerusalem about 315 A. D., and ordained a deacon in 334, a presbyter in 345, and on the death of Maximus in 351, was elected bishop of his native city. His metropolitan was the Arian bishop, Acacius of Casarea, with whom he was soon engaged in hot conflict concerning originally the rights of his office, but ultimately their differences of doctrine. Acacius accused C., before a council hastily 'got up' at Casarea in 358, of selling the treasures of his church in a time of famine to feed the poor! Strange to say, C. was deposed for doing this praiseworthy action. He now appealed to a larger synod, which was held at Seleuceia. This synod restored him to his office; but once more, through the persevering hostility of Acacius, he was deposed by a council assembled at Constantinople in 360. On the death of the Emperor Constantius, he was again restored to his episcopate in 362. Soon after, his old enemy Acacius died, but C. was immediately involved in new difficulties. After considerable strife, C. was banished, by order of the Emperor Valens, in 367; nor did he return till the emperor's death in 378. He died in 386.

C.'s writings are extremely valuable, not on account of their vigour, profundity, or beauty, but on account of their theology. They consist of 23 treatises, 18 of which are addressed to catechumens, and 5 to the newly baptised. The former are for the most part *doctrinal*, and present to us in a more complete and systematic manner than the writings of any other Father the creed of the church; the latter are *ritual*, and give us a minute account of baptism, chrism, and the Lord's Supper. Their style is simple and unattractive. The best edition of C.'s works is that published by Toultée, the Benedictine monk (Par. 1720).

CYRIL, the apostle of the Slaves (in the 9th c.), sprang from a respectable family living in the half-Slavic, half-Greek town of Thessalonica. On account of his knowledge, he obtained the surname of the Philosopher. Having been consecrated a priest, he went forth, during the reign of the Byzantine emperor, Michael III., to evangelise the Chasars, who dwelt by the Caspian Sea. His labours were very successful, the khan himself being among his converts. Boris, the heathen prince of Bulgaria, having about this time besought the patriarch of Constantinople to send him a preacher of the gospel, C., along with his brother Method, were selected. Their labours were not in vain. Boris was baptised in 860. Rastic, prince of Moravia, next invited them to his country. They accepted the invitation, and while there, assisted by a number of their own pupils, completed their translation of the Holy Scriptures, which is in use to the present day, as a sacred or church language, among all Greek-Catholic Christians (Russians, Bulgarians, and Serbs). From Moravia, Christianity, according to the Slavic ritual, spread into Bohemia, whose prince, Boriwoj, and his spouse, Ludmilla, were baptised by Cyril. C. died in 869. The *Apologi Morales*, ascribed to C., were published by Corter (Vienna, 1630). See Richter's *Cyril and Method* (Olmütz, 1825).

CYRUS, the founder of the Persian monarchy, commonly called C. THE ELDER, was, according to Herodotus, the son of Cambyses, a Persian noble, and of Mandane, daughter of Astyages, the Medo-Persian king. His birth was a source of alarm to his grandfather Astyages, who had previously had a dream, the interpretation of which portended that the offspring of Mandane would one day be the ruin of the Median supremacy and the ruler of all Asia. He therefore contrived to get the infant into his own hands, and gave it to Harpagus, his chief servant, with orders to put it to death. Harpagus promised to do so, but intrusted it privily to the care of a herdsman, who brought it up along with his own children. The young C. quickly distinguished himself among the country lads by his superior daring and dignity. On one occasion, he was elected king in some boyish game by his companions, and in the exercise of his regal authority, caused a nobleman's son to be severely scourged. The father complained to Astyages, who caused the culprit to be brought before him, and recognising in his person and mien his own grandson, sent C. back to Persia—the Magi having in some way satisfied him that his dream had already received its fulfilment. C. himself, however, did not think so, and as he grew up to manhood, began to meditate ambitious schemes. All writers testify to his courage, amiability, and address. He was exactly the kind of man to gather round him brave, venturesome, loyal followers. The tyranny of Astyages had made him hateful to his subjects, and by the help of the crafty Harpagus, C. soon formed a party among the Medes favourable to his designs. Putting himself at the head of his Persian troops, C. advanced into Media, and overthrew the

forces of Astyages (559 B. C.). After consolidating his new dominions, which seems to have cost him many years' labour, he proceeded in his career of conquest. The kingdom of Lydia first yielded (546 B. C.), and its king, the famous Croesus, fell into his hands. Ultimately, the whole of Asia Minor was subdued. But the crowning triumph of C. was his capture of the city of Babylon, the metropolis of Assyria (538 B. C.), whose king was Labynetus, the Belshazzar of Daniel. Through the instrumentality of C., the Jews were delivered from their captivity, and allowed to return to Palestine. His vast ambition, however, proved his ruin. He wished his power to overshadow all Asia, in harmony with the dream of his grandfather; and although his dominions already extended from the Hellespont almost to the Indus, he resolved to subjugate the Scythian peoples, and began an unjust war with the Massagetae, a nation or tribe who dwelt to the north-east of the Caspian, beyond the Araxes, whose queen was called Tomyris. At first C. was successful, but in a second engagement he was defeated and slain (529 B. C.).

Such is the account given by Herodotus, and although we are unable to affirm that it rests on absolutely historical ground, it is unquestionably to be preferred to any other. The work of Xenophon, entitled the *Cyropædia*, is not a history; it is a historical romance, and was manifestly intended by the author for such. Xenophon wished to picture a great and wise king, and finding the elements both of greatness and wisdom in C., he took advantage of his historic personality, and engrafted upon it whatever, according to his own notion, would ennoble and dignify it.

CYRUS, THE YOUNGER, the second of the sons of Darius Nothus, or Oechus, lived about 130 years after the great Cyrus. He conspired against his brother Artaxerxes Mnemon, who had succeeded to the throne (404 B. C.). The plot, however, being discovered, he was at first sentenced to death, but afterwards pardoned, and even restored to his dignity as satrap of Asia Minor. Here he employed himself in making arrangements for war against his brother, although he concealed his purposes to the very last. In the spring of 401 B. C., he left Sardis at the head of 100,000 Asiatics, and 13,000 Greek mercenaries, under pretence of chastising the robbers of Pisidia. Artaxerxes being warned of C.'s perfidy, made preparations to oppose him, and the two armies encountered each other in the plains of Cunaxa, 500 stadia from Babylon. C. was defeated and slain, although the Greeks fought with the greatest courage, and even routed that portion of Artaxerxes' troops immediately opposed to them. The fortunes of the Greeks, on their retreat through the highlands of Armenia, in severe winter-weather, are recorded by Xenophon in his *Anabasis* (q. v.).

CYST (*kystis*, a bladder), a word sometimes used in the original sense as applied to hollow organs with thin walls, as the urinary bladder and gall bladder; but commonly reserved for the designation of pathological structures or new formations within the body, having the bladder form. Cysts are commonly transparent, and often almost structureless in their tenuity; they are commonly, however, lined by an Epithelium (q. v.), and have membranous walls, with faint indications of fibrous structure. They are either simple or compound, unilocular or multilocular; they are sometimes small, numerous, and separate; in other cases, they grow to an enormous size, and are very complex. Some cysts are distinctly parasitic, and of independent animal nature; such are Hydatids (q. v.) and the cystic Entozoa (q. v.) generally. Others are probably

formed out of the structures in which they arise, their true pathology being, however, obscure. Such are the cysts of the kidney, and still more distinctly, the immense complex cystic structures which form in the ovary. See OVARY, DISEASES OF.

CYSTIC WORMS, an order of *Entozoa*, or Intestinal Worms, according to the system of Zeder and Rudolphi, for some time generally received by naturalists, characterised by the body ending in a transparent cyst or bladder filled with pellucid fluid, this body having sometimes only one head, as in *Cysticercus*, sometimes many, as in *Cœnurus*. It has, however, been found that certain species, as *Cysticercus cellulosæ* and *Cœnurus cerebralis*, are the young of cestoid worms, and it is therefore concluded as highly probable, that all the C. W. are of the same nature, more particularly as all present the appearance of immaturity, in the want of visible organs of reproduction. Until a comparatively recent date, the animal nature of C. W. was not recognised, nor is it long since their relation to tape-worms and other cestoid worms has been fully ascertained. See CESTOID WORMS, CYSTICERCUS, ECHINOCOCCUS, STAGGERS, and TAPE-WORM.

CYSTICERCUS (Gr. bladder-tail), according to many naturalists, a genus of Cystic Worms (q. v.), characterised by a dilated cyst with a single head, which has four suckers and a circlet of hooks. This genus has, however, recently been displaced from the system of nature by the discovery that the forms referred to it are only the young of tape-worms. This discovery has been confirmed by a multitude of observations and experiments with regard particularly to *C. cellulosæ*, found in human beings, and in many rodent and pachydermatous animals—as rabbits, pigs, &c.—the young of the common tape-worm; and *C. tenuicollis*, found more rarely in human beings, but often in the abdominal cavity of ruminant quadrupeds, and of pigs, horses, and many other animals—the young of a tape-worm of the dog. *C. cellulosæ* often exists in great numbers in the flesh of pigs, causing the diseased appearance known as *measly*. See CESTOID WORMS, where it is figured. It sometimes occurs in like manner infesting the human body, in muscles of most various parts; it has been found even in the heart, in the brain, and in the eye. That in such cases it sometimes causes death, is too certain, and its removal is not easy, except when it is so situated that it can be reached by the knife, nor is there any sure indication by which its presence in many situations can be known; but it appears also that it may die and be absorbed without causing any very serious consequences to the person in whom it has dwelt. The cysts of this species are always of small size; those of *C. tenuicollis*, however, which generally occurs in the liver, or in other abdominal organs, sometimes become, in some of the lower animals, as large as a child's head. Injurious consequences are produced by them when either numerous or very large.

CYSTIN, or CYSTIC OXIDE, forms a rare variety of Calculus (q. v.). It contains  $C_6H_8NO_4S_2$ , has a crystalline texture, a brownish-yellow colour, and is semi-transparent. It is not soluble in water, alcohol, or ether, but dissolves in the strong acids.

CYSTITIS. Inflammation of the urinary bladder (q. v.).

CYTISUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, of which some of the species, having long twiggly branches, are popularly called Broom (q. v.), others are called Laburnum (q. v.), whilst others still are generally known by the name Cytisus. The characters of the genus are stated in the article Broom. The

species are numerous—small trees or shrubs, with leaves of three leaflets, and yellow, white, or purple flowers, natives chiefly of the warmer temperate parts of the Old World. Many of them are very beautiful, and some are among the esteemed ornaments of our shrubberies, others of our green-houses.

**CYTOBLAST.** See **CELLS.**

**CY'ZICUS**, a peninsula of Anatolia, Asia Minor, projecting into the Sea of Marmora. It lies to the south-east of the island of Marmora, and about 70 miles south-west of Constantinople. It was at one time an island, but the gradual formation of an isthmus connected it with the mainland. Its length from south to north is about nine miles, and its breadth from east to west 18 miles. In early times, C. was a Milesian colony, and the city of C., upon whose site vineyards and orchards now flourish, is described by Strabo as one of the first cities in Asia, alike for extent and splendour.

**CZACKI, TADEUSZ**, an eminent Polish author, was born in 1765 at Poryck, in Volhynia. At the age of twenty, he obtained an office in the supreme judiciary court at Warsaw, and was also made director of the crown archives—a situation which enabled him to gratify his taste for Polish history. Some essays on Polish finance induced the diet to select him, in 1788, as a member of the commission of inquiry into the state of the revenue. His efforts to animate the industry and extend the commerce of his native country were most praiseworthy. A valuable result of his travels through Poland for this purpose is a map of its river-system. He also interested himself greatly in the navigation of the Dniester. At the second partition of Poland, he lost his property, but it was afterwards restored. The chief labour of his life, however, was in connection with the education of his countrymen. His endeavours to instruct the people in the old Polish provinces of Russia, where education had been almost wholly neglected, met the approval of the Emperor Alexander. The most important of C.'s educational institutions was the gymnasium at Krzemieniec. In 1807, he was appointed the deputy of Prince Czartoryski, who had the care of public instruction in the Polish government of West Russia. C. died at Dubno, 8th February 1813. His writings prove the comprehensive character of his attainments. His most valuable work is upon Lithuanian Law (*O Litewskich i Polskich Prawach*, 2 vols., War. 1800).

**CZAR**, more properly *Zar*, is a title of the Russian emperor. The word is derived from the old Slavonic language, and signifies much the same as Ger. *Kaiser*, Lat. *Cesar*, to which it probably owes its origin; although some etymologists identify it with the termination of the names of the old Assyrian kings—such as Phalassar, Nabonassar, and Nabopolassar. After the 12th c., we find the Russian annalists giving the title of C. to the Grand Duke Wladimir, Monomach (died 1125), and to several of his successors. In general, however, the rulers of the various Russian provinces were called Grand Dukes till the 16th century. Thus, we have the Grand Dukes of Wladimir, Kiew, Moscow, &c. The Grand Duke Wassilij Iwanowitch first assumed, in the year 1505, the title of *Samoderzh*, which signifies autocrat. The son of Wassilij, Iwan II., Wassiljewitch the Cruel, caused himself to be solemnly crowned C., 16th January 1547. From this time, the Russian monarchs called themselves Czars of Moscow; and after the conquest of Little Russia and Smolensk, Czars of All the Russias. The word now became practically the equivalent of Emperor; yet Peter I., in 1724, thought fit to assume this latter title in addition; and as the

Russian language had no term corresponding to it besides C., the Latin word *Imperator* was introduced, while the empress was termed *Imperatrix*. At first, several European powers refused to sanction the assumption of imperial dignity by the Russian C., but ultimately consented to do so. The wife of the C. was named Czariza (Czarina); the sons, Czarewitch; the daughters, Czarewna; but after the death of Alexei—Peter I.'s son—these titles were abolished, and the imperial princes were called Grand Dukes, and the imperial princesses Grand Duchesses. In 1799, the Emperor Paul I. introduced the title of Cesarewitch (not Czarewitch) for his second son, the Grand Duke Constantine. In the same way, the Grand Duchess now bears the title of Cesarewna. Among the Russian people themselves, the emperor is more frequently called Gossudar (Hospodar, i.e., Lord) than Czar.

**CZARTORYSKI, ADAM GEORGE**, son of Prince Adam Casimir C., descended from Olgerd, the founder of the Jagellonian dynasty of Poland, was born at Warsaw, 14th January 1770. Having completed an excellent education at Edinburgh and London, he returned to his native country, and took part against Russia in the war occurring on the second partition of Poland. On the defeat of the Poles, C. was taken to St Petersburg as a hostage, and here he exhibited so much ability and prudence as to gain the friendship of the Grand Duke Alexander, to whom he was attached, and the confidence of the Emperor Paul, who made him ambassador to Sardinia. When Alexander ascended the throne, he appointed C. assistant to the Minister of Foreign Affairs; and he took an active part in official life until after the peace of Tilsit. As curator of the university of Wilna, to which he was nominated in 1803 by Russia, he exerted all his influence to keep alive a spirit of nationality; and when some of the students were arrested on a charge of sedition, and sent to Siberia, C. resigned his office. His successor reported to the emperor, that the amalgamation of Russia and Lithuania had been delayed a century by C.'s occupancy of the curatorship. Russian favours could not deaden or even dull C.'s pure patriotism. Into the revolution of 1830 he threw himself with all his heart. He was elected president of a provisional government, and in this capacity summoned a national diet, which met, and in January 1831, declared the Polish throne vacant, and elected C. head of the national government. He immediately devoted half of his large estates to the public service, and adopted energetic measures to meet the power of Russia, but in vain; the Poles were crushed, and C.—specially excluded from the general amnesty, and his estates in Poland confiscated—escaped to Paris, where he has since resided, the liberal friend of his poor expatriated countrymen, and the centre of their hope of a revived nationality. In 1848, he liberated all his serfs in Galicia, and during the Crimean war he ineffectually endeavoured to induce the Allies to identify the cause of Poland with that of Turkey. [He died July 1861.]

**CZA'SLAU**, a town of Bohemia, 45 miles east-south-east of Prague. Its deanery-church, in which the celebrated blind Hussite leader, General Ziska, was buried, is surmounted by the highest steeple in Bohemia. C. is also noted as the scene of an important victory gained over the Austrians by Frederick the Great, 17th May 1742. Pop. 4000, who are chiefly engaged in agriculture and the manufacture of saltpetre.

**CZECHEs**, the most westerly branch of the great Slavic family of nations. About 451—495 A. D., the C. migrated from their lands in Carpathia, on the

Upper Vistula, and came into the country now known as Bohemia. According to tradition, their chieftain was named Czech. Georgsberg, near Raudnitz, on the Elbe, is said to have been the first place chosen by the C. for their encampment. Other Slavic tribes migrated into Bohemia; but in the course of time the C. gained such an ascendancy that, in the 9th c., the name C. was commonly applied to the whole Slavic population of Bohemia (q. v.).

**CZE'GLED**, a market-town of Hungary, situated on a plain between the Danube and the Theiss, 40 miles south-east of Pesth. It has some handsome buildings and large breweries. The inhabitants, 18,000 in number, are employed principally in agricultural pursuits, the district around yielding much grain and red wine.

**OZENSTOCHAU**, or **CZENSTOCHOWA**, a monastery of the order of St Paul the Hermit, in the Polish government of Kalisch. It is the most frequented place of pilgrimage in the whole country, and is celebrated throughout all the Slavic nations. It occupies a commanding position on the Warthe, not far from the Silesian frontier, and possesses the famous dark-coloured picture of the mother of Christ, which has given occasion to the worship of the Black Virgin by all the Polish Catholics. This picture is probably of Byzantine origin. According to the legend in connection with it, it was painted by Luke himself; passed into the hands of the Princess Helena; subsequently found its way through a Russian prince, Laon, to Belz in Galicia; and finally, through Wadyslaw, Duke of Oppeln, who built the monastery of C., was brought thither to assist him against the Tartars. In more recent times, C. is noted as being the only place in Poland which offered resistance to the army of Charles Gustavus, king of Sweden, on which occasion (1655 A. D.) the inmates, comprising 70 monks and 150 soldiers, withstood a siege of 38 days carried on by a Swedish force of 10,000 men. At a later period,

however, C. lost its importance as a military position. At the foot of the eminence on which the monastery stands, lie two little towns, Old and New C., which carry on a considerable trade in holy pictures and amulets.

**CZE'RNOWITZ**, a town of the Austrian Bukowina, situated on a hill near the right bank of the Pruth, about 140 miles south-east of Lemberg, in lat. 45° 26' N., long. 25° 59' E. It has a Greek cathedral, and manufactures of cloaks, silver articles, and hardwares. Pop. 1851, 20,500.

**CZERNY**, **GEORG**, properly, *Karadjordje*, i. e., Black George, the leader of the Servians in their struggles for independence, was born in 1770 in the neighbourhood of Belgrade. He shewed, when young, his hatred of the oppressors of his country by murdering a Moslem. After spending some time in Austria, he returned to his paternal estate. In August 1801, a band of janizaries broke into his dwelling, and plundered it. C. fled, vowing vengeance. He soon collected a band of malcontents, and commenced a sort of guerilla war. Gradually his numbers increased, and in 1804 he captured the fortress of Schabaz. Subsequently, he invested Belgrade, and in the beginning of 1806 routed the Turks at the rivers Drina and Morawa. Assisted secretly by Russia, he captured Belgrade in December 1806. After the treaty of Slobosje (8th July 1808), he was elected governor by the people, and recognised as Prince of Servia by the sultan. The French invasion of Russia in 1812 compelled the latter country to let Servia shift for itself. Hostilities recommenced; the Turks were successful, and C. had to flee to Russia. He afterwards went to Austria, where he lived for some time. Meanwhile, the freedom of Servia had been secured through the leadership of Milosch Obrenowicz; and in July 1817, C. returned, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, when he was murdered at the instigation of Prince Milosch.

# D

THE fourth letter in the Greco-Roman alphabets, was called in the Semitic languages *daleth* (hence Gr. *delta*), i.e., 'door;' and in all probability its original hieroglyphic or picture form was a door. The Greek Δ, in fact, yet preserves a recognisable resemblance to the door or opening of a tent, the kind of door most familiar to a nomadic people. D belongs to the order of letters called *dentals* (see LETTERS, ALPHABET), *t, d, th* (in *thin*), *th* (in *thine*), and in the corresponding words of sister-languages is often exchanged with those of the same order or organ; thus: Ger. *du*, Eng. *thou*; Ger. *tot*, Eng. *death*; Lat. *duc*-, Eng. *tug*; Lat. *duo*, Eng. *two*. A more remarkable interchange is that between *d* and *l*, and *d* and *r*. See L and R. D seems to have been drawn into some words (to which it does not radically belong) by a kind of affinity for *n*, as Lat. *canis*, Gr. *kyon*, Eng. *hound*; Lat. *gener*-, Eng. *gender*. *Di* followed by a vowel is sometimes transformed into J; as in *Janus* for *Dianus*; *Journal* from *diurnal*. *Di* followed by a vowel in Latin, has, in Italian, become *z*; and from MSS. and other evidence, we know that this sibilant sound of *di* prevailed, in the popular pronunciation at least, while Latin was yet a living tongue. Thus, *diabolus* is found written *zabolus*, and *Amazones*, *Amadiones*.—D, the Roman numeral for 500, arose out of the character IϞ. See NUMERALS.

D, in Music, is the second note in the natural scale, and is a whole tone above C, to which it stands in mathematical proportion as 9:8, that is, when C vibrates eight times, D vibrates nine times. The whole tone from C to D is called the greater whole tone, being a comma larger than the next whole tone from D to E.

DA CA'PO (Ital., from the beginning), a term in Music, frequently placed at the end of a part or movement, indicating that the performer must return to the beginning of the movement, or to some other part of it usually marked with the sign §, and finish where the word *fine* is placed. Scarlatti was the first who introduced the use of the *da capo* in his opera of *Theodora*. The words are generally abbreviated thus, D. C., sometimes *D. C. al fine*.

DA VINCI, LEONARDO. See LEONARDO DA VINCI.

DAB (*Platessa limanda*), a fish of the same genus with the plaice and flounder, and very much resembling them, but easily distinguished from either of them by its more uniform and lighter-brown colour, the roughness of its scaly surface, and its more curved lateral line, which rises into a high arch over the pectoral fin. It is common on all sandy parts of the British coasts, inhabits deeper water than the flounder, and does not, like it, enter the mouths of streams. It is known on the coasts of the Firth of Forth as the Salt-water Fluke. It is

preferred to the flounder for the table. It seldom exceeds 12 inches in length. A rather larger species of the same genus, less plentiful on the British coasts, is the LEMON D. or SMOOTH D. (*P. microcephala*). Its body is smooth, its colour a pretty

Dab (*Platessa limanda*).

mixture of various shades of reddish-brown and yellow: its head and mouth are very small.

DABCHICK. See GREBE.

DA'CCA, a city of Bengal Proper, stands about 150 miles to the north-east of Calcutta, in lat. 23° 43' N., and long. 90° 25' E. It is situated on the Burha Gunga, a considerable auxiliary of the Dulassere, which is itself at once a mingled offset of the Brahmaputra and the Ganges, and an affluent of the lower course of the former stream. The city thus enjoys singular facilities in the way of inland navigation. Down to the close of the 18th c., D. was widely celebrated for the delicate texture of its muslins, which, in the phraseology of the East, were characterised as 'flowing water' and 'evening dew;' and, in connection with this manufacture, the French and the Dutch, as well as the English, had extensive establishments in the place. Since 1801, however, these European agencies have disappeared; while the annual value of the elegant fabric, under the influence of British competition, has gradually fallen from £250,000 to nothing at all. The present aspect of the city is in keeping with this utter decay of its staple trade. In many quarters are ruins overgrown with jungle, the haunts of tigers and serpents; and this remark is applicable to numerous splendid edifices, such as the residences of its native princes and the factories of its foreign sojourners. Still D., within a space of 4 miles in length by 1½ in breadth, is understood to contain upwards of 60,000 inhabitants. It seems, of late years, to have partially recovered from the effects of its commercial decline. Besides 180 mosques and 119 pagodas, there are places of worship belonging to Romanists, Armenians, Greeks, and English, both Episcopalians and Baptists. By the last-mentioned denomination, several schools are maintained; and there is also a college, which, in 1850, was attended by 340 pupils—46 Christians, 15 Mohammedans, and 279 Hindus. The temperature at noon averages on the twelve months 79° F.; and the mean rain-fall is said to be 70 inches.

DACCA, the district of which the above-mentioned city is the capital, extends in N. lat. from 23° 12' to 24° 17', and in E. long. from 90° 11' to 90° 58', containing 1960 square miles, and numbering about 600,000 inhabitants. Forming part of the great delta of the Ganges and Brahmaputra, it is traversed by streams in every direction, being so low and level as to be generally flooded during the rainy season. It is, on this account, admirably adapted to the cultivation of rice. From the character of the country, roads—happily rendered less necessary by the net-work of rivers—are very difficult of construction. In addition to the city of its own name, the district has two principal towns, Narainganj and Islampoor. Though the climate, as a whole, is moist, yet it by no means presents uniformity in this respect, the annual rain-fall varying in different years from 46 to 93 inches. Among commercial crops, cotton—the raw material of the far-famed muslins—once occupied a prominent place. It is now comparatively neglected, being too short in the staple for the coarse fabrics which alone continue to be made in the district. Recent attempts to introduce a better variety from the United States have failed. It was in 1765—the epoch of the cession of Bengal, Bahar, and Orissa on the part of the Great Mogul—that D. became subject to England; but down to 1845, the heirs of the native ruler succeeded each other as stipendiaries of the East India Company.

DACE, DARE, or DART (*Leuciscus vulgaris*), a fresh-water fish of the family *Cyprinidae* (q. v.), and of the same genus with the roach, ide, chub, bleak, minnow, &c. It chiefly inhabits the deep and clear water of quiet streams. It is found in Italy, France, Germany, &c., and in some of the rivers of England, but is very local. It is in form not unlike the roach, but rather more elongated; the mouth is rather larger, the scales smaller. The upper parts are dusky blue, becoming paler on the sides, and passing into white on the belly, the cheek and gill-covers silvery white. The D. is gregarious, and swims in shoals. Its flesh is preferred to that of the roach, but is not highly esteemed. The D. is perhaps the

Dace (*Leuciscus vulgaris*).

liveliest and most active of the *Cyprinidae*, and affords the angler fair sport both with fly and bait. It is fished for with a light float and a fine gut-line. The float is set so that the bait may almost touch the bottom. At the least symptom of a bite, the angler must strike quickly. The best baits are the red-worm, the tail of a lob-worm, gentles, graves, and flies or grubs of any kind. The best places to fish with bait are moderately sharp streams, of from two to four or five feet deep. Dace at times take the fly very freely, and shew capital sport. Small red and black palmers will be found the most useful flies for the purpose, and their killing properties will be greatly increased if the hook is tipped with a tough gentle, as D. are very apt to follow the fly without taking it, when the gentle overcomes their scruples; a small piece of the white, tough, inner rind of bacon answers equally well; and even a small piece of wash-leather may be used. Shallows,

scours, and by the edge of weed-beds, are the best spots for the fly. D. may be taken also by 'dapping' with the natural fly, and those so taken are usually the finest fish. D. seldom exceed a pound in weight, though in some rivers they have been taken up to 1½ lb. In the Thames, a fish of half a pound is considered unusual. They spawn in the end of April, or early in May, and soon recover their condition again.

DA'CIA, the land of the Daci or Getæ. Its geographical limits were very indefinite until its conquest by the Romans. After that period, it comprised the various countries now known as Eastern Hungary, Transylvania, Bukowina, Moldavia west of the Pruth, Wallachia, and the Banat of Temesvár. The Getæ came originally from Thrace, and were divided into various tribes. Their course northward can only be imperfectly traced; but we know that, shortly before the time of Alexander the Great (335 B. C.), they had migrated across the Danube. It is not known when or for what reason the Getæ changed their name to Daci. They seem to have been the most valiant of the Thracian barbarians. Curio, the first Roman general who ever penetrated as far north as the Danube, did not venture to assail them. Julius Cæsar, however, is said to have intended their subjugation. In 10 B. C., Augustus sent an army up the valley of the Maros. From this time, there was almost continual fighting between the Romans and the Daci, on the whole, to the advantage of the latter, who actually compelled their civilised enemies, in the reign of Domitian, to pay tribute. In 101 A. D., the Emperor Trajan crossed the Theiss, and marched into Transylvania, where he fought a great battle near Thorda. The peasant calls the battle-field to the present day *Prat de Trajan* (*Pratum Trajani*, field of Trajan). The Daci, who were commanded by their famous chief Decebalus, were defeated. A second expedition of the emperor's (104 A. D.) resulted in the destruction of their capital, the death of Decebalus, and the loss of their freedom. Roman colonists were sent into the country, a bridge was built over the Danube—the ruins of which are still extant—and three great roads were constructed. In 270—275 A. D., the Romans abandoned the country to the Goths, and the colonists were transferred to Mæsia. After a series of vicissitudes, D. fell into the possession of the Magyars in the 9th century.

DACIER, ANDRÉ, a French author, born of Protestant parents at Castres, in Upper Languedoc, 6th April 1651, studied at Saumur; and in 1672 came to Paris, where he was employed to bring out an edition of the Latin writer *Festus*, for the use of the dauphin, which he did in 1681. In 1683, he married Anna Lefèvre, also a Protestant, and two years later, both entered the Roman Catholic Church. D. subsequently became royal librarian, member of the Academie des Inscriptions, and perpetual secretary of the 'Academie.' He died 18th September 1722. D.'s principal works, besides his *Festus*, are *Œuvres d'Horace en Latin et en Français* (Par. 1681—1689), an edition of Valerius Flaccus, and numerous translations into French of Greek authors, such as Putharch and Epictetus, all of which are of very middling quality, while the expositions and criticisms are extremely shallow.

ANNE DACIER, wife of the preceding, was born at Saumur in 1651, and after the death of her learned father, who had developed her talent, came to Paris, where she acquired such a reputation by her edition of Callimachus (1674), that the Duke of Montausier commissioned her to edit several of the ancient authors for the use of the dauphin. Similarity of tastes and employment led to a marriage between

her and André Dacier. Her domestic duties did not, however, weaken her literary ardour. Besides editing various of the classics, she translated the comedies of Terence; the *Amphitryon*, *Epidicus*, and *Rudens* of Plautus, accompanied by an able dissertation on the origin, progress, and mutations of dramatic poetry; Anacreon, Sappho, and the *Plutus* and *Clouds* of Aristophanes. Her admiration of Homer was unbounded, and, in spite of her sex, involved her in two learned controversies. Madame D. is generally acknowledged to have possessed a more acute and vigorous mind than her husband. She died 17th August 1720.

**DACOITS**, or **DACOTAH INDIANS**, in the United States. See **INDIANS**.

**DACRYDIUM**, a genus of trees of the natural order *Taxaceæ*, having male and female flowers on separate trees. The species are lofty trees, chiefly natives of Australia and New Zealand. *D. Franklinii* is called **HUON PINE**, although rather a yew than a pine. Its timber is harder than any Baltic pine, and is excellent for spars for naval purposes. *D. taxifolium*, the Kakaterra Tree of New Zealand, attains a height of 200 feet, and is also very valuable for its timber. A beverage resembling spruce-beer is made from its branches.

**DACTYL** (Gr. *duktulos*, the finger), the name of a measure or 'foot' in Greek and Latin versification, consisting of a long and two short syllables, as in the word *omnibus*. It was so called from its resemblance to the finger, which consists of three joints—one long and two short. The same name is sometimes applied to a trisyllabic measure in English verse, consisting of one accented syllable and two unaccented syllables, as in *désiny*. See **VERSE**. Dactylic verses consist of dactyls and equivalent feet. See **HEXAMETER**.

**DACTYLIS**. See **COCK'S-FOOT GRASS**.

**DACTYLOLOGY**, the art of communicating thoughts by the fingers. See **DEAF AND DUMB**.

**DACTYLOPTERUS**. See **FLYING GURNARD**.

**DA'DO** (Ital. a die), in classical Architecture, the term applied to the cubic block which forms the body of a pedestal. It is also applied to the plane face and the series of mouldings which, in the interiors of buildings, form, as it were, a continuous pedestal. The interior D. is formed of wood, and, running round the bottom of the walls of a room, serves to protect the plaster or paper from injury. It is generally about three feet in height, and surmounted by a narrow cornice.

**DADU'R**, a town of Beloochistan, is five miles to the east of the Bolan Pass. Though it is in the 30th degree of N. lat., yet it is said to be one of the hottest places in the world. It contains about 3000 inhabitants. It is worthy of notice chiefly as the spot where, in November 1840, the British troops routed a Kelat force. The neighbourhood yields grains of various kinds, pulse, cotton, sugar, madder, and fruits.

**DÆDALUS**, according to the Greek myths, was sprung from the old Athenian race of kings, the Erechtheidae, and was a contemporary of Theseus and Minos. He was famous for his ability as an artist and mechanic. Among the numberless works which he is said to have executed, may be mentioned the Cretan labyrinth, the Colymbethra, or reservoir, near Megaris in Sicily, the temples of Apollo at Capua and Cuma, that of Artemis Britomartis in Crete, and an altar sculptured with lions on the Libyan coast. His mechanical genius is clearly celebrated in the poetic fiction of his flying safely over the Ægean by means of wings which he had himself made. D. got the credit among the

Greeks of having invented carpentry, and most of its tools, such as the saw, the axe, the plumb-line, the gimlet, as also glue. The history of D. is obviously a myth, wherein, as recent criticism has conclusively shewn, is embodied that epoch in which the first rude forms of art were thrown aside, and a higher skill and intelligence displayed.

**DAENDELS**, **HERMANN WILHELM**, a Dutch general, was born in 1762 at Hattem, in Gueldres, took part in the revolutionary disturbances that broke out in Holland in 1787, and was in consequence compelled to seek refuge in France. In the campaign of 1793, he rendered important service to Dumourier, and was elevated to the rank of a general of brigade. In 1799 he commanded one of the two divisions of the republican army, which, with a third corps under the orders of General Brune, compelled the Anglo-Russian forces to surrender. Circumstances induced him to leave the service in 1803, but in 1806 he was re-instated in his former rank by the king of Holland. He now conquered East Friesland, and was made governor-general of Münster, commander-in-chief of the Dutch cavalry, marshal of Holland, and governor-general of the Dutch East Indian possessions. This last office he held from 1808 to 1811, and discharged its duties with great prudence. He also published a work upon his administration in Java, which was an important contribution to our knowledge of that island. On the overthrow of Napoleon, his services were secured by the new king of Holland, Wilhelm I., who intrusted him with the organisation of government in those colonies on the coast of Africa which had been restored to the Dutch. In this capacity he laboured with energy and success until his death in June 1818.

**DAFFODIL** (corrupted from Lat. *asphodelus*), the English name of those species of *Narcissus* (q. v.) which have a large bell-shaped corona. The common D. (*N. pseudo-narcissus*) is a native of England and of most parts of Europe, growing in woods and hedges. It is naturalised in many places in Scotland, but seems scarcely indigenous. All the other species are more southerly, chiefly abounding in the countries near the Mediterranean. Some of them, as *N. minor*, have become naturalised in some places in England, having been long known as ornaments of gardens, in which double-flowered varieties are also cultivated. They are favourites, not so much for their beauty, which is not of the most delicate kind, as on account of their large yellow flowers, which are produced early in spring. The bulbs are purgative and emetic. The mode of cultivation is the same as for other species of *Narcissus*.

**DAG**, a thick clumsy pistol, used in the 15th and 16th centuries. In the *Spanish Tragedy*, published in 1603, one of the characters shoots the dag.

**DAGGER**, a weapon resembling a sword, but considerably smaller, being used for stabbing at close quarters. Daggers are generally two-edged, and very sharp towards the point. Originally, it had no guard for the hand, and was worn at the girdle in a sheath. It is now regarded as a general military weapon in European countries.

**DAGHESTAN** (Tartar, *Tagh stan*, signifying mountainous country), a province of Asiatic Russia (called also Derbend), stretching along the west coast of the Caspian Sea, in lat. 41°—43° N., long. 46°—50° E. Area about 8600 square miles. Pop. (1856), 427,931. The surface is generally mountainous, being traversed by offsets from the Caucasus, but there are many valleys and level tracts of great fertility, where the principal kinds of grain are produced, as well as flax, madder, saffron, silk, and

tobacco. Cattle-rearing is also a source of considerable employment to the inhabitants, who are composed chiefly of Tartars and of Caucasian tribes. The chief town is Derbend (q. v.).

DA'GO, an island in the Baltic Sea, forming a part of the Russian government of Esthonia, situated near the entrance of the Gulf of Finland. The narrow channel called Sele-sund separates it from the island of Oesel on the south. Its length is estimated at about 34 miles, and its breadth at 15 miles. The soil, a mixture of sand and chalk for the most part, is not fertile, the coasts are rocky, and shoals make navigation dangerous. The population, Esthonians mostly, number about 10,000, and are chiefly employed in fishing and cattle-rearing.

DAGOBA, or DAHGOPA (according to Wilson, from *deha*, the body, and *gopa*, what possesses, because it contains the hair, teeth, &c., of Buddha; according to others, from *dhatu*, a relic, and *gabba*, a shrine), are monumental structures containing relics of Buddha. Dagoba seems to be the common Singhalese term for such monuments; but the more general name is Stupa (q. v.) or Tope.

DA'GON (Heb. *dag*, a fish), the national idol of the Philistines, is frequently mentioned in Scripture; in profane history, the name by which it is known is Derceto. It is always represented on ancient medals as half-fish, half-woman, but the Hebrew writer or writers speak of it as a masculine being. Some scholars have attempted to shew that the word D. comes from the Phœnician *dagan*, wheat; and that it is not the name of a fish-god, but of a god of agriculture. It is possible, however, to combine both notions, by supposing that D.

Dagon.

was a deified mortal who had come in a ship to the coast, and taught the people agriculture and other useful arts. Ancient history abounds with such mythological personages, one of whom was called by the Babylonians *Odakon*, and is regarded by the learned Selden as identical with the fishy idol of the Philistines.

DAGUERREOTYPE PROCESS, the name given to the original photographic process as introduced by its inventor, M. Daguerre, in 1839. Notwithstanding that it has now become so unpopular, on account of the very circumstance which gives such perfection to the result—viz., the polish of the plate—it is a process which yields to none in point of microscopic perfection of detail and perfect gradation of shade. The pictures it yields are positive or direct, as given in the camera, though they also appear as negative when viewed at certain angles, and are the result of the successive action of the vapours of iodine, bromine, and mercury upon a highly polished surface of chemically pure silver. The manipulations involved in conducting the process are—1. Cleaning and polishing the plate; 2. Rendering the plate sensitive; 3. Exposing it in the camera; 4. Developing the latent image; 5. Fixing the picture.

A copper-plate of moderate thickness is coated with silver by the electrotype or other suitable method, and then polished to the utmost possible extent, so as to obtain, though by mechanical means, a chemically pure surface; it is then exposed first to the vapour of iodine, and then to the vapour

of bromine for a length of time, ascertained in practice by watching the beautiful succession of prismatic colours which begin to appear with the first contact of the vapour. The length of exposure in the camera which follows is determined by the amount of light at the time of operating, and the relation between the diameter and focal length of the lens employed. The development of the latent image, which is the next operation, is effected by exposing the plate in a suitable box to the vapour of mercury, which attaches itself to the various parts of the picture in proportion to the more or less intense action of the light. These portions of iodide and bromide of silver unacted on by light, are next removed by immersing the plate in a solution of hyposulphite of soda; and the picture is subsequently fixed and intensified by pouring over its surface a solution of hyposulphite of gold, and applying heat; by which means it is coated with a thin film of metallic gold, and thereby rendered so permanent that it cannot be rubbed out by ordinary means, but requires a chemical solvent for its removal. It may be mentioned, in conclusion, that though M. Daguerre published, in 1839, the first practicable process for taking pictures by the agency of light, his experiments would seem to have been suggested by the researches of M. Niepce, who, in 1820, obtained impressions on silver plates rendered sensitive by exposure to the vapours of sulphur and phosphorus.

DAHL, JOHANN CHRISTIAN CLAUSEN, a Norwegian landscape painter, born at Bergen 24th February 1788, was at first intended for the church, but afterwards devoted himself to art. He studied painting for six years under the direction of Professor J. G. Møller. His first attempts were in *genre* and miniature. They did not exhibit much genius; but public attention was at length excited by a work which he exhibited in Dresden in 1819, entitled 'Cascade among Rocks in Norway.' Next year, he went to Italy, where Thorwaldsen and the Prussian consul-general, Bartholdy, commissioned him to execute several works. In 1821, he was appointed professor of painting at Dresden, where he has since permanently resided. D. is fond of reproducing on his canvases the picturesque scenes of his native country, which he has often revisited. Among his more famous works are a 'View of Naples,' 'Winter in Zealand,' 'View of Bergen,' 'Scene from the Environs of Christiania,' and a 'Winter Scene on the Banks of the Elbe,' the last two of which attracted great attention at the Paris Exhibition of 1855. D. is a member of several academies.

DAHLGREN GUN, named after a naval officer in the service of the United States government, is the result of a careful series of experiments on the construction of large ordnance. One peculiarity consists in having relatively less metal in front of the trunnions, and more behind, than had hitherto been customary. Dahlgren guns, made to fire shells or hollow shot, have been introduced to a considerable extent in the United States navy.

DAHLIA, a genus of large perennial herbaceous plants of the natural order *Compositæ*, sub-order *Corymbifera*, natives of Mexico. All the varieties in cultivation in our flower-gardens, of which not fewer than 2000 have been carefully enumerated, are derived from two species, *D. variabilis* and *D. coccinea*, and chiefly from the former. Few plants manifest so strong an inclination to sport and produce new varieties as the D., and florists have also obtained many by the artificial fecundation of one with the pollen of another. Dahlias were first brought to Madrid by Spanish botanists

in 1789, and were soon introduced into England, but did not become well known in English flower-gardens till about thirty years after. The name was given in honour of Dahl, a Swedish botanist; but because another genus of plants had received the same name, an attempt was made to change it to *Georgina*, which is sometimes used on the continent, but *D.* universally prevails both popularly and among botanists in Britain. Among the most essential characteristics of a fine *D.*, according to the estimation of florists, are a fulness of the flower, a perfect regularity in the shape of the florets, and the absence of an eye or disc; the florets of the disc, as in other 'double' *Corymbiferae*, having assumed the appearance of florets of the ray. Dahlias have tuberous roots, which contain a considerable quantity of *Inulin* (q. v.), and are in use as an article of food in Mexico. It was at one time attempted to introduce them into cultivation in Europe for the food either of man or of cattle; but the taste is nauseous to European palates, and even cattle do not readily eat them. Dahlias are often cut down in the northern parts of Britain by early frosts, in the very midst of their flowering; and their tubers require to be taken up for the winter, and stored in a dry place out of the reach of frost till spring. They are propagated by seed, by cuttings, and by tubers. The finer varieties are sometimes grafted on more ordinary stocks.

DAHLMANN, FRIEDRICH CHRISTOPH, Professor of History and Political Science in the university of Bonn, was born, May 17, 1785, at Wismar. His earlier studies in Copenhagen and Halle were devoted to archaeology and philology; but his attention was subsequently directed to the study of politics and the history of the middle ages. The results of his diligence appeared in his *Vita Ansgarii*, his *Researches in German History* (2 vols., Altona, 1822—1823), his edition of the *Dithmarsh Chronicle* (Kiel, 1827), and other works. In 1829, *D.* was appointed Professor of Political Science in Göttingen, where he published (1830) his valuable work on the *Sources of German History*. Banished in 1837, by King Ernest of Hanover, on account of his protest against the abolition of the Hanoverian constitution, he went to Leipsic and Jena, where he wrote his historical master-piece, the *History of Denmark* (3 vols., Hamburg, 1840—1843). In 1842, he became Professor of History at Bonn, and took a prominent part in the political affairs of Germany after the movement in 1848. Equally opposed to the tyranny of the mob and of the crown, he headed the party of constitutional liberals, who were unfortunately too reasonable to be successful. At the close of the struggle, he returned to his academic duties.

DAHOMEY, an independent state of Guinea, Western Africa, extending along the coast from Fort Badagry on the east, to the river Volta, which separates it from Ashantee on the west. Its limits have not been precisely defined, but it is usually regarded as extending back to the Kong Mountains. It will thus lie between lat. 6°—8° 50' N., and long. 0° 30'—3° E.; its breadth being about 200, and its length 180 miles. *D.* is for the most part a vast plain, rising with gentle ascent from the sea towards the Kong Mountains, with offsets of which it is traversed in its most northerly parts. Although it has no river of any importance save the Volta on its western boundary, it is well watered by springs and streams; and the soil, a rich, red-coloured clay, almost quite free of stones, is extremely fertile. Magnificent trees clothe the hills in the north, and maize, beans, and pease grow in splendid luxuriance on the plains, as well as yams, potatoes, melons,

limes, oranges, pine-apples, and other tropical fruits; cotton, sugar, tobacco, and indigo are also raised. The scenery is described as exceedingly varied and beautiful. Lions, tigers, elephants, hyænas, and enormous snakes of the boa kind abound. The Dahomans, who came into possession of this tract of country about the beginning of the 18th c., are for the most part tall, well-formed, and intelligent, and, for an African race, singularly honest and far advanced in agriculture. With the exception of a few Mohammedans, whose religious belief is in no way interfered with, they are all pagans, and practise fetish-worship. The king is the most absolute of despots, having entire control over the lives and property of his subjects. Wholesale murder is one of the chief features in religious and state ceremonies, and the most valued ornaments of the royal residence are human skulls. As many as 2000 human victims are sometimes sacrificed at one 'grand custom;' and the present king immolated 7000 at the death of his father. Of the regular army of 12,000, about one-half are Amazons (devoted to celibacy), who are described as much more effective soldiers than their male companions in arms; but at the same time as bloodthirsty and ferocious as tigresses. The revenue, until recent years, depended greatly upon the sale of slaves; but the vigilance of the cruisers employed to prevent the traffic, has reduced this source of income materially. Hence the monster slave-hunts which periodically took place, in order to supply slave-traders, are now comparatively rare. Pop. estimated at 200,000.—ABOMEY, the capital city, and the royal residence, is situated about lat. 7° 30' N., long. 1° 40' E. It is stated to be eight miles in circumference, is surrounded by a ditch, and clay walls, pierced by six gates, in each of which are two openings—one for the exclusive passage of the king, the other for his subjects. The houses are mostly of one story, built of clay, and thatched. There are no regular streets, each house standing within its own enclosure of clay wall. There are three palaces belonging to the king here, which differ little from the other houses, save in their greater extent and higher roof. There are two markets, but no shops. Farms are cultivated within the city, its large space in proportion to the population (30,000) admitting of this. See Forbes's *Dahomey and the Dahomans* (2 vols., Lond. 1851).

DAHRA, a district of Algeria, once inhabited by the Ouled-Riahs, a Kabyle tribe. It has acquired a melancholy celebrity as the scene of a frightful massacre perpetrated by the French in the month of June 1845. The district contains immense caverns. In these the Ouled-Riahs, hotly pursued by the French under Colonel (now Marshal) Pelissier, took refuge. They were ordered to surrender their arms and horses, and were promised, in return, life and liberty. On their refusal, fascines were made up, kindled, and placed at the entrance of the caves. Thrice Colonel Pelissier sent a flag of truce, exhorting the imprisoned Kabyles to accept his terms, but in vain—the last messenger being received with a discharge of musketry. The fire was therefore again kindled in all its intensity, and gradually the cries of agony from the interior of the caverns ceased, until nothing broke the dead silence but the occasional crackling of the green wood of which the fascines consisted. When the caverns were examined, about 600 dead bodies were found scattered here and there; but it was calculated that in all (including those who afterwards died and those who could not be got at), about 800 had been suffocated by smoke, or gored to death by the maddened cattle whom they had brought with them into their fatal asylum. The news created a great sensation in Paris. Marshal Soult, then minister of war,

formally condemned the deed; but Marshal Bugeaud, the governor of Algeria, affirmed that Pelissier had only acted under positive orders.

**DAIMIEL**, a town of Spain, in the province of Ciudad Real, twenty miles east-north-east of the city of that name. It is in general tolerably well built; it has several squares, and its principal streets, though unpaved, are wide and comparatively clean. Its chief buildings are the churches of San Pedro and Santa Maria—the former a Doric, and the latter a Gothic structure—a town-hall, and a hospital. D. is environed by fine public walks and gardens, and has manufactures of woollens, linen, blonde lace, &c. Pop. about 10,000.

**DAIR-EL-KAMAR**, or **DEIR EL-KAMR**, a town in Syria, and the capital of the Druses, about 13 miles south-south-east of Beyrout. It is situated on the edge of a deep and picturesque glen of Mount Lebanon, the banks of which and the slopes above are richly clad with mulberries, olives, and vines, which are cultivated in terraces by an exceedingly industrious population. On the opposite side of the glen stand the ruins of the palace Bteddin, formerly the residence of Emir Beshir, who, for more than half a century, from 1788 to 1840, ruled over the Lebanon with a strong but impartial hand. Population of D. about 8000.

**DAIRY**, all that concerns milk and its management on a farm; or the place or house where the milk is kept, cheese made, &c. (The old word *dey*, the milkmaid who presided over the *deyry* or dairy, is probably allied to *dag*, a teat, and to Lat. *duc*, to draw, or milk; in Polish, *doic* is to milk; and in Sw., *deja* is a dairymaid). Throughout the best cultivated districts both of England and Scotland, the growing of corn and green crops, and the rearing and feeding of stock, are now generally carried on in conjunction with the dairy. This mixed system of husbandry is certainly productive of better cultivation, and, moreover, divides the farmer's risks, and enables him to make the most both of his stock and his land. Milk-cows, however, still occupy the farmer's chief attention, and dairy-produce still pays the rent throughout most of Ayrshire, many parts of Lanarkshire, and most of the south-western counties of Scotland; amongst many of the smaller tenants in the midland districts of England; in the rich vale of Aylesbury; among the old pastures and small enclosures of the south-western counties; and in Cork and the adjoining Irish provinces. Possessing a mild moist climate, these portions of our island are better adapted for pasture than for corn, and have always been noted for their dairy-produce.

The selection of cattle of a sort profitable for the dairy, is a point of the first importance. Certain breeds have long been famed for their milking properties; at the head of these is generally placed the Ayrshire. In proportion to their small size, and the limited amount of food which they consume, they yield a large quantity of rich good milk, and are highly prized by the dairymen of Glasgow and other Scottish towns. The oxen, however, are of small value, for, unless the produce of short-horn sires, they are poor graziers. The cows of the Channel Islands also stand in high repute. The elegant, deer-like Alderneys are kept, more especially in England, by those who prize rich milk, and many farmers have one or two amongst their herd to impart a higher colour and richer flavour to the milk and butter. Alderneys frequently give 14 quarts of milk daily, and 8 or 9 lbs. of butter per week, while instances occur of their yielding as much as 12 or 14 lbs. The small Brittany breed, scarcely larger than goats, have also of late years

been brought to this country, and are profitable for gentlemen's families, and where only one or two cows are kept. These breeds are, however, in little favour with those who, besides dairying, look also to the breeding of profitable grazing-stock. Many families of the short-horns unite, with size, substance, and aptitude for fattening, excellent milking properties. Short-horns, or animals with a large infusion of short-horn blood, constitute the bulk of the handsome and high-priced cows seen twice a week in our metropolitan market, and preferred to all others by the London dairymen. Throughout the north of England, such cows are also in general favour. They are used by Mr Horsfall, whose excellent papers on dairy management, published in the Journal of the Royal Agricultural Society of England, should be read by all interested in this subject. With his liberal dietary, fifteen to twenty cows daily average, for seven or eight months, ten or eleven quarts of milk, producing a pound of butter. Of late, however, many breeders of our more fashionable and prize-taking short-horns have devoted their undivided attention to early maturity, flesh, and quality, neglecting altogether the milking properties. This is to be regretted. The original short-horns, in the hands of the Brothers Coling, Mr Bates, the Earl Ducie, and other earlier breeders, were excellent milkers; and even at the present day certain families are to be found still retaining their ancient character. The Herefords, although used for the dairy in their own and the adjoining counties, are chiefly famed for their good working and feeding bullocks. The symmetrical blood-red Devons are dairied in some of the southern counties, and are reputed fair milkers. The ancient long-horns, once common throughout the midland counties, and much valued for milk, have now given place to more compact, symmetrical, and profitable varieties. Some of the older Scottish breeds were also celebrated for their dairy qualities, and none more so than the long shapely black Fife cows, of which only a scattered few now remain. Amongst Angus, Galloways, and West Highlanders, good milk-cows may also be found. Of Irish breeds, the neat hardy black cow of Kerry is well known, alike for the quantity and richness of its milk.

Good milking animals of every breed possess certain qualities in common, which guide the farmer in profitably recruiting his dairy-stock. They have neat, tapering, well-placed heads; small and rather narrow necks; light fore-quarters; oblique rather than upright shoulders; large and shapely udder, well under the belly; largely developed milk-veins; a pliant mellow skin, well covered with soft silky hair. Of great importance, also, is the fact of the animals being descended of parents possessing good milking qualities, for certainly no property is more distinctly hereditary. The milk of small and young cows is usually richer than that of larger or older animals. From four to seven is the most profitable age for the dairy-cow; after that, the milk is poorer; the animals eat more food, especially during winter; and, moreover, become less profitable when dried for feeding. The stock is usually recruited by heifers bred on the farm, which are generally preferred to those bought in. Roan and red colours are most in favour, white animals being rather more delicate and dainty, especially as calves and year-olds.

There is much truth in the old Scottish adage, 'What gangs in at the mou [mouth] makes the guid milk-ew [cow].' In no department of the farm is liberal and regular management more satisfactory and remunerative; in none are carelessness and irregularity more hurtful and ruinous. To produce large quantities of good milk, it is absolutely necessary

## DAIRY.

to supply the cow with the materials from which such milk can be easily elaborated. These briefly consist of albuminous materials and phosphates for forming the caseine, and oily matters for producing the butter. In the ordinary dietary of cows, these materials, especially during winter, are seldom present in sufficient amount to produce, without waste, a copious flow of good milk. Cows yielding 12 or 15 quarts of milk, and fed on good meadow-hay alone, will require daily the large and wasteful amount of 28 or 30 lbs., and even then, never maintain their condition during the earlier periods of lactation. The addition of 20 lbs. of mangold or Swedes will not always prevent loss of weight. A still greater falling-off in flesh and fat—a constant robbing, in fact, of the materials of the body to supply the secretion of milk—is observed in the case of cows kept on the Scotch system on straw and a full allowance of turnips. Under better management, the expensive hay and roots may be materially reduced in quantity, and the adequate amount of nutriment supplied by such articles as bean-flour, rape or cotton cakes, bran, malt combs, and the like; whilst sufficient bulk—an important matter in the feeding especially of ruminants—is attained by the use of chopped straw. The cutting of straw into chaff is gradually commending itself to all stock-masters; a larger amount of straw is eaten, and thus becomes nearly twice as valuable as when employed merely as litter. Bean-straw, when steamed or fermented with pulped or grated roots, loses entirely its bitter flavour, and being rich in albuminous matters, is specially adapted for milking-cows. A portion of the roots, or all of them where the supply is small, should be pulped, mixed with the cut chaff, and the mixture allowed to lie in a heap for a day or two before being used. With the roots should be added 3 or 4 lbs. of rape-cake and 2 lbs. of bran for each cow. The moisture and flavour of the succulent roots permeate the dry food, inducing fermentation, with the development of sugar, and the mass thus becomes more palatable and digestible. Sometimes the mixture is steamed and given warm; and for milk-cows in cold weather, one or two such messes given daily, usually pay for the cost and trouble of steaming. Of the mixture thus fermented or steamed, the cows should have as much as they can eat thrice a day. Cows in full milk, or intended to be speedily fattened, should have sprinkled over it a small quantity of bean or wheat meal, to the extent of 1 lb. or even 2 lbs. daily. After each meal, give 3 lbs. of good meadow-hay, and be careful never to allow of hay or anything else more than can be cleared up at once and with relish. In most parts, especially of England, cabbage and green rape form the best succulent food for the first two winter-months; turnips and Swedes for the next two; whilst mangold should serve until the grass is abundant in spring; but it should ever be borne in mind, that animals thrive best on varied and frequently changed food. A few feeds of mangolds, when the Swedes are the staple root, and *vice versa*, besides being a pleasing variety, will be found to augment the quantity of the milk. Rape-cake answers for milk-cows quite as well as the more expensive linseed-cake, especially when its bitter taste is got rid of, as already advised, by fermenting or steaming. The oily matters of the rape being nearly the same as those present in good butter, may account, as has been ingeniously suggested by Mr Horsfall, for its being specially suitable for milking-cows. This, in its main features, is the system of winter-feeding recommended by Mr Horsfall in his excellent papers above referred to. We can also, from some considerable experience, testify to its merits, and believe

that all who have fairly tried it have had good reason to be satisfied with the results. The increased produce and condition of the cows, with the augmented value of the manure, repays the trouble and cost. Each cow in full milk daily consumes about

	s.	d.
20 lbs. bean, oat, or wheat straw, cut into chaff, say at 37s. per ton,	0	4
56 lbs. turnips, Swedes, or mangold, partly pulped, at 10s.	0	3
4 lbs. rape-cake, ground, at £5, 12s.,	0	2½
4 lbs. bran, at £5,	0	2½
9 lbs. meadow-hay, at £4,	0	3
1 lb. bean or wheat meal,	0	1
Attendance, including chaff-cutting, cooking, &c.,	0	2
Total,	1	6½

The summer-feeding of cows is more natural and less expensive than the winter. In the English dairy counties, they are grazed upon the old pastures, which are for this purpose always preferred to those more recently laid down; whilst in Scotland they are pastured upon the clovers. They should never have to work hard for their meals, and should further receive in the house, when brought in for milking, cut clover and rye-grass. Unless in the case of very fine and rich pastures, an allowance of rape-cake is also advisable. Such management not only improves the yield and quality of the milk, but supports the cows in high condition, and maintains the pastures in high and increasing fertility. This last matter is worthy of consideration, for under the older system, many of the once famed dairy-farms of Cheshire and other counties have rapidly declined in value. The tons of butter and cheese carried away from the soil have left it poor and unprofitable. In such circumstances, the use of bones and other such manures, by improving the condition of the soil, have also greatly improved the nutritive quality of the grass and hay. The produce of good land in high condition is always more valuable alike for dairy and for feeding purposes. It is worthy of remark, that a given acreage will support more animals, if the produce be cut and brought to them, than if they are permitted to depasture it. The advantages of both systems are, however, secured by running the cows at grass during part of the day, and giving them cut clover in the house during the remainder. Throughout the early and later part of the season, it is better that the animals be out during the day, and in at night; but in the intense heat of a warm summer, their being housed in the day secures them from the attacks of troublesome flies, and permits their grazing undisturbed during the cool of the night.

A good supply of water is necessary for milk-cows, which require much more than feeding-stock. In winter, they should have access to it at least twice a day, and require it still oftener in summer. Adequate shelter, and comfortable and convenient buildings, are very essential to successful management. Cows kept, as is still common in the south of England, even during an inclement winter, in open yards, or worse, on the bare damp poached pastures, cannot yield rich milk under any system of feeding: the materials which ought to go to the formation of butter are wastefully spent in supporting animal heat. Cows in full milk are most profitably kept in well-ventilated byres or hovels, of which the winter temperature should fall little below 60°.

The heifer may be put to the male when about two years old. The period of gestation is nine calendar months, or 284 days, but is usually shorter in young animals, and when the calf is a female. During pregnancy, cows fortunately are little liable to disease. Abortion occasionally occurs, and is most common about the third or fourth month. The

heifer will receive the ordinary food of store-stock until within six or eight weeks of calving, when it will be profitable to diet her as recommended for cows. It is a great mistake to starve cows in calf; half the summer passes before they recover from the effects of such parsimony. In older cows, especially if good milkers, for a fortnight before calving, the bowels must be kept relaxed, the teats drawn, and any milk removed several times a day, and an occasional dose of salts given. Such simple precautions will prevent that apoplectic form of milk-fever which destroys so many excellent milk-cows. The enlargement of the udder, and appearance of milk, the loosening of the ligaments of the pelvis, the relaxation of the vulva, and the animal's evident desire to be alone, betoken the approach of parturition. The act is generally accomplished speedily and easily, and without requiring much assistance. The calf usually comes with its forelegs first, and its head rather on one side, with the nose between the knees. The cow generally stands, and as the calf drops, the navel-string is ruptured. With a wisp of straw, the little animal is rubbed dry, and receives either from its mother, or from a bottle, a small quantity of the rich new milk popularly known as the 'beastings' or cherry-curds, technically termed the colostrum (q. v.). In this the casein is mostly displaced by more easily digested albumen; whilst the large amount of sugar and oily matter promotes the clearing out of the bowels. Where valuable stock are reared, they are generally suckled by their dam thrice daily for three weeks or a month; then receive from the bucket six or eight quarts of new milk twice a day, for which a portion of skim is gradually substituted, until, after three or four months, the milk is discontinued, and the animal subsists on grass, hay, or other such food, which in the meanwhile it has been learning to eat. From the time the calf is a fortnight old, it should have a small box in its crib, and be twice a day supplied with a few slices of Swedes or mangold, sprinkled with a little ground wheat, bruised linseed-cake, oatmeal, or any other such nutritive food. Rapid, continuous, and healthy growth is thus insured; the calf is easily and safely weaned; and if such feeding is continued, the animal goes on thriving, and, what is most important, never loses his calf's flesh. To prevent calves sucking each other, it is well to tie them up for an hour after feeding. Those intended for veal should have plenty of new milk three times a day, as much wheat-meal as they will eat, and be tied up constantly in a dark place. Rearing calves should not be tied up, as is too often done in Scotland, but have a comfortable, warm, well-littered, and freely ventilated house. Three or four may be placed together, but overcrowding must be sedulously avoided. The cow after calving should have a drink of meal and tepid water, to which a little salt may be added. For the first week, steamed food, bran-mashes, with good hay, constitute the best food; roots at all times, and cold water during winter, are best withheld. Cleansing drinks are quite uncalled for; and if the placenta do not come away within twelve hours after calving, it may be very properly and safely removed by any one accustomed to such offices.

In England, milking is usually done by men, eight or ten cows being allotted to each, and the operation, except in the case of newly calved cows, being repeated only night and morning. In Scotland, the milking is done by women, three times a day; and more milk is thus got than by milking only twice. The removing of the whole of the milk at each operation is most essential; indeed, experienced

dairymen aver that half their profit lies in carefully getting the last of the milk, which, as is well known, is much the richest. With liberal feeding, such as that above described, well-selected cows yield daily, in a fortnight or three weeks after calving, 12 to 16 quarts, and should continue to do so for six or eight months. Even with the same management, the milk of some cows is especially rich, and yields an unusually large proportion of butter; whilst others are equally remarkable for the way they fill the cheese-tub. A quart of ordinary milk yields about an ounce of butter, and more in summer than in winter; but under good feeding, the amount reaches and even exceeds an ounce and a half, and is tolerably equal at all seasons. A quart of new milk yields four ounces of curd; and in the midland counties of England, each cow is estimated to produce 500 lbs. of cheese in the season.

In the successful management of milk, butter, and cheese, much depends upon the dairy itself. It should have, if practicable, a northern exposure. Proximity to sewers, pigsties, or any offensive smells, must be sedulously avoided. Stone and lime are the best materials. The walls may be advantageously lined with a skirting of brick, or, where the cost is not objected to, with white glazed tiles. A lofty roof and free ventilation must be provided, with windows looking north. A double door is advisable—a light splayed one placed inside, useful in summer for freely admitting plenty of air; and a solid, well-fitting, boarded one, removable in summer, and necessary for keeping out the winter cold. The temperature of the dairy may be further moderated, in hot weather, by allowing a stream of cold water to trickle slowly over the floor, or, better still, round the milk-vessels, placed in large vats, and by hanging throughout the room coarse calico saturated with water several times a day. In winter, hot-water pipes, closed doors, windows protected by straw, and such other appliances, must be resorted to for the maintenance of the desirable temperature of from 50° to 56°. Further to insure an equable temperature, it is advisable to shelter the building with trees and shrubs, and, if possible, have it four or five feet below the level of the ground. No animal food, drying clothes, or indeed anything else, except milk, butter, and newly made cheese, should ever enter its walls. To remove any acidity or noxious emanations, charcoal-powder is sometimes kept strewed on the shelves. An annual whitewashing of roof and walls helps to cleanse and purify. Daily must the floor and shelves be thoroughly scrubbed and washed, and not a drop of spilled milk allowed to remain for many minutes unremoved. By far the neatest and best shelves are of stone or slate, two and a half feet wide, raised on stout iron rods about two feet from the bricked or paved floor. The dishes are best made of earthenware, or oak lined with lead. Where many cows are kept, these last may be conveniently made three feet wide, and four or five feet long. They will thus project six inches over the shelf, and should be provided with a brass plug, by which the milk, when skimmed, can be drawn off without moving the vessels. These, and the milk-buckets, and, indeed, every article that comes in contact with milk or butter, must be kept scrupulously clean. Immediately after use, they should be rinsed out with cold water, and then with hot; wooden and metal articles well-scoured with a wisp of straw, again washed, or, where practicable, dipped into a boiler amongst scalding water, and then set aside for several hours, to dry, air, and sweeten. For scouring purposes, the plaited wisp of straw is greatly preferable to the dish-cloths in common use, as it is more likely to be changed when foul.

The milk, when brought into the dairy, is run through a wire-gauze or horse-hair strainer, into the vessels above described. To encourage the rapid rise of the cream, the layer of milk should be shallow, especially in summer. At the end of 12 or 24 hours, the cream is carefully removed; and in cool weather the milk may stand for another 12 or 24 hours, when it is again skimmed, the residue going to the pigs or calves. The cream removed at the first skimming is always richest and best; and where it is desired that the butter should be first-rate, any subsequent skimmings may be kept separate, and churned by themselves. Churning at short intervals of twice or thrice a week is preferable to allowing the cream to stand for a longer period. Every time cream is added, the contents of the tank or cistern are well stirred, and a little salt added, unless, as in Scotland, where the butter is liked perfectly fresh. The cream should be kept as cool as possible, especially during the several hours preceding churning. For this end, in very hot weather, the cream-tank is sometimes lowered into a conveniently deep well, or placed for several hours in a water-cistern or under a running tap. In such weather, the churning, which generally occupies from 30 to 40 minutes, should be done at night, the butter laid in brine, and made up early next morning. When the whole milk is kept for churning, care must be taken never to add new milk to that which has already been sour. Cheese-making requires so much time and labour, that it is not very popular among the present generation of farmers' wives and daughters, and has of late years been rather on the decline. As with the manufacture of good butter, it requires careful attention, precise regularity, and scrupulous cleanliness. See CHEESE.

Railway communication has greatly extended, improved, and even cheapened the dairy supplies of London and other large towns. The night and early morning trains now carry thither from distances of 60, 80, or 100 miles, quantities of butter and milk, the latter in large tins, which in hot weather are usually covered with wetted calico to promote evaporation, and thus keep the milk cool and sweet. The management of the large dairies from which such supplies are mostly drawn, closely corresponds with that described. The sale of the sweet-milk is found to pay better than the making either of butter or cheese. Quantity rather than quality of milk is usually the main requirement, and a liberal amount of soft succulent food is accordingly used. Calves, as soon as dropped, are disposed of, and are carried for rearing into the grazing counties. When butter is made, it is usually from the whole milk, the butter-milk being used for feeding pigs. In London, Edinburgh, and other large towns, the dairymen keep their cows tied in the stall throughout the year, seldom retain them longer than ten or twelve months, usually dispose of them either in a store or fat state so soon as the yield of milk does not pay for the feeding, purchase their fresh ones immediately before or just after calving, pay particular attention in their selection to the appearance and size of the udder and other points indicating good milking properties, and attach great value to high condition, which presents materials readily convertible into the high selling milk. Cut grass, hay, or sound straw, roots raw and boiled, draff or brewers' grains, with an occasional allowance of flour or cake, form the staple articles of diet. A considerable portion of the food is given in a soft sloppy state, water is freely allowed, with frequent supplies of dreg, better known in England as brewers' or distillers' wash. By such diet, a maximum quantity of milk is obtained.

For further information, the reader is referred to the following works: *Dairy Farming*, by John C. Morton; *Dairy Management*, by J. Horsfall, being a republication of the papers above alluded to (Kidgway); *Dairy Management*, by Mrs Scott (Blackwood); articles on Dairy Management in Morton's *Cyclopadia of Agriculture*; and Stephens's *Book of the Farm*.

DAIS (Fr.). This term was used with considerable latitude by medieval writers. Its most usual significations are the following: 1. A canopy over an altar, shrine, font, throne, stall, chair, statue, or the like. The term was applied to the canopy without regard to the materials of which it was composed, which might be cloth, wood, stone, metal, or other substance. 2. The chief seat at the high table in a hall, with the canopy which covered it, from which probably the word in all its significations was introduced, its French meaning being a canopy. 3. The high table itself. 4. The raised portion of the floor, or *estrade*, on which the high table stood, and by which the upper was divided from the lower portion of the hall; and 5. A cloth of state for covering a throne or table. In old writings, the word occasionally takes the form of *dois*, and more rarely that of *dez* or *detz*.

DAISY (*Bellis*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbifereæ*.—The common D. (*B. perennis*), plentiful throughout Europe, flowers almost all the year in pastures, meadows, and grassy places. What are called double varieties, with flowers of various and often brilliant colours, are very commonly cultivated in gardens, the flowers consisting entirely of florets of the ray. A variety called the *Hen-and-chickens D.*, frequent in cottage-gardens, has the flower (head of flowers) surrounded by smaller ones, the short stems of which grow from the summit of the *scape* or leafless stem. The D. (*Gowan* of the Scotch) has long been a favourite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms gemming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its flowers close at night. It is not found in America. A species of *Bellis* is, however, found in the United States (*B. integrifolia*), but it is confined to Tennessee, Arkansas, and the neighbouring regions. Europe produces some species unknown in Britain, but of little interest; and species of the nearly allied genus *Bellium* are also found in the south of Europe. In the days of chivalry, the D. was the emblem of fidelity in love, and was frequently borne at tournaments both by knights and ladies.

DAISY, MICHAELMAS. See ASTER.

DAKOTA, or DACOTAH (so called from the Dacotah Indians or Dacotics—see INDIANS), a territory of the United States, bounded by Minnesota on the east, Nebraska on the south, Washington on the west, and the British possessions on the north. It was formerly part of the territory of Minnesota, but was detached when that became a state. D. is in length 450 miles, its average breadth is about 200 miles, and it has an area of 70,000 square miles. The 45th degree of north latitude runs across the middle of the territory, which is watered by the Missouri and its branches. D. includes open grassy plains, high rolling prairies, and abounds in game furnishing valuable furs. The land is fertile and well-timbered, and is rich in coal and other minerals. The territory was only organised in 1860, and as yet the country is but meagerly settled.

DALAI-LAMA. See LAMAS.

DALAMOW, a city of Oude, on the left bank of the Ganges, in lat. 26° 4' N., and long. 81° 7' E. It is 68 miles above Allahabad. Pop. stated at 10,000, of whom only 250 are said to be Mohammedans. D. has long been regarded as a holy place in connection with its sacred river, having two antique temples of Siva on the margin of the stream, and an ancient ghat or stair for aiding the ritual ablutions of the pilgrims.

DALARADIA, the ancient name of a territory in Ireland which comprehended what is now the southern half of the county of Antrim, and the greater part of the county of Down. It was sometimes also called *Cric na Cruithne*, 'the region of the Picts,' from the Irish name of its inhabitants, otherwise called the Dal Araidhe, 'the race of Fiacha Araidhe,' a chief or prince of Ulster, who is said to have lived about 236 A.D. The name continued in use till the end of the 12th century. It must not be confounded with DALRIADA (q. v.).

DALBERG (formerly, DALBURG), the name of an ancient and noble German family, of which several members held, by hereditary right derived from the oldest times of the middle ages, the office of chamberlain to the archbishopric of Worms. So great was the renown of the D. family, that at every coronation of a German emperor the royal herald exclaimed: 'Is there no Dalberg here?' whereupon the representative of the family knelt, and received from the new emperor the dignity of 'first knight of the empire.' Several members of this family have been celebrated as patrons of literature and art, of whom the most distinguished is

DALBERG, KARL THEODOR, BARON VON, Chamberlain of Worms and Archbishop of Regensburg, born at Hemsheim, February 8, 1744. He studied in Göttingen and Heidelberg, and, after some time passed in travel, devoted himself to the church. At Erfurt, of which he was appointed governor, 1772, he was active and generous as a patron of literature and art, and also contributed greatly to the social and commercial welfare of the little state placed under his control. After holding several high offices in the church, D. was sent to Paris (1804), in order to assist in adjusting several ecclesiastical affairs with Napoleon and Pope Pius VII. He died at Regensburg, February 10, 1817. D. was as highly respected as a ruler and a scholar as for his private character. During his whole life, he cultivated the friendship of those eminent in literature and art, such as Goethe, Schiller, Wieland, &c. His writings—marked by sound learning and eloquence of style—include a treatise *On the Influence of the Arts and Sciences on Social Order* (1793), and *Pericles, or the Influence of the Fine Arts on the Public Welfare* (1806). These were his favourite objects of study; but natural history, chemistry, botany, mineralogy, and agriculture, also engaged his attention.

DALBERGIA, a genus of trees and climbing shrubs of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having a stalked membranous pod, which is flat, tapers to both ends, and contains 1–3 flat seeds. The leaves are pinnate, with a terminal leaflet. All the species are natives of warm climates. Some of them are valuable timber-trees, particularly the Sissoo of Bengal (*D. Sissoo*), much prized, and more extensively used in the north of India than any other timber-tree except the Sal (q. v.). *D. monettaria*, a native of Surinam, yields a resin very similar to Dragon's Blood.

DALECARLIA, or DALARNÉ (signifying 'valley-country'), an old province of Sweden, now forming the lin or county of Falun or Falun (q. v.). The Dalecarlians are celebrated for the part they

took under Gustavus Vasa in freeing their country from the yoke of Christian II. of Denmark.

DALGA'RNO, GEORGE, an almost forgotten but very able author, was born at Aberdeen about 1626, studied at Marischal College, and afterwards kept a school in Oxford for 30 years, where he died August 28, 1687. He deserves to be remembered for two remarkable works—the *Ars Signorum, Vulgo Character Universalis et Lingua Philosophica* (Lond. 1661); and *Didascalocophus, or the Deaf and Dumb Man's Tutor* (Oxf. 1680). The former is a very ingenious attempt to represent and classify ideas by specific arbitrary characters irrespective of words. It contains the germs of Bishop Wilkins's subsequent speculations on a 'real character and a philosophical language.' Leibnitz has repeatedly alluded to it in complimentary terms. The latter work has for its design, 'to bring the way of teaching a deaf man to read and write, as near as possible to that of teaching young ones to speak and understand their mother-tongue.' D. has the great merit of having anticipated, by more than 130 years, some of the most profound conclusions of the present age respecting the education of the deaf and dumb.

DALHOUSIE, MARQUIS OF, JAMES ANDREW BROUN-RAMSAY, Governor-general of India, third son of the ninth Earl of D., was born April 22, 1812, at Dalhousie Castle, Middlethian. He was educated at Harrow, and graduated at Christ Church, Oxford. In 1832, by the death of his only remaining brother, he succeeded to the honorary title of Lord Ramsay. In 1835, he contested the representation of Edinburgh, in the Conservative interest, against the Whig candidates, Sir John Campbell, afterwards Lord Campbell, and Mr Abercromby. He bore his defeat with great good-humour. In 1836, he married the eldest daughter of the eighth Marquis of Tweeddale; in 1837, was elected for Haddingtonshire. On the death of his father, in 1838, he succeeded to the earldom of D., and became a member of the Upper House. In 1843, he was appointed, by Sir Robert Peel, Vice-president of the Board of Trade, and in 1845 succeeded Mr Gladstone as President of the Board. The 'railway mania' threw an immense amount of labour and responsibility upon his department; but the energy, industry, and administrative ability he displayed in his office, no less than his readiness and fluency in parliament, marked him out for the highest offices in the state. When Sir Robert Peel resigned office in 1846, Lord John Russell, who succeeded him, paid the Earl of D. the rare compliment of asking him to remain at the Board of Trade, in order to carry out the regulations he had framed for railway legislation and intercommunication. In 1847, he was appointed Governor-general of India, as successor to Lord Hardinge, and arrived in Calcutta, January 12, 1848—the youngest governor-general ever sent to that country. His Indian administration was not less splendid and successful, in regard to the acquisition of territory, than in the means he adopted for developing the resources of the country and improving the administration of the East Indian government. Pegu and the Punjab were conquered; Nagpore, Oude, Sattara, Jhansi, and Berar were annexed—altogether, four great kingdoms, besides a number of minor principalities, were added to the dominions of the Queen under his governor-generalship. Railways on a colossal scale were planned, and partly commenced; 4000 miles of electric telegraph were spread over India; 2000 miles of road between Calcutta and Peshawar were bridged and metalled; the Ganges Canal, the largest of the kind in the world, was

opened; the Punjab Canal was undertaken; important works of irrigation all over India were planned and executed; and the official department of public works was re-organised. Among other incidents of his beneficent administration may be cited the permission to Hindu widows to marry again; relief to persons of all sects from the risk of forfeiting property by a change of religion; the improvement of education and of prison-discipline; the organisation of the Legislative Council; the improved training of the civil service, covenanted and uncovenanted; and the reform in the postal service of India, whereby a letter from Peshawar to Cape Comorin, or from Assam to Kurrachee, is now conveyed for three-farthings, or  $\frac{1}{16}$ th of the old charge. These, and many other achievements of his Indian administration, will be found in a minute which he drew up on resigning office, in which he reviewed, with pardonable pride, the events of his eight years' governor-generalship. His constitution had never been strong, and it gave way under the incessant labour and responsibility imposed upon him by his noble ambition. Meanwhile, honours had been showered upon him by his queen and country with no sparing hand: in 1848, he was made a Knight of the Scottish order of the Thistle; in 1849, he received the marquise, the thanks of both Houses of Parliament and of the East India Company, for the 'zeal and ability' displayed in administering the resources of British India in the contest with the Sikhs, immediately previous to the annexation of the Punjab; in 1852, on the death of the Duke of Wellington, he was nominated by the then prime minister, the Earl of Derby, to the office of Constable of her Majesty's Castle of Dover, and Lord Warden of the Cinque Ports. D. sailed from Calcutta in March 1856. On his arrival in England, he was unable to take his seat in the House of Lords; and the remainder of his days was spent in much physical suffering and prostration of strength. On the 19th December 1860, he died at Dalhousie Castle in his 48th year, leaving behind him a name that ranks among the highest in the roll of Indian viceroys for statesmanship, administrative vigour, and the faculty of inspiring confidence among the millions subjected to his sway. As he died without male issue, his title of marquis became extinct on his death, the earldom of D. and other Scottish honours reverting to his cousin, Baron Panmure.

**DALIAS**, a town of Spain, situated in the province of Almcira, 20 miles west-south-west of the city of that name, and about 4 miles from the Mediterranean. It is badly and irregularly built, and is subject to earthquakes. Pop. 9000, who are employed chiefly in mining, smelting, and fishing.

**DALKEITH**, a burgh of barony, 6 miles south-east of Edinburgh, standing on a narrow strip of land between the North and South Esk, and near the junction of these two streams. It chiefly consists of one main street. Pop. (1861) 7114. It has one of the largest corn-markets in Scotland, has a large and commodious market-hall erected in 1854; manufactures of brushes, woollens, and hats; besides iron-foundries, tanneries, and coal-works. D. arose round an ancient castle, which was long a great stronghold. The regality of D. was successively held by the Grahams, the Douglasses, the Earls of Morton, and the Earls of Buccleuch—the latter having bought it from the Mortons in 1642. During the minority of James VI., D. Castle was the chief residence of the Regent Morton; hence it was called the Lion's Den. General Monk lived in it during his government of Scotland under Cromwell. Dalkeith Palace, the

chief seat of the Duke of Buccleuch and Queensberry, built about 1700 on the site of the old castle, is a large square structure overhanging the North Esk, amid fine grounds, in which the two Esks flow and unite. This palace has been visited by Froissart, James VI., Charles I., George IV., and Queen Victoria. In addition to the old parish church, there is a second parish church, a fine cruciform structure in the early English style, built (in 1840) and endowed by the Duke of Buccleuch. Within the grounds of the palace is a very elegant Episcopal chapel. In an ancient chapel attached to the parish church are the recumbent statues of an Earl and Countess of Morton.

**DALKISSO'RE**, a river of Bengal Proper, joins the Hoogly from the right at Diamond Harbour, about 30 miles below Calcutta. It has a south-east course of about 170 miles, rising in lat. 23° 30' N., and long. 86° 34' E. In its lower section, the D. assumes the name of the Roopnerain. That channel of the Hoogly which receives the Roopnerain, has of late years become silted up through the same cause to which the adjacent delta owes its existence, so as to be now frequented only by native craft. Nor does it, on other grounds, afford a desirable passage upwards, for as the tide sets strongly into the Roopnerain, as offering less resistance to its progress, many vessels bound to Calcutta have been swept up the shallow estuary, and lost.

**DALLAS**, GEORGE MIFFLIN, an American statesman and diplomatist, was born at Philadelphia, July 10, 1792. He was educated at Princeton College, where he graduated with high honours in 1810. Soon after he was called to the American bar, he accompanied Mr Gallatin in his special embassy to St Petersburg as private secretary. On his return, he resumed the practice of the law, and successively filled the offices of deputy of the attorney-general of Philadelphia, mayor of Philadelphia, and district-attorney of Philadelphia, an office which his father had held. In 1831, he represented Pennsylvania in the senate of the United States, but after two years retired, and resumed his profession. In 1837, he was appointed American minister at St Petersburg, but was recalled in 1839. In 1844, he was elected vice-president of the United States, and held this office until 1849. In 1856, he succeeded Mr Buchanan as American minister at the court of St James's. He was empowered to settle the Central American question; but shortly after his arrival, a dispute between the two governments, arising out of the dismissal of Mr Crampton, the British minister at Washington, by the president of the United States, threatened to bring the diplomatic mission of D. to a premature termination. Through the forbearance of Lord Palmerston, he was, however, permitted to remain, and discharged the duties of American minister until 1861, when he was succeeded by Mr C. F. Adams. In person, he is tall, and of venerable aspect. He has diligently applied himself to study the politics and institutions of the mother-country, and during his embassy, assiduously attended the debates in both Houses of Parliament.

**DALLES**, romantic and perilous rapids on the Columbia or Oregon, form, along with the Clntes above them, and the Cascades below them, an almost continuous interruption between the tide-water of the river and its long reach—about 400 miles—of comparatively practicable navigation towards the interior. They are subdivided, reckoning downwards, into the Little D. and the D. Proper. On the latter, the basaltic rocks, which, from a considerable distance above, bound the channel, suddenly confine the stream to one-third of its width, with a perpendicular wall on either side; while the

damming up of the plunging surges fearfully aggravates the difficulties and dangers of the descent.

DALMATIA, a narrow strip of territory, extending along the Adriatic Sea, and bounded on the N. by Istria and Croatia, on the E. by Bosnia and Herzegovina. Lat.  $42^{\circ} 15'$ — $44^{\circ} 54'$  N., long.  $14^{\circ} 30'$ — $19^{\circ}$  E. It forms, with its adjacent islands, the most southern crownland of the Austrian empire. Area, 4881 square miles; pop. (1857) 404,499. The coast of D. is everywhere steep and rocky, and the adjacent series of islands, divided by picturesque straits and channels, are of a like character. Numerous bays intersecting the coast form excellent havens and landing-places. Offsets from the Dinaric Alps traverse the interior, and attain in Mount Orient, the highest culminating point, an elevation of 6332 feet; the Velbich Mountains, separating D. from Croatia, and which belong to the Julian Alps, have a height of more than 5000 feet. The mountains of D., for the most part composed of limestone, present a bleak and barren aspect, with many romantic chasms and fissures, through which dash impetuous mountain-streams. The chief rivers—none of which, however, are of any importance—are the Zermagna, Kerka, Cettina, and Narenta, the second and third of which are broken in several places by beautiful cascades and falls. The lakes are numerous, but, with the exception of Lake Vrana—which is separated from the Adriatic by only a narrow tongue of land, and the waters of which are brackish—they are periodical, drying up in summer, and filling their beds in late autumn. A large part of the whole area of D. consists of moor and morass, yet in summer there is often a great scarcity of water. The climate is in general warmer than that of any other part of Austria, the African sirocco being occasionally felt on its shores. The minerals are limestone, coal, gypsum, &c. Agriculture is in a backward state. About one-ninth of the land is arable, and produces wheat, barley, oats, maize, rye, and potatoes. Wine and olives are also produced. More than half of the land is in pasture, and wood occupies about a fifth. The islands are not very fertile, but supply good timber for ship-building. Cattle-rearing, sea-faring, and the fisheries on the coast, are the chief kinds of industry. The exports in 1853, consisting principally of wine, oil, brandy, hides, wool, wax, honey, and fruits, amounted to £503,295, and the imports to £670,163. The shipping-trade of D. in 1859 employed 27,770 vessels, with an aggregate burden of 783,974 tons. Of the whole population, it is computed that about 30,000 are Italians, 1000 Albanians, 410 Jews, and the remainder consists of Southern Slavonians, or the Dalmatians, and Morlaks. The Dalmatians are a fine race of men—bold and brave as seamen and soldiers—and formerly were the main support of the military power of Venice. But it must be added that they are deceitful and rapacious, while the love of independence is extreme. They speak the Illyrian-Serbian or Herzegovinian dialect; but the language used in the government offices, especially in Spalatro, is the Italian. The Morlaks—who inhabit the interior, the mountainous districts, and the Turkish sanjak of Hersek—are also good soldiers, hospitable and faithful to their engagements, lovers of independence, but it is said they are addicted to robbery and drunkenness. D. is divided into four circles—Zara, Spalatro (or Spalato), Ragusa, and Cattaro. These are also the names of the chief towns.

In ancient times, D. was a considerable kingdom, and, after many unsuccessful attempts, was first subjugated by the Romans in the time of Augustus. After the fall of the Western Empire, D., which had formed the most southern part of the province

Illyricum, was captured by the Goths, from whom it was taken by the Avari (490), who in their turn yielded it to the Slavonians about 620. The state founded by the Slavonians continued until the beginning of the 11th c., when King Ladislaus of Hungary incorporated a part of D. with Croatia, while the other part, with the title of Duchy, placed itself under the protection of the Venetian republic. The Turks afterwards made themselves masters of a small portion; and by the peace of Campo-Formio (1797), the Venetian part of D., with Venice itself, became subject to Austrian rule; and when Austria, in 1805, had ceded this part of D. to Napoleon, it was annexed to the kingdom of Italy; afterwards (1810) to Illyria. Since 1814, D., excepting the Turkish portion, has been reunited with Austria.

DALMATIC (*Dalmatica*), the deacon's robe, in the Roman Catholic Church. The most ancient form of the D. is exhibited in the annexed wood-cut,

after an early Christian painting on the walls of catacombs at Rome. It was originally of linen, but it is now generally made of the same heavy silk as the Planeta (q. v.), worn by the priest.

DALRYADA, the ancient name of a territory in Ireland, comprehending what is now called 'the Route,' or the northern half of the county of Antrim. It signifies primarily, 'the race of Riada,' and secondarily, 'the country of the race of Riada,' i. e., Cairbre Ríghfada, or 'Cairbre of the Long Arm,' the son of a chief or prince of the Scots in Ireland, and himself a warrior of note. He lived in the 3d c., and not only obtained an ascendancy in the district of Ireland which came to be called after him, but, according to some writers, planted a colony of his Scottish countrymen on the shores of Argyleshire in Alba, or Albany, as Scotland was then called. It is certain that about 506 A. D. some of his descendants, led by Loarn, Fergus, and other sons of Eirc, son of Muirreanhar, passed over to Argyleshire, where they settled themselves permanently, and founded the kingdom of 'Dalriada in Albany,' or 'the Scots in Britain.' More than twenty kings of this state are enumerated before Kenneth MacAlpin, who, about 843, united under one sceptre the Dalriads, or Scots, and the Picts, and thus became the first king of Albany, which about two centuries afterwards began to be known as Scotia or Scotland.

DALRYADS, or DALREUDI'NI, the inhabitants of DALRIADA (q. v.).

DALRYMPLE FAMILY, a very old and

illustrious Scottish family, deriving its name from the lands of Dalrymple in Ayrshire. The principal members are :

DALRYMPLE, JAMES, VISCOUNT STAIR, a lawyer and statesman, son of a small proprietor in Ayrshire, was born at Drummurchie, in the same county, May 1619, educated at Glasgow University, and at an early age, entered the army raised in Scotland to repel the religious innovations of Charles I. But the bent of his mind lay towards civil and literary pursuits; and in 1641, he was appointed professor of philosophy at Glasgow. The use which he made of philosophy, however, was rather to aid him in basing law—his favourite study—on profound and comprehensive principles, than to add another metaphysical system to those already in existence. In short, his wish was to be a philosophic lawyer, rather than a philosopher. In 1648, he entered as an advocate at the Scotch bar, where he rapidly acquired great distinction; in 1649, and again in 1650, he was appointed secretary to the commissioners sent to Holland by the Scottish parliament to treat with Charles II.; and in 1657, was induced—but with difficulty—to become one of the ‘commissioners for the administration of justice’ in Scotland under Cromwell’s government. Dalrymple was a conscientious, but at the same time an exceedingly moderate and enlightened royalist; and although appointed one of the new Scotch judges after the Restoration, he resigned his seat in 1663, because he could not take the ‘Declaration’ oath, which denied the right of the nation to take up arms against the king. His great talents, however, induced the monarch to accept his services on his own terms. Dalrymple was now created a baronet. In 1671, he became Lord President of the Court of Session. As a member of the Privy Council, he was invariably the advocate, though not always successfully, of moderate measures. In 1681, when the infamous ‘test’ oath was under consideration, Dalrymple, with the dexterity of a lawyer, caused John Knox’s Confession of Faith to be introduced as a part of the test; but as this Confession inculcated resistance to tyranny as a duty, the one half of the test contradicted the other. Dalrymple’s private conscience, however, was more fastidious than his public one, for he himself refused to take the very oath which, by his ingenuity, he had virtually deprived of its despotic character, and in consequence had to resign all his appointments. Before this, he had published the *Institutions of the Law of Scotland*, which is still the grand text-book of the Scotch lawyer. The disquisitions are both profound and luminous, characterised alike by their philosophic insight and their sound common sense. After some time spent on his estate in Wigtownshire, Dalrymple went to Holland in 1682, to escape the persecution to which he was subjected at home. During 1684—1687, he published at Edinburgh—though he himself was then residing at Leyden—his *Decisions*; and in 1686, at Leyden, a philosophic work in Latin, entitled *Physiologia Nova Experimentalis*. He accompanied the Prince of Orange on his expedition to England. When matters were prosperously settled, William re-appointed him Lord President of the Court of Session, and elevated him to the peerage under the title of Viscount Stair. He died 25th November 1695.

JOHN DALRYMPLE, eldest son of the preceding, held office under James II., and also under William III. While Secretary of State for Scotland, he incurred great odium on account of his share in the barbarous transaction known as the ‘Massacre of Glencoe.’ In 1703, he was elevated to the earldom of Stair. He died in 1707.—SIR JAMES DALRYMPLE, second son of Viscount Stair, was the author of

*Collections concerning Scottish History preceding the Death of David I.* (1705), and the grandfather of Sir John Dalrymple of Cranston, author of that excellent work, *Memoirs of Great Britain and Ireland, from the Dissolution of the last Parliament of Charles II. until the Sea-battle off La Hogue*.—The other sons—Viscount Stair had altogether nine children, five sons and four daughters—were more or less distinguished.

DALRYMPLE, JOHN, second Earl of Stair, second son of the first Earl of Stair, and grandson of Viscount Stair, was born at Edinburgh, July 20, 1673. He had the misfortune, while young, to kill his elder brother, by the accidental discharge of a pistol. This unhappy circumstance induced the parents, both for their own comfort and that of the boy himself, to educate him away from home. He was placed under the care of a clergyman in Ayrshire, who, by his prudence and kindness, soon developed the excellent qualities of the youth. Dalrymple afterwards went to Leyden, where he had the reputation of being one of the best scholars in the university. He completed his curriculum at Edinburgh. In 1701, he accepted a commission as lieutenant-colonel of the Scottish regiment of foot-guards, and gained the highest distinction in Marlborough’s campaigns. When the accession of the Tory ministry, in 1711, put a stop to the brilliant career of the great duke, Dalrymple retired from the army. When George I. succeeded to the throne, Dalrymple—who had become Earl of Stair by the death of his father in 1707—was made a lord of the bedchamber, a privy-councillor, and commander-in-chief of the forces of Scotland. Next year, he was sent as ambassador to France, in which capacity he exhibited the highest ability, and was of the greatest service in traversing the schemes for the reinstatement of the Pretender; but as he refused to flatter his countryman, Law—notorious in connection with the fatal Mississippi scheme—who was then omnipotent in France, the government was mean enough to recall him. For 22 years he lived in retirement at Newliston, near Edinburgh, devoting himself chiefly to agriculture, which was then beginning to improve in Scotland. He was the first to plant turnips and cabbages in the open fields. In 1742, he was sent as ambassador to Holland, and in the following year served under George II., at the battle of Dettingen. Later, he was made commander-in-chief of the forces of Great Britain. He died at Queensberry House, Edinburgh, 9th May 1747.

DALRYMPLE, SIR DAVID, a Scottish judge and historical antiquary, commonly known as Lord Hailes, was born at Edinburgh, 28th October 1726. He was the grandson of Sir David Dalrymple, youngest and reputedly the ablest son of Viscount Stair. He was educated first at Eton, afterwards at Edinburgh, and finally at Leyden, whence he returned to Scotland in 1746. In 1748, he was called to the Scotch bar, where his success was highly respectable, but not astonishing. Dalrymple was a man of extensive culture and classical tastes, of sound judgment, and great industry, but a very indifferent orator; and, in consequence, men of far inferior powers often acquired a greater reputation and a more lucrative practice. In 1766, he was appointed one of the judges of the Court of Session, and assumed the title of Lord Hailes, by which he is chiefly known to posterity. His accuracy, diligence, judicial impartiality, and dignified demeanour, secured him the highest respect in his new office. Ten years after, he was made a justiciary lord. He died 29th November 1792.—Although Dalrymple’s official duties were very arduous, he found time to compose numerous

works, surpassing in value those of many men whose lives have been wholly devoted to literature. We can afford to mention only a few: *A Discourse on the Gowrie Conspiracy* (1757); *Memorials and Letters relating to the History of Britain in the Reign of James I.* (1762), a curious and interesting volume; *The Works of the ever-memorable John Hailes of Eton, &c.* (1765); *Memorials and Letters relating to the History of Britain in the Reign of Charles I.* (1766); *Annals of Scotland from the Accession of Malcolm III., surnamed Canmore, to the Accession of Robert I.* (1776); and *Annals of Scotland from the Accession of Robert I., surnamed the Bruce, to the Accession of the House of Stuart* (1779). Besides these, Dalrymple wrote works on legal antiquities and ancient church history, edited old Scotch poems, and published sketches of the lives of various notable Scotchmen, as specimens of how a *Biographia Scotica* might be executed.

DALRYMPLE, ALEXANDER, F.R.S., F.S.A., younger brother of the preceding, was born at New Hailes, the seat of his father, near Edinburgh, 24th July 1737. In 1752, he obtained an appointment in the East India Company's service; but his extreme youth, as well as the imperfect education he had received at home, rendered it necessary, on his reaching Madras, that he should be placed under the store-keeper for a time. Lord Pigot himself, at that time governor of the presidency, condescended to give him lessons in writing; but young Dalrymple having, unluckily for his own prospects, fallen upon some papers in the secretary's office relating to the commerce of the Eastern Archipelago, became so engrossed with the importance of the subject, that after some bickerings with his superiors, he relinquished his appointment, and made a voyage of observation among the eastern islands. At Sooloo, in the course of his expedition, he concluded a commercial treaty with the sultan, which might have led to beneficial results; but on his return in 1762, he found political affairs entirely changed, small-pox raging, and most of his influential friends dead. The scheme, in consequence, proved a failure. In 1765, he returned to Britain, to urge its importance on the home-authorities, but did not succeed. In 1762, he found political affairs entirely changed, small-pox raging, and most of his influential friends dead. The scheme, in consequence, proved a failure. In 1765, he returned to Britain, to urge its importance on the home-authorities, but did not succeed. In 1775, however, he was sent out to Madras as a member of council, but was recalled in two years, apparently without good reason, for in 1779 he was appointed hydrographer to the East India Company, and shortly after received a pension. In 1795, when the Admiralty resolved to establish a similar office, it was conferred on Dalrymple, who held it till within a short period of his death, which occurred 19th June 1808, at Marylebone, London. Dalrymple wrote a vast number of letters, pamphlets, &c., containing plans for the promotion of British commerce in various parts of the world, political dissertations, accounts of geographical expeditions, &c. His library was rich in works of navigation and geography, all of which were purchased by the Admiralty. His collection of poetry, also very valuable, was deposited in the library at New Hailes, as a family heirloom.

DALTON, JOHN, was born September 5, 1766, at Eaglesfield, near Cockermouth, in Cumberland. He received his early education in the school of his native place, and, after 1781, in a boarding-school kept by a relative in Kendal. Here his love of mathematical and physical studies was first developed. He wrote several mathematical essays, and, in 1788, commenced a journal of meteorological observations, which he continued throughout his whole life. In 1793, he was appointed teacher of mathematics and the physical sciences in the New College at Manchester, where he chiefly resided during the remainder of his life, though frequently employed, after 1804,

in giving lectures on chemistry in several large towns. In the years 1808—1810, he published his *New System of Chemical Philosophy*, 2 parts (Lond.), to which he added a third part in 1827. In 1817, he was appointed president of the Literary and Philosophical Society at Manchester. He was also a member of the Royal Society, and of the Paris Academy, and, in 1833, received a pension of £150, afterwards raised to £300. In the same year, D.'s friends and fellow-townsmen collected £2000, to raise a statue to his honour, which was executed by Chantrey, and placed at the entrance of the Royal Institution in Manchester. D. was also honoured by the university of Oxford with the degree of D.C.L., and with that of LL.D. by the university of Edinburgh. He died, universally respected, at Manchester, July 27, 1844. His chief physical researches were those on the constitution of mixed gases, on the force of steam, on the elasticity of vapours, and on the expansion of gases by heat. In chemistry, he distinguished himself by his progressive development of the Atomic Theory (q. v.), as also by his researches on the absorption of gases by water, on carbonic acid, carburetted hydrogen, &c. His treatises are mostly contained in the *Memoirs of the Literary and Philosophical Society of Manchester*, the *Philosophical Transactions*, Nicholson's *Philosophical Journal*, and Thomson's *Annals of Philosophy*. Besides these, we have his *Meteorological Essays and Observations* (Lond. 1793; 2d edit. 1834). D. was unquestionably one of the greatest chemists that any country has produced. Profound, patient, and intuitive, he had precisely the faculties requisite for a great scientific discoverer. His atomic theory elevated chemistry into a science. In his habits, D. was simple; in his manners, grave and reserved, but kindly, and distinguished by his truthfulness and integrity of character.

DA'MAGES, in Law, are the pecuniary recompense claimed on account of suffering an injury through the act of another. The peculiar constitution of the English common-law courts, which, till lately, prevented them in most cases from giving any other remedy than by way of D., rendered the questions relating to this subject of unusual importance; but the progress of recent legislation has been in the direction of restricting actions for D. to the cases in which the restitution of property or enforcement of a right cannot be otherwise attained. The Court of Chancery, on the other hand, could not give D., it could only enforce performance of an obligation by personal restraint, and hence, according to the nature of the remedy desired, the suitor resorted to the one or other court. In Scotland, the supreme court has always been able to give redress in either way.

Where a sum ascertained in amount is due, the action is one not properly for D., but of debt. But where the sum is not ascertained, as where an injury has been done to a man's character or property, the action in either country can in general only be for D., the amount of which the injured party estimates, and which is determined by the judgment of the court, or verdict of a jury, subject to certain fixed rules which the courts have laid down, as the principle according to which the estimation is to be made. These, it is obviously impossible to detail here, and reference must be made to the title of the special subjects out of which a claim may arise for such information as it is practicable to give. It may be observed, however, that it is a general rule to restrict the amount of D. to that of the actual pecuniary loss, wherever it can be ascertained; and that neither in Scotland nor England will a stipulated penalty for breach of agreement be accepted as determining the sum due for D., unless it shall appear, by the use of the term 'as liquidated

damages,' or some equivalent expression, that both the parties had intended to fix conclusively the sum payable in case of default. Other general rules are, that the injury for which D. are claimed must have affected the claimant individually, and not merely as one of the general public, although it is not essential that the injury should have done material hurt to him, as this only affects the amount of damages. And the injury suffered must have been the direct and immediate consequence of the act done; if it has only been a secondary or remote result of the act, no D. will be given. And any act sued on must be an actual injustice; it is not enough that it produces disadvantageous results, if these arise only from doing what the party was justified in doing. D., therefore, may be sued for in respect of a crime involving liability to criminal punishment; but in England, in the case of a felony, no action for D. will lie against the offender, because it is the duty of the complainant to prosecute him criminally. It is otherwise, however, in the case of misdemeanours; an action for D. is there independent of criminal proceedings. In Scotland, this is the rule in reference to every species of crime.

**DAMA'N**, a seaport town, province of Guzerat, Hindustan, belonging to the Portuguese. It stands at the mouth of the Daman Gunga, or Daman River, which rises in the Syadree Mountains, as the upper extremity of the Western Ghats is called by the natives, in lat.  $20^{\circ} 11' N.$ , and long.  $73^{\circ} 42' E.$  Common spring-tides give at least three fathoms on the bar, while outside is a roadstead of more than double that depth. The harbour affords good shelter from the south-west monsoon, and, as the neighbourhood is well-stocked with suitable timber, the people are largely employed in the building and repairing of ships. The peculiar drawback of the locality is the scarcity, or rather the want, of fresh-water. The river, even when swollen by the rains into an inundation, is brackish, and the wells likewise are so in some degree. Endemic fevers are the natural consequence. The place is fortified with a rampart and bastions, and it is described as having been, before the arrival of the whites, 'a town great and strong.'

**DAMAN**, an outlying portion of the Punjab, runs about 300 miles along the right or west bank of the Indus, extending back, with an average breadth of about 60 miles, as far as the Suliman Mountains. It stretches in N. lat. from  $28^{\circ} 40'$  to  $33^{\circ} 20'$ , and in E. long. from  $69^{\circ} 30'$  to  $71^{\circ} 20'$ . In the absence of irrigation, the district in general is little better than a plain of smooth, bare, hard clay—the result of alternate inundation and evaporation. But when duly irrigated, this baked and burned surface becomes very productive, more especially in the strip of land—known as the Derajat—which is nearest to the bordering stream.

**DAMAN** (*Hyrax*), a genus of quadrupeds, highly interesting as a connecting link between the *Rolentia* and the *Pachydermata*. On account of their small size, their thick fur, and their general appearance, they were always ranked among the former, till Cuvier pointed out their essential agreement, in dentition and anatomical characters, with the latter, and assigned them a place next to the elephant and the rhinoceros, remarking, that 'excepting the horns, they are little else than rhinoceroses in miniature.' He adds that 'they have quite similar molars, but the upper jaw has two stout incisors curved downwards, and during youth, two very small canines, the lower jaw four incisors without any canines.' The skull, also, and other bones of the head, resemble those of the pachyderms. The muzzle is short; the ears, short and round. The

ribs are more numerous than even in the pachyderms—21 pair, a number exceeded in no quadrupeds except the sloths, whereas no rodent has more than 15 pair. The toes are united by the skin to the very nail, as in the elephant and rhinoceros, and are round and soft, merely protected in front by a broad nail, which does not reach the ground. The legs are short. The tail is a mere tubercle. There are several species of this genus, natives of Africa and of the south-west of Asia. The **SYRIAN D.** (*H. Syriacus*) is now generally believed to be the *shaphan* of the Old Testament, the *Cony* (q. v.) of the authorised English version, an illustration of which will be found under article **CONY**. The D. is common in Syria and Palestine, inhabiting rocky places, and sheltering itself in the holes of the rocks, but not burrowing, for which its feet are not adapted. It is a timid harmless creature, quick and lively in its movements, completely herbivorous, easily domesticated, and, in confinement, readily eating bread, roots, fruits, and herbs. It is about eleven inches long, and ten inches high; brownish-gray above, white beneath, the thick hair interspersed with long scattered bristles. The **ASHKOKO** (*H. Abyssinicus*) of Abyssinia, first described by Bruce, and supposed by him to be the shaphan, is now believed to be distinct from the Syrian D., although very similar. The **KLIP-DASSE** (*H. capensis*) of South Africa differs from the shaphan in its darker colour and rather larger size, and also in having only three toes on each foot, whereas the Syrian D. has four toes on the fore-feet and three on the hind-feet. It is very common in rocky places in South Africa, both on the hills and near the seashore. Its favourite food consists of aromatic plants, and its flesh, although eatable, is highly flavoured. In the places which it frequents, a peculiar substance called *Hyracum* (q. v.) is found—an animal secretion, to which medicinal virtues are ascribed, but the nature and origin of which have not yet been thoroughly ascertained.

**DAMA'R**, a town of Yemen, Arabia, pleasantly situated on an elevation about 120 miles north-north-west of Aden. It has about 5000 houses, is the residence of a governor, and has a college, attended by several hundred students.

**DAMASCENUS**, JOANNES, the author of the standard text-book of Dogmatic Theology in the Greek Church, was born at Damascus about 700 A. D. On account of his eloquence, he was surnamed *Chrysorrhoeas* ('Golden Stream'). In 730, he became a monk in the convent of St Saba at Jerusalem, where he spent the rest of his days in the composition of theological works. He died about 756 A. D., and had the honour of being canonised by both the Latin and Greek churches. D. was a man of extensive erudition, and was considered the ablest philosopher of his time; but the word 'philosopher' must have meant something very different in those days from what it does now, as D.'s writings are characterised by weakness of judgment and want of critical power. The best edition is that of Le Quien (2 vols., Paris, 1712).

**DAMASCUS** (Arabic, *Dimishkesh-Shâm*), a city of Syria, the largest in Asiatic Turkey, occupies a situation of unrivalled beauty on a luxuriant plain at the eastern base of the Anti-Libanus, and 53 miles east-south-east of Beyrout, which forms its port, lat.  $33^{\circ} 27' N.$ , long.  $36^{\circ} 23' E.$  The appearance of the city from a distance is beautiful in the highest degree. The bright buildings, sparkling beneath a Syrian sun, rise out of a sea of various tinted foliage, while all around—save on the north-west, where stretches the long bare snow-white ridge of the Anti-Lebanon—extend charming gardens,

rich cornfields, and blooming orchards, with the river Barrada (the Abana of Scripture) and its branches winding through until they lose themselves far to the east in the Lake Bahr-el-Merj, into which the Phege (the Pharpar of Scripture), a smaller stream, also flows. As in the case of all eastern cities, the expectations excited by a distant view of D. are by no means realised on a close inspection. The city proper is about 6 miles in circumference, and is partly surrounded by old tumble-down walls, portions of which date from early Roman times, while other parts are of Saracenic architecture, and some mere mud-patches of the present day. The streets generally are dirty and decayed, and so very narrow that a loaded donkey almost entirely blocks up the passage. The best street is 'Straight Street,' mentioned in the Acts of the Apostles in connection with St Paul. The houses for the most part are very mean-looking structures, often presenting to the street nothing but a dead-wall with a doorway in it, while the best have rough mud-walls, with a projecting upper story extending so far over the narrow street that hands may be shaken from opposite windows. But as the interior of the city presents a sad contrast to its charming surroundings, so do the rich interiors of the houses contrast with their miserable externals. Fine marble-paved courts ornamented with trees, shrubs, and fountains, rooms with arabesqued roofs and walls, most luxuriously furnished, are the common features of all the dwellings of the wealthier classes. The principal buildings of D. are places of worship, chief of which is the Great Mosque—formerly a heathen temple, then a Christian church—composed of different kinds of architecture, and occupying a quadrangle 163 yards by 108 yards, the interior dimensions being 431 feet by 125. The floor is of marble tessellated, and covered with Persian carpets, and the walls and piers of the transept are enriched with beautiful devices formed of various coloured marbles, while rows of noble Corinthian pillars divide the interior into nave and aisles. Altogether, this is one of the handsomest ecclesiastical buildings of which Mohammedans can boast. The citadel is large and imposing, but not strong; and the Great Khan is a splendid building, crested of black and white marble. There are many interesting remains of antiquity in D., but they are lost amid the mean modern structures and the bazaars. The latter are numerous, and finer than those of Cairo or Constantinople, and very well supplied with goods of European as well as Oriental manufacture; each class of goods having a street or bazaar for itself. The manufactures of D. are important, consisting of silks, cottons, coarse woollen cloth, jewellery, saddlery, and arms. The Damascus blades, once so famous, have lost the high reputation they had, but those made are still good. The coffee-houses are among the most attractive of the East. D. has an extensive trade, carried on by means of camels with the inhabitants of the eastern desert. The trade with Bagdad was large; but in 1857 the caravan was plundered on its way across the desert, the loss to the merchants of D. being estimated at £40,000. This paralysed the commerce. The annual caravan to Mecca from D. at one time consisted of some 50,000 or 60,000 persons, most of whom engaged to some extent in trade; but the facilities which in recent years have been afforded for making the pilgrimage by way of Egypt and the Red Sea, has caused a considerable diminution in the pilgrims, and consequently in the trade. But the greatest blow at the prosperity of D. was struck in 1860, when the Druses (q. v.) entered the city, and destroyed about 6000 houses in the Christian quarter, killing from 3000 to 5000

persons, and selling many of the women into Turkish harems. The imports of British goods, chiefly plain and printed calicoes, cotton handkerchiefs, and cotton yarn, were approximately valued in 1858 by the British consul at £150,000. The population of D., including the adjoining village of Salahiyyeh, is stated at 150,000, of whom about 130,000 are Mohammedans, 15,000 Christians, and 5000 Jews.

D. is perhaps the most ancient city in the world. Josephus attributes its foundation to Uz, the great-grandson of Noah; but whether it dates so far back or not, it is certain that it was a place of consequence in the days of Abraham. During the time of the Hebrew monarchy, it was the capital of Syria. It afterwards passed successively under the rule of the Assyrians, Persians, Macedonians, Romans, and Saracens; and finally, in 1516, it was captured by the Turks under Sultan Selim I.—in whose hands, with the exception of a short interval (from 1832 to 1840), when it belonged to the Pasha of Egypt, it has remained ever since. Under every change of dynasty and every form of government, D., unlike most cities, has retained its prosperity.

The pashalic of D. comprises all the territory between the Lebanon and the Euphrates—that is, all between lat. 31°—36° N., and long. 35°—41° E. The surface is for the most part level and very fertile, and produces grain of various kinds, hemp, flax, silk, cotton, madder, tobacco, and cochineal. It is considered the most important pashalic of Turkey, and its pasla takes high rank at the Ottoman court. Pop. about 500,000.

DA' M A S K, the name given to all textile fabrics in which figures of flowers, fruits, or others not of geometrical regularity, are woven. The word is supposed to be derived from the city of Damascus having been an early seat of these manufactures. From the intricacy of the early process, the art of D. weaving was long a mystery confined to a few localities; but since the introduction of the Jacquard-machine, it is extensively employed wherever ornament is wanted in the stuffs used for dresses or house-furnishings. The rich satins and brocades of Lyon and Spitalfields, the flowered ribbons of Coventry, and the bed and window curtains of Halifax and Bradford, are all examples of D. manufacture; but it is in the department of table-linen that the art has had its widest scope and greatest triumphs. The principal seats of the manufacture, on the continent of Europe, are at Contraix and Liege in Belgium, and in some parts of Saxony, Silesia, and Austria; in England, to an inconsiderable extent at Barnsley, in Yorkshire; in Ireland, at Belfast, Lisburne, and Ardoyn; and in Scotland, at Dunfermline, which may be called the metropolis of the manufacture, the production of that town being at least equal to that of all Europe, one factory there turning out 10,000 yards daily by steam-power alone, besides a large quantity by hand-loom, and employing about 1400 hands.

There are three descriptions of D. known in the trade—viz., 1. Full Harness, which is generally employed in patterns of limited size and minute detail, the peculiarity being that the Jacquard-machine only lifts one thread by each needle, and in such cases, the pattern is repeated to fill up the breadth wanted. 2. 'Single' or 'Common' D., in which any number of threads, from two to seven, can be lifted by one needle, to form the pattern; while the ground is produced by a set of five shafts and heddles, giving from twice to seven times the extent of pattern obtained from the same machine by the full-harness process. In full harness and single D. goods, a square fabric is considered the proper medium, that

is, the warp and weft equal; but sometimes a thread or two less or more on warp or weft is used, according to the effect wanted to be produced. 3. In Double D, the pattern is produced in the same way as in single, and the ground formed by eight shafts and heddles, forming what the weavers call an eight-leaved twill, absorbing one-half more weft than warp, and giving that fine satin-like ground which distinguishes double damask. Besides these descriptions of D., within the last ten or twelve years, a mixed cotton and woollen coloured fabric in table-covers has been introduced, and is now manufactured extensively, the ground of which is woven with twelve shafts.

To give an idea of the capital required to work the finer branches of the trade, it may be mentioned, that it is quite usual for the mere designing and painting of a pattern to cost £50; and £70 has been paid for some extensive designs; while it is known that one pattern lately executed cost £600 of outlay, ere a yard of cloth could be brought to market, employing seven Jacquard-machines, consuming 50,000 cards, and containing 4800 threads in the square yard. No statistics of the trade have been collected since 1836, when there were in Dunfermline 3000 D., and 517 diaper looms, and the capital embarked in the trade was estimated at £826,261, and the total number of persons employed 5044. Since then, from the introduction of steam-power, the hand-looms have decreased; but the number of hands employed, and the value of the goods manufactured, have greatly increased.

DAMASKEENING, or DAMASCENING, is the art of producing upon ordinary steel certain ornamental appearances resembling those observed on the famous Damascus blades. Attention was first drawn to this branch of industry by the Crusaders, who brought from Damascus to Europe many articles made of superior steel, such as sword-blades and daggers. These were found to possess not only great elasticity, united with considerable hardness, but their surfaces were covered with beautiful designs, formed by a tissue of dark lines on a light ground, or light lines upon a dark ground, and occasionally by the inlaying of gold on the steel-blue ground. These Damascus blades appear to have been constructed of steel and iron welded together; and the elegant designs were brought out by immersing the blades in dilute acids, which, eating away unequally the surface, gave rise to the mottled appearance. In genuine Damascus blades, the designs run through the substance of the blade, and the *watering*, or regular, almost symmetrical figuring is not worn off by friction, or even grinding. Imitations of the watering of Damascus steel are produced on common steel by etching with acids; and in this way landscapes, inscriptions, and ornaments, and decorations in general, are imprinted on the steel-blue ground. Gold and silver are also inlaid in the higher-class of sword-blades and other articles. Gun-barrels are occasionally subjected to the process of Damaskeening. Attempts have been made in France to accomplish damaskeening by means of photography, but as yet with very imperfect results.

DAMASUS, Sr, Bishop of Rome, was by extraction a Spaniard, and born probably early in the 4th century. In 366 A.D., he was elected Bishop of Rome, but had to struggle fiercely for the possession of his office with one Ursinus, who was supported by a considerable party. His career was throughout far from peaceful. It was mainly spent in subduing the still numerous Arians in the West; in combating the heresy of Apollinaris, which

he caused to be condemned by the council assembled at Constantinople in 382; and in defending the cause of Paulinus against Meletius. He died 384. It is difficult to form a just estimate of D.'s character. His enemies used to call him *Auriscalpius Matronarum* ('The car-tickler of the married ladies'), and hinted that he was in the habit of inducing rich female penitents to make testamentary bequests in his favour—a conspicuous vice of the clergy at that time; so much so, indeed, that Valentinian was obliged to issue an edict forbidding ecclesiastics to receive such bequests for the future. The edict was addressed to D., who was required to announce it to the church. On the other hand, he was a great friend of St Jerome, and was primarily instrumental in inducing that learned divine to undertake a new translation of the Bible. His extant works consist of seven epistles, addressed to various bishops, and rather more than forty short poems, religious, descriptive, &c., but of little or no merit. The first edition was published at Rome by Sarrazanius in 1638. D.'s festival falls on the 11th December.

DAMBOO'L, a vast rock-temple of the Buddhists in Ceylon, containing, among a profusion of carvings, figures of Buddha of extraordinary magnitude. See *Ceylon*, by Sir J. Emerson Tennent (Lond. 1859), vol. ii. p. 577.

DAME (Lat. *domina*, a mistress), a title of honour which long distinguished high-born ladies from the wives of citizens, and of the commonalty in general. In the age of chivalry, it was customary even for a queen to be so called by her chosen knight ('the dame of his heart, of his thoughts,' &c.). In consequence of the greater courtesy shewn towards women of higher rank, arose the custom of prefixing the word *ma* to *dame*, as a special proof of veneration and homage. Hence, too, the Virgin-mother was called in France *Notre-Dame* ('Our Mistress,' or Lady, as if no one Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called *Madame*; and this was also the sole title of the wife of the king's eldest brother. In England, the word D., though not much used, is now applied to married women of all classes. *Madame* is shortened into *Madam*, which is still a word of honour, applicable, in particular cases, to majesty itself. Thus, Alfred Tennyson, in dedicating his poems to Queen Victoria, speaks as a chivalrous troubadour might have done—

'Take, *Madam*, this poor book of song.'

DAME'S VIOLET (*Hesperis*), a genus of plants of the natural order *Crucifera*, having four-sided or two-edged pods, and containing several species, annual and biennial herbaceous plants, natives, chiefly, of the middle and south of Europe. One only, the COMMON D. V., or WHITE ROCKET (*H. matronalis*), is found in Britain, in hilly pastures, but perhaps rather escaped from cultivation than a true native. It has an erect branched stem, with ovato-lanceolate leaves, and terminated by numerous large lilac-flowers,

Dame's Violet:  
a, a flower divested of calyx and corolla; b, a petal; c, calyx.

and terminated by numerous large lilac-flowers,

which are scentless by day, but very fragrant at night, on which account this plant is cultivated in flower-pots by German ladies. The custom appears to have been an old English one also, and from it the plant derives its common name. The NIGHT-SCENTED ROCKET (*H. tristis*) is also a favourite flower in Germany.

DAMIENS, ROBERT FRANÇOIS, known for his attempt to assassinate Louis XV., was born in 1714 at Tienilloy, a village near Arras, in France. He was evilly-disposed from his youth, being known even then as *Robert le Diable*. On account of a robbery which he had committed, he was obliged to flee into Belgium in 1756, whence he returned to Paris about the end of the year. It was during his absence in that country that he formed the intention of assassinating his sovereign. The motives which led him to this are not well understood. He himself alleged that it was the conduct of the king towards the parliament; while a more popular, but apparently groundless opinion was, that he was instigated by the Jesuits. On the 5th of January 1757, having gone to Versailles on the previous day, he assiduously followed the king and his courtiers about everywhere; and about six o'clock at night, when the king was entering his carriage to leave Trianon, managed to stab him. The king, however, recognised his assassin, and D. was seized. The punishment inflicted on him was horrible. The hand by which he attempted the murder was burned at a slow fire; the fleshy parts of his body were then torn off by pincers; and, finally, he was dragged about for an hour by four strong horses, while into his numerous wounds were poured molten lead, resin, oil, and boiling wax! Towards night, the poor wretch expired, having by an effort of will almost superhuman, kept his resolution of not confessing who were his accomplices—if, indeed, he had any. His remains were immediately burned, his house was destroyed, his father, wife, and daughter were banished from France for ever, and his brothers and sisters compelled to change their names.

DAMIETTA, a town of Lower Egypt, situated on the right bank of the chief of the Nile's eastern branches, about 8 miles from its mouth in the Mediterranean, in lat. 31° 25' N., long. 31° 49' E. It is in general ill and irregularly built, but it has some handsome mosques and marble baths, and several bazaars. Its commerce was formerly important, but it has been much injured by the prosperity of Alexandria. It still, however, carries on a considerable trade with the interior in rice, which grows abundantly in the neighbourhood, and fish. The cloth known as *dimity* received its name from D., where it was first manufactured. A bar at the mouth of the river prevents vessels of more than 50 or 60 tons burden from ascending to Damietta. Pop. 28,000. The existing town was erected about 1251, but, prior to that, a city of the same name (more anciently Tamiáthis) stood about four miles to the south. It was strongly fortified by the Saracens, and formed on that side the bulwark of Egypt against the early Crusaders, who, however, succeeded in capturing it more than once. It was razed, and rebuilt further inland on the site it now occupies, by the Sultan Baybars, who also choked up the mouth of this branch of the Nile by sinking loaded barges across it, to prevent the Christian warriors gaining access.

DAMMAR, or DAMMAR PINE (*Dammara*), a genus of trees of the natural order *Conifera*, distinguished from all the rest of that order by their broad lanceolate leathery leaves, which have numerous nearly parallel veins, and by their seeds being

winged, not at the end, but on one side. The tree from which the name, originally applied to its resinous product, has been extended to the whole genus, is the MOLUCCAN D. (*D. orientalis*), which grows on the high mountain-ridges of the Molucca islands. It grows to a great height, attains a diameter of nine feet, and generally has the lower part of the trunk beset with knots as large as a man's head. The timber is light and of inferior quality; and the tree is chiefly valuable for its resin, which is soft, transparent, hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spontaneously from the tree in such quantity, that it hangs in masses like icicles of a handbreadth and a foot long. At another period of the year, it is yellow, and less valued. By incision, especially in the protuberances of the stem, it is obtained in large pieces. So long as *Dammara Resin* is soft, it has a strong smell; but loses it when it dries. It contains only a trace of volatile oil, but consists of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine; quickly becomes viscid when heated; when sprinkled on burning coal, diffuses an odour like that of rosin or mastic; readily takes fire, and burns with much smoke and a somewhat acid smell. It is used in Asia for domestic purposes, and in the arts like other resins; it is an article of commerce, and in Europe is employed in various ways to form varnishes, which dry quickly, have a very bright lustre, and being colourless, allow the beauty of the colours over which they are spread to be perfectly seen; but readily become viscid again, and are not permanent, so that this resin cannot be made a substitute for copal and amber. It is almost completely soluble in benzole, and in this solvent, makes an excellent colourless varnish for positive photographs on glass—it is, however, scarcely hard enough for negatives.—To this genus belongs also the KAURI PINE (q. v.) of New Zealand (*D. australis*), which produces the resin known as *Kauri Resin*, or *Kauri Gum*.—The word *Dammara*, *Dammer*, or *Damar*, signifies *resin* in some of the languages of India. The resin known as BLACK DAMMAR is obtained in the Molucca Islands from the trunk of *Marpipia acutifolia*, a tree of the natural order *Amyridaceæ*. It is a semi-fluid soft resin, with a strong smell, becoming black when it dries; it is used as pitch, also to yield a kind of turpentine, which is obtained by distillation.—*Canarium microcarpum*, a tree of the same order, also a native of the furthest east, yields, by incision of the trunk, a viscid, odorless, yellowish substance, very similar to Balsam of Copaiva, which is called *Damar* or *Dammara*, and is used in naval yards as oakum, being mixed with a little chalk and the bark of reeds, and becomes as hard as a stone.—Quite distinct from all these is the resin also called *Dammara* or *Piney Dammara* in India, often also called *Copal* (q. v.) in India, and *Anime* (q. v.) in Britain, the produce of *Vateria Indica*, a large tree of the natural order *Dipteraceæ*. It is obtained by wounding the tree, and when fresh, is clear, fragrant, and acridly bitter; when dried, it becomes yellow, brittle, and glass-like. It is used in India as a varnish (*Piney Varnish*), which is hard, tenacious, and much esteemed. It is also made into candles in Malabar, which, in burning, diffuse an agreeable fragrance, and give a clear light with little smoke. Some of these candles were sent to Britain, and were highly prized, but the excessive duty stopped the importation. *Shorea robusta*, the *Sal* (q. v.), so much valued in India as a timber-tree, also of the natural order *Dipteraceæ*, and some other species of *Shorea*, yield a resin, also known as *Dammara*, and as

*Ral* and *Dhoona*, which is much used in dockyards in India as pitch.

**DAMMU'DAH**, or **DUMMO'DAH**, a river of India, rises in Ramgurb, a district in the sub-presidency of Bengal, about lat. 23° 55' N., and long. 84° 53' E.; and after a generally south-east course of 350 miles, it enters the Hoogly from the right, in lat. 22° 13' N., and long. 88° 7' E. The valley of the D.—traversed, or to be traversed by the main railway between Calcutta and the North-west—abounds in coal and iron; and competent judges have calculated that bar-iron may here be manufactured 20 per cent. cheaper than it can be imported from Great Britain.

**DAMOCLES**, one of the courtiers and sycophants of the elder Dionysius, the tyrant of Syracuse. It is recorded by Cicero that D., having landed in the highest terms the grandeur and happiness of royalty, was reproved by Dionysius in a singular manner. The sycophant was seated at a table, richly spread and surrounded by all the furniture of royalty, but in the midst of his luxurious banquet, on looking upwards, he saw a keen-edged sword suspended over his head by a single horse-hair. A spectacle so alarming instantly altered his views of the felicity of kings.

**DAMON** AND **PYTHIAS**, or **PHINTIAS**, two noble Pythagoreans of Syracuse, who have been remembered as models of faithful friendship. Pythias having been condemned to death by Dionysius the tyrant of Syracuse, begged to be allowed to go home, for the purpose of arranging his affairs, Damon pledging his own life for the reappearance of his friend. Dionysius consented, and Pythias returned just in time to save Damon from death. Struck by so noble an example of mutual affection, the tyrant pardoned Pythias, and desired to be admitted into their sacred fellowship.

**DAMPER**, a door or valve which, by sliding, rising and falling, turning on a hinge, or otherwise, diminishes the aperture of a chimney or air-flue: this lessens the quantity of air that can pass through a furnace or other fire, and thus 'damps' or checks the combustion.—The D. of a pianoforte is that part of the mechanism which, after a key is struck, and the finger is lifted up from the key, immediately checks or stops the vibration of the string. It consists of a second hammer, which, on the rising of the key, strikes the string and remains upon it, instead of bounding off as the sounding-hammer does. Perfect damping is always desirable, but seldom obtained, especially in upright pianofortes. In respect of damping, the pianofortes of the German makers are superior to the English. The more perfect the damping is, the more distinctly and clearly the passages and harmony are heard, while the instrument gains in purity of tone, when there is none of that confusion of sounds which arises from imperfect damping.

**DAMPER** is also the name given in Australia to a simple kind of unleavened bread formed of wheat-flour. It is made while travelling in the bush, and baked among the ashes of a fire often kindled for the purpose.

**DAMPIER**, **WILLIAM**, a celebrated English navigator, was born of a Somersetshire family in 1652. He early went to sea, where he was soon distinguished alike by his intelligence and enterprise. Along with a party of bucaniers, D. crossed the Isthmus of Darien in 1679, and embarking on the Pacific in canoes and similar small craft, captured several Spanish vessels, in which they cruised along the coast of Spanish America, waging war with the Spanish subjects. In 1684, D. engaged in

another bucaniering expedition, in which he coasted along the shores of Chili, Peru, and Mexico, sailing thence to the East Indies, touching at Australia, and after some time returning to England, where in 1691 he published an interesting account of the expedition, entitled *A Voyage Round the World*. He was afterwards deputed by government to conduct a voyage of discovery to the South Seas, in which he explored the west and north-west coasts of Australia, also the coasts of New Guinea, New Britain, and New Ireland, giving his name to the Dampier Archipelago and Strait (q. v.). The events of the latter part of D.'s life are not well known. Besides the one already mentioned, the following are his principal works: *Voyages to the Bay of Campeachy* (Lond. 1729); *A Treatise on Winds and Tides*; and a *Vindication of his Voyage to the South Sea in the Ship St George* (1707).

**DAMPIER ARCHIPELAGO** AND **STRAIT** take their names from the famous navigator and bucanier. The *strait*, which is 35 miles wide, separates the island of Waygiou from the north-west extremity of Papua or New Guinea, lying almost immediately under the equator, and about long. 131° E., so as to be, as nearly as possible, the antipodes of the mouth of the Amazon. The *archipelago*, again, is off the north-west coast of Australia, about lat. 21° S., and long. 117° E. The principal islands of the cluster are Enderby, Lewis, Rosemary, Legendre, and Depuch.

**DAMPING OFF**, in Horticulture, the death of plants from excess of moisture in the soil and atmosphere. Young seedlings in stoves and hotbeds are particularly liable to it. Although the cause is sufficiently obvious, prevention is not always easy; not only because some plants are very sensitive as to moisture, but also because the necessity of keeping sashes closed on account of temperature often stands in the way of the ventilation which would otherwise be desirable, and it is when a moist atmosphere stagnates around them, and the temperature is not very low, that plants are most liable to damp off.

**DAMSON**, a rather small oval-fruited variety of the common plum, much esteemed for preserving, and not wholly unfit for dessert. The tree grows to a considerable height, but has a bushy, sloe-like appearance. It is extremely fruitful. There are many sub-varieties, with fruit of different colours, dark purple, bluish, black, yellow, &c. Damsons are produced in great quantities in some parts of England. D. pies, and D. cheese—made somewhat in the manner of fig-cake—are well-known English luxuries. The name is a corruption of *Damascene*, from Damascus.—The **MOUNTAIN D.** or **BITTER D.** of the West Indies is the Simaruba (q. v.).

**DAMUGGO'**, a large and populous town of Upper Guinea, Africa, situated on the left bank of the Niger, in lat. 7° N., long. 7° 50' E. The houses, built of mud, and supported by wooden props, are circular in shape. The town is dirty, and has a miserable appearance. The population, the number of which has not been ascertained with any degree of accuracy, support themselves by trade and the cultivation of the soil.

**DANA**, **RICHARD HENRY**, an American poet and novelist, was born in 1787 at Cambridge, Massachusetts. After leaving Harvard College, at which he had remained three years, he adopted law as a profession, but eventually renounced it, and applied himself to literature. In 1817, he became a contributor to the *North American Review*, his connection with this periodical continuing for three years, during a portion of which time he assisted in its editorship. The *Idle Man*, which contains

many of his best prose efforts, was commenced in 1821, but proving a failure in a commercial point of view, was soon discontinued. Having at an earlier date published the *Dying Raven*, a poem of great merit, he came forward, in 1827, with the *Buccaneer*, and other poems. Upon these his reputation principally rests. In 1833, he published a volume of his previous writings, both prose and verse, and since that time has written little. D., in 1839—1840, delivered in Boston and New York a series of well-received lectures on Shakspeare.—RICHARD H. DANA, the son of D., is well known as the author of *Two Years before the Mast*.

DA'NAË, the daughter of Acrisius, king of Argos, and Ocaleia. According to the mythological narrative, an oracle had announced that she would one day give birth to a son, who should kill his grandfather. Acrisius, of course, felt extremely uncomfortable after this declaration, and took every precaution to keep D. a virgin. He shut her up in a dungeon, where, nevertheless, she was visited by Zeus in a shower of gold, and became, in consequence, the mother of Perseus. Acrisius put both the mother and child into a chest, and exposed them on the sea. The chest, however, drifted ashore on the island of Seriphos, and D. and her child were saved. D. remained in the island until Perseus had grown up and become a hero famous for his exploits. She afterwards accompanied him to Argos. On his arrival, Acrisius fled, but was subsequently slain by Perseus at Larissa.

DA'NAÛS, a mythical personage, the son of Belus and Anchinoë, brother of Ægyptus, and originally ruler of Libya. Thinking his life in danger from the machinations of his brother, he fled to Argos, accompanied by his fifty daughters, known as the DANAIDES, where he was chosen king, after the banishment of Gelanor, the last of the Inachide. The fifty sons of Ægyptus followed him, and under the pretence of friendship, sought the hand of his daughters in marriage. D. consented, but on the bridal-night he gave his daughters each a dagger, and urged them to murder their bridegrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her betrothed, Lynceus, to escape. D., as may naturally be supposed, found great difficulty in obtaining new husbands for his daughters; and in order to get them off his hands, instituted games, where they were given as rewards to the victors, although they could scarcely have been considered very tempting prizes. As a punishment for their crime, they were compelled, in the under-world, to pour water for ever into a vessel full of holes. So runs the myth; but Strabo mentions an old tradition, which declares D. and his fifty daughters to have provided Argos with water, which is probably the origin of the scene in Hades. Greek art, of course, represents the Danaides in conformity with the popular myth. The tomb of D., in the Agora of Argos, was shewn as late as the time of Pausanias.

DA'NBY, FRANCIS, A.R.A., a painter, born about six miles from Wexford, in Ireland, 16th November 1793. He was educated in the school of the Society of Arts, Dublin, and soon gave indications of superior artistic talent. His first attempts were sent to the Dublin Exhibition. After 1820, he took up his residence at Bristol, whence he sent to the Royal Academy, London, his 'Disappointed Love' (1821), 'Warriors of the Olden Time listening to the Song of their Minstrel' (1823), and 'Sunset at Sea after a Storm' (1824). In 1825, D. produced 'The Delivery of Israel out of Egypt;' in 1826,

'Christ Walking on the Sea;' in 1827, 'The Embarkation of Cleopatra on the Cydnus;' and in 1828—1829, 'An Attempt to Illustrate the Opening of the Seventh Seal,' 'The Passage of the Red Sea,' and 'The Deluge.' Circumstances now induced him to visit the continent, where he resided till 1841, during which interval he executed very few paintings. On his return, he took up his abode at Exmouth, where he has since lived. Among his later works, may be mentioned, 'A Morning at Rhodes' (1841), 'The Enchanted Island' (1841), 'The Contest of the Lyre and Pipe in the Valley of Tempe' (1842), 'The Tomb of Christ after the Resurrection,' 'Fiensford Lake (Norway)—a Sudden Storm passing off,' 'Caius Marius among the Ruins of Carthage' (1848), and 'The Departure of Ulysses from Ithaca' (1854).

DANCE OF DEATH (Lat. *Chorea Machabeorum*, Fr. *La Danse Macabre*), a name given to a certain class of allegorical representations, illustrative of the universal power of Death, and dating from the 14th century. When the introduction of Christianity first banished the ancient Germanic conception of a future state, a new description of death-mythology arose, partly out of biblical sources, partly out of the popular character itself, wherein the Last Enemy was represented under simple and majestic images, such as that of a husbandman watering the ground with blood, ploughing it with swords, rooting out weeds, plucking up flowers, or felling trees, sowing it with corpses; or of a monarch assembling his armies, making war, taking prisoners, inviting his subjects to a festival, or citing them to judgment. But with a gradual change in national manners came a change in the mode of treating the subject, and it was associated with everyday images, such as the confessional, chess-playing, and above all, with the adjuncts of a festival—viz., music and dancing. This tendency to familiarise the theme increased during the confusion and turmoil of the 14th c., when the national mind alternated between fits of devotion and licence, or blent both elements in satire and humour. Such a mood as this naturally occupied itself with personifying Death, and adopted by preference the most startling and grotesque images it could find—that of a musician playing to dancing-men, or a dancer leading them on; and as the dance and the drama were then intimately connected, and employed on religious occasions, this particular idea soon assumed a dramatic form.

This drama was most simply constructed, consisting of short dialogues between Death and four-and-twenty or more followers, and was undoubtedly enacted in or near churches by religious orders in Germany during the 14th c., and at a rather later period in France. It would appear that the seven brothers, whose martyrdom is recorded in the 7th chapter of the 2d Book of *Maccabees*, either played an important part in the drama, or the first representation, which took place at Paris in the Cloister 'aux Innocents,' fell upon their festival, and hence the origin of the ancient name, *Chorea Machabeorum*, or *La Danse Macabre*. As early as 1400, the dramatic poem was imitated in Spain, and appears there in 79 strophes of 8 lines each (*La Dança General de los Muertos*), but it did not spread; while the French, having a love for pictorial representation, very early affixed an illustration to each strophe, and in 1425 painted the whole series on the churchyard-wall of the Cloister of the Innocents, where the Dance of Death was habitually enacted. We find the subject treated in painting, sculpture, and tapestry, in the churches of Anjou, Amiens, Angers, Rouen, to say nothing of the numerous wood-cuts and accompanying letter-press which

succeeded the invention of printing. From Paris, both poem and pictures were transplanted to London (1430), Salisbury (about 1460), Wortley Hall in Gloucestershire, Hexham, &c.

But nowhere was the subject so variously and strikingly treated as in Germany. A picture in one of the chapels of the Marienkirche, at Lübeck, still, in spite of repeated re-paintings, bearing the unmistakable impress of the 14th c., exhibits the very simplest form of the drama, and has some genuine Low-German verses attached to it. Here we see 24 figures, partly clerical, partly lay, arranged in a descending scale, from the pope himself down to a little child, and between each of them a dancing-figure of Death, not in the form of a skeleton, but a shrivelled corpse, the whole being linked in one chain, and dancing to the music of another Death. This representation is almost the same as a very ancient one at La Chaise-Dieu, in Auvergne, and points to the identity of the original dramatic spectacle in both countries.

The celebrated Dance of Death on the cloister walls of the Klingenthal, a convent in Basel, though painted probably not later than 1312, exhibited a departure from the simplest form—the number of persons exceeding the original 24, and the chain being broken up into separate couples. But both alike are only to be regarded as scenes from a drama, and cannot, therefore, be justly compared with a contemporary Italian painting, the 'Triumph of Death,' by Andrea Orcagna. And the acted drama enduring till the 15th c., we find that while there were varieties in the paintings, the poem, which was the most important feature, remained almost unchanged.

About the middle of the 15th c., however, the drama being altogether laid aside, the pictures became the main point of interest, the verses merely subsidiary. Accordingly, we find from this time the same pictures repeated in different places, with different verses, or no verses at all, till at length both verses and pictures entirely change their original character. The Dance of Death being transferred from the quiet convent walls into public places, gave a new impulse to popular art. Duke George of Saxony had, in 1534, the front of his Dresden castle ornamented with a life-size bas-relief of the subject, and other representations are to be found at Strasburg and Bern. There was a Dance of Death painted round the cloister of old St Paul's in London, in the reign of Henry VI.; and there is a sculptured one at Rouen, in the cemetery of St Maclou. But Holbein has the credit of availing himself most effectively of the original design, and giving it a new and more artistic character. Departing from the idea of a dance, he illustrated the subject by 53 distinct sketches for engravings, which he called 'Imagines Mortis.' The originals of these are at St Petersburg, and impressions of them have been frequently repeated under different names.

We may cite as authorities on this subject, Peignot's *Recherches sur les Danses des Morts* (Dijon and Paris, 1826); Massman's *Baseln Todtentänze* (Stuttgart, 1847), and Douce's *The Dance of Death* (Lond. 1833).

Dancette.

DANCETTE, one of the lines of partition in Heraldry, which differs from Indented (q. v.) only in the greater size of the notches. The indentations where the division is *per fess* dancette, never exceed three in number.

DANCING may be defined in a general way as the expression of inward feelings by means of

rhythmical movements of the body, especially of the lower limbs, usually accompanied by music. Dancing may almost be said to be as old as the world, and prevails in rude as well as in civilised nations. Children, and also the lower animals, dance and gambol as by instinct. Our early records, sacred and profane, make mention of dancing, and in most of the ancient nations it was a constituent part of their religious rites and ceremonies. They danced before their altars and round the statues of their gods. The Greek chorus, 'in the oldest times, consisted of the whole population of the city, who met in the public place (*choros*, the market-place), to offer up thanksgivings to their country's god, by singing hymns and performing corresponding dances.' The Jewish records make abundant mention of dancing. Moses and Miriam danced to their song of triumph, when the Israelites passed through the Red Sea as on dry land; David danced before the Ark. It is certain that the primitive Christians danced at their religious meetings, though we have no mention of this in the New Testament. The Greeks made the art of dancing into a system expressive of all the different passions, the dance of the Eumenides, or Furies, especially, creating such terror, that the spectators seemed to see these dreaded deities about to execute Heaven's vengeance on earth. The most eminent Greek sculptors did not disdain to study the attitudes of the public dancers for their art of imitating the passions. In Homer, we read of dancing and music at entertainments. Aristotle ranks dancing with poetry, and says, in his *Poetics*, that there are dancers who, by rhythm applied to gesture, express manners, passions, and actions. In Pindar, Apollo is called the dancer; and Jupiter himself, in a Greek line, is represented as in the act of dancing. The Spartans had a law obliging parents to exercise their children in dancing from the age of five. This was done in the public place, to train them for the armed-dance. They were led by grown men, and all sang hymns and songs as they danced. The young men danced the Pyrrhic dance, in four parts, expressive of overtaking an enemy and of a mock-fight.

Dancing, as an entertainment in private society, was performed in ancient times mostly by professional dancers, and not by the company themselves. Among the sedate Romans, in fact, it was considered disgraceful for a free citizen to dance, except in connection with religion. Having professional dancers at entertainments is still the practice among Eastern nations. In Egypt there are dancing and singing girls, called *Almé*, who improvise verses as in Italy. They are highly educated, and no festival takes place without them. They are placed in a rostrum, and sing during the repast; then descend, and form dances that have no resemblance to ours. All over India there are Nautch girls or Bayaderes (q. v.), who dance at festivals and solemnities.

It is among savage nations that the passion for dancing is most strongly manifested. Their dances are mostly associated with religion and war; and the performers work themselves into a state of frantic excitement—a kind of mechanical intoxication. As civilisation advances, dancing—amateur dancing, at least—assumes a more and more subdued character. As a social amusement and a healthful exercise, dancing has much to recommend it; the chief drawbacks are the ill-ventilated and overheated rooms in which it is generally performed. By many, it is unfavourably regarded in a moral point of view; but this seems a relic of that outburst of puritanism that characterised the 17th c., and which saw sin in every joyous excitement. Dancing

is doubtless liable to abuse, but not more so than most other forms of social intercourse. Connected with the subject of dancing, see ACROBATS, BALLETS, PANTOMIME, COUNTRY-DANCE, QUADRILLE, POLKA, &c.

**DANCING MANIA**, a form of epidemic disorder allied to hysteria (q. v.), and evidently the result of imitative emotions acting upon susceptible subjects, under the influence of a craving for sympathy or notoriety. There is little doubt that imposture entered to a considerable extent into all the epidemic forms of the dancing mania, which indeed were usually attended and followed by consequences that shewed but too clearly the presence of impure motives; but there is also evidence that in many cases the convulsive movements were really beyond the control of the will, whatever may have been the original character of the motives that prompted them. Epidemics of this sort were common in Germany during the middle ages, and are formally described as early as the 14th c.; in Italy, a somewhat similar disease was ascribed to the bite of a spider called the *Tarantula* (see **TARANTISM**); and similar convulsive affections have been witnessed in Abyssinia, India, and even in comparatively modern times and in the most civilised countries in Europe, under the influence of strong popular excitement, especially connected with religious demonstrations. But the true dancing mania of the middle ages had its theatre chiefly in the crowded cities of Germany.

In July 1374, there appeared at Aix-la-Chapelle assemblies of men and women, who, excited by the wild and frantic, partly heathenish, celebration of the festival of St John, began to dance on the streets, screaming and foaming like persons possessed. The attacks of this mania were various in form, according to mental, local, or religious conditions. The dancers, losing all control over their movements, continued dancing in wild delirium, till they fell in extreme exhaustion, and groaned as in the agonies of death; some dashed out their brains against walls. When dancing, they were insensible to external impressions, but haunted by visions, such as of being immersed in a sea of blood, which obliged them to leap so high, or of seeing the heavens open, and the Saviour enthroned with the Virgin Mary. The frenzy spread over many of the towns of the Low Countries. Troops of dancers, inflamed by intoxicating music, and followed by crowds, who caught the mental infection, went from place to place, taking possession of the religious houses, and pouring forth imprecations against the priests. The mania spread to Cologne, Metz, and Strasbourg, giving rise to many disorders, impostures, and profligacy. These countries were generally in a miserable condition; and arbitrary rule, corruption of morals, insecurity of property, and low priestcraft, prepared the wretched people, debilitated by disease and bad food, to seek relief in the intoxication of an artificial delirium. Exorcism had been found an efficacious remedy at the commencement of the outbreak; and in the beginning of the 16th c., Paracelsus, that great reformer of medicine, applied immersion in cold water with great success. At the beginning of the 17th c., the St Vitus's Dance, as the affection was called (see *VITUS, St*), was already on the decline; and we now hear of it only in single cases as a sort of nervous affection. A detailed account of the phenomenon is given in Hecker's *Epidemics of the Middle Ages*. See **CONVULSIONAIRES, JUMPERS**.

**DANDELION** (*Leontodon taraxacum*, or *Taraxacum officinale*), a plant of the natural order *Compositæ*, sub-order *Cichoraceæ*, common throughout Britain and

the whole of Europe, in pastures and by waysides, and now also so perfectly naturalised in many parts of North America, as to be there one of the most familiar spring-flowers. The names *D.* and *Leontodon* (Fr. and Gr. lion's-tooth) both have reference to the form of the leaves. The whole plant abounds in a milky juice, containing a peculiar crystalline principle called *Taraxacin*; has a bitter taste; and is tonic, deobstruent, and diuretic. *D.* root is employed in medicine, in the form of infusion, decoction, and extract, chiefly in diseases of the liver and chronic affections of the digestive organs. It contains resin, inulin, sugar, &c. When roasted and ground, it is also sometimes used as a substitute for coffee. *D. coffee*, however, is usually a mixture of ordinary coffee and the powder or extract of *D.* root; and *D. chocolate* is composed of one part of common chocolate and four parts of the powder of *D.* root. The young leaves, when blanched, are a good salad, resembling lettuce or endive.

**DA'NDOLO**, a famous Venetian family, which has given four doges to the republic. The most illustrious of its members was Enrico D., born about 1110 or 1115 A.D. Eminent in learning, eloquence, and knowledge of affairs, he ascended from one step to another, until, in 1173, he was sent as ambassador to Constantinople, and in 1192 was elected doge. In this latter capacity, he extended the bounds of the republic in Istria and Dalmatia, defeated the Pisans, and (in 1201) marched at the head of the Crusaders. He subdued Trieste and Zara, the coasts of Albania, the Ionian Islands, and Constantinople (17th July 1203). When the Emperor Alexius, who had been raised to the throne by the exertions of D., was murdered by his own subjects, D. laid siege to Constantinople, and took it by storm, 13th April 1204. He then established there the empire of the Latins, and caused Count Baldwin of Flanders to be chosen emperor. By the treaty of partition which he concluded with the other leaders of the crusade, Venice obtained possession of some of the islands of the Ionian Sea, and of the Archipelago, several harbours and tracts of land on the Hellespont, in Phrygia, the Morea, and Epirus, an entire quarter of Constantinople, and also, by purchase, the island of Candia. Soon after this, D. died (June 1, 1205), in Constantinople, and was buried in the Church of St Sophia. His monument was destroyed by the Turks at the taking of Constantinople in 1453.

**DANE BROG**, ORDER OF, the second of the Danish orders, was instituted by King Waldemar in 1219. The word *brog* in old Danish signifies 'cloth,' and thus *D.* is equivalent to the cloth or banner

Dandelion:  
a, leaves, scape, and head of flowers; b, head of ripe fruit with pappus.

of the Danes. The order is a sort of glorification of the old national flag of Denmark, which long floated, like the oriflamme of France, at the head of the army. It is meant to recompense services rendered to the state, whether civil or military, and irrespective of age or rank. The decoration of the order consists in a cross of gold *patée*, enamelled with white, and encircled by a white ribbon, embroidered with red.

DA'NEGELT, or DANEGOLD, a tribute, first of 1s., and afterwards of 2s., levied on every hide of land by the Anglo-Saxons, for the purpose of meeting the outlay requisite for defending the country against the Danes. The tax was continued after the Conquest, as one of the rights of the crown, till the time of Stephen.

DA'NE-LAGE, or DANE-LAW. After the overthrow of the Danes under Guthruu at Ethandune by King Alfred (878 A. D.), a treaty was concluded between the two, in virtue of which the entire kingdom of Wessex, from Somerset to Kent, was evacuated by the Danes, who were, however, allowed to retain the greater part of the east coast of England, including the whole of Northumbria. This district was called Danelagh or Dane-law (which name it retained down to the Norman Conquest), because the inhabitants were ruled by Danish and not by English law.

DA'NIEL, a Hebrew prophet, who flourished about 600 B. C. He was a contemporary of Ezekiel, and was carried captive to Babylon in the fourth year of Jehoiakim. He was one of the youths selected to be brought up for future service at the court of the conqueror, and received instruction in all the learning of the Chaldeans. His skill in the interpretation of dreams procured for him the royal favour. He rose to be governor of the province of Babylon under Nebuchadnezzar; and under Darius, the Mede, to be first president of the whole Medo-Persian empire, a dignity only inferior to that of Darius himself. The time and the place of his death are alike unknown. He was alive, however, in the first year of the reign of Cyrus, but did not return to Judea with his countrymen on their release from captivity. Epiphanius and others affirm that he died at Babylon; but the common tradition is, that he expired at Susa or Shusan in Persia, when upwards of ninety years of age; and at the present day, a tomb bearing his name is the only standing building among the ruins of that ancient city. D. was the only one of the Hebrew prophets who enjoyed a high degree of worldly prosperity. Ezekiel mentions him as a model of wisdom and piety.—The Book of D. consists partly of historical notices of D., and partly of visions and prophecies, some of which are written in Chaldee. The genuineness of the book, in its present form, has been much disputed in recent times.

DANIEL, SAMUEL, an English poet, was the son of a music-master, and was born in 1562 near Taunton, in Somersetshire; entered Magdalen Hall, Oxford, in 1579, but quitted the university without taking a degree. For some time he acted as tutor to Anne Clifford, daughter of the Earl of Cumberland. In 1603, he was appointed master of the queen's revels, and inspector of the plays to be represented by the juvenile performers. Subsequently, he held other offices about the royal household. Towards the close of his life, he retired to a farm which he possessed at Beekington, in his native county, where he died, October 14, 1619. D. is an elegant, if not a great poet. His writings are pervaded by a moral thoughtfulness and purity of taste which are very remarkable, but lack that vital energy of movement and memorableness of expres-

sion which result from genuine inspiration. The 'well-lingued Daniel' is therefore not the most interesting of the Elizabethans, although his style is quite modern. His works include sonnets, epistles, masks, and dramas; but his chief production is a poem in eight books, entitled a *History of the Civil Wars between York and Lancaster*.

DA'NIELL, JOHN FREDERICK, D. C. L., a distinguished English savant, was born in London, March 12, 1790. He was a pupil of Professor Brande, along with whom he made several scientific tours; was elected a fellow of the Royal Society in 1814, and in 1816 started, in connection with Professor Brande, the *Quarterly Journal of Science and Art*. From this period, D. devoted almost the whole of his time to the subjects of chemistry and meteorology. In 1823, he published his *Meteorological Essays*, which is still the standard-work on meteorology; and in 1824 the Horticultural Society awarded him their silver medal for his *Essay on Artificial Climate*. In 1831, he was appointed Professor of Chemistry in King's College, London; and in 1839 published his *Introduction to Chemical Philosophy*. In 1843, he received the degree of D. C. L. from the university of Oxford. He also enjoyed the great honour of being the only person who ever obtained all the three medals in the gift of the Royal Society. Besides his professorship in King's College, D. also held the post of Lecturer at Addiseombe, and of Examiner in Chemistry to the university of London. He died March 13, 1845. D.'s *Meteorological Essays* was the first attempt to account, in a truly philosophical manner, for the known phenomena of the atmosphere. Besides the works mentioned, D. wrote a large number of interesting and valuable papers for the Royal Society. For an account of his new hygrometer, see HYGROMETER.

DANISH LANGUAGE AND LITERATURE. The Danish language, which, with slight modifications, is common to the three Scandinavian kingdoms, is a branch of the ancient Gothic, and has been retained almost in its original form in Iceland. The oldest memorials of the Danish are codes of laws, as the *Skaanske Lov*, and the old and new *Sjællandsk Lov*, promulgated by Valdemar the Great in 1162 and 1171; but these, no less than the writings of Harpestreng, canon of Roeskilde (1244), already shew marked deviations from the Icelandic, in consequence of the intermixture of the Anglo-Saxon, English, and Norman elements, due to the Danish occupation of England, and the immigration of monks and artisans into Denmark from Britain. The influence of the English dialect was again modified towards the close of the 12th c. by the influx of Germans into the country. Saxo Grammaticus, the father of Danish history, who died in 1204, wrote, like almost all his ecclesiastical brethren at that day, in Latin, as did also his contemporary, the knight Svend Aagesen. The Danish *Kæmpeviser* are the richest poetical remains of the folks-lore of the middle ages in Europe, and consist—1. Of narratives and songs of giants, demigods, and other supernatural creatures of the Scandinavian mythology; 2. Of romantic songs and tales connected with these mythical beings; and, 3. Of historical verses, referring to a later period. The names of the writers are unknown, and these compositions seem rather to be the expression of the entire people, than the production of individual poets. Many have, from time immemorial, been associated with certain national melodies, which have secured them a permanent place in the hearts of the people, whose disposition leads them to dwell with fondness on the memory of by-gone times and events, and to seek in the glory of the past a

compensation for the national humiliation and reverses of the present. The first printed collection of the *Kæmpeviser* is due to the royal historiographer, Vedel, and appeared at Ribe, 1592; another edition (Copenh. 1695) by Peter Syv found its way to almost every peasant's cottage; but the most complete of any is probably that by Nyerup and Rabek, in 5 vols. (Copenh. 1810—1814). After the Reformation, the national literature was comparatively neglected, for the composition of poor theological treatises and bald versions of the Psalms. Among the best of the writers in this department we may instance Christian Pedersen (born 1480), who, after having made a metrical version of the ancient national chronicles, devoted himself to the diffusion of the Lutheran faith, and made Danish translations of the New Testament, and the reformer, Hans Taussen (born 1494), who composed catechisms, and translated the Pentateuch into Danish. The Danish language acquired stability and new life by the translation of the whole Bible, which, by order of King Christian III., was effected in 1550 by Palladius and other professors of the university. The close of the 16th c. was memorable for the many admirable writers on history which it produced in Denmark. Among those who edited and annotated the ancient Danish and Icelandic historical chronicles, we may mention Peder Claussen, A. S. Vedel, and Axil Hvitfeldt, whose respective works supply invaluable materials to the historical inquirer. These men were contemporaries of the great astronomer, Tycho Brabé, and, like him, experienced the caprices of court-favour. The 17th c. shews a large number of able writers, among whom were Longomontanus, the pupil of Tycho Brabé; the family of Bartholin, numbering seventeen in three generations, who were all known for the ability of their writings on medical, philosophical, and mathematical subjects in Latin, German, and Danish; the family of the Pontoppidans, eleven in number, all of whom have left memorials of their proficiency in philology and history, and of their acquaintance with the theology and natural history of the times; Arreboe, the father of Danish poetry, who wrote on sacred subjects, and in his principal work, *Hexameron*, described in epic verse the events of the first six days of creation; Steno, the anatomist, and the lyrical poet, T. Kingo. A new era began with the genial and versatile Ludvig Holberg (born 1684), who wrote in Latin, French, German, and Danish, and has left very numerous works on history, biography, and topography, but whose fame among his countrymen will ever rest on his inimitable comedies, farces, and satirical compositions. His genius and his writings gave an impetus to the cultivation of the Danish language, which not all the studied neglect of the court-party, and their persistence in the use of German, could check. The 18th c. produced many good historical critics—as, for instance, Torfcus, Langebek, Schöning, and Suhm, Magnæus, the Icelandic scholar, Thorlacius, and Thorkehn, learned in ancient northern lore, and Rosenvinge, the jurist. Among the epic and dramatic poets of that age, Ewald stands foremost, whose national lyrics evince true poetic genius. The close of the century was, however, unfavourable to mental development and freedom of thought; and the best writers, as in the case of Malte Brunn and the poet Heiberg, were either compelled to leave the country, or to abstain from giving expression to their opinions. Among the more recent writers, we may instance the poet Oehlenschläger—whose national tragedies and lyrical legends of Scandinavian mythology have rekindled all the long slumbering fire of Danish patriotism—Baggesen, Winther, Hauch, P. P. Müller, Heiberg, Hertz, H. C. Andersen, Rosenhoff, Holst, and Overskou. Ingemann, who stands

first as a writer of historical novels, has also written good lyrics, and his subjects have generally been taken from the national history. Short tales or novellettes would seem, however, to be more congenial to the taste of the Danes, and most of their best writers of fiction have adopted this form—as, for instance, Blicher, Heiberg, Trane, Andersen, Winther, Carit Etlar, &c. The names of Oersted, Schonow, Forehammer, Rask, Finn Magnussen, Worsaa, Grundtvig, Petersen, and Eschricht, sufficiently attest the stand that the physical sciences, philology and archæology, have attained in Denmark in the present day. Thorwaldsen, by the gift of his works to the nation, has created a taste and appreciation for sculpture and the arts generally among his countrymen, to which they were previously strangers, and has thus given a new direction to the mental culture of the Danes.

The Danish language is peculiarly soft, from the great number (ten) of distinct vowel-sounds which it contains, the absence of gutturals, and the softening of all the consonants. It may be said to bear the same relation to the ancient tongue, the *Norrana* or *Donsk Tunga*, that Italian does to Latin, force and precise inflections having been sacrificed for melody and simplicity.

DANKALI, an independent state of Abyssinia, extending along the south-west border of the Red Sea, between lat. 13°—15° 30' N., a range of mountains running almost parallel to the coast, and about 50 miles distant from it, forming its boundary inland. D. is a sterile territory, being almost quite destitute of water. The heat is excessive, often reaching 110° F. The inhabitants are composed of various Arab tribes, and are indolent, treacherous, and cruel. They number about 70,000.

DA'NNECKER, JOH. HEINR. VON, a German sculptor, was born at Waldenbuch, in the district of Stuttgart, 15th October 1758. His parents were in the humblest circumstances; but through the favour of the Duke of Würtemberg, he received a good education at the Military Academy at Ludwigsburg. His artistic talents were rapidly developed. In 1780, he obtained the prize for the best model of 'Milo of Croton destroyed by the Lion;' and in 1783 went to Paris, where he studied for two years under Pajou; after which, he proceeded to Rome, where he met with Goethe, Herder, and Canova, to the last of whom he was indebted for much valuable instruction in his profession. At Rome, D. remained till 1790. Here he executed in marble his statues of 'Ceres' and 'Bacchus.' On his return to Germany, the Duke of Würtemberg appointed him Professor of Sculpture in the Academy at Stuttgart, in which city he resided till his death, 8th December 1841. D. was undoubtedly one of the best of modern sculptors. His forte lay in expressing individual characteristics, in which respect he has not been surpassed. This gives a great value to his busts of distinguished persons, such as Schiller, Lavater, Gluck, and the kings Frederick and William of Würtemberg. His perceptions of the beautiful and the delicate, especially in the female form, are also considered by his countrymen to be more exquisite and true than those of Canova himself. His earlier works are chiefly pagan in their subjects, while his later ones are Christian, and are pervaded by a pensive idealism. Of the former, besides those already mentioned, the principal are 'Sappho,' 'Love,' 'Psyche,' and 'Ariadne as the Bride of Bacchus riding on a Leopard (at Frankfurt);' of the latter, 'Christ,' 'John the Baptist,' and 'Faith.'

DA'NTÉ (properly, DURANTE) ALIGHIERI, one of the greatest poets of all time, and incomparably the greatest among the Italians, was born in

Florence in 1265. The outward circumstances and fortunes of his life are involved for the most part in great uncertainty. His family was, by his own account, one of the most illustrious in the city. His father dying while D. was young, his education devolved upon his mother, Bella. In this duty, in which she displayed great fidelity and judgment, she seems to have been counselled and aided by the great statesman, scholar, and poet, Brunetto Latini. The elements of knowledge D. probably acquired in Florence; in riper years, he studied philosophy at Bologna and Padua. After his banishment, he pursued theology for a time at Paris, and, if Boccaccio were to be believed, even visited England. His studies, however, did not prevent him from discharging the public duties of a citizen. He fought in the successful battle with the Aretines at Campaldino in 1289, and was present at the taking of the fortress of Caprona, 1290. What civil offices he first held, we do not know, but it is certain that he was sent on several embassies, and at last, in 1300, rose to the highest dignity of the city, being chosen one of the Priori for two months, an office which was the source of his subsequent unhappy fortunes. Florence, on the whole, belonged to the party of the Guelphs (q. v.), but was divided into the two factions of the Neri and Bianchi (the *blacks* and *whites*). The Neri were the unconditional adherents of the pope, and this of course gave to the other faction a more Ghibelline leaning. See GUELPHS and Ghibellines. A tumult in the city, occasioned by the heads of the ultra-Guelphic or *black* party, caused their temporary expulsion from Florence. They hurried to Rome, to lay their complaints before his Holiness. D., who belonged to the Bianchi, was sent by his party to Rome, to counteract their machinations; but Boniface VIII., in concert with the Neri, got Charles of Valois, brother of Philip IV. of France, to come to Florence and restore peace under the title of peacemaker. This explains the deadly enmity of D. to Boniface. The peace established by Charles of Valois consisted in recalling the banished leaders of the Neri, in giving up the houses and property of the Bianchi to be plundered, and banishing many of them, and among others Dante. D. never entered his native city again, and his whole subsequent life was unsettled, spent in various places, and under various protectors, at Arezzo, Verona, Padua, &c. In 1304, the Bianchi made a final attempt to return to Florence by force of arms, which failed; and it was probably on this occasion that D. went to Paris. The march of Henry VII. to Rome in 1310 recalled him to Italy, and he endeavoured, by addressing ardent letters to the Italian princes, to promote the cause of the empire, which had now become his own. It was probably with this view and at this time, that his work *De Monarchia* was written. The unsuccessful siege of Florence, and the death of the emperor, which followed in 1313, annihilated the last hopes of D., and he spent the closing years of his life at Ravenna, under the protection of Guido Novello da Polenta. He went on a mission for this prince to Venice, returned sick, and died on the 14th September 1321.

As not unfrequently happens with distinguished men, an accidental circumstance in D.'s early youth had made an indelible impression on the soul of the poet, and, as he himself expresses it, awakened in him a 'new life.' At a family festivity, he had seen Beatrice Portinari, then eight years old, the daughter of a rich citizen, and the love that sprang up in the heart of the nine years' old boy became the fountain of the poetical inspiration of his life. How pure, chaste, and tender this love was, is testified by the *Vita Nuova*, his first work, which appeared about

1300. It is a collection of poems or canzoni, bearing upon this youthful love, and along with each piece is given a history of its origin and a minute analysis. The best edition of this collection is that prepared by the Marquis Trivulzio (Mil. 1827). Beatrice married a nobleman, Simone de Barli, and died young about 1290. D. himself afterwards married a lady named Gemma, of the powerful House of Donati.

His immortal work, the *Divina Commedia*, depicts a vision, in which the poet is conducted first by Virgil, the representative of human reason, through hell and purgatory; and then by Beatrice, the representative of revelation; and finally by St Bernard, through the several heavens, where he beholds the triune God. The name *Commedia* was given to the work by the poet himself—because, beginning with the horrible, it ends cheerfully; and because, in respect of style, it is lowly, being written in the vulgar tongue. The epithet *Divina* was added by the admiration of after-times. Hell is represented in the poem as a funnel-shaped hollow, formed of gradually contracting circles, the lowest and narrowest of which is at the earth's centre. Purgatory is a mountain rising solitary from the ocean on that side of the earth that is opposite to us; it is divided into terraces, and its top is the terrestrial paradise, the first abode of man. From this, the poet ascends through the seven planetary heavens, the heaven of the fixed stars, and the 'primum mobile,' to the empyrean, or fixed seat of God. In all parts of the regions thus traversed, there arise conversations with noted personages, for the most part recently deceased. At one time, the reader is filled with the deepest sorrow, at another, with horror and aversion; or the deepest questions of the then philosophy and theology are discussed and solved; and the social and moral condition of Italy, with the corruptions of church and state, are depicted with a noble indignation.

Fifty-two years after the poet's death, the republic of Florence, at the instigation of Boccaccio, set apart an annual sum for public lectures to explain the *Divine Comedy* to the people in one of the churches, and Boccaccio himself was appointed first lecturer. The example was imitated in several other places of Italy. The works of these men are among the earliest commentaries on D. that we possess. The number of editions of the work amounts by this time to about 300. Only a few, in addition to the commentaries above mentioned, deserve notice. They are: that printed at Fuligno in 1472—the earliest of all; the Nidobentine edition at Milan (1478); the first Aldine edition (1502); the first Cruscan edition (1695); that of Volpi (1727); of Venturi (1732); of Lombardi (1791), and with additions and illustrations in 1815, 1821, and 1822; of Dionisi (1795); of Ugo Foscolo (Lond. 1842—1843). A reprint of the Fuligno edition above mentioned, together with those printed at Jesi (1472), at Mantua (1472), and at Naples by Francesco del Tuppa (about 1478), appeared at London, in 1858, under the superintendence of Mr Panizzi, and at the expense of Lord Vernon.

The *Divina Commedia* has been translated into almost all European languages. Two translations of the whole into Latin have been printed, one by Carlo d'Aquino (1728), and lately by Piazza (1848). In French, there are a number of translations both in prose and verse. The earliest, by Grangier, in 1596, is still the nearest to the original in form, but none is good. The German translations are numerous, and such as no other modern language can equal in faithfulness. Kannegiesser has translated the whole in the measure and rhyme of the original (4th edition, Leip. 1843); Prince John of Saxony's translation is said by some to be the best.

The chief English translations are Boyd's (1785) and Cary's (1814), in blank verse; Wright's (1833), in triple rhymes; Cayley's, in the original ternary rhyme (the *Inferno*, 1851, the *Purgatory*, 1853, the *Paradiso* in 1854, with a volume of notes in 1855); Dr John Carlyle's, the *Inferno*, in prose, with a judicious commentary (1849); Fred. Pollock's, in blank verse (1854). Besides the *Divina Commedia*, the *Vita Nuova*, and the *De Monarchia*, D. wrote one or two other works.

DANTON, GEORGES-JACQUES, was born at Arcis-sur-Aube, 28th October 1759. At the outbreak of the French Revolution, he was practising as an advocate in Paris, but did not enjoy much reputation, on account of his dissolute habits. The fierce half-savage nature of the man, however, immediately found a fitting sphere for its action in the chaos into which France then fell. Mirabeau quickly detected his genius, and hastened to attach D. to himself. President of the district of the Cordeliers, D. ruled it at his will. Along with Marat, and Camille Desmoulins, he instituted the Cordeliers' Club, an exaggerated copy of that of the Jacobins. It soon became the rallying-point of all the hotter revolutionists. There the tall brawny man, with harsh and daring countenance, terrible black brows, and a voice of enormous power, thundered against the aristocrats, till the passions of the populace rose into ungovernable fury. It was not, however, till after the flight of Louis that the political rôle of D. commenced. On the 17th July 1791, he and others assembled the people of Paris in the Champ-de-Mars, and goaded them on by furious declamation to sign a petition for the deposition of the king. Some time after, he became *procureur-substitut* for the city of Paris. The court, which found that it could not frighten D., now attempted to bribe him. It is not certain that he proved venal, but the evidence undoubtedly leaves a strong suspicion of his venality on the mind. Be that as it may, he soon broke off his secret intercourse with the royalist agents, and became more the implacable enemy of the monarchy than before. It was D. who excited to action the wild sanguinary rabble that, on the 10th of August 1792, stormed the Tuileries, and butchered the faithful Swiss. The reward of his fatal eloquence was the office of Minister of Justice, and here the gigantic personality of the man seemed to overshadow all the surrounding figures. He stood forth as the incarnate spirit of the Revolution, manifesting alike its heroic audacity in the presence of danger from without, and its maniacal terror in the presence of danger from within. The advance of the Prussians seemed for a moment to inspire France with a panic. On the 2d of September, D. mounted the tribune, and addressed the Legislative Assembly in a speech of tremendous power, probably the most effective delivered during the whole of the Revolution. It closed with these words regarding the enemies of France: 'Pour les vaincre, pour les atterrir, que faut-il? De l'audace, encore de l'audace et toujours de l'audace.' France quivered to its core with enthusiasm. 'In a few weeks, fourteen republican armies stood upon the field of battle, and repelled with unexampled bravery the aggressions of the allied forces.' But unhappily that 'audacity,' by which alone D. thought it possible for France to save herself, required for its perfection the immolation of the imprisoned royalists. On the very evening when D. spoke, the frightful September Massacres began. D. publicly thanked the assassins, 'not as the Minister of Justice, but as the Minister of the Revolution.' Elected by the city of Paris one of its deputies to the National Convention, he resigned his judicial function, and zealously hurried on the

trial of the king. As a proof of his ferocious decision of character when pressed by difficulties, it is recorded that one of his friends having pointed out that the Convention could not *legally* try the king, 'You are right,' instantly replied Danton. 'So, we will not try him; *we will kill him!*' In the meantime, D. was sent on a mission to the army of the north, commanded by Dumourier, with whom he was soon on very close terms of intimacy—too much so, indeed, for the suspicious soul of his old friend Marat. The defection of Dumourier was the signal for Marat to give vent to his suspicions. It therefore became necessary for D. to throw himself again into the van of the revolutionary movement. On the 10th March 1793, he established the 'extraordinary criminal tribunal,' which was at liberty to make what arrests it pleased, and from whose deadly decisions there was no appeal. He also became president of the 'Committee of Public Safety.' D. now set himself to crush the Girondists, or moderate party, alleging, with singular candour, that 'in a revolution the authority ought to belong to the greatest scoundrels.' In this he was supported by Robespierre, now gliding into power swiftly and silently like a serpent. After he had effected his purpose, however, a species of remorse seems to have seized him. He objected to the institution of the guillotine. This trait of moderation lost him the favour of the Jacobins or Mountain party, whose murderous instincts led them to select Robespierre as a chief, on the permanence of whose cruelty more reliance might be placed. Several other indications of returning humanity lessened his influence still more, and at the close of 1793, D. felt that a crisis was approaching. A fruitless attempt was made to reconcile Robespierre and him. They had an interview, but parted on worse terms than ever. It was now a struggle for life between them; but D., sick of the Revolution, and conscious that it was rapidly becoming a *sham* (a thing which D., with all his faults, could not abide), gave himself up to a sort of reckless apathy, which enabled the sleepless Robespierre to ruin him. His friends endeavoured to rouse him. 'I would rather be guillotined than guillotined,' he answered. Blinded by the consciousness of his own inherent power, he also declared that his enemies 'would not dare' to lift their finger against him. But men of the stamp of Robespierre—though essentially cowards, and incapable of facing danger with honest straightforwardness—have a certain furtive audacity that emboldens them to attack a greater than themselves, if circumstances are favourable. So Robespierre sprang at D., and so the great anarchy perished. On the night of the 30th March 1794, he was arrested, and brought before that Revolutionary Tribunal which he himself had established, summarily condemned, and, along with Camille Desmoulins and others, was guillotined on the 5th of April. He predicted the fate of Robespierre, calling him 'an infamous poltroon,' and immediately added, 'I was the only person who could have saved him.' D. was an atheist—not a calm, thoughtful dispassionate disbeliever in the existence of God, but one who, by his own vices, and the general godlessness of the times in which he lived, had been robbed of the spirit and power of faith in the Unseen. When formally interrogated regarding his name and dwelling, he replied: 'My dwelling-place will soon be annihilation, and my name will live in the Pantheon of history.'

DA'NUBE, the second in rank of European rivers, inferior only to the Volga, has its origin in the Brege and Brigach, two mountain-streams rising in the eastern part of the Black Forest, in Baden, at an elevation of 2850 feet above sea-level, in lat. 48° 6' N.,

## DANUBIAN PRINCIPALITIES—DANZIG.

and in long, 8° 9' E. The total length of the D. is about 1750 miles; the area which it drains is estimated at 250,000 square miles, comprising countries widely varying in climate and productions. The average fall of the D. is 18 inches per mile. At Ulm, it attains a breadth of 108 feet, and before its junction with the Sereth the mean breadth is 6000 feet, and the depth, which at Ulm is 6 feet, and at Passau 16, is here on an average 20 feet. The D. is joined in its course by sixty navigable rivers, and falls into the Black Sea, pouring into it a volume of water nearly equal to that of all the other rivers that empty themselves there. From its source, it flows in a north-easterly direction through Würtemberg and Bavaria. Passing Ulm, at which point the river becomes navigable for vessels of 100 tons, it receives from the south the Lech and the Isar, with some unimportant streams from the north; flows rapidly past Ingolstadt, and onwards to Regensburg (Ratisbon); then suddenly altering its course, it proceeds in a south-easterly direction, passing Straubing and Passau, where it enters the Austrian dominions. With little variation of course, the D. flows eastward from Passau to Presburg, receiving from the south the Inn and the Ens, and from the north the March or Morava, through a tract of country rich in minerals, well peopled, and highly cultivated. Near Linz, and also in the picturesque neighbourhood of Vienna, the waters of the D. frequently divide, and enclose large tracts of soil, forming islands, among which are the Great and Little Schütt, called also the 'Golden Gardens.' Hurrying past Presburg, the D. alters its course to south-east, and such is its velocity here, that barges can only navigate it downwards. Passing Pesth, and flowing directly south, it enters upon the Hungarian plain, a vast sandy and alluvial flat, in which it is continually forcing new channels and silting up old ones, sometimes sweeping away towns, or capriciously removing its waters to a distance of several miles from such as were formerly built upon its banks. Here it receives from the north the Waag and the Gran, while the Drave from the west adds considerably to its volume. After this accession, the river turns towards the east, and joined by the waters of the Theiss and Teme from the north, sweeps past Belgrade, forming the boundary between Servia and Hungary. Still flowing eastward, the D., leaving Orsova, passes the famous 'Iron Gate,' a broad plateau of rock 1400 yards wide, over which the water formerly rushed with an overpowering noise. This rapid, which was followed by a series of whirlpools, eddies, and shallow falls, formed an effectual bar to the upward progress of vessels, no craft drawing more than 2½ feet of water being able to pass it. In 1847—1849, however, the obstruction formed by the 'Iron Gate' was to some extent removed by blasting, so that now vessels of eight, and even nine feet draught, can pass at certain seasons of the year, although the majority of vessels engaged on this part of the river draw no more than four feet of water. A few miles further on, it enters a plain, and proceeding uninterruptedly, forms the boundary between Walachia and Bulgaria. From the Carpathians it receives the Schyl and the Aluta, and from Mount Balkan the Morava. Increased by these rivers and by numberless streams, it progresses through a district fertile indeed, but badly cultivated and thinly peopled, occasionally broadening like a sea, as at Hirsova, and enclosing many islands. After being joined by the Sereth and the Pruth from the north, and after dividing into several branches forming deltaic islands, it flows eastward into the Black Sea. The principal mouth is the Sulina, by which the greater number of ships enter. The D., which is the chief

natural highway for European commerce, is, throughout the greater part of its course, surrounded by picturesque and impressive scenery—at one time flanked with lofty mountains, again having on each side, and bordering on its brink, dense and far-extending forests, while along the border of Bulgaria, and onwards to its mouth, its broad surface is dotted with numerous and beautiful islands. The Danube Steam Navigation Company, which of late years has done much to increase the commerce of the D., possessed, in 1870, 155 steamers, with 547 tow-boats. Many vessels enter the D. in ballast, and take out cargoes of Indian corn. Wheat and other grain, horns, timber, hides, tallow, and salt, are also exported.

**DANUBIAN PRINCIPALITIES.** See **MOLDAVIA AND WALACHIA.**

**DA'NZIG,** an important city and seaport of Prussia, in the province of West Prussia, is situated on the left bank of the western branch of the Vistula, about 3½ miles from its mouth in the Baltic, in lat. 54° 21' N., long. 18° 40' E. D. is an ancient place, having been in existence at least as early as the 10th c., and its possession was long an object of ambition to the Danes, Swedes, Pomeranians, and Teutonic knights, the last of whom obtained, and held it for a considerable period. In 1454, it became a free city under Poland, and remained so until 1793, when it fell under the dominion of Prussia, in whose hands, except during the years 1807—1814, when it existed as a separate dukedom under Napoleonic rule, it has since continued. D. is surrounded by ramparts and wet ditches, and is otherwise strongly fortified, and the garrison possesses the means of laying the surrounding country under water on three sides. The city is traversed by the Motlau and Radaune, tributaries of the Vistula, the former of which is deep enough to admit vessels of eight or nine feet draught up to the town. The principal port, however, is at Neufahrwasser, at the mouth of the Vistula, which river cannot be entered by large vessels on account of the sand-bars across it. Many of the streets of D. are narrow and crooked, but the principal street, intersecting it from east to west, abounds in fine specimens of antique architecture, and has altogether a most picturesque appearance. Among the most noteworthy buildings are the cathedral, a fine structure, commenced in 1343, but not finished until 1503, and possessed of a noble and widely celebrated picture of the 'Last Judgment' (the painter of which is unknown), the Church of St Catharine, Trinity Church, the fine old Town-hall (which has lately been restored at a cost of 60,000 thalers), the Exchange, &c. D. was at one time a prominent member of the Hanseatic League, and is still one of the chief commercial cities of Northern Europe. To provide for its immense trade in grain, it has enormous granaries, capable of containing 500,000 quarters of corn, and built on an island forming one of the parts of the town where, in order to prevent fire, no person is permitted to live, nor lights allowed. The value of the wheat exported from D. in 1865 was 11,517,600 thalers; and the value of other grain, 3,344,160 thalers. The annual value of timber exported averages about £600,000 sterling; in 1865, timber valued at £400,000 was exported from D. to Great Britain alone. Besides grain and timber, there are some minor articles of export, as black beer, amber, spirits, &c. In 1869, the total value of the exports was 25,649,310 thalers; of the imports, 29,257,910 thalers. In that year, 1851 vessels entered the harbour. The inhabitants of D., of whom the majority are Protestants, numbered, in 1871, 89,121.

DAOUDNUGUR, a town of Bahar, in the sub-presidency of Bengal, stands on the right bank of the Sone. D. is about 90 miles to the east of Benares, being in lat. 25° 3' N., and long. 84° 27' E. It is a wretched-looking place, most of its thoroughfares being mere passages. It possesses, however, a considerable trade, manufacturing coarse fabrics both of wool and of cotton. Pop. estimated at 10,000.

DAOURIA, a country of Asia, partly in the Russian government of Irkutsk, and partly belonging to the Chinese territory of Manchuria. Its limits are not exactly defined. The Daourian mountains, offsets of the Yablonoi mountains, traverse it from north-east to south-west, and separate it from the region of Lake Baikal. The mountains are fertile in minerals.

DAPHNÉ, a magnificent grove and sanctuary in ancient times, near Antioch (q. v.). The grove was finely laid out in walks of cypress and bay trees, and as the chief resort of all the dissolute persons in the city, became the scene of the greatest debauchery. In the centre, surrounded by the luxuries of nature and art, glorious gardens, fountains, baths, colonnades, stood the temple of Apollo and Diana, which was invested with the privileges of an asylum, and became for centuries a place of heathen pilgrimage. The progress of Christianity gradually revived in the Antiochenes the purer instincts of virtue and decorum, and the grove was finally abandoned. Julian the Apostate, in his vain endeavour to resuscitate the lifeless corpse of paganism, visited D., and made the altars of the temple smoke once more with incense; but on his departure, they were again neglected, until one night the altars and the statues were discovered to be in flames. They were consumed to ashes; and so perished for ever the gods of Daphne.

D. owed its origin to Seleucus Nicator. He planted the grove, built the temple, and gave the place a mythological history in connection with the river Peneus and the nymph Daphne, who was here turned into a laurel or bay tree, whence the grove of D. received its name. Modern travellers are not agreed as to its site. Pöcocke and Richter decide in favour of *Beit-el-Maa*, about five miles from Antioch; while Forbiger and Kinneir consider Babylas the true position.

DAPHNE, a genus of plants of the natural order *Thymelæacea*, having a 4-cleft, funnel-shaped perianth, the throat of which is destitute of scales, eight stamens, and a one-seeded succulent fruit. All the species are shrubs or small trees, some having deciduous, and some having evergreen leaves, all of them possessing in all their parts a more or less considerable acidity, which in some is so great, that they are even caustic; and the berries are poisonous, whilst, however, the flowers of some are deliciously fragrant. To this genus belongs the MEZEREON (q. v.), well known both for the fragrance of its flowers and for its medicinal uses, naturalised in some places of England. The GAROU bush (*D. genkium*), a native of the south of Europe, less hardy than the mezereon, has the same medicinal properties and uses, which is also in some measure the case with many other species. The only species certainly a native of Britain is the SPURGE LAUREL (*D. laureola*), an evergreen shrub, 3—4 feet high, with obovate-lanceolate leaves, which grow in tufts at the end of the branches, and give it a remarkable appearance. It grows well under the shade of trees. It is naturalised, rather than a native of Scotland. — *D. Japonica*, a species recently introduced from Japan, has exquisitely lemon-scented leaves. From the bark of some species of D., and of the most nearly allied genera, paper is made in different parts

of the East, particularly *Nepaul paper* from that of *D. cannabina*. Slips of the inner bark are boiled in a lye of wood-ashes for half an hour till quite soft, are then reduced to a homogeneous pulp by beating

Daphne Mezereon.

with a wooden mallet in a mortar, churned with water into a thin paste, and poured through a coarse sieve upon a cloth stretched on a frame. The paper is subsequently polished by friction, with a shell or a piece of hard-wood, and is remarkable for its toughness, smoothness, and durability. Most of the paper used in Tibet is made from the bark of different species of D. and allied genera, particularly of *Edgeworthia Gardneri*, a beautiful shrub, with globes of waxy, cowslip-coloured, deliciously fragrant flowers, growing on the Hünalaya, at an elevation of 6000—7000 feet. The bark of *Dais Madagascariensis* is also made into paper in Madagascar, and that of *Gnidia daphnoides* into ropes.

DAPHNIA. See WATER-FLEA.

DAPHNINE is a bitter, astringent, crystalline substance present in different species of *Daphne*. It is analogous to asparagine. See ASPARAGUS.

DARABGHET'D, or DARA'B, a town of Persia, in the province of Farsistan, lat. 29° N., long. 54° 30' E. It is situated on a small river in the midst of an extensive plain, and is surrounded by lemon and orange groves. At one time, it was a place of great extent and importance, but most of it is now in ruins, and its population is not more than 15,000 or 20,000.

D'ARBLAY, MADAME. See BURNEY, DR CHARLES.

DARBU'NG, a mountain-torrent of Bussahir, Hindustan, with a course of only 27 miles, rises about 15,000 feet above the sea, in lat. 31° 57' N., and long. 78° 25' E., and loses itself in the Sutlej, the most easterly of the five rivers of the Punjab, in lat. 31° 43' N., and long. 78° 35' E. About 7 miles above the point of confluence—having already descended 6000 feet in 20 miles—the D. is crossed by a wooden bridge of 33 feet in length; and even somewhat further up, it is bordered by several villages. Its source has been described as a scene of terrific desolation, consisting of fields of snow and ice half-buried under stones and rubbish.

**DARDANELLES** (ancient *Hellespont*), a narrow channel separating Europe from Asia, and uniting the Sea of Marmora with the Grecian Archipelago. It extends from north-east to south-west, between lat.  $40^{\circ}$ — $40^{\circ}$   $30'$  N., and long.  $26^{\circ}$   $10'$ — $26^{\circ}$   $40'$  E., having a length of about 40 miles, and a breadth varying from less than 1 to 4 miles. From the Sea of Marmora, a strong current runs through the strait to the Archipelago. To prevent an attack on Constantinople from the Archipelago, the D. is strongly fortified on both sides. At the south-western opening of the strait there are two castles, one on the European, and the other on the Asiatic shore, called the new castles; and about 18 miles to the north-east are situated two other castles (the old castles), that on the European side marking the ancient Sestos, and the other, ancient Abydos. Between these points, the strait is defended by strong modern fortifications, mounting many hundreds of guns, some of them of immense calibre. The D. is celebrated in ancient history on account of Xerxes and Alexander having crossed it, the former in 480 B. C., to enter Europe; and the latter in 334 B. C., to enter Asia. The point at which Xerxes crossed, by two separate bridges, was in the neighbourhood of Abydos; and Alexander crossed at nearly the same place; and across here also young Leander nightly swam to visit Hero—a feat performed in modern times by Lord Byron for 'glory.'

**DARFUR**, a country of Africa, east of Sudan, is generally said to be situated in lat.  $10^{\circ}$ — $16^{\circ}$  N., and in long.  $26^{\circ}$ — $29^{\circ}$  E.; but its limits are not very clearly defined. D. towards the south is hilly, the principal elevation being a mountainous ridge called Marrah, which traverses the country longitudinally, and is the source of numerous streams. Towards the north, D. is level, sandy, and almost destitute of water. During the rainy season, which commences in June, and continues till September, it exhibits a rich vegetation. The principal products are wheat, millet, rice, maize, and sesame. Tobacco, which is used by the natives in every form, abounds. Water-melons, also, are abundant during the rainy season. Among the fruits are tamarinds and dates. The minerals are chiefly copper and iron. The wealth of the inhabitants of D. consists chiefly in cattle, which are paid as tribute to the sovereign, all the commercial transactions of the country being conducted by barter. Horses and sheep are scarce. D. carries on a considerable trade with Egypt, Mecca, and the inland countries of Africa, bartering with the former slaves, ivory, ostrich-feathers, hides, drugs, copper, &c., for silks, cotton cloths, glass-ware, trinkets, spices, sword-blades, firearms, &c. The religion is Mohammedanism; the government, that of a despotic sovereign. Pop. estimated at 200,000. The capital, Kobbé, about lat.  $14^{\circ}$   $11'$  N., long.  $28^{\circ}$   $8'$  E., whence the caravans depart for foreign countries, is a straggling town of about 6000 inhabitants.

**DA'RGAN, WILLIAM**, was born about the beginning of the present century in county Carlow, Ireland, where his father was a large farmer. D. received, when young, a good education, and after spending some time in the office of a surveyor, where he acquired a high reputation for integrity and assiduous industry, he went to England, and was employed under Telford, who was then constructing the Holyhead Road. Inspired perhaps by the example of that great engineer, D. now resolved to carve out a similar path for himself in his own country, and having returned to Ireland, obtained some small 'jobs,' the beginnings of a career crowned with the most splendid success—for he became one

of the first capitalists in Ireland. It was D. who contracted for the first railway ever executed in Ireland (the Dublin and Kingstown), and he was afterwards connected with most of the great undertakings in that country, such as the making of railways, canals, tunnels, and embankments. He was also an extensive holder of railway stock, a steam-boat proprietor, flax-grower, and farmer. He planned the Industrial Exhibition of Dublin (1853), with the view of developing more vigorously the material resources of his native country; and as a help towards its realisation, placed £20,000 in the hands of a working-committee. This sum was gradually increased to about £100,000. The Exhibition was opened on the 12th of May 1853, by the Lord-lieutenant; and was visited by the Queen and Prince Albert, when the honour of knighthood was offered to D., but was declined. In so far as the Industrial Exhibition was a *personal* speculation on the part of D., it was a failure, for he lost, it is said, £20,000 by it; but in every other respect it was highly gratifying to him, and to every genuine lover of his country. William D. was not one of those sham-patriots with whom Ireland has been too often afflicted. He died, February 7, 1867.

**DARIEN**, a term of various application, indicating at once a province, a gulf, and an isthmus, on the common border of the two grand divisions of the New World.—1. The province—a portion, or rather, perhaps, a fragment, of the apparently crumbling republic of New Granada—seems to have been Spain's earliest possession on the western continent—the nucleus, in fact, of what, under the name of the Spanish Main, or *Terra Firma*, soon came to be distinguished alike from the islands on the one hand, and from Mexico and Peru on the other. The surface is mostly rugged and mountainous; and the climate, more particularly on the Atlantic side, is understood to be singularly moist and unhealthy.—2. The gulf, measuring 26 leagues from north to south, and averaging 9 from east to west, is the most southerly arm of the Caribbean Sea, penetrating as far down, between South America and Central America, as lat.  $8^{\circ}$  N. At its inner extremity, it receives the Atrato, by much the largest of its tributaries; and on the west it is half met across the already narrow neck by the Gulf of San Miguel, an inlet of the Bay of Panama. The eastern shore, happily the least important in its position, is said to be but little available for navigation.—3. The isthmus, originally traversed by Vasco Nunez de Balboa, governor of the infant colony, in 1513, is at one point only 30 miles from sea to sea. Two projects have been entertained with a view to the constructing of a ship-canal in this locality, both of them prompted and facilitated by remarkable depressions of the Cordilleras. One of them, which, however, does not confine itself wholly to the isthmus, proposes to link together the Atrato (q. v.) on the one side, and the San Juan on the other; while the second of them contemplates the direct junction of the Gulfs of D. and San Miguel. The Isthmus of D. appears to take the name also of Panama (q. v.); but, strictly speaking, this nomenclature denotes different, though continuous necks of land.

**DARIEN SCHEME**, THE, one of the most disastrous speculations on record, and one which caused an unprecedented excitement in Scotland from 1695—in which year the Darien Company was established by act of the Scottish parliament, sanctioned by royal authority—till 1701, when the last of the disappointed adventurers returned home. The D. S. was projected by William Paterson, the founder of the Bank of England. Its object was to plant a colony on the Atlantic side of the Isthmus of

## DARIEN SCHEME.

Panama, and so form a commercial entrepôt between the eastern and western hemispheres. An entire monopoly of the trade of Asia, Africa, and America, for a term of thirty-one years, was granted to the Company. At that time, the foreign trade of Scotland had been ruined by the English navigation act of 1660, which provided that all trade with the English colonies should be conducted in English ships alone, so that when Paterson opened his subscription-list, the nobility, the gentry, the merchants, and people, royal burghs, and public bodies in Scotland all hastened to subscribe. £400,000 were immediately put down on paper, of which £220,000 were actually paid up. Deputies in England received subscriptions to the amount of £300,000; and the Dutch and Hamburgers subscribed £200,000. The English parliament, however, actuated by a feeling of national antipathy, and the jealous clamours of trading corporations, gave its unequivocal condemnation to the scheme. The British resident at Hamburg, probably with the concurrence of the king (William III.), also made various insinuations against it. The result of this interference was the almost total withdrawal of the Dutch and English subscriptions. It must now be admitted, even by a Scotsman, that there was one fatal objection to the scheme—viz., the danger of settling on ground claimed by Spain, without coming to a proper understanding with that country beforehand. Unable, however, to see any sort of obstacles, incited by the vehement eloquence of Paterson, and dazzled by the magnificent proportions of the scheme, the Scotch hurried forward their arrangements. Five ships, with 1200 men on board, set sail from Leith for Panama on the 25th July 1698. They reached their destination in four months, and having bargained with the natives for a country which they called New Caledonia, the colonists fixed the site of what was to be their capital city, New Edinburgh, and built a fort in its vicinity, which they named New St Andrews. Having thus constituted their colony, they issued a proclamation of perfect freedom of trade, and universal toleration in religious matters

to all who should join them. According to the act which established their company, all goods imported by them, with the exception of foreign sugar and tobacco, were free from all duties and impositions for 21 years; and thus, on the whole, they seemed for the first few months to be on the highway to success. But the climate, which was tolerable in winter, became unbearable in summer, and many sickened under it; their supplies also failed before they could derive a return from the soil; and on sending to the British colonies in America for provisions, they learned with the deepest indignation and despair that the British American colonies, having been informed that King William had not given his sanction to the expedition, had resolved to hold no intercourse with the new colony at Panama.

Sickly and desponding, they waited long for supplies from the mother-country; but the Company at home were not aware of their wretched condition, and none came. At length, having waited eight months for assistance, the colony broke up. In the meantime, 1300 colonists, including 300 Highlanders from the estate of Captain Campbell of Finab, who had charge of the expedition, had set sail from Scotland, but ere they arrived, the pioneers had fled. A Spanish force of 1500 men, and a squadron of 11 ships, immediately threatened the new-comers. Captain Campbell marched by night with a body of 200 men upon the Spanish camp, which he broke, and completely dispersed. On returning to the fort, however, he found it invested by the Spanish squadron. The ammunition of the colonists had now become exhausted, and they were obliged to capitulate, the Spaniards granting honourable terms to all except Captain Campbell, who, however, escaped, and reaching New York, obtained a passage to Scotland. The remainder of the colonists, too weak to weigh the anchor of the vessel which was to carry them home, had to be assisted in their departure by the Spaniards. Not more than 30, among whom was Paterson, who was rendered for a time lunatic by his dreadful misfortunes, ever reached Scotland. Of Paterson, who has been regarded by some writers as a swindler, Lord Macaulay, in his

Scottish India House.

fifth volume of the *History of England*, says: 'There is not the least reason to believe that he was dishonest. Indeed, he would have found more difficulty in deceiving others, had he not begun by deceiving himself. His faith in his own schemes was

strong even to martyrdom; and the eloquence with which he illustrated and defended them had all the charm of sincerity and enthusiasm.'

In Edinburgh, as the head-quarters of the D. S., a building was erected to accommodate the officials,

and carry on the business of the Company. Known as the Scottish India House, this building recently existed in connection with the establishment for the poor of the city—a melancholy memorial of a disconcerted national enterprise. The books and other documents which had belonged to the Company are contained in the Advocates' Library, where they are shewn as a curiosity. The most complete account of the D. S. is that by Mr J. H. Burton, printed by the Bannatyne Club.

**DARIUS**, or **DAREIUS**, is the name of several Persian kings, and, like the Egyptian word *Pharaoh*, is *titular* and not *personal*.—**DARIUS I.**, the son of Hystaspes, a Persian noble, leagued himself with six other nobles to murder Smerdis, the Magian, who had usurped the throne on the death of Cambyses. The conspirators were successful in their plot, and having, after some discussion, fixed on the monarchical as the proper form of government, D. contrived to be elected king, 521 B.C. His position at first was very insecure, but his caution, skill, and energy enabled him to govern his vast dominions for thirty-six years. To strengthen himself, he married the daughter of Otanes, who had been the head of the conspiracy, and likewise took three wives from the royal House—viz., two daughters of Cyrus, and one of Cyrus's son, Smerdis. He then divided his empire into twenty satrapies, and determined the exact amount of taxation to be borne by each. In some of the remoter provinces, great confusion seems to have prevailed after the death of Smerdis, the Magian; and a proof of how little D. could effect at first is afforded by the conduct of Oretas, the governor of Sardis, who for some time was quite defiant of his authority. Babylon next revolted, and D. besieged the city unsuccessfully for two years. At last, however, it was taken by an extraordinary stratagem of his general Zopyrus, 516. In 513, D., with an army of 700,000, crossed the Bosphorus by a bridge of boats, marched through what is now known as European Turkey to the mouths of the Danube, crossed, and advanced against the Scythians. The expedition proved a failure. D. retreated, but detached from his main force an army of 80,000 men under Megabyzus, to conquer Thrace, while he himself returned to Persia, where he extended his authority in the East as far as the Indus. The assistance given by the Athenians and Eretrians to the Ionic states, when they ventured to throw off the Persian yoke, and the part which they took in the burning of Sardis, determined D., who was also influenced thereto by the banished Hippias, to attempt the subjugation of the whole of Greece. In 495, he sent Mardonius with an army into Thrace and Macedonia, and at the same time despatched a fleet against the islands. The former was routed by the Brygi in Thrace, the latter was shattered and dispersed by a storm when rounding the promontory of Mount Athos. In 490, he renewed his attempt. His fleet committed great ravages in the Cyclades, but his army was entirely defeated at Marathon by the Athenians, under Miltiades, the 'tyrant' of the Chersonese. In the midst of his preparations for a third expedition, D. died, 485 B.C.

**DARIUS II.**, called, before his accession to the throne, *Ochos*, and after his succession, *Nothos* ('the Bastard'), was one of the seventeen hasty sons of Artaxerxes I. Longimanus. When Sogdianus, another of the bastards, had murdered the rightful king, Xerxes II., and assumed for himself the royal power, Ochos declared war against him, slew him, and secured the diadem for himself, 424—423 B.C. He now called himself *Darius*. His reign was ignoble. He shewed himself to be completely under the control of his eunuchs and his cruel step-sister

and spouse Parysatis. Rebellions were constantly breaking out among his satraps, all of which, however, were crushed except that of Amyrteus, satrap of Egypt, who made himself independent in 414. It was during the life of D., and chiefly through the craft of Tissaphernes, satrap of Asia Minor, and of his successor Cyrus the Younger, son of the king, that the Persians exercised so great an influence over the affairs of Greece in the last years of the Peloponnesian War. D. died 405—404 B.C.

**DARIUS III.**, great-grandson of D. H., called, before his accession, *Codomanus*, was a monarch noted for his mild disposition, handsome person, and courageous spirit. He was raised to the throne through the help of Bagoas, after the murder of Arsēs, 336 B.C. But in spite of his superior qualities, he could offer no solid opposition to the advance of the Macedonians. At the battle of the Issus, in 333, his mother, wife, and three children fell into the hands of Alexander; the victory of Gaugamela, in 331, opened to the latter the way to Susa and Persia Proper. D. now fled to Ecbatana, in Media; and, on the approach of his opponent, to the northern provinces, where he was seized by Bessus, satrap of Bactria. Alexander, in a fit of generosity, hurried to deliver Darius. Bessus then prepared for flight, but D., refusing to follow, was stabbed by the barbarian, and left. The scouts of Alexander's cavalry found D. dying, and administered to his last necessities. Thanking the Grecian king for his magnanimity, and commending his family to his care, he expired (330). Alexander sent the dead body to Sisymbria, mother of D., to be interred in the tomb of the Persian kings. With him, the Persian empire, that had so long overshadowed Asia, came to a close.

**DARKHAN MOUNT**, a lofty granite mountain in Mongolia, in lat. 47° 36' N., long. 110° 10' E. It is interesting as the place whither annually repair large numbers of Mongolians, to do honour to the memory of Genghis Khan (q. v.), to whom a monument has been erected here.

**DARLING, GRACE**, a name famous in the annals of heroism, was the daughter of William Darling, light-house keeper on Longstone, one of the Farne Islands, and was born at Bamborough, 24th November 1815. On the morning of the 7th September 1838, the *Forfarshire*, which, with 63 persons on board, had been wrecked among the Farne Islands, was seen by Darling from his light-house, lying broken on the rocks. At the solicitation of his daughter, then in her 22d year, he put off through the storm to the wreck, his only companion the noble girl who prompted the generous act. By wonderful strength and skill, they brought their boat to where the sufferers (nine in number) crouched, in momentary expectation of a watery grave, rescued them, and bore them safely to Longstone. Such an undertaking, so daring in itself, and so successfully carried out, filled every one with the warmest admiration. The light-house at Longstone, no longer solitary and peaceful, was visited by many of the wealthy and the great. Presents, testimonials, and money were heaped at the feet of the heroine; but she did not long survive her change of circumstances. She died of consumption, after a year's illness, on the 20th October 1842.

**DARLING**, a name derived from a governor of New South Wales, and applied to a district, a mountain-range, and a river in Australia.—1. A district in New South Wales, extending in S. lat. from 27° to 28° 15', is exclusively pastoral, and has an area of 50,000 sq. m. It is traversed by the Condamine, one of the head-waters of the Murray. Under the designation of *Downs*, it contains the

counties of Aubigny and Merivale.—2. A mountain-range, about 250 miles long, lying wholly in West Australia. It terminates, in the direction of the sea, at Point d'Entrecasteaux, pretty nearly the south-west extremity of the entire island. Its culminating summit is not less than 3500 feet above the sea-level.—3. The river Darling, in New South Wales, aptly characterised as 'mysterious,' demands special attention, not only in itself, but also in connection with some of the most striking peculiarities of the country. From the western declivities of the almost continuous ridge that skirts the eastern coast, innumerable torrents pour down into the vast plains, which gradually slope away towards the interior. The more northerly of these torrents converge in a central 'basin of clay,' on the 30th parallel of S. lat., where, within a comparatively narrow space, meet the Maranoa, the Condamine, the Dumaresque, the Gwydir, the Namoi, the Castlereagh, the Macquarie, and the Bogan. In this region, the channels undergo many transformations, sometimes losing themselves in wide marshes, and sometimes presenting an inextricable labyrinth of bifurcations and junctions. After parting with a large proportion of their volume, under the combined influences of evaporation and absorption, the united streams, now distinguished as the D., pursue a journey of 600 miles to the Murray, through plains which are habitable only on the immediate verge of the water-course. Through this immense reach, the D. receives not a single affluent; nay, on the contrary, it sends out many an offset, to bury itself in some stagnant lagoon. It may be added, that none of the so-called rivers of this region of Australia, with the solitary exception of the Murray itself, is really entitled to the name. Between lofty banks of bare earth, they exhibit at times an inundating flood, at times a mere series of detached pools of every size and shape.

**DARLINGTON**, or **DARNTON**, a burgh in the south of Durham county, in a rich tract, on a hill-slope, on the banks of the Skerne, near its junction with the Tees, 18 miles south of Durham city. It consists of a square market-place, from which branch several streets called gates. Pop. in 1871, 27,730, many belonging to the Society of Friends. The chief manufactures are woollen yarns, for imitation Indian shawls, Brussels carpets, &c.; flax, optical glasses, brass and iron wares. Near D. was the seat of George Allan the antiquary. St Cuthberts, the beautiful parish church, was built in the 12th c., and has three carved stone stalls, and a tower 180 feet high. At Oxen-le-field, three miles from D., are curious cavities of unknown origin, called Hell Kettles.

**DARMSTADT**, a town of Germany, capital of the grand-duchy of Hesse-Darmstadt, residence of the grand duke, and seat of government, is situated on the river Darm, 15 miles south of Frankfurt-on-the-Maine. It consists of an old and new town, both of which are surrounded by walls and ditches. The streets of the former are narrow and squalid, but those of the latter exhibit many imposing specimens of architecture. D. has five public squares, from the centre of one of which a fine Doric column rises to the height of 134 feet, and is surmounted by a statue of the Grand Duke Louis, who founded the new town. Besides the arsenal, the barracks, and the various religious edifices, one of which is crowned by a dome supported upon 28 large columns, D. has two palaces; one of these, the old ducal palace, contains the museums of painting—comprising 700 pictures, some of them by the most famous of the old masters—and natural history, in which are shewn fossil remains of the deino-

therium. The palace contains also a public library consisting of 200,000 vols. D. is more dependent upon its ducal court and the government, which holds its seat there, than upon its commerce or manufactures; but these are now becoming more important. Pop. (1871) 39,584.

**DARNEL** (*Lolium temulentum*), a grass of the same genus with the valuable RYEGRASS (q. v.), an annual, common in cornfields in England and many parts of Europe. It has no tufts of leaves from the root, the glumes are as long as the spikelets, or longer, the spikelets contain 5—7 florets which are awned. This grass has from ancient times been reputed to have a narcotic poisonous seed, to which many bad effects were ascribed, which, in years of bad harvest, were observed to ensue upon the eating of bread or the feeding of horses upon oats. Even Lindley, in his *Medical and Economical Botany*, published in 1849, ascribes narcotic and acrid qualities to D. seed, and speaks of fatal consequences as produced by it when mixed with flour, saying that it 'is the only authentic instance of unwholesome qualities in the order of the Grasses.' On the other hand, it is asserted that very recent researches on the continent have completely established the perfect harmlessness of this grass and of its seed; and the effects which have been ascribed to it must therefore be regarded as proceeding from grain injuriously affected in some way by bad weather.

**DARNETAL**, a town of France, in the department of Seine-Inférieure, about 2½ miles east of Rouen. It is well built, and has two Gothic churches. Situated at the top of a narrow valley, and intersected by two streams, D. possesses unusual facilities for carrying on cloth and other woollen manufactures. Pop. (1872) 5636.

**DARNLEY**, HENRY STUART, LORD, husband of Mary Queen of Scots, the eldest son of the Earl of Lennox by Lady Margaret Douglas, was born in 1546, in England, where also he was educated. He was handsome in appearance, accomplished in manners, but fatally destitute of all moral and intellectual power. D. is interesting chiefly on account of the position which he occupied with respect to his wife. See STUART, MARY.

**DARTER** (*Plotus*), a genus of birds very nearly

Darter (*Plotus Anhinga*).

allied to Cormorants (q. v.), but having a bill longer than the head, perfectly straight, slender, and

sharp-pointed; and also remarkable for the great length of the neck, which has obtained for them the name of *Snake-birds*. They derive the name D. from darting forward their bill at their prey by means of their long flexible neck. They are very voracious, and eat great quantities of fish, which they swallow entire. They are found in warm climates.

**DARTFORD** (Saxon, *Darentford*), a town in the north-west of Kent, 17 miles east-south-east of London by rail, on the left bank of the Darent, which is navigable for barges. It lies in a narrow valley between two steep hills. Pop. (1871) 8298. It has large corn-mills, cotton and silk printing-works, large powder and paper mills; also manufactures of oil, iron, and machinery. Near D. stood the first rolling, sitting, and wire-drawing mill in England, as well as the first paper-mill, built by Spielman, who died in 1607. Here stand the ruins of a nunnery, founded 1355, by Edward III., with 12 acres of walled orchards and gardens. This king held a tournament here in 1331. Wat Tyler's insurrection, in the reign of Richard II., broke out at D. in 1381. Watling Street, an ancient Roman road, crossed the river here. Near D. Heath are many ancient chalk hollows and pits, with deep shafts leading to numerous chambers and galleries, excavated probably for sepulture, for retreat, or to make use of the chalk.

**DARTMOOR**, a granitic table-land in the south-western part of the county of Devon, remarkable for its wild and rugged scenery, its towering rock-capped hills, the numerous streams that have their source in its boggy soil, and the many cyclopean relics of the aboriginal inhabitants that are scattered over its solitary wastes, where the deep silence is broken only by the sudden flight of the ring-ouzel, the screams of the curlew, or the shrill whistle of the lapwing, dotterel, or stone-plover. D. Proper (or the ancient and royal forest of that name) and its adjuncts, including the outlying common lands that present the same physical features, extend about 20 miles from east to west, and 22 miles from north to south, occupying one-fifth of the entire area of the county of Devon, or more than 130,000 acres. This moorland region, encircled by a natural rampart, moated by deep valleys, has a very considerable elevation above the surrounding country, and culminates in Yes Tor, 2050 feet above the sea-level. Its broken uneven surface has been compared, not inaptly, to 'the long rolling waves of a tempestuous ocean, fixed into solidity by some instantaneous and powerful impulse.'

The most important rivers that rise in Northern D. are the Dart, the Teign, the Taw, the West Ockment or Okement, the Lyd, the Tavy, and the Walkham; while from the swamps of Southern D. spring the Plym, the Yealm, the Erme or Aime, and the Avon, Aven, or Aune.

*Geologically*, D. is formed, for the most part, of granite rock, which has been protruded through the shales, slates, and sandstones of the Devonian system. Large masses of trap occur at White Tor, Cock's Tor, and other localities. Tin, copper, and manganese are found amongst the granite, of which four varieties—common, finer, red, and compact—are distinguished. These, as well as the several kinds of trap-rock, are much used for economical purposes. At Wheal, Duchy, and Birch Tor are productive tin mines. The soil of D. is composed chiefly of peat, which in the bottoms has accumulated in some places to the depth of 25 feet; it rests on a subsoil of fine sand. Many of the well-watered dells and ravines are fertile, while the whole moor affords pasturage for cattle, sheep, and horses. Amongst the mosses and lichens, with which the region

abounds, are the *Lecanora perella* and the *L. tartarea*, or Oudbear Lichen. See **CUDBEAR**. Some years ago, both these lichens were largely exported; and it is said that, from 1762 to 1767 inclusive, nearly 100 tons of the *L. tartarea* were collected from the tors of the moor. Wistman's Wood, a grove of stunted oak-trees, averaging about ten feet in height, is of venerable antiquity. It stands on a rocky declivity about 400 yards in length, and measures less than 100 yards across the widest part. The *ornithology* of D. is more limited than formerly; the progress of cultivation and the preservation of game are driving away the eagle, the bustard, the crane, and the kite, which are now rarely seen. The black-cock is likewise becoming extinct. Dr Moore says: 'The frequenters of the uncultivated parts are now chiefly the sparrow-hawk, the hobby, the goshawk, the hen-harrier, the brown or marsh harrier, and the buzzard.' The *antiquities* of D., as illustrating ancient periods of British history, are worth an attentive study; of these, the Grey Wethers, below Sittaford Tor—a fine specimen of what is usually styled a Druidical circular temple—the vestiges of a large aboriginal village at Grimspound, the cromlech at Drewsteignton, the logan-stones and stone-avenues, the kistvaens, barrows, cairns, rock-pillars, and ancient trackways, whose story the old tors alone could tell, are examples. Many legends and stories of moorland adventure are related; but the most famous is that of the bold hunter, Childe of Plymstock, whose fate Carrington has celebrated in a spirited ballad. See Carrington's Poems, Mrs Bray's *Tamar and Tavy*, and article 'Lost on Dartmoor,' *Chambers's Journal*, vol. i. p. 350.

During the long war with France, consequent on the great Revolution and the career of Napoleon, a prison was erected in the centre of the western quarter of D., at about 1400 feet above the sea-level, for the accommodation of prisoners of war. The first stone was laid on the 20th March 1806, and the building was finished at a cost of £127,000. Prince Town sprang up close by, and soon became a thriving place. The prison is now used as a dépôt for convicts, who are employed in cultivating the adjacent moor.

The castle, manor, and forest of D. were granted by Henry III. to his brother Richard, Earl of Cornwall; and since 1337 A.D. D. has been permanently annexed to the Duchy of Cornwall.

See De la Beche's *Report on the Geology of Cornwall, Devon, and West Somerset* (Lond. 1839); and for a full account of D., *A Perambulation of the Ancient and Royal Forest of Dartmoor, &c.*, by Rev. S. Rowe (Plymouth and Lond. 1856); also *Papers on the Geology, Soil, Botany, and Ornithology of Dartmoor*, by Ed. Moore, M.D., &c., in appendix of the above work.

**DARTMOUTH**, a parliamentary and municipal burgh and seaport, in the south of Devonshire, built in terraces on a steep slope 300 to 400 feet high, on the right bank of the romantic estuary of the river Dart, at a short distance from the sea. D. is 32 miles south-by-west of Exeter. The streets are narrow, and many of the houses very old, with overhanging stories, projecting gables, and wood-carvings. St Saviour's Church, of the 14th c., has a richly sculptured, painted, and gilt stone pulpit, a highly ornamented interior, and a beautifully carved rood-loft. A battery, and the remains of a castle built during the reign of Henry VII., stand at the entrance to the harbour. Pop. (1871) 5338. Many of the inhabitants are engaged in the pilchard and Labrador fisheries. The chief exports are woollens, cider, and barley. D. is a quarantine port of the English Channel, and has a considerable trade with the Mediterranean. In 1869, 1062 vessels, of 75,968 tons, entered and

cleared the port.—At D., in 1190, the Crusaders, under Richard Cœur-de-Lion, embarked for the Holy Land. The French burned the town in the time of Richard I., but were repulsed in a third attack on it in 1404. In the reign of Edward III., D. furnished 31 ships for the siege of Calais. In 1643, Prince Maurice besieged and garrisoned D. for Charles I.; but in 1646, Fairfax stormed and took it. Sir Humphrey Gilbert, who took possession of Newfoundland for Queen Elizabeth, was born here. Newcomen, the inventor of the steam-engine, was an ironmonger here.

DARU, PIERRE ANTOINE NOEL BRUNO, COMTE, author, and also one of the ablest of the first Napoleon's ministers, was born at Montpellier, 12th January 1767, and in his sixteenth year entered the army. In 1791, he was appointed intendant of the army of Brittany; but having the misfortune to speak ironically of the English as 'our friends,' the suspicious revolutionists threw him into prison as a royalist, where he remained till the fall of Robespierre. He spent his time in translating the Odes and Epistles of Horace (*Traduction en Vers des Poésies d'Horace*, 1800). Subsequently, he translated the Satires. In the same year in which his version of Horace appeared (1800), he published *Cleopédie, ou la Théorie des Réputations en Littérature*, a work full of spirit and felicitous turns of thought. His firmness, fidelity, and industry recommended him to Napoleon, who, in 1805, made him a councillor of state, and at a later period, intrusted him with the portfolio of the war-department. After the restoration of the Bourbons, he was made a peer. Thenceforth, he devoted himself exclusively to letters. He died 5th September 1829.—D. was a member of the Institute and of the Academy of Sciences. His writings are numerous. Besides those already mentioned, the chief are *Histoire de la République de Venise* (7 vols. 1819—1821); *Histoire de Bretagne* (3 vols. 1826); his *Eloges*; his examination of the *Génie du Christianisme*; his *Discours sur les Facultés de l'Homme* (in verse); and his *Discours sur la Liberté de la Presse*.—His son, NAPOLEON COUNT DARU, named after the Emperor, was born in 1802, and has had the fortune (strangely enough) to be as much disliked by Napoleon III. as his father was liked by Napoleon I. Some time after the *coup d'état*, to which he had strongly opposed himself, he was placed on the list of the proscribed.

DARWIN, ERASMUS, M.D., an English physician, natural philosopher, and didactic poet, was born 12th December 1731, at Elton, near Newark, in Nottinghamshire; studied first at Cambridge, and afterwards at Edinburgh, where he took his degree; and finally settled in Derby, where he died 18th April 1802. D. had once a great reputation as a physiologist, but his system is, for the most part, inconsequential, baseless, and untenable. At the same time, many of his ideas are original, suggestive, and contain within them the germs of important truths. His strength and his weakness lay in his faculty for seeing analogies in nature. Sometimes he is exceedingly happy in his discoveries, at other times, he is quite fantastical. The same remarks hold good as regards his verse, where, amid the frequent extravagance and incomprehensibility of his notions, there burst forth strains of genuine poetry. D.'s chief works are his *Botanic Garden*, in verse (Lond. 1781); his *Zoonomia, or the Laws of Organic Life* (1793); and his *Phytologia, or Philosophy of Agriculture and Gardening* (1800).

DARWIN, CHARLES, F.R.S., a living naturalist of the highest eminence, was born at Shrewsbury, February 12, 1809. He is the son of Dr Robert W. Darwin, F.R.S., and grandson of Erasmus Darwin

(q. v.). His mother was a daughter of Josiah Wedgwood, the famous manufacturer of pottery. After attending a public school at Shrewsbury for some years, he studied at Edinburgh University for two sessions, and thence proceeded to Christ College, Cambridge, where he took his degree of B.A. in 1831. He now volunteered to go as naturalist in H.M.S. *Beagle*, commanded by Captain Fitzroy, R.N., and started for a survey of South America, and the circumnavigation of the globe, December 27, 1831, returning to England October 2, 1836. His entire life, so far as his health has permitted, has been devoted to scientific researches. D., who is a fellow of the principal scientific societies, has obtained the Royal Society's medal, and the Wollaston medal of the Geological Society.—His earliest well-known work, *The Voyage of a Naturalist* (2d ed. 1845), is a most interesting and beautifully written work. In 1839 was published his *Journal of Researches into the Geology and Natural History of the various Countries visited by H.M.S. Beagle*; in 1840—1843, the *Zoology of the Voyage of H.M.S. Beagle*, published by government, to which D. contributed the introduction, and many of the notes; in 1842, *The Structure and Distribution of Coral Reefs*; in 1844, *Geological Observations on Volcanic Islands*; and in 1846, his *Geological Observations on South America*. He has also written many papers in the *Transactions of the Geological Society*. In 1851—1853, appeared his valuable *Monograph of the Cirrepedia*; and in 1859, D.'s name became 'familiar as a household word' to the mass of educated and semi-educated Englishmen, through the publication of his work, *The Origin of Species by means of Natural Selection, or the Preservation of Favoured Races in the Struggle of Life*. In the *Origin of Species*, D. contends that the various species of plants and animals, instead of being each specially created and immutable, are continually suffering change through a process of adaptation, by which those varieties of a species that are in any way better fitted for the conditions of their life survive and multiply at the expense of others. So potent and universal does this process of natural selection seem to be, that D. considers it capable, with other less important causes, of explaining how all existing species may have descended from one or a very few low forms of life. This theory has excited controversies which are not yet laid to rest; but it has been embraced by many of the ablest naturalists, and has already induced great changes in the methods of biology and kindred sciences. See SPECIES. D. has since written, *Fertilisation of Orchids* (1862); *Variation of Plants and Animals under Domestication* (1867); *The Descent of Man and Selection in relation to Sex* (1871); and *Expression of the Emotions in Man and Animals* (1873). D. has supported his views with a vast amount of accurate information, and has invariably expressed them with caution and courtesy.

DARWIN MOUNT AND SOUND are on the south-west side of King Charles's South Land, the largest of the three principal islands which together constitute Tierra del Fuego, at the southern extremity of America. The mountain is nearly 7000 feet above the level of the sea.

DASHKOV, PRINCESS EKATERINA ROMANOVA, a celebrated Russian lady, daughter of Count Vorontsov, was born 1744, and from her earliest youth received a careful training. Her great desire was to obtain, by a solid study of the Greek and Latin languages and history, an insight into the spirit of antiquity. She was an intimate friend of the Empress Catharine II., and one of the heads of the conspiracy formed against Peter III., the success of

which secured the throne to Catharine. Her conduct in this dangerous affair was, in truth, quite Amazonian; she rode forth in uniform at the head of a part of the troops whom she had instigated against Peter; but soon afterwards quarrelled with Catharine, because the latter would not gratify her desire to be made colonel of the Imperial Grenadiers. She now removed from the court, obtained permission to travel, and visited Germany, England, France, and Italy, where she made the acquaintance of many learned men (among others, Garrick, Dr Blair, and Dr Robertson, with the last of whom she wished to place her son for the purpose of being educated), and in 1782 returned to St Petersburg. The empress and she were reconciled to each other, and the princess was appointed Director of the St Petersburg Academy of Arts and Sciences; and in 1783, President of the Russian Academy, established at her own suggestion in imitation of the French *Académie*. On the death of Catharine in 1796, she was deprived of her offices, and ordered by Paul III. to retire to her estates at Novgorod. She died at Moscow, 4th January 1810. Besides several comedies and occasional magazine-papers, the Princess D. was mainly instrumental in inducing the Russian Academy to draw up a dictionary of the Russian language. This work was completed in twelve years. The princess herself assigned the various letters of the alphabet to different scholars, took three herself, and superintended the execution of the whole. Her very interesting memoirs were published by Mrs W. Bradford (2 vols., Lond. 1840).

DASYŪRE (*Dasyurus*), a genus of carnivorous marsupial quadrupeds, nearly allied to the opossums; but differing from them in having only eight incisors in the upper, and six in the lower jaw, and only twelve molars in each jaw; also in their tail being everywhere covered with long hairs, and not prehensile; in the hinder thumb being reduced to a mere tubercle, or wanting; and in the important anatomical character of the want of a cæcum. All the species are Australian. The URSINE D., or Ursine Opossum (*D. ursinus*), was very abundant in

Ursine Dasyure (*D. ursinus*).

the north of Van Diemen's Land, when first colonised, and very destructive to sheep and poultry. It is about the size of a badger, of a stout form, with a tail half as long as the body; the body and tail covered with coarse black hair, marked with white bands. It burrows in the ground. It is very untamable. The Spotted-tailed D. (*D. macrourus*) is about as large as a cat, has a tail fully as long as the body, is of a rich brown colour with white spots, and as well as a rather smaller species (*D. Maugii*), the wild cat of the colonists, is very destructive to poultry in Van Diemen's Land.

DATE (Lat. *datum*, given), the precise time at

which a document was written, or an event happened. The importance of accurately ascertaining the date of an event or writing is very obvious, but the difficulty which there may be of doing so is not so apparent. It might be thought, for example, that, at least in modern times, where the day of the month and year are authoritatively set down, there can be no room for any further question; but it is not so. If, for instance, we refer to a newspaper of the reign of Queen Anne, we shall see the *Amsterdam Gazette* of the 22d February translated in the *London Gazette* of the 13th February, and abridged in the *Edinburgh Courant* of the 19th February, all of the same year, 1705. And this is but one of several seeming inconsistencies or contradictions of the same sort.

In the first place, the difference of the two styles by which dates are reckoned may cause a discrepancy of ten, of eleven, or of twelve days, according to the century to which the date belongs. Until 1582, there was but one style or calendar throughout Europe; but in that year, Pope Gregory XIII. introduced the 'new style' or 'Gregorian calendar,' which at once corrected the long accumulated errors of the old method of computing time, by declaring the 5th to be the 15th of October 1582, or, in other words, by striking ten days out of the almanac of that year. The new style was adopted generally in Roman Catholic countries. Most Protestant countries, on the other hand, continued for a longer or shorter period to use the 'old style,' or 'Julian calendar.' It is necessary, therefore, in dealing critically with dates after 1582, to ascertain what 'style' was in use at the time and place in question. This, in not a few cases, may call for some inquiry; but generally, the following table will serve to shew when the chief states of Europe adopted the new style:

Year.	Country.
1582.	Great part of Italy, France, Lorraine, Portugal, Spain, Holland, and the greater part of the Netherlands.
1584.	The Roman Catholic parts of Germany and of Switzerland.
1586.	Poland.
1587.	Hungary.
1682.	The city of Strasburg.
1700.	The Protestant parts of Germany and of Switzerland, Guelders, Zutphen, Utrecht, Friesland, Groningen, and Overysse.
1749 or } 1751. }	Tuscany.
1752.	Great Britain and Ireland.
1753.	Sweden.

In Russia and Greece, the old style is still followed, and it obtains generally in the East. Thus, what was the 12th January 1861 at Paris and London, was the 31st December 1860 at Athens and St Petersburg.

But difference of style is not the only cause of perplexity in dates. Countries using the same style, and therefore agreeing as to the day of the month, may differ as to the year to which they refer an event. Thus, the beheading of King Charles I. was reckoned, both in England and in Scotland, to have taken place on the 30th of January; but while England held the year to be 1648, Scotland held it to be 1649. The cause of this discrepancy was the difference which obtained as to the beginning of the year. By the English, the year was held to begin on the 25th of March; by the Scots, on the 1st of January. It becomes necessary, therefore, in considering dates, to keep in view not only the style which was used, but the day on which the year was accounted to commence. There was much variation in this respect, not only between one country and another, but even in the same country as between one time and another, as well as between its different

provinces at the same time. The new years' days most commonly used were the Nativity or Christmas (25th December), the Circumcision (1st January), the Annunciation or Lady Day (25th March), and the Resurrection or Easter. The 1st of January was adopted as the commencement of the year by France in 1563, by Scotland in 1600, by England in 1752. In this last country, the inconvenience of dating by a different year from most of the other great European states had been so generally felt, that for some time before the new mode of computation was sanctioned by act of parliament, dates falling between 1st January and 24th March were commonly expressed in both ways, thus: 2d February 1706, or 1706-7, the lower or last figure indicating the year according to the present reckoning.

Hitherto, we have spoken of dates where both the year and the day of the month are set down in figures. But in ancient writings, even where the year is expressed in figures, nothing is more common than to indicate the day of the month only by reference to some festival or other peculiarity in the service of the church. Thus, an English letter of the latter part of the 15th c. is dated in this way: 'Written at Paston, in haste, the Wednesday next after *Deus qui errantibus*;' that is, the first Wednesday after the third Sunday after Easter, on which day that portion of the church service which is called the *introit* begins with the words *Deus qui errantibus*. So, again, as late as the year 1610, the battle of Weissenburg, near Prague, is described by the contemporary chroniclers as having been fought 'upon the Sunday on which the church sings *Reddite quæ sunt Cæsaris Cæsari*;' that is, the 22d Sunday after Pentecost, which, in the year referred to, fell upon the 8th of November. A still more common way of dating was by reference to a saint's day. Thus, the English parliament which met at Westminster on the 6th October 1399, is described in the contemporary record as meeting 'on Monday, the Feast of St Faith the Virgin;' and the Scottish parliament which met at Scone on the 3d December 1318, as meeting 'on the Sunday next after the feast of St Andrew the Apostle.' In order, therefore, to interpret all this class of dates—and it is a very large one—recourse must be had to the calendar and service books of the church, or to the 'glossaries of dates' and 'catalogues of saints' days' which antiquaries have compiled from them.

For centuries, it was more common to date by the year of the king's reign than by the year of our Lord. The risk of error in reducing this way of computation to that now in use is such, that in Rymer's *Pœdera*, a great collection of English state papers, printed at the public expense, in the beginning of the 18th c., many documents of all the reigns from Richard I. to Edward IV. are misplaced by a whole year. These mistakes arose chiefly from insufficient inquiry as to the day from which the king dated his reign. This was assumed to be from the day of his predecessor's death, but in point of fact the early English sovereigns dated their reign only from the day of their coronation. Where a date, therefore, has to be ascertained by reference to a regnal year, it becomes necessary to make sure not only of the time when the king came to the throne, but of the very day from which he reckoned his reign. In the case of the popes of Rome, this inquiry is at once more than usually necessary, and more than usually troublesome, inasmuch as, until comparatively recent times, scarcely any two of them in immediate succession dated or computed on the same principle. Not a few of them, indeed, adopted different computations at different times of

their reign. Thus, Pius II., during his pontificate of six years (1458—1464), commenced the year sometimes on the 25th December, sometimes on the 1st January, and sometimes on the 25th March. Some popes, again, dated from the day of their election; others, from the day of their consecration or coronation. Nor is it only in interpreting regnal years into modern chronology that there is a chance of error; there is proof that occasionally the regnal years were wrongly computed at the time, by the kings themselves, or rather by the officers who wrote their charters. Thus, for example, it has been discovered that from the time that King David II. of Scotland returned from captivity in 1357, the year given as that of his reign is one year short of the truth. In dealing with regnal years, there is yet another risk of mistake to be guarded against. Until the 16th c., it was not common for kings to distinguish themselves by numbers from their predecessors of the same name. In order, therefore, to discriminate one from another, charters or other deeds of the English Henries and Edwards, or the Scottish Roberts and Jameses, recourse must be had to such tests as the character of the writing, its seal, its style and language, and above all, the names of the persons enumerated in it.

With no other help than is to be gained from such tests, the antiquary is often called on to fix the date of a charter, containing no reference to the year of our Lord, the year of the king's reign, the year of the pope's pontificate, or any other measure of time. If the persons mentioned in the deed be men of note, he may be able to ascertain its date to a year, a month, or even a day; on the other hand, if they are obscure, he may be unable to reduce the date within a narrower range than 50 or even 100 years.

The skill of the antiquary is not infrequently put to the proof in another way. Dates were often recorded by reference only to an event of the time. Thus, one leaf of the Scottish statute-book contains two acts of parliament, with no more explicit record of their date than that the one was passed 'at Aberdeen in Lent next after the coming in Scotland of Vivian the Legate of the Apostolic See;' and that the other was passed at Stirling 'on the Monday next before the feast of St Margaret the Maiden next after the first coronation of Philip king of the French.' An examination of contemporary chronicles fixes the date of the one statute to 1177; of the other, to 1180.

In order to facilitate the discovery and rectification of dates, various elaborate works have been published. By far the most important—*L'Art de Vérifier les Dates des faits Historiques, des Chartes, des Chroniques et autres Monuments*—is due chiefly to the labours of the Benedictines of St Maur. The best edition of this admirable work is that of Paris, in eight folios, the first three containing the period from the birth of Christ till the year 1770, being published in 1783—1787; the fourth, containing the period before the birth of Christ, in 1820; and the last four, continuing the work from 1770 downwards, in 1821—1838. A reprint of this edition, in 42 octavos, appeared at Paris in 1818—1844. Of the other French works, it will be enough to name two—the *Nouveau Traité de Diplomatique*, also by the Benedictines of St Maur (Par. 1750—1765, in 6 vols. 4to), and the *Eléments de Paléographie*, par Nat. de Wailly (Par. 1838, in 2 vols. 4to). The best English work is *The Chronology of History*, by the late Sir Harris Nicolas, published in Lardner's *Cabinet Cyclopædia*. It has passed through two editions; the last bears the date of 1838.

DATE OF DEED. See DEED.

DATE PALM—DATE PLUM.

**DATE PALM** (*Phoenix*), a genus of palms, the most important species of which is the common **DATE PALM**, the *Palm Tree* of Scripture (*Ph. dactylifera*), a native of the northern half of Africa, the south-west of Asia, and some parts of India, and which has also been brought into cultivation in the south of Europe, and might certainly be introduced with advantage into the south of the United States, and many warm parts of America and Australia. The stem, which is straight and simple, reaches a height of 30–60 feet, and bears a head of 40–80 glaucous pinnated leaves, of 8–10 feet long, with lanceolate acuminate leaflets, very much closed up, and a number of branching spadices, each of which on the female tree bears in general 180–200 fruits (dates, *dactyli*). A bunch of dates weighs 20 or 25 pounds. This is one of the most important and useful of all the palms, and is indispensable to millions of the human race, on account of the supply of food which it affords them. In Egypt and the other countries on the north coast of Africa, in Persia, and in Arabia, dates form the principal food, and date palms the principal wealth, of the people. The fleshy part of the fruit contains 58 per cent. of sugar, accompanied by pectin, gum, &c. The main ingredient, therefore, in a dietetic point of view, is the sugar. The fruit is eaten either fresh or dried, and in the latter state becomes an article of commerce. Cakes of dates pounded and kneaded together, and so solid as to be cut with a hatchet,

Date Palm.

are the store of food provided for African caravans on their journey through the Sahara. A liquor resembling wine is made from dates by fermentation, and also a kind of vinegar. In Persia, an ardent spirit is distilled from dates. The soft pith at the summit of the palm stem, along with the young leaves not yet unfolded, are eaten under the name of *palm cabbage*, and the undeveloped panicles of flowers also form an article of food to the Persians and Arabs. The liquor called *palm wine* is prepared by fermentation from the sap of the palm, the top being cut off, and a hollow scooped out, in which the sap collects. Three or four quarts are obtained daily from a single palm for ten days or a fortnight. The quantity afterwards diminishes, till the tree becomes quite dried up. Many of the inhabitants of North Africa use the roasted date stones or seeds as a substitute for coffee, for which purpose the seeds of the *Phoenix reclinata* are also employed in the south of

Africa. The seeds or stones of dates are in many places ground for the sake of the oil which is afterwards obtained from them by expression, and the remaining paste or cake is given as food to cattle. From leaf-stalks of the common D. P., all kinds of basket and wicker work are also made, and walking-sticks, fans, &c. The leaves themselves are made into bags, mats, &c.; the fibres of the web-like integuments at the base of their stalks into cordage. The wood is used for building, fences, &c.—The **TODDY PALM** of the north of India, or Wild Date Palm (*Ph. sylvestris*), so nearly resembles this species, that it is doubtful if it is distinct. In some places, the trees present a curiously distorted and zigzag appearance, from the practice of yearly tapping the alternate sides for the sap or *toddy*. The incision is just below the crown, and slopes upwards and inwards; a vessel is hung below the wound, and the juice conducted into it by a little piece of bamboo. It forms a grateful and wholesome beverage; readily also fermenting into palm wine, and by distillation yielding *Arrack* (q. v.); whilst if boiled down without being allowed to ferment, it yields the saccharine sirup called *jaggery*, from four pounds of which one pound of sugar is obtained, a single tree producing about seven or eight pounds of sugar annually. The operation of tapping for toddy spoils the fruit of the tree, which is small and much inferior to the African date. It is, however, eaten.—Another species, *Ph. paludosa*, the most gregarious of Indian palms, growing only six or eight feet high, covers the whole landscape of the Sunderbunds with the liveliest verdure. *Ph. acutis*, *Ph. farinifera*, and *P. spinosa*, are three other closely allied species; the first grows in the driest soils in the damp valleys of the Himalaya to 5000 feet above the sea. All three are dwarf species.

**DATE PLUM** (*Diospyros*), a genus of plants of the natural order *Ebenaceæ*, consisting of deciduous trees, whose fruit is a globose berry, natives of warm or temperate climates. The black heart-wood of some species is **EBONY** (q. v.), and the hard timber of others is known as **IRONWOOD**. Some are valued for their fruit. The **COMMON DATE PLUM**, or **PISHAMIN**, also called the **EUROPEAN LOTUS** and the **DATE OF TREBISOND** (*D. Lotus*), is a tree of 20–40 feet in height, with oblong shining leaves and small reddish white flowers, a native of the coasts of the Caspian Sea, Mauritania, &c., but cultivated and naturalised in the south of Europe. Its fruit is of the size of a cherry, and in favourable climates larger, yellow, sweet, and astringent. It is eaten when overripe, like the medlar, or is used for preserves. The tree bears fruit abundantly in the neighbourhood of London, but is somewhat tender in the climate of Britain, and its fruit more austere than in more southern regions. This fruit has been supposed by some to be the *Lotus* (q. v.) of the Lotophagi. The **VIRGINIAN DATE PLUM**, or **PERSIMON** (*D. Virginiana*), is a tree of 30–60 feet high, with ovate oblong leaves and pale-yellow flowers, a native of the southern states of North America, where one tree often yields several bushels of fruit. The fruit is about the size of a bullace, reddish, with six to eight oval seeds. It is not palatable till mellowed by frost, and is sweet and astringent. A kind of beer or cider and an ardent spirit are made from it.—The *Mabola* (*D. Mabola*) is cultivated as a fruit-tree in the Isle of France. Its fruit is about the size of a quince, and has a very agreeable flavour.—The *Kaki* (*D. Kaki*), sometimes called the **KEG-RIG**, is a Japanese tree, sometimes kept in green-houses in France and England. The sweetmeat called *Figues-cayes* is made from this fruit in France. The fruit resembles a plum. It is occasionally brought

from China as a dried sweetmeat.—The fruit of some other species of *Diospyros* is also edible, as that of *D. decandra*, a large yellow berry, which, notwithstanding a disagreeable smell, is sold in the markets of Cochin-China.

**DATHOLITE**, a mineral of a grayish or greenish white colour, occurring both massive and crystallised in rhombic prisms, the edges and angles of which are cut off by planes. It is composed of boracic acid, silica, and lime, with a little water. It has been found both in gneiss and in trap rocks. The Salisbury Crags and Corstorphine Hill, near Edinburgh, are localities for datholite.

**DATISCA'CEÆ**, a small natural order of plants, allied to *Begoniaceæ*, and consisting of herbs and trees, chiefly natives of the temperate parts of the northern hemisphere. *Datisca cannabina*, a plant much resembling hemp in its general appearance, a native of Crete, possesses very marked tonic properties. It contains also an amyaceous substance, called *Datiscin*, resembling inulin. It affords a yellow dye.

**DATIVE**. See DECLENSION.

**DATURA**. See THORN APPLE.

**DAUBENTON, LOUIS JEAN MARIE**, a French naturalist, was born at Montbar in Burgundy, 29th May 1716. His father wished him to be an ecclesiastic, and sent him to acquire a knowledge of theology at the Sorbonne in Paris, but D. had no inclination for this study, and gave himself up to that of medicine and anatomy. In 1741, after he had taken his degree at Rheims, he returned to Montbar to practise his profession. In the following year, however, his old school-fellow, the Comte de Buffon, induced him to come to Paris, and assist him in the preparation of his great work on Natural History. For this office, D. was admirably qualified. The sobriety of his understanding, the scrupulous care with which he pursued the smallest investigations, his perseverance and industry, were in complete contrast to the impatient spirit and rapid generalising of his brilliant coadjutor, and enabled him to correct and moderate some of Buffon's hasty theories, as well as to substantially enrich the work with a multitude of new and important facts relative to the anatomy of animals. Unfortunately, Buffon, who was exceedingly jealous, allowed himself to be influenced unfavourably in regard to D., on account of the high estimation in which the Parisian savans generally held the latter. The result was an estrangement between the two friends (who were, however, ultimately reconciled), and science suffered severely in consequence. D., who had contributed richly to the first 15 volumes of the *Histoire Naturelle*, ceased to have further connection with the work, and the subsequent labours of Guéneau, de Montbéliard, Bexon, and Sonnini, but ill supplied the want which his absence created. D. now devoted himself almost entirely to his duties in the *Jardin du Roi*, in which he held an appointment. In 1778, he was made Professor of Natural History in the College of Medicine. During the Revolution, the Convention also appointed him Professor of Mineralogy in the Museum of Natural History. He died 1st January 1800.

Besides his labours in connection with the *Histoire Naturelle*, D. contributed largely to the first *Encyclopédie*. In the Memoirs of the Académie des Sciences, and in those of the Société de Médecine, are to be found a multitude of his most interesting and valuable papers on natural history and mineralogy. Cuvier composed a notice of D.'s life and works for the Memoirs of the Institute.

**DAUBENY, CHARLES GILES BRIDLE, M.D.**,

late Professor of Botany and Chemistry in the university of Oxford, devoted himself chiefly to the elucidation of natural phenomena by the aid of chemical science. His attention was at an early period directed to the chemistry of volcanic action, and one of his first productions was *An Essay on the Geological and Chemical Phenomena of Volcanoes* (Oxford, 1824), which was followed by his great work, *A Description of Active and Extinct Volcanoes* (Lond. 1826). It applies in a remarkable manner the principles of chemistry to the phenomena produced by volcanic changes. To the examination of mineral and thermal springs, a subject closely allied to that of volcanic investigation, D. also applied himself. In 1837, he visited America for scientific purposes, and published the results of his observations in two volumes, *Notice of the Thermal Springs of North America* (1838), and *Sketch of the Geology of North America*. Italy and Auvergne, on account of their volcanic phenomena, attracted the notice of D., and largely employed his pen. He published largely in the 'Transactions' of various scientific societies. His *Introduction to the Atomic Theory* (1831), *Lectures on Agriculture* (1841), and *Lectures on Climate* (1862), are very valuable. D. died December 12, 1867.

**DAUCUS**. See CARROT.

**DAULATABAD**. See DOWLATABAD.

**DAUMIER, HENRI**, a celebrated French caricaturist, was born at Marseille in 1810. Fashion, tittle-tattle, scandal, politics, blemishes of figure, and oddities of character have in turn inspired his inexhaustible genius for mockery. Few among his illustrious contemporaries have escaped his pencil, and the worst of it is, that his caricatures have always some strikingly truthful feature about them. D. made his *début* in the *Charivari*, in a series of sketches from *Robert Macaire*, after which followed *Les Actualités*, *Les Divorceuses*, *Les Femmes Socialistes*, *Les Philanthropes du Jour*, *Les Grecs*, *Les Gens de Justice*, *Les Bons Bourgeois*, *Les Pastorales*, and *Les Papas*. The revolution of 1848 suggested two of his most remarkable series—*Idylles Parlementaires*, and *Les Représentants représentés*. D. is one of the contributors to the *Charivari*. He has been called by French critics the *Aristophanes* and the *Paul Louis Courier* of caricature.

**DAUN, LEOP. JOS. MARIA, GRAF VON**, commander-in-chief of the imperial troops during the Seven Years' War, was the son of Wirlich Philipp Lorenz von Daun, a distinguished officer in the Austrian service, and was born at Vienna 25th September 1705. Entering his father's regiment, he acquired no inconsiderable reputation during the Turkish campaigns, 1737—1739. The Austrian Wars of Succession also afforded him many opportunities of displaying that combination of valour and prudence for which he was famous. After the peace with Prussia in 1745, D. became Master-general of the Ordnance, fought against the French in the Netherlands, 1746—48, and in 1754 received the dignity of field-marshal. Before this, he had, in spite of many obstacles, introduced into the imperial army a new military system, and reorganised the Military Academy at Vienna. At the commencement of the Seven Years' War, he commanded the army of Moravia in 1757, and neutralised the defeat of the Austrians under General Broune near Prague, by driving Friedrich II., who had beleaguered that city, as far as Collin, and forcing the king, after a hard-fought battle, to evacuate Bohemia. On the 14th of October 1758, he gained another victory over Friedrich at Hochkirch, and but for the too late arrival of the Prince of Baden-Durlach with

reinforcements, would probably have annihilated the Prussian army. On the 25th of November 1759, at Maxen, he compelled Fink, the Prussian general, with 11,000 men, to surrender. After this, however, he gained no important successes. Friedrich began to understand his tactics, and to conduct his campaigns accordingly. D. died 5th February 1766.

DAUNG, a tract within the limits of the presidency of Bombay, contains 950 square miles and 70,300 inhabitants, extending in N. lat. from 20° 22' to 21° 5', and in E. long. from 73° 28' to 73° 52'. It is subdivided into several petty states, the whole being under one feudal chief, who is styled the Rajah of Daung. The country is valuable principally on account of its teak-forests, which are rented by the British government.

DAUPHIN (Lat. *Delphinus*), formerly the title of the eldest son of the French king, was originally that of the sovereign lords of the province of Dauphiné. The last of these, Humbert II., dying childless (1349), bequeathed his possessions to Charles of Valois, grandson of Philippe VI. of France, on condition that the heir-apparent to the throne of France should bear the title of D. of Vienne, and govern the province. Louis IX. conferred on the D. almost sovereign rights; but after his time these were gradually abridged, until Dauphiné was placed under the same laws as the rest of the kingdom, and the title became merely honorary. After the revolution of 1830, it was abolished altogether.

DAUPHINÉ, formerly a frontier province in the south-west of France, now comprises the departments Drôme, Isère, and Hautes Alpes. After the fall of the Roman empire, D. formed the southernmost part of the kingdom of Burgundy. It then passed under the dominion of the Franks, and after the dismemberment of the Carolingian monarchy, it became a portion of the new Burgundian kingdom of Arles. It then passed by legacy into the possession of the German emperor in 1032, and remained united with Germany till the middle of the 14th c., when it was presented to France by the last of the lords of Dauphiné. See DAUPHIN. The old rulers of the land bore the title of Dauphin (a title which probably originated in their having the figure of a *dolphin* for their crest), and the name was afterwards transferred to the district.

DAUPHIN'S CROWN is a circle of gold set round with eight fleurs de lis, closed at the top with four dolphins, their tails conjoined in a fleur de lis.

DAUW (*Equus Burchellii*), a South African quadruped, which may be regarded as intermediate between the zebra and the quagga, and is sometimes called the *Zebra of the Plains*, and by the Cape colonists the *Bonte Quagga*, or *Striped Quagga*. In the language of the Bechuanas, it is called *Peetsi*. It is found in numerous herds in the wide plains north of the Orange River, is rather larger than the zebra, and of more robust figure; of a light bay colour, the belly, legs, and tail white; the face, head, and body striped with black; the tail is tufted to near the root. The hoofs are much less concave beneath than those of the zebra, and are thus adapted to the plains, as those of the zebra are to the rough surface of the mountains. The D. is less easily domesticated than the quagga, but more so than the zebra.—This, or a very similar species, is found as far northwards as Congo and the Galla country.

D'AVENANT, SIR WILLIAM, an English poet and playwright, was born in the year 1605 or 1606 at Oxford, where his father kept the Crown Inn, a house at which Shakspeare was in the habit of stopping when on his journeys between London and

Stratford. D., while still a child, had a great admiration for Shakspeare, and when only ten years of age, on the occasion of Shakspeare's death, the precocious boy penned an ode *In Remembrance of Master William Shakspeare*. He began to write for the stage in the year 1628, and ten years after, on the death of Ben Jonson, he was appointed poet-laureate. He afterwards became manager of Drury Lane Theatre, but entering into the intrigues of the civil war, he was apprehended, and cast into the Tower. He escaped, however, to France, and returning, distinguished himself so much in the cause of the royalists, that he was knighted by Charles after the battle of Gloucester. D. a second time got into difficulties, and was confined in the Tower for two years, when he was released, as is said, on the intercession of Milton. Once more free, he set about establishing a theatre, and succeeded. After the Restoration, he was favoured by royal patronage, and continued to write and superintend the performance of plays until his death, April 7, 1668. D.'s epic, entitled *Gondibert*, a poem of about six thousand lines, is now almost wholly forgotten.—CHARLES D'AVENANT, son of the preceding (b. 1656. d. 1714), distinguished himself as a writer on political economy and finance. His chief works are—*An Essay upon Ways and Means of Supplying the War* (1695); *Discourses on the Public Revenues and the Trade of England* (1698); *A Discourse upon Grants and Resumptions* (1700); *An Essay upon the Balance of Power; The Right of making War, Peace, and Alliances* (1701); *Essays upon Peace at Home and War Abroad* (1704), &c. A selection of his works was published in 1771 by Sir Charles Whitworth, afterwards Earl Whitworth.

DA'VENTRY, an ancient municipal borough in the west of Northamptonshire, at the sources of the Avon and Nene, 13 miles west of Northampton, and near the Birmingham Railway, Grand Junction Canal, and Watling Street. It is well built on an eminence, and has two principal streets. Pop. (1871) 4051. The chief manufactures are shoes and whips for export. D. was occupied by Charles I. in 1645, before the battle of Naseby. A mile to the east of D. on Dane's or Borough Hill, is a foot-shaped Roman camp, supposed to be Ben-avenna, one of the largest in the kingdom. Near it is one of an acre in extent.

DA'VID (Heb. 'Beloved'), king of Israel, the ninth and youngest son of Jesse, belonged to the tribe of Judah, and was probably educated in one of the schools of the prophets. He first publicly signalled himself by slaying Goliath of Gath, a gigantic Philistine, who had 'defied the armies of Israel.' Previously, he had acquired a considerable reputation as a skilful harper, and had subdued by his music the paroxysms of insanity which afflicted Saul at certain seasons. By Samuel he was anointed king during the lifetime of Saul, who soon began to regard him as a dangerous enemy, and persecuted him. A kind of intermittent war between the two was the consequence, in which D. was often reduced to great straits. At first, he was simply in the position of a guerilla chief, and his comrades were mainly persons in desperate circumstances—'all who were in distress, in debt, or discontented.' Latterly, he lived among the Philistines as one of themselves, and from the Philistine prince of Gath obtained a present of the strong fortress of Ziklag, after which he was joined by a class very different from his original outlaws—men of consideration, and tried warriors, from various tribes. The contest between him and Saul now assumed the dignity of a civil

war. It was only closed by the death of the latter, whereupon D. ascended the throne of Judah, with the city of Hebron as his capital. The other tribes elected Ishbosheth, a son of Saul, to be their king, after whose murder D. first acquired possession of the entire kingdom, over which he ruled from 1055 until his death in 1015 B.C. His first undertaking in his new office was a war against the Jebusites. He took their chief city, Jerusalem, and made it his residence, as also the centre of the religious worship of the Hebrews. Subsequently, he subjugated the Philistines, Amalekites, Edomites, Moabites, Ammonites, and, after a long war, the Syrians. His kingdom now stretched from the Euphrates to the Mediterranean, and from Syria to the Red Sea, and contained a population of 5,000,000. He fostered navigation and trade, especially with Tyre, and sought to instruct the Hebrews in the arts. No less careful was he of the religion of his countrymen. He divided the priests and Levites into classes, and appointed sacred singers and poets for the musical service of God. Law and justice likewise received improvements at his hands, through the institution of higher and lower judiciary courts, while he secured the stability of his power by the formation of a standing army. Besides this, there were twelve governors over the tribes of Israel, 'who may perhaps be compared to the lord-lieutenants of English counties.' D. was not, however, without his trials. Two conspiracies were formed against him in his own family, and although both failed, they greatly embittered his life. His sensual excesses also drove him into acts of criminality, the memory of which haunted him for ever. 'My sin is continually before me.' Yet we cannot help recognising in the man, in spite of all his errors and sins, a sincerity of moral feeling rarely equalled in history. His passions might lead him astray, but they never blinded his conscience. The crime once committed, D. never tried to find excuses for it, and so blunt the edge of his deserved misery. The psalms which he has left reveal to us the naked soul of the royal poet wrestling with a host of black troubles, fears, and doubts, out of which, however, as from the seething bosom of chaos, there emerges at last a 'full-orbed faith,' made perfect by suffering and much tribulation. There has never been trust in God more clear, unwavering, and tender than that expressed in the 23d Psalm. It is this many-sided experience of life that has made the 'Psalms of David' (though it is uncertain who made the collection, which contains many not written by David himself) the most precious heritage of the afflicted and tried in all ages of the Christian Church.—By those theologians who look upon Jewish history as having a *typical* or *allegorical* meaning as well as a literal one, D. is regarded as a type of Christ.

DAVID I. (often called St DAVID), king of Scotland, was the youngest of the six sons of King Malcolm Ceanmohr, by his second wife, the Anglo-Saxon princess, St Margaret (q. v.). He was born about the year 1080. During the fierce struggle for the Scottish crown, which followed the death of his father in 1093, the youthful D. seems to have found refuge in England, along with his sister, Eadgyth or Matilda, who, in 1100, married Henry I., king of England. The residence of D. at the court of this accomplished monarch would appear to have been prolonged for several years, and the assertion of a contemporary English annalist may well be credited, that 'it freed him from the rust of Scottish barbarity.'

In 1107, his elder brother, Alexander, succeeded to the throne, and D. became Prince of Cumbria, a territory which comprised what are now the

shires of Cumberland, Dumfries, Roxburgh, Selkirk, Peebles, Lanark, Dumblarton, Renfrew, and Ayr, and was held of the English king by the heir of the king of the Scots. Along with this great principality, he seems to have held lands in Lothian; and by his marriage in 1110 with Matilda, widow of the Earl of Northampton, he acquired possession of that earldom, together with a claim to the rest of the vast domains of her father, Waltheof, Earl of Huntingdon, of Northampton, and of Northumberland. The first act of D., as Prince of Cumbria, was to restore the fallen bishopric of Glasgow, which he committed to the charge of his old preceptor, John. His next act was to bring a colony of Benedictine monks from the newly founded monastery of Tiron, in France, and to plant them beside his forest castle of Selkirk. This was in 1113; and even thus early, as his charters shew, he had gathered round him the Bruces, the Lindsays, the Morvilles, the Umiravilles, the Percies, the Riddels, and other Anglo-Norman knights, through whose help he was to effect such a momentous change in Scotland.

In 1124, he succeeded to the Scottish throne, on the death of his brother, King Alexander I. That prince had had to fight for his crown against the heirs of the old Celtic dynasties, supported by the wild tribes of the north and the west. They renewed the struggle with his successor, first in 1130, when they advanced almost to the gates of Brechin; and again about twenty years later, when they appear to have been encountered on the plains of Murray. On both occasions, the Anglo-Norman chivalry with which D. had garrisoned the southern provinces, gave him decisive, but far from easy victories. He was less fortunate in his wars beyond the Tweed. In 1127, he had sworn, along with the other great barons of England, to maintain the right of his niece, Matilda, as heir of the English crown, should her father, Henry I., die without male issue of his own body. The event thus contemplated came to pass in 1135; and when Stephen mounted the English throne, D. took arms in behalf of Matilda, and subdued almost all the country to the south of Durham. Peace was restored by the grant of the earldom of Huntingdon, and the promise of the earldom of Northumberland, to D.'s son Henry, then in his 20th year. But the war was soon resumed; and in 1138, the king of Scots, deserted by Bruce and others of his Anglo-Norman vassals, was signally defeated in 'the Battle of the Standard,' near Northallerton. The next year, a second peace was concluded between the two kings, when the promised earldom of Northumberland was bestowed on D.'s son Henry. In 1141, the Scottish king marched into England for the third time to assert the rights of Matilda. He was a third time defeated, and only regained his own country with difficulty.

The rest of his reign was devoted to the accomplishment of the great revolution which had been begun by his father, King Malcolm, and his mother, St Margaret, and continued by his brothers, King Edgar and King Alexander—the establishment in Scotland of the civilisation which obtained in England. By building castles, he secured the peace and safety of the country; by erecting burghs, he promoted its trade, shipping, and manufactures, and laid the foundations of its freedom; by endowing bishoprics and monasteries, he provided homes for the only men of learning and enlightenment known in his time. His descendant, King James I., standing by his tomb in Dunfermline, is said to have complained that 'he was ane sore sanct for the crown;' but the remark, if it was ever made, would only shew that the sloth and ignorance of the clergy

in the 15th c. had blotted out the remembrance of the great services which they rendered to mankind in the 12th c., when they were the schoolmasters, the statesmen, the lawyers, the physicians, the bankers, the engineers, the artists, the builders, the glaziers, the agriculturists, and the gardeners of the age. One who was a hard judge of monarchs—the great scholar, Buchanan—said with much more truth, 'that if men were to set themselves to draw the image of a good king, they would fall short of what David shewed himself throughout the whole course of his life.'

King D. died at Carlisle on the 24th May 1153. His son Henry had died in the previous June, and he was succeeded by his grandson, Malcolm, then in his twelfth year. The oldest Scottish painting now known to exist—an illuminated charter to the monks of Kelso, written in 1159—preserves rude miniatures of the young king and his saintly grandfather. It is engraved in facsimile in the *Liber S. Marie de Calchou*, presented to the Bannatyne Club by the Duke of Roxburghe in 1846. Some pleasing traits of King D.'s personal character—which seems to have been in many ways truly admirable—are preserved in the *Eulogium Davidis Regis Scotorum*, by his friend St Ailred, abbot of Rievaulx, printed in Pinkerton's *Vitæ Antiquæ Sanctorum Scotiæ* (Lond. 1789). Other instructive materials for the king's life are supplied by the same writer in his tract *De Bello Standardi*, printed (together with other contemporary accounts of the battle) in Twysden's *Historia Anglicanæ Scriptores Decem* (Lond. 1652); and by Joceline of Furnes in his *Vita S. Walthævi* (abbot of Melrose, and D.'s stepson), printed by the Bollandists in the *Acta Sanctorum*, and in a less perfect state in Fordun's *Scotichronicon*. The remains of D.'s legislation, including the interesting code of the *Leges Burgorum*, have been carefully collected in the first volume of *The Acts of the Parliaments of Scotland* (Edin. 1844).

King D. is often called St David. He was never formally canonised, or placed in the roll of saints of the Roman Catholic Church; but his name was inserted in the calendar prefixed to King Charles's Prayer-book for Scotland, printed at Edinburgh in 1637.

DAVID II. See BRUCE.

DAVID, FÉLICIEN, a French composer, was born 8th March 1810, at Cadenet, in the department of Vaucluse. He was at first a chorister in the cathedral of Aix, and at the age of twenty entered the Paris Conservatoire. He threw himself earnestly into the social speculations of his day; became an ardent disciple of St Simon, and afterwards of *Enfantin*; and finally, on the break-up of the brotherhood attempted at *Ménilmontant* in 1832, he betook himself, along with eleven of his fellow-dreamers, to the East, there to realise his theory of life in undisturbed peace. The little knot of enthusiasts reached Constantinople, whence they made their way to Smyrna and Cairo. As they had no means, they suffered greatly from want, sickness, and ill-usage. The plague forced them to flee from Egypt, through the desert, to the coasts of Syria. It is said that they dragged a piano with them over the sands, and often, when they rested on their toilsome march among the wild tribes of the wilderness, D., whose ear was quick to catch the native airs of the East, sent forth enchanting strains from the instrument, and made his comrades forget their misfortunes. In 1835, he reached France, and published his *Mémoires Orientales* for the pianoforte. They were unsuccessful; and D. remained in obscurity till 1844, when he brought

out at the Conservatoire his *Désert*, a grand *Ode-symphonic*, as he called it, the words of which were furnished by his friend and fellow-wanderer, M. Auguste Colin. Its success was sudden and complete. D. was declared a master at once, and his *Désert* was performed in all the theatres. Subsequently, he travelled through Belgium and Germany, and was everywhere greeted with applause; his imitation of the scenes of nomadic life being considered as perfect as music could achieve. D.'s later works, however, have not sustained his reputation. The principal are—*Moïse sur le Sinai* (1846), *Christophe Colomb*, and *Le Paradis* (1847), and *La Perle du Brésil* (1851). In 1869, D. was appointed Librarian to the Paris Conservatoire de Musique.

DAVID, JACQUES LOUIS, the founder of the modern French school of painting, and, according to his countrymen, 'the regenerator of French art,' was born at Paris, 30th August 1748, and studied under Vien both at Paris and Rome. His first efforts by no means indicated the latent tendencies of his mind. His devotion to the classic style of art was first perceptible to any extent after his second visit to Rome in 1784, where he executed his 'Horatii.' It excited the greatest enthusiasm. In 1787, he painted 'The Death of Socrates;' in 1788, 'The Loves of Paris and Helen;' and in 1789, 'Brutus condemning his Son.' During the Revolution, he was artistic superintendent of those grand national fêtes and solemnities that recalled (but rather theatrically) the customs of ancient Greece. As a member of the Convention, he voted for the death of Louis XVI.; he was a hot Jacobin, and a member of the Committee of Public Safety, in all the atrocities of which he shared, and, in consequence, was twice imprisoned after the fall of Robespierre. To the period of the Revolution belong his 'Murder of Marat,' 'Murder of Pelletier,' and his 'Oath taken in the Tennis Court.' His genius culminated in the 'Rape of the Sabinæ' (1799). In 1804, Napoleon appointed him his first painter, and gave him a number of commissions, and among his best and most celebrated works are several historic portraits of the emperor, such as 'Napoleon crossing the Alps.' D. was warmly attached to Napoleon, and in 1814, when the Duke of Wellington paid a visit to his studio, and expressed a wish that the artist would paint his portrait, he coldly replied: 'I never paint Englishmen.' As one of the regicides of Louis XVI., he was banished in 1816 from France, and he died in exile at Brussels, December 29, 1825. D.'s later style is more free and natural than his earlier, in which his figures, although manifesting quite an ideal beauty of form, have all the rigidity of sculpture, and lack that vital expression which creates a sympathy in the mind of the beholder. Among the paintings executed by him during his banishment were—'Love and Psyche,' 'The Wrath of Achilles,' and 'Mars disarmed by Venus.' The number of his pupils who acquired distinction was very great.

DAVID, PIERRE JEAN, a French sculptor, commonly called David d'Angers, was born at Angers, 12th March 1789; went to Paris when very young; and studied art under his namesake, Jacques Louis David (q. v.). In 1811, his 'Death of Epaminondas' obtained the first prize for sculpture given by the Academy of Arts. D. now visited Rome, where he formed a friendship with Canova. In 1816, he returned to France. A statue of the Great Condé, which he executed about this time, established his reputation. In 1826, he was named a member of the Institute, and appointed a professor in the School of the Fine Arts. Two years later, he went to Germany, where he executed a colossal bust of

Goethe for the library at Weimar; and in a second tour in 1834, similar busts of Dannecker, Schelling, Tieck, and Rauch, as well as many portrait-statues of life-size. During the July revolution, D. had fought in the ranks of the people, and, in consequence, he was employed by the new government to execute the frontispiece of the Pantheon in 1835. He finished it in 1837. By many it is considered his *chef-d'œuvre*. In 1848, the well-known republicanism of the artist procured for him the honour of a seat in the Constituent Assembly. After the *coup-d'état*, he was sent into exile, and went to Greece, but soon after returned to France. He died 5th January 1856. It would be impossible to enumerate all D.'s works. The principal are—'A Young Girl at the Tomb of Botzaris,' 'A Monument of Bonchamp,' 'A Virgin at the Foot of the Cross,' a 'Saint John,' statues of General Foy, Marshal St Cyr, Corneille, Fénelon, and Racine, and busts of La Fayette, Béranger, Rossini, Chateaubriand, Balzac, and Casimir Delavigne. There is great force of expression in many of D.'s works, but the drawing and execution are not always accurate.

DAVID, or DEWI, Sr, the patron saint of Wales, was, according to tradition, the son of the Prince of Ceretica (Cardiganshire), and was born about the end of the 5th or beginning of the 6th century. Having resolved on a religious life, he spent, as was customary in those days, a probationary period in solitude, after which he commenced preaching to his countrymen. He built a chapel at Glastonbury, and founded twelve monasteries, the chief of which was at Menevia, in the vale of Ross. At the synod of Brevy, in Cardiganshire, held in 519, St D. shewed himself a strong opponent of the Pelagian heresy. Subsequently, he became Archbishop of Caerleon-upon-Usk, but transferred his see to Menevia, now called St Davids, where he died about the year 601. St D. was celebrated for his eloquence and success in conversion. Several works have been ascribed to him, but these are no longer extant. His life was written by Ricemarch, Bishop of St David's, who died about the year 1099. The *Historia S. Davidis*, by Giraldus Cambrensis, written about 1175, and published in Wharton's *Anglia Sacra*, is little more than an abridgment of Ricemarch's work.

DAVID, a town on the left bank of a river of the same name, is situated near the south-west extremity of Veragua, the most westerly province of New Granada, and lying on the frontier of Costa Rica, in Central America. D. is in lat. 8° 23' N., and long. 82° 27' W., and is separated by a comparatively narrow part of the Isthmus of Darien from the lagoon of Chiriqui, an inlet of the Caribbean Sea, which, with sufficient depth for large ships, penetrates nearly 50 miles into the land towards the Pacific Ocean. To this position the place appears to owe its prosperity. Though of recent origin, it numbered, in 1843, 4321 inhabitants, with a constant and regular immigration. It exports rice, coffee, hides, turtle, shells, and gold-dust. Its climate is understood to be comparatively salubrious.

DAVIDS, Sr, an ancient but now decayed episcopal city, in the west of Pembrokeshire, the westmost town in Wales. It is situated on the streamlet Allan, a mile from its mouth, near St David's Head, on the north side of St Bride's Bay. It has been the seat of a bishopric since about 519, when St David transferred the archbishop's see to St D. (before called Mynyw, and by the Romans Menevia) from Caerleon. It was in the middle ages a large city—the great resort of pilgrims to St David's shrine; it is now a small village, with only a few good houses, besides those of the clergy.

It has a fine cathedral, and splendid remains of religious houses, episcopal palace, and St Mary's College (founded by John of Gaunt), within a high embattled wall nearly a mile in circuit. These were several times pillaged and burned by the Danes and others during the 9th and two following centuries. The cathedral, founded in 1180, on the site of the monastery of St David, is cruciform. Its dimensions, in the interior, are as follows: length, 290 feet; breadth, 76; nave, 124; choir, 80; transept, 120; central tower, 127 feet high. It contains a curious movable pulpit, an elaborately worked bishop's throne; the tomb of the Earl of Richmond, father of Henry VII.; and also sepulchral monuments of the early bishops of the see, as Giraldus Cambrensis, Anselm, &c. Among the former bishops, may be named Laud, Bull, South, and Horsley. The present occupant of the see is Connop Thirlwall, the historian of Greece. The cathedral establishment includes a bishop, a dean, four canons, five vicars choral, and other officers residentiary, with four archdeacons, and 12 prebendaries, or honorary canons, non-resident. The bishop has £4500 a year, and lives at Abergwili, near Caermerthen. Pop. (1871) 2131, chiefly agricultural labourers. William the Conqueror made an offering as a pilgrim at St David's shrine. Cairns, tumuli, holy wells, chapels, crosses, &c., abound around St D., and especially at ST DAVID'S HEAD, a high rugged promontory two miles north-west of the city, and the westmost point in Wales, in lat. 51° 54' N., and long. 5° 20' W.

DA'VIES, SIR JOHN, a poet and statesman of some reputation, was the son of a legal practitioner in Wiltshire, and was born in 1570. At the age of 15 he was sent to Queen's College, Oxford, where, five years after, he took his degree of B.A., having spent two of these years in the Middle Temple, where he studied law. He was called to the bar in 1595, but forfeited his privileges, and eventually was expelled from the Temple on account of certain indiscretions. He began his political career in 1601. In 1603, he was sent by James I. as solicitor-general to Ireland, and almost immediately after, he became attorney-general. He was called to the degree of sergeant-at-law in 1606, and in the spring of the following year received the honour of knighthood. On the assembling of the Irish parliament, called in 1613, D. was chosen Speaker of the House of Commons. In 1620, he took his seat in the English parliament as member for Newcastle-under-Lyne. He died suddenly of apoplexy, December 7, 1626.

As a lawyer, the character of D. is that of a man of great learning and talent. His *Reports of Cases adjudged in the King's Courts in Ireland*, published in 1615, were the first reports of Irish cases ever published, and had a preface from the pen of D., which was esteemed by an old critic as the best that was ever prefixed to a law-book. But it is as a poet that he is chiefly notable. His *Orchestra, or a Poem on Dancing* (1596), was followed by his great work, the *Nosce Teipsum, a Poem on the Soul and the Immortality thereof* (1599). His verse is elegant without being artificial, and flowing without being careless, while its compact structure is remarkable for his times. Among his miscellaneous works may be mentioned his *Discovery of the True Cause why Ireland was never Subdued entirely until the Reign of King James I.* (Lond. 1612), a work which has always been considered of great value to political inquirers.

DA'VILA, ENRICO CATERINO, a celebrated Italian historian, was born at Pieve di Saeco, in the vicinity of Padua, October 30, 1576. D., when seven years old, was taken to France for his education. At the

age of 18, he entered the service of Henry IV., which he afterwards exchanged for the military service of Venice. On his way to Crema, to take command of the garrison, in 1631, he was shot by a postmaster on the road, with whom he had quarrelled. D. has been rendered famous by his great work, entitled *Storia delle Guerre Civili di Francia* (History of the Civil Wars in France), (Venice, 1630), comprising that eventful period from the death of Henry II., 1559, to the peace of Vervins in 1598. D. is universally regarded as one of the best historical writers of Italy.

DAVIS, JEFFERSON, a political character noted in the modern history of the United States of America, first made himself conspicuous as a member of the House of Representatives, and afterwards of the National Senate, in which he represented the state of Mississippi. At the commencement of the Mexican war he left Congress, and engaged actively in the contest. Having the advantage of a military training, and having served in the regular army, he soon acquired distinction. When Pierce was elected president in 1853, D. was appointed secretary of war, and at this period he exercised a powerful influence in the administration—ruling, in fact, the president as well as the greater number of the members of the cabinet. When Buchanan became president, he left the cabinet, but was returned to the senate by the legislature of Mississippi, which position he retained till the secession of his state. On the 18th February 1861, the southern states, which had previously passed votes professing to secede from the Union on account of the election of Mr Lincoln to the presidency, formally appointed D. to be *their* president at Montgomery, Alabama. See UNITED STATES.

DAVIS, JOHN, an eminent navigator of the latter part of the 16th c., was born at Sandridge, near Dartmouth, and is principally distinguished for having, between 1585 and 1588, undertaken three voyages to the northern seas in search of a north-west passage. In the first voyage, he sailed as far north as the 73d degree of latitude, and discovered the strait which bears his name. He afterwards made five voyages to the East Indies, in the last of which he was killed in a fight with some Japanese on the coast of Malacca. This event took place in 1605. He is the author of several works, among which the chief are—*The World's Hydrographical Description, wherein is proved that the World, in all its Zones, Climates, and Places, is Habitable and Inhabited, and the Seas likewise universally navigable* (Lond. 1595); and *The Seaman's Secrets, wherein is taught the Three Kinds of Sailing, Horizontal, Paradoxal, and Sailing upon a Great Circle*, 8vo (Lond. 1595).

DAVIS, SIR JOHN FRANCIS, BART., born in London 1795, long resident in China as chief superintendent of Canton, and afterwards as governor and commander-in-chief of the colony of Hong-kong, is one of the best and most trustworthy authorities on China and the Chinese. In 1845, D. was created a baronet, and received the order of Knight Grand Cross of the Bath in 1854. Sir Francis D. is deputy-lieutenant of the county of Gloucester. His *China, during the War and since the Peace*, appeared in 1852, and was followed in 1857 by his *China, a General Description of that Empire*.

DAVIS' STRAIT, so called from the navigator who discovered it, forms the southern part of that inlet of the Atlantic which washes the western coast of Greenland. It thence connects Baffin's Bay, and also, in some sense, Hudson's Strait, with the open ocean. At its narrowest point, it measures 160 miles across. It is largely frequented by whaling-ships.

A constant current, bringing with it, of course, much ice, flows down D. S. from the circumpolar waters. Recently, however, it has been maintained, on apparently good grounds, that, on the eastern side, an opposite current, similarly freighted, sweeps round Cape Farewell, on its way from Spitzbergen.

DA'VIT, in Ship-building, is a piece of timber projecting over the bow or front-part of a vessel,

A, A, Davits.

and used as a crane for hoisting the anchor out of the water clear of her bow; two such pieces of timber or iron on her side, or stern, are used for hoisting or lowering the boats.

DAVOUT (not DAVOUST, as commonly written), LOUIS NICOLAS, a French marshal, was born 10th May 1770, at Annoux, in the old province of Burgundy; was educated along with Bonaparte at the military school of Brienne; and in 1785, became sub-lieutenant in a cavalry regiment. During the revolutionary wars, he rose to the rank of general. He accompanied Bonaparte to the East, where he mainly contributed to the victory at Aboukir, and otherwise distinguished himself both in Upper and Lower Egypt. On his return to France, he was named general of division in 1800, commander-in-chief of the consular grenadier guards in 1801, and marshal of the empire in 1804. In the campaigns of 1805, 1806, and 1807, he acted a brilliant part in the great victories obtained by the French at Ulm, Austerlitz, Jena, Auerstadt, Eylau, and Friedland. In reward of his bravery, Bonaparte created him Duke of Auerstadt (July 2, 1808). On the renewal of the war with Austria in 1809, D.'s star was again in the ascendant, and he was created Prince of Eckmühl for his services at the battle of Eckmühl. At Wagram, he performed prodigies of valour. Appointed governor of Poland, he ruled that country in a spirit of the harshest despotism, and provoked the reproaches of the emperor, but, nevertheless, did not change his system. In the Russian campaign of 1812, he gathered fresh laurels on the fields of Mohilow and Boredino. After the retreat from Moscow, D. became governor-general of the Hanse towns, and established himself at Hamburg, where he gallantly maintained himself till the first restoration of the Bourbons. On the return of Bonaparte from Elba, D. was appointed war-minister, and in this office shewed a remarkable genius for the rapid organisation of troops and supplies. After the battle of Waterloo, he received the command of the relics of the French army under the walls of Paris. He would have continued the

contest, had he not been ordered by the Provisional Government in the capital to conclude a military convention with the allies. In 1819, he was made a peer of France. His death took place June 1, 1823. Firmness of character and dauntless courage were D.'s leading characteristics; but his military severities often went the length of harshness, and even cruelty, while his rapacity had in it something akin to barbarism.

DAVY, SIR HUMPHRY, one of the greatest chemists of his own or of any age, was born on the 17th December 1778, at Penzance, in Cornwall, where his father was a carver in wood. At the school of Truro, where he was educated until he was 15, he shewed little relish for classical learning, but he was distinguished for a highly retentive memory and an early passion for poetry, which never forsook him. Another prominent trait of his character was equally early developed: as a child, he would angle even in the gutters of the streets; and only two years before his death, and after his health had given way, he published his interesting volume, *Salmonia, or Days of Fly-fishing*. Soon after leaving school, he became apprentice to a surgeon and apothecary in Penzance. He at the same time entered upon a course of study all but universal. 'Speculations on religion and politics, on metaphysics and morals, are placed in his notebooks in juxtaposition with stanzas of poetry and fragments of romance.' A system of mathematical study, sceptical philosophy, Scotch metaphysics and German transcendentalism, successively engaged his attention. The study of natural philosophy brought him nearer to that department which was to be his own; but it was not till he had reached his 19th year, that he entered seriously upon the study of chemistry. He now made the acquaintance of Dr Beddoes, who had established a Pneumatic Institution at Clifton, and who took him as his assistant. Here D. carried on a course of experiments on the respiration of different gases, in which he had more than once nearly sacrificed his life. He thus discovered the singular exhilarating effect of nitrous oxide when breathed. The account which he published of his researches, established his reputation, and led to his appointment, at the age of 22, as lecturer to the Royal Institution of London. He delivered his first lecture in 1801; and his eloquence, and the novelty and variety of his experiments, soon attracted crowded and brilliant audiences. In 1803, he began researches connected with agriculture, on which he delivered a course of lectures. These were published in 1813, under the title of *Elements of Agricultural Chemistry*, and form an era in that science. The discoveries, however, on which D.'s fame as a chemist chiefly rests, took their origin in the views which he developed in 1806, in his Bakerian lecture, *On some Chemical Agencies of Electricity*. This essay was universally regarded as one of the most valuable contributions ever made to chemical science, and obtained the prize of the French Institute. Following out his principle, he was led to the grand discovery, that the alkalis and earths are compound substances formed by oxygen united with metallic bases. It was potash that he first succeeded in decomposing, on the 8th October 1807. When he first saw the globules of the new metal, *potassium*, his delight is said to have been so ecstatic that it required some time for him to compose himself to continue the experiment. He next decomposed soda and the alkaline earths, baryta, strontia, lime, and magnesia; and discovered the new metals, *sodium*, *barium*, *strontium*, *calcium*, and *magnesium*. With regard to the earths proper, he succeeded in proving that they consist of bases united to oxygen.

It was reserved for Wöhler and others to exhibit the bases by themselves.

In 1812, D. was knighted, married a lady of considerable wealth, and resigned the chemical chair of the Royal Institution. That he might investigate his new theory of volcanic action, he received permission from the French government—though the two countries were then at war—to visit the continent, and was received with the greatest distinction by the scientific men of France. On returning to England in 1815, he entered on the investigation of the nature of fire-damp, which is the cause of explosions in coal-mines. This resulted in the invention of the safety-lamp (q. v.)—one of the most valuable presents ever made by science to humanity. Though the value of the invention was everywhere acknowledged, the only national reward was a baronetcy after a lapse of three years. This has been contrasted with the pension of £1200 a year bestowed by the same government on Sir William Congreve for the invention of his rocket. On the death of Sir Joseph Banks, in 1820, Sir Humphry D. was elected President of the Royal Society. His attention was shortly after called to the important object of preserving the copper-sheathing of vessels from corrosion by the action of sea-water. This he effected by altering the electric condition of the copper by means of bands of zinc; but the bottoms of the vessels became so foul from the adhesion of weeds, shells, &c., that the plan had to be abandoned.

Early in 1825, Sir Humphry D. had begun to complain of the loss of strength, and, in 1826, he had a paralytic attack affecting his right side. He made two journeys to the continent for the recovery of his health, and died at Geneva on the 29th May 1829, at the early age of 51. The Genevese government evinced their respect by a public funeral. So widely spread was the reputation of Sir Humphry D., that he was a member of almost all the scientific institutions in the world. Cuvier, in his *Eloge*, says: 'Mr Davy, not yet 32 years of age, occupied, in the opinion of all that could judge of such labours, the first rank among the chemists of this or of any other age.' Besides the works already mentioned, and a great number of contributions to the *Philosophical Transactions*, Sir Humphry D. published *Elements of Chemical Philosophy* (Lond. 1812); and *Consolations in Travel, or the Last Days of a Philosopher* (3d ed. Lond. 1831), appeared after his death. See *Memoirs of the Life of Sir Humphry D.*, by his brother (Lond. 1836, 2 vols.); and *The Life of Sir Humphry D.*, by Dr Paris (Lond. 1831).

DAVY'S SAFETY-LAMP. See SAFETY-LAMP.

DAWA'LLA (*Hypophthalmus dawalla*), a fish of the family *Siluridae*, found in the rivers of Guiana, and highly esteemed for the delicacy of its flesh. It is sometimes two feet and a half long, and has a snout somewhat like that of a pike, but the mouth is furnished only with very minute teeth. The skin is destitute of scales, and the colours have that brightness so often seen in tropical fishes, green, brown, and carmine. The D. has become shy in the waters of the more populous and long-settled parts of Guiana, although easily captured in more remote regions.

DAWK, or DAK, a method of travelling in India which consists in posting by palanquin from station to station, or for any distance. The traveller must first purchase a strong palanquin, which he can have for from 40 to 100 rupees (£4 to £10), but which he can always dispose of when his journey has been completed, and generally at a profit. His clothes, together with whatever articles he may

not immediately need, are carried in tin-boxes or wicker-baskets called *pettarahs*, by separate bearers, who precede or accompany the palanquin; whatever he considers necessary, however, he keeps beside himself inside. At all the stages, which are from 9 to 11 miles apart, there are relays of bearers, previously provided by the postmaster, the usual number for one palanquin being eleven. All arrangements as to cost are made with the postmaster of each presidency before starting, but the traveller is also expected to give some small sum to his bearers at the end of each stage; eight annas (one shilling) among the entire set of bearers is as much as is expected in the way of gratuity. The Horse-dawk, a kind of carriage with seats for four, and capable of being used as a bed in which two can sleep, the baggage being conveyed on the top, set on wheels, and drawn by horses, is in use on the great trunk road from Calcutta to the npper provinces, but has not been established throughout the country generally.

**DAW'LISH**, a flourishing and picturesque watering-place, on the south coast of Devonshire, 12 miles south of Exeter. It lies in a valley running east and west between the mouths of the Exe and Teign. It has recently built public-baths. Pop. (1861) 4014.

**DAWN**. See **TWILIGHT**.

**DAX**, a town of France, in the department of Landes, pleasantly situated on the left bank of the Adour, 20 miles north-east of Bayonne. Among its principal buildings are the high church, once a cathedral, and the bishop's palace. It is an intermediate dépôt for goods forwarded to Spain, and has some manufactures of earthen-ware, wine, and brandy; but it is chiefly remarkable for its hot saline springs, the temperature of which at the source is 212° F. The water, which is medicinal and nearly tasteless, was used for bathing-purposes by the Romans, who conferred upon the springs the name *Aque Augustæ Tarbellicæ*. Pop. 5801.

**DAY** (probably allied to the Lat. *dies*, day, *divum*, the sky, from the root *div*, to shine) originally meant the space of time during which it is light, in opposition to the space of darkness or night; it now more usually denotes a complete alternation of light and darkness. It is the earth's rotation that causes the vicissitude of day and night. The earth being a globe, only one-half of it can be in the sun's light at once; to that half it is day, while the other half is in its own shadow, or in night. But by the earth's rotation, the several portions of the surface have each their turn of light and of darkness. This happens because the position of the earth is such that the equator is on the whole presented towards the sun; had either pole been towards the sun, that hemisphere would have revolved in continual light, the other in continual darkness.

One complete rotation of the earth does not make a day, in the usual sense. If the time is noted when a particular fixed star is exactly south or on the meridian, when the same star comes again to the meridian the next day, the earth has made exactly one rotation, and the time that has elapsed is called a *sidereal day*. This portion of time is always of the same length; for the motion of the earth on its axis is strictly uniform, and is, in fact, the only strictly uniform motion that nature presents us with. Sidereal time, or star-time, from its unvarying uniformity, is much used by astronomers. But the passage of a star across the meridian is not a conspicuous enough event for regulating the movements of men in general. It is not a complete rotation of the earth, but a complete alternation of light and

darkness that constitutes their day. This, which is called the *civil* or the *solar* day, is measured between two meridian passages of the sun, and is about four minutes longer than the sidereal day. The cause of the greater length is this: When the earth has made one complete turn, so as to bring the meridian of the place to the same position among the fixed stars as when it was noon the day before, the sun has in the meantime (apparently) moved eastward nearly one degree among the stars, and it takes the earth about four minutes more to move round so as to overtake him. If this eastward motion of the sun were uniform, the length of the solar day would be as simple and as easily determined as that of the sidereal. But the ecliptic or sun's path crosses the earth's equator, and is therefore more oblique to the direction of the earth's rotation at one time than another; and besides, as the earth moves in her orbit with varying speed, the rate of the sun's apparent motion in the ecliptic, which is caused by that of the earth, must also vary. The consequence is, that the length of the solar day is constantly fluctuating; and to get a fixed measure of solar time, astronomers have to imagine a sun moving uniformly in the celestial equator, and completing its circuit in the same time as the real sun. The time marked by this imaginary sun is called *mean solar time*; when the imaginary sun is on the meridian, it is *mean noon*; when the real sun is on the meridian, it is *apparent noon*. It is obvious that a sun-dial must shew apparent time, while clocks and watches keep mean time. Only in four days of the year do these two kinds of time coincide. In the intervals, the sun is always either too fast or too slow; and the difference is called the *equation of time*, because, when added to or subtracted from apparent time, it makes it equal to mean time. The mean solar day is divided into twenty-four hours, the hours into minutes and seconds. A sidereal day, we have seen, is shorter; its exact length is 23 hours, 56 minutes, 4 seconds of mean solar or common time. Astronomers divide the sidereal day also into twenty-four hours, which are of course shorter than common hours. In the course of a civil year of 365 days, the earth turns on its axis 366 times, or there are 366 sidereal days. Astronomers reckon the day as beginning at noon, and count the hours from 1 to 24. The civil day begins at midnight, and the hours are counted in two divisions of twelve each. The ecclesiastical day was reckoned from sunset to sunset.

A *day, in law*, includes the whole twenty-four hours, without any reference to the season of the year, or the amount of light or darkness. Where there is no qualifying stipulation, therefore, the obligation to pay on a certain day is discharged, if the money be paid before twelve o'clock at night, or the commencement of the following day. On the same principle, if anything is to be done within a certain time from or after the doing of a certain other thing, the day on which the first act or occurrence takes place is excluded. If A binds himself to pay money ten days after B's death, and B dies on the 1st, the money will not be due till the night of the 11th at twelve o'clock. Where it is not absolutely necessary, for the purposes of justice, the law excludes fractional portions of time; thus, half a year consists of 182 days, and a quarter of a year of 91.

A *lawful day* is a day on which there is no legal impediment to the execution of a writ—i. e., all days except Sundays and fast-days appointed by government. Criminal warrants are an exception to this rule, and may be both granted and executed on Sundays and fast-days. By 29 Car. II. c. 7, all contracts made by persons in their ordinary calling

on a Sunday are void. The exceptions to this rule will be explained under **SABBATH OBSERVANCE**. In England, Christmas-day, Good-Friday, and Easter-day, generally stand on the same footing with days appointed by royal proclamation for public fasting and humiliation; but in Scotland, there is no exception made in favour of any of the feast or fast days of the church.

**Days of Grace.** The time at which a bill is actually *due*, or at *maturity*, is in general three days after the time expressed on the face of it. The three additional days which are generally allowed by the custom of merchants, and which the laws of the United Kingdom recognise and protect, are called days of grace. If the third day of grace fall on a Sunday, or on a day of public fast or thanksgiving, or, in England, on Christmas-day or Good-Friday, the bill is due the day before. See **BILL**.

**DAY, THOMAS**, a political writer and poet, was born in London, June 22, 1748, and studied at Oxford. The American war of independence, with which he strongly sympathised, seems to have roused his poetical energies. In 1773, he published *The Dying Negro*; in 1776, *The Devoted Legions*; and in 1777, *The Desolation of America*. But he is chiefly remarkable as the author of the famous *History of Sandford and Merton*, as also the *History of Little Jack*. He was killed by being thrown from a horse, 28th September 1789.

**DAYAKS.** See **BORNEO**, and **BROOKE, SIR JAMES**.

**DAY-FLY.** See **EPHEMERA**.

**DAY-LILY** (*Hemerocallis*), a genus of plants of the natural order *Liliaceae*, having a perianth with bell-shaped limb, and sub-cylindrical tube, and globose seeds with soft testa. Several species are cultivated in our flower-gardens, especially the fragrant Yellow Day-lily (*H. flava*), a native of

Day-lily.

Hungary, Siberia, and the north of China. It has also been recommended to farmers as affording a supply of a most acceptable green-food to cattle. But *H. flava*, a native of the Levant, produces more abundant foliage, and cattle are equally fond of it. Both species are fibrous-rooted perennials with linear leaves.

**DAY'SMAN**, a name formerly given in England (and still in use in some of the northern counties) to an arbitrator, umpire, or elected judge. It has its origin in the judicial language of the middle

ages, when the word *Day* was specially applied to the day appointed for hearing a cause, or for the meeting of an assembly. A daysman was thus a judge appointed to decide between parties at a judicial hearing. The word occurs in Scripture, where Job sorrowfully says, in reference to his relation to God: 'Neither is there any daysman betwixt us, that might lay his hand upon us both' (Job ix. 33).

**DAYTON**, the fourth city of Ohio in the United States with regard to population and wealth, stands at the confluence of the Miami and the Mad, in lat. 39° 44' N., and long. 84° 11' W. It is connected with Cincinnati, the commercial capital of the state, on the Ohio, by the Miami Canal—the distance being 52 miles; and it is the terminus of six railways, which radiate in every direction. In the variety and extent of its manufactures, D. stands foremost among western towns in proportion to its size. The population has very rapidly increased. In 1850, it amounted to 10,976, having almost quadrupled within the preceding 20 years; in 1853, it had risen to 16,562, shewing an addition of more than 50 per cent. in three years; while at the census of 1860 it amounted to 20,482.

**D'AZA'RA, DON FELIX**, a very eminent naturalist, was born at Barbunales, in Aragon, 18th May 1746, was educated at the university of Huesca, obtained a commission in the Spanish army, was severely wounded in the attack upon Algiers, and in 1781 was appointed one of the commissioners for fixing the boundaries of the Spanish and Portuguese possessions in South America. He proceeded immediately to that country, and did not return to Spain till 1801, encountering many difficulties in the discharge of his duties, in which he shewed the greatest faithfulness and perseverance. He devoted himself also to the investigation of the geography, ethnology, and natural history of the regions in which he spent so many years, and published an account of his travels, and an important work on quadrupeds and birds, under the modest title of *Notes on the Natural History of Paraguay and La Plata* (Madrid, 1802, *et seq.*).—D.'s elder brother was eminent as a diplomatist.

**DEACON OF A TRADE**, the president, for the time being, of certain incorporations in Scotland; in which country, before the passing of the Burgh Reform Act (3 and 4 Will. IV. c. 76), the deacons of trades or crafts represented the trades in the respective town-councils. They were elected by the incorporations, but generally under the control of the town-council. The subordinate incorporation presented a list of six of its members to the town-council, by whom three of the names were struck off. The lect, thus shortened, was returned, in order that the deacon for the ensuing year should be chosen from it. By the act just referred to (s. 19), it is enacted that the deacons shall no longer be recognised as official and constituent members of the town-council, the power of the crafts to elect deacons and other officers for the management of their affairs being reserved (s. 21). This more limited privilege is now exercised independently of the town-council. The deacon-convener of the trades in Edinburgh and Glasgow (s. 22), is still a member of the town-council. One of the duties of the deacon in former times was to essay, or try, the work of apprentices, previous to their being admitted to the freedom of the trade. See **DEAN OF GUILD**. After this explanation, it need hardly be added that these deacons have no connection with ecclesiastical affairs, and are in no respect to be addressed like deacons in a spiritual sense.

DEACONS, literally *servants*, meant, in apostolic times, properly those officers of a congregation or church that had the charge of collecting and distributing the alms, and of taking care of the poor and the sick. The office, therefore, was not a clerical one, though the term deacon or servant may have been at times applied to teachers as *minister* was, which has the same meaning. The limitations of the office of deacon to the functions above specified, continued to be recognised as late as the Council of Trullanum, 692. The Church of Jerusalem chose at first seven deacons, individuals of whom, no doubt, as Philip, also taught and baptised, but only because they were evangelists as well as deacons. The number seven continued to be adhered to in all churches. During the 2d and 3d centuries, the duties falling to the deacons had considerably increased; and since as confidential attendants and helpers of the bishops, they had risen into consequence, it became necessary to divide the various functions among an archdeacon, deacons, and subdeacons. Deacons might now dispense the bread and wine at the communion, but not consecrate them. They had to receive the offerings and presents for the bishop, to keep the sacred vessels, to chant the introductory formulas of public worship, and to take the oversight of the morals of the congregation; and they were allowed, in many cases, with the leave of the bishop, to preach and baptise, and receive penitents into the communion of the church. At an early period, the offices of archdeacon and deacon were considered to belong to the higher orders of consecration (*ordines majores*); this was not the case with that of subdeacon till after the 12th century. At the consecration of a deacon, the sacred vessels are handed to him as symbols of his office. The peculiar robes are the dalmatica and the stole. In Protestant churches, the position of deacons varies. Among Presbyterians, their place is usually supplied by the elders; but in some Presbyterian churches (e.g., the Free Church of Scotland), the offices of elder and deacon are kept distinct. In the Church of England, a deacon is a clergyman receiving a special form of ordination, but differing in effect from a regular priest only from not being allowed to consecrate the elements at the communion, or pronounce the absolution or benediction. For this, as well as for holding any benefice or church-preferment, priest's orders are necessary. The office is of little importance, except as affording an interval of probation before admission to priest's orders. Before a person can be appointed deacon in the English Church, he must have reached the age of 23, and he usually remains in this office one year at least.

DEACONESSES (*ancille, ministra, vidua, virgines, episcopa, presbyterice*), female ministers or servants of the church or Christian society in the time of the apostles (Rom. xvi. 1). They co-operated with the deacons, shewed the women their place in the church-assemblies, assisted at the baptism of persons of their own sex, instructed those who were about to be baptised as to the answers they should give to the baptismal questions, arranged the *agape* or love-feasts, and took care of the sick. In the 3d c., it seems to have been also part of their duty to visit all Christian females who were suffering imprisonment, and to be hospitable to such as had come from afar. In very early times, they were consecrated to their office by ordination in the same manner as other ecclesiastical or spiritual personages; later, however, they were inducted into their office by prayer without the imposition of hands. Until the 4th c., the D. had to be either maidens or widows who had been only once married, and

60 years of age; but after the Council of Chalcedon, the age was fixed at 40. Their assistants were called *sub-deaconesses*. After the 6th c., in the Latin Church, and after the 12th c., in the Greek Church, the office of deaconess was discontinued; but the former has retained the name. In monasteries, for example, the nuns who have the care of the altar are called deaconesses. In the Reformed Church of the Netherlands, also, those elderly females are called D. who take care of lying-in women and of the poor. The advantages resulting to a Christian community from such an order are too obvious to require exposition. It has been a serious misfortune to the church at large, that the office has been allowed to fall into disuse; and the wide-spread institution at the present day in the churches of Great Britain and America of Ladies' District-visiting Societies, Dorcas Societies, &c., satisfactorily shews the necessity of practically supplying, to some extent at least, the want of this primitive office. There is a movement going on at present for the introduction of the order of deaconesses into the Church of England.

DEAD, BURNING OF THE. See BURIAL.

DEAD, in Seafaring Language, is very frequently employed as part of a designation or phrase having, in general, a meaning somewhat opposite to that of *active, effective, or real*. The chief of such phrases are the following: *D. eyes* are circular, flattish wooden blocks, which, with other apparatus, form a purchase or tackle for extending the standing rigging and other purposes. *D. flat* is the name for one of the midship-timbers. *D. lights* are strong wooden shutters to close cabin-windows: on the approach of a storm, it is customary to take out the glass-windows, as being too fragile, and replace them with D. lights. *D. rising* is a name for that part of a ship's bottom where the floor-timbers terminate, and the lower futtocks or foot-hooks begin. *D. ropes* are such as do not run in blocks. *D. wood* consists of blocks of timber laid upon the keel, especially fore and aft; it is piled up, and fastened to the keel with iron spike-nails; the chief object is to give solidity and strength to the ends of the ship. To these may be added *D. wind*, a seaman's designation for a wind blowing directly against a ship's course.

DEAD, JUDGMENT OF THE (in ancient Egypt). The papyrus rolls found with the Egyptian mummies contain a description of the fate of the departed subsequent to their death. Even in the least complete specimens, the most important scene is seldom wanting—that, namely, in which the dead is led by the hand of Ma, the goddess of Truth and Justice, into the judgment-hall of the nether world, before Osiris, the judge of the dead. The god's throne faces the entrance. In the middle of the hall stands a huge balance, with an ostrich feather, the symbol of Truth, in one scale, and a vessel in the form of a human heart in the other. A female hippopotamus appears as accuser. Above sit forty-two gods, each of whom specially presides over one of the forty-two sins from which the deceased has to clear himself. The gods Horus and Anubis attend to the balance, while the ibis-headed Thoth-Hermes, the justifier, writes down the result, which is naturally assumed to be favourable. Such is the judgment of the dead in the Egyptian Hades. But, according to Diodorus, a human judgment had already been passed upon the departed previous to burial. Before the sarcophagus was launched upon the holy lake over which it was to be ferried by Charon, the friends and relatives of the dead, together with forty-two judges, assembled on the shore. Each was permitted to

bring an accusation against him, and if it were proved, the solemnities of burial were withheld. A false accuser, however, was severely punished. Even unjust and unpopular monarchs were often deprived of sepulture by this process.

DEAD, PRAYING FOR THE. See PRAYER.

DEAD-FREIGHT, the compensation paid by the merchant who freights a whole ship to the shipmaster for the space which he fails to occupy. It is rather a claim for damages for the loss of freight, than freight itself, and consequently, apart from positive stipulation, the shipmaster has no lien for dead-freight over the goods on board. His claim must, consequently, be made effectual by a personal action against the freighter.

DEAD NETTLE (*Lamium*), a genus of plants of the natural order *Cobiate*, having a 5-toothed calyx and a 2-lipped corolla, the upper lip arched, the lower lip trifid. The name D. N.—popularly in some parts both of England and Scotland, *Dee Nettle*—is also often extended to the genera *Galeopsis* and *Galeobdolon*, genera very similar to *Lamium*, the first of which is sometimes distinguished by botanists as Hemp-nettle, the second as Weasel-snout. *Lamium purpureum*, *L. incisum*, *L. album*, and *Galeopsis tetrahit*, are very common British weeds, some of them appearing in almost every garden, cornfield, or piece of waste-ground. *L. purpureum* and *L. album* are sometimes boiled as pot-herbs in Sweden. It is probably to *G. tetrahit*, or *G. versicolor*, also very common in Scotland, much larger plants, and rough with strong hairs, rather than to any species of *Lamium*, that the popular belief relates of a power residing in the hairs of the D. N., particularly when the plant is dried, as in haymaking, of causing irritation in the hands of persons handling them, which, extending throughout the system, occasionally terminates in death. They do not, however, seem to possess any poisonous property. The subject is one perhaps deserving of more attention than it has received.

DEAD-RECKONING, a term in Navigation, signifying the calculation of a ship's place at sea, made independently of celestial observations. The chief elements from which the reckoning is made are: The point of departure, i. e., the latitude and longitude sailed from, or last determined; the course or direction sailed in (ascertained by the compass); the rate of sailing—measured from time to time by the Log (q. v.); and the time elapsed. The various principles or methods followed in arriving at the reckoning from these data are known as plain-sailing, middle-latitude sailing, &c. See SAILINGS. But the data themselves are liable to numerous uncertainties and errors, owing to currents, leeway (q. v.), fluctuations of the wind, changes in the declination of the compass, &c.; and therefore the results arrived at by the D. have to be corrected as often as is possible by observation of the heavenly bodies. See NAVIGATION, LATITUDE, LONGITUDE.

DEAD SEA (anc. *Lacus Asphaltites*), called by the Arabs Bahr Loot, or *Sea of Lot*, is situated in the south-east of Palestine, in lat. 31° 10'—31° 47' N., and occupies a central position between long. 35° and 36° E. It is about 40 miles long, with an average breadth of 9 miles. The depth of the D. S. varies considerably: soundings in the north have given about 220 fathoms; this depth, however, gradually lessens towards the southern extremity, where the water is shallow. Its surface, which is lower than that of any water known, is 1312 feet below the level of the Mediterranean. The shape is that of an elongated oval, interrupted by a promontory which projects into it from the south-east.

The D. S. is fed by the Jordan from the north, and by many other streams, but has no apparent outlet, its superfluous water being supposed to be entirely carried off by evaporation. Along the eastern and western borders of the D. S., there are lines of bold, and in some cases perpendicular cliffs, rising in general to an elevation of upwards of 1000 feet on the west, and 2000 feet on the east. These cliffs are chiefly composed of limestone, and are destitute of vegetation save on the east side, where there are ravines, traversed by fresh-water springs. The north shores of the lake form an extensive and desolate muddy flat, marked by the blackened trunks and branches of trees, strewn about, and incrustated with salt, as everything is that is exposed to the spray of the Dead Sea. The southern shore is low, level, and marshy, and desolate and dreary in the highest degree; the air is choking, and no living thing to be seen. On this shore is the remarkable mass of rock called Usdum (Sodom). It is a narrow rugged ridge of hill, extending five miles north-west, and consisting of rock-salt. Large blocks have broken off from this hill, and lie strewn in all directions along the shore, adding to its dreary and deathlike aspect. To the north of Usdum, and at no great distance, is the supposed site of the ancient Sodom. Although the hills surrounding the D. S. are principally composed of stratified rock, yet igneous rocks are also seen; there are also quantities of post-tertiary lava, pumice-stone, warm springs, sulphur, and volcanic slag, clearly proving the presence here of volcanic agencies at some period. The neighbourhood of the D. S. is frequently visited by earthquakes, on which occasions it has been observed that this lake casts up to its surface large masses of asphaltum, of which substance the cups, crosses, and other ornaments that are made and sold to pilgrims at Jerusalem chiefly consist. The long-entertained belief, that the exhalations from this lake were fatal, is not founded upon fact; birds have been seen flying over, and even sitting upon its surface. Within the thickets of tamarisk and oleander, which here and there may be seen upon its brink, the birds sing as sweetly as in more highly-favoured quarters. A curious plant grows on the borders of the D. S., the *Asclepias procera*, which yields fruit called the Apples of Sodom, beautiful on the outside, but bitter to the taste, and when mature, filled with fibre and dust.

The water of the D. S. is characterised by the presence of a large quantity of magnesian and soda salts. Its specific gravity ranges from 1172 to 1227 (pure water being 1000). The proportion of saline matter is so great, that whilst sea-water only contains 30 parts of salts in the 1000 parts, the water of the D. S. contains about 250, or eight times more than that of the ocean. The saltiness of the D. S. has been explained in several ways; but there is no need to advert to more than one. It is a circumstance attending all lakes or collections of water without any outflow, that the water acquires an infusion of salt, its feeders constantly bringing in this material, while none can go off by evaporation. It may, moreover, be remarked that, if the D. S. was formerly at a higher level, and brought down to its present pitch by evaporation, a deposit of salt, such as we see on its banks, would be the natural consequence. Considerable deposits of common salt, sulphate of lime, and carbonate of lime have been formed along the bottom of the lake; and there is reason to believe that the deposits of rock-salt which occur in Cheshire, Poland, and other places, have been formed at remote periods by depositions in lakes similar to those of the Dead Sea.

DEADLY NIGHTSHADE. See BELLADONNA.

## DEAD'S PART—DEAF AND DUMB.

**DEAD'S PART.** The portion of the movable estate of the deceased which remains over, after satisfying the legal claims of his wife and children, should he have left such, is known in Scotland as the dead's part. It is so called, because it is with reference to this portion of his possessions alone that he possessed the power of disposal by will or testament. The D. P. may be increased by renunciations or discharges of their legal rights by the wife or the children, so as to include the whole movable estate, but these discharges must be express. The D. P. may also be increased or diminished by the conventional provisions of a marriage contract. See MARRIAGE CONTRACT, and SUCCESSION, MOVABLE, IN SCOTLAND.

A distribution of the personal estate of the deceased, similar to that which is still followed in Scotland, prevailed, in accordance with the ancient customs, within the city of London and the province of York, and was probably common to the whole island (see Stephen's *Com.* ii. 222, and note). These customs have now been abolished by 19 and 20 Vict. c. 94. See SUCCESSION, PERSONAL, IN ENGLAND.

**DEAF AND DUMB.** Persons who are born deaf, or who lose their hearing at a very early age, are dumb also; hence the compound term *deaf-and-dumb*. But the primary defect is deafness; dumbness is only the consequence of it. Children ordinarily hear sounds, and then learn to imitate them; that is, they learn to repeat what they hear other persons say. It is thus that every one of us has learned to speak. But the deaf child hears nothing; cannot therefore imitate, and remains dumb.

Persons who lose their hearing later in life are not to be classed among the deaf and dumb. Having learned to speak before their hearing was lost, they can readily communicate with others, though deaf themselves; and if they are educated, there are still open to them all the stores of knowledge contained in books, from which the juvenile deaf and dumb, ignorant of all written and spoken language, are utterly excluded. It is this latter class alone which we have to deal with in our statistics, which is contemplated in our census enumerations, and for which our institutions for the education of the deaf and dumb are specially designed.

The term 'deaf and dumb' is somewhat unfortunate, as embodying and repeating the error that the affliction is twofold. It affects two organs, certainly, but only, as above described, in the way of cause and effect. The organ of hearing is wanting, but the organs of speech are present; they merely lack the means of exercise. The ear is the guide and directress of the tongue; and when she is doomed to perpetual silence, the tongue is included in the ban; though, if we could by any means give to the ear the faculty of hearing, the tongue would soon learn for itself to fulfil its proper office. To correct the error involved in this apparent misnomer, some authorities use the terms *deaf-dumb* and *deaf-mute*. The latter seems to be a customary expression in America, as in France it is *Sourds-muets*. In the Holy Scriptures, the same original word is translated 'deaf' in some places (as in St Mark vii. 32), and 'dumb' or 'speechless' in others. (See Matt. ix. 33, and Luke i. 22.)

This affliction is very much more common than, for a long time, and up to a recent period, it was supposed to be. Happily, however, along with the knowledge of its extensive prevalence, have come the means of alleviating it, by education. It was only when the schools now in existence began their useful work, and caused inquiries to be made, that the actual numbers of the deaf and dumb began to appear. In every place where it was proposed to

establish a school—in Paris, London, Liverpool, Manchester, Yorkshire, and in New York—the objection was immediately started, that children could not be found in sufficient numbers to require such schools. Their promoters, however, knew better than this, and persisted in their design. They soon had the satisfaction of converting the objectors into their warmest supporters; and the institutions thus established, in the localities just named, are now the largest, the most useful, and the most prosperous in the world.

The facts thus ascertained, and the calculations based upon them, continued to be the only statistics upon the subject of deaf-dumbness in Great Britain and Ireland until the census of 1851: then, for the first time in this country, the number and ages of the deaf and dumb formed a part of the inquiry. In Ireland, a further investigation was subsequently made, which resulted in the collection of a mass of valuable information upon the causes of deafness, the social condition of the deaf-mute, and other kindred subjects, which has been published in a *Report on the Status of Disease* in that country. There the inquiry was conducted under a special commission; in Great Britain, it was directed by the registrar-general, and its first purpose was to ascertain the number and ages of the deaf and dumb of each sex. It would have been well if it had been limited to this, for the educational statistics were grossly incorrect and deceptive. Perhaps the mistakes which were made were the natural incidents of a first attempt. If, in the census just taken, these errors are avoided, we shall not only obtain a valuable stock of recent and more accurate information, but we shall, for the first time, possess means of comparison, of the greatest importance. The number of children under instruction in the various schools is considerably greater than it was ten years ago; new institutions have been built, and old ones enlarged to meet the additional claims upon them for admission. It is probable that at least 1600 pupils are now in the various schools of Great Britain and Ireland, though in 1851 there were but 1300. Many questions are suggested by this fact, which the census returns of 1861 may help us to solve. Is education more valued and sought after, or is the number of deaf-mutes absolutely increased? If the latter, is the increase in exact proportion to the increase of population, or not? Do the numbers of those born deaf, and of those who have become deaf from disease, preserve the same proportion to each other, and to the general population? These are all questions of the greatest importance, and the possession of accurate information will throw light upon many of the difficulties which surround this subject.

The latest available returns (those of 1851) exhibit the following particulars of the number of deaf and dumb persons in this country, and the proportion which they bear to the whole population:

	Number of Deaf and Dumb.	Total Population.	Proportion.
England, . . . . .	9543	16,738,695	1 in 1754
Ireland, . . . . .	4747	6,552,324	1 in 1330
Scotland, . . . . .	2155	2,888,742	1 in 1340
Wales, . . . . .	771	1,188,914	1 in 1542
Islands in the British Seas, . . . . .	84	143,126	1 in 1704
Total, . . . . .	17,300	27,511,801	1 in 1590

This result of 1 in 1590 for all the British population is very remarkable, on account of its close approximation to the average for the whole of Europe, which is stated in the same returns to be 1 in 1593. As to the local prevalence of deafness, it will be seen in the following table that the proportion varies greatly in different parts of the kingdom:

DEAF AND DUMB.

	Number of Deaf and Dumb.	Total Population.	Proportion.
Northern counties of England,	471	960,126	1 in 2058
North-western, i.e., Lancashire and Cheshire,	1237	2,400,827	1 " 2014
South-eastern counties,	836	1,628,386	1 " 1948
South-midland ditto,	649	1,234,332	1 " 1902
London,	1325	2,362,236	1 " 1783
North-midland counties, Yorkshire,	694	1,214,538	1 " 1750
Eastern counties,	1042	1,789,047	1 " 1717
West-midland ditto,	669	1,113,982	1 " 1665
Wales (including Monmouthshire),	1325	2,132,930	1 " 1610
Connaught, Ireland,	771	1,188,914	1 " 1542
Southern counties of Scotland,	674	1,010,031	1 " 1499
Leinster, Ireland,	1225	1,813,562	1 " 1480
South-western, England,	1185	1,672,753	1 " 1474
Ulster, Ireland,	1295	1,803,291	1 " 1393
Munster, ditto,	1527	2,011,890	1 " 1318
Northern counties of Scotland,	1411	1,857,650	1 " 1317
	930	1,075,180	1 " 1156

A comparison between the first item in the foregoing table and the last, shews us that in the northern counties of Scotland there are nearly twice as many deaf-mutes as in the northern counties of England; and the diversity in some of the English counties is still more remarkable. Thus, for one deaf-mute in Lancashire, there are two in Herefordshire; for one in Huntingdonshire, there are three in Herefordshire; for one in the East Riding of Yorkshire, there are two in Worcestershire; for one in Durham, there are two in Derbyshire, and two in Cornwall.

How far this affliction is inevitable, and how far preventable by improved sanitary arrangements, by medical science and skill, by the prudence of individuals in avoiding marriage with blood-relations, or unions which are likely to result in the transmission of constitutional defect—these are all questions which cannot now be determined. When the facts which bear upon the subject have been fully ascertained, and the truth which they declare is placed beyond question, it is to be hoped that we shall see the number of this afflicted class brought down to the point at which it may be considered due to causes which are beyond man's control, subject alone to the will of the All-wise, who revealed himself in the earliest ages of the world as the maker of man's mouth, of the Dumb and the Deaf, the Seeing and the Blind (Exod. iv. 11). But while social science is prosecuting this important inquiry, Philanthropy has before her the work of educating these 'children of silence,' to whom the ordinary means of instruction are obviously inapplicable, and for whom, until a century ago, there existed no available means of education at all. Mentioned, as we have just seen, at the outset of man's history, by Moses; spoken of frequently in the writings both of the Old and New Testaments; alluded to by the poets, philosophers, and lawgivers of antiquity—we have no account of any attempt at educating the deaf until the 15th c.; no school existed for them until the middle of the 18th; nor could it be said that education was freely offered, and readily accessible, until within the last thirty years. There are now in Europe and America about 200 schools for the deaf and dumb. In the same countries where this provision is made, there were, according to the latest returns upon the subject, between 90,000 and 100,000 deaf-mutes. Of these, about 16 per cent. are of the proper age to be at school, but nowhere is this proportion reached. The nearest approximation to it is in Scotland and in the United States. In only a few countries are the returns sufficiently recent and accurate to be depended upon, and the state of education in them is shewn by the following: In the United States, there were 1162 at school, out of 9717 = 12

per cent.; in Scotland, 250 at school, out of 2155 = more than 11½ per cent.; in England and Wales, 816 at school, out of 9543 = 8 per cent.; in France, 1642 at school, out of 29,512 = 5½ per cent.; in Ireland, 234 at school, out of 4747 = 5 per cent. Thus, of those who were of the proper school-age, there were actually under instruction only 34½ per cent. in Ireland, 50 per cent. in England, and 70 per cent. in Scotland. The next returns may be expected to shew a large increase upon these numbers; and if it should be thought that this is but a meagre result, it must be remembered that only within the present century has this work of educating the deaf and dumb taken a systematic and practical shape at all. Yet during this period—that is to say, since 1792, when the London Asylum, the first public institution in this country, was established—between 7000 and 8000 deaf-mutes have been educated in the schools of Great Britain and Ireland, and upwards of 5000 in those of the United States since 1817. Add to these the pupils of the various continental institutions since 1760, when De l'Épée collected his little group of children in the environs of Paris, and Thomas Braidwood opened his school in Edinburgh, and we should then see that the fruits of these men's labours have not been meagre, but great and marvellous. Some isolated attempts had previously been made, by different men, in different countries, and at long intervals, to give instruction to one or two deaf and dumb persons, and their endeavours had been attended with various degrees of success. These several cases excited some attention at the time; but after the wonder at their novelty had subsided, they seem to have been almost forgotten, even in the countries where the experiments were made. Bede speaks of a dumb youth being taught by one of the early English bishops, known in history as St John of Beverley, to repeat after him letters and syllables, and then some words and sentences. The fact was regarded as a miracle, and was classed with others alleged to have been wrought by the same hand. From this time, eight centuries elapsed before any record of an instructed deaf-mute occurs. Rodolphus Agricola, a native of Groningen, born in 1442, mentions as within his knowledge the fact that a deaf-mute had been taught to write, and to note down his thoughts. Fifty years afterwards, this statement was controverted, and the alleged fact pronounced to be impossible, on the ground that no instruction could be conveyed to the mind of any one who could not hear words addressed to the ear. But the discovery which was to give the key to this long concealed mystery was now at hand. In 1501, was born, at Pavia, Jerome Cardan (q. v.), a man of great but ill-regulated talents, who, among the numerous speculations to which his restless mind prompted him, certainly discovered the theoretical principle upon which the instruction of the deaf and dumb is founded. He says: 'Writing is associated with speech, and speech with thought; but written characters and ideas may be connected together *without* the intervention of sounds,' and he argues that, on this principle, 'the instruction of the deaf and dumb is difficult, but it is possible.' All this, which to us is obvious and familiar, was a novel speculation in the 16th century. With us, it is a common thing for a man to teach himself to read a language though he cannot pronounce it. There are, for instance, hundreds of persons who can read French, who do not and cannot speak it. Now, it is evident, in this case, that written or printed words do impart ideas independently of sounds, yet this was a discovery which the world

DEAF AND DUMB.

owes to Jerome Cardan; and it was for want of seeing this truth, which to us is so familiar, that the education of the deaf and dumb was never attempted, but was considered for so many centuries to be a thing impossible. It was in Spain that these principles were first put into practice by Pedro Ponce, a Benedictine monk, born at Valladolid in 1520, and again, a century afterwards, by another monk of the same order, Juan Paulo Benet, who also published a work upon the subject, which was the first step towards making the education of the deaf and dumb permanent, by recording the experience of one teacher for the instruction of others. This book, published in 1620, was of service to De l'Épée 150 years later; and it contains, besides much valuable information, a manual alphabet identical in the main with that one-handed alphabet which is now in common use in the schools on the continent and in America. From this time there was a general awakening of the attention of intellectual men, not only to the importance of the subject, but to the practicability of instructing the deaf-mute. One of Benet's pupils was seen by Charles I., when Prince of Wales; and the case is described by Sir Kenelm Digby, who was in attendance upon the prince, on his memorable matrimonial journey into Spain. When the art died away in that country, it was taken up by Englishmen, and began forthwith to assume an entirely new aspect. Dr John Bulwer published, in 1648, his *Philosophus, or the Deafe and Dumbe Man's Friend*; Dr William Holder published his *Elements of Speech, with an Appendix concerning Persons Deaf and Dumb*, in 1669; and Dr John Wallis, Savilian Professor of Mathematics in the university of Oxford, both taught the deaf and dumb with great success, and wrote copiously upon the subject. In 1662, one of the most proficient of his pupils was exhibited before the Royal Society, and in the presence of the king. The *Philosophical Transactions* of 1670 contain a description of his mode of instruction, which was destined to bear ample fruits long after his death.

Before the close of the 17th c., many works of considerable merit appeared, the chief of which are the *Surdus Loquens* (the Speaking Deaf Man) of John Conrad Amman, a physician of Haarlem; and the *Didascalophus, or deaf and dumb Man's Tutor*, of George Dalgarno. This treatise, published in 1680, and reprinted a few years ago by the Maitland Club, is eminently sound and practical, which is the more remarkable, as the author speaks of it as being, for aught he knows, the first that had been written on the subject. He is the first English writer who gives a manual alphabet. The one described by him, and of which he was the inventor, is, most probably, the one from which our present two-handed alphabet is derived. Dalgarno was by birth a Scotchman, but was long resident at Oxford. He died in 1687, and Dr Wallis in 1703. From that time until 1760, nothing more was done in this country—though the subject was beginning to excite some attention in France—to resume the work which had been thus far prosecuted and helped on by the writings and labours of these eminent men. In 1760, when the Abbé De l'Épée was opening his little school in Paris, the first school in the British dominions was also established in Edinburgh, by Thomas Braidwood. He commenced with one pupil, the son of a merchant in Leith, who had strongly urged him to carry into effect the plan of instruction followed by Dr Wallis, and described in the *Philosophical Transactions* ninety years before. This school, the parent and model of the earlier British institutions, was visited and spoken of by many of the influential men of

that day, and its history and associations are imperishable. Its local name of *Dumbiedikes* suggested to Sir Walter Scott a designation for one of his most popular characters in the *Heart of Mid-Lothian*. A visit paid to it in 1773, by Dr Johnson, and his biographer Boswell, supplies one of the most suggestive and characteristic passages in the *Journey to the Western Islands*. In the year 1783, Mr Braidwood removed to Hackney, near London, and the presence of his establishment so near to the metropolis undoubtedly led to the foundation of the London Asylum in 1792. Dr Watson, its first principal, was a nephew, and had been an assistant, of Mr Braidwood; and he states that, some ten or fifteen years previously, the necessity for the establishment of a public institution had been plainly seen, and some few but insufficient steps taken towards the accomplishment of such a design. From its foundation in 1792 until 1829, it was directed with great ability by Dr Joseph Watson, in whose work on the *Instruction of the Deaf and Dumb*, this statement is given. On his decease, he was succeeded by his son, Mr Thomas James Watson, of Clare Hall, Cambridge, who had assisted his father in the later years of his life, and had also officiated for a short time as the principal of the Glasgow institution. The death of Mr Watson took place at the end of 1857, and the educational management of this important establishment was committed to his eldest son, the Rev. James H. Watson, M.A., of Pembroke College, Cambridge. This, the oldest public institution in Great Britain, and the largest in the world, has existed nearly seventy years: it contains upwards of 300 inmates; it has educated not less than 3000 persons; it has trained a numerous staff of assistants, from whom have been selected, at various times, the principals of some of the most important institutions in the kingdom; it has received, and sent back to their homes, pupils from every part of England; from Wales, Scotland, Ireland, and the Channel Islands; and from numerous dependencies of the British crown, beginning with Gibraltar and Malta, and extending to India and Australia. This large field of usefulness is now to some extent occupied by the younger institutions, which have subsequently sprung up in the more populous parts of the kingdom, to meet local necessities, and to make easily accessible to the deaf and dumb the inestimable blessings of education.

The following table shews, in the most concise manner, the position and date of the various institutions in Great Britain and Ireland, and the number of inmates, as nearly as they can be ascertained:

Locality.	Date.	Principal.	Inmates.
<i>England and Wales:</i>			
London, . . . . .	1792	Rev. J. H. Watson, M.A.	315
Birmingham, . . . . .	1812	Mr A. Hopper, B.A.	90
Manchester, . . . . .	1823	Mr A. Patterson	134
Liverpool, . . . . .	1825	Mr D. Buxton, F.R.S.L.	95
Exeter, . . . . .	1827	Dr W. B. Scott.	42
Doncaster, . . . . .	1829	Mr Charles Baker.	100
Newcastle, . . . . .	1830	Mr William Neill.	60
Brighton, . . . . .	1841	Mr W. Sleight.	78
Bristol, . . . . .	1841	Mr John Clyne.	22
Bath, . . . . .	1842	Rev. F. Elwin.	44
Swansea, . . . . .	1847	Mr A. Melville.	17
<i>Scotland:</i>			
Edinburgh, . . . . .	1810	Mr W. Hutchinson.	41
" Donaldson's } Hospital, } . . . . .	1850	Mr A. M'Diarmid.	70
Glasgow, . . . . .	1819	Mr D. Anderson.	76
Aberdeen, . . . . .	1819	Mr R. Scott.	30

Thus, it is to the present century that the honourable distinction belongs of having done so much for the deaf and dumb; and this has not been by inventing the art of teaching, or by raising up the earliest labourers in this field of usefulness, but by founding and supporting public institutions for this purpose. De l'Épée, when he opened his school in 1760, had no foreknowledge of the work he was commencing. As his labours increased, he invited others to his assistance, and they were thus enabled to carry the light of instruction elsewhere, and to keep it alive when he was no more. His death took place in 1789, and his assistant, Sicard, succeeded him. Four years afterwards, this school was adopted by the French government, and now exists as the Imperial Institution of Paris. A pupil of the same Institution, M. Laurent Clerc, on being applied to in 1816, consented to go to the United States with the founder and first principal of the American asylum, and he became, like De l'Épée, *le Père des Sourds-muets* (the Father of the deaf and dumb) in the New World. From these small beginnings of Braidwood and De l'Épée, of Heinicke in Germany, and Gallaudet in America, have arisen, within a century, 200 schools for the deaf and dumb. In Great Britain and Ireland there are 20 institutions, 16 in the United States, 2 in British America, about 70 in Austria, Prussia, and the smaller kingdoms and states of Germany, 50 in France, 10 in Italy and in Switzerland, the same number in Holland and Belgium, 5 in the Danish dominions, 3 in Russia and Poland, 2 in Spain, 1 in Portugal; and the effort is being made in one if not more of the great centres of population in Australia, to provide education for the deaf-mute at the antipodes.

The mental condition of the deaf and dumb is so peculiar—so entirely unlike that of any other branch of the human family—that it is extremely difficult, without very close thought, to obtain an accurate conception of it. While almost every one will readily admit that there is a wide difference between a deaf and a hearing child, very few, who have not had their attention painfully drawn to the subject, possess any adequate notion of the difference, or could tell wherein it consists. Sometimes the deaf are compared with the blind, though there exists no proper ground of comparison between them. Except that the blind are more *dependent* than the deaf and dumb, the relative disadvantages of the two classes do not admit of a moment's comparison. The blind man can be talked with and read to, and is thus placed in direct intercourse with the world around him: domestic converse, literary pleasures, political excitement, intellectual research, are all within his reach. The person born deaf is utterly excluded from every one of them. The two afflictions are so essentially dissimilar, that they can only be considered and spoken of together by way of contrast. Each of them affects both the physical and the mental constitution; but blindness, which is a grievous bodily affliction, falls but lightly on the mind; while the effect of deafness is the extreme reverse of this—it touches only one bodily organ, and that not visibly, but the calamity which befalls the mind is one of the most desperate in 'the catalogue of human woes.' The deprivation under which the born-deaf labour is not merely, or so much, the exclusion of sound, as it is the complete exclusion of all that information and instruction which are conveyed to our minds, and all the ideas which are suggested to them, by means of sound. The deaf know almost nothing, because they hear nothing. We, who do hear, acquire knowledge through the medium of language—through the sounds we hear, and the words we read—every hour. But as regards the deaf and dumb, speech tells them nothing, because they

cannot hear; and books teach them nothing, because they cannot read; so that their original condition is far worse than that of persons who 'can neither read nor write' (one of our most common expressions for extreme ignorance); it is that of persons who can neither read, nor write, nor hear, nor speak; who cannot ask you for information when they want it, and could not understand you, if you wished to give it to them. Your difficulty is to understand *their* difficulty; and the difficulty which first meets the teacher is, how to simplify and dilute his instructions down to their capacity for receiving them.

A class thus cut off from all communication through the ear, can only be addressed through the eye; and the means employed in the instruction of the deaf and dumb are—1. The *visible* language of pictures, and of signs and gestures; 2. The finger-alphabet (or Dactylogy), and writing, which make them acquainted with our own *written* language; and, in some cases, 3. Articulation, and reading on the lips, which introduce them to the use of *spoken* language. The education of the deaf and dumb must be twofold—you must awaken and inform their minds by giving them ideas and knowledge, and you must cultivate them by means of language. The use of signs will give them a knowledge of things; but to this must be added a knowledge of words. They are therefore taught, from the first, that words convey the same ideas to our minds which pictures and signs do to theirs; they are therefore required to change signs for words until the written or printed character is as readily understood as the picture or the sign. This, of course, is a long process, as it has to be repeated with every word. Names of visible objects (nouns), of visible qualities (adjectives), and of visible actions (verbs), are gradually taught, and are readily acquired; but the syntax of language, abstract and metaphorical terms, a copious diction, idiomatic phraseology, the nice distinctions between words called synonymous, and those which are identical in form, but of different signification—these are far more difficult of attainment; they can only be mastered through indomitable perseverance and application on the part of the pupil, in addition to the utmost skill and ingenuity of the teacher. The wonder, therefore, surely is, seeing the point of starting, that this degree of advancement is ever reached at all.

Yet it has been set forth by otherwise respectable authority, that the deaf and dumb are a '*gifted race*;' that they are remarkable for 'their promptitude in defining abstract terms;' and those who ought to have known better, and who *did* know better, have strengthened this delusion, if, indeed, they did not cause it, by such proceedings as the publication of 'Essays' purporting to be 'by the Deaf and Dumb,' in which the pupils wrote better English than their master: and by putting forth, as the *bona-fide* answers of deaf-mutes, those brilliant aphorisms and definitions of Massieu and Clerc, which are so often quoted at public meetings, by eloquent speakers who know nothing of the subject. It is very well known to those who are acquainted with the subject, that the so-called definitions, of *Hope, Gratitude, Time, Eternity*, &c., were not Massieu's at all, but those of his master, the Abbé Sicard. The influence of these fallacious has been most mischievous; they raise expectation to an unreasonable height, for it is thought that what was done by 'the celebrated pupil of the Abbé Sicard,' may be done every day: and disappointment is the inevitable consequence. The honest, laborious teacher who cannot produce these marvellous results, and will not stoop to deception, has often to labour on without

## DEAF AND DUMB.

that appreciation and encouragement which are so eminently his due; the cause of deaf-mute instruction suffers, and a young institution is sometimes crippled by the failure of support, which was first given from one impulse, and is now withdrawn from another—not a whit more unreasonably than the first, but very unfortunate in its consequences.

The course of instruction is very much the same in all the schools of this country. In the London Asylum, and in Donaldson's Hospital, Edinburgh, articulation is professedly and systematically taught to every pupil. In other British institutions, it is taught in certain cases only. Very decided and opposite views are held upon the subject, but the question is practically determined in most cases by the financial difficulty. It would require more time and a larger staff of assistants to teach articulation, in addition to the other subjects of instruction, than the moderate means of the institutions generally could afford. The Metropolitan Asylum, and the noble foundation of James Donaldson, near Edinburgh, enjoy ample funds; and these, it is to be hoped, will always be applied so as to give to the deaf and dumb every educational advantage which they are capable of receiving.

The manual alphabet in common use in the schools of this country is the two-handed one, though the

their board. The larger benefactions are invested, where the annual income from ordinary sources will admit of it. Committees, chosen from the body of

Two-handed Alphabet.

subscribers, direct the affairs of these institutions, the executive officers being the head-master and the secretary; but in some cases the sole charge is intrusted to the principal. The gentlemen who fill this office have devoted their whole lives to the work; some of them have also done good service by their writings upon the subject. Mr Baker of Doncaster, Dr Scott of Exeter, and Mr Buxton of Liverpool, have all helped to make it better known and better understood than it could possibly be when it was treated by men with no practical knowledge, as a merely literary topic, or a subject of philosophical curiosity. Justice also requires the mention here of the valuable writings of Dr Peet of New York, and other American instructors of the deaf and dumb. The institutions in the Western World are munificently supported by grants from the states, and appear to be admirably managed. The staff of teachers is numerous, able, and efficient, and a high degree of success may fairly be expected where the work is carried on under advantages which are unknown in the schools of Great Britain. New York contains also a church for deaf-mutes, of which the Rev. Thomas Gallaudet, son of the founder of the American Asylum, is the minister, and where at least one service every Sunday is conducted in the language of signs. At a meeting held under the presidency of Bishop Potter, to promote the erection of a new church, Mr Gallaudet stated some interesting facts concerning his little flock. 'From October 1852 to May 1858, there had been baptised 11 adults, of whom 10 were deaf-mutes; and 33 children, 14 of whom had deaf-mute parents. Thirty-six persons had been confirmed, of whom 26 were deaf-mutes; 21 couples

One-handed Alphabet.

other is used in some of the Irish institutions, and is regarded with favour by a few of the English teachers. The arguments in its favour, like those for the decimal currency, may probably be admitted: it would be better if we had it. But the rival system has got possession, and is in familiar use, and persons are apt to think that the inconveniences of making the change would outweigh the advantages to be expected from it. The institutions in Great Britain are supported by annual subscriptions, donations, and legacies, and by the payments of pupils for

married, 10 of which were deaf-mutes; 30 burials had taken place, 8 for deaf-mute persons, and 2 for children of deaf-mute parents; and he had received 83 communicants, 43 of whom were deaf-mutes. The same necessity which here is so admirably met, must exist in all large communities. In London and Manchester, special arrangements have been made to minister to the adult deaf and dumb; and in some of the other large towns of the kingdom, Sunday-services are held for the former pupils resident in those localities. The desirableness of some agency to supplement and continue the work begun in the institutions, in order to improve the condition of adults, has latterly been in consideration.

A novel experiment is now in operation at Manchester, where a school for the *infant* deaf and dumb has been established. It owes its origin to the persevering advocacy of Thomas Turner, Esq., an eminent surgeon of that city. It was opened on the 26th September 1860, when 26 candidates, of ages varying from six years and eleven months to three years and five months, were admitted. In the Liverpool school, the age of admission is seven years, and this has been found to work well; but the minimum age of admission into most of the other institutions is from eight to nine years. Now, as soon as a child is able to learn anything, he ought to learn something; and deaf children can with difficulty be kept out of mischief and danger, even when under watchful oversight; but in the manufacturing districts, where female labour is valuable, the mothers of families are frequently absent from their homes, at work in the factories, every day of the week. It is this circumstance which makes Manchester the best field for an experiment of this kind. The local necessity is peculiar, and the spirit and energy which have been enlisted in this work will go far to insure its success.

These are the means at present employed for the benefit of the deaf and dumb, and it is no small honour to the present century, which has won so many proud distinctions in other fields of enterprise and usefulness, that it should have done so much for those who for so many generations were utterly excluded from light and knowledge.

**DEAF AND DUMB** (in Law). From the imperfect methods formerly in use for the education of the deaf and dumb, they were almost everywhere held to be legally in the same position as idiots and madmen. The Roman law held them to be incapable of consent, and consequently unable to enter into a legal obligation or contract. Both in England and Scotland, the amount of their capacity is now a question of fact, which, in cases of doubt, will be referred to a jury. In the same manner, a mute will be examined as a witness in regard to a fact to which he is capable of bearing testimony, and the examination will be conducted in the manner which seems most likely to elicit the truth. (Best, *Law of Evidence*, p. 201.) The same principle will govern the estimate of his responsibility for crime. (Stephen's *Com.* iv. 461.) It is of course legally, as it is physically, impossible that a mute should act as a juror.

**DEAFNESS** may be complete or partial, may affect both ears or only one, may date from birth, be permanent or only temporary, and is but too often one of the distressing symptoms of advancing age. The causes of deafness are numerous. On glancing at the article **AUDITORY NERVE**, the reader will at once remark the extraordinary intricacy of the hearing-apparatus there described, and will easily conceive that although it be contained in a little nut of densest bone (the petrous portion of the temporal), still it is exposed to many deteriorating

influences, and that very slight causes may disarrange the exquisite adjustment of its parts. 1. The auditory nerve may itself be unsusceptible to the stimulus of sound, from some diseased condition at its origin in the brain, or at its final subdivision in the labyrinth. This is termed nervous deafness. 2. The structures which conduct the vibrations of sound to the labyrinth may be faulty, from accident or disease. 3. The passage leading to the tympanum or drum may be blocked up. 4. The cavity of the drum may have ceased to be resonant, owing to deposits from inflammatory attacks, to loss of its membrane, or air being excluded, from obstructions in the passage between it and the gullet (the Eustachian tube).

Nervous deafness may be caused by a sudden concussion, as from a 'box on the ear,' or a general shock to the whole body, as in the case of the celebrated Dr Kitto, who lost his hearing, when a boy, by a fall from the top of a house. The concussion from loud sounds suddenly taking the ear unawares, before its small muscles have time to prepare themselves for the shock, causes the deafness which follows the firing of cannon. Even a loud yell close to the ear has been sufficient to destroy the hearing-power on that side. As such an accident is generally accompanied by an increased flow of blood to the part injured, it may be relieved by the application of leeches, applied behind the auricle, and the ear should for some time be protected from loud sounds as carefully as possible. In some of these cases the nerve gradually recovers its sensibility, but in many the deafness continues, and is accompanied by a distressing singing in the ears. Exposure to cold affects the auditory nerve; and gouty persons, or those who are suffering from the poisons of typhus fever, scarlatina, measles, mumps, &c., frequently become deaf. Some medicines, as quinine, produce nervous deafness; so do debility and mental excitement; but all these causes seem to act in one way—viz., to increase the flow of blood to the ear, and should be treated accordingly.

The solid conductors of sound to the auditory nerve may be injured or diseased, so that the vibrations are interrupted. One curious cause of deafness has been recently shewn to exist by Mr Joseph Toynbee of London—viz., an increasing stiffness in the little joint by which the stirrup-bone moves in the oval window of the vestibule; this stiffness prevents the base of the stirrup pressing inwards sufficiently to affect the contents of the labyrinth, therefore it ceases to keep the auditory nerve *en rapport* with the membrane of the drum. This condition may be recognised during life by the patient losing the power of adapting his hearing to varying sounds. Two persons speaking at once prevents his hearing the voice of either; there is a constant buzzing in the ear, and he gets deafer and deafer day by day. This curious disease is frequently associated with gout and rheumatism, and in its earlier stages may be influenced by the same remedies as these; but if once established, it is incurable.

Sound reaches the auditory nerve through the vibrations of the bones of the head, but chiefly through the external opening in the auricle, the passage leading from which is shut at the depth of an inch and a quarter from the surface by the membrane of the drum stretching across it. Should this passage be blocked up, so that the sounds can no longer pass along it to impinge upon the membrane, either total or partial deafness must result.

The most common obstruction is an accumulation of the wax secreted by a small ring of glands near the orifice. The object of this cerumen or wax is to

catch the particles of dust floating in the atmosphere; but sometimes it is harder than usual, and is no longer gradually expelled by the movements of the jaw in speaking and eating. At last, it fills the passage in the form of a hard plug, and sounds can neither pass through it nor by its side; if left, it gradually causes serious changes in the shape of the passage, and even symptoms resembling diseases of the brain. Sometimes foreign bodies find their way into this passage, or tumours grow in it, and no unprofessional attempts should be made to remove them, lest the membrane of the drum be injured. It is but seldom that any instruments are necessary in addition to a stream of water thrown briskly in by means of a syringe, with a nozzle smaller than the circumference of the passage. Should the wax be very firm and hard, it is well to soften it by dropping in some oil or an alkaline solution. But even a stream of water, unless great care be taken, may injure or burst the delicate membrana tympani, and the proceeding leave the patient suffering from a more serious condition than before.

A membrane, to be resonant, must have air on both sides of it, and the membrana tympani obtains this essential by means of the Eustachian tube, the lower orifice of which, on each side of the gullet, opens for a brief period at each act of swallowing, and admits a small quantity of air, which ascends into the tympanic cavity, if the tube is in a healthy condition; but frequently in persons suffering from relaxed mucous membrane, the Eustachian passage becomes swollen and impassable, or blocked up by some thickened mucous secretion. During a common cold, persons often suffer from this cause of deafness. It has been supposed by some, that enlarged tonsils may interfere with the pharyngeal opening of the tube, and with that view they cut portions off them occasionally with great benefit to the condition of throat in which these glands are enlarged; but the latter are situated below and in front of the Eustachian tubes, and cannot be the immediate causes of the obstruction.

In some cases, the membrane of the drum may be perforated; and though the mere perforation is not sufficient to cause more than a slight degree of deafness, if the mucous membrane lining the tympanic cavity be thickened at the same time, the person is usually able to hear only the loudest sounds. If the perforation be stopped up, however, the air confined in the tympanic cavity vibrates sufficiently to stimulate the auditory nerve, through the round window of the labyrinth, and a useful degree of hearing is restored. In 1843, Mr Yearsley of London shewed that a small pellet of cotton-wool might be used for this purpose. It should be moistened with fine oil, and inserted on the end of a probe. Patients generally learn how to stick it neatly into the aperture themselves. It should be removed every three or four days, or oftener, should cleanliness require it.

Mr Toynbee has invented an artificial membrana tympani of vulcanised india-rubber, attached to

Artificial Membrana Tympani.

the end of a fine silver wire, by which it can be inserted or withdrawn. These beautiful little instruments may now be obtained of every surgical instrument-maker, and are at least worth trying in cases of perforated membrana tympani, as they often do good, can do no harm, and are very cheap.

The india-rubber having been pared to the size likely to fit the individual's ear, it is moistened with warm water, and gently passed down the auditory passage; the sensations of the patient will easily decide when it has gone far enough, and he gladly discovers, by the sound of his own voice or that of the surgeon, that his hearing has been suddenly improved.

The deafness of aged persons has been shewn, by Mr Toynbee, to be generally caused by the effects of previous inflammatory attacks, and may frequently be much relieved by counter-irritation behind the ear, alterative medicines, and washes which restore the healthy condition of the throat and the external auditory passage.

There are numerous 'cures for deafness' advertised from time to time; some are harmless if useless, others are useless, but very dangerous, owing to the readiness with which inflammation may be set up, and the liability of the latter to extend to the brain or its membranes. The diseases which affect the ear are the same as affect other organs, and require to be treated upon the same principles. It is always advisable, as soon as the first symptoms of approaching deafness are felt, to apply to one of the regularly qualified practitioners who devote themselves entirely to the subject, and to have nothing to do with these so-called cures, which benefit only the parties who sell them.

The best English works on the subject are *Practical Observations on Aural Surgery*, by William R. Wilde of Dublin, and *The Diseases of the Ear*, by Joseph Toynbee of London.

DEAL, a municipal borough, and member of the parliamentary borough of Sandwich, maritime town and sea-bathing place, in the east of Kent, on a bold open beach, near the south extremity of the Downs, between North and South Foreland, 18 miles east-south-east of Canterbury, and 8 miles north-north-east of Dover. It has three streets running parallel to the beach, and others stretching into the country. A fine anchorage extends 7 or 8 miles between D. and the Goodwin Sands. D. has mainly arisen to supply the wants of vessels which are often detained by the winds in the Downs to the number of 400 or 500 at a time. The chief branches of industry are connected with maritime pursuits, boat-building, sail-making, piloting or hovelling, victualling and naval stores. Pop. (1861) 7531. D. returns two members to parliament with Sandwich and Walmer. It has been one of the Cinque Ports since the 13th century. The coast near D. is defended by Deal Castle, near the town; Sandown Castle and three batteries on the north; and by Walmer Castle, a mile to the south. Walmer Castle is the official residence of the Warden of the Cinque Ports, and here the Duke of Wellington died in 1852. Henry VIII. built Deal Castle in 1539. Julius Cæsar, with two legions, in 82 ships, landed near D. in August 55 B.C. In 1859, 220 vessels, of 17,004 tons, entered and cleared the port. (Pop. 1871—8004.)

The DEAL BOATMEN, who are an enterprising and courageous body of men, amount to between 200 and 300, and have become noted for giving assistance to ships in distress, and for saving the lives of crews and passengers. Besides performing these services, they have been useful in carrying off provisions to outward-bound vessels, and in bringing ashore mail-bags requiring to be forwarded by express. Latterly, in consequence of steam-tugs being much employed in expediting outward and inward bound vessels, and also from the mails from many foreign countries being landed at Falmouth and other places, to be forwarded to London by railways, the occupation of the Deal

beatmen is nearly gone, and the community has sunk into poverty. Their case being made known by the press, some benevolent exertions were made to succour them. The community may be expected to diminish in proportion to the actual wants of navigation on the coast.

**DEALFISH** (*Trachipterus*), a genus of fishes of the ribbon-fish family, having the body much compressed, and so named D. from the resemblance of the form to a piece of deal—a resemblance which is increased by the dorsal fin extending along the whole length of the back. The tail-fin exhibits a

Dealfish, or Vaagmaer.

remarkable peculiarity, rising almost vertically from the horizontal line of the vertebral column, as if it had met with some accident, and assumed a new position. One species (*T. Bogmarus*), the VAAGMAER of the Icelanders and Norwegians, sometimes occurs on the most northerly British coasts. It is not common even on those of Iceland, and is apparently a deep-sea fish. It is a large fish, 4 or 5 feet in length, of a silvery colour, with minute scales. Other species are found in the Mediterranean.

**DEAL ISLAND**, an island in Bass's Strait, between Australia and Tasmania, is worthy of notice chiefly as having a light-house at an elevation of 880 feet above the sea.

**DEALS**, the trade-name for fir-boards exceeding 6 feet in length and 7 inches in width. Beards of smaller dimensions are called 'hattens.' Deals are usually 3 inches thick, and when sawed into thinner pieces, these are called 'planks.' When a deal is sawed into twelve or more thin planks, they are called 'leaves.' Most of the deals imported into this country are from the Baltic ports, North America, Sweden, and Norway. Drammen is the principal Norwegian timber-port, though the general name for the deals from Norway is 'Christiania deals,' so named from the Norwegian capital, where the principal timber-merchants reside, and through which the business of the trade is chiefly transacted.

The duty upon deals and battens from foreign countries is 10s. per load of 50 cubic feet, or 5s. 3d. per load upon those imported from the British colonies. For the various qualities of deals, and their applications, see **TIMBER**.

**DEAN**. The institution of deaneries, as of other ecclesiastical offices of dignity, bears a resemblance to the methods of ancient civil government. Thus, for the preservation of civil order, every hundred consisted of ten districts, called tithings, and in every tithing was a constable or civil dean. In conformity to this, the spiritual governors, the bishops, divided each diocese into deaneries or decanaries (Lat. *decem*, ten), corresponding to tithings, each of which was the district of ten parishes or churches, over every one of which a D. was appointed, who in the cities or large towns was called the D. of the city or town, and in the country, *rural dean*. It has been supposed, but on no certain authority, that the D. of a chapter was appointed to superintend ten canons; but it is more probable that the name was given to the office from its analogy to those above described. In the English Church, there are the following dignitaries who bear this name:

1. In the province of Canterbury, it is part of the dignity of the archbishop to have prelates to be his officers, and of these the Bishop of London is his

provincial D.; and when a convocation is assembled, the archbishop sends to him his mandate for summoning the bishops of the province. This is the sole example of the kind.

2. *Honorary Deans*, as the D. of the Chapel Royal of St James's.

3. *Deans of Peculiarities*, as of Battle in Sussex, founded by William the Conqueror in memory of his conquest. There are also the Deans of the Arches in London, of Bocking in Essex, and of Croydon in Surrey, who have jurisdiction, but no cure of souls.

4. *Deans of Chapters*, as at Canterbury, St Paul's, &c., who are governors over the canons in cathedrals and collegiate churches. Their appointment is in the direct patronage of the crown, which may appoint by letters patent; and the D. so appointed is entitled to be installed. The D. of a chapter must reside eight months in the year, and he may hold one benefice with his deanery. The income of the office is, in the case of Durham, £3000; of St Paul's, Westminster, York, and Manchester, £2000; of other cathedrals, £1000, except St David's and Llandaff, which have £700. See **CATHEDRAL**.

5. *Rural Deans*. These are very ancient officers of the church, but custom gradually transferred their duties to the archdeacon, as in the visitation of churches, parsonage-houses, &c. They may, however, act as deputies to the bishop and archdeacon; and of late the office has been revived with great advantage; and in well-ordered dioceses affords a useful channel of communication between the bishop and his clergy, and a means of joint action in matters affecting the church. There are altogether nearly 600 rural deaneries in England and Wales.

In the universities of Oxford and Cambridge, the D. is the officer who superintends the discipline of the college and the chapel services. At Christ Church, which is a cathedral, the D. is master of the college.

**DEAN OF THE CHAPEL ROYAL** (Scotland), an office held by three clergymen of the Established Church, to which they are appointed by the crown. The duties are nominal, being limited to an occasional sermon before her Majesty when in Scotland, and attendance at the election of the representative peers. Recent appointments, however, have been conferred in connection with chairs in the university of Edinburgh which are not otherwise endowed. The title of dean is somewhat out of place in the Church of Scotland, where the rule of Presbyterian parity is established. It is a remnant of Episcopacy, which the church courts have never had occasion to challenge, as the deans do not sit or act in that capacity, and have scarcely any ecclesiastical duties to perform. The benefice of the Chapel Royal, which was instituted by James V., was richly endowed, but it has been disputed whether the revenues now enjoyed by the deans belonged originally to the Chapel Royal of Stirling or to the Chapel Royal of Holyrood. It is known that the existing revenues were once attached to the see of Dunblane; and an act of parliament was passed in 1621, sanctioning the annexation of the revenues of the Chapel Royal of Stirling to the bishopric of Dunblane, which was the poorest bishopric in Scotland. Hence it is assumed that the whole existing deanery revenues belonged to the Chapel Royal of Stirling. But there are some facts which prove that the benefice was connected with the chapel at Holyrood equally with that at Stirling. William Couper, Bishop of Galloway, held the office of Dean of the Chapel Royal from 1615 to the commencement of 1619. He resided at the foot of the Canongate, and preached regularly in the Royal Chapel of

Holyrood. This individual drew part of his revenue from the parishes of Kirkcinner and Kirkcowan in the county of Wigton, and part of the present deanery revenues is likewise drawn from the same parishes. Dr Adam Bellenden, who was Bishop of Dunblane when the act above mentioned was passed annexing the revenues of the Chapel Royal of Stirling to his bishopric, performed the duties of Dean of the Chapel Royal at Holyrood for many years subsequent to 1621. It seems clear, therefore, that if the revenues of the benefice were ever divided between the two chapels, they were united to the see of Dunblane during the incumbency of Dr Bellenden. The state of the case probably is, that at its institution by James V., who resided frequently at Stirling, the benefice was held by ecclesiastics chiefly resident there. The Chapel Royal is noticed as in full operation in Stirling in 1540. During the reign of Queen Mary, the Chapel Royal seems to have been at Holyrood. In 1574, again, after the Reformation, the name of Johnne Duncanson appears as minister of the Chapel Royal, or King's House at Stirling, where James VI., then very young, resided; while at Holyrood the minister was apparently the regular parish minister of Canongate, and not connected with the Chapel Royal. Afterwards, when the royal residence became fixed at Holyrood, the Dean of the Chapel Royal officiated in the chapel, of which abundant proof exists in the history of the period. The chapel at Stirling was left to decay; whereas during the reigns of James VI., Charles I., Charles II., and James VII., the Chapel Royal of Holyrood was repaired and embellished. The last of the Stuarts laid out considerable sums for the purpose only the year before the revolution. The revenues of the benefice fell to the crown, *jure coronæ*, on the abolition of Episcopacy in 1690, and have since been gifted at the royal pleasure. For a long period, the emoluments were not at all considerable, owing to the practice which existed of giving tacks or leases of the Teinds (q. v.) to the proprietors of the lands at nominal rents. In consequence of the termination of some of those leases in 1841, and the deans being debarred in the gift of the appointment from accepting anything but the full yearly value of the revenues, a very great increase in the emoluments has gradually taken place. In 1841, the amount paid to each of the three deans was only £84, in 1850 it was £700. The present annual rental, which is divided among the three deans, will probably amount to £2400. A large proportion of the whole revenue is drawn from the parishes of Yarrow and Ettrick, and the remainder from parishes in the county of Wigton, Kirkcudbright, and Ayr. A small sum is also drawn from the parish of Crieff, in the county of Perth. The present holders of the office are Dr Norman McLeod, Glasgow, and Professors Robert Lee (Biblical Criticism) and Crawford (Divinity), of the university of Edinburgh.

**DEAN OF FACULTY**, the president of the incorporation of advocates or barristers in Scotland. Like all the other officers of the Faculty, the Dean is elected annually. As a general rule, he is re-elected till he is promoted to the Bench, when he ceases to take part in the deliberations, though not to be a member, of the body. See **ADVOCATE**.

**DEAN OF GUILD**, in Scotch burghs, was the head of the mercantile body called the Guild-brethren. See **GUILD**. In former times (1593, c. 180), he was a judge in mercantile and maritime causes within the burgh, but for a very long period he has been rather what might be called a kind of Scotch edile (q. v.). His chief duty is now

to see that buildings within the burgh are erected according to law, that they are sufficient, and, in case of their falling into a ruinous condition, to order them to be pulled down. Though in some of the larger burghs the D. of G. is still (3 and 4 Will. IV. c. 76, s. 22) a member of the town-council, *ex officio*, his jurisdiction is altogether separate from that of the baillie-court. In Edinburgh, the D. of G. court, in addition to the D. of G., consists of a council of merchants and tradesmen chosen annually, and of the old or former Dean of Guild. They are assisted by the law assessors of the magistrates of the city. No building can be either erected or demolished, or even materially altered, without a warrant from this court. Opposition to the issuing of the warrant may be offered, either by a private party, or by the procurator-fiscal of the court itself, acting for the public interest. The enforcement of the act 1698, c. 8, as to the height of buildings, the thickness of the walls, &c., lies within the province of the D. of G. court. The judgments of the D. of G. court may be reviewed by the Court of Session.

**DEAN FOREST**, a picturesque hilly tract, 22,000 acres in extent, in the west of Gloucestershire, between the Severn and the Wye. It is mostly crown-property, and about half of it is enclosed for the growth of timber for the navy. It contains oak, beech, &c. woods; orchards, yielding the famous Styre apple-cider; coal and iron mines; and stone-quarries for building, grinding, and making troughs and rollers. It is divided into six walks. Pop. 10,692, chiefly miners, once a lawless set. The former inhabitants had many ancient privileges—acquired by birth, and by working a year and a day in the Forest—viz., exemption from rates and taxes, free pasturage, right of mining—a sixth of the produce being due to the sovereign, and access to the woods for timber for their works. D. F. is governed by a lord-warden, six deputy-wardens, and other officials.

**DEATH**. It is one of the fundamental doctrines of physiology, that every part of the organism has its own definite term of vitality, and that there is a continuous succession of the destruction of old cells and the formation of new ones in all tissues, and especially in those in which the most active vital changes are going on, as, for example, in the nervous and muscular tissues. Even the most solid portions of the animal frame, such as the bones and (to a less extent) the teeth are undergoing a perpetual although a slower change of this nature; and throughout the whole body, there is a continuous removal of effete or worn-out tissues, and a corresponding deposition of new matter. Every blow we strike, every thought we think, is accompanied by the death and disintegration of a certain amount of muscular or nervous tissue as its necessary condition; and thus every action of our corporeal life, from its beginning to its close, takes place at the expense of the vitality of a certain amount of organised structure. This is termed *molecular D.*, and, within its proper limits, is obviously essential to the life and wellbeing of the organism.

The cessation of the circulation and respiration may be regarded as constituting *somatic D.*, or the D. of the entire organism, which must obviously be shortly followed by the molecular D. of every portion of the body.

We shall now briefly notice the principal modes in which D. occurs. D. happens either from the natural decay of the organism, as in old age, or (and much more frequently) from some of those derangements or lesions of the vital organs which occur in the course of the diseases and injuries to

which we are liable. These derangements of the vital organs may occasion various modes of dying. Dr Watson remarks in his *Lectures on the Principles and Practice of Physic*, that life rests on a tripod, whose three vital supports are the *heart*, the *brain*, and the *lungs*. Through the impaired functions of one or more of these organs, the tendency to D. is expressed. This is much the same as Bichat's statement, that 'the mode of dying may begin at the head, the heart, or the lungs.' The functions of these organs are, however, so mutually dependent upon each other, that impairment in the functions of one of them may lead to D., while the mode of dying is chiefly expressed through the functions of another.

When a person loses blood to such an extent that he faints, if the flow of blood be not arrested, the state of fainting or *syncope* continues, and the heart's action ceases. The cause of D. here is, not that the heart is unable to contract, but because its natural stimulus, the blood, does not enter it in sufficient quantity to excite contraction. This is termed D. by *anæmia*. In other cases, the stimulus from blood may be sufficient, but the heart may have lost its contractile power. Such a mode of death is said to be by *asthenia* (Gr. want of power). Many poisons and diseases, due to morbid materials in the blood (as, for example, cholera), prove fatal in this way.

D. may likewise be produced by suspension of the functions of respiration, as when access of the air to the lungs is impeded, or when the actions of the muscles of respiration cease, in consequence of disease or injury of the brain or spinal cord. The first of these modes is known as suffocation or *apnæa*, and we have examples of it in drowning, smothering, choking, strangulation, &c. Forcible pressure upon the chest, such as sometimes happens in great crowds, or as occurs to workmen partially buried by the fall of earth, &c., will cause D. in a few minutes, if movement of the lungs is prevented by the pressure. Tetanus and the poison of strychnine prove fatal in this way.

D. by coma, or beginning at the brain, is caused by obstruction to the circulation through that organ by pressure (as, for example, when there is effused blood within the cranium, or when a portion of bone is depressed in a fractured skull); by clots of blood within the vessels; by various narcotic poisons, such as opium, alcohol in excessive quantity, carbonic acid, &c.

To these forms of dying may be added (according to Dr C. J. B. Williams) *neeræmia*, or D. beginning in the blood, such as occurs in typhoid fevers and in other diseases of a malignant or pestilential kind. In this case, there is complete and general prostration of all the living powers. The blood, the natural source of life to the whole body, is itself dead, and spreads death instead of life. Almost simultaneously, the heart loses its power; the vessels, and especially the capillaries, lose their tone, and congestion takes place in various organs; the medulla oblongata, from which the chief respiratory nerves arise, is torpid; the powers of respiration fail; voluntary motion is almost suspended; molecular nutrition ceases, and is very rapidly followed by general molecular D.; that is to say, structures and even organs die, and begin to undergo decomposition as soon as the pulse and breath have ceased; and indeed, a partial change of this kind may even precede somatic D., as, for example, when parts become gangrenous, &c.

The signs of approaching D. require a brief notice. The mind may be affected in various ways; there may be dulness of the senses, vacancy of the intellect, and extinction of the sentiments, as in natural D. from old age; or there may be a peculiar

delirium, closely resembling dreaming, which usually is of a pleasing and cheerful character.

Saw ye not even now a blessed troop  
Invite me to a banquet, whose bright faces  
Cast thousand beams upon me like the sun?  
*King Henry VIII.*, Act iv. Scene 2.

In dreadful contrast with such visions, are those which haunt the dying minds of others, when it would sometimes almost appear as if the sinner's retribution commenced even on his death-bed.

Dementia or imbecility sometimes comes on shortly before D., and manifests itself by an incapacity of concentrating the ideas upon any one subject, and by an almost total failure of memory. The mental weakness is often exhibited by the pleasure which is derived from puerile amusements. The great dramatist, from whom we have just quoted, notices 'playing with flowers' as a token of approaching dissolution. In the form of delirium, ocular spectra seem frequently to be present, the patient apparently trying to catch some imaginary object.

There is generally well-marked relaxation and incapacity of the muscular system, and the voice is usually weak and low as D. approaches, often dwindling to a mere whisper. The mode in which the action of the heart declines is various; in most diseases of long standing, the cessation of the heart's action is gradual, the rate of the pulsations being much increased, but their energy being very much impaired. In some acute affections, the failure is shown by the irregularity of the pulse, while the force is little altered. In other cases (especially in cerebral diseases), the heart, before finally ceasing to beat, contracts violently, and suddenly stops.

The respiration is sometimes hurried and panting till just before D., while in other cases it is slow, laborious, and stertorous. The accumulation of mucus, &c., in the air-passages increases the difficulty of breathing; the sound known as the 'death-rattle' being produced by the passage of the air from the lungs through the fluid collected in the trachea and upper respiratory passages.

There is a loss of animal heat, beginning at the extremities. For further information on this subject, we may refer to the article DEATH in *The Cyclopædia of Anatomy and Physiology*, from which we have borrowed some of the matter of the preceding paragraphs.

The *signs of actual D.* may be arranged under three heads: 1. Signs of the extinction of the vital functions; 2. Changes in the tissues; 3. Changes in the external appearance of the body.

1. The arrest of the circulation and respiration would at first sight appear to afford decisive evidence of D.; but these functions, as in the case of hibernating animals, may be reduced to so low a condition that it is by no means easy to decide whether or not they are completely annihilated. In cases of apparent drowning, these functions are frequently suspended and again restored; and cases like that of Colonel Townsend (see any standard work on medical jurisprudence) occasionally occur, in which the patient has the power of voluntarily suspending these functions for a considerable period.

The loss of irritability in the muscular fibres (a fact which may readily be ascertained by a galvanic current) is a sign of far greater importance than either the apparent stoppage of the circulation or of the respiration. The contractility of the skin is also lost after death. When a cut is made through the skin of a dead body, the edges of the wound collapse, while a similar lesion inflicted during life presents an open or gaping appearance.

2. Among the changes in the tissues, the *rigor mortis*, or rigidity of the muscles, which ensues at a

varying period after D., is the most important. It may appear within half an hour after D., or may be delayed twenty or thirty hours, according to the nature of the disease; and its mean duration is from 24 to 36 hours. It commences in the neck and trunk, then appears in the lower, and lastly in the upper extremities, and disappears in the same order.

3. Various changes in the external appearance of the body have been regarded as indicative of D. by different writers; of these, the most important unquestionably is the altered colour of the surface. Livid spots of various sizes may occur from local congestions during life; but the appearance of a green tint on the skin of the abdomen, accompanied by a separation of the epidermis, is a certain sign that life is extinct.

The discrimination of true from apparent D. is obviously not a matter of mere physiological interest. The case of Vesalius, the eminent anatomist, who opened an apparently dead body in which the exposed heart was seen to be still beating, is well known; as also that of the Abbé Prevost, who, having been struck down by apoplexy, was regarded as dead, but recovered his consciousness under the scalpel, and died immediately afterwards; and a French author of the last century, Bruhier, in a work *On the Danger of Premature Interment*, collected 54 cases of persons buried alive, 4 of persons dissected while still living, 53 of persons who recovered without assistance after they were laid in their coffins, and 72 falsely considered dead.

**DEATH, PUNISHMENT OF.** See CAPITAL PUNISHMENT.

**DEATH-BED, LAW OF, IN SCOTLAND.** If any man, whilst suffering from the disease of which he ultimately died, shall have burdened or conveyed away his heritable estate, to the prejudice of his lawful heir, he is presumed to have so acted in consequence of his inability to resist impertinency in the state of feebleness to which he was reduced, and his heir is entitled to reduce the deed. This rule, which has no counterpart in England, belongs to the most ancient consuetudinary law of Scotland. As Lord Stair suggests (1, 12, 34, and 4, 20, 38), it probably was intended as a protection to the dying and their lawful heirs against the notorious propensities of the priesthood; and is thus referable to the same principle as the prohibition to convey heritage by will. There are two tests which have been fixed upon by the law as establishing the existence of that degree of vigour which is technically called *liege pousitie* (supposed to be a corruption for *legitima potestate*)—viz., survivance for sixty days, and going unsupported to kirk or market, and conducting himself in the ordinary manner. It has been decided that it is of no consequence though the object of the visit were neither to worship nor to buy and sell, but simply to evade the law of death-bed. If the individual was in a condition to take part in the service of the church, or in the trade of the market, that is sufficient. Extreme old age, accompanied by manifest indications of the approach of death, will be equivalent to disease. The absurd part of the law, however, is, that the deed of the oldest or most infirm man, or of the man who is labouring under the most mortal sickness, will not be reducible, if another disease has supervened, of which he dies, or if he be killed by accident.

**DEATH'S HEAD MOTH** (*Acherontia atropos*), a species of Hawk-moth (q. v.), or lepidopterous insect of the family *Sphingidae*, not uncommon in some parts of England and of the continent of Europe, and very widely distributed over the world, being found in Africa, the Mauritius, and the East

Indies. It measures almost five inches from tip to tip of the extended wings; is of a dark colour, the body yellow with black markings, the thorax with pale markings which have some resemblance to a skull, and from which it derives its name; the upper wings mottled with brown, black, and yellow. The caterpillar is greenish-yellow, the back speckled with black, with transverse lines partly blue and partly white; and in countries where the potato is cultivated, is often to be found feeding on the leaves of that plant. This insect is most frequently seen flying about in autumn, and only in the mornings and evenings. It is remarkable for emitting a plaintive squeaking sound, which, with its dark colour, and the skull-like mark on the thorax, has led to its being regarded with superstitious dislike,

Death's Head Moth and Caterpillar.

the sudden appearance of large numbers being popularly held ominous of evil; whilst, in the Mauritius, a notion prevails that it casts a dust from its wings which produces blindness in persons on whom it falls, and its entering an apartment is therefore regarded with dread. How the noise which it emits is produced, is not satisfactorily known. If the insect is taken and confined in the hand, this sound is sent forth sharply and strongly. The D. H. M. is interesting upon still another account, as one of those insects which enter and plunder bee-hives, feeding upon the honey; and although apparently quite defenceless, it enjoys perfect impunity whilst ravaging the stores of creatures so well provided with formidable weapons, and generally so ready to use them against an intruder. No explanation of this fact has yet been found.

**DEATHS, REGISTRATION OF.** See REGISTRATION.

**DEATH-WATCH**, a ticking sound produced by certain insects, inmates of human dwellings, and which being most readily heard in that stillness which attends times of sickness and anxiety, has become associated with superstitious notions and fears, being regarded as indicative of an approaching death in a house. The most common form of this very prevalent superstition is the belief, that when the D. is heard, some member of the household will die within twelve months. The tickings of the D. were formerly attributed to species of wood-louse and of spider, and it is probable that they are not all produced by insects of the same kind; but the most common D. of Britain is a species of Borer (q. v.), (*Anobium tessellatum*). It is of a dusky or grayish-brown colour, and about a quarter of an inch in length. It is generally in the latter part of spring that its noise is heard, from seven to ten or eleven distinct ticks being given in pretty rapid succession,

and this being repeated at uncertain intervals. The noise exactly resembles that made by beating with the nail upon a table; and when this is done, the

Death-watch, magnified :

A, *Anobium Tesselatum*; B, *Anobium Striatum*; C, *Anobium Pertinax*.

insect is not unfrequently induced to reply to it. It is the perfect insect, not the larva, which produces this sound. It seems, indeed, to be a call by which the sexes are attracted to each other, and is produced by the insect's beating upon some hard substance with its head, in doing which, it raises itself upon its hind-legs, and with the body somewhat inclined, beats its head with great force and agility against the substance on which it stands. One of them was seen by Mr Stackhouse thus to beat upon a sedge-bottomed chair, with such force that its strokes made little indentations in the outer coat of the sedge.

DEBACLE, a French word, meaning in that language the breaking up of the ice in a harbour or river, but introduced into English by geologists to express any sudden flood of water, which bears before it opposing obstacles, and leaves its path marked with confused and scattered fragments of rocks, stone, and other débris.

DEBATABLE LAND, a tract of land, chiefly level and of a moory character, but now in course of improvement, on the western border of England and Scotland. This tract of country, situated between the Esk and Sark, was at one time claimed by both kingdoms, and hence its name. In 1542, 'it was divided by royal commissioners, appointed by the two crowns. By their award, this land of contention was separated by a line drawn from east to west, betwixt the two rivers. The upper half was adjudged to Scotland, and the more eastern part to England. Yet the Debatable Land continued long after to be the residence of the thieves and banditti to whom its dubious state had afforded a refuge.—The jest of James VI. is well known, who, when a favourite cow had found her way from London back to her native country of Fife, observed, "that nothing surprised him so much as her passing uninterrupted through the Debatable Land."—*Scott's Minstrelsy of the Scottish Border*. The Gremes, a troublesome clan of freebooters who inhabited the D. L., were transported to Ireland at the beginning of the 17th c., and prohibited from returning on pain of death. See BORDER.

DEBATE is an exchange of opinions, differing from conversation in this, that the speakers succeed one another according to certain regulations, and that the subject is treated formally, and in general with a view to coming to some practical conclusion. The term is usually understood of the discussions of political representative bodies. The debates of the English parliament are divided into two stages. The first concerns the general principle of the measure, and is conducted with strict parliamentary formalities; when this is carried, the details are discussed in a committee of the whole House, when a less formal and more free interchange of opinions is admitted. Parliamentary debates are sometimes derided by men of absolute tendencies as useless, and even mischievous. How, it is said, can a couple of speeches, *pro* and *con*, produce a rational

conviction on any subject; it is more likely that the judgment will be run away with by specious oratory. But this proceeds upon a false conception of the great object of public D., which, though it seldom influences the votes on the actual question, serves to justify the proceedings of public men to their constituents, and forms one of the chief aliments of public opinion and of the political life of a community.

DEBENTURE. There are two kinds of documents to which this term is applied, which may be described separately.

*Excise General D.*—This is a certificate authorising the exporter of certain classes of goods to receive a drawback equal in amount to the excise duties which had been paid on them. The object of the document is to certify two things—first, that the excise duties had actually been paid; and, second, that by a certificate from an officer of customs the goods had been shipped, and *bonâ fide* exported to foreign parts, and not relanded in Great Britain. This kind of D. is executed by an officer of excise (Inland Revenue); it is partly printed and partly written on a sheet of stamped paper, for which the exporter pays. As concerns the export of beer, there is an excise D. slightly differing in form.

*Railway D.*—This is the term applied to a deed of mortgage given by a railway company for borrowed money. By virtue of acts of parliament constituting, and giving additional powers to, a railway company, the company is authorised to borrow a specified sum (see CAPITAL ACCOUNT, also RAILWAYS, Legislation and Management). The deed by which the loan is effected is simple in its appearance and nature. It consists of a sheet of paper duly stamped; and its contents, embraced in a single page, are partly printed and partly written. All expenses connected with it, brokerage included, are borne by the company. At the head of the deed is the name of the railway company, in large letters, with the words Mortgage, No. —, and the amount in figures. It then proceeds: 'By virtue and in terms of an act, &c. [the act or acts being recited], We, the ——— Railway Company, in consideration of the sum of ———, paid to us by ———, Mortgage the said undertaking, and all the tolls and sums of money arising by virtue of the said acts, and all the estate, right, title, and interest of the company in the same, to hold unto our said assignee, ———, until the said sum of ———, together with interest for the same, at the rate of ——— for every hundred pounds by the year, payable as hereinafter mentioned, be satisfied. And it is hereby stipulated that the said principal sum shall be repayable, and the said company are hereby bound to repay the same on the [here date of repayment is inserted]. But if the parties hereto shall mutually think fit, the same shall thereafter remain as a loan to the said company, for such further period, and at any such rate of interest, as shall be mutually agreed upon by a minute indorsed hereon to that effect, and signed by us and our said assignee, or ———. And in respect of the interest to become due on the said principal sum at and prior to the said [date of repayment], the said company shall pay to the bearer of the interest-warrants herewith issued, the several sums contained in such warrants, at the times therein respectively specified. In witness whereof, these presents written, in so far as not being printed, on the face of this sheet of stamped paper by [here follow the name of secretary of the railway company, the name of place, date, and the signatures of three directors, with the signatures of witnesses.] Such is a railway debenture. Along with it are given warrants for the payment of interest at the periods specified, which are paid on presentation.

These interest-warrants, which are sometimes called Coupons (q. v.), are small slips of paper bearing the sum, date, and signatures. The object in giving them to the debenture-holder is to save him all trouble. They are paid to any one presenting them.

Brief, simple, and effective, a railway D., with its accompanying interest-warrants, is perhaps the most convenient deed of mortgage ever invented. In few and unequivocal words, it pledges the whole railway for the loan, and it must necessarily be redeemed before any shareholder can claim a dividend from the undertaking—each D. ranking according to its number. Railway debentures are, therefore, reckoned a safe form of investment, and are eagerly taken up by individuals who have sums of a few hundred pounds to lend for several years at a stipulated rate of interest. These debentures possess the further advantage of being saleable, and through the agency of stockbrokers they pass from hand to hand. In the event of neither interest nor principal being paid, the holder is entitled to enforce the mortgage; but this must be done by a suit at law in the competent court; and wherever there is litigation, there are means for protracting a settlement of claims. w. c.

DEBLAI, in Fortification, is any hollow space or excavation in the ground made during the construction of fortifications or siege-works. The cavity itself is the D., while the earth taken from it is the *remblai*.

DEBORAH (Heb. signifies a *bee*), a Hebrew prophetess, the wife of Lapidoth, who lived in the time of the Judges. She dwelt in Mount Ephraim, and uttered her judicial oracles from her tent under the palm-tree between Bethel and Ramah. To deliver her land from the oppressive yoke of the Canaanites, under which it had groaned for twenty years, D. called to her aid Barak, son of Abinoam, probably a man of heroic temper. An army was raised among the tribes of Naphtali and Zebulun, and a battle took place in the plain of Esdræon, where the Canaanitish host was completely routed, and Sisera during his flight, as D. had predicted, was murdered by a woman. This victory secured to the Israelites a peace of forty years' duration. The 'Song of Deborah' (as it is generally called, though its composition is not ascribed to her in the Book of Judges) is a choice fragment of primitive Hebrew poetry.

DEBOUCHING, in Military Tactics or evolutions, is the marching out of a body of troops from a wood, defile, or other confined spot, into open ground.

DEBRECZIN, a large straggling town of Eastern Hungary, situated in the midst of an extensive plain, about 120 miles east of Pesth. Like many of the Hungarian towns, D. is a mere collection of villages, united on no particular plan. The houses for the most part are mean structures of not more than one story in height, and the streets, if such they can be called, being unpaved, are exceedingly dirty; in certain seasons of the year, planks are laid down to enable passengers to cross. Notwithstanding its generally squalid character, however, D. is possessed of some very handsome public buildings, including a town-hall, a Protestant college, with a staff of 24 professors and 1800 students, and several churches, monasteries, and charitable institutions. The inhabitants, who are very industrious, are dependent chiefly on agriculture, but a number of them are engaged in the manufacture of coarse woollens, sheep-skins, leather, earthen-ware, soap, saltpetre, and tobacco-pipes, which are famous throughout Hungary. The cattle and swine markets of D. are among the most extensive in Europe, and its grain-market is also large. The population of D. is usually

stated at about 60,000, but the most recent official return, printed at Prague in 1859, gives it at only 13,800, which, if correct, implies unusually repressive measures on the part of Austria in retaliation for the part it took in the struggle of 1848—1849. With the exception of 2000, its inhabitants are all Protestants. They have suffered much on account of their faith, especially in 1567 and 1686. D. took a prominent part in the revolution of 1849, and was for some months in that year the seat of the national diet, after it had been forced to remove from Pesth.

Debruised.

DEBRUISED, a term peculiar to English heraldry, used to indicate the grievous restraint of an animal, and its being debarred of its natural freedom by having any of the ordinaries laid over it (*Dictionary of Display*).

DEBT, that which one person owes to another, or the duty which, as responsible beings, all owe towards God. Life is figuratively spoken of as a loan, and the act of dying is called 'paying the debt of Nature.' More commonly, however, the term D. is limited to money legally due, and exigible by process of law. To speak in legal phraseology, D. may originate either in agreement or by operation of law, or as a consequence of injury, though in the latter case it more commonly assumes the form of a claim for Damages (q. v.). Liquidated D. (in Scotland, liquid), is where the exact amount has been ascertained; contingent D., is where the liability depends on the occurrence of an event which may or may not happen; future D., is where the liability is existing, but the time for payment has not yet arrived. This may, in Scotland, be secured by certain legal processes, entitled Arrestment and Adjudication (q. v.); but in England there is, in general, no method of affixing a liability upon property before the D. becomes payable, except in the case of bankruptcy, when a future or contingent D. may be proved against the estate, as in Scotland. The main division of debts in Scotland, however, is into movable and heritable—the former being in themselves chargeable only upon the debtor's personal funds, although they may, by certain forms of law, be made also a charge upon his real estate; and the latter being directly and immediately a charge upon his real estate. The former are, accordingly, esteemed as personal estate so far as regards succession, while the latter are considered as heritable or real property. In England, also, a D. may be secured on the debtor's real estate, as by mortgage; but the distinction is less material as regards succession, for even mortgages are accounted personal estate in the hands of the creditor. In Scotland, on the other hand, there is no distinction corresponding to the fundamental division of debts in England into simple contract debts and specialty debts. The former are all debts which arise without the intervention of a *Deed* (q. v.), or before judgment; and it is only of late years that they have been made recoverable against the heir of the debtor. Such a D. does not by law carry interest. A specialty D. is one constituted by *Deed* (q. v.), or by a record of court, as a recognisance, or by a judgment of a court. The former carries interest from its date, and a judgment D. carries interest from the date of the judgment at  $\frac{1}{2}$  per cent. It binds all lands of which the defendant is possessed, either in law or equity; but to make this effectual against purchasers, the judgment must have been registered in the Common Pleas, and the registration must be renewed every five years.

## DEBT.

**DEBT, ACTION OF,** in England. This lies for the recovery of a debt in its technical sense, of money ascertained in amount due by one to another. Where this has been ascertained by a bond for the amount, or by a judgment of a court, action of debt is in general the only proper action; but in the case of the debt arising from breach of contract under seal, it may generally be sued for either by an action of debt, or by one of covenant; or where the contract was not under seal, by an action of debt, or one of assumpsit. Actions of debt, when on contract under seal, must be brought within 20 years; on other contracts, within six years. The time in both cases is taken from the accruing of the cause of action—i. e., the breach of contract; but if a subsequent acknowledgment in writing has been made by the party liable, or he has paid the debt in part, or paid interest, the time will run from such subsequent act. In an action of debt, the writ by which it is commenced must be endorsed with a note of the amount of the debt, and of the costs of the writ, and an intimation that, if these are paid within four days, no further proceedings will be taken.

**DEBT, NATIONAL,** is the amount which any state admits itself to owe to those who may have advanced money for the use of the government on occasions when its expenditure has exceeded its ordinary income. As in the case of individual debtors, who sometimes engage to pay more than they obtain from the lender, the amount of a national debt may not be the amount which the nation has borrowed; it is often greater, from the necessity of holding out to capitalists, as an inducement to make a large advance, that they will be set down as creditors for more than they have given. On the other hand, it may happen, though of rare occurrence on a large scale, that when money is bearing low interest, a nation may give its creditors the alternative of receiving payment, or allowing a deduction from the nominal amount of their debt, and they may choose the latter as the preferable alternative. When the term, 'the national debt,' is used by itself, it is always understood to refer to that of our own country, which is indeed the heaviest in the world. It amounts, in round numbers, to 805 millions of pounds. The next in amount is that of France. That country having been entirely bankrupt during the first Revolution (see **ASSIGNAT**), its existing debt may be said to date no further back than the Consulate, when credit was restored. On the first return of the Bourbons, before the battle of Waterloo, it amounted to 123 millions of pounds; it is now 373 millions. The next in amount is that of Russia, estimated at 228 millions. Austria closely follows, being indebted to the extent of 226 millions; and, with all its extent and population, this sum is shewn to be a heavier burden on that empire than nearly four times the amount is on the British, from the circumstance that, while our own finance-minister is able to obtain whatever funds are required for carrying out the national policy, Austria is notoriously restrained by want of money, while her creditors do not feel the security for her existing debt to be quite unquestionable. Perhaps the most heavily indebted European state, in proportion to its means, is Spain, owing upwards of 140 millions. Holland has a debt not far from 100 millions; the country, though small, is very rich, and able like our own to bear a heavy burden. The debt of Prussia is understood to be under 50 millions, and that of the minor German states is trifling.

The national debt of the United Kingdom has arisen along with the supremacy of parliament and the necessity for a standing army. Through the

reigns of the Tudors and the Stuarts, the nation's protection against the power of the crown was in the king being unable to keep up a standing army. The force he then commanded consisted of the great vassals of the crown and their feudal retainers, called out to serve for a limited period—a body apt to be wilful, and subject to such fluctuations that it could not be depended on for continuous warlike operations. The House of Commons jealously checked the rise of a standing army, by restricting the means for supporting it. Loans were sometimes obtained or exacted by the sovereign, but they were temporary and of comparatively trifling amount, for the Commons would have considered it an entire sacrifice of the means of protecting the national liberties had they mortgaged to any of these kings the future revenue of the country, so as to enable him to raise a loan and levy an army. But when the control of parliament over the prerogative was strengthened, jealousy in this direction was no longer necessary. Accordingly, it was when parliament triumphed in the Revolution settlement that the national debt began. The first regular loan was obtained in 1693; it consisted of the capital of the newly created Bank of England, amounting to £1,200,000. This accommodation to the government was, in fact, the price paid by the bank for its privileges. As the nation was engaged in an expensive war, this beginning was rapidly followed up, and at the peace of Ryswick, in 1697, the national debt exceeded 20 millions. Before the accession of the House of Hanover in 1714, it had exceeded 50 millions, and the rapid rise of this burden was a strong argument in the hands of the Jacobites against the Revolution settlement. Whenever a loan was negotiated by the government, special terms were offered according to circumstances. In one case, there might be a terminable annuity, say of 60 or 100 years—that is to say, a certain percentage being paid during that period, at the end the debt was to be extinguished by such payments. See **ANNUITY**. In other instances, there was a perpetual annuity. In a loan negotiated on the latter terms, that annuity was always rather under than above what a borrower would give to a private lender, although such a borrower was bound to repay the money, while the nation was not. It came to pass, in fact, through one of the most curious processes in the whole mystery of finance, that a loan never to be repaid was considered a more eligible investment than a loan to be repaid. The government made this gain for a distinct gain it was—by the convenience to the public, who, always having money for which they were glad to get the secure interest of the funds, were always ready with a new lender when the old one wanted to be paid. Hence has come the perpetual shifting of the fundholders. And as long as there are moneyed persons who will buy thus into the stocks without any considerable reduction, there is a sure test that the debt is not beyond the capacity of the nation. Raised, however, as we have seen by special loans, each on its own conditions, the different funds became exceedingly varied and complicated. It was one of the projects of the great South Sea schemers of 1720, to conjoin them all into one uniform fund, but this plan was interrupted by the failure of the whole affair. Afterwards, in 1751, a general uniform arrangement was carried out, and the stocks were then called the Consolidated Fund. See **CONSOLS**. Meanwhile, the progress of the national debt was in round numbers as follows: In 1756, when the war of the Austrian Succession began, it was 75 millions; and seven years afterwards, when this war ended, it was

140 millions. Increased by the American war and the war with France and Spain, memorable by the defence of Gibraltar, it had increased to the amount of 260 millions when, in 1793, the great European war of the French Revolution broke out. At the peace of Amiens in 1803, the debt was 620 millions. When the treaty of Vienna was resumed, after the battle of Waterloo, the amount had risen to \$85 millions. It has since decreased, although some further loans have been incurred. The largest of these is connected with one of the most honourable actions of which the British Empire, with all its traditions of glory, can boast—the advance of 20 millions, in 1834, for the emancipation of the colonial slaves. The latest considerable addition made to the national debt was during the Russian war of 1854, when 16 millions were raised by loan. In 1857, the amount of the D. was close to \$12 millions, but it has now slightly decreased. According to the latest accessible return to parliament, which comes down to 1860, it amounted to £805,946,508. Of this sum, the amount called ‘funded debt’ was £789,718,208, and of floating debt in exchequer bills, £16,228,300. The distinction between the two is, that the government do not profess to repay the former—they only give the creditor an annuity, terminable or perpetual, and if he wants payment of his money, he can only get it by selling his right to this annuity; the other consists of temporary loans, liable to fluctuation, and renewed from time to time.

It must be kept in view, however, that from a peculiarity of phraseology, the enormous amount of the national debt is partly fictitious, the whole sum neither having been borrowed nor being virtually due. When capitalists have advanced money, they have been content with a small percentage—3 or 3½—but they have often insisted that for each £100 advanced by them, they should have more than £100 of actual stock. If the condition of the market were such that the capitalist wanted 4½ per cent., and the interest or annuity obtained by him was only 3 per cent., he would insist on having stock to the extent of £150 for his £100. If 5 per cent. interest were paid on the nominal amount of the national debt, it would be a charge of more than 40 millions a year—the actual burden is between 28 and 29 millions. Such is, however, the reliance on the national credit, and the convenience of having the stocks for investment, that the stockholders are content with little more than 3 per cent. interest, the right to an annuity of £3 actually at present (1861) selling for about £90.

The literature of the country has teemed with projects for getting rid of the incumbrance of the national debt, many of which go far wide of the mark, from the supposition that the debt is the incumbrance. In fact, the incumbrance is in the expenditure—the sacrifice of the nation's capital which has caused the debt—the debt itself is merely the shape in which that loss presses, and it must press in some shape. The millions have been exploded in powder and shot, and in other extravagances, and can never be recalled; all that we can do is, by industry and frugality, to make new millions, and replace the loss. Hence it is the supremest folly to suppose that the nation would profit by abolishing or wiping off the national debt—by repudiation, as it is called. Such an event would only be ruin to a large number of people who are in the position of being the nation's creditors, and would perhaps bring ill-gotten gain to a small number. It would be difficult to estimate precisely how such a calamity would act. In the first place, if it were seen to be in prospect,

the funds would go rapidly down by the holders selling out, so that as long as the chances of stability would induce any one to buy at a very reduced price, the circle of sufferers would be, as it were, widening. The poorest of those interested would be the chief sufferers in the awful scramble. The working-classes, besides any savings which they might have directly invested in the funds, would lose about 40 millions, which they have invested through savings' banks and friendly societies. Widows and unmarried women with narrow fixed incomes would be the next sufferers. It is unnecessary to go further; for the general paralysis of capital and stoppage of manufacturing industry, along with loss of national reputation, would be incalculably disastrous. There is no way of reducing the national debt, except by saving up through taxation from the expenditure of the country. The process of reduction in this form is, however, always met by the consideration, whether the repeal of a disadvantageous tax, or the reduction of the interest of the D., is the better alternative. One thing is very clear, that from the progress of general wealth and increase of population, the national debt, assuming it to remain at its present amount, is always pressing with less and less severity on the country, and is therefore becoming more and more manageable. Some persons, looking at only one side of the matter, have gone the length of saying that, as a ready and safe means of investment, the national D. is a kind of blessing; though the slightest consideration would have shewn, that it can never be advantageous for the community at large to be taxed to pay interest to a limited number of individuals. Whatever be the incidence of taxation to pay the interest, now amounting in the aggregate to about £26,000,000 per annum, it is the proud boast of England that she has ever kept faith with the national creditors—never, under all her embarrassments, repudiated a farthing of her debt. As a natural consequence, the British funds are sought as a secure means of investment by people of capital in all lands. On the reduction of the D., see the article FUND, SINKING.

**DEBTOR AND CREDITOR, LAWS OF.** In the history of this, as of almost every other branch of jurisprudence, we may, if we will, trace the march of social progress in general. In the earlier stages of life in the state, the arrangements for borrowing and lending are rarely such as to enable the citizens to avail themselves with security of their mutual resources, or to assign such limits to the powers of the creditor as either the claims of humanity or his own true interests demand. On the one hand, lending is confounded with alms-giving; and the exaction of interest, and even of capital, is regarded as an act of inhumanity towards the poor. On the other hand, no sooner do the creditor's rights come to be recognised in anything like a legal sense, than there seem to be no logical grounds on which any limits can be set to them. If he is entitled to exact the debt at all, he is entitled to seize the goods of the debtor; and if the debtor has no goods, he is entitled to his services. But the possession of his services implies the possession of his person; and the possession of his person implies the possession of his life. Moreover, from the exaggerated notions of the domestic ties which usually prevail in early times, the person of the individual, where that individual is the father of a family, brings along with it that of his wife, his children, and his slaves. The creditor thus becomes the absolute master of the life and liberty of his debtor, and of all those who are dependent upon him. The arrangements of the Mosaic Law are an illustration of the manner in which, in the ruder forms of society, the laws of

debt thus combine a degree of lenity with a degree of severity which are equally alien to modern views. In this as in many other respects, they are, as Michaelis has pointed out (vol. ii. p. 300), a recognition of the consuetudinary law of the stage of society to which they belonged, rather than a system special to the Jews. If an Israelite became poor, it was a duty to lend to him, and no interest was to be exacted either in money or in produce. If he was a foreigner, the case was different, and the taking of interest was legal (Exod. xxii. 25; Deut. xxiii. 19, 20; Lev. xxv. 35—38). When the Sabbatical year arrived—i. e., at the end of every seven years—there was a general remission of debts as between Israelite and Israelite; and the near approach of the year of remission was not to be recognised as an apology for declining to lend to an indigent brother (Deut. xv. 1—11). Pledges, it is true, might be taken, but even here the same humane principles prevailed. The upper millstone was sacred, for to take it would be to deprive the debtor of the means of subsistence. If raiment was the pledge, it must be returned before nightfall, when it might be required for a covering; and the widow's garment could not be taken in pledge (Exod. xxii. 26, 27). In strange contrast to this is the provision (Lev. xxv. 39) that a poor Israelite may be sold to one possessed of substance, even when modified by the special provision that he shall serve as a hired servant, not as a bond-servant, and shall be set at liberty when the year of jubilee arrived. Michaelis says that the judicial procedure for debt was quite summary, the most important causes being decided probably in a single quarter of an hour; and he remarks that Moses nowhere thinks it necessary to mention how a debt was to be proved before a judge. There was, however, an extensive system of appeal; from the judge over 10, the case was carried to the judges over 50, 100, and 1000, and finally to Moses himself. As every Israelite was entitled to claim the land of his fathers at the jubilee year, and thus to place matters on the footing on which they were after the settlement in Palestine, debts and burdens on land were limited to claims to the fruits of forty-two harvests; but houses, with the exception of those of the Levites, might be sold in perpetuity (Lev. xxv. 29, 30, 32, 33). Children were often given in pledge (Job xxiv. 9), and ultimately into slavery, in payment of debt (2d Kings iv. 1). Subsequent to the Captivity, the pressure of debts upon the poor became so intolerable, that Nehemiah espoused their cause, and insisted on a general remission (Nehem. v.), exacting from the rich an oath that they would never afterwards press for payment. Debts of the character here alluded to probably resembled those which the recipients of parochial relief in our own day owe to the community, rather than debts in the commercial sense. In Matt. xviii., Christ refers to the custom of selling the debtor, his wife and children, and all that he had, in payment, rather as a general custom of all nations, than as one peculiar to the Jews—the 'certain king' being a typical instance of a man of substance.

Both in Greece (Plut. Vita Solonis 15) and in Rome (A. Gell. xx. 1, 19; Liv. ii. 23) the creditor had a claim to the person of the debtor. Previous to the time of Solon, this arrangement had produced consequences at Athens closely analogous to those which afterwards led to the struggles between the patricians and plebeians at Rome; and his abolition of it forms one of Solon's many claims to the character of an enlightened legislator. By the Twelve Tables, it was enacted at Rome that if the debtor admitted the debt, or had had judgment pronounced against him for it, thirty

days should be allowed him for payment. At the expiration of that period, he was liable to be given into the hands of his creditor, who kept him sixty days in chains, exposing him from time to time publicly, and proclaiming his debt. If no one stepped in to release him, the debtor at the end of that time might be sold for a slave, or put to death. If there were several creditors, the letter of the law permitted them to cut their debtor in pieces, sharing him in proportion to their claims; but Gellius tells us that no Shylock ever was found at Rome. To treat him as a slave, however, and make him work out the debt, was the common practice; and the children in his power, in accordance with the whole constitution of society at Rome, followed his condition. The *lex Poetelia* (326 B. C.) alleviated the condition of the debtors (*nezi*) to the extent, at least, of preventing summary imprisonment, and relieving all debtors, for the future, from being put in chains. There do not seem to have been any public prisons for debtors at Rome, and each creditor, consequently, was the jailer of his own debtor. In this circumstance we probably see the reason of the prominence which was given by the plebeians to a change in the laws of debtor and creditor, on the occasion of their first secession, in 494 B. C.; and subsequently during the whole course of the struggles between the two orders. Whatever we may think of the policy of limiting the rate of interest, as was afterwards done by the laws of Licinius, and had previously been done by those of Solon at Athens, there can be but one opinion in modern times as to the propriety of abolishing the right of private imprisonment.

During the feudal period, the person in general was not attachable for debt, imprisonment being inconsistent with the duties of warlike service, to which every man was bound; and it was for the encouragement of commerce, and in consideration of the merchant having to deal with strangers and foreigners, that it was first introduced by the mercantile communities of Europe (Bell's *Commentaries*, Shaw's ed. ii. p. 1067). By the statute of Merchants, it was enacted, at Acton Burnel, in 1282, that in lending money, a merchant might bring the borrower before the lord mayor of London, or the chief warden of another good town, and cause him to acknowledge his debt and day of payment. A recognisance was then enrolled, and an obligation written by the clerk, and sealed with the king's seal and the debtor's. Failing payment, the creditor was entitled to produce this obligation, and to demand a warrant to seize the person of his debtor, and to commit him to the Tower. The history of the law of imprisonment for debt in this country is stated with great clearness by Mr Bell in the section of his *Commentaries* to which we have just referred, but it is impossible to condense it within the limits of the present article. Further information on the subject will be found under IMPRISONMENT, DILIGENCE, EXECUTION, SANCTUARY, BANKRUPTCY, &c. Generally, it may be stated here, that up to the passing of the later bankruptcy acts, the prisons of this country were crowded with debtors. It was ascertained by parliamentary returns, that in the 18 months subsequent to the commercial panic of 1825, 101,000 writs for debt were issued from the English courts. In the year ending 5th January 1830, there were 7114 debtors sent to prison in London, and on that day, 1545 of these were still in confinement. On 1st January 1840, the number of prisoners for debt in England and Wales was 1732; in Ireland, 1000; and in Scotland, 100. The statutes of relief and other causes have reduced the numbers. See the following article.

**DEBTORS, ABSCONDING.** The existing laws for the arrest of debtors absconding from England having been found insufficient, in consequence of the delay which was occasioned in obtaining the necessary process, the 'act to facilitate the more speedy arrest of absconding debtors' (14 and 15 Vict. c. 52) was passed in 1851. The evil was felt chiefly by creditors residing at a distance from London, whose debtors were able to perpetrate frauds upon them by embarking for distant countries from various towns and seaports in England; and authority is consequently given by that enactment to the commissioners of the Court of Bankruptcy acting in the country, and the judges of county courts, except those of the counties of Middlesex and Surrey, to grant warrants for the arrest of absconding debtors. The debt must be certified to amount to twenty pounds or upwards. Any person arrested on a warrant of this kind may, before the issuing of the writ of *capias* to follow thereupon, pay the debt and costs, which shall be endorsed on the warrant, to the messenger or high bailiff intrusted with its execution; or he may enter into a bail-bond to such messenger or high bailiff, with two sufficient sureties; or, lastly, he may make deposit of the sum endorsed on the warrant, with £10 of costs, in all which cases he shall be entitled to be discharged from custody (s. 5). By a subsequent section (s. 8), another course of proceeding is provided. It is therein enacted that any person against whom such a warrant has been issued, may make application to any commissioner of bankruptcy or county court judge, or to any judge of the superior courts, for a summons or rule calling upon the creditor who shall have obtained the warrant to shew cause why it should not be set aside or vacated, if such application shall be made before arrest, or why the debtor should not be discharged, if he has been arrested; and that it shall be lawful for such commissioner or judge to make absolute, or discharge such summons or rule, and to direct the cost thereof to be paid by either party. Any such order made by a judge may be discharged or varied by the court mentioned in the affidavit of debt, on the application of either party.

Absconding shareholders may be arrested under the provisions of the Joint Stock Companies Act of 1857 (21 and 22 Vict. c. 14, s. 11 and 12), or their goods and chattels may be seized, if there be probable cause for believing that it is their intention to leave the country, or to carry off or conceal their effects.—As to the mode of dealing with absconding debtors in Scotland, see *MEDITATIO FUGÆ*.

**DEBTORS, IMPRISONMENT OF.** Except in the case of fraud, no debtor can be imprisoned in England for a debt below £20, exclusive of costs. But such debtors, if ordered by an insolvent or county court to pay the debt by instalments, or otherwise, may, if they make default, be committed by the court to prison for forty days. In Scotland, the limit below which imprisonment for debt is incompetent is £5, 6s. 8d. In both countries, if a debtor escapes after arrest, and before imprisonment, the officer of the law charged with the execution of the process is liable for the debt.

**DEBTS, SMALL.** See *SMALL DEBTS*.

**DEBUT** (*début*), a French word which has been adopted into the English language, and signifies generally a beginning, or entrance, but is specially applied to the first appearance of an actor or actress on the stage at all, or to a first appearance in a particular theatre. In these circumstances, the actor is called a *débutant*; the actress, a *débutante*.

**DECA**, Gr. signifying 'ten,' is of frequent occurrence in composition; as in *Decapolis*, a union of ten

cities; *Decalogue*, the ten commandments; *decamètre*, a measure of ten mètres, &c. From *deca* is formed

**DECADE**, a collection or group of ten. As applied to time, decade was used in the calendar of the French Republic to designate their week of ten days. Each month, of 30 days, was divided into three decades. The days of each decade were named *primidi*, *duodi*, *tridi*, *quartidi*, *quintidi*, *sextidi*, *septidi*, *octidi*, *nonidi*, and *decadi*. The tenth, or *decadi*, was the day of rest; and, as the Republic acknowledged no definite religion, was devoted to the practice of and exhortation to virtue. The republican year numbered 36 decades, and had thus only 360 days. The remaining five (in leap years, six) were devoted as holidays at the end of the year without being numbered.

**DE'CACHORD**, a kind of guitar with ten strings, similar to the common guitar, only larger in the body, and with a broader finger-board. The lower strings have no frets, being only used as open notes.

**DECADENCE** (Fr.), a term used with reference to works of art belonging to a school which had passed the period of its highest excellence before they were produced. In Greece, art in all its forms reached its acme in the time of Pericles; and though there are many exquisite works which were produced at a later period, they all belong, more or less conspicuously, to the decadence of Greek art. In Rome, again, both art and literature culminated in the time of Augustus, and from that time we have a decadence, which soon becomes very obvious and rapid. The school of the *Renaissance*, again, came to perfection with Raphael; even the Caracci belong to its decadence; and the decline was continuous through the *rococo* of Louis Quinze, till art became almost extinct all over Europe. In the beginning of the reign of George IV., it probably reached as low a point in England as it ever attained in any civilised country; and it is only within the last twenty years that it has begun to revive. Let us hope that its decadence is far distant.

**DE'CAGON** is a plane geometrical figure of ten sides. When the sides are equal, the figure is called a regular decagon. A decagon may be formed from a Pentagon (q. v.), by forming any irregular triangles on its sides in such a way that no two of them shall have their sides in the same straight line. A regular decagon is got from a regular pentagon by describing a circle round the latter, bisecting the arcs between its angular points, and drawing lines joining the angular points to the points of section.

**DECAISNËA**, a genus of plants of the natural order *Laricizabaluca*, nearly allied to *Stamtonia*. It contains only one known species, recently discovered, a native of the Himalaya mountains, where it grows at an elevation of 7000 feet. It is a very remarkable plant, and the only one of its natural order which is not a climber. It sends up from the root several straight erect branches like walking-sticks, which bear spreading pinnated leaves, two feet long, standing out horizontally. The flowers are unisexual, green, and in racemes. The fruit is yellow, resembles a short cucumber, being about four inches long, and one inch in diameter. It is full of a soft milky pulp and large black seeds. Two or three fruits grow together. The pulp is sweet and wholesome, much eaten by the natives of the Himalaya.

**DE'CALOGUE** (Gr. *Dekalogos*, 'ten discourses') is the term usually applied by the Greek Fathers to the law of the two 'tables of testimony' given by God to Moses on Mount Sinai. These tables were made of stone, and the commandments inscribed

thereon are said to have been 'written by the finger of God.' The commandments are not numerically divided in the Pentateuch, and it has been supposed by some that the number *ten* was chosen, because *ten* was considered the most perfect number. As, however, there are ten distinct injunctions, it is superfluous to allege any other reason for the division than the simple fact, that this is the correct enumeration. Philo-Judeus divides them into two *pentads*, the first ending with 'Honour thy father and mother,' &c.; but the general opinion among Christians is, that the first table contained those which enjoin upon us our duty to God (comprising the first four), and the second, those which enjoin upon us our duty to our fellow-creatures (comprising the last six). The Talmudists make the introductory words, 'I am the Lord thy God, who brought thee out of the land of Egypt, out of the house of bondage,' to be the first commandment, and in consequence, to keep the number *ten* are obliged to run the next two into one. But the words quoted obviously contain no *command* at all, but merely express the grand general reason why the Israelites should yield implicit obedience to the injunctions which follow. Hence Origen commences the D. with, 'Thou shalt have no other gods before me.' His division is that in use in the Greek, and in all the Protestant churches except the Lutheran; while from the writings of Philo and Josephus, it appears that such was also the received division of the Jewish Church. The Masoretic division is that which is adhered to in the Roman Catholic and Lutheran Churches. According to it, the first two commandments, that concerning the worship of God, and that concerning the worship of graven images, constitute but one. The number *ten*, however, is here also preserved by dividing the tenth into two, the first of which is made to be, 'Thou shalt not covet thy neighbour's house,' and the second, 'Thou shalt not covet thy neighbour's wife, nor his manservant,' &c., to the end. There are two versions of the D. in the Pentateuch; the first is contained in the 20th chapter of Exodus, the second in the 5th chapter of Deuteronomy. These are substantially and almost verbally the same, except in regard to the fourth commandment, for the observance of which the reason assigned in the former differs entirely from that in the latter.

DECANDOLLE, AUGUSTIN PYRAME, one of the most eminent of botanists, was born at Geneva, 4th February 1778, and was descended from an ancient noble family of Provence, which was compelled to seek refuge in Geneva from religious persecution about 1558. His father was a syndic of Geneva, and had an estate near Yverdon, where much of D.'s boyhood was spent. He received his education in the gymnasium of Geneva, distinguished himself by his attainments in classical scholarship and his love of poetry, as well as by his delight in the study of history, to which and to the profession of law he proposed to devote himself. But after he had begun his studies for this profession, the union of Geneva with the French Republic in 1798 made such a change in his prospects, that he thought proper to relinquish it for that of medicine; having also in the meantime learned to delight in the physical sciences, particularly chemistry and botany, to which the lectures of Vaucher at Geneva in 1796 very much contributed. From this time forth, these were the great pursuits of his life, and he never ceased to study and investigate the relations of these two sciences to each other. He went to Paris, where he prosecuted his studies, and where his botanical publications soon won for him a distinguished place among the scientific men of his time. A work on Succulent Plants (Par. 1799—

1803), one on the species of *Astragalus* (Par. 1802), and some less important works, were followed by his extremely valuable *Essai sur les Propriétés Médicales des Plantes* (Essay on the Medicinal Properties of Plants), (Par. 1804). In 1802, he was called to a professorship in the Academy of Geneva, but preferred to remain in Paris, and delivered his first botanical lectures in the Collège de France. In 1804, appeared the first volume of his *Flore Française*. Employed by the government, he visited all parts of France and of the kingdom of Italy in 1806—1812, investigating their botany and agriculture; but the events of 1814 prevented the production of the great statistical work in which it was intended to embody the results of these investigations. On the fall of Napoleon, he was compelled to retreat to Geneva, where a professorship of botany was founded for him, and where he spent the remainder of his life. His *Théorie Élémentaire de Botanique* (Par. 1813) was followed by two other works, the fruits of his studies in systematic botany and the properties and natural affinities of plants, and by which the true knowledge of that science has been wonderfully promoted, his *Regni Vegetabilis Systema Naturale* (2 vols., Par. 1818—1821), and his *Prodromus Systematis Naturalis Regni Vegetabilis* (vols. 1—10, Par. 1824—1846). D.'s labours established on a surer basis, and improved in many of its most important respects the natural system of botany which Jussieu had attempted to found. See BOTANY. The latter years of D.'s life were years of sickness and suffering, and he died of dropsy on 9th September 1841. He bequeathed his collections—including a herbarium of more than 70,000 species of plants—to his son, ALPHONSE DECANDOLLE, on condition of his keeping them open to the public, and of his carrying on the *Prodromus*. To the completion of this work the younger Decandolle has accordingly devoted himself. He also is a botanist of no mean fame, and author of several botanical works, among which an Introduction to the Study of Botany (2 vols., Par. 1835) and a monograph of the *Campanula* (Par. 1830) particularly deserve to be noticed.

DECAPITATION. See CAPITAL PUNISHMENT.

DECAPODA. See CRAB and CRUSTACEA.

DECAZEVILLE, a town in the department of Aveyron, south of France. It has extensive blast-furnaces and ironworks, said to be superior to any in France, and which, with the iron and coal mines of the neighbourhood, afford employment to the mass of the inhabitants. Pop. 7272.

DECCAN (Sans. *Dakshina*, the south), a term applied sometimes to the whole peninsula of Hindustan to the south of the Vindhya Mountains, which separate it from the basin of the Ganges, and sometimes restricted to that portion of the same which is rather vaguely bounded on the north by the Nerbudda, which falls into the Gulf of Cambay, and on the south by the Kistna or Krishna, a tributary of the Bay of Bengal. Independently of this indefiniteness of meaning, the name, like that of the CARNATIC (q. v.), is rather of historical interest than of actual use.

DECEMBER, the last month of the year. In the old Roman calendar, before the time of Julius Cæsar, the year began with March, and that which is now the twelfth, was then the tenth month; hence the name (*decem*, ten). Our Saxon ancestors called it *Mit-winter-month* and *Yule-month*.

DECEMVIRI. The most famous body known under this title were the ten persons who were appointed as a sort of legislative committee, to draw up a code of laws at Rome. The ground-work on which the D. proceeded, was the information which

had been previously collected by three commissioners who were sent for that purpose to Greece. On the return of the commissioners, after a year's absence, a violent dispute arose between the patricians and plebeians as to which of the orders should be intrusted with the revision of the laws. The dispute ended in favour of the patricians, and ten patrician lawgivers were consequently appointed, to whom, moreover, the whole government of the state was intrusted during the year for which they were to hold office. The experiment was eminently successful; the work of legislation was carried on with zeal and success, and the state was governed with prudence and moderation. Their labours not being quite finished, a new body of D. was appointed; only *one*, the notorious Appius Claudius, belonging to the previous commission. In their magisterial and executive capacities, the new D. acted in the most tyrannical manner. In place of the fasces alone being carried before the decemvir who presided for the day, as on the former occasion, each of the ten was now attended by twelve lictors, who carried not only the rods, but the axe which was the emblem of sovereign power. Every species of outrage was committed on the persons and families of the plebeians, and when the term of their appointment expired, the D. refused either to resign or to allow successors to be appointed to them. At length, the iniquitous decision of Appius Claudius (q. v.) in the matter of Virginia brought affairs to a climax. A popular insurrection broke forth, the D. were driven from their office, and the tribunes and other ordinary magistrates of the republic were reappointed. The occurrence is the subject of one of Macaulay's most spirited *Lays of Ancient Rome*.

**DECENNARY.** See TITHING.

**DECEPTION ISLAND,** near South Shetland, in the Antarctic Ocean, is worthy of notice for the contrarieties which it presents. Under the reign of all but perpetual winter, it possesses hot springs and a volcano. In these contrasts it so far resembles Iceland with its Hecla and its geysers. But D. I. seems to be peculiar in this, that its very material consists of alternate layers of ashes and ice. It contains a deep lake of five miles in circuit.

**DECIDUOUS TREES** (Lat. *de*, and *cadere*, falling off) are those which annually lose and renew their leaves. In cold and temperate countries, the fall of the leaf in autumn, and the restoration of verdure to the woods in spring, are among the most familiar phenomena of nature, connecting themselves also very intimately with the feelings, habits, and circumstances of mankind. The greater part of the trees and shrubs of temperate regions are deciduous; but within the tropics, the forest retains always its luxuriance of foliage, except in countries where the diversities of condition, occasioned by the wet and dry seasons, are extreme, and there many trees lose their leaves in the dry season, from causes apparently the same with those which produce the same effect on the approach of winter in colder countries, and which are connected with a sort of rest of the plant, or partial suspension of the active functions of vegetable life. Trees not deciduous are called EVERGREEN (q. v.).

**DECIMAL FRACTIONS** (Lat. *decem*, ten) are such as have for their denominator any of the numbers 10, 100, 1000, &c.—i. e., any power of 10. See FRACTION. Thus,  $\frac{2}{10}$ ,  $\frac{23}{100}$ ,  $\frac{19}{1000}$ , are decimal fractions. In writing such fractions, the denominator is omitted, and the above stand thus: 0·7, or 7·23, ·019. That these numbers do not express integers is intimated by the point to the left; and the denominator is always 1, with as many ciphers annexed as there are figures in the decimal. A

cipher is prefixed to 19, because otherwise it would read as if it stood for  $\frac{19}{1000}$ . The expression £5·617 is read, Five pounds and 617-thousandths of a pound; or, Five pounds, and six-tenths, four-hundredths, and seven-thousandths of a pound. That these two readings are equivalent appears from this, that  $\frac{617}{1000} = \frac{600}{1000} + \frac{10}{1000} + \frac{7}{1000} = \frac{6}{10} + \frac{1}{100} + \frac{7}{1000}$ . It thus appears that the first figure of a decimal to the left expresses tenths of the unit; the second, hundredths; the third, thousandths, &c. In this property lies the great advantage of decimal fractions; they form merely a continuation of the system of notation for integers, and undergo the common operations of addition, multiplication, &c., exactly as integers do. To explain the principles which determine the position of the decimal point after these operations, belongs to a treatise on arithmetic.

The disadvantage attending decimal fractions is, that comparatively few fractional quantities or remainders can be exactly expressed by them; in other words, the greater number of common fractions cannot be *reduced*, as it is called, to decimal fractions, without leaving a remainder. Common fractions, such as  $\frac{1}{2}$ ,  $\frac{2}{3}$ ,  $\frac{3}{4}$ ,  $\frac{5}{7}$ ,  $\frac{9}{25}$ , for instance, can be reduced to decimal fractions only by multiplying the numerator and denominator of each by such a number as will convert the denominator into 10, or 100, 1000, &c. (The common process is merely an abridgment of this.) But that is possible only when the denominator divides 10, or 100, &c., without remainder. Thus, of the above denominators, 2 is contained in 10, 5 times; 4 in 100, 25 times; and 25 in 100, 4 times; therefore,  $\frac{1}{2} = \frac{1 \times 5}{2 \times 5} = \frac{5}{10} = \cdot 5$ ;  $\frac{1}{4} = \frac{1 \times 25}{4 \times 25} = \frac{25}{100} = \cdot 25$ ;  $\frac{9}{25} = \frac{9 \times 4}{25 \times 4} = \frac{36}{100} = \cdot 36$ . But neither 3 nor

7 will divide 10 or any power of 10; and therefore these numbers cannot produce powers of 10 by multiplication. In such cases, we can only approximate to the value of the fraction. Thus, 10, 100, 1000, &c., divided by 3, give 3, 33, 333, with a remainder in each case; and  $\frac{2}{3} = \frac{2 \times 333}{3 \times 333} = \frac{666}{999}$ .

As this denominator is nearly equal to 1000,  $\frac{2}{3} = \frac{666}{1000}$ , or ·666 nearly. As 10, and therefore its powers, are composed of the two factors 2 and 5, it is obvious that any fraction whose denominator contains any other factor than these, cannot be reduced exactly to a decimal fraction.

**DECIMAL NOTATION.** See NOTATION.

**DECIMAL SYSTEM.** This name is applied to any system of weights, measures, money, &c., in which the standard unit is divided into tenths, hundredths, &c., for the denominations below it, and multiplied by 10, 100, &c., for those above it. The nature of this method of division will be best explained by an example from the French system, where it has been most rigidly carried out. The *mètre* (= 39·37 English inches) is the unit of length, and the foundation of the whole system. For the higher denominations of length, the Greek words *déca*, *hecto*, *kilo*, and *myria*, are prefixed to signify multiplying by 10, 100, 1000, 10,000; so that *décamètre* = 10 mètres, *kilomètre* = 1000 mètres, &c. The Latin words *déci*, *centi*, *milli*, on the other hand, are used to express division by 10, 100, &c., and thus furnish names for the lower denominations; *décimètre* =  $\frac{1}{10}$  of a *mètre*, *centimètre* =  $\frac{1}{100}$  of a *mètre*, &c. Similarly with money; the *franc* being the unit, a *décime* is the tenth part of a franc; and a *centime*, the hundredth part.

In regard to money, the decimal division is now adopted in many countries. Belgium, Switzerland, and

and Piedmont have adopted both the French franc as the standard unit and the division into tenths. In Lombardy, the *lira* is divided into 100 *centesimi*; the Roman *scudo* is divided into 10 *paoli*, and the *paolo* into 10 *bajocchi*; the Dutch *gulden*, into 100 *cents*; the Russian *ruble*, into 100 *kopeks*; and in America, China, and Japan, the *dollar*, into 100 *cents*.

This plan of decimal gradation in weights and measures is the only rational one, because it is in accordance with the universally adopted decimal notation. If thoroughly carried out, the facilities it would afford in every department of life are scarcely calculable. For one thing, it is not too much to say that one-half the time now spent in Great Britain in learning arithmetic might be saved. That study might, in addition, be made an effective means of intellectual discipline; whereas at present the time must be spent in acquiring something like a ready but blind application of complicated rules.

The most striking instance, perhaps, of the inconvenience of the arbitrary mode of division is furnished by the thermometer. In this case, nature has fixed the fundamental measure, and made it the same for all nations—the interval, namely, between the freezing and boiling points of water. And yet, in England, this space is divided into 180 parts or degrees; in Germany and the continent generally, into 80°; and only in France has it been divided into 100°. Thus, the basis of uniformity made to our hand has been thrown away, and every observation of temperature made in one country has to be painfully translated before it can be understood in another.

**DECIMATION**, a military punishment, rarely inflicted in the present day. When a considerable body of troops committed some grave military offence, which would be punished with death if committed by an individual, the punishment was awarded to one-tenth of them by lot, instead of to the whole number, in order that the army might not be too much weakened.

**DECIMI**, in Music, is an interval of ten diatonic degrees, as from C to E, or third above the octave, as which it is always treated in harmony. There are only two cases in which it is treated differently from the third: 1st, in double counterpoint, where a necessary difference must be made although the same harmonic rules apply; and 2d, in thorough-bass, where the figure 9 shall rise a degree to 10, instead of falling a degree to 8.

**DECIUS**, C. MESSIUS QUINTUS TRAJANUS, a Roman emperor, was born at Bubalia, in Lower Pannonia, towards the close of the 2d c., and was the first of a line of monarchs who claimed descent from an Illyrian stock. Being sent in 249 A. D. by Philippus, the ruling emperor, to restore to subordination the army of Moesia, which was in a state of revolt; the troops proclaimed him emperor against his will, and forced him to march upon Italy. Philippus encountered the forces of D. near Verona, but was defeated and slain. D. assumed the government of the empire in the end of the year 249 A. D., but his brief reign was one of restless warring with the Goths, fighting against whom he was killed near Abricium, in the close of the year 251. During the reign of D., it was determined to revive the censorship, and to persecute the Christians, in order by the first to check the growing immorality of the state, and by the second to bring back the purity of the Roman religion, and regain for Rome the favour of the gods. The censorship was never fully restored, but a barbarous persecution of the Christians took place. In Rome, Antioch, and Jerusalem, the several bishops were

massacred; Origen, famous among the early Fathers, was subjected to the most acute tortures; dreadful cruelties were also perpetrated at Alexandria. Many Christians, in Africa, disowned their religion, until the persecution had passed.

**DECK** is a nearly flat planked covering to a ship, forming a flooring to the persons above it, and a shelter to those below it. There may be several such in a ship, one under another; not only does each serve the purposes here named, but it helps to strengthen the vessel, by holding the sides together. In ships of war, the number of decks varies with the rate or size. First and second rates have three whole decks, stretching throughout from stem to stern; besides two partial decks called the *fore-castle* and the *quarter deck*. The space between these two partial decks, which renders the upper D. open to the sky, forms the *waist* of the ship. Smaller ships have two whole and one half decks; while a still smaller class have only one of each.

Where there are several decks in a ship, they are distinguished by different names. Thus, the *quarter D.* stretches over that part of the upper D. which extends from the stern to the gangway. The *upper* or *main D.* has just been adverted to. The *middle* or *second D.* is next under the main D., and is rather thicker and stronger. The *lower* or *first D.* is in the broadest part of the ship, and is made very strong, to receive the heaviest guns. The *orlop D.* is the lowest of all, and is often only temporary; it is chiefly occupied as store-rooms. Some of the above are wanting in all but the largest ships; and other names are occasionally substituted.

**DECKANEE' HEMP.** See **HIBISCUS**.

**DE'CKER**, SIR MATTHEW, BART., a political economist, was born at Amsterdam towards the close of the 17th century. He came to London in 1702, was naturalised as an English subject in the following year, and having embarked in commerce, attained the greatest success; received a baronetcy in 1716, and three years afterwards, took his seat in parliament as member for Bishop's Castle. He sat in the House, however, only for four years. His death took place March 18, 1749; the baronetcy then became extinct, and his daughters succeeded to his estates.

D., in 1743, published a pamphlet, which in twelve years ran through seven editions, in which he proposed to raise all the public supplies from one single tax—namely, a tax upon houses. According to D.'s calculation, there were then in England, exclusive of Wales, 1,200,000 houses; of these he meant to tax only one-half, counting off 500,000 as inhabited by the working-classes, and 100,000 as being uninhabited. By this means, he proposed to raise an annual revenue of £6,000,000, which sum was £1,000,000 more than the expenses of the government of that day required. The surplus was to be applied as a sinking fund for the purpose of discharging debt.

**DECLAMATION** (Lat. *declamare*, to speak loudly, hence to exercise one's self in rhetorical delivery), is the art of speaking according to rules, whereby the sense of the words, as well as the feeling and sentiment, is naturally and characteristically represented. Recitation, therefore, whether spoken or sung, is subject to the laws of D., from which it derives its value and significance. Perfect D. implies correctness of speech, distinctness and clearness of enunciation, and a well-toned voice. D. is therefore clearly of a musical nature. In music, however, D. is so far different from the D. of speaking, that the singer must adhere to what the composer has written, as it is the latter who fixes the whole of the intonation, modulation, and

phrasing, and also the *tempi* and expression, and who not unfrequently sacrifices the correctness of the D. to the charm of some peculiar melodic phrase or pleasing rhythm, or a vocal musical embellishment. The truth and beauty of correct musical D. are always endangered by a translation of the original words into another language, a work which, with the greatest care and ability, it is in many cases almost impossible to accomplish word for word, or syllable for syllable, so as to fit accurately to the accent of the music. The master-works of many great composers suffer much in this respect, at which our musical public seem quite indifferent, while listening to translations of operas so carelessly executed as to destroy their greatest beauties, and frequently altogether to distort the sentiment. In earlier times, as well as now, considerable trouble has been taken to establish D. as a science. The ancients had a kind of note, or sign of intonation, which they placed over or under the words, possibly to decide whether the accent should be given by a high or by a low tone, and thus to regulate the modulation of the voice. That the theatrical D. of the ancients resembled the musical recitative of the present day, is generally admitted. In the German language, there are numerous works written on the art of declamation.

**DECLARATION**, in Common Law, the pleading in which the plaintiff in an action at law sets forth his case against the defendant. The plaintiff may declare as soon as the defendant has made appearance in answer to the Writ of Summons (q. v.), or, where the summons is not specially indorsed (q. v.), on failure of the defendant to make appearance. If the plaintiff fails to declare within a certain time, the defendant may obtain judgment of *Non Pros.* (q. v.); and if the failure continue for a year after the writ of summons is returnable, the plaintiff is deemed out of court. On application to a judge, a plaintiff, if not prepared, may obtain time to declare; and a defective D. may be amended. The D. must be entitled on the face of it of the proper court, and of the day, month, and year in which it is pleaded, and bears the Venue (q. v.) in the margin. In the name and number of the parties, and in the character in which they sue or are sued, the D. must correspond with the writ of summons. The D. states succinctly in one or more counts, each count in general setting forth a separate cause of action, the facts of the plaintiff's case, for which he claims redress. Any irrelevant matter will be struck out at the cost of the plaintiff. In case appearance has been made for the defendant, the D. will be delivered to him or his attorney. If no appearance has been made, the plaintiff may proceed to obtain judgment by default. See **JUDGMENT, DEFAULT, PLEADING.**

**DECLARATION**, in lien of an oath. Quakers, Moravians, and Separatists, who object to swear on religious grounds, have been permitted by several statutes to substitute a simple D., or *affirmation*, as it is called, for an oath. See **AFFIRMATION.** The members of all other Christian sects may still be compelled to swear, whatever be their scruples, in criminal cases. But as regards civil cases, it was enacted by the Common Law Procedure Act of 1854 (17 and 18 Vict. c. 125, s. 20), that any person who should declare that the taking of an oath is, according to his religious belief, unlawful, should be entitled to substitute an affirmation, or D., and that persons making a false affirmation should be subject to the same punishment as for perjury. In the following year (1855), these provisions were extended to Scotland by 18 Vict. c. 25, s. 1; and by s. 2, the Queen is empowered, by an order in council, to direct the provisions of the act to be applied to all courts in

Scotland; by which would seem to be meant all courts other than the 'courts of civil judicature' mentioned in the first section, i. e., to all criminal courts.

**DECLARATION, DYING.** The rule that secondary or hearsay evidence is inadmissible, suffers an exception, both in England and Scotland, in the case of a declaration made by a person under the conviction of his impending death, and who does not survive the trial. Such declarations are of peculiar value for the ends of justice, where the party emitting them dies of injuries which are the subject of the prosecution. In cases of murder, the dying D. of the sufferer as to the circumstances of the crime is always admitted as evidence on the trial of the prisoner, provided that it was deliberately emitted while the deceased was in possession of his faculties, and that it is proved by credible witnesses. If it be possible, the dying D. should always be committed to writing, and tested in the most complete manner that is consistent with the circumstances in which it is emitted. In cases of necessity, however, it may be proved by parole evidence. As to the other cases in which secondary or hearsay evidence is admissible, see **EVIDENCE.**

**DECLARATION IN CRIMINAL PROCEEDINGS.** In Scotland, the statement made by the prisoner before the magistrate (see **STATEMENT**) is called his declaration. It is the duty of the magistrate to take this D. immediately on the prisoner being brought to him—that is to say, if he is in his sober senses. The magistrate must previously inform him that it is entirely at his own option to declare or not, but that if he chooses to declare, the D. may be used in evidence against him on his trial. In practice, the examination is generally conducted by the procurator-fiscal, who knows more of the facts of the case than the presiding magistrate. It is taken down by the clerk of court, the magistrate usually dictating to him the form of words which he conceives will most accurately convey the meaning of the prisoner, in case of his statement being of such a rambling description as to render the writing down of the very words impossible. The D. ought to contain the name, age, and designation of the prisoner, the parish and county in which the crime is said to have been committed, and all similar particulars. When completed, it must be read over to the prisoner, who, if he is able to write, signs every page of it along with the magistrate. If he cannot or will not write, the magistrate signs it in his stead. There must, moreover, be two witnesses present, who shall sign the D., and who, if necessary, can speak to the manner in which it was taken. If the prisoner does not understand English, a sworn interpreter must be employed. The D. will be incompetent to be produced as evidence if the magistrate has delegated the duty of taking it to his clerk, or to any one not a magistrate. As the D. is not emitted on oath, it will not be allowed to be produced or used for the purpose of criminating any one else whom the prisoner may have named as a participator in his crime.

**DECLARATION OF RIGHT.** See **RIGHT.**

**DECLARATOR**, a form of action in the Court of Session in Scotland, the object of which is judicially to ascertain a fact, leaving its legal consequences to follow as a matter of course. Such are declarators of property, of contravention under an irritancy in an Entail (q. v.), of non-entry, of marriage, of bastardy, and many others. The declaratory conclusions of such actions are generally followed by petitory or possessory ones, for the purpose of giving effect to the right declared; but

this is by no means necessarily so. A substantial interest on the part of the pursuer must, however, in all cases be shewn, as it is not competent to ask the court to declare a mere abstract fact or right. The existence of this special form of action has contributed to diffuse in Scotland a false view as to the nature of actions and judicial proceedings generally, from which many even eminent lawyers have not been free. It is said that decrees upon actions properly declaratory 'confer no new right, but only declare that a right exists in the pursuer,' as if in this case they were an exception to decrees in general, whereas it is obvious that no decree can confer a new right on the pursuer, otherwise than by committing an act of injustice against the defender. In England, there are no actions of D., an arrangement often wondered at in Scotland, but in which the English seems to be more logical than the Scotch law, inasmuch as all actions are actions of declarator.

DECLENSION, a grammatical term applied to the system of modifications called *cases*, which nouns, pronouns, and adjectives undergo in many languages. How the words Declension (Lat. *declinatio*, a declining, or leaning away) and Case (Lat. *casus*, a fall) came to be applied to this species of inflection, has never been made altogether clear. The relations in which one thing stands to other things may be expressed in either of two ways. Some languages make use of separate words, called prepositions; in others, the relations are expressed by changes in the termination of the name of the thing. Thus, in Latin, *reg* being the root or crude form of the word for 'king,' *regis*, or *rex*, is the word in the nominative case, signifying 'a king' as subject or agent; *regis*, in the genitive case, 'of a king;' *regi*, in the dative, 'to a king,' &c. An adjective joined to a noun, usually takes a corresponding change. The number of cases is very different in different languages. The further we go back in the history of the Indo-European languages, the richer do we find them in these modifications. Sanscrit had eight cases, Latin six, and Greek five. The names of the Latin cases, which are often used also in regard to the English language, are—the Nominative, which names the subject or actor; the Genitive, expressing the source whence something proceeds, or to which it belongs; the Dative, that to which something is given, or for which it is done; the Accusative, the object towards which an action is directed; the Vocative, the person addressed or called; and the Ablative, that from which something is taken. The Greek has no Ablative case. The Sanscrit, in addition to the Latin cases, has an Instrumental case, and a Locative case. The grammar of the inflecting languages is complicated by the circumstance, that all nouns do not form their cases in the same way. This makes it necessary to distribute nouns into various classes, called 'declensions.' In Latin, as many as five declensions are usually given. See INFLECTION. As we descend the stream of time, the case-endings become rubbed off, as it were, and prepositions are used in their stead. The languages descended from the Latin (French, Italian, &c.) have lost all the cases of nouns and adjectives. The Gothic languages, of which Anglo-Saxon is one, had cases almost as numerous and perplexing as those of the Latin. German is still to a great extent encumbered with them. English has only one case in nouns different from the nominative—namely, the genitive, or possessive. See NOUN. The declension of Pronouns (*q. v.*) has been more persistent than that of nouns and adjectives. Languages of the agglutinating order have, in general, a great abundance of cases. In Finnish, nouns have fifteen cases. Thus,

*karhu*, a bear; *karhun*, of a bear; *karhuna*, as a bear; *karhutta*, without bear; *karhussa*, in the bear; *karhusta*, out of the bear, &c. In the Magyar, twenty cases may be reckoned; and the languages of the North American Indians are richer still—perhaps we should say, more embarrassed. What case-endings and other inflectional terminations were in their origin, as well as the comparative merits of the highly inflected and the analytic languages, will be considered under INFLECTION.

DECLINATION. If a great circle be drawn through the pole of the heavens and any star, the D. of the star is the portion of the circle intercepted between the star and the equator. See POLE. The place of a point in the heavens is determined by its right ascension and D., just as a point in the earth's surface is determined by its latitude and longitude.

DECLINATION NEEDLE. When a magnetic needle is suspended or made to rest on a point so as to be free to move in a horizontal plane, it finds its position of rest in a line joining two fixed points on the horizon; and when made to leave that position, after several oscillations, it returns to it again. At certain places on the earth's surface, these two points are the north and south points of the horizon; but generally, though near, they do not coincide with these. A vertical plane passing through the points on the horizon indicated by the needle, is called the magnetic meridian, in the same way that a similar plane, passing through the north and south points, is known as the astronomical meridian of the place. The angle between the magnetic and astronomical meridians is termed the declination or variation of

Fig. 1.

Fig. 2.

the needle. Thus, if NS (fig. 1) be the line of the astronomical meridian, and *ns* the line joining the poles of the needle, the angle *NCn* is the declination. The declination is east or west according as the magnetic north lies east or west of the true north. Instruments for determining magnetic declination are called declination needles or declinometers. In this instrument there are two things essential—the means of ascertaining the astronomical meridian, and a needle for shewing the magnetic meridian. Fig. 3 represents a common form of the declinometer. Upon a tripod provided with levelling screws stands the pillar P, to which is fixed the graduated azimuthal circle CC. The compass-box B, with the vernier V, attached to it, moves on the azimuthal circle by means of a pivot at the pillar P. Two uprights, U, U, are fixed to the side of the compass-box, on the tops of which rests the axis of the telescope T. A graduated arc A, is fixed to the bottom of one of the uprights, and the angle of elevation of the telescope is marked by the vernier on the arm E, attached to the axis of the telescope. A level L, is also hung on the axis of the telescope, for adjusting the instrument. Inside the compass-box is another graduated circle F, the line joining the zero-points of which is parallel to the axis of the

## DECLINATURE—DECORATED STYLE.

telescope. All the fittings are in brass or copper, iron, of course, being unsuitable. It will be easily seen that the compass-box and telescope move round

Fig. 3.

as one piece on an axis passing through the centre of the azimuthal circle. When an observation is made, the telescope is pointed to a star whose position with regard to the astronomical meridian is known at the time of observation. The telescope with the compass-box is then brought the proper number of degrees on the azimuthal circle, until its axis is in the meridian of the place. If, when the telescope is in this position, the north end of the needle stand at the zero-point of the inner circle, the declination would be  $0^\circ$ ; but if it lie east or west of this point, the declination is shown by the degree at which the needle stands. It is difficult to construct a needle so that the line joining its poles exactly coincides with the line joining its visible extremities. If this coincidence be not perfect, the geometrical axis of the needle according to which the reading is made lies to the right or left of the magnetic axis, and consequently of the true reading. To remedy this, the needle is so made that it can rest either on its lower or upper surface. In finding the true reading, the position of the needle is marked, and then it is turned upside down, and again marked, the mean of the two readings giving the true one. This is easily seen in fig. 2. The declination of the needle may be also ascertained by the 'Dipping Needle' (q. v.). The ordinary compass which must be used by making allowance for declination, is a declination compass. See **MAGNETISM, TERRESTRIAL**.

**DECLINA'TURE**, in Scotch Law, a preliminary plea declining the jurisdiction of the judge, either on the ground of his being interested in the suit, or of the case being beyond his province. In England, it is spoken of as a plea to the jurisdiction on the ground of interest, &c.

**DECO'CTION** is the term applied in pharmacy to the solution procured by boiling an organic substance with water.

**DECOLORIMETER** is an instrument for determining the power of portions of bone-black or animal charcoal to abstract colouring matter. See **BONE-BLACK**.

**DECOMPOSITION** is a term employed in chemistry to signify the separation of more simple substances from a compound. Thus, when the red oxide of mercury ( $HgO$ ) is heated, it suffers D., and is resolved into mercury ( $Hg$ ) and oxygen ( $O$ ); and water ( $H_2O$ ), when subjected to a current of voltaic

electricity, is decomposed into hydrogen ( $H$ ) and oxygen ( $O$ ).

**DECOMPOSITION OF FORCES.** See **COMPOSITION**.

**DECORATED STYLE** of Gothic Architecture. During the reigns of the first three Edwards, from the latter part of the 13th till nearly the end of the 14th c., Gothic architecture may be said to have been in full bloom in England. It attained perfection somewhat earlier in France and Germany, and somewhat later in Scotland, and consequently the buildings on the continent which correspond to what is called the D. S. in England, belong, for the most part, to the beginning, and those in Scotland, for the most part, to the end of the 14th century. The decorated style arose so gradually out of the style which preceded it, and merged so gradually into that which followed it, that it is not wonderful that different periods of duration should be assigned to it by different writers. The longest, probably, is that mentioned by Britton, from 1272 to 1461; and the shortest by Rickman, from 1307 to 1392. In fixing on the middle of the 14th c. as its highest point, however, they are all pretty much agreed, and the same agreement is exhibited in recognising it as the most perfect of the Gothic styles. The decorated style was a higher development of the early English style, all the peculiarities of which, both in its forms and in its adornments, it exhibited in greater perfection and richness; and it is remarkable that when we pass from it to the more elaborately florid style which succeeded it, the degeneracy in sculpture is as perceptible as in architecture. It seems, indeed, as if the school of art which we regard as the peculiar production of the middle age, then attained, in all its branches, to a point which admitted of no further progress in that direction. Nor is this remark confined to art, as addressed to the eye, for that it applies equally to poetry will be at once admitted, when it is remembered that the era which we have assigned to the decorated style throws it almost entirely within the period which is covered by the long life of Chaucer. It is a striking instance, moreover, of the intimate relation which subsists between the aesthetic and the general life of a nation, that it was at this very same period that the social, political, and religious institutions of mediæval life culminated. Chivalry and feudality were in the fulness of their vigour, and the church had only just begun to give employment to the innovating minds of the first reformers. Of all the epithets which have been employed to characterise this style—absolute Gothic, pure Gothic, complete Gothic, and the like—that of the 'middle pointed,' is, perhaps, the most descriptive; the simple pointed arch, described from an equilateral or obtuse-angled triangle, being retained, but the window being enlarged, divided by mullions into several lights, and the heads filled with tracery. Of this, as of all the other styles of architecture, the most characteristic feature of all is unquestionably the capitals of the pillars. Of the foliage which is employed in the decorated capital, Mr Bloxam remarks, that it 'may generally be distinguished from that of the early English by its not rising from the neck moulding

Decorated English Capital:  
York Cathedral.

with stiff stems, but being carried round the bell in something of a wreath-like form. . . . It often exhibits much of natural freedom; and we frequently find the oak, the ivy, the hazel, the vine, the fern, &c., very beautifully and closely copied from the natural leaves.

**DECOUPLÉ**, or **UNCOUPLED**, in Heraldry, is severed or disjoined, so that the ends stand at a distance from one another, as a *chevron decouplé*.

**DECOYING OF CHILDREN**. The crime of stealing human creatures, the *plagium* of the Roman law and of the law of Scotland, is severely punished by the legislation of every civilised country. In countries where slavery does not exist, the theft of a human adult is a crime which can scarcely occur. Where a free man is wrongously captured or detained, the crime is not theft, but wrongous imprisonment, which will be dealt with by the criminal law as an injury to the public, while at the same time the individual will be entitled to recover damages for the injury which he has personally sustained. Formerly, it was regarded as treason to the king, inasmuch as it was a wrongful detaining of his free hégeman without his licence or commission, and as such was punishable with death, both in England and Scotland (Hume's *Com. i. p. 83*). The only form in which the crime has been dealt with in modern times is that of child-stealing, for which sentence of death was pronounced in Scotland so lately as 1817; but the *libel* is now invariably restricted, in which case sentence of transportation has usually been pronounced. In England, the offence is statutory, it being enacted by 9 Geo. IV. c. 31, s. 24, 'That if any one shall maliciously, either by force or fraud, lead or take away, or decoy or entice away, or detain any child under the age of ten years, with intent to deprive the parent or parents, or any person having the lawful care of such child, of its custody, or to steal any article upon or about its person; or if any person shall receive or harbour such child for such purposes, every such offender shall be guilty of felony, and liable to be transported for seven, or to be imprisoned for two years; and if a male, to be thrice whipped.' The act does not apply to any person who shall have claimed to be the father of an illegitimate child.

**DECREE**, in Theology. See **PREDESTINATION**.

**DECREE**, or, as it is frequently called in Scotland, a *Decreet*, is a final judgment of a court, whereby the question at issue is set at rest. In England, it is more commonly applied to the final judgments of courts of equity.

**DECREE IN ABSENCE**, in Scotland, is equivalent to a judgment by default in a common law court, or a decree *pro confesso* in Chancery.

**DECREMENT**, **DECRESCENT**, and **DECOURS**, are heraldic terms by which the wane of the moon is indicated. A *moon decrescens*, is a half-moon with her horns turned to the sinister.

**DECREPITATION** is the term applied to the crackling sound heard when a substance like common salt is thrown upon a fire. A series of minute explosions occur, owing to the water between the plates of the crystalline particles becoming expanded by the heat, and ultimately bursting them.

**DECRESCENDO**, in Music, is the reverse of *crescendo*—viz., a gradual diminishing of the sound. The executing of the *decrecendo* is very difficult, whether on one or more notes. Like the *crescendo*, it is also frequently combined with a slight *ritardando*, especially in descending passages. It is frequently marked thus 

**DECRETALS**. The body of the canon law consists, 1st, of the *Decretalium*, a collection made by Gratian, a Benedictine monk, after the middle of the 12th c., in imitation of the Roman *Pandects*, and drawn from the opinions of the Fathers, popes, and church-councils; 2d, of the *Decretalia*, collected by Pope Gregory IX., nearly a century later, from the decretal rescripts or epistles of the popes, as the code of Justinian was from the constitutions of the emperors. To these, additions were made by several succeeding popes. See **CANON LAW**.

**DEDUCTION** is a particular kind of reasoning or inference. In ordinary language, to deduce means to trace one thing to another as its cause, to shew that one proposition follows from some other proposition or propositions. In logic, its signification is more definite. It is usual to oppose Deduction to Induction (q. v.), and to say that the latter consists in reasoning from particulars to generals, the former in reasoning from generals to particulars. In fact, however, every step in a deduction is also an induction. The several steps of a train of deductive reasoning consist of Syllogisms (q. v.), and the major proposition of a syllogism is an induction, or a general proposition expressing the result of a previous induction. The whole object of this kind of reasoning is to shew that some particular case or phenomenon really has the marks which bring it under the class to which the general proposition was meant to apply. Thus, the equality of the angles at the base of an isosceles triangle is deduced from the general proposition, 'That magnitudes which can be applied to one another so as to coincide are equal,' by shewing that the angles in question can be so applied.

Deduction is more properly opposed to Experiment. Suppose the question to be as to the relation between the spaces and times in falling bodies, the point may be determined in two ways. We may institute experiments, and observe how far bodies *do* fall in different times, and conclude a general proposition from the particular instances we observed; or we may bring the case under two general principles already established, those, namely, expressed in the first law of motion, and in the nature of gravity as a moving force, and calculate from these how far bodies *will* or *must* fall in given times. The conclusion or law arrived at in both cases is the same; but in the one case it is experimental, in the other deductive. It is the tendency of all sciences to become more and more deductive. Knowledge put on a deductive basis is sometimes spoken of as science, *par excellence*, and the immediate results of observation as empiricism. Mathematics is essentially a deductive science, and most of the truths in natural philosophy have been gradually put on similar grounds. Chemistry remains almost wholly experimental; it can predict or deduce little or nothing regarding an untried case, except, perhaps, the proportion in which two bodies will combine. See **REASONING**.

**DEE**, the name of two rivers in Scotland. The larger and more important rises in five wells 4000 feet above the sea, near the top of Braeriach Mountain, in the neighbourhood of Cairntoul and Ben Macdhuì, 25 miles north-west of Castleton of Braemar. After flowing 12 miles south-south-east, it joins the Geanley, at the height of 1294 feet above the sea. It then tumbles through a narrow chasm in the gneiss rock, called the Linn of Dee, across which a person can leap. After this it runs east-north-east through Aberdeenshire and a small part of Kincardineshire, and ends in the German Ocean at the harbour of Aberdeen. In this course, 96 miles in all, it receives a number of tributaries—the

Lui, Maic, Feugh, &c. The basin of the Dee, which is about 1000 square miles in area, consists of granite and gneiss in nearly equal areas. In the gneiss occur many beds of primitive limestone, and some masses of trap-rock and serpentine. On the Dee are Balmoral Castle and several villages much resorted to in summer.—Castleton of Braemar, Ballater, Aboyne, Kincardine O'Neil, Bauchory-Ternan, and Cults. The soil on the Dee is light and sandy, and requires much rain. A railway extends up Deeside for 32 miles, from Aberdeen to Aboyne. See BALMORAL and BRAEMAR.—The smaller DEE rises in Kirkcudbrightshire, near the northern boundary of that county. Its general direction for the first 40 miles is south-easterly, after which it flows west to the Solway Firth, into which it falls at Kirkcudbright Bay. The D. divides Kirkcudbright into two nearly equal portions, and near the centre of the county it expands to about the average breadth of a quarter of a mile, preserving this appearance for about 10 miles of its course, and forming successively Loch Ken, Loch Dee, and Long Loch. It is about 50 miles in length, and is navigable for the last 7 miles. The waters of the D. are noted for their salmon, which are of a darker hue, and are fatter than those of most rivers in the south of Scotland.

DEE, a river in England, draining parts of the shires of Merioneth, Denbigh, Flint, and Salop, in Wales, and the west of Cheshire. Near Trevor, it is crossed by the Ellesmere Canal, on an aqueduct 1007 feet long and 120 high; and also by the stone viaduct of the Chester and Shrewsbury Railway, of 19 arches, each 90 feet span, and 150 feet high. Below Trevor, the D. winds first south-east, and then north-east, and north to Chester, which city it nearly encircles. At Chester, it is 100 yards broad, and runs alongside marshes in an artificial tidal canal 9 miles long, and admitting ships of 600 tons. It ends in the Irish Sea, in a tidal estuary 9 miles long and 3 to 6 miles broad, and forming at high water a noble arm of the sea; but at low water a dreary waste of sand and ooze, with the river flowing through it in a narrow stream. Its whole course is 80 miles long, and its chief tributaries are the Treveryn, Alwen, Ceirog, Clyweddog, and Alyn. Its upper basin chiefly consists of Silurian strata, and its lower of new red sandstone. Canals connect the D. with the rivers of Central England. The ancient Britons held its waters sacred.

DEE, JOHN, a celebrated astrologer and mathematician, was the son of Rowland Dee, 'gentleman-sewer' to Henry VIII, born in London 13th July 1527, and educated at St John's College, Cambridge. After residing for some time at the university of Louvain, he went in 1550 to Paris, where, at the College of Rheims, he read lectures on the *Elements* of Euclid with very great success. In 1551, he returned to England, was presented by Cecil to Edward VI., and pensioned; but during the reign of the 'Bloody Mary' he nearly lost his life. He again set out for the continent in 1564, ostensibly for the purpose of presenting to the Emperor Maximilian a book which he had previously dedicated to him. Lilly, however, in his *Memoirs* (p. 224), affirms that he acted as Queen Elizabeth's 'intelligencer' or spy, and 'this theory is probably the true one. Lilly says that he was 'a ready-witted man, quick of apprehension . . . and excellent in all kinds of learning;' while the professional mask which he wore, the pretensions he made of being able to raise and converse with spirits, served to prevent all suspicion.

The impression that Dee had dealings with the devil, seems to have become more prevalent the longer he lived. In 1576, a mob assembled around Mortlake, his country residence, and, attacking the house, broke his instruments, and destroyed his library, which was large and costly, Dee and his family escaping with difficulty.

In the year 1581, having taken into his service an apothecary of the name of Kelly as assistant, Dee visited various continental courts, pretending to be able to raise spirits. Whether he took to this strange profession through a sincere belief in what he professed, or adopted it merely as a blind, a pretext for visiting foreign courts at which he had more serious business to transact, it is impossible to say. In 1595, he was appointed warden of Manchester College, where he resided nine years, and whence he returned to Mortlake. His death took place in 1608, in the 81st year of his age. He died very poor. Dee's writings are very numerous; they are chiefly scientific treatises, and many of them are still in manuscript in the Cottonian and other collections. In 1842, the Cambridge Society published the *Private Diary* of Dr John Dee, with a catalogue of his library of scientific MSS. made by himself.

DEED, in Law, is a formal written expression of something done by the party or parties from whom it proceeds. The term is applied to almost every form of legal writing, and will consequently be treated under various heads. See INDENTURE, CHARTER, TESTAMENT, DISPOSITION. As to the manner in which deeds are executed in England, see SIGNING, SEALING, AND DELIVERING; and in Scotland, see TESTING, WITNESS, DELIVERY, HOLOGRAPH, REGISTRATION.

DEEMSTER, DEMPSTER, or DOOMSTER, the name of an officer formerly attached to the High Court of Justiciary in Scotland, who pronounced the doom or sentence of condemned persons. The office was held along with that of executioner. At the conclusion of a trial, this dread official was produced in open court, in presence of the wretched criminal, as is graphically described by Scott in his tale of *Old Mortality*. See notes to that work, and also notes to *Heart of Mid-Lothian*. The office of deemster has been long abolished. In the Isle of Man (q. v.) and Jersey (q. v.), DEEMSTERS are a kind of judges.

DEER (Ger. *thier*, meaning 'beast'—a sense which the Eng. *deer* once had; Gr. *thēr*, Lat. *fēra*), a Linnaean genus of ruminant quadrupeds, now constituting the family *Cervidae*, which some naturalists have divided into a number of genera, whilst others still regard it as forming only one, the distinctions between its groups not seeming to them sufficiently marked or important for generic characters. Deer are animals of graceful form, combining much compactness and strength with slenderness of limb and fleetness. They use their powerful horns for weapons of defence, and sometimes of offence; but in general they trust to flight for their safety. They have a long neck, a small head, which they carry high, large ears, and large full eyes. In most of them there is, below each eye, a sac or fold of the skin, sometimes very small, sometimes of considerable size, called the *suborbital sinus*, *lachrymal sinus*, or *tear-pit*, the use of which is not well known. Deer have no cutting teeth in the upper, but eight in the lower jaw; the males have usually two short canines in the upper, but neither sex has any in the lower jaw; the præmolars are three, and the true molars three on each side in each jaw. They are distinguished from all other ruminants by their branching horns (antlers), which in most of the species exist

in the male sex only; they are solid and deciduous, i. e., fall off annually, and are renewed with increase of size, and of breadth of palmation, and number of branches, according to the kind, until the animal has reached old age, when the size of the horns begins to diminish on each annual renewal. The size and development of the horns are indeed closely connected with the sexual system, and their annual renewal takes place just in time for the rutting season, when they are much used in fierce combats. Females with diseased ovaries sometimes exhibit horns like those of the male.

The annexed cut represents the horns of the stag at different ages. During the first year, there is only a slight protuberance; the second year is marked

by the *brow antler* (1); the third year, by the *bay antler* (2); the fourth, by the *tray antler* (3); the fifth, by the *crockets* (4); the sixth, by the *beam antler* (5), the various parts of which are termed (A) *crockets*, (B) *tray*, (C) *bay*, (D) *brow*, (E) *pearls*, (F) the *beam of the antler*; seventh year (6).

The horn of a deer is a continuation of bone from the outer table of the skull, and is at first clothed with a velvet-like covering (the 'velvet'), continuous with the outer integuments of the head, which, however, is soon rubbed off—the animal appearing to be impelled by some irritation to rub it against trees or rocks—leaving the horn hard and solid, with traces of the course of the many vessels which were employed for its production. The growth of the horn is very rapid. When the old horn has been cast, there is a wound which bleeds a little, but is soon skinned over with a fine film, and the new horn almost immediately begins to sprout. Cast-horns are very rarely found in deer-forests, a circumstance that has never been quite satisfactorily accounted for. The growth of the horn is attended with much heat, and the blood-vessels which supply the head enlarge in size. The last part of the process is the formation of a rough circle of bony tubercles (the *burr* or *pearl*) at the base of the horn, bearing some proportion to the size of the horn and the age of the animal. It is by these, as they enlarge, that the nutritive vessels of the 'velvet' are compressed and obliterated.—Deer are pretty uniformly clothed with hair, longer and thicker in those which inhabit cold, than in those which inhabit warm climates. The tail of all the species is short. The horns of some are broadly palmated, those of others are rounded; and importance has been attached in classification to their having or wanting a distinct *snay* or short branch projecting in front from the base of the antler; which is present, for example, in the stag, fallow-deer, reindeer, and axis, and wanting in the roebuck, elk, and cariacou. The broad palmation of the horns of species inhabiting the coldest climates has been supposed to be intended for turning over the snow in search of food. One of the most beautiful adaptations in nature is a peculiarity

of the foot of the reindeer, by which the hoofs separate to a remarkable width, and the greater extent of surface prevents the foot from sinking in soft snow. Deer are found in almost all parts of the globe except Austraha and the south of Africa, their place in the latter region being supplied by antelopes in extraordinary number and variety. Some of them live amidst the snows of very northerly regions, and some in tropical forests; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height, none dwelling on those lofty mountain summits which are the chosen abode of some animals of the kindred families of *Antilopidæ*, *Capridæ*, and *Moschidæ*, as the chamois, the bouquetin, and the musk. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated and reduced to the service of man; although individuals of many species have been rendered very tame.

See AXIS, CARIACOT, ELK, FALLOW-DEER, MUNTJAK, REINDEER, RUSA, STAG, WAPITI, &c.—The MUSK (q. v.), although sometimes called Musk-deer, is not of the deer family.

DEER, or DEIR, OLD, a village and parish in the north-east of Aberdeenshire, in the district of Buchan. Here are vestiges of a Cistercian monastery founded about the year 1219, by William Cumyn, Earl of Buchan, on the site of a church believed to have been planted by St Columba, and his disciple St Drostan, about the year 580. A few MSS. which had belonged to the monks of Deir, found their way, after the Reformation, to the University Library at Cambridge; and among them one has been recently discovered, which has come to be known among archæologists and philologists as the *Book of Deir*. It contains a copy of the gospels (in the Latin version of St Jerome) and of the Apostles' Creed, in the handwriting of the 9th c., with a portion of a *Missa de Infirmis*, or 'Communion of the Sick' (containing a Celtic or Gaelic rubric), in a later hand. On the blank leaves at the beginning, in the handwriting of the early part of the 12th c., are a few notes or memorials, in the Celtic or Gaelic language, recording 'How Columcille and Drostan came from Ili to Aberdour, and how Bede the Pict, who was then Maormohr of Buchan, gave them the towns of Aberdour and Deir,' and how succeeding maormohrs, chiefs of clans, kings, and others, added to the immunities and endowments of the church of Deir. These notes or memorials are of great philological interest, as the only known examples of the Celtic speech of Scotland in the 12th century. They are also of great historical interest, as opening up glimpses of the social state of the country during the obscure period between the 7th and 12th centuries. The *Book of Deir* has been edited for the Spalding Club, by John Stuart, LL.D., the secretary. To Mr Bradshaw of King's College, Cambridge, we owe the discovery of the MS.

DEERMOUSE, or JUMPING MOUSE (*Meriones*), a genus of American rodent quadrupeds allied to mice and to jerboas, and differing from the gerbils of the warm parts of the Old World only in the greater length of their hind-legs, the nakedness of the tail, and the existence of a very small tooth in front of the molars of the upper jaw. The D. or Jumping Mouse of Canada (*M. Canadensis*), common in that country, and often seen in summer and autumn, is a beautiful agile little creature, of the size of a mouse, with a very long tail, and very long slender hind-legs. It is capable of taking leaps of

four or five yards. It burrows, and passes the winter in a state of lethargy.—Another species, the Labrador Jumping Mouse (*M. Labradoricus*), inhabits the still more northerly parts of North America.

**DEER-STALKING** is the art of following the red deer by cautious manœuvring, for the purpose of shooting it with the rifle; and as practised in the Highlands of Scotland, is perhaps unequalled as a sport in fatigue as well as in excitement. The extensive tracts of hill-land over which deer roam, and on which they are stalked, are termed 'deer-forests,' few of which, however, notwithstanding the appellation, can boast of a single tree; and where these 'forests' belong to noblemen and others peculiarly addicted to the sport, deer are strictly preserved, to the almost total exclusion of sheep and cattle. This sport is more highly esteemed, and greater sums are paid for it by its devotees than for any other in Scotland. This arises chiefly from two causes: 1st, from the intense excitement occasioned in the pursuit of the red deer; and 2d, from the comparative scarceness of good forests. Deer-stalking demands many expensive accessories, among which may be mentioned—deer-hounds, to pursue and bring to bay wounded game; one or more guides to accompany the stalker; and hill-men to drive the deer, when that method of obtaining shots is determined upon, &c. However excellent a marksman the deer-stalker may be, and though he may be tolerably conversant with the general 'lie' and bearings of the ground, he is almost always accompanied by an experienced guide, upon whose cool judgment, keen eye, and thorough knowledge of every knoll and rock of the 'forest,' depends greatly his chance of obtaining a shot. A dress resembling in colour as nearly as possible that of the ground to be gone over; a rifle of first-rate make, and previously practised with at various distances; a deer-hound or more, that watch constantly in perfect silence for the slightest look or sign from their master; a robust constitution, to stand the fatigue of walking, crouching (sometimes in water), crawling, or advancing on the back, feet first, are some of the absolute requisites the deer-stalker must possess. And when we add to these the most unflinching perseverance and untiring patience, we have not said all, for unless he is gifted by nature or experience with *nerve* to take instant and careful advantage of the rare opportunities a day's stalk may offer, his previous care and toil must go for nothing. The rutting season commences in October, when the harts are of course useless, but yeld or barren hinds may be shot, and are in good condition. This sport depends more upon the vicissitudes of wind and weather than perhaps any other. Deer are gifted with very keen scent, a fact of which the stalker is well aware, and for which he must allow by advancing upon his game up the wind. They are also far-sighted, and exceedingly prone to take alarm at the slightest sound, faculties which warn the stalker never to let himself or his attendant be seen, and to observe the strictest silence. Deer, if disturbed, for the most part look for the cause as proceeding from the *low grounds*, and rarely from above; this peculiarity is duly taken advantage of by the sportsman, who accordingly advances upon his game, wind permitting (frequently by the most circuitous and precipitous paths), down hill. When thus approaching deer that are feeding in the valley below, the utmost caution is requisite, both as regards speed and the mode of progression. The stalker must advance inch by inch on his back, by resting himself on his elbows, and drawing himself forward by his heels; he must observe every motion of the deer, stopping when they stop feeding,

and retaining his position, irksome though it be, till his game recommence pasturing; he must never, even for an instant, display the slightest unusual motion during his toilsome and stealthy advance, and must submit implicitly to every signal and whisper from his guide. During protracted stalks, especially when the nature of the ground between man and deer is free from sheltering knolls, the stalker's patience is tried to the utmost by his having to pause so frequently in his progress; the stalk, however, is usually directed not so much *directly* towards the deer, as for some intervening knoll or rock where a little relaxation of limb and breathing-time may be obtained, ere firing. Thus, if fortunate in properly winding the deer, and if the stalk has been successfully accomplished, the herd may be reached within 50 or 100 yards. The game may possibly consist of either a single stag, or some hinds and one or two stags; the finest of the latter is usually the aim of the true stalker, and the most deadly spot to aim at is behind the shoulder. If mortally hit, the animal frequently bounds away for twenty or more yards, and then falls dead; if not mortally struck, it will sometimes fall at the shot, and spring up again, and follow the retreating herd. It is then the deer-hound is slipped. When a deer is killed, and cannot be immediately conveyed home, the attendant instantly disembowels it, that the venison may not be tainted. This operation is termed *grallocking*. The best stag in the herd is that which is the fattest, and has the finest antlers. See DEER. When there are more than one sportsman, or where the peculiarities of the ground are such as to render the task of stalking unusually difficult, hill-men are employed to drive the deer towards certain passes, behind which the shooters are previously concealed. On such occasions, the excitement produced by the gradually approaching and unsuspecting herd, mingled with the grandeur of the whole scene, as they at length rush through the fatal pass, is enough to try the nerves even of the most experienced stalkers. The Black Mount, belonging to the Marquis of Breadalbane, is the finest deer-forest in Scotland, and extends for upwards of twenty miles. The best work we know of on the subject of deer-stalking is Scrope's treatise, published in 1838; 3d edit. 1847.

**DEER-STEALING.** By 7 and 8 Geo. IV. c. 29, s. 26, it is enacted that any person who shall unlawfully hunt, snare, or carry away, kill or wound any deer kept in the enclosed part of a park, chase, or other enclosure, shall be guilty of felony, and shall be liable to be punished in the same manner as in the case of simple larceny. If the deer be in the unenclosed portion of the park, the punishment is a fine not exceeding £50, which the justice may modify as he shall see fit. The second offence, in every case, is to be considered felony. Suspected persons found in possession of venison, or of the head or skin of a deer, or of snares or engines for taking deer; who shall not be able to satisfy the justice that they came lawfully by the venison, or had a lawful occasion for the snare, may be fined a sum not exceeding £20. A like penalty is imposed (s. 28) for setting engines for taking deer and pulling down park-fences. By s. 29, deer-keepers and their assistants may seize the guns, snares, dogs, &c., of offenders who do not deliver them up on demand, and resistance on their part is declared to be felony. In Scotland, the offence of breaking into a deer-park and shooting deer is punishable as theft. Shooting a stray deer without the owner's consent, is punishable by fine. Though not entitled to kill deer trespassing on his property, the proprietor may drive them off (Stair, ii. 3, 68; Ersk. ii. 6, 14); and one of two co-proprietors may drive off deer against the will of

another. (Irvine, *Game-laws*, p. 13.) There is no reference to deer in any of the acts which regulate the duty on game certificates, and persons shooting them would not be liable to the penalties imposed by these statutes, nor are they alluded to in either of the two more recent acts against poaching by night or day (ib.).

**DEFAMATION.** See **LIBEL**.

**DEFAULT, JUDGMENT BY.** Where the defendant in a cause has failed to make appearance or to lodge a sufficient plea, or other pleading, in due time the plaintiff may proceed to sign judgment by default. Where a writ of summons has been specially endorsed (q. v.), the plaintiff, on lodging an affidavit (q. v.) of the service of the writ, may immediately sign judgment by default, and in eight days from the last day for appearance, execution may issue against the defendant. If the writ of summons have not been specially endorsed, the plaintiff must file, at the office of the Master (q. v.) of the court, a Declaration (q. v.) endorsed with a notice to plead in eight days, and at the expiry of that time may, if there be no appearance, sign judgment by default. Judgment by default, for want of a plea, &c., may in like manner be signed on failure of the defendant to deliver a sufficient plea in the prescribed time. Judgment by default is not necessarily final. In case of non-appearance, it will be set aside on the defendant making affidavit as to the cause of non-appearance, and disclosing a ground of defence on the merits. If judgment have been for want of a plea, &c., it may also in general be set aside on an affidavit of merits. But in both cases, the defendant must suffer the costs of the proceedings.

**DEFEASANCE, DEED OF** (in English law). An instrument which defeats the force or operation of some other deed or estate; and that which in the same deed is called a condition, in a separate deed is called a defeasance. Defeasance is of two sorts, one applicable to freehold estates, the other to terms of years and other executory interests.—*Bytewood*. Defeasance of the freehold is a collateral deed made at the same time with a feoffment (q. v.), or other conveyance, containing certain conditions, upon the performance of which the estate thus created may be defeated or totally undone.—*Stephen's Commentaries*. This deed owes its origin to the restrictions on the conveyance of land imposed by the feudal law. Under that system, every tenant of land was, by virtue of his tenancy, vassal under a superior lord, to whom he owed suit and service. The consent of the lord was necessary for every change of vassal; and the law would not recognise a condition whereby, in a particular event, the land should revert to the original tenant, and the over-lord be thus forced to change his vassal. Hence, when a holder of land wished to obtain money on the security of his land, the conveyance to the lender was *ex facie* absolute; but a deed of defeasance was executed, in virtue of which the borrower, on payment of his money, could recover his land. In this manner mortgages were originally effected. In process of time, the practice of inserting conditions in the original conveyance became established, and from that period, deeds of defeasance have ceased to be in general use. Lord Talbot, in the case of *Cottrell v. Purchase* (Ca. tem. Talbot 61), said he should always discourage the practice of drawing absolute deeds, and making a defeasance which wore the face of fraud.\*

\* The mode of conveying land in security in Scotland was formerly almost identical with that which in England was effected by a defeasance. The Scotch deed was called the absolute disposition with a back bond. See **WADSET, DISPOSITION, Abs. with back bond**.

Defeasance of executory interests may be made at any time after the creation of the estate to which it refers. It must be made with the same formalities as those which created the estate, and between the same parties or their representatives.

**DEFENDER OF THE FAITH**, a title conferred on Henry VIII. by Pope Leo X., as a reward for writing against Martin Luther, in 1521. When the king afterwards suppressed the religious houses at the Reformation, the pope not only recalled the title, but deposed him. The title was afterwards confirmed by parliament (35 Henry VIII. c. 3), and has ever since been used by the sovereigns of this country. The corresponding title in Spain is, Most Catholic, and in France was, Most Christian King.

**DEFERENT**, an old term in Astronomy, signifying a circle on which the centre of another circle moves, while a body is supposed to be moving on the latter itself. If we suppose the sun to be moving round a centre in space, while the earth moves, say, in a circle round the sun, then the sun is moving in the deferent. The term originated in the Ptolemaic System (q. v.).

**DEFICIENT NUMBERS.** A number is said to be deficient whose aliquot parts, or factors, added together make a sum less than the number itself: thus, 16, whose parts, 1, 2, 4, 8, make together only 15, is a deficient number.

**DEFILADING** is that part of the art of fortification which consists in determining the directions and heights of the lines of rampart, so that the interior may not be commanded by the fire of any works which the enemy may raise. Defilading is divided into horizontal and vertical. The object of the first is to prevent the lines being commanded in the direction of their length, or enfiladed; the prolongations of the lines, therefore, must avoid all points where hostile works could be erected. Vertical defilading determines the height of rampart necessary to protect the interior from direct fire.

**DEFILE**, in Military Language, is the name given to any passage which is of such a nature that it must be traversed by troops only in column with a narrow front. Wherever free lateral movement is obstructed, is a defile; and a defile is a 'pass' when it cannot be avoided, without making a long circuit.

**DEFINITE PROPORTIONS, LAWS OF**, in Chemistry. See **ATOMIC THEORY**.

**DEFINITION** is the explanation or statement of the meaning of a word, viz., either the meaning it usually bears, or that which the speaker or writer, for the particular purposes of his discourse, intends to annex to it. To give merely another synonymous name—to say, for instance, that 'Man is a human being'—is not commonly considered a definition at all. Names requiring definition mostly imply, or connote, a set of attributes. To define such a name, then, is to enumerate all the attributes connoted by it. Hence, definition is a kind of analysis. If we were to define 'Man' as 'a rational animal,' the definition would be imperfect; for no one would call such beings as Swift's Houyhnhms men, which shews that, in the common acceptance of the word man, it connotes among other things a certain form. Definition, then, is of the nature of essential propositions; it conveys no information about the object to any one who is aware of the connotation of its name; it is only a statement of all the attributes, the absence of any one of which would make the object cease to be called by that name.

The definition, 'Man is a rational animal,' though incomplete, is correct so far as it goes; though it does not enumerate all the essential attributes—i. e., all the attributes connoted by the name man, yet those it does enumerate are connoted by the name, and are sufficient to mark out its denotation—that is, to distinguish all the beings known to exist to whom it can properly be applied. Such is generally held, therefore, to be a complete definition, though logically imperfect; but to say that 'Man is a featherless biped,' involves a different kind of imperfection. The attribute featherless, though actually true of all men, and therefore serving to distinguish them from the only other bipeds, the birds, is no part of the meaning of the word, but is what logicians call an *accidental* attribute. This kind of imperfect definition is called a description. Such definitions are very common in science, and serve special purposes of classification. In Cuvier's *Animal Kingdom*, man is defined or described as 'a mammiferous animal having two hands.'

A distinction is generally drawn between definitions of names and definitions of things, or *nominal* and *real* definitions. A real definition is intended, it is said, 'to explain and unfold the nature of the thing.' In objection to this view, it is replied, that no definition can unfold the whole nature of a thing, and every true proposition respecting it unfolds some part of its nature: of all the propositions, then, unfolding its nature, how shall we distinguish those that define it from the others? This question has never been answered. The fact seems to be, that 'all definitions are definitions of names, and of names only;' but that many expressions that pass for definitions, are something more. They not only define the name of the thing, but they comprise a tacit assumption, that a thing with such attributes does or may exist. This is the case with the definitions of geometry; and it is from these tacit postulates that the consequences are deduced, and not from the mere definition of the meaning of a word.

As there can be no accurate discussion unless all the terms employed have a distinct meaning recognised by all parties, it is often necessary to have recourse to formal definitions of important names. One of the most effectual devices ever yet discovered for settling the signification of terms, is to declare the meaning *opposed* to what is intended; in this way any ambiguity in the language is at once done away with. Thus, the word 'natural' conveys no clear meaning of itself; but if we state what we mean to *exclude* when we use it, we narrow the variety of significations to some one. We may oppose it to 'moral,' and then it means something connected with the world of matter; we may oppose it to 'constrained' or 'compelled,' giving it the meaning of spontaneous or free; other contrasts are the 'artificial,' the 'distorted,' in copying or representing things, &c.

The scholastic logicians made definition consist in stating, first, the 'genus' that a thing belonged to, and, secondly, the 'difference' or peculiarities that separate it from all the other members of the same genus. This suits for natural history, and for all subjects analogous thereto. For example, if we were attempting to define 'Poetry,' we could not do better than proceed *per genus et differentiam*. Poetry belongs to the class of Fine Arts: it has all the characters common to Painting, Sculpture, Architecture, Music, &c. Consequently, if we are well acquainted with these other subjects, we can draw from them part of the characteristics that belong to Poetry; for example, its having for its end refined pleasure. We then inquire into the *difference*

between it and the others, which we find to be the use of a peculiar medium or instrumentality—viz., thoughts expressed in language. If we would give a more particular account of the meaning, we should find it necessary to specify the *kinds* of poetry, or to find out the *differences* of epic, dramatic, lyric, &c.; which would be to define, not the subject itself, but its subordinate species. See J. S. Mill's *Logic*, vol. i. 182.

DEFLAGRA'TION is applied to the rapid combustion of ignited charcoal when a nitrate (such as nitrate of potash) or a chlorate (such as chlorate of potash) is thrown thereon. As chlorates do not occur naturally, it follows that delagration with a natural salt indicates a nitrate; and if the delagration be accompanied by a violet flame, it is characteristic of nitrate of potash (ordinary nitro or saltpetre); and if by a strong yellow flame, it is indicative of nitrate of soda (cubical nitre).

DEFLE'CTION is, generally, a change of course or line of motion of a moving body. The word deflection is also used as synonymous with Diffraction (q. v.).

DEFLU'XION (Lat. *defluxio*), a discharge from a mucous membrane, especially of the air-passages. It is synonymous with Catarrh (q. v.).

DE FOE, DANIEL, was born in London, 1661, and was the son of James Foe, a butcher. The prefix De was not added to the family name of Foe by our author until he had reached manhood. De F., whose father was a dissenter, was educated at a dissenting academy at Newington Green, where he remained until he had nearly reached the age of nineteen. In 1682, he began his career as author, publishing a pamphlet which contained strictures upon the clergy of that day. This was followed, in 1683, by another pamphlet, entitled *A Treatise against the Turks*. In 1685, he took part in the rebellion of the Duke of Monmouth, but luckily escaped being punished on its suppression. After this he engaged in trade, but a series of misfortunes finally determined him to forsake it.

In 1701, he published his famous satirical poem, *The True-born Englishman*, which was written in vindication of King William, and in answer to a poem in which he had been attacked, called *The Foreigners*. This poem proved a wonderful success; 50,000 pirated copies of it were sold on the streets at a trifling price. During the same year, when the deputation that presented the famous petition of the freholders of Kent to the House of Commons were illegally thrown into prison, De F. drew up, a few days after, a remonstrance, known in history as the *Legion Memorial*; and is said to have himself, in the disguise of a woman, presented it to the Speaker as he entered the House. In 1703, a complaint being made in the House of Commons regarding one of his recent publications, called *The Shortest Way with Dissenters* (1702), the whole tenor of which seems to have been misunderstood, he was apprehended, tried, found guilty, pilloried, fined, and imprisoned. While in prison, he wrote a *Hymn to the Pillory*; and here also he projected *The Review*, a periodical which he established on his release in August 1704, and continued to conduct for nine years. In 1706, Lord Godolphin, who admired the practical talent and literary vigour of De F., employed him as one of the staff of the commissioners sent down to Scotland to bring about a union of the two countries. De F.'s knowledge of revenue, trade, and taxes, was found to be of great value; and it is supposed that he was rewarded with a pension for his services to government on that occasion. For some years after, De F. seems to have lived in

comfortable circumstances, but gradually his numerous political enemies gathered voice again, and De F. was literally silenced by noise and obloquy; at last, however, roused by the insolence of the Jacobite party, he was once more tempted to write unwarily, and the result was that he was again (1713) apprehended, fined in £800, and committed to Newgate. After his release, De F. became sick of politics, and, fortunately for the world, sought rest in the sphere of imaginative literature. In 1719, appeared the famous *Robinson Crusoe*—the most popular of all his works. Its success was immediate. The publisher, who had accepted the book after all the others had refused it, is said to have cleared £1000 by its publication—no small sum in those days. De F., in rapid succession, produced his other notable works of fiction. *Moll Flanders* (1721), *Journal of the Plague* (1722), *Colonel Jack* (1721), *Adventures of Roxana* (1724), and the *Memoirs of a Cavalier*, the last of which Chatham used to recommend as the best account of the Civil Wars extant, bear witness to De F.'s industry during these years. He died in April 1731. D.'s style, both in his political and imaginative works, is simple, clear, and vigorous. His fictitious narratives are characterised by an unparalleled appearance of truth. This is pre-eminently the case in the *Journal of the Plague*, which for a long time imposed upon the well-known Dr Mead, who thought it genuine.

**DEFORCEMENT**, in English Law, is an ouster of the freehold (q. v.). It is the holding of any lands or tenements to which another person has right. In this sense, it includes as well an abatement, intrusion, disseisin, or discontinuance (q. v.), as any other species of wrong whatsoever, whereby he that hath right to the freehold is kept out of possession. But in its strict sense, it is only such a detainer of the freehold from him that hath the right of property, but never had any possession under that right, as falls within none of those injuries.—*Co. Litt.*, by Butler, 331 b. n. (1). The party thus wrongfully retaining possession was called the deforciant, and was said by Blackstone (2 *Comm.* 196) to have an *apparent right of possession*. There was this difference between a party retaining possession of the freehold by means of deforcement, and one who occupied by either of the other modes of ouster, that in the former case the party ousted had no right of entry (q. v.). This, previous to the reign of William IV., was a matter of some importance, inasmuch as the claimant was thereby debarred from recovering possession by means of entry or ejectment, and was driven to the more tedious process of asserting his right by a real action (q. v.). But by 3 and 4 Will. IV. c. 27, all real actions, except four, having been abolished, this distinction between deforcement and the other means of ouster has ceased to have the same practical importance.

**DEFORCIANT**, a title of the defendant in a suit for levying a fine of lands (q. v.).—The party wrongfully retaining possession of a freehold by Deforcement (q. v.).

**DEFORMITIES**. Varieties of form which mar the external appearance, may be *congenital* or *acquired*, according as they occur before or after birth. The former class were considered by the ancients to carry some important meaning in their mysterious shapes, and to shew the anger of the gods; hence, they termed them *monsters*, from *monstrare*, to shew; and even in later times, they were popularly believed to be the result of the most hideously unnatural combinations. Modern scientific writers have, however, made them a subject

of special study, under the name *Teratology* (*teras*, monster, and *logos*, science), and their researches have shewn that deformities generally depend on some arrest of development of the fœtus, or some accidental position it has got into, or some inflammatory disease which has caused unnatural adhesion of parts. It has been found that in 3000 births in Paris, there occurs about one monster. They generally follow some definite law. Deformities are more common among domestic than wild animals, among mammalia than birds, and very rare among fishes and the invertebrata.

It is a common belief, that the mind of the female parent has an influence over the shape of her infant; but although some singular coincidences have occurred, there is no scientific proof that such is really the case. This theory, however absurd, was eagerly adopted in the middle ages; it was, in fact, often appealed to in the interest of mercy as a loophole of escape for pregnant women, who, by the barbarous ignorance of the time, might be condemned to torture; and so universal has the popular belief in this theory become, that even at the present day no scientific demonstration to the contrary has proved sufficient to undermine it. Deformities are, however, in many cases, hereditary, as may be seen in the instances of additional fingers and toes, and of hare-lips.

It seems uncertain whether the male or female parent chiefly influences the occurrence of deformity in the offspring. One rarely sees a case of hare-lip without being able to recognise a sort of tuck or shortening in the same feature of the mother; but the writer of this article knows a family of three with hare-lips, whose father alone is similarly deformed; and another family of three, with perfectly formed mouths, whose mother has an uncured and extremely unsightly hare-lip.

The chief congenital deformities may be classed under the following heads:

Deformity as regards *number* of parts; as, for instance, the Sirens, who have *apparently* but a single inferior extremity, which tapers to a point: the Cyclops, with but one eye; or the head itself may be absent, or some organ, as the brain. Such deformities, from a deficiency of parts, may also result from amputation of portions of the limbs of the fœtus when still within the uterus by the pressure of the umbilical cord. Curiously enough, however, it often happens that this intra-uterine amputation of parts leads indirectly to an exactly opposite condition—namely, a multiplication of parts arising from the stumps left by these uterine amputations; the fœtus in the early stages of its growth appearing to possess something of the power of reproduction of parts observed in most of the lower orders of animals. The parts most commonly reproduced are fingers and toes, or, most commonly of all, only abortive portions of these, as little projections from the stump of the limb, with traces of nail, and sometimes a single joint with an imperfect bony development. We see a new growth of little fingers or toes according to the member lost, and this power shews itself sometimes without being preceded by such an injury, in additional fingers, toes, &c. These parts are generally close to the similar natural ones, but not always, as, for instance, an ear in the neck.

Deformity with regard to *size*. This may involve the whole body, as in dwarfs, of whom there have been some remarkable peripatetic specimens: the Corsican fairy was only 2 feet 7½ inches high; Mademoiselle Crachani, the smallest lady who ever lived, died at 10 years of age, only 20 inches in height. This kind of deformity is not necessarily hereditary; the father of Borowlaski, who

was only 39 inches when 30 years old, had six children alternately short and tall; and dwarf women have brought forth infants as long, when extended, as their mothers. One limb only may be diminutive. Of course, deformities the opposite of these exist, such as giants, or instances of premature or excessive local growth. O'Byrne, the Irish giant, measured 8 feet 4 inches when he died at the age of 22. Such individuals are generally subject to premature decay.

Deformity as regards *shape*; this results generally from retarded growth, the parts of the embryo not consolidating as growth advances, as in hare-lip; or from irregular muscular contractions, as in Club-foot (q. v.); or by two or more parts coalescing, as two fingers; or in Cyclopy, when both the eyes run into one.

Deformities of *colour* are frequently co-existent with tendency to, or the presence of, some disease. There may be deficiency of colouring matter, as in albinos; or an apparent increase, as in *blue disease*, arising from the partition between the right and left sides of the heart not being completed; or from some colouring matter produced in the body, as in the mottled individuals shewn in caravans.

Deformities of *continuity* occur from the lateral halves of the embryo not completely closing, as seen in clefts of the back, the palate, &c.

*Acquired Deformities* will be noticed under their special names.

DEGERANDO, JOS. MARIE, BARON, author and philanthropist, was born 29th February 1772, at Lyon, France. His family was originally from Italy. He studied at the College of the Oratoire of Lyon with a view to becoming a priest; but the persecutions of the revolutionists altered his plans. In 1797, he went to Paris. The *coup-d'état* of the 18th Fructidor compelled him to flee to Germany, where he entered the army of Massena as a common soldier. While at Colmar with his regiment, D. wrote a treatise, which was 'crowned' by the Academy, and which was afterwards enlarged and published under the title of *Des Signes et de l'Art de penser, considérés dans leurs Rapports Mutuels* (Par. 1800). In 1802 appeared his *De la Génération des Connaissances Humaines*, a precursor of his *Histoire comparée des Systèmes de Philosophie relativement aux Principes des Connaissances Humaines* (Par. 1803; German, by Tenenmann), which is reckoned the best French work on the History of Philosophy. It procured him, in the following year, admission into the Académie des Inscriptions et des Belles-lettres. About the same time, he was appointed Secretary-general to the Ministry of the Interior, and subsequently held a variety of high offices under Napoleon. But D. is even better known, and has done more service, by his philanthropic than his philosophic writings. To the former class belong his excellent work, *Le Visteur du Pauvre* (Par. 1820), which obtained the Montyon Prize, as did also his *Du Perfectionnement Moral*, &c. (Par. 1824), his *Cours Normal des Instituteurs Primaires* (Par. 1832), *Institutions du Droit Administratif* (Par. 1835), *Education des Sourds-muets de Naissance* (Par. 1827), *Des Progrès de l'Industrie* (1841). D. was elevated to the peerage in 1837, and died 12th November 1842, Vice-president of the Council of State.—His son, A. DEGERANDO, has written two interesting works—*Essai Historique sur l'Origine des Hongrois* (Par. 1841), and *Transylvanie et ses Habitants* (Par. 1845).

DEGGENDORF, a town of Lower Bavaria, situated on the Danube, 29 miles north-west of Passau. It is well built, and has several churches.

On the walls of one of these is a series of 24 paintings, detailing an ancient story of how certain miraculous wafers possessed by this church spouted forth blood on being pricked; and when cast into water, a radiant glory appeared on the surface. In 1489, Pope Innocent VIII. promised general absolution to all such as visited this church; and for a long time after, thousands of devotees annually journeyed thither. D. has manufactures of linen with some shipping-trade, also several mills. Pop. 3800.

DEGLUTITION. See SWALLOWING.

DEGRADED, in Heraldry, means placed upon steps or degrees, as in a *Cross Calvary*.

DEGREE, in a College or University (Fr. *degré*, from Lat. *gradus*, a step), is a recognition of the student having made a certain step in advance, and having attained, as it were, to a certain resting-place in his academical career. The evidence of a degree is usually called a Diploma (q. v.). Degrees may be divided into various classes, according to the privileges which they confer. 1. They are either simple certificates of attainment granted by a competent authority; attesting either that the college or university granting them has ascertained the fact by examination—in which case they are ordinary degrees—or that the common fame of the individual is such that the learned body conferring the degree is willing to take it for granted, in which case they are honorary degrees. To this class belong our degrees in arts, and the honorary degrees of LL.D., D.C.L., and D.D., which are granted by most universities. 2. They are licences to teach the branch of knowledge with which the holder is certified to be acquainted. To this class belonged all doctors', and probably all masters' degrees in the universities of the middle ages. See DOCTOR. 3. They are licences to practise a certain profession or art. As the latter privilege is one in which the general community is more deeply interested than in either of the others, it is generally requisite to its full exercise that the university degree should be accompanied by a government licence. These latter degrees—of which the degree of M.D. and D.C.L. (see DOCTORS-COMMONS) are the only ones known in this country—in this case resolve themselves into one or other of the former classes.

University degrees, like most institutions which have held their place in society long, arose out of public exigencies, and are not traceable to any single founder or to any single act. There is every reason to suppose that, substantially, they have existed for ages. The doctors or teachers of the law (*nomodidaskatoi*), so often mentioned in the New Testament—and probably the scribes also—were a class, taken, it would seem, very frequently from the sect of the Pharisees, but essentially distinct from them (Luke v. 17), possessing privileges very closely resembling those which were attached to the degree of a teaching doctor in after-times. In classical Greece, though far less formal than it afterwards became, education was probably more systematic than is commonly supposed. In the schools of Isocrates and Plato, Mr Kirkpatrick, in his ingenious book on the *Historically received Conception of the University*, has traced not only substantially the function, but much even of the external organisation of the university. He has shewn also, very clearly, that it was the systematic training which had become necessary for success in public life that called the Sophists into existence, and gave to them the marvellous social influence which they possessed. It was the ambition, not of the higher class of orators and statesmen alone, but of every noisy demagogue who aspired to notoriety, to come before the public with the prestige of having

been the pupil of some famous Sophist, or, as we should say, of having been to a good school, and taken a good degree. All the appliances of modern teaching existed unquestionably in the Museum at Alexandria, and it is inconceivable that those who had passed through the *kuklos* or cycle of studies, should not have carried away some testimonial of proficiency very much resembling a degree. As there was a distribution both of teachers and students into what we should call the faculties of philosophy, philology, and medicine, it is probable, moreover, that there were distinct degrees corresponding to each of them. During the three centuries which intervened between Alexander and Augustus, Athens continued to be the great school of philosophy, as Rhodes was of oratory, and Alexandria of philology and medicine. The importance of an education in the Greek schools rather increased than diminished during the period of the Roman empire. So entirely, indeed, was the success of the young provincial in public life also dependent upon his literary acquirements, that, as Mr Kirkpatrick informs us, students, before leaving the provinces for Rome, were obliged to obtain a written permission from a magistrate, and that a record of the proficiency of each student was sent in to the government, in order that the latter might be thereby guided in the selection of fit individuals for the public service. In Constantinople, moreover, down to the very last, lifeless and unproductive though the intellectual life unquestionably was, it was formally organised to an extent which reminds one of China rather than of any existing European nation. The worthless and contemptible Byzantines, male and female, like the Chinese, passed endless examinations, and took abundance of degrees. After the incursion of the northern nations, the extreme rudeness of the general community of Western Europe caused the learned class to stand out from it with a prominence unknown in the society of antiquity, and hence the greater importance which academical degrees assumed in the middle ages. A man who had passed through the trivium or quadrivium at Constantinople before barbarism had made learning rare, or who had received the far higher instruction which was communicated at the museum of Alexandria, by no means differed from the society which surrounded him to the same extent as did a master or a doctor at Paris or Bologna. The minutest history of academical degrees in the middle ages is involved in much obscurity. The following are passages from the above-mentioned work of Mr Kirkpatrick, who has gone over the authorities with much care: 'Wood mentions (*Hist. and Antiq. of Oxford*, i. 50) that St John of Beverley (680 A. D.) was commonly reported to have been the first who took the degree of Master of Arts at Oxford. The same writer informs us, that this degree had become common in the reigns of John and Richard I. According to Buleus (*Hist. Univ. Paris*, ii. pp. 256, 679, sqq.), academic degrees were first instituted at Bologna. The forms designative of the various orders of academic dignity in that university are stated to have been the *Baccalaureatus*, *Licentiatius*, and *Doctoratus*. Of these, the last two were probably equivalent to the degrees of the master incipient and the magister socius or regent of Paris. Certain *stalia*, or successive courses of legal study, are said to have been in existence from the time of Justinian. The five years devoted to the acquisition of juristic knowledge were divided into the *Anni Justiniani*, *Edictales*, *Papinianiste*, *Lyte*, and *ProlYTE*. The student who had passed through all successively was described as a *licentiatius*, from the circumstance that he was considered qualified to discharge

the duties of an antecessor or public professor of this subject. The practice adopted in this respect by the schools of jurisprudence was afterwards transferred to theology at Paris by Peter Lombardus. The name Bachelor is supposed by Malden (*History of Universities and Academic Degrees*, p. 23) to have been borrowed from the terminology of the military hierarchy of those ages. See BACHELOR. 'Bachelors are often styled scholars (Wood, *Hist. and Antiq. of Oxford*, i. p. 59), and the individual invested with this degree was regarded as, at the utmost, an imperfect graduate. At the same time, in accordance with the system of mutual instruction so thoroughly adopted in the schools of the middle ages, the more advanced class of scholars were both encouraged and commanded to perfect their own acquirements, and extend the educational influences of the university into the minutest ramifications of the system by teaching and catechising the junior members of their own body (Crevier, *Histoire de l'Université de Paris*, ii. p. 160). Bachelors, though thus intrusted with certain tutorial functions, never possessed any of the legislative powers assigned to the masters' (pp. 206, 207). It was to the teaching masters—and all who took the master's degree were bound to perform the duties of tuition for a time—that the term regent was applied both on the continent and in Scotland. On retiring from the office of regent, the master—at Paris, at least—ceased to take an active share either in the legislation or the government of the university (Buleus, par. iii. p. 420). The question as to whether the institution of teaching masters or regents ought to be revived, to the extent of permitting them to compete on equal terms with the endowed professors, is one of the most important now under discussion amongst the university reformers of Scotland. A very excellent pamphlet in favour of it was published by Dr Kilgour of Aberdeen, in 1850. See BACHELOR, MASTER OF ARTS, DOCTOR, REGENT, UNIVERSITY.

DEGREE, in Music, is the difference of position or elevation of the notes on the lines and spaces. When notes are on the same line or space, they are on the same degree, even though one of the notes should be raised by a sharp, or lowered by a flat. When two notes follow diatonically, so that one of them is on a line, and the other on the space adjoining, the interval is of one degree. Subtracting one from an interval, gives the degrees which separate the two notes; thus, a third is separated by two degrees; a fourth, by three, &c.

DEGREE. See CIRCLE.

DEGREE OF LATITUDE is the space along the Meridian (q. v.) through which an observer must pass to alter his latitude by one degree—i. e., in order to see the same star one degree nearer to or further from the zenith. See LATITUDE. This space must be found by actual measurement; and owing to the earth being an oblate spheroid, and not a sphere, it varies with the place of observation—the degrees being generally longer towards the poles, where the earth is flatter, and shorter at the equator, where the earth is more curved. If the earth were a sphere, a degree would be exactly a 360th part of the meridian. As it is, the length of a degree of latitude depends on the latitude of the place. From a variety of observations conducted at various times and places, from as far back as the time of Eratosthenes (250 B. C.), tables have been constructed shewing the length of degrees at different latitudes. The length of 'the middle degree,' as it is called, or that of places in latitude 45°, may be taken approximately at 69  $\frac{1}{10}$  English miles. The ascertained differences between degrees of latitude

is one of the proofs of the earth's sphericity. See GEODESY.

**DEGREE OF LONGITUDE** is the space between two meridians that make an angle of 1° at the poles, measured by the arc of a circle parallel to the equator passing between them. It is clear that this space is greatest at the equator, and vanishes at the poles; and it can be shewn that it varies with the cosine of the angle of latitude.

The annexed table shews the lengths of a degree of longitude for places at every degree of latitude from 0° to 90°. It is computed on the supposition that the earth is a sphere.

**DEGREES OF LAMBETH.** By 25 Henry VIII. c. 21, sundry powers formerly belonging to the pope were conferred upon the Archbishop of Canterbury, among which was the right of granting degrees. He can confer all the degrees taken in the universities of Oxford and Cambridge, but his degrees do not carry with them all the privileges which belong to degrees conferred by the universities.

**DEGREES OF NOBILITY.** See NOBILITY.

**DEGREES OF RELATIONSHIP.** See CONSANGUINITY, AFFINITY.

**DEI GRATIÁ** (Lat. 'by the favour of God'), is a formula taken from several apostolical expressions in the New Testament. It is believed to have been first formally used by the bishops at the council of Ephesus, 431 A. D. Afterwards, it came to be appended by archbishops, bishops, abbots, abbesses, deans, monks, and even chaplains, to their titles, in letters, and other documents, as a humble expression of dependence on the Most High. After the middle of the 13th c., when the sanction of the pope began to be considered necessary to ecclesiastical offices, the higher clergy wrote *Dei et Apostolicæ sedis gratiá*, 'by the favour of God and the apostolic see.' At a later period, many of them preferred to write *misericordione divina, permissione divina*, and the like; but they still continued to be styled by others *Dei gratiá*. In the British Islands, this style was generally dropped about the time of the Reformation, but it was occasionally given to the Archbishops of Canterbury and York, even after the beginning of the 17th century. Beginning with the times of the Carlo-

vingians, many temporal princes, earls, and barons made use of the formula *Dei Gratia*; and before the 15th c., no idea of independence or of divine right seems to have attached to it. But in 1442, King Charles VII. of France forbade its use by the Comte d'Armagnac, and in 1449 obliged the Duke of Burgundy to declare that he used it without prejudice to the rights of the French crown. These instances shew that it had now begun to be regarded as belonging exclusively to sovereigns who owed no allegiance to any other earthly potentate or power. In this way, what was originally a pious expression of humility, came to be looked upon as an assertion of the doctrine of the 'divine right' of kings.

**DEINOTHERIUM.** See DINOTHERIUM.

**DEISM, or THEISM,** properly means belief in a God, as opposed to atheism. In common language, however, Deism is opposed to belief in a revelation; and a Deist is one who holds the existence and providence of God, but grounds his belief on reason and the evidence afforded by the constitution of things, and rejects the testimony of a revelation. The name is often used vaguely by way of reproach, similarly to 'infidel.'

The term *Deists*, or *Freethinkers*, is sometimes used to designate a school or series of writers who appeared in England in the 17th and 18th centuries, and who aimed at establishing what they called *Natural Religion*, upon the basis of reason and free inquiry, and then bringing all positive or revealed religion to the test of this. They are looked upon as the precursors of German Rationalism in theology. The leading names in this school are Lord Herbert of Cherbury (died 1648); John Toland, whose *Christianity not Mysterious* (Lond. 1696) gave exact expression to the tendency of the Deists; Lord Shaftesbury; Anthony Collins (died 1729), the friend of Locke; Thomas Woolston; Matthew Tindal, the author of *Christianity as Old as the Creation, or the Gospel a Republication of the Religion of Nature* (Lond. 1730); Viscount Bolingbroke.

**DEKKER, THOMAS**, a dramatist of some note, was born in the latter part of the 16th century. He appears to have applied himself industriously to his vocation, and is said to have written upwards of twenty plays, either wholly or in part. In company with Ben Jonson, he wrote for the Lord Admiral's theatre; the two dramatists, however, afterwards quarrelled. D.'s chief plays are *Fortunatus, or the Fishing-cap*, and *The Honest Whore*. Hazlitt, who regarded the latter as a highly successful comedy, has said that it unites 'the simplicity of prose with the graces of poetry.' D. died about the year 1638. His poetic diction is choice and elegant, but he often wanders into absurdity. His life, like that of many of his contemporaries, seems to have been one of alternate revelry, want, and despair. Recently, D. has become better known by the re-issue of a work of his (not a play), called the *Gull's Hornbook*, which is full of interesting details of the manners of his time.

**DEL** (*Artocarpus pubescens*), a tree of the same genus with the Bread-fruit (q. v.), indigenous to the forests of Ceylon, and valuable on account of its timber, which is used both for house-carpentry and for ship-building.

**DEL CREDERÉ COMMISSION**, an Italian phrase, borrowed by the law-merchant to express the additional premium charged by a factor or agent, in virtue of which he warrants the solvency of the purchaser, and renders himself personally liable for the payment of the price of the goods sold. It is, in short, what is called a guaranty or warranty in England, and *warrantice* in Scotland. If the percentage on the price for effecting the sales be two

and a half, two and a half more is usually charged as del credere commission.

DE LA BECHE, SIR HENRY THOMAS, a well-known geologist, was born near London in 1796. He was educated at the military school at Great Marlow, and entered the army in 1814. Three years after, he became a fellow of the Geological Society, of which he was afterwards made secretary, and eventually president in 1847. In 1820, while residing in Switzerland, he published a paper, *On the Temperature and Depth of the Lake of Geneva*. Shortly after, he returned to England; and in 1823, in conjunction with the Rev. Mr Conybeare, he issued a paper, *On the Discovery of a New Fossil Animal, forming a Link between the Ichthyosaurus and the Crocodile*. This was the *Plesiosaurus*. In 1824, De la B. visited Jamaica, where he possessed some property, and while there he devoted himself to the geology of the country, and in two years published a paper on that subject. On his return to England, he wrote a variety of scientific papers, among which are the following: *On the Excavation of Valleys*, *On the Geographical Distribution of Organic Remains*, and his *Geological Manual* (1831), which met with a very cordial reception. He now undertook to form a geological map of England, in which the various formations should be distinctly marked. Shortly after he had begun, the government, sympathising with his design, instituted the Geological Survey, and placed him at its head. In 1848, De la B. received the honour of knighthood; in 1851, he published the *Geological Observer*, with upwards of 300 wood-cuts; and in 1853, was elected a corresponding member of the Academy of Sciences of Paris. He continued to discharge the duties of his position until within two days of his death, which took place on the 11th of April 1855.

DELACROIX, FERDINAND VICTOR EUGENE, a modern French painter, chief of the 'romantic school,' was born at Charenton-Saint-Maurice, near Paris, 26th April 1799. At the age of eighteen, he entered the *atelier* of the artist Pierre Guérin. In 1822, he exhibited his first work, 'Dante and Virgil.' It attracted much attention. The love of colour, at the expense of accurate drawing, for which D. afterwards became conspicuous, is quite visible in it. It was highly praised, however, by M. Thiers among others. In 1824, D., who was now at the head of the new school of young painters, produced the 'Massacre of Scio;' in 1826, the 'Death of Marino Faliero,' and 'Greece on the Ruins of Missolonghi;' in 1827, 'Christ in the Garden of Gethsemane,' 'Appearance of Mephistopheles to Faust,' 'The Blind Milton Dictating Paradise Lost,' and the 'Death of Sardanapalus;' and in 1828, 'Cardinal Richelieu.' The July revolution left its impress on D., and in 1831 appeared his 'Liberty directing the People on the Barricades.' About this time, he made a voyage to Marocco, where he familiarised himself with novel effects of light and costumes. The Paris Exhibition of 1852 contained the results of his artistic expedition. From this period, D. has continued to send forth picture after picture, proving, at least, the extraordinary fecundity of his mind. The principal are: the 'Prisoner of Chillon' (1835); 'Cleopatra' (1838); 'Hamlet Contemplating the Skull of Yorick' (1838); 'Capture of Constantinople by the Crusaders' (1841); a 'Shipwreck' (1841); 'Death of Marcus Aurelius' (1845); 'Farwell of Romeo and Juliet' (1846); and 'Flowers and Fruits' (1849). D. has also decorated many public buildings and churches. In 1857, he was chosen by the Institute to fill the place of Paul Delarochette (q. v.).—The most striking quality of D.'s

genius is its wonderful versatility. He has painted almost all sorts of subjects, involving a vast variety of costumes. As a colourist, he ranks high, but he is almost equally noted, as has been said, for his incorrect drawing. What renders his pictures so attractive, is a certain dramatic energy of execution, with brilliant effects of light and shadow. He has been compared to Paolo Veronese and Rubens, but is vastly inferior to both. He has also been styled the *Victor Hugo* of painting, a criticism which more nearly expresses the truth.

DELAGO'A BAY, an inlet on the south-east coast of Africa, lat. 25° 58' S., and long. 33° E. It is about 55 miles in length, and about 20 in breadth. Into D. B. many rivers fall, among which are the Delagoa River, from the west, which gives its name to the bay; the Manice, from the north; and the Machavanna, from the south. The shores of the bay being flat and marshy, are unhealthy in summer; the anchorage, however, is commodious and safe, and attracts many whalers. The Portuguese have a small fort here, whence they export ivory and gold-dust. In common with most of the Portuguese possessions on this continent, D. B. lies out of the thoroughfares of the world's traffic.

DELABRE, JEAN BAPTISTE JOSEPH, a French astronomer, was born at Amiens, 19th September 1749, and studied first under Delisle, and afterwards under Lalande, with both of whom he formed a close friendship. The discovery of the planet Uranus, in 1781, gave him the first opportunity of attracting the attention of the learned world in general. He formed tables of its motion, which obtained the annual prize of the Academy of Sciences. Soon after, he commenced the construction of new solar tables, and, at a still later period, tables of the motions of Jupiter and Saturn. Along with Méchain, he was appointed by the French government, in 1792, to measure the arc of the meridian between Dunkirk and Barcelona, which was completed in 1799. Afterwards, he was elected member of the academy. In 1802, he was appointed Inspector-general of Education, and in 1803, perpetual secretary of the mathematical section of the Institute. The result of his measurements appeared in his great work, *Base du Système Métrique Décimal* (1806—1810). In 1807, he obtained the chair at the College of France, rendered vacant by the death of Lalande, his master and friend. In 1814, he was appointed a member of the Council of Public Instruction. He died at Paris, 19th August 1822. D. received a multitude of honours during his lifetime. He was a member of most of the learned bodies in Europe, an officer of the Legion of Honour, and a Chevalier of the Order of St Michael. His writings are very numerous. The principal are: *Traité d'Astronomie* (Paris, 1814); *Histoire de l'Astronomie du Moyen Age* (Paris, 1819); *Histoire de l'Astronomie Moderne* (1821); and *Histoire de l'Astronomie au Dix-huitième Siècle* (Paris, 1823, 1827), published under the care of Matthieu. Besides these, D. wrote several excellent *Mémoires*.

DELANE, JOHN THADDEUS, editor of the *Times* newspaper, was born in London in 1815. He received the earlier part of his education in a private seminary, first in England, and afterwards in France. He then went to Oxford, where he entered himself of Magdalen Hall. His father being manager of the *Times*, he was at a very early age introduced into the editor's room, and on the death of Mr Bacon in 1840, succeeded to the direction. Under his editorship, the *Times* has attained a prodigious circulation, and an influence unparalleled in the history of journalism. The division of labour in newspapers being more

complete than in the days of his predecessors, the duty of the modern editor is not so much to write in his own journal, as to suggest topics to others; to revise and bring into harmony conflicting contributions; to make arrangements for the prompt and punctual supply of the news of the day (in which he is assisted by the manager); and, before putting the journal to the press, to decide which of many competing articles and reports shall be inserted, and which laid aside or postponed. These are duties requiring for their due fulfilment great tact, quickness of decision, an extensive knowledge of men and things, literary taste and ability, and, in the case of a journal which claims to be the representative of the English nation, a ready discrimination of those straws on the surface, which denote the ultimate direction of public feeling—qualifications which D. obviously possesses in larger measure than perhaps any journalist who ever lived. He is a member of the Hon. Society of the Middle Temple, having been called to the bar in 1847.

DELAROCHE, PAUL, a historical painter, the head of the modern 'Eclectic' school of art in France, was born at Paris in 1797, became a pupil of Baron Gros, and between the years 1819 and 1823 acquired some note by painting subjects taken from Scripture, but first excited public admiration in 1824 by his 'St Vincent de Paul preaching in the Presence of Louis XIII.,' and 'Jeanne d'Arc interrogated in Prison by Cardinal Beaufort.' These exhibit the earliest indications of that style for which he afterwards became famous—a style which endeavoured to unite the picturesqueness of the romantic with the dignity of the classic school of art. In 1826, D. produced his 'Death of President Durante;' and in 1827, his 'Death of Queen Elizabeth.' These pictures greatly increased his reputation, but the last is reckoned a failure by English critics. In 1831, appeared his 'Children of Edward IV. in the Tower,' a work of very high merit, but transcended, in this respect, by his 'Cromwell contemplating the Corpse of Charles I.' (1833), which is generally regarded as one of the first historical paintings of modern times. Both are well known in Britain through the medium of engravings. In 1834, appeared his 'Execution of Lady Jane Grey;' and in 1837, his 'Charles I. in the Guard-room Insulted by the Parliamentary Soldiers,' and his 'Lord Strafford on the Way to Execution receiving the Blessing of Archbishop Laud.' From this period until 1841, he was engaged on what is probably his grandest work—the series of paintings executed on the wall of the semicircular saloon of the Ecole des Beaux Arts. This composition contains 74 figures, comprising the greatest sculptors, painters, and architects in all history, according to D.'s judgment. The style is simple, lofty, and chaste. Among his later works may be mentioned, 'Bonaparte at St Bernard' (1850), 'Marie Antoinette before the Revolutionary Tribunal' (1851), 'Moses Exposed' (1852), 'Calvary' (1853), 'Jesus in the Garden of Gethsemane' (1854), 'The Girondins in the Concierge' (1856). He died November 4, 1856.—The characteristic excellences of D. are delicacy of treatment, picturesqueness of conception, harmony of colour, and accuracy of drawing. He has been accused, however, of want of fire, imagination, and depth, and it must be admitted that he very rarely, if ever, exhibits the highest qualities of creative genius. D. was named a member of the Institute in 1832, and Professor of Painting in the Ecole des Beaux Arts in 1833.

DELAVIGNE, JEAN FRANÇOIS CASIMIR, a French poet and dramatic writer, was born at Havre, 4th April 1793, and educated at the Lycée

Napoléon in Paris, where he first attracted notice by his poem on the birth of the 'king of Rome' in 1811. A few years after the fall of Napoleon, he published his *Messianiques*, a series of patriotic elegies, in which he bitterly deplored the misfortunes brought upon his country by the disaster of Waterloo. The July revolution inspired his song *La Parisienne*, which was set to music by Auber, and he wrote several other revolutionary lyrics, such as *La Varsoivienne, ou la Polonoise*, and *La Brusilloise*. Many offers of employment in political affairs were made to him by Louis Philippe, but he chose to remain a *littérateur*, and worked assiduously at the composition of plays. His incessant labours at length undermined his health, and he retired to Lyon for change of air, where he died, 10th December 1843. D. is, next to Béranger and Scribe, the most popular of recent French poets. He represents that 'golden mean' of the French Parnassus, the half-classic, half-romantic style of poetry. There is nothing extravagant, nothing profound about him. Easily comprehended, moderately liberal, with a slight tincture of scepticism and Voltairian wit, yet, on the whole, rather moral in his tendencies, D. was just the man to charm the more elegant and decorous circles of Parisian society. His language, too, is piquant, picturesque, and select, and skilfully conceals the lack of poetic substance. The titles of his principal dramatic pieces are—*Les Vêpres Siciliennes* (1819), *Les Comédiens* (1820), *Marino Faldieri* (1829), *Louis XI.* (1832), *Les Enfants d'Edouard* (1833), *Don Juan d'Autriche* (1835), and *La Fille du Cid* (1839). Several editions of his works have been published, the first in 1845, containing a biography of D. by his brother Germain, and a panegyric by Sainte-Beuve.

DE/LAWARE, a term of various application in the United States, indicates a river, a bay, and a state, to say nothing of counties and less important localities.—1. The river D. rises in New York, on the west slope of the Catskill Mountains, commonly reckoned a portion of the Appalachians or Alleghanies; and, in a generally southerly direction, it divides New York state and New Jersey from Pennsylvania and the state of its own name, forcing its way through the great chain above designated between almost perpendicular crags of more than 1000 feet in height, and gradually expanding into a broad estuary. With a course of fully 300 miles, it is navigable for large ships to Philadelphia, and for steam-vessels to the head of tide-water at Trenton. The D. is connected by one canal with the Chesapeake, and by two others with the Hudson; and along the right side of the stream runs a similar work for 60 miles from Easton to Bristol.—2. D. Bay—the estuary of the river—measures about 60 miles in length; the greatest width being 25 miles. It has New Jersey on the left, and D. on the right, its entrance being between Cape May in the former state, and Cape Henlopen in the latter. As numerous shoals make the navigation dangerous and the anchorage inconvenient, an artificial harbour of about 300 acres in extent, and of at least 4 fathoms in depth, has been formed at Cape Henlopen.—3. The state of D., stretching in N. lat. from 38° 29' to 39° 47', and in W. long. from 75° to 75° 45', is situated between Pennsylvania, Maryland, and its own bay and river. With the single exception of Rhode Island, it is the least considerable member of the Union, being very little larger than the county of Norfolk in England. Its area is 2120 square miles, and its population, according to the census of 1860, is 112,222, having been, in 1850, 91,535. Though bondage is permitted by law, yet the number of slaves does not amount to 3000. D. sends to congress one representative and two

senators, being therefore entitled to appoint three presidential electors. The constitution appears to be peculiar in two respects—the governor can never be re-elected, and the laws must be renewed every twenty years. The principal products are wheat, maize, oats, potatoes, flax, wool, fruit, and timber; and in addition to woollen and cotton factories, there are tanneries, paper-mills, iron-works, and ship-building establishments. Besides Dover, the political capital, and Wilmington, the most populous city, the other places of any note are Milford, Newcastle, Lewes, Smyrna, and Georgetown. Originally settled in 1627 by Swedes and Finlanders, D. was, in 1655, subjugated by the Dutch of New Amsterdam, afterwards New York. Again, in 1664, it fell, with the Dutch possessions in general, into the hands of the English, ultimately becoming a part of the grant to Penn in 1682; and though in 1701 it was detached from Pennsylvania for legislative purposes, yet it remained subject to the same governor down to the epoch of the Revolution.

DELAWARES. See INDIANS.

DELEB PALM, a palm of great importance to the inhabitants of the regions around Lake Tsad, and other parts of the interior and west of Africa, being in some districts the predominant tree, although very local in its distribution, which extends, however, through the vast tracts from Kordofan to the Atlantic. It is supposed to be nearly related to the Palmyra Palm (q. v.) of India (*Borassus flabelliformis*). Its fruit, when full grown, is 6–8 inches long, and 4 inches thick, yellowish-brown; the pulp a very close and coarse fibrous tissue. It has a mawkish taste; yet it is very much used by the natives of Africa, who also break the stone and plant it in the ground, when in a few days a blade shoots up, and a very tender root is produced, which is very pleasant, and much used as an article of food.—Barth's *Travels*.

DELECTUS PERSONÆ (Lat., choice of the person). In some legal relations, a choice of the person, for some qualification possessing value in the eyes of one of the parties to the contract, is assumed; and the individual so chosen cannot consequently transmit his rights and obligations to another without the consent of the person who is supposed to have chosen him. Thus, in Scotland, in an agricultural lease, of such duration as not to exceed the ordinary life of a man, the landlord is assumed to have chosen his tenant with a special view to his personal qualifications, and unless in virtue of a positive stipulation, the tenant cannot sublet the farm. The reverse is the case with urban tenements. For reasons still more obvious, the same rule holds in partnership; and unless in the case of great companies, where the sale of the stock is provided for, no new partner can be admitted if a single partner object to him. Even the executors and personal representatives of a partner do not succeed to his share. For the same reason, offices of trust are neither saleable nor adjudicable for debt, though their emoluments may generally be attached for debt.

DELEGATES, COURT OF, formerly, the supreme court of appeal in ecclesiastical and maritime causes. Before the time of Henry VIII., the practice had gradually become established of taking ecclesiastical causes on appeal to the court of Rome. By 24 Hen. VIII. c. 12, this practice was abolished, and appeals were directed to be heard by the archbishops of the several provinces. By 25 Hen. VIII. c. 19, it was directed that appeals should finally be referred to the king in council, and his majesty was by the same statute empowered to issue a commission

under the great seal to hear the appeals. The court thus established was called the Court of Delegates. It consisted in ordinary causes of a puisné judge from each of the common law courts, and three or more civilians. After sentence had been pronounced by the Court of Delegates, it was competent for the king to grant a commission of review; but this power was rarely exercised, except upon the ground of error in fact or in law. When application for review was made, it was usual to refer to the chancellor the memorial praying for review, and by him the expediency of granting the prayer of the petition was determined. By 2 and 3 Will. IV. c. 92, the Court of Delegates was abolished, and its jurisdiction was transferred to the King in council. And by 3 and 4 Will. IV. c. 41, and 6 and 7 Vict. c. 38, her Majesty is empowered to refer all appeals from ecclesiastical or other courts to the judicial committee of the privy council.

DELEGATION (Ital. *Delegazione*), the term applied in Lombardy, Venice, and the States of the Church, both to the governing court of a province and to the province itself. Until the recent political changes in Italy, there were nine delegations in Lombardy, and eight in Venice, each of which was presided over by a delegate, vice-delegate, and various subordinates. In the States of the Church, by a decree of 1816, seventeen delegations were established, but the number was several times altered. The delegate was always a prelate, and directly appointed by the pope. If he was a cardinal, he was called a Legate, and his province a Legation.—*Delegados del fomento* is the name given in Spain to the superintendents of the entire police administration of a province.

DELF, a heraldic charge, representing a square sod or turf, the term being derived, it is supposed, from the verb to *delve* or dig. A delf tenné is the appropriate abatement for him who revokes his challenge, or otherwise goes from his word. See ABATEMENT.

DELFT, one of the most ancient towns of South Holland, is situated on the Schie, 8 miles north-west of Rotterdam. It is intersected by numerous canals, the bridges over which are 69 in number. D. was once noted for its pottery (Delft-ware), but has now entirely lost its high reputation for this manufacture, and not more than 200 persons are engaged in the earthen-ware factories. D. is a dull town, but has several interesting buildings, one of which, the town-hall, is a picturesque and richly adorned edifice. The New Church contains a monument, more ornate than tasteful, to the memory of Prince William I. of Orange, who was assassinated here 10th July 1584. It also contains the tomb of Grotius, and the burial-vaults of the present royal family of Holland. The Old Church, a building of some note, contains the tomb of the naturalist Leeuwenhoek, and of the celebrated Admiral Tromp. D. has also a state arsenal, a college where all matters connected with the management of the dikes are taught, a gymnasium, and infirmary. There are some manufactures of woollen cloths and tobacco-pipes. Pop. 18,500.

DELHI, a district of India, and one of the administrative divisions of the North-western Provinces, includes but a small portion of the ancient province of the same name. It is situated in 28° 24'—28° 54' N. lat., and 76° 49'—77° 29' E. long., having an area of 602 square miles, and a population, in 1848, of 306,550. Exclusive of the city of Delhi—which contains one-half of the population above enumerated, and if the suburbs be reckoned, more than one-half—the district is divided into two pergunnahs. In the pergunnahs, the Hindus bear

the proportion of 13 to 2, compared with the other classes; but in the city the difference is little more than 8 to 7. To the south, the district is rocky and barren. The soil generally is sandy or rocky, and the most fertile portions are those to the north and north-west, watered by the Jumna. The grand trunk road from Calcutta runs through the district.

DELHI (ancient name, *Indraprestha*, or *Inderput*; Mohammedan name, *Shahjehanabad*), a celebrated city of Northern India, in 28° 39' N. lat., and 77° 18' E. long., capital of the province and district of the same name, is situated on an offset of the river Jumna, at about a mile from the right bank of that river, and at an estimated elevation of 800 feet above the level of the sea. The modern city, which was founded by Shah Jehan in 1631, has a circumference of about seven miles. It is protected by ramparts, bastions, &c., and is entered by 11 gates. The greater number of the streets in D. are narrow, but the Chandni Chauk is an exception, being 90 feet broad, and 1500 yards in length, and intersected by an aqueduct. The other principal street is 120 feet wide, and one mile in length. D. has many monuments of its former magnificence. The Mogul's palace was thought by Bishop Heber to surpass the Kremlin. The Jumma Musjid, or principal mosque, was commenced by Shah Jehan in the 4th year of his reign, and completed in the 10th, at a cost of £100,000. This magnificent building has been restored by the British government. The Delhi College was founded in 1792, and in 1829 the sum of 170,000 rupees was bequeathed to it by a minister of the king of Oude. The interest of this sum, together with grants from government, raises its annual revenue to 40,580 rupees. For each of the languages, English, Arabic, Persian, and Sanscrit, there is a separate department. The number of students on the 30th of April 1851, was as follows: Christians, 22; Mohammedans, 206; Hindus, 105—total, 333. According to the census of 1845—1846, D. contained 137,977 inhabitants, of whom 71,530 are Hindus, 66,120 Mohammedans, and 327 Christians; but if the suburbs, with their 22,302 souls, be reckoned, the total population of the city and suburbs will be in round numbers 160,000. The mean temperature of the day has been ascertained, by observations extending over three years, to be as follows: January, 56°; February, 61°; March, 72°; April, 83°; May, 91°; June, 92°; July, 86°; August, 83°; September, 83°; October, 77°; November, 65°; December, 58°. The vestiges of ancient D., on the east bank of the Jumna, consisting of ruined tombs, gardens, serais, and palaces, cover an area of about 30 miles in circumference, and present a remarkable scene of desolation. The modern city is noted for its needle-work, and here the shawls of Cashmere are embroidered in silk and gold. The D. goldsmiths are famous for the delicacy and beauty of their work. D. was the capital of the Afghan or Patan, and afterwards of the Mogul empire. It was taken by a British army under Lord Lake, September 8, 1803, and has ever since—if we except the brief period it was held by the mutineers in 1857—continued under British rule.

In our own time, D. has been rendered memorable by the events of 1857. The march on the city of the mutineers from Meerut, the terrible 11th of May, the explosion of the powder-magazine by Willoughby and his heroic band, the tragic scenes that followed; the siege, the assault (September 14), when the city was won (September 20) gate by gate and quarter by quarter—a success saddened by the death of the gallant Nicholson; the subsequent daring capture of the king of D. by Hodson of Hodson's Horse,

and the capture and shooting of his miscreant sons by the same officer, are historical facts still fresh in the recollection of the world. See *The History of the Indian Revolt*, published by the Messrs Chambers in 1859; *The Punjab and Delhi in 1857*, by the Rev. J. Cave Browne, M.A. (Edin. and Lond.), 1861; *Twelve Years of a Soldier's Life in India*, edited by the Rev. George H. Hodson, M.A. (Lond. 1859).

DELICT. The law of Scotland, following that of Rome, divides delicts into delicts proper and quasi delicts—the former being offences committed with a positively malicious purpose, the latter being injuries inflicted by culpable negligence of so gross a kind as to amount almost to crime. The latter class of delicts, though inferring an obligation to repair the injuries sustained by the private party, do not generally form grounds for criminal prosecution. See DAMAGES.

DELILAH (Heb. the languishing) is the name of a Philistine woman whom Samson loved. By her flattering blandishments, she obtained from him the secret that his God-given strength lay in his locks; and having cut these off while he lay asleep, she then treacherously betrayed the strengthless warrior into the hands of his enemies.

DELILLE, JACQUES, a French poet, was born at Aigues-Perse, in Auvergne, June 22, 1738, and received his education at the Collège de Lisieux, Paris. He first occupied the position of instructor at the colleges of Beauvais and Amiens successively, and was afterwards appointed to a professorship in Paris, at the Collège de la Marche. Here he published various poetical effusions, the most considerable of which was a translation of the *Georgics* of Virgil—a work which appeared in 1769, was distinguished by its grace and elegance of style, and met with a most enthusiastic reception. In 1774, he published *Les Jardins*, the success of which, however, was not equal to that of his *Georgics*. The Comte d'Artois presented him with the abbey of St Severin, or rather with its revenues, for he did not insist on D. becoming a priest. His poem *L'Imagination* was written during a visit which he made to Constantinople in 1784, in the suite of Comte de Choiseul-Gouffier, the French ambassador to the Ottoman court. On his return, he was elected professor of *Belles Lettres* at the university of Paris, and of Latin poetry at the College of France. At the Revolution in 1789, however, he lost all his property. He afterwards removed to Switzerland, where, in 1800, he published *L'Homme des Champs*. In 1801, he visited London, published a translation of *Paradise Lost*, and in that same year, having been solicited to return to Paris, he re-entered the academy and the college there with which he had formerly been connected. He died 1st May 1813.

DELIQUESCENCE is the term applied to the property which certain substances have of absorbing moisture from the air, and becoming damp, and even running into liquid. Caustic potash, and the chlorides of calcium and magnesium, are examples of substances which undergo this change.

DELIRIUM (from Lat. *deliro*, I am furious), a state of deranged mind, in which the intellect and the judgment are perverted or lost, while the imagination and the passions are often excited, or at least left without control. The result is an incoherent or totally disordered course of action and speech, frequently attended by delusions, or unreasoning belief in supposed facts, which the sound mind at once perceives to have no existence in nature. The nature, extent, and variety of the delusions, and the degree to which the control of the reason

over them is lost, may be said to indicate the type of delirium to which the patient is subject; and in some instances, the cause of the disease is pretty decidedly shewn forth by the prevailing impressions on the mind and senses. Referring to the article *Insanity* for the description of *Maniacal Delirium*, or *Mania*, and to the article *Fever* for that of *Typhoid Delirium*, or *Typhomania*, we may confine ourselves in the present article to a slight sketch of the delirium arising from habitual intoxication, the *Delirium ebriosorum* or *potatorum* (of drunkards), or, as it is more commonly called, from the bodily tremors that accompany it, *Delirium tremens*. This disease is not to be confounded with the mere paroxysm of intoxication, and still less, if possible, with the insane craving for drink, or *Dipsomania* (q. v.). It is, on the contrary, often found in persons who have not been recently intoxicated at all, though of persistently intemperate habits, and in whom the desire for drink, as well as for food, has been entirely suppressed by the access of the disease. It is a true though usually a temporary form of insanity or of mania, brought on by the habitual poisoning of the nervous system, over a long course of weeks or months, by alcoholic liquors; and it is not going too far to say that it is rarely, if ever, induced by a single debauch, at least in its aggravated form. *Delirium tremens* is characterised by a restless, irritable state of the nervous system, rather than by furious paroxysms of excitement (though these are not rare); by constant though ill-regulated and ineffectual attempts of the patient to occupy himself; by spectral illusions, or the vision and hearing of non-existent objects; by tremors of the hands and tongue; by prostration of appetite; and by great wakefulness, the want of sleep being often protracted over many days and nights, and forming, with the constant excitement of the senses, and the prostration of the vital powers from deficient nourishment, the true source of danger in this disease. The main elements in the cure are careful nursing, and the use of all means to secure sleep, and re-establish the digestion. Opium, hyoscyamus, and antimony, are used in some cases, and tonics with laxatives in others; chloroform has also been employed. In certain cases, stimulants are required for a time; but none of these remedies ought ever to be used except under the best medical advice, for there is little doubt that delirium tremens is one of the diseases where the rash employment of strong medicines is extremely dangerous to life, and where good nursing and food, without other remedies, will usually succeed. Where proper protection and vigilance cannot be otherwise secured, the patient should at once be transferred to the nearest hospital or lunatic asylum; and if the attacks have been repeated, he should be detained for some time after his recovery. (See *DELIRIUM TREMENS* in *Supp.*)

**DELIVERY OF A DEED.** See *DEED*.

**DELLA CRUSCAN SCHOOL.** About the year 1785, a number of English residents at Florence endeavoured to amuse their lagging hours by writing verses, which they published under the title of *The Florence Miscellany*. The insipidity, affectation, and fantastic silliness of these productions transcend all belief; yet such was the poetic destitution of the period, that they soon found a crowd of admirers and imitators. Taking the name of an academy at Florence (see *ACADEMY*), the Della Cruscanes now began to print their precious lucubrations in England, chiefly in two daily newspapers called *The World* and *The Oracle*. 'While the epidemic malady was spreading from fool to fool,' as Gifford pungently says, one

of the brotherhood, a Mr Robert Merry, came over from Florence, and 'immediately announced himself by a sonnet to Love.' It was answered by a certain Anna Matilda, who (as was the custom) praised it immoderately in language even more absurd than Merry's own. According to Gifford, 'the fever now turned to a frenzy: Laura, Maria, Carlos, Orlando, Adelaide, and a thousand other nameless names, caught the infection; and from one end of the kingdom to the other all was nonsense and Della Crusca.' Retribution, however, came (for Nemesis watches the course of poetry as sharply as that of politics). In 1794, Gifford produced his *Baviad*, and in 1796, his *Mariad*. Rarely has literature witnessed such a scathing. It completely killed the school, and, indeed, it is only in these two poems that the memory of most of the unhappy Della Cruscan songsters has been preserved—an immortality which may be compared with that conferred by the *Neergate Calendar*.

**DELOLME, JEAN LOUIS**, born at Geneva in 1740, was originally an advocate in his native town, but on account of certain political disturbances which took place there, and in which he had shared, he was forced to leave it. He went to England, where, in spite of his literary activity, he lived for several years in great poverty. He returned to his native country in 1775, and died at a village in Switzerland, July 16, 1806. D.'s principal work is *Constitution de l'Angleterre, ou Etat du Gouvernement Anglais comparé avec la Forme Républicaine et avec les autres Monarchies de l'Europe* (Amsterdam, 1771); English translation by the author himself (Lond. 1772). In 1772, he also published in English, *Parallel between the English Government and the former Government of Sweden*; ten years later, his *History of the Flagellants, or Memorials of Human Superstition*; and in 1796, an *Essay containing Strictures on the Union of Scotland with England*. His work on the British constitution, although not reckoned of great value by English critics, contains some acute observations regarding the advantages of a limited monarchy.

**DELORME, MARION**, a Frenchwoman, whose name figures too prominently in the history of the 17th century. She was born about 1612, at a village near Châlons-sur-Marne, and came at an early period of her life to Paris, where her great beauty would easily have secured for her a good match, had she not been inclined to a life of licentious intrigue. Almost all the distinguished men of the age were her 'lovers.' During the first disturbances of the *Frondeurs*, her house was the rallying-point of the chiefs of that party, and in consequence, Mazarin was about to imprison her, when she suddenly died, at the age of 39. A curious tradition sprang up in France during the next century, to the effect that Marion had not died, but escaped to London; that she had returned to Paris in 1682; that she, meanwhile, had been thrice married—first, to a lord, second, to a robber-chief, and third, to a procurator of finance; and, finally, that she died in 1706, or, as others say, in 1741, when in her 129th year. Victor Hugo has made her the subject of one of his historical dramas.

**DELOS** (called also in ancient times *Asteria*, *Ortygia*, *Cynthus*, &c.), an island in the Grecian Archipelago, the smallest of the Cyclades, is situated between the islands *Rheneia* and *Mykonos*, in lat. about 37° 23' N., and long. 25° 17' E. According to the mythological account, it was at first a floating island, but was fixed to the bottom by Zeus, in order that it might become a safe abode to Leto, who, about to bring forth Apollo and Diana, was seeking a refuge from the wrath of Here. Its earliest

historical inhabitants were Ionians, and it appears to have been the centre of a great periodical festival held in honour of Apollo, both on the mainland and in the islands. In 426 B. C., D. was purified by the Athenians, all the tombs were removed from it, and it was declared pollution for any birth or death to take place on it. Four years after, the inhabitants of Athens expelled the Delians from the island. After 146 B. C., when Corinth fell, D. became the seat of extensive commerce. Its sacred associations, its great festival, its excellent harbour, and its situation in the direct route from Southern Europe to the coasts of Asia, all combined to render it a port highly favoured by merchants. So great was the traffic of D., that it is said 10,000 slaves changed hands here in one day. After flourishing for a considerable time, it was devastated in the Mithridatic war, and from this calamity it never recovered. Pliny describes D. as being merely a rock, and only five miles in circumference. It was noted for its palm-trees, and also for its brass, and the brazen vessels which it manufactured. The town of Delos, which stood at the foot of Mount Cynthus, a granite crag of from 400 to 500 feet high, is now a mass of ruins. Still, however, the remains of the great temple of Apollo, and of the colossal statue raised in his honour, may be distinctly traced, although shiploads of the more perfect architectural fragments were conveyed, centuries ago, to Venice and Constantinople. A few shepherds and goatherds from Mykonos are now the only inhabitants of Delos.

DELPHI (now CASTRI), an ancient town of Phocis, Greece, celebrated chiefly for its famous oracle of Apollo, was situated about eight miles north of an indentation in the northern shore of the Gulf of Lepanto (Corinthian Gulf), at the southern base of Parnassus, in lat. 35° 27' N., and long. 22° 37' E. Its original name, and that by which Homer invariably speaks of it, was Pytho. It stood in the centre of a district renowned for its classical associations. Occupying the vale of the Pleistus, it was seated in a semicircle like the area of a grand natural theatre, backed towards the north by two lateral spurs of Parnassus. These lateral ranges extend east and west around D., and give rise also, from the point at which they approximate, to the famous fountain of Castalia, the holy water of the Delphian temple. The earliest inhabitants of D. are said to have come from Lycoreia, a town upon one of the slopes of Parnassus, the inhabitants of which are supposed to have been Dorians. From the Delphian nobles were at first taken the chief magistrates and the priests of the temple, while the Pythia or female who delivered the oracle, at first always a young maiden, but latterly always a woman not younger than fifty, was usually selected from some family of poor country-people. In the centre of the temple was a small opening in the ground, whence arose an intoxicating vapour; and the Pythia having breathed this, sat down upon the tripod or three-legged seat, which was placed over the chasm in the ground, and thence delivered the oracle, which, if not pronounced at first in hexameters, was handed over to a poet, employed for the purpose, who converted it into that form of verse. As the celebrity of the Delphic oracle increased, D. became a town of great wealth and importance. In the 8th c. before the Christian era, it had become famous not only in Hellas, but also among the neighbouring nations. Here the Pythian games were first celebrated in 586 B. C. The first stone temple at D., built by Trophonius and Agamedes, was destroyed by fire in 548 B. C., but was rebuilt at the cost of 300 talents, or £115,000, and was fronted with Parian marble. In 480 B. C., Xerxes

sent a portion of his army to plunder the temple; but as they climbed the rugged path that led to the shrine, a peal of thunder broke overhead, and two huge crags tumbling from the heights crushed many of the Persians to death, while the others, struck with terror, turned and fled. It was plundered by the Phocians during the Sacred War, and was attacked by the Gauls in 279 B. C., who, approaching by that route which the Persians had on a former occasion adopted, were repulsed by a similar supernatural agency. D. subsequently excited the rapacity of many potentates, and suffered severely by their attacks. Nero carried off from it 500 statues in bronze; Constantine also removed many of its works of art to his own capital. In the time of Pliny, the number of statues in D. was not less than 3000, and within the temple for a long time stood a golden statue of Apollo.

The modern town of Castri now occupies the site of Delphi. Its situation is beautiful, and from it the traveller may command an excellent view of the ancient valley. Castri stands in the immediate neighbourhood of the source of the still flowing Castalian spring.

DELPHIN CLASSICS, an edition of the Greek and Roman classics, prepared by 39 of the best scholars of the time, under the editorship of Bossuet and Huet, tutors to the Dauphin (q. v.), son of Louis XIV. The title-pages bear the words, 'In usum Serenissimi Delphini,' and hence the name. They have never been reprinted as a whole in England, but octavo editions of particular authors, such as Virgil and Horace, have been published for the use of schools. The Delphin Classics possess little value in the eye of a scholar of the present day.

DELPHINAPTERA, a genus of *Cetacea*, of the family *Delphinidae*, agreeing with *Beluga* (q. v.) in the want of a dorsal fin, but differing in having the snout produced into a slender beak, which is flattened transversely, and separated from the head by a marked furrow. *D. Peronii*, the RIGHT

Delphinaptera Peronii.

WHALE-PORPOISE of the South Sea whalers, is an inhabitant chiefly of the seas of high southern latitudes, but sometimes found even on the coasts of New Guinea. It is about five or six feet long, black, with brilliantly white belly and snout. Its mouth is furnished with a great number of slender sharp teeth. *D. Commersonii*, also found in high southern latitudes, is about the size of a porpoise, silvery white; the snout, tail, and pectorals tipped with black, and is described as one of the most beautiful inhabitants of the ocean. *D. borealis* was discovered by the United States Exploring Expedition in the North Pacific Ocean.

DELPHINIDÆ AND DELPHINUS. See DOLPHIN.

**DELPHINIUM.** See LARKSPUR.

**DELTA** is the alluvial deposit formed at the mouth of a river from the deposition of the particles which it has held in suspension. The term was originally applied to the tract of land thus formed by the Nile, which, being enclosed by two main branches and the sea, has the form of the Greek letter Δ, Delta. The formation of deltas depends more upon the presence or absence of currents met with at the mouth of the river, than upon the quantity of sediment held in suspension when it reaches the sea. Deltas are consequently of almost invariable occurrence in inland lakes, in the quiet estuaries of the nearly tideless Mediterranean, and in the sheltered bays and gulfs of other seas. When, on the other hand, there are strong ebb-tides, or powerful oceanic currents, the detritus is carried off into the sea.

**DELUGE** (through the French, from Lat. *diluvium*, a washing away, a flood). There is scarcely any considerable race of men among whom there does not exist, in some form, the tradition of a great deluge, which destroyed all the human race except their own progenitors. That the Noachian deluge, recorded in Scripture, covered the whole earth, was the universal opinion until towards the close of the last century. The organic remains, on which the science of paleontology is now founded, were regarded as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geology, it soon became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits; but many of these were, after a few years, found to belong to a period vastly anterior to any historical epoch, and to have been produced by long-continued and steady agencies, differing totally from a temporary deluge. The present tendency of opinion among writers like the late Hugh Miller, is to regard the flood of Noah as partial and local, although the universality seems to be implied in the biblical description.

**DE LUNATICO INQUIRENDO.** See **INSANITY** (legal).

**DELVINO**, a town of European Turkey, in the province of Albania, beautifully situated on a hill-side covered with olive and orange groves, in lat. 40° N., long. 20° 15' E. It is fortified, is the seat of a Greek bishop, and has a considerable trade in olive-oil. The women's dress is peculiar, being a long white wrapper, enveloping them from head to foot, and giving them the appearance of animated monumental figures. Pop. estimated at 10,000.

**DEMAND AND SUPPLY.** The nature and influence of the law or agency so designated by Political Economists have been the subject of considerable dispute. It has sometimes been maintained as a ruling principle, that the demand for anything creates the supply. This has been denied, however; and it has been held that, on the contrary, the supply precedes the demand, since the article must be in existence before a purchaser goes to ask for it. Steam-engines, for instance, and india-rubber galoshes, must have been invented and made before any one thought of purchasing them. The most convenient way, perhaps, of viewing the term demand and supply, is to consider it as applicable to articles in the market; and here we shall find that the demand and the supply are continually vibrating with a tendency to balance. Sometimes there is more of an article than will sell at a remunerating price, sometimes less; but there is always a strong tendency to a balance. Thus, on

any day in London, the supply of beef or of fish may be less than the demand—that is to say, the trade may be so brisk that had there been a few more bullocks at Smithfield, or a few more salmon and turbot at Billingsgate, they might have been sold at remunerating prices. At the same time, there may happen to be an excess of both commodities at Windsor. It never will happen, however, that a supply suited for the London market will find its way to Windsor, or that no more will reach London than might feed Windsor—it would be as rational to expect the river Thames to reverse its course. This is the great law, then, by which the world is supplied with the necessaries of life. Every day the proper supply for the enormous consumption of London is on its way from the uttermost ends of the earth, as systematically as the sap is ascending to penetrate through all the branches of the tree. How impossible it would be to effect the same thing by artificial organisation, may be illustrated from the Russian campaign of Napoleon, where, despite of the most skilful and costly arrangements, one portion of the army were starving to death, while another were slaughtering their bullocks and leaving them to rot! It is necessary to keep in view the proper function of this law, which is in some measure defined under Competition (q. v.). The demand will not produce everything: no money will bring forth when wanted a Milton's *Paradise Lost*, or a Raphael's 'Transfiguration.' On the other hand, there are services beneficial to the world, or to a community, for which there is no demand in the commercial sense. There is a demand for almanacs, but none for the astronomical investigations on which they are founded. There is a demand for teachers of Latin and Greek, and for Latin and Greek school-books, but none for the profound scholarship necessary for keeping the knowledge of these languages alive; hence come scientific and scholastic endowments and establishments.

**DEMAVEND**, the name of a volcanic mountain in Persia, situated about 40 miles north-east of Teheran. It is said to have an elevation of about 20,000 feet, and is of conical form; several hot springs have their source at its base.

**DEMBËA, LAKE OF**, in Abyssinia, is situated in lat. 12° N., long. 37° 15' E., and is about 60 miles in length, with an average breadth of 25 miles. It occupies part of an extremely fertile plain, situated at an elevation of some 6000 feet above the sea, and contains several beautiful islands, one of which is inhabited. Its southern portion is traversed by the Blue Nile.

**DEMBINSKI, HEINRICH**, a Polish general, best known in Britain through his connection with the Hungarian revolution, was born in the palatinate of Cracow, 16th January 1791, entered the Polish army in 1803, took part in the invasion of Russia by the French in 1812, and was made captain by Napoleon himself on the battle-field of Smolensk. He subsequently distinguished himself at Leipzig. After the fall of the Empire, he returned to his native country, and lived in comparative obscurity for some time. The Polish revolution of 1830 called him again to arms. He obtained the command of a brigade of cavalry, and exhibited heroic courage at the battle of Kuslew. Afterwards, he made the campaign of Lithuania, under Gielgud; and arriving in Warsaw—having traversed the entire Russian lines—was made commander-in-chief of the national army. After the surrender of Warsaw to the Russians, D. went to France, where he published his *Mémoires sur la Campagne de Lithuanie* (Strasbourg, 1832). In

1833, he proceeded to Egypt, and entered the service of Mehemet Ali, but returned to Paris in 1835. On the outbreak of the Hungarian insurrection, he offered his services to that country, and Kossuth appointed him commander-in-chief of the Hungarian army. He drew up a plan of the campaign, but could not obtain the concurrence of Görgei, whose tardy arrival caused the loss of the battle of Kapolna (26th—28th February 1849). Forced to retreat behind the Theiss, D. resigned his command, but subsequently consented to act under Messaros. He strongly urged the necessity of uniting the cause of Hungary with that of Poland, and proposed to lead an army into Galicia; but his advice was not taken. After the resignation of Kossuth, and the capitulation signed by Görgei at Vilagos (13th August 1849), D. fled to Turkey. In 1850, he returned to France, and commenced to write his *Mémoires* on the Hungarian war. (He continued to live in Paris till his death, which took place 13th June 1864.)

**DEMEMBRÉ**, or **DISMEMBERED**, a heraldic term to signify that the members of an animal are cut from its body.

Dismembered.

**DEMENTIA**. See **INSANITY**.

**DEMERRARA**, a district and river of British Guiana (q. v.). The river D. is upward of 200 miles in length, is  $1\frac{1}{2}$  mile broad at its mouth, and is navigable by ships of considerable burden for 100 miles. Its affluents are numerous though small, and at its

embouchure into the Atlantic it affords a spacious harbour, obstructed, however, by a bar. It has many settlements on its banks.

**DEME'SNE** (Lat. *Terre dominicales*. *Dominicum*), in the present day, may be said to be the right which the owner in possession of lands in fee simple has in his estate. But the original signification of demesne was that portion of the lands of a Manor (q. v.) which the lord of the manor reserved for his immediate use and occupation. The lands so reserved were either in the cultivation of the lord of the manor or his Villeins (q. v.), and were thus distinguished from lands granted or subfeneo to vassals for services to be rendered. So long as the practice of sub-infeudation continued, the demesne lands were a distinct and separate right; but the statute *Quia Emptores*, 18 Ed. I., having abolished sub-infeudations, and declared that on every transfer of land the feelee should hold of the lord paramount, all lands became of necessity demesne, being in the actual possession of the owner or his tenants.

**DEMESNE, ANCIENT**, a species of Copyhold Tenure (q. v.). Lands held in ancient demesne are said to have belonged originally to vassals of the crown. The services rendered were determinate, not variable at the will of the lord, and more honourable than those of copyhold in general. The tenants also were entitled to certain privileges and exemptions from feudal services. But in process of time, the character of the services appears to have varied; so that in the present day tenants in ancient demesne in some instances differ little from ordinary copyhold tenants.

**DEMETER**. See **CERES**.

**DEMETRIUS, PHALEREUS**, so named from the Attic demos of Phalerus, a seaport of Athens, where he was born about 345 B. C., was distinguished as an orator and politician. Though descended from a family possessing neither rank nor property, yet by the resolute and persevering exercise of

his abilities, he rose to the highest honours at Athens. Having been educated in the school of Theophrastus, he entered upon public life about 325 B. C., and soon made himself famous by the display of great oratorical talent. In 317 B. C., D. was placed by Cassander at the head of the administration of Athens, which office he discharged with such acceptance for nearly ten years, that the grateful Athenians, during that time, heaped all kinds of honours upon him, and erected to him no less than 300 statues. During the later period of his administration, he seems to have given himself up to dissipation; and when Demetrius Poliorcetes, king of Macedonia, approached Athens with a besieging army, in 307 B. C., D., having lost the sympathies and co-operation of the Athenians, was obliged to flee. All his statues were demolished except one. D. retired first to Thebes, but afterwards found refuge in the court of Ptolemy Lagi, at Alexandria, where he lived for many years, devoting himself to literary pursuits. On the death of his protector, D. was expelled from the court of Egypt, and retreating to Busiris in Upper Egypt, he is said to have died there from the bite of an asp, 283 B. C. D. was the last of the Attic orators worthy of the name. His style was graceful, insinuating, and elegant; bearing, however, in its luxuriousness and tendency to effeminacy, the marks of a declining oratory. The list of his works (50 in number) given by Diogenes Laërtius shews him to have been a man of most extensive acquirements.

**DEMETRIUS**, the assumed name of four different persons who figure prominently in Russian history between the years 1603—1613. In 1584, Ivan the 'Terrible' died, leaving two sons, Fedor and Demetrius, the former of whom ascended the throne, but proved a weak ruler, and was completely under the control of his brother-in-law, Boris Godunoff; the latter, D., was brought up at a distance from the Muscovite court, and when only nine or ten years old, either accidentally killed himself, or, which is more probable, was put to death. In 1598, Fedor died also, and Boris ascended the throne, but his tyrannical measures rendered him very unpopular. In 1603, a strange story reached Russia. It was affirmed that D. was not dead, but had appeared in Poland. The fact was, that a person calling himself D., but who, it was asserted, was in reality a monk, named Grishka Otrepiev, belonging to the convent of Tchudoff, had found means to persuade Prince Wisniewski in Lithuania, and afterwards Mniszek, Palatine of Sandomir, that he was the true son of Ivan. The latter introduced him to Sigismund III., king of Poland, who saw in him a useful instrument for introducing Polish influence into Russia, and so aided him in his designs against Boris. Towards the close of 1604, he invaded Russia, repeatedly defeated Boris (who died April 1605), and entered Moscow in June, the people receiving him with every demonstration of enthusiasm. He ruled for some months with vigour; but his manifest predilection for the Poles soon excited the Russians against him, and the arrival of his bride, Marina Mniszek, the daughter of the Palatine of Sandomir, on the 12th of May 1606, brought the discontent to a head. Sixteen days later, an insurrection broke out in the capital, headed by Prince Wasili Shuiski. D. was slain, and a multitude of the Poles massacred. Wasili Shuiski now ascended the throne; but in the following year, an individual appeared alleging that he was D., and that another had been mistaken for him in the Moscow massacre. He found a considerable number of adherents, especially when Marina acknowledged him to be her husband. The Poles also helped him, and for some time it seemed likely that he would succeed; but at length he was put to

death at Kaluga in 1610. The third *fils* D. gave himself out to be the son of the first. After a brief career, he fell into the hands of the czar, and was strangled. The *fourth* made the same pretensions, but falling into the hands of the Cossacks, was carried to Moscow, where he was executed in 1613.

**DEMI**, or **DEMY** (half). In Heraldry, an animal is said to be demi when only the upper or fore half of it is represented. In inanimate objects, the dexter half per pale is usually intended, when it is said to be demi, though a *demi-fleur-de-lis*, for example, may be a *fleur-de-lis* divided per fess.

**DEMI-BASTION**, in Fortification, is a kind of half-bastion which frequently terminates the branches of a crown-work or horn-work, and which is also occasionally used in other places. See **BASTION**, **CROWN-WORK**, **HORN-WORK**.

**DEMIDOFF**, a Russian family who in Russia occupy a position as capitalists similar to that held by the Rothschilds elsewhere, and who are not more celebrated for their wealth than they are for their beneficence.—**NIKITA DEMIDOFF**, the founder of the family, was a serf in the time of Peter the Great, but, leaving the place of his birth in order to escape being taken as a recruit, he afterwards became famous as a manufacturer of arms, and before his death had amassed an immense fortune. In 1699, he established an iron-foundry, under the auspices of Peter the Great, in whose favour he had attained a high position, near Neviansk, on the eastern base of the Ural Mountains; this being the first iron-foundry ever established in Siberia. He subsequently erected numerous other forges among the solitudes of the Urals, and realised from them very great riches.—**AKIMFI DEMIDOFF**, son of the preceding, employed German workmen to explore the rich mines of gold, silver, and copper, that are found in the valley of the Irtysh, and the upper reaches of the Obi. In 1725, he built, at the foot of the Magnetic Mountain, in Siberia, a foundry called Nischneitagilsk, which is still the most important in all Siberia. The Russian government, sensible of the great service done to the country by the labours of such a man, conferred upon the enterprising metallurgist the title of Counsellor of State.—His son, **PROCOPE**, founded in 1772 a school of commerce at Moscow, intended to furnish a complete education for the sons of Russian tradesmen. This establishment was transferred to St Petersburg in 1800.—**PAUL DEMIDOFF**, cousin of Procope, also a man of energy, travelled extensively when young, devoting himself to the cultivation of the natural sciences. He presented to the university of Moscow a valuable museum of natural history, and founded also, in 1803, the Demidoff Museum, at Yaroslavl.—**NICHOLAS**, **COUNT DEMIDOFF**, nephew of the preceding, born in 1774, distinguished himself while young as an aide-de-camp in the war against the Turks. Later, he married the Countess Stroganoff, and became a privy councillor and imperial chamberlain. His taste for the fine arts and for the natural sciences led him to travel extensively; he also caused the workmen whom he employed in his mines to travel, in order to acquaint themselves with the processes of foreign miners. In 1812, he fought at the head of a regiment which he himself raised and led against the French. His death occurred in 1828. A collection of his works, entitled *Opuscules d'Economie Politique et Pratique*, was published at Paris in 1830. Of his two children, **PAUL** and **ANATOL**, the former died young, leaving the great bulk of his fortune to the latter, who was born in 1810 or 1812, and was educated in France. He was always remarkable for his enthusiasm in letters and in the sciences. His principal book, published

at Paris in 1839, and of which an English translation appeared at London in 1853, is entitled *Travels in Southern Russia and the Crimea, through Hungary, Wallachia, and Moldavia*. Demidoff, in 1840, married the Princess Mathilde de Montfort, daughter of Prince Jerome Bonaparte. After five years, the marriage, by which there had been no children, was by mutual consent dissolved. Demidoff, on the 19th June 1856, presented the town of Spa with a bust of Peter the Great. Russia, as well as other countries, owes the foundation of many valuable charitable institutions to the philanthropy of Demidoff. Demidoff died at Baden, 13th July 1858.

**DEMI-GORGE**. See **BASTION**, **GORGE**.

**DEMI-LUNE**, in Fortification, is a work constructed to cover or defend the curtain or wall of a place, and the shoulders of the adjoining bastions. It is composed of two faces, forming a salient angle towards the open country outside the place. It has two demi-gorges, formed near the counterscarp, and is surrounded by a ditch. See further under **LUNETTE** and **RAVELIN**.

**DEMIR-HISSAR** ('iron-castle'), a town of European Turkey, in the province of Roumelia, in lat. 41° 12' N., long. 23° 28' E. It is situated on a tributary of the Karasu, at the foot of an old fort-crowned hill, is fortified, and contains several mosques and a Greek church. Pop. 8000.

**DEMI'SE**. See **LEASE** (**ENGLISH**).

**DEMISE OF THE CROWN**. That 'the king never dies,' is a maxim of the public law of this country, in accordance with which, immediately on the death of the reigning monarch, the sovereignty passes to his successor, by the act of the law itself. No installation, proclamation, coronation, or other ceremony is required to vest the new sovereign in the regal office, and thus there is no interval or interregnum, and the royal dignity remains perpetual. The word demise has, in English law, the more general signification of a lease or conveyance, by which a man grants lands or tenements to another for life, for years, or at will; such estate being short of the lessor's own interest therein. It is thus, as it were, by a sort of courteous and loyal analogy that it is employed to signify the death of the sovereign. 'So tender,' says Blackstone, 'is the law of supposing even a possibility of his death, that his natural dissolution is generally called his demise, an expression which signifies merely a transfer of property.'

**DEMISEMIQUAVER**, half a semiquaver, or the 32d part of a semibreve. See **NOTATION**.

**DEMIURGE** (from Gr. *demos*, people, and *ergon*, a work; hence a handicraftsman) was the name given in the cosmogony of the Gnostics to the creator or former of the world of sense. He was conceived as the archon or chief of the lowest order of the spirits or æons of the pleroma; mingling with chaos, he formed in it a corporeal animated world. He created man, but could impart to him only his own weak principle, the *psyche* or sensuous soul; therefore the highest, the really good God, added the divine rational soul, or *pneuma*. But the power of evil in the material body, and the hostile influence of the merely sensuous demiurge, prevented the development of that higher element. The demiurge holding himself to be the highest God, could not bring his creatures to the knowledge of the true Godhead; as the Jehovah of the Jews, he gave them the imperfect law of Moses, which promised merely a sensuous happiness, and even that not attainable; and against the spirits of the *hyle*, or world of matter, he sent only a psychical, and therefore powerless Messial, the man Jesus. See **GNOSIS**.

DEMMIN, a town of Prussia, on the river Peene, on the borders of Pomerania and Mecklenburg, in lat. 53° 50' N., long. 13° 1' E. Besides the town proper, D. comprises three suburbs. It has four public squares and a town-house, and manufactures of woollens, linens, hats, and leather. It has also distilleries and breweries, and some trade in tobacco, gloves, &c. Pop. 6140. D., which is a place of some antiquity, was a walled and fortified town during the 12th century. It suffered considerably during the Thirty Years' War, previous to which it was of much more importance than it has since been.

DEMOCRACY (Gr. the rule of the people). It is interesting to trace the progress of this idea, which now plays so important a part. In Greece, whence we derive the name, it was understood to mean a commonwealth so constituted that the power was exercised by the body of the citizens (the *demoi*), and not by an individual, or by a dominant caste. Democracy, therefore, stood opposed both to monarchy and aristocracy. Most of the republics of Greece, more especially that of Athens, were democracies in this sense. The name by no means implied the notion of an absolutely equal right in all citizens, still less in all men, to the exercise of political power. Neither the total absence of rights of all kinds on the part of the larger half of the population, the slaves, nor the distinctions recognised by law among citizens proper (e. g., the exclusion of the poorer citizens from office under the Solonian constitution at Athens), were considered incompatible with the nature of a democracy; though in regard to inequalities among citizens, the continually growing force of the democratic principle tended to their gradual extinction, and the transference of power to the mass of citizens without distinction. Aristotle regarded this as an encroachment of *ochlocracy* (mobocracy), the degenerate form of democracy, or democracy proper. Or more frequently, he speaks of democracy as the degenerate form of the polity (Gr. *politeia*). The polity with him was the form where the many govern for the common benefit.—*Polit.* III. chap. 5, and IV. chap. 6.

In modern history, we meet at the very threshold a state of society which may be called democratic. Among the German nations, we find an almost perfect equality of all freemen (i. e., all that were not slaves), and real self-government exercised by these freemen in each separate tribe. For the personal distinction enjoyed by certain families gave them no privileges over the other freemen, and where royalty existed, it could hardly be said to rule, since the king could do nothing without the concurrence of the assembly of freemen, and reigned not by mere birthright, but required the confirmatory choice of the people.

This condition of general liberty and equality gave place gradually to one of a quite opposite kind. Through the growth of the Feudal System (q. v.), the majority fell into a more or less abject dependence upon a privileged minority. The mass of former freemen, now sunk into serfdom, were hardly distinguishable from those properly slaves, whose position, on the contrary, was become less dependent. The dominant class, the nobility, branded all that did not belong to themselves as 'people,' 'commonalty,' 'canaille.' Thus the term 'people,' which in the ancient republics implied the rights of citizenship, came to denote the masses that were without rights. The distinction between the dominant class and the mass of the people rested chiefly on two points—exclusive occupation in war, and the free possession of land, which was granted for warlike service alone.

But within this system of graduated dependence, from the monarch down through the aristocracy and their retainers in various degrees, there sprang up slowly an opposing element, which, as originating in the mass called the people, we may designate as democratic. It was not so much a new element, as the resuscitation of the old Roman municipal life, which had never altogether become extinct. It was of course in the cities that this fresh element first manifested itself. Here, instead of a lord with a group of dependants, there arose communities of men with equal rights and self-government. At the same time, a new material interest, that of movable property, the product of industry and commerce, began to claim recognition alongside of territorial possessions and nobility. In England, as early as the Anglo-Saxon times, a merchant who had made three voyages ranked with a thane; and soon after the Norman Conquest, the cities were represented in parliament on an equal footing with the warlike aristocracy. This took place later on the continent, and never to the same extent, except in the cities of Lombardy and Flanders, where, at an early period, the citizen element entered the lists with the feudal and warlike. Even within the cities, the same contest was carried on between aristocracy and democracy. At first, it was only those carrying on commerce on a large scale that asserted their right to take part in the municipal government of the towns; but the trades or guilds soon set up the same claims. These claims were pertinaciously prosecuted, and often led to bloody contests, but sooner or later were everywhere victorious. Thus was the basis of democracy widened; although the guilds also did not fail to manifest an aristocratic and exclusive spirit towards the body of the people not belonging to them, and with their restrictions and monopolies acted oppressively to the country population. It was not so easy for these last to break the bonds of feudal subjection in which they were held, or to acquire any political standing. Isolated attempts to throw off the yoke, by peasant insurrections and wars, failed, and only were followed by increased oppression. The abrupt division between the feudal possessor of the soil and the serfs under him continued long everywhere except in England. There the rigour of the relation began early to give way, and the transition was effected in such a peaceable and gradual way, that the English historian cannot say exactly how or when. For the greater part of the continent, it was not till the French Revolution in 1789, and the impulse given by it to legislation in other countries, that the agricultural population acquired more or less complete freedom and equality with other classes.

Thus had one part after another of that 'people,' so oppressed and contemptuously thrown into the background by the dominant class in the middle ages, emerged from bondage, and successfully asserted a participation of rights that were at one time the privileges of a single class. The aristocratic principle of feudal society, the principle of exclusion, privilege, of the subjection of the majority to a minority, had given way to the democratic principle of the equal rights of all classes, of all callings and employments. But the development of this last principle was not yet complete. Those who had made good a position in the state alongside of the feudal aristocracy, formed in their turn an exclusive class, taking their stand on certain material grounds. Thus, the merchants, as representing large masses of capital; the guilds, with their privileged industry; the agriculturists, as possessors of land, however little: all these interests formed, as it were, another aristocracy within

the democracy. They were democratic in their origin, and as compared with the class that was at one time exclusively privileged; but in another point of view they were aristocratic, since there still remained without a numerous body, which, instead of elevating to political power with them, they rather repelled, and treated much as the nobility had treated themselves. This residuary mass, which now came to be chiefly designated by the name 'people,' comprehended all those who possessed no capital, no privileged trade or calling, no land—nothing, in short, but their personal powers and capacities for work. This class forms at the present day by far the most numerous portion of the population in nearly all the civilised states of Europe. The designation 'people,' intended to be depreciative, is taken by them in the very opposite sense, and they ground upon it their claim to rule the state, as being properly the people, the numerically strongest class of the community. The preference given to the class of possessors, they look upon as groundless and absurd, just as these had judged of the nobility; they therefore claim perfect equality with them, especially in the exercise of the highest political rights. It is from this point of view that universal suffrage and the rule of mere numbers, without regard to possessions or other conditions, has been proclaimed as a self-evident consequence of the democratic principle.

With this there is connected in many quarters a still further extension of the idea. The same principles, it is said, that have dictated political reformations, call for a remodelling of the social arrangements of mankind; that the possessors of property, the *bourgeoisie*, ought to be deprived, not only of the political privileges they have hitherto enjoyed, but also wholly or in part of the material basis of those privileges, their property, so as to produce a perfect equality, political, material, and social, of all classes. This gives rise to a division of the democrats of the present day into two parties: the purely democratic party, aiming only at securing the political consequences of the democratic principle—universal suffrage, and the absolute equality of social rights; and the 'democratic and social,' who look upon the attainment of political rights as only a means of ultimately securing the general social equality of men.

There seems, however, to be a fundamental error in thus treating the relation between the possessionless class and the possessors as analogous to that between the serfs and lords of feudalism. The contest of democracy against feudalism was not primarily so much for equal rights as for this, that among the same people mere birth should not make one man privileged, and a ruler; another destitute of all rights, and bound to obey. It was a contest for personal freedom, the right for every man to use his powers for his own behoof, and not for that of a master; the right to the free possession of land, &c. Participation in political rights was chiefly prized as a guarantee for securing this personal and social liberty. Now, there is no such absolute distinction between possessors of property and non-possessors, as between the nobleman and *roturier* of the middle ages; the two classes run imperceptibly into one another. Still less does the one class exercise any right of controlling the personal freedom of the other in respect of labour and acquisition, as was the case in villenage and feudal servitude. Possession has endless gradations, and in the present day, he who had nothing at the outset often becomes a capitalist, and the reverse. There may be other reasons for wishing that there were less abrupt differences of possession, and greater social equality between the lower and middle classes than

society actually presents (see SOCIALISM); but this by no means follows necessarily from the notion of democratic equality. All that this notion requires, seems to be the removal of all privileges that destroy the unity and homogeneity of a nation, the establishment of complete personal and social liberty, and of the equality of all in the eye of the laws; and, in regard to political rights, or direct participation in the government of the state, such a form of constitution as will exclude no fixed class of citizens as such. All this, however, seems quite compatible with making the exercise of the different political functions dependent, in the case of each individual, on certain guarantees, and not admitting the whole body of the people to share in the government of the commonwealth at once, but only in proportion as increasing culture renders a wider circle capable of such functions. If we may judge from the example of England and Belgium, this is the way in which the real and steady progress of the democratic principle is best secured.

In France, the feudal principle, instead of a timely compromise with the democratic, as in England, came to a struggle with it of life and death. The consequence was that victorious democracy, instead of seeking to satisfy the practical wants of society first, and leaving the theoretical to be attained gradually, undertook to reorganise at one stroke the whole political and social fabric. In Germany, things took lately a similar course. The case of America is peculiar. There the foundation of the state structure was to be laid on a clear site, and the first page of the history to be written. Those who came together to form the new community were personally perfectly free and equal, and the local circumstances were such as to favour the exercise of this liberty and equality, by rendering any very great disparity in material means impossible. In such circumstances, the construction of a perfectly democratic order of society could be carried out without struggle, and without any dangerous straining of the principle. There no one looks upon the restriction of the franchise to residents—which is the law in most states of the Union—as an infringement of the democratic principle. Norway bears no little resemblance to America; in that country, the democratic element was never so completely crushed as in other parts of the continent, and that form of society is favoured by the means and style of living, which are extremely simple, and are based on a nearly equal division of the soil.

In the development of democracy in modern times, circumstances have directed its attacks rather against the aristocratic, than against the monarchical principle. At one time, monarchy, in its struggle with the aristocracy, found its natural allies in the democracy. The princes, in striving to break the power of the great nobles, which limited their own, often called in the help of the democratic element, partly by conferring privileges on bodies of the people, such as city corporations, and partly by attaching individuals of the non-privileged classes to their personal service, and appointing them to influential positions in the state. The road to power and distinction was, it is true, already open to individuals of the democracy through the church, whose dignities and privileges were not confined to the noble by birth, but were accessible to personal capacity. At a later period, the universities, especially in the faculty of law, formed for the democracy stepping-stones to power, from which they sometimes overtopped the aristocracy of birth. And when the princes—at their head the Louis of France—aiming at absolute authority, sought to find a counterpoise to the feudal nobility, by creating a bureaucratic state machinery, and favouring intelligence in every

form, the very widest path was opened to the democratic element for attaining influence and distinction. It is true that all this was at the cost of its most essential principle; for the equality created by a levelling absolutism, raising the low and depressing the high, was nothing more than an equality of dependence upon the one absolute master of all.

The relation between democracy and monarchy was different where the ruler came to be limited as the chief officer of the nation. Such a limitation of the power of the monarch, by means of a representative system not confined to the privileged classes, but embracing at least the citizens of towns, was in itself a victory of the democratic principle. As the circle of this popular representation widens, and its influence in the state increases, such a monarchy becomes more and more democratic in all its institutions.

In a purely democratical state, the people may exercise their power in either of two ways—directly, or through delegates: in the one case, the democracy is said to be absolute; in the other, representative. The absolute or direct form prevailed in the republics of antiquity; political representation, in fact, seems to be a modern idea. The same is the case with the original Swiss cantons, where almost all public business is discussed in a full assembly of the people. In Switzerland generally, the representative form is now preferred. It is also carried out in the states of North America, and was adopted in the French republic of 1848. The absolute form, in fact, is only adapted for small communities with a population concentrated as to space, and differing little in mode of life or culture. According to some, the representative system is inconsistent with the principle of democracy, as the will of the people is liable to be falsified and crossed by the very organs that are to carry it into execution. It is rather an advantage, however, that the first impulse of the public will, sometimes passionate and short-sighted, should be tempered and enlightened, by passing through a series of media on its way to action; and the hold which the constituency have upon their representatives, by means of frequent re-election, and in other ways, is sufficient guard against any defeat of a steady, earnest, public conviction.

M. de Tocqueville and Mr J. S. Mill have applied themselves to setting forth the evils and dangers of democracy, which they—the latter especially—both regard not only as a system that must inevitably extend itself, but as the ideally perfect form of government. Mr Mill is at great pains to shew that self-government by a representative democracy is what develops, in the greatest degree, the good mental qualities, both intellectual and moral, of the governed, and that it is desirable gradually to extend this participation in the acts of government till it include the entire adult population, male and female. On the other hand, there are two sources of evil to which we are liable, more or less, as democracy approaches to the term of universal suffrage, and which are to be provided against by proper constitutional arrangements. The first of these is the insufficient mental qualifications of the governing body for the highly complicated work of government. Public administration is a profession, like engineering, medicine, or the law, and demands, no less than these, a special training and devotion of mind. In monarchies and aristocracies, the management of affairs is in the hands of a few, who make it the business of their life, and acquire the requisite skill for doing the work well. In a democracy, this advantage is lost, except in so far as the details of administration are left to skilled officials; the public assembly merely retaining the power

of checking and controlling those officials, and of determining general rules of policy.

The other danger is the predominance of the labouring class, by virtue of their numbers, over the class made up of employers of labour, and the rich and educated generally. When there are two or more classes in the community with conflicting interests, the desirable arrangement is, that their power should be equally balanced, so that no party could carry a point by political position alone, or without appealing to the reason, and sense of justice, of some members of the other parties. But if the suffrage were universal, the labouring-class interest would be the predominant one; and so serious would be the danger of class legislation as a result, that Mr Mill thinks it necessary to provide a remedy in the shape of granting a plurality of votes to certain persons, especially those distinguished by education, so as to restore the balance.—*Considerations on Representative Government*, chap. viii.

DEMOCRITUS, an illustrious Greek philosopher, was born at Abdera, in Thrace, about 470 or 460 B.C. Of his life, little is known. The statement that he was first inspired with a desire for philosophic knowledge by certain Magi and Chaldæans whom Xerxes had left at Abdera, on his Grecian expedition, is as untrustworthy as that which represents him as continually laughing at the follies of mankind. His extensive travels, however, through a great portion of the East, prove the reality of this desire, as does also his ceaseless industry in collecting the works of other philosophers. D. was by far the most learned thinker of his age. He had also a high reputation for moral worth. He appears to have left a strong impression of his disinterestedness, modesty, and simplicity on the mind of the community, for even Timon the scoffer, who spared no one else, praised him. The period of his death is uncertain. He lived, however, to a great age. Only a few fragments of his numerous physical, mathematical, ethical, and musical works are extant. These have been collected by Mullach (Berlin, 1843). Cicero praises his style, and Pyrrhon imitated it.

D.'s system of philosophy is known as the *atomic system*. Its essence consists in the attempt to explain the different phenomena of nature—not like the earlier Ionic philosophers, by maintaining that the original characteristics of matter were *qualitative*, but that they were *quantitative*. He assumes, therefore, as the ultimate elementary ground of nature, an infinite multitude of indivisible corporeal particles, *atoms* (see *ATOM*), and attributes to these a primary motion derived from no higher principle. This motion brings the atoms into contact with each other, and from the multitudinous combinations that they form, springs that vast and varying aggregate called *nature*, which is presented to our eyes. D. did not acknowledge the presence of *design* in nature, but he admitted that of *law*. 'The word *chance*,' he says, 'is only an expression of human ignorance.' He believed strictly in secondary or physical causes, but not in a primary immaterial cause. Life, consciousness, thought, were, according to him, derived from the finest atoms; those images of the sensuous phenomena surrounding us, which we call mental representations, were, according to him, only material impressions, caused by the more delicate atoms streaming through the pores of our organs. D. boldly applied his theory to the gods themselves, whom he affirmed to be aggregates of atoms, only mightier and more powerful than men. Strange to say, the ethical system of D.—in spite of the grossness of his metaphysics—is both pure and noble. Such fragments of his writings as we possess contain beautiful, vigorous, and true thoughts

concerning veracity, justice, law, order, the duties of rulers, &c.; while, in a spirit not alien to the teaching of Christianity, he looks upon an inward peace of heart and conscience as the highest good, the end and the aim of all virtuous endeavour.

**DEMOISELLE** (*Anthropoides*), a genus of birds of the family *Gruidæ* (cranes), differing from the true cranes in having the head and neck quite feathered, and the *tertials* of the wings elongated and hanging over the tail, so as in some species to reach the ground. The D., or NUMIDIAN D. (*A. Virgo*), is about 3 feet in length from the point of the bill to the tip of the tail, and the top of its head

Demoiselle (*Anthropoides Virgo*).

is about 3½ feet from the ground. It is remarkable, as are all its congeners, for elegance and symmetry of form, and grace of deportment. The general colour of its plumage is gray, but the sides of the head are adorned with two elegant white tufts, formed by elongation of the ear-coverts, and a tuft of blackish feathers hangs down from the breast. The D. is an African bird, but visits Greece and other parts of the south of Europe. To the same genus belongs the beautiful Stanley Crane (*A. paradisæus*) of the East Indies, a larger and taller bird, with very long tertials. Notwithstanding its large size, it seems to feed chiefly on the insects of marshes, which it takes when on wing.

**DEMOIVRE, ABRAHAM**, a distinguished mathematician, was born at Vitri, in Champagne, 1667, and died at London in 1754. Of French extraction, he spent most of his life in England, whither he fled, with many others, for shelter in 1685, on the revocation of the Edict of Nantes. He long supported himself by private tuition and public lecturing, and, towards the end of his life, by answering questions in chances, play, and annuities, most of his responses, it is said, being given at a coffee-house in St Martin's Lane, where he passed much of his time. The appearance of Newton's *Principia* incited him to increased devotion to mathematical studies, to which he had always been disposed, and at last he ranked among the leading mathematicians of his time. He was a member of the Royal Societies of London, Berlin, and Paris. The *Philosophical Transactions* of London are enriched by many contributions from his pen; and he was so esteemed by the Royal Society, that they judged him a fit person to decide the famous contest between Newton and Leibnitz for the merit of the invention of fluxions. Among his published works are *Miscellaneous Analytica de Seribus et Quadratis*, &c. (1730, 4to); a work on *The Doctrine of Chances* (1718 and 1738), dedicated to Sir Isaac Newton; and another on *Life Annuities*

(3d edit. 1750). D.'s name is well known from its association with a useful trigonometrical formula—viz., that whatever be the index  $n$ ,  $\cos n\theta + \sqrt{-1} \sin n\theta$  is a value of  $(\cos \theta + \sqrt{-1} \sin \theta)^n$ .

**DEMOLITION**, in Military Operations, is one of the destructive parts of the duty intrusted to the engineers. When works and buildings belonging to the enemy are to be destroyed, to facilitate operations on the one side, or to obstruct on the other, rides are laid down by which the demolition may be most easily and quickly effected. The quantity of gunpowder to be blasted for bringing down masonry of a particular thickness, the determination of the line of least resistance—these, and similar matters, are required to be studied by officers of the engineer corps.

**DEMONIACS** (*demoniaci, obsessi*, or, with reference to the supposed influence of the moon, *lunatici*), the name given by the Jews to persons afflicted with epilepsy, hypochondria, or insanity, diseases of frequent occurrence in the East. The name originated in the belief, that persons so afflicted had been taken possession of by Evil Spirits or Demons (q. v.). It was a prevalent opinion among the Persians, Greeks, Romans, and the ancients generally, that the extraordinary conditions and actions of men, which could not be referred to the known and apparent operations and powers of the mind, must be ascribed to the influence of one or more higher spirits. This belief is found in Homer, Herodotus, Euripides, and later writers, and also rooted itself very deeply in the Christian mind during the middle ages. As the *good*, when beyond the limits of the ordinary powers or faculties of great men, was attributed to the inspiration of the Muses, or to the direct co-operation, or even incarnation in their persons of some beneficent deity, so also that deep internal unhappiness of 'a mind diseased,' which no strength of will, and no physician's art in olden times could remove, was as unhesitatingly attributed to evil spirits, or *demons*, as the later Jews, probably with an oblique reference to paganism, called them. Spells and exorcisms, in consequence, took the place of the healing art in reference to such as were supposed to be demonised, and the Jewish exorcists (demon-banishers) alleged, according to Josephus, that they possessed the necessary magic formulas, wonder-working roots, &c., which had been handed down from antiquity. The good spirits thus appeared—in harmony with the idea that healing was a thing natural and divine in itself, the normal action, so to speak, of nature—to fulfil their function in banishing and destroying the demons. Thus, Christ appears in the synoptic Gospels as healing many who were possessed of unclean spirits, casting out devils, &c. But apart from the fact, that a belief in demoniacal possession was more vital and universal among the later Jews than among the other nations, on account of their being more deeply penetrated by the consciousness of sin, and by a conviction of the mysterious connection between evil and Satan, it was also expected of the Messiah, the Anointed of God, that he would possess 'power' over demons. This fundamental national belief would unconsciously prepare the contemporaries of Christ for regarding his divine exercise of the physician's art from a *religious* rather than a *scientific* point of view. When they beheld the miraculous effects of his 'power' on the bodies and spirits of the so-called demoniacs, it was natural that they should speak of it in language intelligible to their age, and in harmony with its general notions. To have used other words from the stand-point of a higher scientific knowledge, would have been as confusing

to the Jews and earliest Christians as it would have been to assure them that it was the *earth*, and not the *sun*, which stood still during the battle at Gibeon. Besides, when it is remembered that before even the synoptic Gospels were written, the miraculous incidents in Christ's life must have fixed themselves in the memory of the populace, under the conditions of the popular belief, it is difficult to see that there was any other course open to the evangelical historians, even if they did not share the common belief of their countrymen, than to adopt the current representations. They had no interest in the mere scientific accuracy or inaccuracy of such representations. Their object was different and higher: it was to show the power, wisdom, and goodness of the Saviour, qualities which are equally manifest whichever theory may be adopted. This view of the question, which is held to be in conformity with sound science and sound criticism, presents itself almost irresistibly to the candid and impartial student of the Bible, when he bears in mind that there is nothing in the recorded examples of demoniacal possession different from the ordinary symptoms of epilepsy, hypochondria, and insanity, which are not *now* beyond the physician's skill.

DEMONS (Gr. *daimōnes*, Lat. *genii*) are, according to superstitious belief, spirits which exercise an influence on the fortunes of men. Their dignity and character have both changed greatly in the course of time. Homer calls the *gods* demons, and *daimoniakos* is with him equivalent to *divine*. Hesiod affirms that there are in the air 30,000 demons or ministering spirits, who were the souls of men in the Golden Age; but a proper classification of these is first found in the Pythagorean and Neo-Platonic systems. Aristotle separates the immortals into gods and demons; mortals, into heroes and men. Plato, from whom Aristotle probably received the hint of his division, says in his *Symposium* that 'the demon is a middle intelligence between God and man, and the uniting link which completes the chain of being.' In other places, he informs us that they inhabit the air, wander through the sky, hover over the stars, and tarry on the earth. They also see the hidden issues of the future, and can alter them at their pleasure. Every mortal receives at his birth a particular demon, who accompanies him to the end of his life, and bears his soul to the place of purification and punishment. In general, it may be said, that the Greeks included the divinity or deity among the demons, in so far as he arranged and disposed the dissimilar fortunes of men. In reference to the actions ascribed to them, the demons were divided into *good* and *bad*—*agathodaimones* and *kakodaimones*. These evil demons were not, however, originally supposed to be hostile to the divinity or supreme demon. They came from him, and carried out his purpose as truly as the good demons. This was precisely the belief of the earlier Jews also, as we find, for example, from the history of Saul, into whom God repeatedly sent an 'evil spirit,' i. e., a demon, in the classical and not in the mediæval sense of the term. The demonism of the Romans consisted chiefly in the worship of departed spirits. See MANES, LARES, and PENATES. The origin of the doctrine of demons is to be sought for in the East. In the teaching of the Hindus, who, besides the highest Deity, Brahma, recognise a countless number of divine agents or messengers, the demons are called *deityas*. In Parseism, or the religion of Zoroaster, however, this doctrine is found in its most systematic and elaborate development. Indeed, the Persians and Jews *alone* among the nations of the Old World had the conception of evil spirits headed by a chief demon, a Satan, who was over

them as a god. To the genii or demons in the kingdom of Ormuzd (Light), who are called *Izeds*, stand opposed the genii in the kingdom of Ahriman (Darkness), who are called *Dews*. According to the belief of the Egyptians, the circuit of the world (the sea, the earth, the air) was filled with demons, who ruled the elements, exercised mysterious influence over stones, metals, and plants, and had the souls of men in their power. Although demonism came to Greece from various countries, and by various channels, yet the principal source of it was Egypt. The Jews derived theirs—at least to a great extent—directly from the Persians, during the time of the Babylonish captivity; and although acquainted with 'angels' from an early period, angelology, beyond all question, first received elaborate treatment after the return from exile. The dualism which characterises the system of Zoroaster now made itself conspicuous here. According to the Jewish demonology, there were seven good demons who formed the council of Jehovah, and ever stood before his throne, while the evil demons have at their head Satan or Asmodi. After the Jews had, under the Seleucidæ and Ptolemies, entered into extensive commercial relations with the Egyptians and Greeks, especially in Alexandria, Græco-Egyptian conceptions were associated with those derived from Persia. When Christ made his appearance in the world, the Jewish conception of a demon as an 'evil spirit,' *not* from God, had become definitely fixed and popular. This narrowing of the application of the word may have partly originated in the wish to glorify Judaism at the expense of paganism. It would gratify the national pride, which was strongest when it had least to boast of, to include the *demons*, i. e., the spirits both good and bad, of all the surrounding Greek-speaking nations, in one black category, and so make them stand as the representatives of Evil. The early Christian writers carried out this tendency to perfection; for instead of denying the existence of the heathen gods, they turned them into demons, who, acting under the inspiration of their wicked master, had cheated the souls of men, and so made them also worship Satan unawares. See DEVIL. The doctrine of the early church concerning the fall of the demons, based on Genesis vi. 2, and concerning their activity, is a mixture of Jewish and Platonic notions, Christianised, however, by the belief that all their action is controlled and directed by God. Among the Germanic races, during the middle ages, the idea of a person's being taken possession of by demons, led to the other idea of a covenant with the devil, of which the legend of Faust is a well-known example. See Ukert, *Über Dämonen, Heroen und Genien* (Leip. 1850).

DEMONSTRATION (Lat. *demonstrare*, to point out, to cause to see), in Mathematics, is a proof of any proposition which excludes doubt; such are the demonstrations of the propositions in Euclid's *Elements*. The method of demonstration in mathematics is the same with that of drawing conclusions from principles in logic, and is usually syllogistic, the premises being omitted to be stated at each turn. The principle of *reductio ad absurdum* is also employed. See REASONING, SYLLOGISM.

DEMONSTRATION, in Military Operations, is an apparent movement or manœuvre, the chief object of which is to deceive the enemy, and induce him to divide his force, as if to meet dangers from various quarters. When thus divided and weakened, he may be attacked with greater chance of success.

DEMONTÉ, a town in the south-west of Piedmont, Northern Italy, situated on the Stura, 15 miles south-west of Coni. Pop. 6956.

DE MORGAN, AUGUSTUS, was born in 1806, in the small Indian island of Madura, on the north-east coast of Java. His father was an officer in the British army. He was educated at Trinity College, Cambridge, and took his degree of B.A. in 1827, when he was fourth wrangler. He was appointed first Professor of Mathematics in the University College, London, after its foundation in 1828. In 1831, he resigned this office, but was reappointed in 1836, and has continued in that capacity ever since. His writings are very numerous. Besides being a mathematician of the first order, he is extensively and minutely versed in the history of the mathematical and physical sciences. He has also devoted himself to the development of the Aristotelian or 'Formal' Logic, to which he has given so symbolical a shape as to make it seem like a branch of Algebra. He has written likewise on the calculation of Insurances and on the Decimal Coinage. The following are the titles of a few of his works: *Elements of Arithmetic* (1830); *Elements of Algebra, preliminary to the Differential Calculus* (1835); *Elements of Trigonometry and Trigonometrical Analysis, preliminary to the Differential Calculus* (1837); *Essay on Probabilities, and on their Application to Life Contingencies and Insurance Offices* (1838); *Formal Logic, or the Calculus of Inference necessary and probable* (1847); *Arithmetical Books, from the Invention of Printing to the Present Time, being brief notices of a large number of works drawn up from actual inspection* (1847). De M. is also the author of the treatises on the Differential and Integral Calculus, published by the Society for the Diffusion of Useful Knowledge; and contributed largely to the *Penny Cyclopædia*. (He died March 1871.)

DEMOSTHENES, the greatest orator of Greece, and indeed of the ancient world, was a native of Athens. The date of his birth is doubtful. Fynes Clinton assigns it to the year 382 B.C.; Thirlwall and other good authorities, to the year 385 B.C. His father, a wealthy manufacturer, died early, leaving his fortune and children to the care of three guardians, who cruelly abused their trust. As soon as D. came of age, he resolved to prosecute at law these unfaithful stewards. He gained his case, but much of the property had been already squandered, and he only recovered enough to save him from poverty. His success in this and some other civil causes fixed his resolution to devote himself to public life; and he set himself to master the law and politics of his country with a labour and perseverance almost without a parallel. His first care was to conquer the physical disadvantages under which he laboured. His health was naturally feeble, his voice harsh and tuneless, and his action ungraceful. To strengthen his lungs, he used to climb steep hills, reciting as he went, or declaim on the shores of the sea in stormy weather. To improve his delivery, he took instructions from Satyrus the actor, and did not even disdain to study effects before a mirror. His feebleness of health he never fairly overcame, but he obviated the defects of his early training by the severest study pursued for months at a time without an interruption.

D. first began to take part in public affairs in the 106th Olympiad, when he was between 27 and 30 years of age, and from that time till his death, his history is the history of Athens. The states of Greece were at this time miserably weak and divided, and had recklessly shut their eyes to the dangerous encroachments which Philip of Macedon was even now making on their common liberties. The first period of D.'s public life (extending over ten years from 356 B.C.) was spent in warning his countrymen to abate their mutual jealousies, and unite their forces against the common enemy,

whose crafty and grasping policy he exposed so nobly in 352 B.C. in the oration known as the First Philippic. Three years later, Philip became master of Olynthus, the last outpost of Athenian power in the north, which, in a series of splendid harangues—the three Olynthiacs—D. had implored his countrymen to defend. Peace was now necessary for Athens; and D. was among the ambassadors sent to negotiate with the conqueror; but Macedonian gold had done its work, and D., as incorruptible as he was eloquent, saw with despair that Philip was allowed to seize Thermopylæ, the key of Greece, and become a member of the Amphictyonic League. The peace lasted for six years, during which Philip's incessant intrigues were exposed and denounced by D. in orations hardly less remarkable for their political wisdom than for their matchless eloquence. The most important of these were the Second, Third, and Fourth Philippics; and the speeches on the 'Misconducted Embassy,' and 'The Affairs of the Chersonese.' When war broke out in 340 B.C., D. introduced several important reforms into the army and navy, and shewed such powers of vigorous administration, that Philip was baffled for a time. The struggle was closed in 338 B.C. by the battle of Chæroneia, which laid Greece prostrate at the feet of the Macedonians. Only once after that event did D. appear on the scene of his previous triumphs. But on that occasion he delivered, in defence of his friend Ctesiphon, his oration 'For the Crown,' which the almost unanimous verdict of critics has pronounced to be the most perfect master-piece of oratory that ancient or modern times have seen. Æschines, his life-long enemy, against whom this speech was delivered, was so overwhelmed by it, that he quitted Athens, and spent the remainder of his life in exile. In 324 B.C., D. was accused of taking part in a revolt against the Macedonian domination, and thrown into prison, whence he escaped, and fled into exile. The death of Alexander the Great in the following year brought a gleam of hope and sunshine to the Athenians; and D., recalled from exile, was again at the head of affairs. Once more the power of Macedon prevailed. D. was demanded up by the conquerors. Finding escape impossible, the hunted orator sought an asylum in the temple of Neptune, in the island of Calauræa. Before his pursuers overtook him, he had died, as was generally believed, of poison administered by his own hand. His death took place in 322 B.C.

The personal character of D. is one which it is scarcely possible either to praise or to admire too much. His dauntless bravery, the stainless purity of his public and private life, his splendid and disinterested patriotism, and his services as a statesman and administrator, entitle him to a place among the highest and noblest men of antiquity. On his merits as an orator, it is hardly necessary to dwell. Suffice it to say, that the intelligent of all ages subsequent to his own have, with scarcely a dissentient voice, assigned to him the highest place. Homer is not more clearly the prince of ancient poets, than is D. the prince of ancient orators.—The best of the earlier editions of D. are those of Taylor and Reiske, both now superseded by the more recent edition of Bekker. For a detailed analysis of D.'s style, see Lord Brougham's *Dissertation on the Eloquence of the Ancients*.

DEMOTIC ALPHABET. See HIEROGLYPHICS.

DEMOTICA, a town of European Turkey, in the province of Roumelia, 22 miles south of Adrianople. It is situated on the Maritza, here navigable for small vessels, and is defended by a citadel. It contains an old palace, is the seat of a Greek bishop,

and has manufactures of silks, woollens, and pottery. Pop. 8000. Charles XII. of Sweden, who, after the battle of Pultowa, first found a refuge at Bender, afterwards removed to D., where he remained for some time.

**DEMPSTER, THOMAS**, a professor famous for his learning, and a miscellaneous and voluminous writer, was born at Muirsk, in Aberdeenshire, about the year 1579. What the rank or condition of his family was, is unknown; we know, however, that he studied at Cambridge, and that when he went to France, which he did while yet young, in order to perfect his education, he represented himself as a man of family, and as the possessor of an estate. At Paris, he obtained a professorship in the college of Beauvais, where he manifested a very quarrelsome temper, engaging, it is said, almost daily in some brawl. One of these unseemly disturbances resulted in D.'s having to retreat to England. To France, however, he again returned, bringing with him a wife, whom he had married while in England, and who was very beautiful. Crossing the Alps, he obtained a second professorship at Pisa, drawing a handsome salary for his labours. Here, however, the infidelities of his wife marred his peace; and he removed to Bologna, where he became professor of *belles lettres*, and where his wife completed her shame by eloping with 'one or more' of his students. Poor D. seems to have been fond of this wanton, for he took the trouble of attempting the capture of the fugitives. He failed; and died at Butri, near Bologna, 6th September 1625.

D. is the author of numerous treatises, among which may be mentioned the *Historia Ecclesiastica Gentis Scotorum*—a work in which his desire to magnify the merits of his country often induced him to forge the names of persons and books that never existed, and to unscrupulously claim as Scotchmen, writers whose birthplace was doubtful, or who were known to be natives of England, Wales, Ireland, and even France and Germany; but nevertheless, in spite of its defects, it is justly reckoned a valuable and erudite performance. It was reprinted for the Bannatyne Club in 1829.

**DEMULCENTS** (Lat. *demulceo*, I soften), bland and lubricating liquid substances, taken by the mouth, for the purpose of soothing irritation of the mucous membranes, and promoting the dilution of the blood, and the increase of the secretions. Demulcents are chiefly composed of Starch (q. v.), or Gum (q. v.), or of substances containing these, dissolved in water; sometimes also of oily matters, or the white of eggs, and other albuminous or gelatinous substances largely diluted. The decoction of althæa, or marsh-mallow, is a favourite form of demulcent.

**DEMURRAGE**, in the law-merchant, is an allowance made to the master or owners of a ship, by the freighter, when she is detained in port by the latter beyond the specified time of sailing, for his own convenience. A certain number of days, called running or working days, are allowed for receiving and discharging cargo, and it is usually stipulated in charter-parties that the freighter may detain the vessel, either for a specified time, or as long as he pleases, on paying so much *per diem* for overtime. All the ordinary causes of detention, such as port-regulations, the crowded state of the harbour, and the like, are at the risk of the freighter, and demurrage must be paid, though it be proved that the delay was inevitable by him (*Commentaries*, V. i. 431, Shaw's ed.). 'In short,' says Mr Bell, 'the rule is, that during the loading or unloading of the ship, the merchant runs all the risk of interruptions from necessary or accidental causes;

while the ship-owners have the risk of all interruptions from the moment the loading or unloading is completed.' But demurrage is not due where the delay arose from detention of the ship by a public enemy, or from hostile occupation of the port; and it cannot, of course, be claimed where the fault lay with the owners themselves, or the master, or crew of the vessel. The demurrage ceases as soon as the vessel is cleared for sailing, though she should be prevented from actually doing so by adverse winds. When the days of demurrage are limited by special contract, and the ship is detained beyond them, the sum due as demurrage under the contract will be taken as the measure of the loss for the further time which may be claimed in the form of damages. It will be open, however, to both parties to shew, that the rate thus fixed *per diem* is either too high or too low. Where there is no stipulation beyond the ordinary agreement that the usual time shall be allowed for loading and unloading, the master will be entitled, when this period expires, either to sail or to claim damage for detention.

**DEMURRER**, in English Law, is an exception by one party in a suit or action to the sufficiency in point of law of the case of the opposite party. Demurrers are in use in common law and in equity. At common law, each party may demur to the sufficiency of the pleading of the opposite party. The party whose pleading is demurred to may either amend or put in a *joinder* in demurrer. Before argument, the pleadings are prepared in a particular form, called the Demurrer-book. A *demurrer in equity*, like a demurrer in law, admits the facts of the case, but states objections to the form of the bill in equity (q. v.), or the sufficiency of the plaintiff's case therein disclosed, to sustain the remedy craved. It is a pleading the use of which is confined to the defendant.

*Demurrer to evidence* is also a form of procedure existing in both common law and equity practice. In the former courts, it is, however, almost obsolete; and in its place is substituted a motion for a new trial (q. v.). It may arise on a trial at bar or at *Nisi Prius* (q. v.). It admits the facts proved, but objects that they are not sufficient to sustain the issue. In equity, a demurrer to evidence is where a witness refuses to answer a question put to him by direction of the court. The objection is then taken down in writing, and is argued before the judge by whom the interrogatories were settled.

*Demurrer to a criminal indictment* is also almost obsolete. After the passing of 7 Geo. IV. c. 64, this form of demurrer, which was formerly of little moment, became of consequence to a prisoner, inasmuch as by neglecting to state in the form of a demurrer his objection to an indictment, he was precluded from afterwards insisting in them. But by 14 and 15 Vict. c. 100, it is enacted that no indictment shall for any of these defects be held insufficient; and further, that every objection for any formal defect in an indictment shall be taken before the jury is sworn, and may be amended by the judge. This last provision places demurrers in criminal cases on a similar footing to that of objections to the indictment in Scotland. There is, however, this material difference, that in Scotland the defect cannot be immediately remedied, but the prisoner, if the objection be sustained, undergoes a further detention in jail on a new indictment.

**DEMY**, a particular size of paper. In that of printing-paper, each sheet measures 22 inches by 17½; drawing-paper, 22 by 17; and writing-paper, 22 by 15½.

**DENAIN**, a town of France, in the department of Nord, on the left bank of the Scheldt, about five

miles west of Valenciennes. Its situation, in the centre of an extensive coal-field, and in the immediate vicinity of iron mines, gives it unusual facilities for smelting iron, and its works of this kind are of considerable importance. D. is a regular and well-built town, and has a good market. It has some manufactures of beet-root sugar. Pop. 8714. Here the allies under Lord Albemarle were defeated by the French under Maréchal de Villars, 24th July 1712.

**DENARIUS** (*deni*, ten each), the principal silver coin among the Romans, was equal to ten *ases*, but upon the reduction of the *as*, the denarius equalled

Denarius of the earliest kind:

Having on the obverse a personification of *Rome* as a warrior with helmet; and on the reverse, a chariot drawn by four horses.

sixteen of it. It was first coined 269 B.C. Its weight at the end of the Roman Commonwealth is estimated at 60 grains, while under the Empire the weight was 52.5 grains of silver. The value of the Commonwealth denarius was thus rather more than  $8\frac{1}{2}d.$ , and of the later period about  $7\frac{1}{2}d.$

**DENARY SCALE.** See NOTATION.

**DENBIGH**, a parliamentary and municipal borough, the county town of Denbighshire, in the north of the county, 30 miles west of Chester, and 213 miles north-west of London. It stands in the hundred of Isaled, near the middle of the vale of the Clwyd, on the sides and at the bottom of a rugged steep limestone-hill, crowned by the imposing ruins of a castle built in 1284 by Henry Lacy, Earl of Lincoln, where there had stood fortifications erected by William the Conqueror, and where there are traces of still earlier castellated remains. The newer part of D. was built at the bottom of the hill, after the destruction and desertion of a great part of the town on the top of the hill, about 1550. D. has manufactures of shoes, and leather for the English markets and export trade; but it is more a place of genteel retirement than commerce. Pop. of parish in 1861, 4054. It sends one member to parliament; Ruthin, Holt, and Wrexham being contributory boroughs. In 1645, Charles I. took refuge in the castle after the battle of Rowton Heath. The garrison surrendered to the parliamentary forces, after a siege of two months. It was shortly afterwards dismantled. The fortifications have an area of a square mile in extent. A lunatic asylum for the five counties of North Wales was erected near the town in 1848. A noble institution for the maintenance and education of 50 female inmates, of whom 25 are orphans, was built in the town, and opened in 1860, with funds in the hands of the Drapers' Company of London, from money left to them in 1540 by one Thomas Howell, a Welshman. It has an endowment of about £1500 a year. The charter of Henry de Lacy is preserved among the corporate archives.

**DENBIGHSHIRE**, a county of North Wales, on the Irish Sea, and between the Dee and the Conway. It is 41 miles long, with an average breadth of 17; contains 603 square miles, has 8 miles of coast, and is the sixth in size of the Welsh counties. The surface is partly rugged and mountainous, with some beautiful and fertile vales, as the vale of the

Clwyd, 20 miles by 7. In the north, is a horse-shoe range of hills, 65 miles long, and convex to the coast. The highest hill is Cader Fromwen, 2563 feet; and many others rise above 1500 feet. The rocks are chiefly Silurian clay and graywacke slates, with some granite and trap, and bands of Devonian, Carboniferous, and Permian strata. There occur coal, iron, slates, flags, millstones, limestone, lead, and copper. The chief rivers are the Dee, Conway, Elwy, and Clwyd. The Rhaiadr waterfall is 200 feet high in two parts. Llangollen vale is famed for romantic beauty and verdure, amid hills of savage grandeur. The climate is mild in the lower parts, but cold and bleak among the hills, where small hardy sheep and ponies are reared. Nearly a third of D. is arable, and is highly cultivated; its corn, cheese, butter, and livestock are greatly esteemed. It is also well timbered. Salmon are caught in the rivers. D. is divided into 6 hundreds, 3 poor-law unions, and 64 parishes, in the diocese of Bangor and St Asaph. The chief towns are Denbigh, Wrexham, Ruthin, Holt, Llangollen, Llanrwst, Abergele, and Ruabon. In 1861, pop. 100,862; churches, 341 (Methodists, 171; Church of England, 76). D. returns three members to parliament, two for the county, and one for Denbigh. D. was anciently occupied by the Ordovices, a powerful tribe, not entirely subdued by the Romans till the time of Agricola. Of British or pre-Roman remains there still exist tumuli, two cistvaens or stone cells, barrows, and forts. To the times of the Welsh and Saxon struggles are referable the Pillar of Eliseg, near Llangollen, and the dikes of Offa and Watt. Offa's, the king of Mercia's dike, to keep out the Welsh, was a ditch, with small forts on mounds at intervals, and ran from Herefordshire to the estuary of the Dee; Watt's dike ran on the east side of Offa's dike, and parallel to it. Wrexham Church is one of the seven wonders of Wales. Chirk Castle is a fine Norman stronghold, lately restored.

**DENDERAH** (Gr. *Tentyra*, Coptic *Tentore*, probably from *Tēi-n-Athor*, the abode of Athor), a ruined town of Upper Egypt, situated near the left bank of the Nile, in lat. 26° 13' N., long. 32° 40' E. It is celebrated on account of its temple, dating from the period of Cleopatra and the earlier Roman emperors, and one of the finest and best preserved structures of the kind in Egypt. The principal temple measures 220 feet in length by about 50 in breadth, and has a noble portico supported on 24 columns. The walls, columns, &c., are covered with figures and hieroglyphics. Prominent among the former is that of Athor or Aphrodite, to whom the temple was dedicated. On the ceiling of the portico are numerous mythological figures arranged in zodiacal fashion, and which were long regarded as a representation of the zodiac; but the absence of the crab has led some recent archaeological travellers to doubt whether the figures were intended to have any reference to astronomy. There are many other sacred buildings at D., including a temple of Isis. The whole, with the exception of one propylon, are surrounded by a sun-dried brick-wall, 1000 feet long on one side, and in some parts 35 feet high.

**DENDERMONDE** (Belg. *Termonde*), a town of Belgium, in the province of East Flanders, situated at the confluence of the Dender and the Scheldt, 18 miles east of Ghent. D., which is said to have originated in the Sth c., is fortified, and has a citadel dating from 1584, and possessing the means of laying the surrounding country under water in case of attack. Louis XIV. besieged it in vain in 1667, but Marlborough, aided by a long drought, succeeded in taking it in 1706. [In connection with

Marlborough's siege, D. is mentioned frequently in Sterne's *Tristram Shandy*.] The principal buildings of D. are the town-house and several churches, the most noteworthy of which is the church of Notre Dame, a very old edifice, containing two admired pictures by Vandyk. The manufactures are woollens, lace, cotton-yarn, &c., and there is a large weekly market for the disposal of the agricultural produce of the neighbourhood. Pop. 8700.

**DENDRERPETON**, a small lizard-like batrachian, found by Lyell and Dawson in the interior of the hollow trunk of an upright *sigillaria* in Nova Scotia. The tree was about two feet in diameter, and consisted of an external cylinder of coal, and an internal axis of mud and sand, cemented together with fragments of wood into a solid rocky mass. In this was discovered the shell of a *pupa*, the first air-breathing mollusc met with in the coal, and the bones of a small reptile probably  $2\frac{1}{2}$  feet long. It was described and figured by Owen as *D. Acadianum*. He shewed it to be nearly related to *Archegosaurus*, from the plicated structure of the teeth, the sculpturing of the broad cranial plates, and the structure and proportion of certain limb-bones. It received its name, 'tree-lizard,' from its having been found in a tree; and this was supposed to shew that it had arboreal habits: it is, however, probable that the remains had been washed in with the mud and sand which form the matrix in which they are preserved.

**DENDRITE**, the name given to a peculiar branching mineral crystallisation on the surfaces of the fissures and joints, or in the substance of rocks, having the appearance of moss, and often mistaken for fossil plants. The hydrous oxide of manganese is the mineral that generally assumes this form, occurring frequently in great abundance in limestone, steatite, trachyte, and other substances.

**DENDROLITES**, petrified stems of trees or shrubs, which occur in all parts of the world in the formations called Secondary, especially in the Coal formation. They may be regarded as the remains of a former creation. They are of very various magnitude. In some places, gigantic stems are found, and these are often observed to have branches, fruit, and even leaves—these, however, only as impressions—whilst in other places only fragments occur, which, however, belong to trees having nothing in common with those now growing in the same regions—as, for example, beautiful stems of palms at Chemnitz in Saxony, &c. Such woods are generally changed into agate, or into pitchstone, when they occur in ancient strata altered by volcanic fire. Concerning the question of their origin, opinions are still divided. Many of them are so hard and beautifully coloured, that they are cut and employed for all artistic purposes. When cut into very thin plates, they exhibit under the microscope the structure of the wood so perfectly, that it is not only possible for botanists to determine the natural order or family of plants to which it belongs, but even the genus and species. They mostly belong to the *Filices*, *Cycadeæ*, and *Coniferae*. Brongniart was amongst the first investigators of this department of science. He has had many followers, amongst whom, in our own day, Unger and Göppert have especially distinguished themselves. See Göppert, *Monographie der fossilen Koniferen* (Leyden, 1850).

**DENDROPHIS** (Gr. tree-snake), a genus of serpents of the family *Colubridæ*, remarkable for their extremely slender form, their beautiful colours, and the liveliness of their movements. Their eyes are very large and prominent. They are widely distributed over the warm parts of the world; none are

found in Europe. They live chiefly among the branches of trees, and insects are their principal food.

**DENGUE**, or **BREAK-BONE FEVER**, also called **DANDY** and **BUCKET FEVER**, is a disease known in the southern states of North America and in the West Indies, where it was first described as having appeared in the years 1827 and 1828. It was very violent in its access, but not often fatal, and consisted chiefly of a severe attack of inflammatory fever, with great heat and redness of the surface, and well-marked rheumatic pains of the limbs both in the joints and muscles. It usually terminated by a copious perspiration after a few days.

**DENHAM**, SIR JOHN, an English poet of the reign of Charles I., was the son of the Chief Baron of Exchequer in Ireland, and was born at Dublin in 1615. In 1631, he entered Trinity College, Cambridge, where, after studying three years, he took his degree. Turning his attention to literature, he wrote a tragedy, entitled *Sophy*, which in 1641 was acted with great applause at Blackfriars. Two years after, he produced the poem *Cooper's Hill*, which has done more to perpetuate his name than any other of his works. In 1647, he was engaged in the performance of secret services for Charles I.; but these being discovered, he was obliged to escape to France in 1648, returning thence to England in 1652. After the Restoration, he was appointed surveyor-general of his majesty's buildings, and created Knight of the Bath. Towards the close of his life, the latter part of which was darkened by an unfortunate marriage, he was visited by insanity; but recovering for a short time, he commemorated the death of Cowley in one of his happiest poetical performances. His own death occurred in 1668. His verse is characterised by considerable smoothness and ingenuity of rhythm, with here and there a passage of some force.

**DENINA**, CARLO GIOVANNI MARIA, an Italian author, was born 25th February 1731, at Revello, in Piedmont; studied at Turin, and in 1754 was appointed Humanity Professor at Pignerolo, but was deprived of his office on account of his having written a comedy in which there was much that excited the professional animosity of the ecclesiastical order. D. went to Milan, but was soon after recalled to Piedmont, and appointed Professor of Rhetoric in the university of Turin. In 1777, he published anonymously at Florence his *Discorso sull' Impiego delle Persone*, in which he sought to shew how monks might be transformed into useful members of society. This, of course, again cost him his chair, and he was even banished from the metropolis. In 1782, he went to Berlin, on the invitation of Frederick the Great. Here he lived for many years, and wrote a considerable number of works. In 1804, he was introduced to Napoleon at Mentz, to whom he dedicated his *Clef des Langues* (Ber. 1804), and was in consequence appointed imperial librarian at Paris, where he died 5th December 1813.—D.'s principal productions are—*Discorso sopra le Vicende della Letteratura* (2 vols., Turin, 1761), *Delle Rivoluzioni d'Italia* (3 vols., Turin, 1769—1770), an excellent work, which was copiously abused by the apologists of ecclesiastical privileges; and *Storia Politica e Letteraria della Grecia Libera* (4 vols., Turin, 1781—1782). D.'s other works were, for the most part, written in Prussia. Amongst them may be mentioned—*Essai sur la Vie et le Regne de Frédéric II.* (Berlin, 1788), *La Prusse Littéraire sous le Regne de Frédéric II.* (3 vols., Berlin, 1790—1791), *Tableau Historique, Statistique et Moral de la Haute Italie et des Alpes*

*qui Ventourent* (Turin, 1805), and *Storia dell' Italia Occidentale* (6 vols., Turin, 1809—1810).

DENIS, Sr, according to tradition, the apostle of France and first Bishop of Paris, suffered martyrdom in the 3d century. He was sent (as is said) from Rome about 250 A. D. to preach the gospel to the Gauls. After various detentions at Arles and other places, he arrived in Paris, where he made numerous proselytes. Pescennius or Sciminius Lescennius, who was then the Roman governor of this part of Gaul, ordered D. to be brought before him, along with other two Christians, Rusticus, a priest, and Eleutherus, a deacon. As they continued firm in their faith, in spite of threats, Pescennius caused them to be cruelly tortured, and afterwards beheaded, 272 A. D., or, as others say, 290 A. D. Gregory of Tours, Fortunatus, and the Latin martyrologists, state that the bodies of the three martyrs were thrown into the Seine, but taken up by a pious woman named Catulla, and interred near where they lost their lives. At a later period, a chapel was built over their tomb. In 636, King Dagobert founded on the spot an abbey, called St Denis, which soon grew to be one of the richest and most important in the whole kingdom, and was long the sepulchre of the French kings. What measure of truth there may be in the above biography, it is impossible to say. The Acts of St D., written about the end of the 7th or beginning of the 8th c., is founded merely upon vulgar traditions, and is full of absurdities. The Greek Church makes St D. to be the same person as Dionysius, the Areopagite, first Bishop of Athens. The Roman Catholic Church celebrates his memory on the 9th of October. For a long period his name was the war-cry of the French soldiers, who charged or rallied to the words *Montjoie St Denis*.

DENIS, Sr, a town of France in the department of Seine, six miles north of Paris. It is traversed by two small streams, the Croud and Rouillon, and is well built, with clean spacious streets. It is situated within the line of forts forming the out-works of the fortifications of Paris, and was itself formerly fortified, but its ramparts have been converted into promenades. St D. has manufactures of printed calicoes and other cotton goods; also several flour-mills, dye-works, bleacheries, and chemical works. Its yearly market, at which there is an annual sale of about 180,000 sheep, is one of the oldest in France, and lasts for a fortnight. Pop. 14,155. The town is supposed by some to date from the foundation of a chapel raised above the tomb of St Denis (q. v.). This chapel was replaced, some time after his death, by a church and abbey, built by Dagobert I., who was buried in the abbey church, which thereafter became the mausoleum of the kings of France. By a decree of the National Convention in 1793, the abbey was ordered to be destroyed, and in three days 51 tombs were sacrilegiously rifled and demolished, and the bodies cast indiscriminately into ditches prepared for them. The building, stripped of its lead to furnish bullets for the revolutionists, remained roofless, and was used as a cattle-market, until the time of the Empire, when Napoleon commenced its restoration, a work which was completed by succeeding governments, in a style surpassing even its former splendour. The crypt of the abbey church contains statues of the French kings and princes from Clovis to Louis XVI.

DENISON, JOHN EVELYN, Speaker of the House of Commons, and Privy Councillor, was born in 1800; eldest son of John Denison, Esq., of Ossington, Nottinghamshire. Educated at Christ Church, Oxford; married, 1827, Lady Charlotte,

third daughter of the fourth Duke of Portland; represented Newcastle-under-Lyne from July 1823 to 1826, and Hastings from 1826 to 1830; was a Lord of the Admiralty from 1827 to 1828; sat for Notts from 1831—when he was also returned for Liverpool—till December 1832. On the division of the county under the Reform Bill, he was returned for South Notts until 1837. He was then without a seat until 1841, when he was returned for Malton, but exchanged this borough for North Notts in 1857. In May 1857, on the elevation of Mr Shaw Lefevre to the peerage, D. was elected Speaker of the House of Commons without opposition, and re-elected in May 1859. In person he is tall, and his deportment is urbane and dignified. In knowledge of parliamentary practice, however, and the faculty of inspiring confidence in his decisions on points of order, he can hardly be expected to equal his distinguished predecessor.

DENIZLI, a town of Anatolia, Asiatic Turkey, situated on a low hill rising out of a spacious plain, in lat. 37° 48' N., long. 29° 3' E. D. is chiefly occupied with bazaars and market-places, the inhabitants for the most part residing in the environs. The manufacture of leather and a kind of morocco forms the staple industry of the place. The population may now amount to 8000 or 10,000; it was formerly much more numerous, but by an earthquake in 1715, no less than 12,000 people perished.

DENMARK (Dan. *Danmark*), the smallest of the three Scandinavian kingdoms, is situated between 53° 23' and 57° 44' 50" N. lat., and 8° 5' and 12° 45' E. long., excepting the small island of Bornholm in the Baltic, about 90 miles east of Seeland, which lies in 15° E. long. D. is bounded on the N. by the Skager Rack, a gulf of the North Sea; on the E. by the Cattegat, the Sound, the Baltic, and Mecklenburg Schwerin; on the S. by the Elbe; and on the W. by the North Sea, which the Danes call the 'Western Ocean.'

The following table gives the main divisions of the kingdom of D. and its principal colonies, with the chief towns, extent, and population of each:

	Chief Towns.	Area in Eng. sq. miles.	Population in 1858.
Denmark Proper (comprising the islands of Seeland, Fühnen, Lauenland, &c., and the peninsula of Jutland),	Copenhagen (capital), Odensee, Aalborg, &c.	13,600	1,500,000
The duchies of Slesvig, Holstein, and Lauenburg,	Slesvig, Altona, Kiel, &c.	7,300	960,000
The Faröe Isles, Iceland, and Greenland,	Thorshavn, Reikjavik, &c.	42,600	80,000
Santa Cruz, St Thomas, and St John, in the West Indies,		110	37,000
		63,610	2,577,000

(In 1870, the area of Denmark proper was 14,550 English square miles, and the pop. 1,784,740.)

The continental portion of D., which comprises Jutland, Slesvig, and Holstein, and is, in point of fact, the north-western extremity of the German continent, has a geographical length from north to south of about 300 miles, while its breadth from east to west varies from about 30 to 100 miles. The entire coast-line of D., from the Elbe along the North Sea, Skager Rack, Cattegat, Sound, Baltic, and Little Belt, exceeds 1100 miles; but many parts of this extended range are entirely unavailable for purposes of maritime intercourse, in consequence of the shallowness of the water, or of the numberless sand-banks, bars, and small islands which skirt the

coasts. Seeland, or *Sjælland*, the largest of the islands, and the seat of the metropolis, Copenhagen, has an area of about 2000 square miles. Its surface is in general very flat, and only a few feet above the level of the sea, and the highest of its few isolated elevations is not 500 feet above the sea. The island is generally fertile, and well wooded, more especially in the south, but in the north the soil is in many parts arid. Fühnen, the island next in extent, with an area of about 900 square miles, is divided from Seeland by the Great Belt, and from Jutland by the Little Belt. It is less wooded than Seeland, and is intersected by a range of hills of inconsiderable height. The smaller islands of Laaland, Langeland, Falster, and Moen, with an area of 1200 square miles, are grouped to the south of Fühnen and Seeland, and exhibit the same physical and geological characters. They evidently, at some earlier epoch of the world's history, formed, together with those two larger islands, one connected whole with Jutland on the west, and Sweden on the east. The north-east shores of Sjælland are separated from the latter country by a channel 70 miles in length, and only  $1\frac{1}{2}$  mile in breadth at its narrowest point, known as the Sound, or the *Øre Sund*, Ear Sound, so denominated from its resemblance to the human ear. This channel varies from 10 to 19 fathoms in depth. The western coasts of Sjælland are divided from Fühnen by the Great Belt—a channel 9 miles wide at its narrowest point, and from 5 to 25 fathoms in depth—while the western shores of Fühnen are separated from the peninsula of Slesvig and Jutland by the Little Belt, which is about four-fifths of a mile wide. The peninsula of Jutland, whose area is about 8500 square miles, was anciently, and even comparatively recently, covered with forests, but since their wasteful destruction, extensive tracts have become converted into sandy heaths, and in some parts it has been found necessary to sow bent-grass and plant shrubs, in order to prevent the mischief accruing to the cultivated lands by the clouds of dust raised by the wind. Some fine beech and oak forests still remain, and the country is pleasantly diversified with woods and pastures. The Jutlanders are either engaged in a seafaring-life or in agriculture, there being scarcely any manufactures in the peninsula. The pastures are extensive, and good breeds of horned cattle and of horses are raised, and large numbers exported to Germany, Russia, and France. The southern portion of the peninsula, comprising Slesvig, Holstein, and Lauenburg, with an area of 7200 square miles, contains large tracts of marshy land like the fens of Lincoln and Cambridgeshire, but the soil is very rich, and yields excellent crops. Along the entire western shore, from the north of Jutland to the German frontier, the surface is a continued level, and has been redeemed from the sea; it is still exposed to inundation, and hence it is found necessary to protect it by embankments and dikes from further inroads of the ocean, and to drain the fields when under water by wind-mills, as in Holland. These defensive works are under the management of a Board, appointed by government, who prescribe regulations which the local proprietors are obliged to observe. The eastern side of Slesvig and of the islands generally, is skirted by abrupt limestone cliffs known as *klinte*. Jutland is, on the whole, the least fertile part of the peninsula, and the central portions of Holstein and Slesvig the most so. Jutland is an integral portion of the monarchy. The duchy of Slesvig is an appanage of the Danish crown, but distinct from it, and held by the sovereign as the count-duke of the province. Holstein fell to the Danish kings at the same time with Slesvig, but is a fief of the German empire; and Lauenburg was made over to Denmark

in 1815, at the congress of Vienna, in lieu of a portion of Pomerania.

The coasts of D., both on the continent and in the islands, are indented with numerous bays or *fjords*, the largest of which is Liim Fjord, which intersects Jutland, and since 1825 has insulated its northern extremity by breaking through the narrow isthmus which had separated it from the North Sea. It covers an area of 250 square miles. D. abounds in small lakes, but as no inland point is more than 30 or 40 miles from the sea, and the ranges of hills low and interrupted, the country has no large rivers. The Elbe, which forms the southern boundary of the duchy of Lauenburg, receives the inconsiderable Danish streams of the Bille, Alster, Stoor, and Delvenau. The largest river of D. is the Eyder, navigable along nearly the whole of its course, of about 150 miles. D. has four large canals—the Slesvig, Holstein, and Kiel Canal, which connects the North Sea with the Baltic, comprising a portion of the Eyder and of Lake Flembude, and terminates in the Kiel Fjord; the Stecknitz Canal, in the duchy of Lauenburg, which unites the Elbe with the Baltic; the Daneskjold Canal, in the island of Seeland; and the Olensee Canal, connecting the capital of Fühnen with the sea. There are three lines of railway in D., viz. from Copenhagen to Corsoer on the Great Belt; from Altona (opposite Hamburg) to Kiel, with various branches; and from Tonningen, across the duchy of Slesvig, to Flensborg. The public roads, along which the mails are carried, are well kept, and are under the management of the royal engineers.

*Climate, Soil, Productions, &c.*—The climate of D. is modified by vicinity to the sea, and is considerably milder, and the air more humid, than in the more southern and continental Germany. The cold is seldom very intense much before Christmas, or after the middle of March. The summers are occasionally very hot; the weather generally may be characterised as very variable; rain and fogs are frequent. The cold is the greatest in the north parts of Jutland, and the least in the adjoining islands. The mean temperature in Copenhagen, whose climate may be regarded as representing an average of that of all D., is, in winter, 32.9; spring, 43.5; summer, 63.5; autumn, 49.3, Fahrenheit. The alternations from winter to summer are rapid, and scarcely broken by the intervention of spring, or the succession of autumn. The soil is productive, and it is estimated that more than half the population of D. are engaged in agricultural pursuits. The cereal crops are generally good; the average annual yield of wheat, rye, barley, buckwheat, and pease, is reckoned at eight and a half millions English quarters. About half this quantity is exported. The production of potatoes has been on the increase of late years. D. produces about one-half of the flax, and three-fourths of the hops which it consumes. In Seeland, where alone fruits and vegetables are cultivated with any special attention, the produce is remarkable rather for quantity than quality. From 20,000 to 25,000 horses are annually exported. Cattle are reared chiefly for the sake of the dairy produce, which constitutes the principal revenue of the farm; sheep are raised for the same purpose, butter being made of their milk. The streams and fjords abound in valuable fish, as cod, herrings, salmon, &c. The fisheries form an essential branch of national industry; the herring-fishery in the Great Belt alone gives an annual produce of 50,000 tons, nearly half of which is exported. Oysters are in Holstein a crown monopoly; seals are captured off Jutland, and their fat converted into oil. The Danes take an active share in the cod-fishing in the North Sea, and the whale-fishing

off Greenland. No part of the Danish territories is rich in minerals; some coal is found in the island of Bornholm, gypsum at Segeberg, and salt at Oldesloe. Amber is collected on the western shores of Jutland. Peat is got wherever there are swamps; and from the absence of productive coal-mines, and the increasing scarcity of wood, it is of great value for fuel, and every village in the vicinity of such land has a certain portion assigned for its supply. The crown owns one-fourth of the forest-land of D. Proper and Slesvig. Beech and birch are the prevalent trees, but oak, pine, and larch are also indigenous, and grow to perfection. Agriculture has been steadily improving in D. of late years, but the land is too much subdivided to admit of the expenditure of great capital; and, moreover, is seldom cultivated by the owners. The peasants were freed from serfdom in the last century; but although more educated and enlightened than the same class in most other countries, the dues and services by which they are weighed down prevent their availing themselves largely of modern scientific improvements in the cultivation of their ancestral farms. Still, the condition of the labouring classes is happy; they are more roomily and warmly lodged, and better clad, than in Great Britain, and their dwellings are always clean. The peasants manufacture almost all that they require within their own homes, the women weaving linen and woollen stuffs for the use of the household, and the men making their own furniture and simplest farm-implements, and the wooden shoes which are worn by men, women, and children. The abundance of reeds and rye-straw enables them to have sound thatch on their houses, and to supply themselves with many articles of straw-work. The population of the rural districts is four times greater than that of the towns. Almost two-thirds of the entire area of the country is arable land. The Danes have not hitherto availed themselves of the great natural advantages which the country possesses for manufactures and trade; and notwithstanding the rich clays which afford valuable materials for the manufacture of earthen-ware, and the abundant water-power in every part of the kingdom, the industrial operations are very inconsiderable. There are, however, a few good porcelain and glass works and iron foundries, chiefly in Seeland and near Copenhagen; and of late years the manufacture of ornamental paper has been brought to great excellence at Lilkeborg, near Copenhagen. Linen is the principal article of domestic manufacture in Seeland, but the supply does not suffice for the home-demand. Many of the restrictions which formerly cramped foreign commerce have of late years been removed, but the commercial legislation is still too protective to give free scope to individual enterprise. The following are the principal seaports, and the populations which they were said to contain in 1859: Copenhagen, 150,000; Altona, 32,000; Flensburg, 16,000; Kiel, 15,000; Elsinore and Aarhus, about 8000—9000; Frederickshavn, Glückstadt, Aalborg, &c., 6000—8000.

*Exports and Imports.*—The principal articles of export are grain, butter, cheese, smoked and salted meats, brandy, liqueurs, horned cattle, horses, skins, hides, tallow, bristles, fish, train and whale oils, cider-down, &c. Among the imports are wines and spirits, salt, drugs, spices, textile fabrics, timber, coal, coffee, tea, tobacco, rice, flax, hemp, &c.

The value of the exports amounted in 1859 to about 27 millions of rix-dollars, or about 3½ millions sterling, and the imports to about 5 millions. About two-thirds of the export trade is carried on in native vessels. The entrances and clearances at the various

ports were, in 1858, about 75,000 vessels, of about 2 million tons. The number of Danish mercantile vessels, including freight-steamers, was in the same year about 2500, which, with few exceptions, had been built in Denmark.

*Revenue, &c.*—The estimated revenue for the whole kingdom, including the duchies and dependencies, for the year ending March 1860, was, in round numbers, £2,900,000, and the expenses were estimated at nearly the same sum. The national debt, in 1858, was in round numbers 14 millions sterling, of which 60 per cent. are held in Denmark. The Sound dues, which yielded an important item to the revenue, have been recently abolished, in conformity with an agreement entered into by various mercantile nations to pay to D. a compensation for their abolition. See SOUND DUES.

The monetary system of D. is now placed on a secure basis. The present national bank of D. at Copenhagen, with branches at Aarhus and Flensburg, was established in 1818. It is authorised to put 20 million rix-dollars in notes in circulation, and must have half that amount in gold and silver, in the current coin of the country, bullion, sovereigns, &c., according to certain fixed proportions, and must hold 150 per cent. securities for the amount of the deposits. The coins in circulation are gold Fredericks d'or (16s. 10*l.*), silver specie-dollars (4s. 6*d.*), rix-dollar (2s. 3*d.*), marks (4*d.*), and skillings (½*d.*). The rix-dollar is divided into 6 marks, of 16 skillings each.

*Army, Navy, &c.*—The Danish army, on the peace-footing, amounts nominally to 40,000 men, of which 10,000 are actually on service, and the remainder at the disposal of the crown, when required. The militia numbers about 60,000 rank and file. Since 1807, when Britain deprived D. of the whole of her fleet and all her naval stores, the government has been making strenuous efforts to repair this severe loss, and D. is now in possession of several fine ships of the line, and a well equipped complement of smaller vessels, war-steamers, and gun-boats. The navy is recruited from certain of the maritime districts exempt from the liability of having to supply recruits for the army. The officers of both services are obliged to receive their education in the royal colleges, specially designed for them. The chief fortified ports of D. are Copenhagen, Rendsborg, Glückstadt, and Fredericia; and the principal fortress is Kronborg Castle, near Elsinore.

*Education.*—The educational institutions of D. have reached a very high degree of perfection, and few countries, if any, can compete with her in regard to the excellence of the system, and its extensive application relatively to the amount of the population. All educational institutions are managed by a royal college, or board, consisting of three assessors and a president. It has no superior but the king, to whom it reports directly; and with it rest all appointments in the university of Copenhagen, and all grammar schools in D. Proper. Education is compulsory for children between the ages of 7 and 14 years, and poor parents pay a nominal weekly sum towards the government schools. Confirmation is also compulsory, and certificates of baptism, vaccination, and confirmation are indispensable before entering the public service, the learned professions, or trades, and even before entering on marriage. The university of Copenhagen, which was founded in 1474 by Christian I., has a staff of about 40 professors, besides lecturers and tutors. The average number of students is 1100. There are 130 grammar schools in 64 provincial towns, and 2504 national schools in the rural districts, attended by about 180,000 children, and several seminaries

for normal-school teachers. The university of Kiel, and the grammar and other schools in the duchies, are under the control of the respective local authorities.

*Religion.*—The established religion of D. is Lutheran, to which the king must belong; but complete toleration is enjoyed in every part of the kingdom. The reformation was introduced in 1536, when Christian III. caused all the Romish bishops to be seized in one day, when their deposition from their sees was formally proclaimed, and the property of the church incorporated with that of the crown. D. is divided into 7 dioceses, or *stifter*, but it has 9 bishoprics (besides those in the West Indian colonies)—viz., Seeland, Laaland, Fühnen, Ribe, Aarhuns, Viborg, Alsen, Aalborg, and Skalholt in Iceland; 1907 parishes, with numerous affiliated churches, 62 rectors, and 1677 parish ministers. The nomination of the bishops is vested in the king; they have no political character; but in other respects exercise nearly the same privileges within their dioceses as their English brethren of the same rank.

*Law.*—The supreme court of justice holds its sittings at Copenhagen, and there are royal courts in the duchies, and lower courts in the towns. All civil cases are first carried before a Court of Conciliation, composed of persons from the vicinity, selected on account of their position and character. Their decisions are registered, and have legal force where both parties have engaged to abide by the judgment; otherwise, the case is carried to the higher courts. Appeals are allowed from all the lower courts to the Supreme Court.

*Constitution and Government.*—The succession to the crown was not necessarily hereditary till 1660, when the people and the clergy, impelled by hatred towards the nobles, in whose hands the supreme power of the state rested *de facto*, constituted themselves into a national assembly, which invested the sovereign (Frederick III.) for himself and his heirs with absolute power, and declared the succession to the throne hereditary. From that time, the crown exercised the *dominium absolutum*, unchecked by any constitutional restraint, till 1831, when Frederick VI., yielding to the pressure of the times, granted a constitution to his people, and established an assembly of notables for the islands and Jutland, the duchies being governed by their own constitutional forms. The nation was at first perfectly satisfied with the amount of power conceded by the king, but after a time the anomalous character of the powers vested in the assembly were more fully understood; and on the death of Christian VIII., his son and successor, the present king, Frederick VII., saw himself obliged to depart from the conservative policy of his father, and to grant the constitutional form of government which D. now enjoys, and which is based upon the most liberal principles. The people are efficiently represented, and have a voice in all public matters. The press is virtually free, and only answerable to law. The national assembly consists of the Folksting and Landsting, and is invested with very extensive powers; it meets annually for two months, but the deputies are elected triennially, and receive a fixed allowance during their sittings. Both branches of the assembly are elective, and although the Landsting bears some analogy to the English House of Lords in respect to the sphere of its powers, and its position in regard to the Lower House, or Folksting, its members do not of necessity belong to the aristocratic class. Their number is in the proportion of 1 deputy for every 14,000 of the population. The Holstein-Slesvig differences have, since their outbreak in 1848, been a source of perpetual national disturbance, and have been made the subject of

fierce debates in the assembly; indeed, the anomalous position in which D. stands to the duchies, has of late years become a question of European policy; and the failure of direct heirs of the king, or the heir-presumptive, has added to it the still more difficult problem of the settlement of the succession to the crown.

The king's person is inviolable; the ministry is responsible. There are separate ministers for Slesvig, Holstein, and Lauenburg, and the last two provinces, as fiefs of the empire, have separate courts of justice, provincial chambers, and independent forms of local administration. The nobility of the three duchies constitute a distinct body. As Duke of Holstein and Lauenburg, the king has a seat and three votes at the German Diet, where he ranks tenth in order, and is bound to furnish a contingent of 3600 men to the confederate army. The titles of nobility in D. are limited to counts and barons, which were first created by Christian V. in 1670; but the untitled nobility, consisting of the most ancient families in the kingdom, rank higher in public estimation. The several colonies are governed by governors or high bailiffs, nominated by and alone responsible to the crown. The king has a privy-council, in which there are associated with him the heir-apparent and eight members.

*Physical Constitution and Character of the Dane.*—The Dane has a strong and muscular frame, of the middle height; he is generally of a fair complexion, with light hair and blue eyes. He is of an open, unsuspecting disposition, not easily roused to action, prone to let others take advantage of him rather than exert himself to assert his own rights; vain of his native land, disposed to overrate its importance, on the ground of its earlier history; but brave, and capable of great self-sacrifice, when called upon to act in defence of his home and country. The taste and care that are bestowed by all classes, from the humblest to the highest, in tending the graves of the dead, and planting flowers round them, and the love of decoration evinced in the interiors of houses generally, testify to the existence among the Danes of the æsthetic feeling for which their ancestors were distinguished in the palmy-days of Norman supremacy. Copenhagen is the centre of the mental and political activity not only of the entire nation, but also of the neighbouring Scandinavian countries.

*History.*—The Cymri were the earliest known inhabitants of Scandinavia, and made themselves formidable to the Romans 100 years B.C. The next we hear of are the Goths, who, under their mythical leader, Odin, established their rule over the Scandinavian lands. Odin's son, Skjold, is reputed to have been the first ruler of D.; but the little that is known of the Danish history in those remote ages, seems to indicate that the country was split up into many small territories, whose inhabitants lived by piracy. The people were divided into 'Bønder,' freemen, and 'Trælle,' bondsmen. The former busied themselves with war, and 'Vikingetog,' or piracy, and the government of the land; while to the latter were left the peaceful pursuits of hunting, fishing, and tilling the soil. A similar condition prevailed in Sweden and Norway, which were divided, like D., among a number of petty rulers. See SWEDEN, NORWAY. The women among the ancient Scandinavians were regarded as the equals of the men; and their chastity, heroic fortitude under dangers, and devotion to their families, are honourably mentioned by the oldest bards. As the power of Rome declined, that of the Northmen increased. They began to make successful incursions on England in the 8th and 9th centuries. Rollo established himself with his followers in France in 912, and his countrymen, under other leaders, gradually

peopled the Farøe Isles, the Orkneys and Shetlands, Iceland, a part of Ireland, and penetrated to Spain, Italy, and Sicily. In 826, Harald Klak, king of D., returned home after a marauding expedition in Germany, accompanied by Ansgarius, the apostle of the north, by whom he was baptized. The country was now torn by civil dissensions between the adherents of the ancient and modern faith. Gorm the Old, the first authentic king of D., the bitter enemy of Christianity, died in 935, after having subjugated the several territories to his sway; and although his death gave fresh vigour to the diffusion of the new faith, paganism kept its ground for 200 years longer, and numbered among its adherents many of those half-mythical heroes whose deeds are celebrated in the Eddas and the *Kæmpeviser* of the middle ages. The success that attended the piratical incursions of the Northmen, drew them from their own homes; and while Gorm's descendants, Sven and Knud, were reigning in England, D. was left a prey to anarchy. On the extinction of Knud's dynasty in 1042, Sven Estridson ascended the throne. Internal dissensions and external wars weakened the country, and the introduction of a feudal system raised up a powerful nobility, and ground down the once free people to a condition of oppressed serfage. Valdemar I., by the help of his great minister Axel, subjugated the Wends in 1156; conquered Rügen and Pomerania, and compelled them to adopt Christianity; and seized upon Holstein, Lauenburg, great part of Prussia, and Esthonia. His two sons, Knud VI. and Valdemar II., extended these conquests further along the Baltic; but all these acquisitions were speedily lost through the treachery of the agnate princes and the nobles. Under Valdemar III., the last of the Estridsons, the national laws were collected into one comprehensive code. He recovered Slesvig and Scania; and on his death, in 1376, his daughter Margaret secured the triple crown of Scandinavia, in the name first of her son Olaf, and subsequently of her grandson Eric. The union of Calmar was, however, rather the idea of the individual queen than of the three kingdoms, and at her death (1412), each kingdom proceeded to choose a ruler for itself. See NORWAY, SWEDEN. Eric was compelled to flee, and Christopher of Bavaria was elected king of Denmark. At his death, in 1448, the choice of the nobles and clergy—for the people had no voice in the matter—fell on Christian I., Duke of Oldenburg, descended from Skjold's race on the mother's side. On the death of his maternal uncle, he was elected Duke of Slesvig and Holstein, but he was so fettered by the coronation-oath, which the council of state had exacted from him, that he exercised little or no power. From his grandson, Christian II. (who sided with the people against the nobles), the crowns of D. and Norway passed to Frederick I., Duke of Slesvig and Holstein (1523), while Sweden elected a king of her own. Christian III., in whose reign the reformation was established, united the duchies in perpetuity to the crown in 1533. His partition of the greater part of these provinces among his brothers became a source of much mischief to D., which did not end till 1773, when the alienated territory was recovered by the cession of Oldenburg and Delmenhorst to the Grand Duke of Russia, the representative of the Holstein-Gottorp family. Frederick II., who increased the embarrassments connected with the crown-appanages, by making additional partitions in favour of his brother (the founder of the Holstein-Sonderburg family), was succeeded by Christian IV., 1588, who was the ablest of all the Danish rulers. His liberal and wise policy was, however, cramped in every direction by the

arrogant nobles, to whose treasonable supineness D. owes the reverses by which she lost all the possessions she had hitherto retained in Sweden. The national disgraces and abasement which followed, led, in 1660, to the rising of the people against the nobles, and their surrender into the hands of the king of the supreme power—an act known as the *Arve-Enevold's-Regjering's Akt*. In 1665, the *Konge Lov*, or law of settling the succession to the united crowns of D. and Norway, was drawn up, which has continued in force to our own times. For the next hundred years, the peasantry were kept in serfage, and the middle classes depressed; while the power of the crown rested in the hands of a Germanised nobility, who despised the language and usages of their country, and exerted the most baneful influence on the true national life. Many improvements were, however, effected in the mode of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The abolition of serfage was begun by Christian VII. in 1767, but not finally completed till twenty years later; it was extended to the duchies in 1804. Struensee, the minister of Christian VII., originated many other reforms in regard to freedom of the press, the abolition of monopolies, and of numerous abuses in the machinery of the state; and although these were checked for a time on his downfall, they were ultimately established under Christian's son, Frederick VI. The miseries of this reign, due to the relations maintained by D. with Napoleon, brought the country to the verge of ruin. At war with Sweden, England, Russia, and Prussia, and with the finances in a depressed condition, the kingdom was threatened with bankruptcy; and although it had speedily rallied from the injuries and losses inflicted by the battle of Copenhagen, under Nelson, in 1801, the fresh rupture with the allies, which ended in the compulsory surrender to the English of the entire fleet, after the destructive bombardment of Copenhagen, September 1807, completely paralysed the nation. By the congress of Vienna, D. was compelled to cede Norway to Sweden, in consequence of a previously existing stipulation on the part of Russia to secure this important section of the Scandinavian territory to the Swedes, in return for the part taken by the Swedish government against Napoleon. The discontent that had long been brooding in the duchies, degenerated after the stirring year of 1830 into mutual animosity between the Danish and German population, which was not allayed by the schemes devised by the court to meet the difficulties of the case. The anticipated failure of heirs to the throne complicated the questions at issue; and the Holstein party, being encouraged by the diet at Frankfort, and perhaps still more by Prussia, came to an open rupture with D. in 1848, hastened, no doubt, by the reaction produced all over the continent by the French revolution, and thus, on the accession of the present king, Frederick VII., half his subjects were in open rebellion against him. After alternate hostilities and armistices, the Slesvig-Holstein war was virtually concluded in 1849, by the victory of the Danes over the Slesvig-Holsteiners at Idsted, followed by the conclusion of peace between D. and Prussia. The liberal constitution granted by the king has fully satisfied his subjects in D. Proper, but disaffection still smoulders in the duchies, where the question of the order of succession is the principal obstacle to an adjustment of the differences. The subject has of late years been repeatedly submitted to the consideration of foreign powers, but the result of the many negotiations to which it has given rise, is as yet (June 1861) obscure and indefinite. A further consideration of the principles which regulate the succession

in the duchies, must be deferred to the articles HOLLSTEIN and SLESVIG. (See GERMANY in SUPP.)

DENNEWITZ, a small village in the province of Brandenburg, Prussia, 42 miles south-south-west of Berlin. Here was fought, on the 6th of September 1813, a battle between 70,000 French, Saxons, and Poles, commanded by Marshal Ney, and 45,000 Prussians, under General Taucenzien. The fighting was obstinate to the last degree. Both armies more than once drove each other from their positions, but the patriotic enthusiasm of the Prussians finally prevailed, and Ney gave the order to retreat. At this moment Bernadotte, crown-prince of Sweden, appeared at the head of 70 battalions of Russians and Swedes, supported by 10,000 horse, and preceded by 150 pieces of cannon. These fresh troops turned the retreat into a complete rout, until the whole of the French army presented nothing but a vast mass of fugitives. The French lost 15,000 killed, wounded, and prisoners (the Germans say 20,000), and 43 pieces of cannon. The loss of the allies was 6000 killed and wounded, of whom 5000 were Prussians. The most important feature of this victory to the Prussians was that most of their troops were *landwehr* (militia), for whom Napoleon had expressed the utmost contempt, designating them a 'rabble.'

DENNIS, JOHN, the son of a London saddler, was born in London in 1657. He was put to school at Harrow; and afterwards, in 1675, he went to Caius College, Cambridge. Four years afterwards, he removed to Trinity Hall in the same university, and in 1683, took there his degree of M.A. After leaving Cambridge, he travelled on the continent, passing through France and Italy. Returning home, and in the possession of a small fortune, he joined the Whigs, and brought a sufficiently rancorous pen to the assistance of his party. He formed the acquaintance of Dryden and Wycherley, and other distinguished wits of the time, and instigated by companionship, as well as by native bent, he made various attempts as a theatrical writer. D. was expensive in his habits; and having dissipated his fortune, he had to depend for subsistence during the remainder of his life on private patronage and his pen. For several years, he enjoyed a small annuity procured for him by Lord Halifax, but that he outlived. He became blind before he died; and in his distress, some of those he had flattered, and some of those he had abused, got up a play for his benefit. He died in 1734. D. had an ungovernable temper, and made many enemies; and his name, which his own writings could not preserve, will live for ever in their contempt and hate. He is one of the best abused men in English literature. Swift lampooned him, Pope assailed him in the *Essay on Criticism*, and finally 'damned him to everlasting fame' in the *Dunciad*.

DENON, DOMINIQUE VIVANT, BARON, was born at Châlons-sur-Saône, January 4, 1747. At an early period, he went to Paris, to study law, but quickly betook himself to the fine arts, and acquired a high reputation as an amateur and art critic. During a residence in Southern Italy, he spent much of his time in studying etching and mezzotint engraving, and along with the Abbé St Non, wrote a, *Voyage Pittoresque de Naples et de Sicile* (Par. 1788). Afterwards, he lived at Venice, and other Italian cities, but returned to France during the Revolution. Having, at the house of Madame Beauharnais, formed the acquaintance of Bonaparte, he was chosen by him to accompany the expedition to Egypt in the capacity of a *savant*. He was indefatigable in drawing the relics of ancient Egyptian art. In 1802, he published his *Voyage dans la*

*Basse et la Haute Egypte*, the engravings attached to which admirable work are very correct, and prove D. to have been a skilful artist. As a member of the Egyptian Institute, he had also the most important part in the *Description de l'Egypte* drawn up by that learned body. Bonaparte now made him Inspector-general of Museums, in which capacity he exhibited great ability. He accompanied Bonaparte in various subsequent expeditions, and suggested to him what art-treasures of the conquered cities would be most suitable for the Louvre. After 1815, he was dismissed from his office. The remaining years of his life were occupied in preparing for publication a History of Art, to be illustrated by the best artists, but he did not live to finish it, having died 27th April 1825. D.'s work was completed by Amaury Duval, and published in 1829, under the title *Monuments des Arts du Dessin chez les Peuples tant Anciens que Modernes*. D. himself executed as many as 300 etchings, chiefly imitations of the style of Rembrandt.

DÉNOUEMENT (Fr. from *dénouer*, to untie, which again is from *nœud*, a knot.) In Fiction, this term is generally applied to the termination or catastrophe of a play or romance; but, more strictly speaking, it designates the train of circumstances solving the plot, and hastening the catastrophe. A good dénouement in a novel or play should be natural, as a result of the preceding plot, and yet should not be so obvious as to be easily anticipated. Forced and arbitrary solutions of plot, offending against nature and common sense, are frequently perpetrated for theatrical effect (*coups de théâtre*).

DENS, PETER, a well-known Roman Catholic theologian, was born in 1690, at Boom, a small Belgian town, situated on the river Rnpel, about 10 miles south of Antwerp. Apparently, nothing is known—at least by Protestant writers—regarding the incidents of his life, as his name appears in no encyclopædia or biographical work that we are acquainted with. The scanty information we possess is derived from the epitaph inscribed on his tomb in the chapel of the archiepiscopal college of Malines by the present (1857) rector. From this epitaph it appears that he was reader in theology at Malines (something equivalent to our professor of divinity) for twelve years, *plebanus* or parish priest of St Rumold's or Rumbold's Church in the same city, and president of the College of Malines for 40 years. He also held various honorary church offices. He was canon and penitentiary, synodical examiner and scholastic archpriest of St Rumold's—the metropolitan church of Belgium. He died 15th February 1775, in the 85th year of his age. The work which has rendered D.'s name familiar, even to the Protestant public, is his *Theologia Moralis et Dogmatica*. It is a systematic exposition and defence—in the form of a catechism—of every point of ethics and doctrine maintained by Roman Catholics, and is extensively, if not generally, adopted as the text-book of theology in their colleges. It appears to owe its popularity more to its being a handy and usable compilation than to any great talent exhibited by its author. The casuistical parts of the work have been severely criticised by Protestant moralists. The edition we have consulted is the Dublin one of 1832.

DENSITY. When of two bodies of equal bulk or volume, the one contains more matter than the other, it is said to have greater density than that other. The quantity of matter is measured by the weight, and thus density and specific gravity come to be proportional to one another. Platina, which is about 21 times the weight of water, long passed for the densest body; but Breithaup of Freiburg, in

1833, made out *iridium* to be twice as dense. Rare is opposed to dense, and the rarest body known is *hydrogen*, which is about  $14\frac{1}{2}$  times rarer than atmospheric air. The density of bodies is diminished by heat, and increased by cold. See HEAT, MATTER.

DENTA, or GYENTA, a market-town of Hungary, situated on the Berzava, about 30 miles south of Temesvar. It has several large annual fairs. Pop. 5100.

DENTAL SYSTEM. See TEETH.

DENTALIUM (Lat. *dens*, a tooth), a genus of marine gasteropodous molluscs, of the order *Tubuli-branchiata*, having two symmetrical *branchiæ* (gills),

Dentalium :

B, the shell of *Dentalium Entalis*, broken longitudinally, shewing the animal advancing out; a and b, the foot, the lobes of which are developed in the form of a corolla; c, a part of the collar of the mantle. E, the animal, magnified, extricated from the shell, with the mantle slit along the dorsal and medial line, detached in part from its posterior insertion, and turned aside so as to shew the parts enclosed; a, the extremity of the foot, which closes the aperture *j*, of the collar *bu*, of the mantle *nop*; *bb*, lobes of the foot; *c*, the foot itself, presenting a depression or a channel, running its whole length; *d*, the head; *e*, the cerebral ganglion; *f, f*, the two sides of the mouth; *g, g*, the membranes which support the branchiæ; *hh, ii*, the branchiæ; *pp, qq*, the retractor muscles; *s*, the muscle of insertion; *t*, the expanded posterior extremity, in which is situated the vent.

which are enclosed, along with all the other soft parts of the body, in an elongated shelly tube. The tube is conical, somewhat curved, and has a considerable resemblance to an elephant's tusk in miniature. Until recently, from a mistake originating in the similarity of its branchiæ to those of some of the *Annelides*, the D. was ranked in that order. Fossil species abound in the Tertiary formations.

D'ENTEX, a genus of acanthopterous fishes of the family or *Sparidae* (Sea-breams, &c.), having a deep compressed body, and generally perch-like form;

Dentex.

a single dorsal fin, the anterior rays of which are spinous; scaly cheeks; and many small conical teeth, among which are in each jaw at least four large

canine teeth, elongated, and curved inwards. One species (*D. vulgaris*), the *Dentex* of the ancient Romans, abounds in the Mediterranean, and has occasionally been taken on the southern shores of Britain. It is sometimes called the Four-toothed Sparus. It attains a large size, sometimes three feet in length, and 20 to 30 pounds weight. It is an excessively voracious fish, as its large canine teeth might be held to indicate, devouring other fishes; but is itself in much request as an article of human food, and great numbers are taken in the mouths of rivers in Dalmatia and the Levant. It is there also a considerable article of commerce, being cut in pieces, and packed in barrels with vinegar and spices, in which state it will keep good for twelve months. It was preserved in the very same way by the ancients.

DENTIFRICES are substances, generally powders, which are employed as aids in cleaning the teeth. Charcoal and cuttle-fish bone-powder are useful as detergents; chalk, as a soft powder; and pumice, as a hard gritty substance for occasional use, when the teeth are more than ordinarily coloured. Catechu, emichona, and rhatany are employed to give astringency to the tooth-powder; myrrh, to impart odour; and bole armeniac, to communicate a red colour. Common salt, cream of tartar, phosphate of soda, and sulphate of potash, are occasionally used; and where the breath has an unpleasant odour, the addition of 4 parts of bleaching-powder (chloride of lime) to the 100 of the tooth-powder, removes the fetid character of the breath, and also tends to whiten the teeth.

DENTILS (Lat. *dens*, a tooth), in the Ionic, Corinthian, and Composite orders of architecture, are ornaments resembling teeth. See ENTABLATURE.

DENTINE is the thin layer of cement or enamel which more or less coats the teeth of the mammalia, and from the compactness of its structure and fine texture, it is generally called the ivory of the tooth. It is very hard and durable, and consists mainly of phosphate of lime accompanied by gelatine.

DENTIROSTRES, a tribe or sub-order of birds, of the order *Insectores*, characterised by a bill with a

Examples of Notched Bills :

The notches or serratures are evidently adapted to the better securing of the prey; and this conformation appears not only in the *Dentirostres*, but in birds of other groups and orders. Examples may be seen in the double-toothed Falcons, as in the genus *Harpagus*, *a*; in the *Nogons*, *b*; in the sub-genus *Andropadis*, *c*; and in the *Chizerbis Variegata*, *d*, where the teeth are small, sharp, regular, and of equal size. The *Lanius* of Vieillot, *e*, has a central or raptorial tooth to its bill.

marginal notch towards the extremity of the upper mandible. It is composed chiefly of insectivorous birds, although the *Shrikes* (*Laniado*), which belong

to it, prey also on small birds, quadrupeds, and reptiles. Among the other families of D. are *Merulide* (Thrushes, &c.), *Sylviade* (Warblers, &c.), *Ampelide* (Chatterers), and *Muscicapide* (Fly-catchers, &c.).

**DENTISTRY**, the art of the dentist, or that of treating disease in the teeth (*Dental Surgery*), and of replacing these organs when lost (*Mechanical Dentistry*).

1. *Dental Surgery*.—The disorders to which the teeth are liable are those arising from defective development, such as imperfections in form or structure, irregularity of position, &c.; those, again, constituting diseases more properly so called, such as caries or dental decay, necrosis or death of a tooth, inflammation or neuralgia of the soft tissues connected with them, such as the gum, the central pulp or nerve, &c.; lastly, those arising from accidents of various kinds, such as blows, falls, and the like.

The treatment of all these different affections is generally of a local kind; or, in other words, confined to the spot in which the disease manifests itself. But dental diseases themselves are not always of a purely local nature; and it may be generally stated that wherever a tooth becomes diseased without any well marked or ostensible cause, such a tooth has been originally defective or weak. It has been, in fact, imperfectly developed, and this imperfection is due to constitutional causes, or such as affect the general health of the individual. In this way, a very slight cause is sufficient to excite disease in, and lead to the destruction of, such a tooth. Disease impairs what little vitality it already possesses; it becomes less and less able to resist the action even of such influences as it is naturally exposed to in the mouth—chemical decomposition is set up, and the substance of the tooth is broken down, and decays—literally, rots away.

The object of the dentist, in these circumstances, is twofold: he either attempts to arrest the decay, and repair its ravages; or he removes the diseased tooth altogether. These operations, along with supplying artificial teeth when the natural ones are lost, constitute the main offices of dentistry.

Premising that all operations in dentistry require to be modified according to different cases, we shall shortly describe the various manipulations required in their performance.

*Scaling*.—This is a little operation, by which the accumulation of a substance termed 'tartar' is removed from the teeth. Tartar is a deposit from the saliva, and lodges in greatest quantity most commonly behind the lower front-teeth. When allowed to accumulate to any extent, it causes absorption of the gums, whereby the necks of the teeth are exposed, and they become loosened, and fall out. Its removal is effected by little hoe-shaped steel instruments, bent in a manner to reach more easily those situations in which the tartar is found. Their mode of use is by inserting the point of any one of them under the free edge of the mass of tartar, at the gum, and lifting it away from the backs of the teeth to which it is adherent. The teeth are then freed from any particles still sticking about them, and their surface smoothed by being rubbed with pumice-powder or chalk.

*Regulating*.—The teeth of the second, or permanent or adult set, are very liable to be crowded and misplaced, one overlapping the other, or those of the upper-jaw falling behind those of the lower when the mouth is closed, thus producing the prominent condition of the under-jaw denominated 'under-hung.' To remedy these defects, a variety of means have been adopted by dentists; the principle upon which all of them act, however, being that of pressing the displaced tooth or teeth into the natural position. This, of course, requires that

room or space should exist for them to be thus adjusted; and where this is not the case, the usual procedure is to remove one or more of the back-teeth, or those which it is less desirable to preserve. On matters being thus prepared, a plate or frame is fitted to the gums and remaining teeth, and fixed there in the same manner as an artificial set of teeth, and as shall be described in speaking of them. Two modes are then at the dentist's disposal for bringing the faulty teeth into position—viz., either that of *dragging* them into their place by means of elastic ligatures passed round them in a suitable manner, and attached to the plate as a fixed point; or, again, that of *pressing* them into position by means of small wedges of dry wood inserted between the adjacent part of the plate and the teeth to be moved; so that on the moisture of the mouth causing the wood to swell, it acts in this way with great force. Some considerable time is necessary to complete the regulation of misplaced teeth; and even after they have assumed their proper position, they require to be carefully maintained there, otherwise a tendency to resume their former irregularity soon manifests itself.

*Stopping or Filling*.—This is one of the most important and delicate operations the dentist has to perform. The first step to be taken in filling or 'stuffing' a tooth, as it is sometimes called, is to clear away all decayed and decaying substance. For this purpose, a number of slender digging and excavating steel instruments, termed 'excavators,' are required. With these, the hollow in the tooth is scooped out and thoroughly cleaned. If pain be occasioned by this process, the operation of destroying the nerve had better at once be resorted to. This is performed in several ways. Where the tooth is single-fanged, as in front-teeth, the nerve may be bored out by passing a slender broach, or square and pointed steel wire, up into the central cavity of the tooth, with a slight rotatory motion. Where this cannot be done, however, the best plan is to destroy the nerve by some caustic application, such as chloride of zinc. The method of doing this is to clean the tooth thoroughly out, and then to apply a little bit of the caustic—about the size of a barley-pickle or a grain of rice—pressing it well into the decayed hollow, and then filling it over with soft bees-wax. This should be allowed to remain there for six, eight, or twelve hours; it may at the end of that time be taken out, and the stopping proceeded with.

The cavity being cleaned out until its walls are of sound and hard tooth-bone, it is to be well dried, and the plug of stopping-material inserted. Various substances are employed for this purpose, and the mode of using each is somewhat different. For temporary stoppings, pure gutta-percha is a serviceable material. A quantity sufficient to fill the cavity, and somewhat more, is to be gently warmed over a spirit-lamp—not in hot water—and when quite plastic, is to be firmly pressed with a blunt-pointed stopping-instrument or 'plugger,' into all the interstices of the hollow in the tooth—more and more being pressed in, until the surface of the plug so formed is on a level with the surface of the tooth, when all the superfluous portion should be removed, and the solid plug smoothly finished.

Another variety of stopping-material consists of amalgams of different kinds. Many absurd statements have been made regarding the evil effects of amalgam stoppings, but the only real disadvantage attending their use is, that many of them get black in the mouth, and discolour the tooth, while those that do not get black are friable, and crumble away in a short space of time. They are to be readily obtained, made up, and under various names. None

of them seem very much superior to the common one of silver, tin, and mercury. The amalgam, then, whatever one it may be, is to be reduced to a firm, plastic consistence, and carefully introduced into the dried cavity in the same way as described regarding the gutta-percha, and is to be finished off in precisely a similar manner.

Gold-stopping is an operation of a much more complicated and difficult description. The materials used here are either gold-foil—that is, thick gold-leaf—or the peculiar substance, or rather the peculiar form in which gold exists, known as sponge-gold. In stopping a tooth with gold, even more care is necessary in preparing the cavity than what has been already inculcated. Its *shape* must now also be taken into account, and the nearer it approaches to a cylindrical form the better. The gold-foil, when it is employed, should be cut into strips, their breadth varying according to circumstances. Various modes of packing the gold are adopted, the chief object being that the foil shall lie in the cavity in such a way that its edges, and not its flat surfaces, shall be presented at the surface of the plug; otherwise the plug will be liable to injury by layers of it peeling off. In stopping with sponge-gold, the preparatory steps are the same as for foil-stopping; it is, however, necessary to be more careful that no moisture be allowed to interfere with the operations.

The surface of a gold plug, formed in either of these ways, should be well consolidated by hard pressure with a blunt plugger, and the superfluous portion being removed, it ought to be burnished until it assumes a brilliant metallic lustre.

*Extraction.*—This is the principal surgical operation falling to the dentist. It is most commonly demanded in consequence of what is termed tooth-ache—a disorder which, however, is not always one and the same in its nature. This want of uniformity in the nature of those diseased states to which teeth are subject, and which are comprehensively denominated toothache, leads to the conflicting results obtained from those applications recommended for its cure. These remedies are numerous, and of various characters. To explain their mode of action, and the particular symptoms indicating the selection of each one in preference to another, would here be out of place. Their intention, in general, is either to destroy the nervous fibres existing in a tooth, or to narcotise and render them insensible. Among those acting in the former manner, are such as creasote, chloride of zinc, nitrate of silver, alum, tannin, &c.; among those acting in the latter mode are chloroform, laudanum, ether, spirit of camphor, &c. Perhaps, as a general rule, it may be stated, that before proceeding to extraction of a tooth on account of pain, some of these milder measures should be tried, in order, if possible, to avert the necessity for such an operation. There is no necessity for describing the method of their application, further than to remark, that in all cases the decayed cavity should previously be well cleaned out, otherwise the remedy employed may be altogether prevented from reaching the spot where it is intended to act.

Where extraction comes to be demanded, it is performed by means of instruments adapted to the special peculiarities of the tooth requiring removal, or to the circumstances in which it exists. Thus the instruments employed in ordinary cases are termed forceps, and these are adapted in their construction to that particular tooth for which each instrument is intended, different teeth requiring different patterns; again, those instruments used for the same purpose, and termed tooth-keys, likewise require adaptation to individual cases; lastly,

those instruments employed for digging out the fangs remaining after total decay of the crown, and termed elevators or punches, are made of such forms as may suit various conditions in which these roots or fangs are found.

The great matter is, that each tooth should be extracted in accordance with its anatomical configuration; and to accomplish this, of course, requires an intimate knowledge of the natural form proper to each of these organs individually; without this, it is impossible to extract any tooth upon a correct principle. The tooth is grasped, as far as the instrument can be made to do so, by that portion of the root or fang which just emerges from, or perhaps which is just within, the socket; it is then loosened, not exactly by pulling, but rather by moving it in a lateral or in a rotatory manner, in strict accordance with the respective character of fang possessed; and finally, on its being thus detached from its connection with the jaw, it is, with very little force, easily lifted from its socket.

Anesthetics are employed in the extraction of teeth in the same manner as for other surgical operations, where it is desirable to abolish pain. Ether and chloroform are the only agents of this nature which have as yet been found generally fit for practical application in cases of the kind. Other modes of inducing insensibility, local or general, have been proposed from time to time, but one after another has been abandoned as unserviceable. All over the world quack nostrums are found for rendering this operation painless; these, however, do not demand consideration here, as had any one of them afforded the least chance of success, it would long ago have been gladly welcomed and generally adopted by dentists.

*2. Mechanical Dentistry.*—The manufacture of artificial teeth, and other matters comprehended in mechanical dentistry, involve many subjects of which no adequate or satisfactory idea can be conveyed by mere description. Nothing beyond a mere outline of the materials employed, and the leading processes involved in this branch of art, can be given without practical illustration. The various conditions of the mouth requiring the adaptation of artificial teeth, range from cases where only one tooth may be wanting, to those where not a single tooth remains in the jaw, above or below. Accordingly, artificial teeth are spoken of as partial or complete sets—a partial set being one for either upper or lower jaw, where some of the natural teeth still remain; a complete set being one for either jaw, where none are left, or for both jaws, when both are in such circumstances.

The simplest form of partial sets is what is termed a pivoted tooth. This is an artificial tooth fixed in the mouth upon the fang or root of one whose crown has been lost by decay or otherwise. The mode of procedure is as follows: An artificial tooth, as near as possible to the colour and form of that to be replaced, is selected. This artificial tooth may be either the crown of a natural human tooth corresponding to that lost, or one made in imitation of this, in a species of pottery-ware, and by a process much too long for detail in this place. Such *mineral teeth*, as these last are termed, are manufactured on an extensive scale, and sold ready for use to dentists. A tooth of either kind then being selected, is accurately fitted to the root remaining in the mouth, and, by means of a gold pin, adjusted to, and inserted into the open central canal existing in the root—the other extremity of this gold pin being attached to the substitute tooth—the whole is fixed in its natural position, in a manner that renders detection almost impossible.

Where more than one tooth is required, and

occasionally even where only one is necessary, a somewhat different contrivance is had recourse to. What is called a 'plate' requires to be fitted to the gum and remaining teeth in so precise and perfect a manner as to lie quite firmly and steadily in its place, and to which the artificial teeth required are subsequently fixed.

This 'plate' is frequently made of gold, silver, or platinum plate, of the thickness of card-board, in which case, the name of 'plate' is used in its literal signification. But such plates may be made of other substances besides those of gold, silver, &c., such as the ivory of the walrus, or the hippopotamus's tusk, or what is more common now, of vulcanised Caoutchouc (q. v.) or Vulcanite. The first step in any of these processes is to obtain an exact model of the gum and other parts upon which the plate is to rest. This is obtained by introducing bees-wax, or gutta-percha, softened by previous heating, into the patient's mouth, and pressing it forcibly upon those parts of which an impression is desired. On removing the wax or other substance from the mouth, Paris plaster is poured into the mould thus procured, and on its hardening, or 'setting,' this plaster-cast presents an exact counterpart of the gum. It is upon this plaster-model that all the subsequent operations are performed in fitting the artificial set. The following is a very brief sketch of the principal steps in working each of the three classes of material alluded to as being used for these purposes.

*Walrus or Hippopotamus Tusk Sets.*—In commencing a set of this kind, and, indeed, of any kind, the surface of the plaster-model requires to be hardened, in order to render it less friable and subject to abrasion during its use. This is generally done either by varnishing it, or boiling it in linseed oil, melted wax, stearine, or the like. This being done, a block of suitable size is cut from the tusk to be employed, and by means of different-shaped cutting tools termed scalpels, it is carved until it fits the model accurately. The way in which its fitting is secured consists in painting the model on that part representing the gum, &c., with any common dark colour which will remain wet; the block is then applied to the painted surface, and wherever a mark is left by the colour, it is cut away by a scalpel, and the same process repeated, until, by constantly doing so, the concavity thus produced in the block corresponds exactly to the convexity of the model representing the patient's gum. The block is then trimmed and adjusted, according to taste and circumstances; and is finished either by carving upon its substance the appearance of the teeth required, or by fitting and fixing into it mineral teeth of the kind already described.

*Metallic-plate Sets.*—Where the framework lying upon the gum is to be of gold or silver plate, or the like, it is necessary to procure, besides the plaster-model, a metal one. This metal-model is generally cast in zinc, gun-metal, or some such material; and a counter-model of a softer metal, generally lead, is taken from this again, so that a complete pair of dies is in this way procured. The gold or other plate, cut of a convenient size, is then stamped between the two metallic dies, and so made to assume the precise form desired. It is then trimmed, and any more delicate adjustments made upon it, such as soldering clasps round those parts where it is to embrace any teeth remaining in the mouth, and finally completed by having the individual artificial teeth added to it, and adapted to the comfort and convenience of the wearer. The mode of fastening the teeth to the plate is in one of two ways. One kind of teeth have a tube extending along their whole length, and these are fastened by means of a

pin fixed to the plate, upon which the tooth is secured by this pin passing up the tube alluded to. The other kind are provided with short platinum pins, fixed in the material of the tooth during its manufacture, to which pins a piece of gold or other plate is soldered, and this, again, to the framework of the set itself, wherever they are required.

*Vulcanite Sets.*—The first step in the manufacture of a vulcanite set of teeth is to make a pattern set in wax, with the mineral teeth constructed for the purpose, and which are to be used in the piece when it is finished, fixed in the wax; the whole constituting, in short, an exact fac-simile of what the completed set is intended to be. This pattern set is, of course, made upon and fitted to the plaster-model as usual, and is adjusted to the wearer's mouth precisely as if it were the set to be worn there. When everything is thus prepared, a duplicate of the wax-set is made in vulcanite—the vulcanite replacing the wax, and the mineral teeth being retained as they were. The process by which the vulcanite is made to take the place of the wax, is too complex for description here.

The foregoing description comprehends most of the operations connected with surgical and mechanical dentistry. For a more detailed account of them, as well as the discussion of many minor points connected with the subject, we must refer to the numerous and beautifully illustrated works specially devoted to such matters, lately published both in this country and America; of these, Tomes' *Dental Surgery*, published by Churchill, London, Taft's *Operative Dentistry*, and Richardson's *Mechanical Dentistry*, both published in America, deserve to be specially mentioned as among the latest and best works on the subject.

**DENTITION, PERIOD OF** (Lat. *dentitio*, the process of teething, from *dens*, a tooth). In man and most mammals, there are two distinct sets of teeth: one set which appears shortly after birth, and which are termed the *milk* or *deciduous* teeth; and a second set, which, after a few years, replaces these, and which are termed *permanent* teeth.

In the human subject, the milk-teeth are twenty in number, each jaw containing (from before backwards) four incisors, two canines, and four molars; while the permanent teeth are thirty-two in number, each jaw containing four incisors, two canines, four premolars or bicuspids, and six molars. Anatomists are in the habit of briefly expressing the number of the different kinds of teeth in any mammal by what they term a *dental formula*. The permanent teeth in man are represented by the formula,  $i \frac{2-2}{2-2}, c \frac{1-1}{1-1}, p \frac{2-2}{2-2}, m \frac{3-3}{3-3} = 32$ , where the letters *i*, *c*, *p*, *m*, stand for incisors, canines, premolars, and molars, and where the two terms in each numerator and in each denominator represent the number of each particular kind of tooth in each half of the upper and lower jaw respectively. As these formulæ are of common use in most works on zoology and comparative anatomy, we add another example—that of the permanent teeth of the hog, whose formula is,  $i \frac{3-3}{3-3}, c \frac{1-1}{1-1}, p \frac{4-4}{4-4}, m \frac{3-3}{3-3} = 44$ ; which signifies that there are on each side of both upper and lower jaws three incisors, one canine, four premolars, and three molars, making in all 44 teeth.

For a general description of the form and uses of these different kinds of teeth, we refer the reader to the article DIGESTION, ORGANS AND PROCESS OF, where their special uses are noticed in reference to the digestive function; while the history of their structure, &c., is given in the article TEETH.

The following is the usual order and period of appearance of the milk-teeth: The four central incisors usually appear through the gums about the 7th month after birth, those of the lower jaw shewing themselves first. The lateral incisors next appear between the 7th and 10th months; the anterior molars shew themselves about the 13th month, and are soon followed by the canines, which usually appear between the 14th and 21st months. The posterior molars are the last and most uncertain in their time of protrusion, which may range from the 18th month to the end of the 3d year. Except in the case of the incisors, there is no definite law as to whether the upper or lower teeth first appear.

About the middle or end of the 7th year, the jaw-bones have become sufficiently elongated to permit the appearance of the first true molar; and about the same time, the central incisors are replaced by the corresponding permanent teeth. The advance of the permanent teeth towards the surface of the gum causes the absorption of the roots of the temporary teeth, and thus facilitates their shedding; the crown falling off, and leaving room for the permanent tooth behind it to come forward and supply its place.

In the replacement of the first by the second set of teeth, the following order is observed: The middle incisors are first shed and renewed (usually when the child is about eight years of age), and then the lateral incisors (perhaps a year later). The anterior molars of the first set are then replaced by the anterior premolars (this usually happens about the 11th year); and about a year afterwards the posterior deciduous molars are replaced by the second premolars. The persistent canines take the place of the deciduous ones in the 12th year; these being the last of the milk-teeth to be exchanged. The second molars appear between the ages of twelve and a half and fourteen years; and the third molars, or *dentes sapientie* (wisdom teeth), seldom appear till three or four years subsequently, and often much later.

The factory laws in England render it very important that we should be able to determine the ages of *nine* and *thirteen* in children, because before a child is nine years old, it is illegal to employ it in factory-work; and until it is thirteen, it may only be employed during nine hours a day. Mr Saunders, a well-known dentist, has shewn in his pamphlet, *The Teeth a Test of Age, considered with Reference to Factory Children*, that the teeth afford a far better test of age at this period of life, than the standard of height which has been adopted by the legislature for this purpose.

*Dangers attending Teething.*—The teeth are formed in closed sacs, and in rising to the surface in the progress of their growth they slowly penetrate the gum from below; a process familiarly called 'cutting the teeth.' The minuter physiology of this process will be described in a separate article (see *Teeth*); in the present, it will be sufficient to indicate shortly the dangers to which children are exposed, particularly during the period of the first dentition, or from five months old to two years or more. Infants are occasionally said to die of 'teething;' but this, like many other vague terms, may be said to be only a cloak for ignorance; for the mere cutting of the teeth is never, by itself, mortal, or even a serious source of suffering. It only becomes a cause of disease by its reflected influence on the delicate nervous system of the child. The period of dentition, in fact, is one during which the whole organisation of the infant is undergoing a revolution; in passing from an exclusively milk-diet to one of a more complex character, the entire digestive system undergoes a corresponding development. The diseases of this period of life correspond in importance

with the great physiological changes taking place in it, and with the dangers of derangement in the just order or symmetry of their development. If these diseases often appear to be due directly to the cutting of a tooth, it is because complex causes of disorder have prepared the way for a morbid change, which is ready to be developed into activity by a comparatively slight irritation. The principal diseases of dentition are Diarrhoea (q. v.), Convulsions (q. v.), vomiting, and hydrocephalus, or tubercular inflammation of the membranes of the brain, which are all apt to originate at this period of infantile life, and to coincide more or less closely with the development of the first set of teeth. It is very doubtful how far the operation of cutting the gum with a lancet, so commonly supposed a specific for the diseases of dentition, ought to be encouraged. Sometimes there is evident irritation, or even inflammation of the gum, and then the operation will probably at least do no harm; but the indiscriminating use of the gum-lancet, at the request of anxious but foolish mothers and nurses, is characteristic of a weak and erroneous routine practice, and must be denounced as an unwarrantable interference with the truly beautiful process by which the tooth is gradually evolved from its socket, in most cases, without any suffering. The special treatment of the diseases of dentition is discussed under the separate articles devoted to some of these diseases.

**D'ENTRECASTEAUX**, a term of various application in Australasia, affords one of the few traces of French discovery in that part of the world. It indicates an archipelago, a cape, and a channel.—1. The archipelago lies between New Guinea and New Ireland, about lat. 16° S., and long. 151° E.—2. The cape, a headland in Swan River Colony, forms nearly the south-west point of Australia, being in lat. 34° 52' S., and long. 116° E. 3. The channel, an arm of the Pacific, separates Bruné Island from the south-east coast of Tasmania or Van Diemen's Land. It is about lat. 43° 25' S., and long. 147° 15' E., is 35 miles long, and varies in width from 3 to 9 miles. On the side of the mainland, it is connected with the interior by means of the Derwent and the Huon, communicating through the former with Hobart-Town, the capital.

**DENUATION** is the removal of solid matter by water in motion, whether of rivers or of the waves and currents of the sea, and the consequent laying bare of some inferior rock. The rate of abrasion depends upon the velocity of the current, and the nature of the solid materials through which it flows; these two causes equally affect the deposition of the abraded matter, for the carrying power of the water varies with its velocity and with the weight of the particles. The heavier débris—large stones and gravel—are carried short distances, and deposited generally in masses; the finer particles are conveyed even by a slow current to great distances, and scattered in thin layers over extensive districts. All deposition, except in the case of showers of volcanic ashes, is the sign of a superficial waste going on contemporaneously, and to an equal extent, elsewhere, the gain at one point being equal to the loss at another. No new material has been used in the formation of the sedimentary rocks. The degradation and abrasion of igneous rocks provided the materials of the earliest strata; these in their turn were frequently abraded and re-deposited, under new conditions, and with the remains of a newer fauna and flora. Thus the crust of the globe has not actually increased in thickness, for whenever it acquires density in one place, it becomes thinner in another. The changes

that have been effected by denudation, and the amount of matter thus transported, are difficult to imagine. In districts where faults occur, the surface has been smoothed, and the uptilted ends have been washed away. These faults sometimes extend over several hundred square miles, and the dislocations, had they remained unaltered, would have produced mountains with precipitous escarpments of different heights, reaching occasionally to a thousand feet. But denudation not only levelled the surface of the earth; in regions with horizontal stratification it has produced inequalities, hollowing out valleys of denudation, and often carrying away the whole of the superficial strata, leaving mountains here and there which shew, by the direction and succession of their beds, that the strata of which they are composed were at one time continuous.

**DEOBSTRUENTS** (Lat. *de*, from, and *obstruo*, I obstruct), medicines which have the property of removing obstructions, especially in the Lymphatic System (q. v.). The glands of the thorax and abdomen (e. g., the liver, spleen, kidney, &c.), as well as the lymphatic and lacteal glands, are subject to enlargements, which were formerly, under a mechanical theory of disease, universally ascribed to obstructions of their outlets, or of the vessels in connection with them; against all of these states, deobstruents were employed with varying success. The favourite deobstruent remedies are mercury, iodine, and bromine; blisters and friction, with stimulating liniments, may be said also to have a like action in some cases.

**DEODAND.** A personal chattel which was the immediate and accidental occasion of the death of a reasonable creature, was, by the law of England, forfeited to the crown, in order that it might be applied to pious uses, or given to God, as the term implies. The rule did not apply where the instrument had been intentionally used for the purpose of causing death, as in cases of murder and homicide. Blackstone traces the origin of the custom to the popish prayers for the souls of the dead, and asserts that deodands were 'designed in the blind days of popery, as an expiation for the souls of such as were snatched away by sudden death; in the same manner as the apparel of a stranger, who was found dead, was applied to purchase masses for the good of his soul.' The more probable view is, that it originated in the natural horror which is felt for whatever has been the instrument of so dreadful an occurrence; just like the Jewish law, that if 'an ox gore a man that he die, the ox shall be stoned, and his flesh shall not be eaten;' or the old English law, that a well in which a person was drowned should be filled up under the inspection of the coroner. Similar regulations are to be found in the legal systems of most nations. The law of deodand was abolished by 9 and 10 Vict. c. 62.

**DEODAR.** See CEDAR.

**DEODAR**, remarkable as being one of the pettiest states in the world, is a district in the north-west of Guzerat, which is itself within the limits of the presidency of Bombay. Containing only 80 square miles, and 2000 inhabitants, it is yet subdivided into as many independent communities as there are villages—the whole being, for external purposes, under the gratuitous protection of the British government. The principal village, bearing the name of Deodar, is in lat. 24° 9' N., and long. 71° 49' E. The district was forced on the East India Company in 1819, as having become a refuge of marauders.

**DEODORISERS** are chemical substances employed for the purpose of absorbing or destroying the odoriferous principles evolved especially from

decomposing animal and vegetable matter. They strictly belong to the classes of substances known as **ANTISEPTICS** (q. v.) and **DISINFECTANTS** (q. v.).

**DEORI**, sometimes distinguished as **BURA DEORI** or **GREAT DEORI**, a town of Hindustan, stands in lat. 23° 22' N., and long. 79° 4' E., and is 1765 feet above the level of the sea. Though it has been but little noticed by travellers or writers, yet it appears to be not unworthy of its second name, as mentioned above, for, on its being burned down, some years ago, by a freebooter, 30,000 people are said to have perished in the flames. It is situated in the south-west part of the sub-presidency of the North-west Provinces, on the table-land, whence flow the Sone to the Ganges, and the Nerbudda to the Arabian Sea; so that the territory of Saugor and Nerbudda, within which it is contained, is common to the two principal basins of Northern India. The place is about half-way between the better-known cities of Saugor and Gurrah, being 44 miles to the south-east of the former, and 41 to the north-west of the latter.

**DEOXIDATION** is the term applied to the process of withdrawing the oxygen from a compound, as in the reduction of the native peroxide of iron in the smelting furnaces to the condition of metallic iron. On the small scale, in experimental inquiries, the process of deoxidation may be carried on before the **BLOW-PIPE** (q. v.), where the inner or reducing flame is essentially a deoxidising one.

**DEPARTMENT** (Fr. *Département*), a term used to denote a territorial division in France. Previous to the Revolution, France was divided into provinces; but in 1790 Mirabeau rose in the Constituent Assembly, and declared that, after having abolished aristocracy, it was neither convenient nor safe to preserve these provincial divisions. He alleged that they were too large, that they tended to concentrate the administrative power in the hands of a few, and that such power soon becomes aristocratic of necessity. He suggested, therefore, a minuter territorial division, as a carrying out of the principles of the Revolution. This expression of opinion was followed by a decree of the Assembly, dated February 16, 1790, ordering the abolition of the old provincial divisions (34 in number), and the redistribution of the land into 83 Departments. During the year 8 of the Revolution, these were increased to 98; in 1808, the Empire consisted of 127; at the fall of Napoleon, of 130; and at present it consists of 89, including the three new Departments formed by the annexation of Savoy and Nice. Originally, it was intended that the Departments should be governed by persons elected by the citizens; but this plan did not suit the views of the First Consul, who placed over each Department a prefect, and a *conseil de préfecture*. The Departments were again subdivided into *arrondissements*, over each of which was placed a sub-prefect (*sous-préfet*). The right of naming these functionaries was reserved to the chief of the state. This system of departmental administration is still in force in France.

**DEPARTURE**, a term in Navigation, explained under **SAILINGS**. See also **DEAD RECKONING**.

**DEPENDING ACTION.** An action is said, in Scotland, to be in dependence, from the moment of citation, until it be finally decided by the House of Lords, should it be appealed to that ultimate tribunal. As a security for the implement of the decree by the defender, in the event of his being found liable, the pursuer is entitled to use either Inhibition (q. v.) or Arrestment (q. v.) on the dependence, or depending issue.

**DEPHAL** (*Artocarpus Lakoocha*), a tree of the same genus with the Bread-fruit (q. v.) and Jack (q. v.), a native of the south of India, and frequently cultivated in the northern parts of that country. The fruit is eaten, but is inferior to the Jack. The juice, like that of the Bread-fruit, is tenacious, and is used for bird-lime. The root is used for dyeing yellow. The D. is a large tree, and its timber is valued for a variety of purposes.

**DEPHLOGISTICATED AIR.** See PHLOGISTON.

**DEPILATORIES**, or **EPI'LATORIES** (Lat. *depilo*, to pull out the hair), are chemical agents employed for removing superfluous hair from the skin. They were extensively used by the ancients, but are now restricted in their employment to the face, and to the removal of the hair from the scalp in the treatment of certain diseases. The caustic alkalis and alkaline earths are generally used, and a good recipe is to mix five parts of caustic or slaked lime, ten parts of carbonate of soda, and forty parts of lard. The tersulphuret of arsenic (commonly known as orpiment) is occasionally used, but its employment is dangerous, as any abrasion of the skin will enable the arsenical compound to begin to act. A mixture of caustic lime and orpiment constitutes some of the depilatories to be purchased; and it is believed that the Turkish *Rusma* is composed of these ingredients. A very active and comparatively safe compound is a strong solution of sulphuret of barium made into a paste with starch, which is immediately applied to the part from which the hair is to be removed, and is allowed to remain for five or ten minutes.

**DEPLOY'**, as a military movement, is a spreading-out of a body of troops in such way that it shall display a wider front and a smaller depth than it did before the deploying.

**DEPONENT**, a term in Latin Grammar applied to verbs having a passive form but an active signification. They are so called because they, as it were, lay down (Lat. *depono*) or dispense with the signification proper to their form. Such verbs had all originally a reflexive meaning, like the middle voice in Greek verbs; thus, *aversor*, 'I detest,' means radically, 'I turn myself away from.'

**DEPOSIT** was a real contract of the civil or Roman law. It was the simplest of all contracts, and consisted merely in the delivery of an article by one person to another, to be kept without remuneration, and to be restored *in specie* as soon as the depositor should require.—*Inst.* iii. 15, s. 3. Return when required was the sole condition of the contract; and no obligation was incurred by the depositary but to exercise ordinary care in preservation of the article. The civil law recognised a distinction, as to the value which might be recovered by the depositor in case of loss, between the case of articles voluntarily deposited, and those which came into the hands of the depositary by the misfortune of the owner, as by fire or shipwreck. In the latter case, double the value of the article might be recovered. There was also a special provision by the edict *Nautæ, cauponæ, stabularii*, whereby shipmasters, innkeepers, and stablemen were compelled to exercise more than ordinary vigilance over the goods of their customers and passengers.

The principles of the civil law as to deposit have been universally adopted by modern nations. In Scotland, the name of the contract is preserved. Lord Stair, i. 13, 2, lays down that the depositary is 'not liable for light faults, or for the perishing or deterioration of the thing deposited by casualty or accident.' The article must be restored when

demanded, and failure to do this will involve the depositary in liability for the consequences. See also Erskine, iii. 1, 26.

Deposit, in English Law, is a branch of bailments, which includes also loans, pledges, and letting and hiring. From each of these, deposit is distinct. It is defined by Judge Story to be 'a bailment of goods, to be kept by the bailee without reward, and delivered according to the object and purpose of the trust.'—Story on Bailments, c. ii.

The chief questions which have arisen in modern times relate to the amount of care which the depositary is bound to exercise. Judge Story lays down the principle to be, not the care which a man takes of his own affairs, but that which a reasonable being would use, and cites in support of his view the case *Doorman v. Jenkins*, ii. Ad., and Ellis 256, where a person intrusted with money placed it in his own cash-box, and the box having been stolen, the depositary was yet held liable for negligence. So also with jewels or other valuables—the nature of the article implies extra care. Where, however, a sealed packet or locked box is deposited, the question arises as to the liability of the depositary. Erskine lays it down broadly, that where such a deposit is made without shewing the contents, the depositary incurs no extra liability. But Story takes a distinction, and states that if the depositary had reasonable ground to believe the contents were valuable, he incurs liability accordingly. The immense value of the timber-trade of America raises in that country questions as to the liability of a landowner for timber left by the river on his ground. On this point, Story indicates that the smallest amount of liability is incurred. Whether or not the depositary may make use of goods left in his charge, is said by the same author to depend on the particular circumstances. If the article would benefit by use, then such use is allowable; but if injury were likely to accrue, it is not. If use is a matter indifferent, then the depositary is not entitled to the use. The admirable work of Story on Bailments is the best authority on this subject.

**DEPOSIT**, a term much used in Geology, to characterise those rocks which have been formed from matter that has settled from suspension in water. The materials constituting such rocks have been obtained by denudation, and their extent in one place equals the denudation in some other. Deposits are characterised according to the conditions under which they were formed, as marine, lacustrine, fluvial, and so forth.

**DEPOSITION**, the testimony of a witness set down in writing. Depositions are taken either by a judge or by a commissioner specially appointed by him for that purpose. The questions to which the depositions are answers are usually put by the legal representatives of the parties to the suit, under the control of the court or commissioner, and the answers are taken down by the clerk of court, or by a clerk specially appointed for the purpose. If the competency of the questions or the admissibility of the witnesses be objected to, the objection must be stated to the court or commissioner. The latter may either dispose of the objection at the time, or reserve it for the opinion of the court by which he was appointed. It is a rule in the laws of evidence of all countries that the deposition cannot be read where the witness might be himself produced, because his oral testimony is the best evidence, and secondary evidence is never admissible. Where he is dead, however, or insane, or beyond the jurisdiction of the court, his deposition then becomes the best evidence, and may be read in court.

**DEPOSITION OF A CLERGYMAN.** In Scotland, the minister of a parish who has been guilty either of immoral and scandalous conduct, or of preaching or otherwise publishing doctrines contrary to the standards of the church to which he has declared his adherence, or of contumaciously setting aside the authority of the Presbyterian church-courts, may be deposed from his holy office by the church-courts. By this means he is deprived not only of his ecclesiastical dignity, but of the temporalities of his benefice (stat. 1592, c. 115), and the benefice becomes vacant, just as if he were dead. He may, however, be restored to the exercise of the ministry, and to his position as a minister of the church by the General Assembly, but he cannot, of course, be restored to his benefice; and it is considered irregular that he should be so even by a new presentation by the patron, because the stigma attached to his character by his deposition is likely to affect his usefulness. Where sentence of deposition is pronounced by an inferior church-court, the judgment of which is reversed on appeal to the General Assembly, it is held that it had never been pronounced; but if the sentence be affirmed, it takes effect from the date when it was pronounced by the inferior court, and from that date the minister's right to the profits of his benefice ceases. Sentence of deposition cannot be pronounced by a presbytery in the absence of the minister, except by the authority of the General Assembly. See DEPRIVATION.

**DÉPÔT**, in Military matters, is a name sometimes given to a place where army-stores are deposited during war. In reference to the regimental system, however, a *dépôt* is the head-quarters of the regiment, the town or barrack where certain stores belonging to the regiment are kept, as well as the regimental-books and some of the men, when the regiment is ordered on foreign service. It is rarely that the whole strength of a regiment is engaged in active service at one time; reserve companies are kept at home, under the command of one of the officers. Either one or two companies are generally thus reserved, under the name of *dépôt companies*. They form a nucleus where recruits are received and drilled, and where the corporate existence of the regiment may be kept up. The system has existed in the British army since about the year 1825. There is an acting staff at each *dépôt*, of which the officers receive an allowance over and above their ordinary daily pay. There are not as many *dépôts* as regiments, seeing that a small body of officers can command the reserve skeletons of many regiments.

**DEPRESSION or DIP OF THE HORIZON** is the angle through which the sea-horizon appears depressed in consequence of the elevation of the spectator.

Let A be a point on the surface of the earth, B a point situated in a vertical line from A. Let BH be a tangent to the earth's surface drawn from B, B*h* a line in the same vertical plane perpendicular to AB. The angle *h*BH is the true dip of the horizon to a spectator at B.

The true dip measured in minutes is equal to the distance in nautical miles of the visible horizon. Let C be the centre of curvature of the surface;

then, since CHB is a right angle, the angle *h*BH = HCA; and the minutes in this angle are the

nautical miles in the arc AH. To find this angle in minutes or nautical miles, the rule is: Multiply the square root of the height in feet by 1.063.

The true dip of the horizon, however, is not exactly the same as its apparent depression. The apparent sea-horizon is raised above its true place by refraction through an angle, which varies according to the state of the atmosphere and the relative temperatures of the air and water, the variation ranging from one-third to one-twenty-third of the amount of the true dip. The rule commonly employed is to diminish the true dip by about one-fourteenth of its amount, to find the apparent dip.

If S be a star or the sun in the same vertical plane with ABH, and an observation of the altitude above the sea-horizon be made by means of a sextant from the point B (as from the deck of a vessel), the apparent dip of the horizon must be subtracted from the observed angle, in order to find the altitude of the sun. Owing to the uncertainty of the amount of refraction, the nearest minute to the dip given in the tables is usually taken. The following table gives a sample of the amount of the apparent dip under ordinary state of the atmosphere and equal temperature of air and water. See Raper's *Practical Navigation*.

Height.	Dip.	Height.	Dip.
Feet.	m. s.	Feet.	m. s.
0	0 0	8	2 60
1	0 0	9	3 0
2	1 20	10	3 10
3	1 40	20	4 20

**DEPRIVATION OF A CLERGYMAN.** In England, this may be either (1.) by a sentence declaratory in the proper court, on the ground of attainder or conviction of treason, felony, or any other infamous crime, or of conviction for heresy, infidelity, or gross immorality, or for farming or trading contrary to law, 1 and 2 Vict. c. 106, s. 31; or (2.) in pursuance of divers penal statutes, which declare the benefice void for some nonfeasance or neglect, or else some malfeasance or crime, as simony; for maintaining any doctrine in derogation of the king's supremacy, or of the Thirty-nine Articles, or the Book of Common Prayer; for neglecting to read the liturgy and articles in the church, and to declare assent to the same, within two months after induction; for using any other form of prayer than the liturgy of the Church of England; for continued neglect, after order from the bishop, followed by sequestration, to reside on the benefice. In these latter cases, the benefice is void, without any formal sentence of deprivation (Stephen's *Com.* iii. 37). A bishop may be deprived of his bishopric, but cannot be deposed, as may be done in the case of a Presbyterian clergyman, the character of a bishop, like that of a priest, being indelible. The tribunal by which the Bishop of Clogher was deprived in 1822 consisted of the archbishop and the other bishops of the province; and this precedent having been established, would probably be adhered to on any future occasion, notwithstanding that the archbishop alone might have full authority to deprive. —Cripps's *Laws of the Church*, p. 100.

**DE PROFUNDIS** ('Out of the depths'), the first words of the 130th psalm, which forms a portion of the liturgy of the Roman Catholic Church, and is sung when the bodies of the dead are committed to the grave. A tender melancholy pervades the psalm, which, however, brightens up at the close under the conviction that with God there is 'plenteous redemption.'

**DEPTFORD**, a town on the south bank of the Thames, about 4 miles below London Bridge, divided from Greenwich by the river Ravensbourne, a creek of deep water (*depe ford*), formerly fordable at the spot where D. Bridge now stands. It contains two parishes, St Nicholas' and St Paul's, the latter formed by act of parliament in 1727. St Nicholas' Deptford lies wholly in Kent, but St Paul's extends into Surrey—the Surrey portion being known as the Manor of Hatcham. Pop. in 1861, 45,714, chiefly engaged in the Royal Deptford Dock and Victualling Yards, and in extensive private ship-building and engineering establishments. The market-gardens of Deptford are famous. The upper portion of the town is well built, and is a favourite place of residence for persons engaged in business in London. D. forms, with Greenwich, Woolwich, Charlton, and a portion of Plumstead, the parliamentary borough of Greenwich, which returns two members. The ancient Incorporation of the Master and Brethren of the Trinity House of 'Deptford Strand,' founded by Henry VIII., has its hall at D., and also two sets of almshouses. Queen Elizabeth, in 1581, visited Drake at D., in the ship in which he 'compassed the world.' In 1698, Peter the Great acquired the art of ship-building in the dock-yard here, residing at the manor-house of Sayes Court, which John Evelyn had previously occupied.

**DEPTFORD DOCK-YARD**, as one of the royal naval establishments, is not so remarkable for ship-building as for other operations connected with the fitting-out of fleets. There are five budding-slips—one for first-rates, three for frigates, and one for sloops; and there are two docks for frigates. The Victualling Establishment is an important place, employing several hundred persons as officers, clerks, workmen, and boys. This is the chief dépôt for victualling the home and foreign stations, and the marines; also for slops and many of the necessaries for seamen; and for barrack-stores. It is convenient for these purposes in being near the metropolitan markets. The officers receive, examine, store, pack, re-issue, and register the various stores, and transmit all their accounts to the Admiralty. For simplicity, we call this collectively a royal dock-yard; but the ship-building, the store-keeping, and the provisioning are the work of distinct establishments.

**DEPU'CH ISLAND**, a member of the Danpier Archipelago, lies off the north-west coast of Australia, in lat. 20° 38' S., and long. 117° 44' E. Though only eight miles in circuit, yet it is, on more than one ground, worthy of notice. On it have been found some curious specimens of native sculpture; and, rising with its greenstone rocks to a height of 514 feet above the sea, it presents a remarkable contrast to the low-lying shore of the adjacent mainland.

**DEPUTY**, one who exercises power which properly belongs to another who has placed him in his stead. The appointment of a deputy does not free the principal from responsibility, for the deputy is not an assignee. It is a general rule, that no judge can appoint a deputy unless he be authorised to do so in the commission by which he himself is appointed. In the rare cases in which a deputy is empowered to appoint a deputy, the latter is usually called a substitute. See **SHERIFF**.

**DE QUINCEY**, THOMAS, a distinguished English writer, was born in Manchester, August 15, 1786. His father was a wealthy Manchester merchant, who, dying while his children were yet young, left his widow a fortune of £1600 a year. De Q. received his first education at home, and was afterwards sent to the grammar school of Bath. He

proceeded to the university of Oxford in 1803, and remained there till 1808. At the university, he made the acquaintance of opium, which was ever afterwards his dread familiar. On leaving college, he went to reside at the Lakes, and formed one of the cluster of literary lights which made that region at the time so illustrious, and afterwards so memorable. He left Cumberland in 1819, and in 1843 he came to reside in Scotland, settling with his family at the village of Lasswade, near Edinburgh. He died at Edinburgh on the 8th December 1859.

With the exception of a strange episode of his youth, described in the *Confessions of an Opium-eater*, the heroine of which was, singularly enough, one of the 'waifs of womanhood,' De Q.'s career was almost entirely eventless. He led a lonely and a speculative life, and his writings are at once history and autobiography. He was perhaps, with the exception of his friend Professor Wilson, the most brilliant magazine-writer in this century of magazines. Everything he wrote, putting aside the *Confessions*, *The Logic of Political Economy*, and a novel, which no one seems to have read, or if read, to have remembered, is in the form of articles. Even the *Confessions* themselves were originally published as a series of articles in the *London Magazine*. De Q. has written on a great variety of subjects, and in a great variety of styles. He has written articles pervaded by humour of the most curious and novel kind, philosophical and critical articles distinguished by originality and daring of speculation, and articles of the nature of prose-poems, which are unquestionably of their kind the most wonderful things in English literature. In point of imaginative grandeur, and music and sweep of sentence, the *Suspiria de Profundis*, and the opium visions that close the *Confessions*, are miracles of impassioned prose. De Q.'s works were first collected and republished in America. Between the years 1853 and 1859, Messrs Hogg and Son of Edinburgh brought out an edition, founded to some extent on the American one.

**DERAJAT**, the fluvial portion of Daman (q. v.), itself a comparatively narrow strip between the Suliman Mountains and the Indus, is, when duly irrigated, singularly fertile. It is so called from *dera*, a camp, which is a common element in the names of its four chief towns—Dera Deen Punah, Dera Futti Khan, Dera Ghazee Khan, and Dera Ismail Khan. These places are all built on or near the right bank of the Indus, in Afghanistan.—1. Dera Deen Punah, apparently the least considerable of the whole, has suffered much from physical causes, having, in 1819, been nearly destroyed by an earthquake and by a simultaneous flood from the Suliman Mountains.—2. Dera Futti Khan is the centre of a district which produces cotton, grain of various kinds, indigo, sugar, and opium. Pop. 5000.—3. Dera Ghazee Khan, the most important of the number, occupies, for commercial purposes, a very favourable position—the intersection of the two great routes of the country between north and south, and between east and west. Hence it has been recommended as the best site for an annual fair, so as to suit at once Sindh, the Punjab, Afghanistan, Beloochistan, and Khorassan. Besides manufactures in cotton, silk, and steel, it has a bazaar of 1600 shops. Pop. said to be 25,000.—4. Dera Ismail Khan, next in consequence to Dera Ghazee Khan, is a new creation, another town of the same name having, a few years ago, been swept away by an inundation of the bordering river. It stands on the thoroughfare already mentioned between north and south, commanding also two ferries across the Indus. To

this position it is indebted for a thriving trade, and, more particularly in spring, it is crowded by the Lohant Afghans, an enterprising tribe of pastoral peddlers. Pop. 8000.

**DERBEND**, or **DERBENT**, a town of Russia, capital of the government of the same name, is situated on the western shore of the Caspian Sea, on the declivity of a branch of the Caucasus, which here approaches very close to the water's edge, and forms a defile anciently known as the *Albanic Pylos*, now called the Pass of Derbend. Lat. 42° N., long. 48° 15' E. D. is built in the form of a parallelogram, being about three miles in length, and from a quarter to half a mile in breadth. It is surrounded by strong walls of very ancient date, which are further strengthened at intervals by towers. From two massive iron gates, through which the road to the interior passes, the town derives its name, which signifies 'the shut-up gates.' The harbour of D. is quite inaccessible to all but small boats. The manufactures of the place consist chiefly of coarse silk and woollen stuffs. Pop. 12,870. D. is a very ancient place, having, as it is said, been fortified by Darius I. to prevent the incursions of the Scythians; and it was long considered the key of Persia on the north-west side. It came finally into the possession of Russia in 1795.

**DERBY**, the titular name of a distinguished family of the British aristocracy, descended from a common family with the Barons Audley or Audleigh, county Stafford. William de Audleigh, on exchanging with his cousin, Sir Adam de Audleigh, the manor of Talk, county Stafford, for that of Stanleigh (Stony Lea), county Derby, adopted the latter name, and continued it to all his descendants. This event occurred in the 12th century. The first who assumed the arms now used by the family—viz., 'three stags' heads on a bend'—was Sir William de Stanley, son of William de Stanley, who flourished in the reign of Henry III. The first Lord Stanley was created in 1456; his eldest son Thomas was created first Earl of Derby in 1485.

**DERBY**, **EDWARD GEOFFREY SMITH-STANLEY**, 14th EARL OF, was born, 1799, at Knowsley Park, Lancashire. He was educated at Eton and Christchurch, where, in 1819, he gained the Latin Verse prize (subject, *Syracuse*). He was elected member of parliament for Stockbridge in 1820; in 1825, he married the second daughter of the first Lord Skelmersdale; and in 1826, he represented Preston, but lost his seat in 1830, on becoming Chief Secretary for Ireland under the administration of Earl Grey. A seat was then found for him at Windsor. He took a distinguished part in the debates in favour of the Reform Bill, and signalled his Irish administration by two bold measures—one for National Education in Ireland, and another relative to the Irish Church Temporalities, which resulted in ten Irish bishoprics being abolished. The grievance of church-rates and first-fruits was also removed, and a graduated tax upon benefices and bishoprics substituted. In 1833, he became Secretary of State for the Colonies, and in the same year carried the bill for emancipating slaves in the West Indies, and providing a compensation of twenty millions to the planters. In 1834, being alarmed by the success of Mr Ward's motion for appropriating the surplus of the Irish Church temporalities to secular purposes, Lord Stanley seceded from the Grey ministry, carrying with him Sir James Graham, the Duke of Richmond, and the Earl of Ripon. He ever afterwards adhered to the Conservative party, although, in 1834, upon the dismissal of the Melbourne ministry by William IV., he declined to join the administration of Sir Robert Peel. After

acting in concert with the opposition for seven years, he accepted the colonial seals in the Peel administration of 1841, and held them for four years. In September 1844, he resigned his seat for North Lancashire, for which he had sat since 1832, and was called to the Upper House in his father's barony of Stanley of Bickerstaffe. In December 1845, when Sir Robert Peel determined to repeal the corn laws, he retired from the cabinet. In 1846, he put himself at the head of the Protectionist opposition, which, headed in the Commons by Lord George Bentinck and Mr Disraeli, waged a stout but ineffectual opposition to the free-trade measures of Sir Robert Peel. He was now regarded as the leader of the great Conservative party. In 1851, on the death of his father, he succeeded to the earldom. In February 1852, on the resignation of Lord John Russell, he was sent for by the Queen, and intrusted with the formation of an administration, which was, however, displaced in December following by a hostile vote of the House of Commons condemnatory of the budget of his Chancellor of the Exchequer, Mr Disraeli. On the death of the Duke of Wellington in 1852, he was elected to the post of Chancellor of the University of Oxford. In February 1858, when the Palmerston government resigned on the rejection of the Conspiracy Bill, he again became First Lord of the Treasury. At the meeting of parliament in the following year, his government brought forward a measure of Parliamentary Reform. A hostile amendment having been moved by Lord John Russell, and carried, he dissolved parliament, and appealed to the country. When the new House of Commons re-assembled in June 1859, a vote of want of confidence was carried against his government, and he resigned. He returned to power in 1866, and, in conjunction with Mr Disraeli, passed the Reform measure of 1867. See **REFORM IN SUPPLEMENT**. In 1868, he resigned the premiership in favour of Mr Disraeli. His last speech in parliament was made (1869) in opposition to the disestablishment of the Irish Church. He died October 23, 1869. As a debater, he stood in the very first rank. Lord Macanlay remarked that his knowledge of the science of parliamentary debate, at the very outset of his career, resembled an instinct. His power of invective was almost unequalled, and his vehement contentions with Mr O'Connell on the Repeal of the Union and the Irish Church in 1833 and subsequent years, did much to diminish the influence which the great Irish agitator had previously exercised on English politics. He was tall, of commanding gesture, and his voice, in elevated passages of declamation, rang with trumpet-like power and effect.

**DERBY**, a parliamentary and municipal borough and manufacturing town, the capital of Derbyshire, in the south part of the county, in the wide and fertile valley of the Derwent—thence navigable to the Trent—at the junction of the main branches of the Midland Railway, 132 miles north-north-west of London, and 35 miles north-north-east of Birmingham. The houses are mostly of brick, and the public buildings of stone. The Free Grammar School is one of the oldest English foundations, reaching to 1162. Here Blackwell, author of the *Sacred Classics*, was a master, and Flamsteed a pupil. Dr Darwin, in 1783, founded the Philosophical Society of D., and wrote most of his works here. D. is well situated for manufacture and trade, being at the south end of a coal-field, and being connected by canals and railways with a great part of England. It has manufactures of silk, cotton, lace, hosiery, lead, iron, paints, porcelain, jewellery, black marble vases, columns, chimney-pieces, and ornaments of fluor-spar,

petrifications, marble, &c. The staple manufacture is throwing silk, introduced by Mr Crochet from Italy early in the 18th c.; the silk-mill, with machinery still in use, erected in 1718 by John Lombe, being the first and largest of the kind in England. Pop. (1861), 43,091. D. returns two members to parliament. It seems to have been the Roman station *Derwentio*, which stood on the east bank of the river, opposite the present town. Roman brass, silver, and gold coins have been found here, as well as a Roman pavement, and the foundations of a Roman bridge over the Derwent. D.—called *Northworthige* by the Saxons, and *Deoraby* by the Danes—was given by the Conqueror to Wilham Peverill; obtained the privilege of dyeing cloth from Edward III.; and was occupied by the Pretender in 1745. Richardson the novelist, and Flamsteed the astronomer, were born here. Here Justice Brent first called George Fox a Quaker. Jeddiah Strutt invented the ribbed stocking-frame here in 1756. (1871—pop., mun. boundary, 49,793.)

DERBY DAY is the second day, the Wednesday, of the Grand Spring Meeting, which takes place at Epsom in Surrey, in May, in the week succeeding Trinity Sunday. Upon this day, the most important on the list, and that on which the best horses run, the famous Derby stakes, instituted by the Earl of Derby in 1780, and which consist of 50 sovereigns each, are contended for. When the first Derby was run for, there were only 36 subscribers at 50 guineas each (with £25 forfeit in case of non-starters); but the number of subscribers is now so large, that the value of the stakes in 1861 amounted to £6500. The Derby Day is the great English holiday. To be present at Epsom on that occasion, London empties itself, and proceeds to the Downs by modes of locomotion the most heterogeneous. For hours, a continuous stream of carriages, gigs, dog-carts, vans, and vehicles of every description, moves tumultuously along the road to Epsom. Shopkeepers on that day shut up their shops, the benches of parliament are deserted, one-half of the aristocracy appear on the ground, people of every condition arrive in countless numbers from all districts; and huge trains arrive every few minutes at the station, bringing their thousands, until the entire Downs are covered with a vast moving mass. So great is the demand for conveyances on this day, that scarcely a horse can be had either in London or within 40 miles of it. At the Derby in 1861, the course, which is a mile and a half in length, was gone over in 2 minutes 43 seconds—swifter running, by 2 seconds, than any hitherto known on that course.

DERBYITES. See PLYMOUTH BRETHREN.

DERBYSHIRE, an inland county of England, the twenty-first in size, lying between Yorkshire on the north and Leicestershire on the south. Its shape is triangular; its greatest length from north to south, 56 miles; greatest breadth, 34; area, 1030 square miles, of which above  $\frac{2}{3}$ ths are either arable, in pasture, or in meadow. No English county has such variety of scenery. The north-west is occupied by the south end of the Penine chain, called the High Peak or Derbyshire Highlands, composed of carboniferous limestone. This tract forms the water-shed between the Trent and Mersey, and is not surpassed for rugged and romantic scenery by anything in England; abounding in precipices, faults, rocking-stones, caverns—one of which is 2700 feet long—and streams that often lose themselves for a time among the fissures of the limestone hills. The Peak, the loftiest hill in D., is 2000 feet high. From the Peak tract, a range runs south; another runs 60 miles south-south-east. Other ranges

intersect parts of the county. To the south, D. sinks into a flat or gently undulating tract of new red sandstone, with some spots of magnesian limestone and coal, and beds of red marl and gypsum. The chief rivers are the Trent—dividing D. from Staffordshire for 10 miles, and then crossing the south of the county and passing into Nottingham—and its tributaries, the Derwent and the Dove, both of which rise in the region of the Peak, and flow in a south-easterly direction. Warm mineral springs exist at Buxton and Matlock, and intermitting springs at Barmoor and Tideswell. D. is celebrated for metals and minerals—iron, lead, zinc, manganese, copper, coal, fuller's-earth, mineral caoutchouc and mineral oil, gypsum, pipe-clay and chert for potteries, marble, fluor-spar, and alabaster for ornaments, &c. D. has six canals, and is intersected by many branches of the Midland Railway. In the north, the climate is cool and moist, with fogs, and often frosts in summer. D. is more a manufacturing and mining than an agricultural county. The best soils in the south are red, marly, fertile loams. There are many woods and coppices. The chief crops are wheat, barley, and oats. D. has much permanent pasture, large dairies, and sheep-pasturage in the Peak district. There are manufactures of cotton, silk, worsted, metallic goods, porcelain, and marble and spar ornaments. D. is divided into 6 hundreds, 9 poor-law unions, and 140 parishes in the diocese of Lichfield. The chief towns are Derby, Ashbourne, Bakewell, Buxton, Chapel-le-Frith, Chesterfield, Belper, and Wirksworth. In 1851, pop. 296,084 (in 1861, 339,377); 840 schools, with 37,271 scholars; 776 churches—250 being of the Church of England, and 404 Methodist. D. returns six members to parliament—four for the county, and two for Derby. There are in the county remains of so-called Druid circles, barrows, cromlechs, British and Roman roads, Roman baths, and a Roman altar at Haddon Hall. There are also ecclesiastical and monastic remains. Repton Church crypt is older than 874. Hardwick Hall contains some furniture of Elizabeth's time, and some embroidery said to have been done by Mary Queen of Scots. Near Bakewell is Chatsworth, the magnificent seat of the Duke of Devonshire. Arkwright built his first mill at Cromford, in 1771. Brindley was born at Turnstead; and Strutt, the inventor of ribbed stockings, at Normanton. (1871—pop. 380,538.)

DERBYSHIRE SPAR is a name given to the fluoride of calcium, or Fluor-Spar (q. v.).

DERECSKÉ, a town of Hungary, 12 miles south of Debreczin. It is situated in the vicinity of several small lakes, from which, in the summer-time, a considerable quantity of soda is obtained by evaporation. In one of the lakes, small but very beautiful pearls are found. Pop. 5320.

DEREHAM, EAST, a town in the middle of the county of Norfolk, 16 miles west-north-west of Norwich. Its streets are wide, well lighted, and well paved. The church, which is cruciform, with a tower, contains the remains and monument of Cowper the poet. D. has manufactures of agricultural machines, and in the highly cultivated country around there are many gardens and orchards. Pop. (1861), 4315. Here Withburga, daughter of King Anna, founded a nunnery in the 7th c., which was burned by the Danes, and afterwards refounded. Withburga was buried in her nunnery in 654, but her remains were stolen thence by the monks of Ely in 974.

DERELICT, a term in English Law, signifying anything forsaken or left, or wilfully cast away. Derelict lands, if suddenly left by the sea, belong to the crown; but if the sea has receded gradually and

imperceptibly, the gain will go to the owner of the adjacent lauds.

In order to constitute a ship which has been wrecked derelict, it is necessary that the master and crew shall have abandoned her, without hope of recovery. The mere quitting of a ship for the purpose of procuring assistance from the shore, or other temporary cause, with the intention of returning to her again, is not an abandonment. See Lord Stowell's judgment in the case of the *Aquila* (1 Rob. 37), and *Abbot on Shipping*, p. 489. When such abandonment or dereliction has occurred, the first-comers are entitled to take temporary possession of the ship, and to claim salvage, either from the owners, the lord of the manor, or other person having right to wrecks unclaimed by the owners, or in the event of no claim from the crown. The general superintendence of all matters relating to wreck is placed in the Board of Trade by the 439th section of 17 and 18 Vict. c. 104, commonly called 'the Merchant Shipping Act;' and the board may, with consent of the Commissioners of her Majesty's Treasury, appoint any officer of customs, or of the coast-guard, or other person, to be a receiver of wreck in any district, and to perform the duties imposed on him by the act. These duties consist in taking the command of the persons present, and availing himself of their services to the best of his ability to save the ship and her crew and cargo. If any one refuses to obey him, he shall incur a penalty of £50; and if any master of a ship or boat shall refuse him his aid, or any proprietor of a wagon, cart, or horses shall refuse him the use of them, he shall incur a penalty of £100. All articles washed on shore or lost are to be delivered to the receiver, and he has power to suppress plunder and disorder by force. Within 48 hours after taking possession of any wreck, the receiver shall cause to be posted up in the nearest custom-house a description of the same, and of any marks by which it is distinguished; and if the value of such wreck exceeds £20, he shall transmit a similar description to the secretary of the committee of Lloyd's (s. 452). See LLOYD'S. Goods deemed perishable he may sell immediately (s. 453). The owner of all wreck is entitled, within one year, to claim it from the receiver, who will deliver it up to him on receiving payment of such expenses, fees, and salvage as may have been incurred in terms of the act (s. 470). In the event of no owner establishing his claim before the expiration of a year from the date at which the wreck has come into the possession of the receiver, it shall be delivered up to the lord of the manor or other person having title to it. If a dispute arise as to the property of wreck, or the amount of salvage or other charge due, it may be decided by two justices, whose proceedings may be reviewed by any court of law or equity, if carried there by appeal within three months. If no claim shall be established to wreck either by an owner or lord of the manor, or admiral, mayor, or other person having title to wrecks cast on shore at particular parts of the coast, the wreck becomes the property of the crown, and shall be sold by the receiver, and the proceeds, after deducting fees and expenses, paid into her Majesty's exchequer (s. 475).

The principle upon which Salvage (q. v.) is given on wrecks and derelict is, that a person who by his labour preserves goods which the owner or those intrusted with the care of them have either abandoned in distress at sea, or are unable to protect and secure, is entitled to retain the possession of the goods until proper compensation is made to him for his trouble. Where the parties cannot agree on this sum, and are unwilling to adopt the decision of the justices, as above stated, the amount is generally ascertained by a jury. Till the question is decided,

the goods remain in the custody of the salvor, or of the receiver for his behoof. No claim for salvage is due where the owner, or those in his employment, are at hand on the coast, and in a condition to save and protect his property. If any one set of persons have taken possession of a derelict, and are endeavouring to bring it into port and save it, another set have no right to interfere with them and become participators in the salvage; unless it appears that the first in possession would not have been able to effect the rescue of the property without the aid of the others (Abbot, p. 490). This rule applies to king's officers, even where the property saved is government stores. The original salvors cannot be dispossessed without reasonable cause. As to the proportion which the salvage allowed bears to the value of the property saved in various circumstances, see SALVAGE.

DERG, LOUGH (signifying the *red lake*), the name of two Irish lakes. One, the largest lake expansion of the river Shannon, between Tipperary on the south-east, and Galway and Clare on the north-west, is 24 miles long from north-east to south-west, 2 to 6 broad, 10 to 20 feet deep at the upper, and 50 to 80 at the lower end. Its surface is about 100 feet above the sea. It contains several islands.—The other Lough Derg is in the south of Donegal county, on the borders of Tyrone. It is 3 miles by 2½, has many small isles and rocks, and wild dreary shores, and is surrounded by mica-slate hills 700 to 1200 feet high. Saint's Isle contains the remains of a priory, founded about 600, and is the original seat of St Patrick's Purgatory. But the place of penance has for some centuries been on Station Isle—under an acre in extent, and with two chapels—which is now the most celebrated place of pilgrimage in Ireland, 10,000 to 15,000 persons flocking to it annually, from 1st June to 15th August, for prayer, fasting, and vigils.

DERIVATION. See ETYMOLOGY.

DERIVATION, in Medicine, a method of curing disease, by which it was formerly supposed that the *materies morbi*, or matter of the disease, was drained away through some channel established for it by artificial means, as when a blister is applied over an inflamed lung, or a discharge from the bowels established in a case of dropsy. Without too closely scrutinising the theory, it may be admitted that many of the practices founded on it have also a pretty firm basis of experience, and are well established in modern medicine.

DERMATOLOGY (Gr. *dermatos*, of the skin, *logos*, a discourse), the science of the management of the skin and of its diseases. See SKIN.

DERMATOPHYTES (Gr. *derma*, the skin, and *phyton*, a growth or plant), vegetable growths, chiefly of the lowest of Cryptogamia (q. v.), inhabiting the cuticle or epidermis, and giving rise to some forms of skin-disease, as Favus (q. v.), Fityriasis (q. v.), Ringworm (q. v.), &c.

DERMESTES, a genus of coleopterous insects of the section *Pentamera*, and of the family *Clavicornes* (q. v.); having antennæ shorter than the thorax, their three terminal joints forming an ovate compressed club. Their larvæ feed mostly on dry and decaying animal matter, and are very voracious, committing great ravages among furs, collections of natural history, &c.

*D. lardarius* is the well-known BACON BEETLE, the larva of which is so often destructive to bacon and

Bacon Beetle  
(*Dermestes lardarius*).

other dried meats, and often also to cheese. The perfect insect is about a quarter of an inch in length, and of a dull black colour, the base of each wing-cover ash-coloured with three black spots. The larva is of a long shape, tapering towards the tail, dark-brown above, white beneath, with long hairs, and furnished with two horny hooks on the last segment. The larva of *D. murinus* is common in the dried carcasses of vermin nailed up on doors by gamekeepers; that of *D. vulpinus* abounds among cargoes of hides brought from warm climates; that of *D. paniceus* in long-kept stores of ship-biscuits.

Use is sometimes made of the larvæ of species of *D.* for procuring well-cleaned skeletons of birds and other small animals: the animal is first soaked in water, to get all the blood out; then dried, to suit it to the taste of the larvæ, which are placed with it in a covered box; and in a short time their work is very neatly and completely done, much better than by ants.

DERMIS. See SKIN.

DERMOPTEROUS (Gr. skin-finned) FISHES, an order of fishes in Owen's classification, so named from the cutaneous vertical fins, in which the rays are extremely soft and delicate, or altogether imperceptible, and further characterised by the want of pectoral and ventral fins. Lampreys, the lancelet, &c., are dermopterous fishes.

DERNA, or DERNAH, a town of Tripoli, Northern Africa, situated at the mouth of a ravine a mile from the Mediterranean, in about lat. 33° 30' N., long. 22° 30' E. Built on both sides of the ravine, it has regular streets, which are far from cleanly, although a copious stream of pure water flows through several of them. The houses are low, and have a mean appearance, but they are surrounded by fine gardens and orange-groves. The harbour of *D.* is insecure, and its prosperity, which was formerly considerable, has now greatly declined. Pop. 6000.

DERREYEH, EL, or DERAYEH, a town of Nedjed, Central Arabia, in lat. 25° 15' N., long. 46° 30' E. It is fortified, and has a population usually stated at about 15,000. It was formerly the capital of the country of the Wahabees, but was captured and almost destroyed by Ibrahim Pasha in 1819.

DE'RRICK, a mechanical contrivance used for the same purposes as the crane, but recently so improved in size, strength, and mechanism, as to be able not only to raise a body of 1000 tons in weight, but to transport it from one place to another. The following description of the *Great Floating Derrick*, built in 1859, will convey an idea of the powers of this machine, and of the principles upon which it works. This derrick was built by the Thames Iron Ship-building Company, at Blackwall. It consists of a flat-bottomed vessel, 270 feet long, and 90 feet across the beam, and is divided throughout into a number of water-tight compartments, which can be filled, so as to counterbalance any weight on an opposite side. From the deck of this floating steam-crane rises an iron tripod 80 feet high, on the top of which revolves a gigantic boom, 120 feet long, and above the boom the 'king-post,' a continuation of the tripod, rises to the height of 50 feet. One arm of the boom is furnished with ten fourfold blocks; the chains attached to these blocks are passed across the king-post, brought over the other arm of the boom, and so descend to the other side of the vessel, where they are connected with two powerful steam-engines, by means of which the weights are raised. This derrick is capable of being propelled by means of a series of bucket-paddle floats at the rate of four miles an hour.

It is the invention of Mr Bishop, an American. Derricks have been long in use in America, and have proved much more expeditious and economical

Lifting of the *Forcingen* and *Water Sprite* by the New Patent Derrick.

than any other species of lifting-power. They are chiefly used for lifting machinery or other great weights, and for raising wrecks.

DERVISH is a Persian word signifying *poor*, corresponding to the Arabic *Fakir* (q.v.). It designates, in Mohammedan countries, a class of persons resembling in many respects the monks of Christendom. The dervishes are divided into many different brotherhoods and orders. They live mostly in well-endowed convents, called Tekkije or Changah, and are under a chief with the title of a Sheik, i. e., 'elder.' Some of the monks are

Dervishes.

married, and allowed to live out of the monastery, but must sleep there some nights weekly. Their devotional exercises consist in meetings for worship, prayers, religious dances, and mortifications. As the convent does not provide them with clothing, they are obliged to work more or less.

It is difficult to say when these religious orders took their rise. From the earliest times, pious persons in the East have held it to be meritorious to renounce earthly joys, to free themselves from the trammels of domestic and social life, and to

devote their thoughts in poverty and retirement to the contemplation of God. In this sense, poverty is recommended by Mohammed in the Koran. Tradition refers the origin of these orders to the earliest times of Islam, making the califs Abubekr and Ali found such brotherhoods; but it is more probable that they arose later. Many Mohammedan princes and Turkish sultans have held dervishes in high respect, and bestowed rich endowments on their establishments; and they are still in high veneration with the people. The orders are generally named after their founders, and the best known are the *Bestamis*, established 874 A. D.; *Kadris*, 1165; *Rafuji*, 1182; *Mevlevis*, 1273; *Nakshibendis*, 1319; *Bektashis*, 1357; *Rushnis*, 1533; *Shemsiss*, 1601; and *Jemalis*, 1750.

DERWENT, one of the principal rivers of Tasmania, issues from Lake St Clare, in the centre of the island; flows tortuously towards the south-east; waters Hobart-Town, the capital; and enters Storm Bay, in D'Entrecasteaux Channel, by an estuary of four miles in width. Up to Hobart-Town, the D. is navigable for ships of any burden. The lat. and long. of the mouth are about 42° 53' S., and 147° 25' E.

DERWENTWATER, or KESWICK LAKE, an oval sheet of water in the south of Cumberland, and one of the most beautiful of the lakes of that county. It stretches south from Keswick, is 3 miles long by 1½ broad, 72 feet deep, and 222 feet above the sea. Its banks are rocky and abrupt, and behind them rise rocky mountains, one of which, the Cat Bells, is 1443 feet high, and another, Lowdore, has a fall of 100 feet. This lake is an enlargement of the Derwent river, which runs through the lake in its course towards the Irish Sea, into which it flows at Workington. It has several wooded isles, besides a remarkable floating isle—a mass of earthy matter six feet thick, and varying in size in different years from an acre to a few perches, covered with vegetation, and full of air-bubbles, which buoy it on the surface of the water. D. abounds in trout, pike, perch, and eels.

DERWENTWATER, JAMES, EARL OF, one of the leaders in the rebellion of 1715, and the last Earl of D., was the descendant of an ancient Northumberland family named Radcliff. He was born in 1688, educated in France, and on the death of his father in 1705, D., then in his 17th year, returned to the seat of his ancestors at Dilston, in Northumberland, and assumed the paternal titles and estates. On the eve of the insurrection, at the close of 1714, warrants were issued on suspicion against several gentlemen in the north of England, and one, among others, against the Earl of D.; but having been previously warned, he fled from Dilston, and found refuge in the cottage of one of his dependents. He soon afterwards collected a few retainers, and placed himself at their head, under the impression that the entire body of the Jacobites either had risen, or were about to rise. From this period the history of the Earl of D. becomes the history of the Rebellion of 1715, which ended in the disastrous encounter at Preston, on which occasion D. conducted himself with the utmost heroism, but, with the most of the rebel leaders, was taken prisoner, and conveyed to the Tower of London. Having been impeached of high treason at the opening of parliament, he was carried before the House of Lords, February 9, 1716, and, requesting time to prepare an answer to his accusation, was remitted till the 19th, when, being taken for trial to Westminster Hall, he pleaded guilty, and threw himself upon the mercy of the king. His appeal was

unavailing, and he was condemned to suffer. Every possible effort was made by the relations and friends of D. to obtain a pardon, but their exertions were fruitless, and he was beheaded on Tower Hill, 24th February 1716. His youth, his invariable amiability of temper, his rank, and his bravery, combined to excite great sympathy for the unhappy sufferer.

DERZAWIN, GABRIEL ROMANOWICZ, a celebrated Russian lyric poet, was born at Kasan, 3d July 1743, studied at the gymnasium of his native city, and in 1762 entered the army as a private soldier. His talents and superior education soon procured him promotion. The Empress Catharine highly esteemed him; and in 1791, appointed him Secretary of State; in 1800, Imperial Treasurer; and in 1802, Minister of Justice. This last office, however, he held for only one year, when he retired on a pension, and devoted the remainder of his life wholly to the muses. He died 6th July 1816. D. is a thoroughly original poet. He excels in loftiness of idea, purity of sentiment, and rich vigour of language; in fact, the latter quality at times manifests itself in an Oriental extravagance of imagery which the colder fancy of the West fails to appreciate. D.'s noblest, as well as his most popular ode, is his *Address to the Deity*. It has been translated into English, German, and other European languages. His collected works were first published at St Petersburg in 5 vols. (1810—1815), and have been often reprinted since.

DESAGUADERO, the name of various waters in Spanish America, of which the chief are a lake and two rivers.—1. The lake, situated in Araucania (q. v.), measures 35 miles in length, with an average breadth of five, and sends forth the Osorno to the Pacific.—2. A river of the Argentine Confederation, separates the departments of San Luis and Mendoza. It is, however, merely a winter torrent, being quite dried up in summer.—3. A river of Bolivia—the only stream of any magnitude that is wholly within its borders—issues from Lake Titicaca, and, after a south course of 190 miles, loses itself in the land-locked lake of Aullagas, near the town of Oruro. It is, without exception, the loftiest stream of any length on either continent, for the elevation of its source, not greatly exceeding that of its mouth, is 12,846 feet, or nearly 2½ miles.

DESAIX DE VEYGOUX, LOUIS CHARLES ANTOINE, a general of the first French republic, was born at St Hilaire-d'AYat, in Auvergne, August 17, 1768. After studying at the military school of Effiat, he was appointed in 1792 aide-de-camp to Prince Victor de Broglie, then at the head of the army of the Rhine. Here D. distinguished himself by his bravery, which was at the same time cool and fearless. In 1796, Moreau, having obtained the command of the army of the Rhine, made D. his lieutenant, and employed him in the most difficult and dangerous missions. In Moreau's (q. v.) famous retreat through the Black Forest during this year, D., who commanded the left wing of the army of the Rhine, increased his already great reputation. The French by this retreat had now retired within the Rhine, retaining on the right bank only the fort of Kehl, which D. was commissioned to defend. The fort was in ruins, and could not be well repaired before the approach of the Austrians; nevertheless, behind this imperfect defence D. resisted the Austrian army for more than two months, only capitulating in January 1797, when his ammunition was spent. His greatest achievement, however, was the conquest of Upper Egypt, which he accomplished in 1799, after an eight months' campaign. He was incredibly fertile in resources, and possessed the power of winning and restraining

the people whom he had conquered, to a wonderful degree; his own soldiers used to compare him to Bayard, while the inhabitants named him *The Just Sultan*. D. returned from Egypt just in time to take part in the battle of Marengo, on the 14th June 1800, in which he was killed by a musket-bullet. His body was placed—after being embalmed—in the convent of Mount St Bernard. A statue has been raised in his honour in the Place Dauphine, in Paris.

DESCANT, or DISCANT (Sp. *discante*), a term which, in ancient times, was given to a musical composition; also to the counterpoint or melody which the singer (taking the upper part), sung extempore to the tenor or bass. In modern music, the term is applied to the part written for the voices of females or boys, and is the same as treble or soprano.

DESCARTES, RENÉ (Latinised into RENATUS CARTESIUS), the name of one of the reformers of philosophy, was born March 31, 1596, at La Haye, in Touraine. He was sent at the age of eight years to the Jesuit College at La Flèche, where he soon became distinguished for his keenness of intellect, and made great and rapid progress in languages, mathematics, and astronomy. It was not long, however, before he became dissatisfied with the doctrines and method of scholasticism, and felt it impossible to acquiesce in what had hitherto been regarded as *knowledge*. The first thing that he did after leaving college, as we are informed in his treatise on Method, was to abandon books, and endeavour to efface from his mind all that he had hitherto been taught, that it might be free to receive the impressions of truth, whencesoever they should come. In pursuance of his plan, he resolved to travel, and soon entered the army as a volunteer, serving successively in Holland and Bavaria. As, however, the life of a soldier contributed little to his main object, he quitted the army in 1621; and after making journeys in different directions, he at last retired to Holland, where he prepared most of his works, attracted many disciples, and at the same time became involved in several learned controversies, especially with the theologians. Although he loved independence, yet, in 1649, he accepted an invitation to go to Sweden, addressed to him by Queen Christina, who desired his learned intercourse and instruction. His willingness to leave Holland was partly occasioned by his anxiety to escape from the hostility of his enemies. Only a few months after his arrival at the court of Queen Christina, he died on February 11, 1650. Sixteen years later, his body was brought to Paris, and buried in the church of St Genevieve-du-Mont.

The grand object towards which D. directed his endeavours, was the attainment of a firm philosophical conviction. The way whereby he sought to attain this end, is explained in the Discourse on Method (*Discours de la Méthode*, published in 1637), to which we have already referred. This small, but extremely interesting and important treatise, contains a history of the inner life of the author, tracing the progress of his mental development from its commencement in early years, to the point where it resulted in his resolution to hold nothing for true until he had ascertained the grounds of certitude. The author also, in the same treatise, explains the practical rules whereby he resolved to be guided while in this state of *suspended belief*, and by the observance of which he hoped to arrive at *absolute certainty*, if, indeed, it were at all attainable. The results of his inquiries, so conducted, he exhibited more particularly in his *Meditations de Primâ Philosophiâ*

(Amst. 1641), and the *Principia Philosophiæ* (Amst. 1644). In the former of these treatises, the independence of his thinking is strikingly brought out by his commencing his Meditations with the expression of doubt with regard to all that had hitherto borne the name of knowledge. After examining thoroughly, as he thought, the grounds of certitude in the various departments of knowledge, he found one, and only one proposition that seemed to him to stand the test, and of which the truth could not possibly be doubted: that proposition was, that he existed, which he inferred from the fact of his possessing consciousness. He could not doubt that he felt and thought, and therefore he could not doubt that *he*, the feeler, the thinker, existed. This relation between consciousness and existence he expressed by the memorable words: *Cogito, ergo sum*. Instead, however, of making the above proposition the foundation of his philosophy, by which he would have been led into a direction similar to that of Kant or Fichte, he employed it only so far as to ascertain from it the criterion of certitude—viz., that whatever is *clearly and distinctly thought, must be true*. Amongst these clear and distinct thoughts, he soon recognised the idea of God as the absolutely Perfect Being. This idea, he reasoned, could not be formed in our minds by ourselves, for the imperfect can never originate the perfect; it must be *connate*, i. e., part of the original structure of our understanding, and implanted there by the Perfect Being himself. Hence, from the existence of the idea of perfection, D. inferred the existence of God as the originator of it; he inferred it also from the mere *nature of the idea*, because the idea of perfection involves existence. But if God exist, then we have a guarantee of the previously determined ground of certitude, for God the Perfect Being cannot deceive, and therefore whatever our consciousness clearly testifies, may be implicitly believed.

The most general fundamental principle of the philosophical system of D., is the essential difference of spirit and matter—the thinking and the extended substances—a difference so great, according to D., that they can exert no influence upon each other. Hence, in order to account for the correspondence betwixt the material and spiritual phenomena, he was obliged to have recourse to a constant co-operation (*concursus*) on the part of God; a doctrine which gave rise subsequently to the system called Occasionalism (q. v.), the principle of which was, that body and mind do not really affect each other, God being always the true cause of the apparent or occasional influence of one on the other. This doctrine received its complete development in the pre-established harmony of Leibnitz. See LEIBNITZ.

D. did not confine his attention to mental philosophy, but devoted himself systematically to the explanation of the properties of the bodies composing the material universe. In this department, his reforms amounted to a revolution, though many of his explanations of physical phenomena are purely *a priori*, and certainly sufficiently absurd. His corpuscular philosophy—in which he endeavoured to explain all the appearances of the material world simply by the motion of the ultimate particles of bodies—was a great advance on the system held up to that time, according to which special qualities and powers were assumed to account for every phenomenon. It was in mathematics, however, that D. achieved the greatest and most lasting results; and, indeed, his mathematical discoveries procured among his contemporaries, for his, in many cases, wild philosophical views, a greater importance than they in themselves are entitled to. It was D. who first recognised the true meaning of the negative roots of equations; and we owe to him the theorem,

which is called by his name, that an equation may have as many positive roots as there are changes of sign in passing from term to term, and as many negative roots as there are continuations of sign, and not more of either kind. He gave a new and ingenious solution of equations of the fourth degree; and first introduced *exponents*, and thereby laid the foundation for calculating with *powers*. He shewed, moreover, how to draw *tangents* and *normals* at every point of a geometrical curve, with the exception of mechanical or transcendental curves; and, what perhaps was his highest merit, he shewed how to express the nature and the properties of every curve, by an equation between two variable co-ordinates; thus, in fact, originating *Analytical Geometry*, which has led to the brightest discoveries. D. was less happy in his cosmological exertions, in which he attempted to explain the movements of the heavenly bodies by *vortices* (*tourbillons*), consisting in the currents of the ether which he supposed to fill the universe; a theory which not only then, but even after the discoveries of Newton, made a great noise, and found many adherents, but which has long ago been consigned to oblivion. The philosophical and mathematical works of D., which are composed in Latin, were published at Amsterdam (9 vols. 4to, 1692—1701, also in 1713), and at Paris (1724—1726, in 13 vols. 12mo). More recently, an edition of his whole works has been published by M. Cousin (11 vols., Paris, 1824—1826).

**DESCENDANTS.** See **HEIR**, **COLLATERAL**, &c.; **SUCCESSION**.

**DESCENT, LINE OF SWIFTEST**, is that by which a body falling under the action of gravity, passes most quickly from one point to another. It is proved that, when the one point is not directly over the other, the line of swiftest descent is an arc of a Cycloid (q. v.).

**DESERET.** See **UTAH**.

**DESERT** (*desertus*, solitary), a term used to denote any portion of the earth's surface which, from its barrenness, as in the case of the arid plains of Northern Africa and Arabia, or from its rank exuberance, as in the case of the *Silvas* of South America, is unfitted to be the site of great commercial and industrial communities. Many names, each differing in meaning to some extent, are employed to designate the desert-plains of different countries. The *Desert* proper may be said to signify the vast sandy plains of Africa and Arabia; while the flats extending from the Black Sea on the north, and from Persia on the south, onward across Tibet and Tartary to the north-eastern coasts of Asia, are called *Steppes*; those in the northern division of South America, *Silvas* or desert-forests; those in the other portions of South America, *Llanos* and *Pampas*; and those in North America, *Prairies* or *Savannahs*. All these, though widely differing in individual characteristics, have in common the important physical features of wide extent and uniform general level. The *Oases*, which are occasional spots in the desert where springs arise, and where the waste is enlivened by the presence of vegetation, are usually lower than the general level of the surrounding plain. The great and famous desert-ground, however, is to be found in the Old World. A huge tract of comparatively rainless country stretches almost continuously from the North Atlantic to the shores of the North Pacific, thus forming a great belt of sand from east to west, along the whole extent of the eastern hemisphere. Beginning from Cape Nun on the north-west coast of Africa, the *Great Sahara*, the grand type of all desert-grounds, stretches away eastward from the shores of the Atlantic to the

banks of the Nile, its eastern division being frequently called the desert of *Libya*. Crossing the Nile, by the irrigation and inundations of which alone Egypt is preserved from subsiding into the waste condition of the surrounding country, the desert is again found, interposing a strip of hot sand between the right bank of the Nile and the western border of the Red Sea, upon whose shores no rain ever falls. On the right shore of the Red Sea, desert-grounds unvisited by any rains prevail over the greater portion of Arabia, and stretch onward, with occasional interruption, over Persia, Tibet, and the Tartaries. The most extensive desert in the eastern portion of these arid districts is called the Desert of Gobi, which extends from the western extremity of Tibet north-east to the shores of Lake Baikal. The cause of this extraordinary zone of parched land, and of similar smaller tracts in other parts of the world, will be best explained under the head of **RAIN**.

**DESERTAS**, the general name of three rocky islands in the Atlantic Ocean, situated to the south-east of Madeira, in lat. 32° 31' N., long. 16° 30' W. The southern and largest island is called Bugio; the centre one, *Deserta Grande*; and the northern, *Chão*. *Deserta Grande* has a length of six miles, with a breadth of from half a mile to one mile; *Chão* and Bugio are only about a mile in length—the latter about the same in breadth, but the former not more than a quarter. The D. are not inhabited, but they yield considerable pasturage, and are visited at certain seasons of the year by fishermen and herdsmen.

**DESERTION FROM THE PUBLIC SERVICE OF THE COUNTRY** is the crime of a man absconding, during the period for which he is enlisted, from the service of the army or navy. This crime was, by certain old statutes, made punishable with death; but now the punishment for desertion is prescribed by the annual Mutiny Acts. By 23 Vict. c. 9 and 10, any court-martial may inflict a sentence of corporal punishment, not exceeding fifty lashes, for desertion, and may in addition award imprisonment for the period prescribed by the articles of war. By 20 Vict. c. 13, s. 35, and 22 Vict. c. 4, s. 35, it is provided that deserters may be marked on the breast in gunpowder or ink with the letter D. This provision is omitted in the Mutiny Act, 1860. Recruits deserting before they have joined their regiments, are to be taken to the regiment nearest to the place where they were found, but to suffer no punishment except loss of bounty. Inducing to desert was formerly punishable by death; the punishment has, by modern statutes, been commuted to penal servitude. If simply 'absent without leave,' a British soldier, besides undergoing some kind of punishment, forfeits his regular pay for the days of absence; but if his non-appearance involves actual desertion, he loses all claim to additional pay, good-conduct money, and pension. The number of deserters from the British army is very great. In one particular period of eight months, from October 1, 1857, to March 31, 1858, no less than 8822 men deserted from the regular army, and 6614 from the militia; and recent experience points to 20,000 as a probable yearly average at present. Many experienced officers attribute the evil to the temptations of bounty, rather than to any other cause (see **BOUNTY**); and advise that the same amount of money should be applied to the soldier's benefit in some other form.

Desertion is equally a crime when committed by a seaman of the royal navy as by a soldier. A sailor absent from three successive musters is

a 'runaway;' and when discovered and brought back, his punishment consists in a deduction of his wages. If his absence is continued, it amounts to desertion. All harbouring of deserters by other persons is punishable. The year 1860 was marked by great and scandalous desertions from the royal navy; the cause is very obscurely known, but is generally referred to some points of superiority in the merchant-service, which tempt the seamen away from their duty.

**DESERTION OF SPOUSE.** Before the passing of the Divorce and Matrimonial Court Acts, there existed in England no means whereby a wife, wilfully deserted by her husband, could obtain redress. By 20 and 21 Vict. c. 85, and 21 and 22 Vict. c. 108, desertion by either spouse is made a ground of judicial separation; and desertion coupled with adultery, is a ground for dissolution of marriage. The same acts make provision for the protection of property acquired by a wife who has been deserted. In an action for divorce on account of adultery, it is no bar to the action that the husband has deserted his wife. *Morgan v. Morgan*, Curtis ii. 686.

In Scotland, where the wife deserts the husband, she forfeits her claim to aliment; but in the event of her contracting debt for necessities, the husband will be liable in payment, unless he shew that the tradesman was aware of the separation. It is said that she may claim her legal provision of terce on the husband's death, though she have deserted him. A husband deserting his wife, continues liable to aliment her. It appears to be doubtful whether *simple desertion* of a wife by her husband is a ground for judicial separation. But if either party shall, without just cause, have abandoned the conjugal society of the other for four years together, a decree of divorce will be pronounced at the instance of the deserted spouse (1573, c. 55), *Fraser On Domestic Relations*, 458, 650. See DIVORCE; SEPARATION JUDICIAL, OF MAN AND WIFE.

**DESERTION OF THE DIET.** See DIET, DESERTION OF.

**DESICCANTS**, in Medicine, are substances with astringent properties, which are serviceable in checking secretion and exhalation.

**DESICCATION** is the process of drying by the employment of heat, dry air, or chemical agents which have an affinity for water. Examples of the class of *desiccants* or drying substances are fused chloride of calcium, quicklime, fused carbonate of potash, and oil of vitriol. The latter is employed by being placed in a separate vessel near the substance to be dried, and under a bell jar.

**DESIGN**, a preliminary work, either in outline or colour, in which the conception of the artist is indicated, and more or less fully expressed. The design ought to exhibit the whole composition and drawing of the work, though the last only in a general way. The design ought thus to be a correct, though not a complete representation of the future work. When colours are employed in a design, it is rather tentatively, and for the purpose of ascertaining what their effect will be, than with a view to actually producing the effect required. A sketch differs from a design, inasmuch as the former is generally applied to a first drawing from an object placed before the artist; the latter, to a first drawing of an object which he has imagined, either wholly, or in the attitude and combinations in which he represents it. In Architecture, the term is applied to a drawing mathematically correct, but in which the effects to the eye which will ultimately be produced by distance and by light and shade, are altogether ignored. An

architectural design is consequently scarcely intelligible on first sight.

Designing on wood for wood-cuts or engravings is now a distinct profession, followed by a class of artists. A design of this kind consists of a drawing in pencil on the wood, the effects being as closely as possible what the printed engraving is intended to represent. See WOOD-ENGRAVING.

**DESIGN, GOVERNMENT SCHOOLS OF.** The object of these schools is to communicate to artisans and manufacturers, and above all, to the designers whom manufacturers employ in the preparation of patterns and models, such an acquaintance with the principles and practice of the fine arts, as may be brought to bear on manufactures. The idea of their founders was, that by training artisans in this manner, greater symmetry of form, harmony and richness of colour, and appropriateness of decoration, might be given to the ordinary objects of everyday use which it was their occupation to produce. The effort was not in opposition to, but in direct accordance with, the principles of an enlightened utilitarianism, for it was hoped that not only the direct and primary function of each object might thus be performed as well, or better, but that it might be made to serve the indirect and secondary, but not less important office of refining and purifying public taste, and thus of adding to the sum of human happiness. Even the ethical side of the question was not overlooked. It was remembered that the good and the beautiful are intimately related, and it was hoped that not only enjoyment but virtue might be thus promoted. With these high objects in view, a central School of Design was established at Somerset House in 1837, and branch-schools have since been opened in almost every town in the kingdom. These schools are managed by the Committee of Council on Education, through the intervention of the Department of Science and Art, the offices of which are now situated in the Cromwell Road, South Kensington. In connection with the schools of design, it was very soon found necessary to establish classes for elementary drawing, it being fruitless labour to attempt to teach the more advanced branches of art to persons who were ignorant of its first principles. It was also felt that, before a general demand for good designs could be created, the large body of the public, who form the purchasers, must be instructed in the general principles of art. Impressed with the necessity of an acquaintance with elementary drawing for the accomplishment of their ultimate object, and entertaining strong opinions as to its value as a branch of general education, the Department of Science and Art resolved to throw their drawing-schools open to the public, on the payment of merely nominal fees. These schools are now attended by large numbers of persons of all classes, and nothing can exceed the precision and accuracy of the instruction which is communicated in their elementary classes. In the more advanced stages, however, their pupils seem to make little progress: and the water-colour paintings which they exhibit, both of flowers and landscapes, are inferior to those of many private drawing-schools. The following is an abridgment of the arrangements by which assistance in promoting the teaching of elementary drawing, &c., and in establishing local schools, is afforded by the Committee of Council on Education, taken from the *Directory for 1860*, issued by the Science and Art Department:

*Establishment of a National Training-school of Art.*—I. A Central Training-school, for the benefit of the United Kingdom, is established at South Kensington, to which male and female students are admitted when properly qualified, receiving an allowance in aid of their maintenance which is

proportioned to their attainments and to their qualifications for the duties of teaching required from them. When such students have obtained the requisite certificates of qualification, they are recommended as teachers to the local Schools of Art throughout the United Kingdom; and as long as they perform their duties to the satisfaction of the local committees managing the schools which appoint them, and afford instruction to the poorer classes, they receive from the Department, in augmentation of their incomes, payments proportioned to competency and successful results of teaching.

*Establishment of Local Art-schools or Drawing Unions.*—2. A School of Art or Local Union for obtaining instruction in drawing, can be formed wherever the public provides and maintains, at its own liability, suitable premises. Towards the erection of new premises the Department is authorised to make grants not exceeding 25 per cent. on the cost; and an Art-master will be recommended by the Department, on condition that five public schools for the poor, or 500 poor children are found, to whom drawing may be taught; that pupil-teachers of public schools for the poor are taught at a low charge, and that an evening class is held three times a week at a fee not exceeding 6d. a week. As these payments are insufficient to support a master, the local committee must shew that there is a reasonable prospect of his obtaining a livelihood in teaching drawing to other classes, private schools, &c.

*Annual Local Inspections.*—3. At every School of Art or Local Union for teaching drawing, an annual inspection and examination are held by the Department, at which medals and prizes are awarded to students, including those in public schools for the poor, and payments proportioned to the success of the results are made to the teacher.

*National Competition.*—4. The drawings and works of art executed in local schools, which have obtained medals, are brought together once in the year, for competition with each other at an examination held at South Kensington, when Queen's prizes and national medallions are awarded to the most successful students; and to the Schools of Art where they have been instructed, works of art and publications to the value of £10 for each Queen's prize or national medallion, are presented. These examinations, as well as all others conducted by the Department, are open to all persons, whether taught by an Art-master or otherwise.

*Circulation of Examples and Books from the Central Museum.*—5. Every local School of Art is privileged to borrow objects of art from the Museum, and valuable examples, books, &c., from the Library at South Kensington, both these institutions being, as far as possible, circulating institutions, for the benefit of the United Kingdom.

*Grants for Purchase of Examples.*—6. All Schools of Art, public schools for the education of the poor, and mechanics' and other institutions for artisans, may obtain from the Department grants in aid of purchasing examples, models, casts, and other apparatus for art instruction.

**DESIGNS, COPYRIGHT IN.** Designs for articles, whether of ornament or utility, are protected by various statutes. Of these, the most important are the Act to consolidate and amend the Laws relating to the Copyright of Designs for ornamenting Articles of Manufacture, of 1842 (5 and 6 Vict. c. 100), since amended by 21 and 22 Vict. c. 70. By the latter of these statutes, the protection which the former had granted for nine months, is extended to three years, to be computed from the time when the design was registered. By section 5, it is provided that the registration of any pattern or portion of an article

of manufacture to which a design is applied, instead of, or in lieu of, a copy, drawing, print, specification, or description in writing, shall be as valid and effectual as if such copy, drawing, print, specification, or description in writing had been furnished to the registrar under the Copyright of Designs Act. The other statutes are 6 and 7 Vict. c. 65, 13 and 14 Vict. c. 104, 14 and 15 Vict. c. 8, and 15 and 16 Vict. c. 6.

The copyright of paintings, and pictorial representations generally, is considered to be in an unsatisfactory state, and a bill is now (1861) before parliament, brought in by the attorney-general, to amend the law on the subject. See PICTURES, COPYRIGHT OF.

**DESIRA'DE, or DESIDERA'DE, or DESEADA,** the first of Columbus's discoveries during his second voyage, lies about 4 miles to the east of Guadeloupe, of which, under France, it is a political dependency. It measures 6 miles by 2, and contains 2568 inhabitants, among whom are 2070 emancipated slaves. The surface is elevated in proportion to the area, and the soil, though not generally fertile, is yet said to yield excellent cotton.

**DESMAN. See MUSK RAT.**

**DESMIDIEÆ,** according to the prevalent opinion of naturalists, a tribe or group of *Algae*, and as such ranked by some botanists among *Diatomaceæ* (q. v.); whilst other naturalists regard them as belonging to the animal rather than to the vegetable kingdom, some also esteeming them to be vegetable who maintain the animal character of the true *Diatomaceæ*. They are amongst those lowest organisms which seem to connect the animal and vegetable kingdoms at their common starting-point. The D. are readily distinguished from the true *Diatomaceæ* by their rounded—not angular—form, and by their want of silicious covering; also by their colour, which is a herbaceous green, whilst the *Diatomaceæ* are generally brownish. Unlike the *Diatomaceæ*, they shrivel up, and lose their form in drying. They are, like them, microscopic, but are usually found in stagnant or very slowly running water, sometimes in brackish, but never in salt water. They may often be procured in great numbers, by pouring the water in which they exist upon a cloth; and if the cloth is kept moist, they will live for a long time, and their progress may be observed. They all exhibit a transverse constriction, sometimes not very distinct, but often almost dividing the single cell which forms the organism into two parts. It is at this constriction that new cells are formed; but this process ceases after a while, and a true reproduction takes place by spores, either through Conjugation (q. v.) or Swarming (q. v.). It is very much on account of these modes of reproduction, and of the presence of starch in the D., that they are confidently referred by naturalists to the vegetable kingdom. Our knowledge of the D. has been much extended by the work of Mr Ralfs on the *British Desmidiæ*.

**DESMONCUS,** a genus of palms, with slender stems, climbing over shrubs and trees, like the Rattans (*Calamus*) of the East Indies. They are the only American palms of this character. They have alternate pinnate leaves, with long hooked spines instead of several of the uppermost leaflets, which make them very formidable to those who attempt to penetrate the forests where they grow. The species are pretty numerous, and all American.

**DESMOULINS, CAMILLE,** one of the prominent personages of the French Revolution, was born in 1762 at Guise, in Picardy; studied law at the Collège Louis-le-Grand, Paris; but on account of a stutter in his speech, did not prosecute the profession. His

mind was filled with lofty but confused notions of classical republicanism, which found vent on the eve of the Revolution in his *La Philosophie au Peuple Français* (Par. 1788), and *La France Libre* (Par. 1789). To his exaggerated denunciation was owing that outburst of popular fury which resulted in the destruction of the Bastille on the night of the 14th July 1789. In the events of the Champ de Mars, August 10, 1792, D., like his friend Danton, took a leading part, but was less implicated in the September massacres. Elected to the National Convention by the people of Paris, he voted for the death of Louis XVI. His relation to Danton, which had always in it something of dependence, induced him to take up the pen against the Girondists, and in his *Histoire des Brissotins*, he covered these moderate republicans with ridicule. In this, however, D. was not quite sincere, for many of the Girondists he highly esteemed, and he was himself by nature much more like Vergniaud and Brissot than like Robespierre and St Just. When the guillotine was erected, D. saw his error, and bitterly repented his facile folly. Towards the end of 1793, he began to publish *Le Vieux Cordelier*; a journal which recommended, among other things, that the forms of justice should be restored, and attacked the members of the *Comité de Salut Public*. Twice accused before the Jacobin Club, he was at length, on the night of the 30th March 1794, along with Danton, arrested, and brought before the Revolutionary Tribunal. When asked his age, D. replied: 'J'ai Pâge du sans-culotte, Jésus, c'est-à-dire trente-trois ans, âge fatal aux révolutionnaires.' He was condemned without a hearing, and mounted the scaffold along with Danton, April 5, 1794. His wife, the beautiful Lucile Duplessis, vainly endeavoured to excite an insurrection in his favour, and a fortnight after, she also was executed.—D. was essentially an enthusiast and hero-worshipper, always leaning for support on some stronger spirit than his own. His first idol was Mirabeau, after whose death he devoted himself to Danton. His aspirations were noble, his sympathies magnanimous, but he had neither sufficient moral resolution to oppose the political excesses of the popular party, nor even, until the close of his career, sufficient insight to assure him of their injustice and folly. Gifted abundantly by nature, as the light-hearted Camille was, with wit, fancy, and feeling, one cannot help regretting that he did not live in less troublous times, when he might have given to the world, in the form of poesy or fiction, the treasures of his rich and sparkling genius.

DESNA, a river of Russia, rises in the government of Smolensk, 50 miles south-east of the town of that name. It flows south-east through the governments of Smolensk and Orel, until it reaches Briansk, where it enters the government of Tchernigov, through which it flows south, then south-west to the town of Tchernigov, and finally joins the Dnieper nearly opposite Kiev. The D. is 500 miles in length, and is navigable throughout almost the whole of its course. Its chief affluents are the Scim, from the left, and from the right, the Snov.

DESPOT AND DESPOTISM. A despotism is a form of government which has for its object the interests either of an individual or of a class, to the exclusion of those of the whole community. In the former case, it is usually called a Tyranny (q. v.), which is the degenerate form of monarchy; in the latter, it may be either an oligarchy, which is the degenerate form of aristocracy, or an ochlocracy, which is the degenerate form of democracy. A despot is the individual or class in whose favour

and for whose benefit such a government is carried on. A despot may thus include any number of persons, from unity upwards—from a monarch to a mob. Much of the confusion which attends political speculation, and many of the disasters which befall political life in modern times, would be obviated, if these terms were used in the strictly scientific sense which was assigned to them by the Greek politicians more than 2000 years ago. See MONARCH, TYRANT, DICTATOR.

DESSALINES, JACQUES, some time emperor of the island of Hayti (St Domingo), was imported into that island from the Gold Coast of Africa as a slave. On the liberation of the slaves, 4th February 1794, he became one of the most prominent among the negroes who rose in insurrection against the white colonists. After the organisation of the insurrection, D. occupied the position of first-lieutenant to the leader Toussaint l'Ouverture; and in the wars against the French troops, was always distinguished by his agility and swiftness of movement, as well as by his fearlessness and ferocity. D. submitted, however, and took advantage of the amnesty granted on the capture of Toussaint in 1802; but shortly after he headed another insurrection, attacked the French forces, defeated them in the battle of St Mark, and compelled them to evacuate the island in October 1803. He was created governor in January 1804, when the people of the island declared themselves independent, and had himself crowned as Emperor of Hayti, 8th October of the same year, under the name of Jacques I.; but his despotism and cruelty soon alienated from him the sympathy and support even of those who were formerly his firmest adherents. On the 17th of October 1806, D. was attacked and killed by Christophe, a negro chief, who succeeded him as Emperor Henri I. of Hayti.

DESSAU, a town of Northern Germany, capital of the duchy of Anhalt-Dessau, is situated on the left bank of the Mulde, not far from its junction with the Elbe, about 80 miles by railway south-west of Berlin. D. is enclosed on three sides by walls, the river forming the protection on the fourth side. D. consists of three parts, the old and new town, and the Sand, and it has besides three suburbs. It is, in general, well built, and one or two of the streets are particularly handsome. Among the principal buildings are the ducal palace, a noble structure, built in 1748, with a picture-gallery, and a library, containing many MSS. of Luther, a town-hall, an elegant theatre, and several churches and benevolent institutions. Its educational establishments are numerous and excellent. It has a fine cemetery, and the environs are surrounded by beautiful gardens. The manufactures are woollen cloth, hosiery, tobacco, and spirits. Pop. 14,000.

DESUETUDE, a technical term in the law of Scotland, signifying that repeal or revocation of a legal enactment which is effected, not by a subsequent enactment in a contrary sense, but by the establishment of a contrary use, sanctioned by the lapse of time and the consent of the community. The corresponding term in English law is *nonuser*; but neither the word nor the idea attached to it is familiar to that system. The rule in England is, that a statute once formally enacted by the legislature, remains in force, however unsuited it may be to the altered conditions of society, till it be repealed by another statute. The repeal may be by implication, but here the law watches with a jealous eye. Such repeal 'is to be understood,' says Blackstone, 'only when the matter of the later statute is so clearly repugnant that it necessarily implies a negative. As, if a former act says that a juror upon such

a trial shall have an estate of twenty pounds a year; and a new statute afterwards that he shall have twenty marks—here the latter statute virtually repeals the former.' So far was this principle carried, that it was formerly the rule, that if a statute repealing another was itself repealed afterwards, the first statute was revived without any formal words for that purpose. But this rule has been changed by 13 and 14 Vict. c. 21, s. 5 and 6, which enact that where any act repealing, in whole or in part, any former act, is itself repealed, such last repeal shall not revive the act or provisions before repealed, unless words be added for that purpose; and that where any act shall be made, repealing in whole or in part any former act, and substituting provisions instead of those repealed, such repealed provisions shall remain in force till those substituted shall come into operation by force of the last made act. In Scotland, an opposite principle prevailed, and it is still held that acts of parliament made before the Union may lose their force by disuse, without any express repeal, or 'go into desuetude,' as it is commonly said. But by desuetude is meant something more than mere non-use for a period of time, however great. There must be contrary use of a positive kind, inconsistent with the statute, and of such a kind as to prove the altered sense of the community; there must, in short, be consuetudinary law in a negative sense; and the so-called desuetude thus amounts to a repeal of statute law by consuetudinary law. Both rules are liable to objections. The result of that followed in England has been, that statutes have remained on the statute-book without formal repeal, after their enforcement had become morally impossible. Of this it may be mentioned, as one single example, that the judicial combat was formally demanded in virtue of an unrepealed statute, and had in point of form to be conceded in the present century. See DUEL. In such cases, a virtual recourse to the principle of repeal by opposite consuetude becomes a matter of necessity, and the deficiency of the English law in point of principle is corrected in practice by the impossibility of administering it. The Scottish principle, on the other hand, though far more philosophical and reasonable in itself, scarcely admits of practical application; and the greatest difficulty has consequently been felt in determining what constitutes such contrary use as to support the plea of desuetude. The best arrangement probably would be, whilst retaining the Scottish rule as correct in principle, to endeavour, by purging the statute-book of all obsolete enactments, to render its practical application as limited as possible.

**DETAICHMENT**, in Military matters, is a small but indefinite number of troops, sent for some special duties away from the regiment, brigade, division, or army, as the case may be. In a fleet, also, a detachment of one or more ships may be told off in a similar way.

**DETERMINANTS**, the name given to a new method of great use, *inter alia*, in the solution of equations embracing several unknown quantities, whereby the student can almost on inspection write down the values, in terms of the known quantities, of each of the unknown.

**DETINUE**, in English law, an action for the recovery of goods wrongfully detained, or their value, with damages and costs. The action is for the recovery of a specific article; the goods detained must, therefore, be of such a character that they can be distinguished from others, as a horse, money in a bag, &c. In this respect, the action of detinue differs from an ordinary action at law, and judgment in detinue is accompanied by its special

remedy for enforcing execution—called writ of *Distringas*. There must actually be a title of property in the plaintiff at the time he brings his action; but property without possession is sufficient, and an heir can thus bring his action for an heirloom which has never been in his possession. This action was formerly subject to *Wager of Law* (q. v.), now abolished, whereby the defendant was allowed to clear himself by his own oath, supported by that of eleven neighbours. This proceeding rendered the action of detinue so inconvenient, that, by a fiction of law, remedy for wrongful detention was most frequently sought by the action of *Trover* (q. v.).

**DETMOLD**, a town of North-western Germany, on the Werre, capital of the principality of Lippe-Detmold, 47 miles south-west of Hanover, consists of an old and new town, the latter of which is well built, and adorned with public walks and gardens. The chief buildings are the palace, a fine old castellated edifice surrounded by prettily arranged gardens, the gymnasium, and the theatre. D. has also a training-school, a public library, and a hospital. The manufactures are leather, woollens, and linens. There are also several breweries. Pop. 5232.

**DETONATION** is the phenomenon of combustion with explosive rapidity, accompanied by sound and light. Thus the firing of gunpowder, gun-cotton, and fulminating-powders, as in a percussion-cap, is detonation.

**DETRITUS**, applied in Geology to accumulations formed by the disintegration of rocks, which consist of gravel, sand, or clay, or of an admixture of them.

**DETROIT** (French for strait) is that part of the St Lawrence which discharges Lake St Clair into Lake Erie. With a south-south-west course, it forms the lowest section of that mighty body of waters before it assumes its north-east direction towards the gulf of its own name. It is about 28 miles long, with a minimum breadth of fully half a mile. Though the middle of its length is barely above the 42d parallel—about 550 miles to the south of any point in England—yet it is frost-bound for about four months in the year. It is navigable for vessels of any burden, the deeper channel being on the Canadian shore.

**DETROIT**, the oldest city by far in the west of the United States, and older than either Baltimore or Philadelphia on the sea-board, was founded by the French of Canada in 1670, as an outpost for the prosecution of the fur-trade, on the right bank of the river of its own name. For more than a century and a half, however, the advantages of its position were rather prospective than actual. Even under American impulses, the settlement of the adjacent wildernesses was so slowly carried into effect, that Michigan, of which D. was the capital, continued to be a subordinate territory, as distinguished from a sovereign state, from 1805 to 1837. Accordingly, as late as 1830, the place contained only 2222 inhabitants. But in 1840, the population had risen to 9102; in 1850, it was 21,019; and by a local census of 1853, it stood at 34,436; and finally, notwithstanding the commercial crisis of 1857, the census of 1860 gave 45,619. The exports and the imports between them exceed 20 million dollars, or 4 million pounds; while the aggregate shipping cannot be less than 50,000 tons—more than the half being propelled by steam. Besides a net-work of navigable communications, which, with the aid of art, has added the open ocean and the Gulf of Mexico to the St Lawrence, D., to say nothing of plank-roads, now commands overland facilities to an extraordinary extent. Westward, the Michigan Central Railway leads

to Chicago; while, eastward, the Great Western of Canada, after traversing the more fertile portion of that province, meets the Grand Trunk, which stretches its arms to Portland on the Atlantic. D. has a well-organised system of public schools. It is supplied from the river with water, which is forced into a reservoir 50 feet high. The manufactures are extensive and important, consisting of steam-engines and of machinery in general, of stoves, ploughs, cabinet-ware, &c. Brewing and tanning are also largely carried on. (1871—pop. 79,577.)

DETTINGEN, a village of Bavaria, circle of Lower Franconia, on the right bank of the Maine; noted as the scene of a battle during the Austrian wars of succession. This conflict, in which George II. of England headed the army of the allies, while the Duke de Noailles acted as commander of the French forces, took place on the 27th June 1743, and was the last occasion in which a king of England appeared in person on the field. The army of the allies was composed of English, Hanoverians, Hessians, and some troops from the Low Countries, amounting in all to an active force of 37,000 men; while the French leader Noailles had an army of about 60,000. The former occupied a valley extending from Aschaffenburg to Dettingen. Before the fight, Noailles threw 12,000 men into Aschaffenburg, and so made it impossible for his opponents to retreat with safety. The defile of D. in front of the allies was also held by De Grammont with 25,000 men, while Noailles himself, shifting his position on the Maine, so as to command with his batteries the flank and rear of the allies, rendered their position so critical that George resolved to force his way through the enemy. It was his only chance; and fortunately for him, De Grammont rashly and foolishly left his position, rushed over the morass and rivulet in his front, and engaged. At this moment, George, dismounting, placed himself at the head of the British and Hanoverian infantry, flourished his sword, and shouted: 'Now, my boys, for the honour of England! fire; behave well; and the French will soon run!' Shock after shock from the impetuous French horse broke on the steady lines of infantry in vain, and at length George, forming his infantry into one solid column, advanced. Onward went the column, dense, steady, and overwhelming, breaking the squadrons of De Grammont, and driving horse and foot before them, until the enemy broke into promiscuous and bewildered retreat. Noailles's reserves were too late to be of any use: the allies had won the day. Many of the French were driven into the Maine, and so drowned; some were killed in the pursuit, which, however, was not prosecuted to any great extent. The loss of the French, in killed, wounded, and prisoners, was estimated at 6000, and that of the allies at 2000 men.

DETVÁ, a town in the north-west of Hungary, is situated in a deep valley, 20 miles east of Altsohl. Pop. 7240.

DEUCA'LION, according to the Greek myth, was a son of Prometheus, grandson of Iapetus, and husband of Pyrrha. When Zeus had resolved to destroy the race of men by a flood, D. built and provisioned, by the advice of his father, an ark or ship, which he entered along with his wife. The flood came, and all Hellas was submerged. D. floated about for nine days, and on the subsidence of the waters, the ark rested on Mount Parnassus. Other versions of the myth, however, make it rest on Mount Othrys in Thessaly, on Mount Athos, or on Mount Etna in Sicily. D. and Pyrrha, according to one account, now offered up sacrifice to Zeus

*Phycius*, i. e., Zeus, the protector of fugitives, and prayed that he would repeople the world, which he did; but the more common tradition was, that they went to the sanctuary of Themis for this purpose, and were told by the goddess that they must throw behind them the bones of their mother as they departed from the temple. Understanding by the 'bones of their mother' the stones of the earth, they obeyed the injunction, and from those thrown by D. sprang up men, and from those by Pyrrha, women. D. built his first dwelling-place at Opus or Cynus. He is also said to have founded the sanctuary of Olympian Jove at Athens, and in later ages his tomb in the vicinity was long pointed out. D. had by Pyrrha several children, Hellen, Amphictyon, Protogeneia, and others. It was at one time extensively believed, even by intelligent scholars, that the myth of D. was a corrupted tradition of the Noachian deluge, but this untenable opinion is now all but universally abandoned. The myth is a comparatively late one, being mentioned neither by Homer nor Hesiod.

DEUS EX MA'CHINA, an expression borrowed from the classical theatre. In conformity with the popular mythological beliefs of their age, the tragic poets of Greece, instead of bringing about the dénouement of their plots by natural means, had often recourse to a more expeditious mode—viz., the intervention of a god, who descended in a machine, and abruptly solved whatever difficulty barred the proper termination of the piece. As examples of the *Deus ex Machina*, take the appearance of Hercules in the *Philoctetes*, and of Diana in the *Iphigenia in Tauris*. In modern tragedy, when a person or incident is introduced arbitrarily, *forced*, as it were, into the conduct of a plot, merely to remedy some martistic negligence in its construction, or to save the author the labour of further ingenuity, such a contrivance is metaphorically called a *Deus ex Machina*. In modern comedy, the rich old uncle who suddenly comes home from the West Indies, and rescues the young couple (hero and heroine) from their dreadful pecuniary embarrassment, serves exactly the same purpose. When a savant or philosopher cannot explain some fact of nature by any known law, and has recourse to the supposition of the direct and immediate action of God, his assumption is also termed by analogy a *Deus ex Machina*.

DEUTERONOMY (Gr. *Deuteronomion*, i. e., the second law) is the name given by the Septuagint translators to the 5th book of the Pentateuch, because it contains a repetition of the entire Mosaic legislation, with the exception of what pertains to the priesthood. It is commonly presumed to have been written by Moses himself, with the exception of the last four chapters, which narrate the closing events in the life of the great lawgiver in a biographical and not in an autobiographical spirit. Many critics, however, especially in Germany, affirm that the entire book itself in its present form is post-Mosaic. The repeated allusions to the kingdom, the prophethood, the temple at Jerusalem, places in Palestine which Moses never saw, and could not have known, as well as various other particulars, render it (it is alleged) probable that Deuteronomy is a late recension and enlargement of some Mosaic abridgment of the previous portion of the Pentateuch. That the work has a Mosaic basis, nevertheless, is indisputable, for the language in many parts is more lifelike, and partakes more of the personality of the author, than anything ascribed to Moses elsewhere. The style, in fact, except in the connecting narrative, is for the most part the exact opposite of a compiler's.

DEUTOXIDE. See CHEMICAL NOMENCLATURE.

DEUTZ. See COLOGNE.

DEUTZIA, a genus of shrubs of the natural order *Philadelphaceæ*, natives of the north of India, China, and Japan, some of which are now reckoned among the favourite green-house plants of Britain, in some situations even enduring the open air. They produce beautiful white flowers in great profusion. The leaves of *D. scabra* are so rough with silicious hairs, that they are universally used by joiners in Japan for polishing wood.

DEUX-PONTS (Ger. *Zweibrücken*), a town of Rhenish Bavaria, picturesque situated among wooded heights on the Erbach, near its junction with the Sere, 34 miles west-north-west of Landau. D., which owes its name to the two bridges which there cross the Erbach, is well built, and has among its principal buildings a Lutheran cathedral, also the remains of an ancient ducal palace, now used as a Catholic chapel. Its manufactures are woollen and cotton cloth, hardware, leather, and tobacco. Pop. 7300.

D., or, in Latin, *Bepontium* (whence the name *Bepontine* given to the edition of Greek and Latin classics here printed by a society of scholars in 1779), is not mentioned in history till 1197, and was then in the possession of Counts of Deux-Ponts. After various changes of masters, it finally came into the possession of Bavaria.

DEVAPRAYA'GA, a town in India, remarkable chiefly for its situation, stands in the fork of the *Alukmnda* and the *Bhageerettee*, whose united waters immediately assume the name of Ganges. It is in lat. 30° 8' N., and long. 75° 39' E., belonging to the protected state of Gurwhal; and its elevation above the point of confluence is 313, and above the sea, 2266 feet. Marking, as it were, the source of the sacred river, D. is a favourite place of pilgrimage for the Hindus; and, in fact, its only permanent population consists of about 1000 Brahmins from the Deccan. In connection with the holy character of the locality, are two ancient temples, a flight of steps in the rock down to the very brink of the mingled streams, and three basins excavated in the solid stone a little below the level of the surface of the current. The town was much shattered by an earthquake in 1803, but was subsequently repaired at the expense of Scindia, the *Mahratta* chief of Gwalior.

DEVELOPMENT OF DOCTRINE signifies the modifying process through which Christian or philosophical opinion passes in its transmission from age to age. At first comparatively simple in its expression, doctrine has a tendency to become more complicated and technical in structure as argument is exercised upon it, and the spirit of controversy excited. The difference between the doctrinal statements in the Pauline Epistles and the earlier creeds, such as that of Nicea, the elaborate expositions of the medieval theologians, and again of the Protestant theologians of the 16th and 17th centuries, is a difference at once appreciable by the theologian, as it is full of interest to him. There is, beyond doubt, at these several points in the history of the church, a certain growth or extension of Christian opinion called forth by, and corresponding to, the exigencies of the times. This is what is meant by the development of Christian doctrine, and the name denotes with sufficient propriety an unquestioned series of phenomena.

It is true that the idea of development in doctrine is one of modern origin, unknown to the earlier dogmatic ages of the church. But this merely proves that it is only in recent times that the history of the church has been reviewed in a critical and

philosophical spirit. The idea of development is modern in its application to science altogether, and especially to the science of history. The ground upon which it is vindicated, in its application to Christian doctrine, is, that this doctrine is not a mere repetition of Christian truth in the language of inspiration, but really the rational or argumentative exposition of this truth. It represents this truth as it appears to the Christian reason in different ages. It is the expression of what has been called the *Christian consciousness* working in contact with the text of Scripture. The Nicene doctrine of the Trinity, for example, is the definite explanation which the Christian reason of the 4th c. gave to the undefined and general expressions of the gospels and epistles as to the relation of the Father and the Son. The doctrine of the atonement, as a *satisfaction* to God for the sins of the world, is first clearly and explicitly unfolded by St Anselm in the 11th century. It is not recant that the elements of either of these doctrines are not to be found in Scripture, or that they are the product of human ingenuity; it is only affirmed that the scriptural elements in the one case and the other, were first clearly and argumentatively unfolded by the ingenuity of the Christian reason at these different times. The very idea of *doctrine* implies the employment of reason, the exercise of inquiry and argument upon the divine truth of Scripture. It is this truth analysed and reflectively given forth—not the mere equivalent of Scripture, but something derived from it by Christian investigation and culture. Such a process of investigation and culture is necessarily variable and progressive. The divine fact remaining the same, the human explanation or doctrine of it may and does greatly vary. The course of this variation—the rising and falling of the human apprehension of the meaning of Scripture—is the development of doctrine.

This view is to be distinguished from that which characterises the extreme subjective school of German theology. According to this school, Christian doctrine is nothing else than the expression of the Christian consciousness at any time. Scripture maintains no permanent or authoritative relation to it. It is all progress—a continued flux, without any normal standard or expression. Scripture may be its primary expression, but it may leave its fountain-head, and in the course of time issue in developments not necessarily bound to Scripture. But according to the view above set forth, Scripture remains the absolute and complete revelation of Christian doctrine, which is continually unfolded, but never exhausted by inquiry—beyond which right reason and truth never travel. The Christian revelation not only admits of, but demands constant criticism, as the means of unfolding more comprehensively and perfectly its contents, but it remains in itself the consummate expression of all spiritual truth; and it is this very peculiarity of the Christian revelation, that makes its contents capable of continual and ever fresh development. It is just because its substance is divine, that its doctrinal expressions never cease to interest and to answer to the necessities of successive times. Other religions, while capable of development, reach a point where they cease to have any further living meaning, and pass on the one hand into mere popular mythology, or into an esoteric priestly tradition. They become transmuted into poetry or some ordinary product of philosophical speculation. Civilisation overtakes and supplants them. But it is of the distinguishing divine character of Christianity that its doctrines possess a vital ever-renewing power, capable of adaptation to the highest forms of human civilisation, and full of enlightenment and guidance to the most advanced intelligence. The development of

Christian doctrine, therefore, is not merely a subject of curious and important study in the past, but of great and significant influence for the present and the future.

DEVELOPMENT OF THE EMBRYO.

Harvey laid down the principle, in opposition to the views of those who believed in the doctrine of spontaneous generation, that all animals are produced from eggs (*omne vivum ex ovo*); and more recent researches have fully confirmed this view, if we are allowed to except the modes of reproduction known as *gemmiparous* and *fissiparous*, or multiplication by buds and propagation by division, and the series of cases in which the offspring never resemble their parents, but the original form reappears in the second generation, and which are consequently said to present the phenomena of *alternate generation*. These exceptional cases occur only in very low forms of animal life, and, as a general rule, in retracing the phases of animal life, we arrive at an epoch in which the incipient animal is enclosed within an egg. It is then termed an *embryo*; and the modifications which this embryo undergoes before the young animal has an independent existence, are included in the general term which stands at the head of this article. Before embryology was properly studied, all animals were arranged under two great heads—the *oviparous*, which lay eggs; and the *viviparous*, which bring forth their young alive. We now know that viviparous as well as oviparous animals are produced from eggs—the only difference in this respect being, that their eggs, instead of being laid before the development of the embryo, begin to undergo their early changes in the body of the mother.

The egg has generally a more or less spherical form; the eggs of birds have, however, the form of an elongated spheroid, narrow at one end, and hence the origin of the word *oval*. Some eggs, as, for instance, those of certain insects (e. g., the podurella), are furnished with projecting filaments; others have a sculptured surface; and others, again, have peculiar forms, being cylindrical or prismatic. A simple sphere is, however, the normal form.

The egg originates within organs termed *ovaries*, peculiar to and characteristic of the female, except in those cases in which both male and female reproductive organs are associated in the same individual. These ovaries are glandular bodies, and are usually situated in the abdominal cavity. So long as the eggs remain in the ovary, they are very minute, and in this condition they are called *ovarian* or *primitive*

Fig. 1.—Ideal section of a Bird's Ovary:

b, the yolk; c, the vitelline or shell membrane; d, the germinative vesicle; e, the germinative dot.

than those laid by some insects.

The egg, when it has attained a certain degree of

maturity, leaves the ovary. This step in the process is termed *ovulation*, and must not be confounded with the laying or deposition of the eggs, which is their subsequent expulsion from the abdominal cavity, through (in most cases) a special canal termed the *oviduct*. Ovulation takes place at a definite period of the year in most of the lower animals, and seldom until the animal has attained its full growth. In general, ovulation is repeated for a number of years consecutively, usually in the spring; sometimes, however, it occurs but once during life, as in most insects, which die soon after the process is accomplished.

After leaving the ovary, the eggs are either discharged from the animal, and undergo their further changes in the external world, or they continue their development within the body of the mother, as is the case in some fishes and reptiles (as sharks and vipers), which have consequently been named *ovoviviparous* animals; or, in the case of the mammalia, they are not only developed within the body of the mother, but, except in the case of the Marsupialia and Monotremata (q. v.), become intimately united to her by the intervention of certain temporary structures—namely, the placenta and umbilical cord. This mode of development is termed *gestation*.

The development of the embryo does not always take place immediately after the egg is laid, and a considerable time may elapse before it commences. Thus, the first eggs laid by the bird do not begin to undergo development until the whole number which is to constitute the entire brood is deposited; and the eggs of most insects are laid in the autumn, and remain unchanged till the following spring. During this time, the vital principle is dormant. See DORMANT VITALITY. In the case of birds and reptiles, a considerable degree of warmth is requisite for the process of development. In birds, the act of *incubation*, or 'sitting,' supplies the necessary amount of heat; and in reptiles, the eggs are hatched by exposure on sands to the sun's rays, by their being deposited in warm dunghills, &c.

We shall endeavour to illustrate the composition and structure of the egg by giving an ideal section

of a hen's egg (fig. 2). In a newly-laid hen's egg—and of course the description equally applies to the egg of any other bird—we have exteriorly the shell, whose hardness is due mainly to carbonate of lime, and which is lined by a double membrane, the shell membrane, c; then there is an albuminous substance, the *white*, in which several layers may be distinguished, e, f; within this, we find the *yolk*, h, enclosed in its membrane; and in the midst of the yolk there was, before it was laid, a minute vesicle, the *germinative vesicle* (fig. 1, d) containing a still smaller one, the *germinative dot*, e. The most conspicuous of these parts—namely, the shell and the white—are not physiologically essential, and are wanting in the eggs of most animals lower than birds; while the yolk, the germinative vesicle, and the germinative dot, are found in the eggs of all animals; and it is from these parts, and these only, that the germ is formed. The *yolk* or *vitellus* is the most essential part of the egg. It is a viscid fluid,

Fig. 2.—Ideal section of a Bird's Egg:

b, the space containing air at the large end; it is formed by the splitting of c, the shell-membrane at the points dd; e, f, layers of albumen; h, the yolk.

DEVELOPMENT OF THE EMBRYO.

sometimes opaque and coloured, as in the eggs of birds, and sometimes transparent and colourless, as in the eggs of many fishes and molluscs. The microscope shews that it is composed of an accumulation of granules and oil-vesicles. The yolk is surrounded by a very thin skin, termed the *vitelline membrane* (fig. 1, *c*). In some insects, this membrane forms the outer coat of the egg.

The *germinative vesicle* (fig. 1, *d*) is a cell, situated in the young egg near the middle of the yolk; it contains one or more minute spots or nuclei, termed the germinative dots, *e*, which themselves contain smaller nucleoli. The *albumen* or *white* of the egg (fig. 2, *e e*, *f f*) is a viscid and colourless fluid, which coagulates and becomes opaque on the application of a temperature of 146° F. Although it forms a large part of the egg of the bird, it is of very trifling importance in reference to the development of the embryo. It is not formed in the ovary like the yolk, but is secreted by the oviduct, and deposited round the yolk during the passage of the egg through that canal; hence, when there is no oviduct, the albumen is generally absent. In birds, it consists of several layers, one of which, forming the *chalaza*, presents a coiled, rope-like appearance. The albumen in this part is thicker than that which lies more externally. The albumen is bounded externally by the *membrana putaminis*, or *shell membrane*, *c*, which, at *d*, *d*, splits into two layers, leaving a space, *b*, at the broad end, filled with air; in birds, and in some reptiles, this membrane is covered by the calcareous shell; in most cases, however, it continues membranous, as in the eggs of the molluscs, most crustaceans, and fishes, frogs, &c.; and sometimes it is horny, as in the sharks and skates.

In order to understand the successive steps of embryonic development, we must remember that the whole animal body is formed of tissues, the elements of which are cells. See CELLS. While in the full-grown animal these cells have undergone such modifications as often hardly to present any indication of their primary form; in early embryonic life, the cells, which originate within the yolk, present a definite form and consistence. These cells we shall presently see become transformed into the blood, bone, muscle, &c., of the young animal. At the commencement of the process of development, the yolk, which previously was a mass of uniform appearance, gradually presents certain alterations. Some portions become more opaque, and others more transparent; and the germinative vesicle, which was in the centre, rises to the upper part of the yolk, where the germ is to be formed. The yolk at the same time undergoes a peculiar process of segmentation. It is first divided into halves, forming distinct spheres, which are again continuously and regularly subdivided into two, till the whole or a part of the yolk assumes the appearance of a mulberry, and is known as the 'mulberry mass.' In fishes, the class of animals whose development we shall specially follow in this article, the segmentation is only partial, the divisions of the yolk not extending into its whole mass. This process leads to the formation of a *germ*, which usually rises above the yolk in the form of a discoid protuberance, which has received the various names of germinative disc, proligerous disc, germinal membrane, &c., and which is composed of minute cells. This disc enlarges, till it embraces the whole, or very nearly the whole, of the yolk. At this early period, the germ consists of a single layer of very minute cells of uniform appearance (see fig. 3, *g*); it soon, however, increases in thickness, and in vertebrate animals separates into various layers, which gradually become more and more distinct (fig. 4). The upper layer, *s*, in this figure is termed the *serous* or *nervous layer*, and from it are subse-

quently developed the principal organs of animal life—such as the bones, muscles, brain and nerves, &c. The lower layer, *m*, gives origin to the organs of vegetative life, and especially to the intestines and chylopoietic viscera, and is called the *mucous* or *vegetative layer*; the cells of which it is composed are larger than those of the serous layer. Between these layers there is, in the vertebrata, an intermediate layer, *v*, giving rise to the organs of circulation and to the first-formed blood, and hence termed the *vascular layer*.

At a very early period, the germ undergoes modifications of form, varying with the department of the animal kingdom to which it belongs. Thus, in the articulata (insects, crustaceans, &c.), the germ is divided into segments, indicating the transverse divisions which occur in the adult animal (fig. 5);

Figs. 3—10.

while the germ of vertebrate animals displays a longitudinal furrow, marking the position which the vertebral column and spinal cord are to occupy (fig. 6). The development of this furrow is highly important, as will be seen by a reference to figs. 7, 8, and 9, in which the egg is supposed to be cut through its centre, in a plane at right angles to its long diameter, so that only the section or cut surface is shewn, while the view in fig. 6 shews the whole course of the furrow as it extends over the yolk. At first, the furrow is very shallow (fig. 7, *b*), and a minute transparent band appears under it, called the *primitive stripe*, *a*. The walls of the furrow consist of two raised edges formed by a swelling of the germ on both sides of the primitive stripe. As these walls increase in height, their summits approach each other, as is seen in fig. 8; and after a time they unite, and convert the furrow into a closed canal (fig. 9), which is soon filled with a fluid from which the brain and spinal cord are subsequently formed.

The primitive stripe is gradually developed into a cartilaginous structure, termed the *chorda dorsalis*, which is the representative of the back-bone. In the meantime, the margin of the germ continues to extend over the surface of the yolk, until at length the latter is entirely enclosed in a cavity thus formed by the germ. In this lower cavity, the intestines and other organs of vegetative life are subsequently developed.

In all classes of the animal kingdom, the embryo rests upon the yolk, and covers it like a cap; but the direction by which its edges approach each other and unite to form the lower cavity, is very different in different kinds of animals, and is highly distinctive in reference to zoological classification. In all the vertebrata, the embryo lies with its face or ventral surface towards the yolk (fig. 10), and thus the suture or line at which the edges of the germ unite to enclose the yolk, and which in mammals forms the navel, lies in front. Another suture is found along the back, arising from the folding together of the upper surfaces of the germ, to form the dorsal canal. In the affection known as *spina bifida*, this suture is

## DEVELOPMENT OF THE EMBRYO.

incomplete. In the articolata, the embryo lies with its back upon the yolk; in the cephalopoda, the yolk communicates, as in the vertebrata, with the ventral surface of the body, but no dorsal canal is formed in them; and in the other departments of animal life, we find special and characteristic relations between the embryo and the yolk.

The development of the embryo of vertebrated animals is best observed in the eggs of fishes, as from their transparency they do not require to be cut open; and with due care the whole series of embryonic changes may be observed upon the same individual, and the succession of appearances of the different organs may be ascertained. Professor Agassiz has carefully examined and depicted the principal phases of development in the white-fish, which belongs to the salmon family, and we shall endeavour to give his chief results. The following magnified sections, copied from his plates, will shew the period at which the different organs successively appear. The egg when laid (fig. 11) is spherical, about the size of a small pea, and nearly transparent. It contains no albumen, and the shell membrane and the membrane of the yolk seem fused into one. In a few hours after it has been laid, provided it has come in contact with the fecundating fluid of the male, a separation between these two membranes takes place, in consequence of the absorption of water (fig. 12), by which the size of the egg is increased. Between the shell-membrane, *sm*, and the yolk, *y*, there is now a considerable transparent space, corresponding in position to the albumen of birds' eggs. Oil globules are scattered through the yolk, but soon arrange themselves in a stratum or disc towards the upper part, where a swelling, in the shape of a transparent vesicle (fig. 13, *g*), begins to shew itself. It is composed of very delicate and minute cells, and is the germ in its earliest stage. As the germ increases, and has a larger surface in contact with the yolk, we notice a depression on its upper part (fig. 14), and soon after a second furrow appears at right angles to the former, so that the germ now presents four elevations, as we have attempted to shew in fig. 15. A continuous subdivision of this nature goes on during the second and third days, until the germ is divided into numerous

depression between two little ridges, whose edges approach till they form a canal (see fig. 8). At about the same time, an enlargement at one end of the furrow is observed, which is the rudimentary head (fig. 17), in which may soon be distinguished traces of the division of the brain corresponding to the organs of sight, hearing, and smell.

Towards the thirteenth day, we see a transparent cartilaginous cord (the *chorda dorsalis*) in the position afterwards occupied by the back-bone, composed of large cells, in which transverse divisions are forming (fig. 18, *c*). In some fishes, as the sturgeon, this cartilaginous or embryonic state is persistent through life, and no true osseous vertebral column is ever formed. The rudiments of the eye soon appear in the form of a fold in the external membrane of the germ, in which the crystalline lens (fig. 18, *x*) is afterwards formed. At the same time we see at the posterior part of the head an elliptical vesicle, *k*, which is the rudimentary ear. At this period, the distinction between the upper (serous) and lower (mucons) layers of the germ is best traced; all the changes which have been mentioned occurring in the upper layer.

At or soon after the seventeenth day, the lower (or mucons) layer separates into two laminae, the inferior of which becomes the intestine. The heart at about the same time appears in the form of a simple cavity (fig. 18, *h*) in the midst of a mass of cells belonging to the middle or vascular layer. As soon as the cavity of the heart is closed in (fig. 19, *h*), regular motions of contraction and expansion are observed, and the movement of blood-corpuscles within it is seen.

It is not till the thirtieth day that any traces of a circulation of the blood are manifested; we then notice two currents, one running towards the head, and the other towards the trunk (fig. 19), with corresponding returning currents. The traces of the liver are now seen. The embryo begins to liberate itself at both extremities from the yolk, the tail first becoming free, and moving in violent jerks.

The embryo, although still enclosed in the egg-membranes, now unites all the essential conditions for the exercise of the functions of animal life: it has a brain, an intestine, a pulsating heart, and circulating blood, and a limited amount of spontaneous motion; but the forms of the organs are still incomplete, nor have they acquired the precise shape characterising the class to which it belongs. The embryo is as yet only a vertebrate animal in general, and might be taken for that of a frog as well as for that of a fish.

Towards the close of the embryonic period, after the fortieth day, the embryo acquires a more definite shape: the jaws protrude; the nostrils approach the end of the snout; divisions are observed in the fin-like structure which surrounds the body; the anterior extremities, which were mere knobs, become rudimentary pectoral fins; and, finally, the gill-openings appear, so that the fish-type is now obvious. In this state, the young white-fish escapes from the egg about the sixtieth day after it is laid (fig. 20); but its development is still incomplete. We cannot yet tell to what genus the fish belongs. The gill-covers are not yet formed, there are no teeth, the mouth is below instead of at the most projecting part of the head, and the fins have no rays. The remainder of the yolk is suspended from the belly in the form of a bladder, but it daily diminishes in size, till it is at length completely absorbed by the animal. The duration of these changes varies extremely in different fishes; some accomplish them in a few days, while in others, months are required.

Figs. 11—20.

minute spheres, which form what is termed the mulberry mass (fig. 16). This appearance, however, does not long continue; at the end of the third day, the fissures disappear, and the germ continues to extend as an envelope around the yolk, which it at last entirely encloses.

On the tenth day, the first outlines of the embryo begin to appear, and we soon distinguish in it a

In frogs and all the naked reptiles, the development is very similar to that of fishes; in the scaly reptiles (snakes, lizards, turtles), and in birds, there are peculiar membranes surrounding and protecting the embryo during its growth, termed the allantois and the amnios; and in mammals there are additional complications of structure, which it would be impossible to describe clearly without occupying more space than could be allotted to a subject of this nature. For further information on this subject, we may refer to the various writings of Agassiz, especially his *Lectures on Comparative Embryology*, and his *Comparative Physiology*, from which this article is mainly drawn, and to Carpenter's *Comparative Physiology*.

**DEVELOPMENT, IN PHOTOGRAPHY**, the process which immediately follows exposure, and which renders the picture visible in all its details. It consists in the precipitation or deposition of *new material* on that portion of the sensitive surface which has been acted on by light; the same principle therefore prevails in all processes. This may be made clearer by reference to a few examples. In the Daguerreotype process (q. v.), an iodised silver plate, after exposure in the camera, is exposed to the vapour of mercury; the vapour adheres to those portions of the plate which have undergone a peculiar molecular change from the action of light, but not to those parts unacted on. The lights of the picture are therefore 'developed,' or 'brought out,' by the acquisition of *new material*, i. e., mercury. A collodion negative is similarly 'brought out' by the precipitation, by means of a de-oxidising agent, such as pyrogallic acid, or proto-sulphate of iron, on the *actinised* portion of the plate, of *new material*, composed of metallic silver and organic matter. A similar change takes place in the Chrysotype Process (q. v.), where the metallic salt with which the paper is impregnated is reduced to a state of proto-salt, which reacts through the decomposition of water, and causes the precipitation of *new material*, in the form of finely divided metallic gold on the parts where light has acted. Other processes might be cited, but these are deemed sufficient to illustrate the principle stated above.

**DEVELOPMENT THEORY.** See SPECIES.

**DEVENTER**, a thriving town of Holland, in the province of Overijssel, situated on the Yssel, about 55 miles east-south-east of Amsterdam. Tower-flanked walls surround D., which is further defended by a broad, deep ditch. The streets are usually narrow, but the market-places are spacious. The principal buildings are the cathedral—a structure in the early Gothic style—the town-house, the court-house, and prison. From the ramparts, which are used as a promenade, there is a commanding prospect. The industry of D. consists in iron-founding, in the manufacture of carpets, stockings, &c. Its gingerbread (called *Deventer Koek*) is celebrated throughout Holland, and many thousand pounds are exported annually. Its butter-market is also very important. Pop. 15,000.

**DEVICÉ**—from the middle-age Lat. *divisa*, a drawing or design—is a motto expressed by means of a pictorial emblem. The motto proper originated in the emblem, a written inscription coming to be added to the pictorial design, with the view of rendering the meaning more explicit. Devices thus consist of two parts—a pictorial figure called the 'body,' and a motto in words called the 'soul' of the device. As early as the times of Æschylus, the 'Seven heroes before Thebes' all appear with devices on their shields; and the same is related by Xenophon of the Lacedæmonians and Sicyonians. In the middle ages, devices on coat-armour came

into regular and formal use, and chivalry employed them in its courtly expressions of devotion to the fair sex. They were used both as charges on the shield and as crests. The only respect in which the device differs from other heraldic emblems is, that it has always some specific reference to the history, or circumstances, or position of the bearer. As an example: Louis XIII. of France had a falcon as a device, with these words: '*Aquila generosior ales*' ('A more generous bird than the eagle'), by which he meant to denote his own superiority to the Emperor, whose device was an eagle. Devices, moreover, were generally borne only by the individual who assumed them, and not by the other members of his family or his descendants, like the crest or cognizance. They were often contrived to typify a special enterprise, the general character of the wearer, or even to designate his name—as the *mullberry* trees in the embroidered trappings of the horse of Thomas Mowbray, Duke of Norfolk. On all festal occasions, they figured on triumphal arches, on banners and hangings. At a later period, it became customary to work devices into buildings; friezes and stained windows were often covered with them. This practice has recently much gone out, at least in its original form. See Radowitz's *Die Devisen und Motto des spätern Mittelalters* (Stutt. 1850).

**DEVIL**, or **SATAN** (Gr. *diabolos*, 'false accuser'; Heb. *satan*, 'adversary'), designates in the Old and New Testament a mighty spirit of evil who has, during unknown ages, ruled over a kingdom of evil spirits, and is in constant and restlessly active opposition to God. This belief, however, was very gradually developed in the Jewish mind; and it is beyond all question, that it acquired clearness and prominence through extra-national influences. In England, the 'doctrine of Satan' has never received any critical treatment at the hands of scholars; but in Germany, the subject has been most learnedly investigated. The conclusions at which some of the profoundest biblical scholars of the continent have arrived, and even the principles on which they proceed, may be rejected by us, but a brief account of their method of historical analysis may be neither uninteresting nor unconstructive. The older Hebrews, it is said, who lived before the period of the Babylonish captivity—judging from the silence of Scripture—knew nothing, and certainly taught nothing, of evil spirits in the later sense; i. e., of beings separated from God, who were evil in the essence of their nature, and worked evil only. *Moral* evil was rather looked upon as properly the act of man; *physical* evil, or adversity, on the other hand, as punishment merited through sin, and inflicted by a just and holy God, who was thus necessarily conceived as the true source of all calamity. The angels who foretold God's purposes, and executed his will, however great might be the physical evil they occasioned, are never accused of *moral* evil. Even in the Mosaic account of the seduction of Eve, there is nothing to induce us to believe that the author regarded the serpent other than as 'the most subtle of all the beasts of the field,' or that he meant to conceal under so plain a statement an allusion to Satan. It is probable, however, that at some early period in their history, the popular faith of the Jews, partly divorcing itself from its grand religious conceptions of the 'one living and true God,' and lapsing—as has everywhere been the case with the popular faith—into petty superstitions, had become familiar with the idea of certain fearful unearthly beings haunting wildernesses, similar to the fauns and satyrs of Greece, who might form the connecting-link in the later development of an

actual demonism. Traces of this are clearly visible in the Pentateuch. The Hebrew word *seirim*, occurring in Leviticus xvii. 7, which our translators have rendered 'devils,' means only 'hairy ones.' Now, the Egyptians worshipped the *he-goat*, and the Hebrews partook, as we know, of their idolatry. Therefore Moses in this verse, forbidding them to commit this sin in future, says: 'They shall no more offer their sacrifices to *seirim*;' i. e., to the Egyptian he-goats. The development of demonism was materially furthered during and after the Babylonish captivity by Medo-Persian influences. In those canonical books of the Old Testament which belong in their present form, to the post-exilian period—i. e., the period subsequent to the exile—the Jewish conceptions of angels become more definite. They possess different ranks, names, and specific offices. They are the tutelary guardians and helpers of particular lands and peoples, but are everywhere in absolute dependence on God. And now we meet also, for the first time, with an angel called *Satan*, who, however, still figures as a minister of God, and along with the others appears in heaven before the throne of Jehovah, but with the function assigned to him of accuser and seducer. It is he who—1 Chron. xxi. 1 (*Chronicles*, it should be mentioned, is considered by most critics, both orthodox and heterodox, to be the composition of Ezra, and therefore *post-exilian*)—stirs up David to number the people; while in the older Hebrew version (2 Sam. xxiv. 1) the same act is attributed to an angry God, the conception of Satan not then having clearly, if at all, presented itself to the Hebrew mind. It is Satan also who throws suspicion on the piety of Job, and with the permission of Jehovah, causes a series of misfortunes to befall him; while in Zechariah iii. 1, he is represented as 'resisting' the angel of God, and as a false accuser of the high-priest Joshua. As yet, however, an evil nature is not expressly ascribed to him, but, what is much the same, it is assumed that he takes a pleasure in active evil. It is a purely arbitrary and untextual interpretation of Isaiah xiv. 12 ('How art thou fallen from heaven, O Lucifer, son of the morning!') that would force these words to refer to the fall of the D., or determine from them his name. In the Apocrypha, of which only a small part is Palestinian, the rest being either *Chaldaico-Persian* (as, for example, *Tobias* and *Baruch*) or *Egypto-Alexandrian* (as, for example, *Wisdom*) in its origin, the older Hebrew doctrine of misfortune coming from the angel of Jehovah is, so to speak, dismembered, and demons or evil spirits, in the New-Testament sense of the term (*pneumata ponēra*), are for the first time mentioned (and in *Tobias* and *Baruch* frequently) as the authors of calamities. According to the representations of these writings, the evil spirits dwell, like the older Hebrew hobgoblins, in waste places, but associate themselves for the injury or destruction of men, enter into them as tormentors, and can be expelled only by magical or mysterious means. To this class of beings the heathen deities were reckoned to belong. But even here there is no mention of an *organisation* or kingdom or prince of demons. The first trace of a *Diabolo* or D. proper (and one in all probability springing from a foreign source) shews itself in the Book of *Wisdom* (ii. 24), in relation to the seduction of Eve, where it is said that through the D. the necessity of death has come into the world.

In the period elapsing between the close of the Apocrypha and the appearance of Jesus, the Jewish ideas of angels, as well as of demons and the D., received an extensive development. This angelology and demonology, wholly foreign to the older Hebrew

religion, was derived in all its essential characteristics from the system of Zoroaster, with which the Jews had become familiar by their long and close intercourse with the Persian empire during the exile, and subsequently. It was, however, impossible to transfer the *dualism* of Zoroaster into a creed so purely *monotheistic* as that of the Jews; this would have destroyed the foundation on which their entire history rested. Two beings, equally eternal, equally powerful, was an idea which no Hebrew—mindful of the glorious deliverance of his forefathers out of the land of Egypt, of the law given amidst the thunders of Sinai, of the manna in the wilderness, of the triumphs in Canaan, and the golden psalms of David—could for one moment entertain. But, on the other hand, now that as a nation the Jews were become weak and of little account, hemmed in, and crushed by mighty and advancing empires, no conception could seem more true, or prove more consolatory, than that which permitted them to attribute their misfortunes to the agency of a demoniacal race, headed by a potentate only inferior to Jehovah himself. They could now believe that God had not forsaken his 'chosen people.' Thus, the dualism of Zoroaster suggested the kingdom and royalty of Satan, but the doctrine shaped itself in harmony with the national monotheism. The D. and his demons were represented as having been originally *angels*, who had fallen from their 'high estate,' been punished by God, and had therefore assumed a position of hostility, without, however, being able to materially frustrate the divine purposes. These opinions found an almost universal reception among the people, as well as among those Jewish theologians who, along with the Mosaic Law, held oral tradition to be an authentic source of religious doctrine. Indeed, the only Jewish sect which rejected them, was that of the Sadducees, who considered them, as also the doctrines of the Resurrection from the Dead, of the Messiah, of the Messianic kingdom, of the Last Judgment, of rewards and punishments, and of angels and demons, to be new, outlandish anti-Mosaic myths and theories. This conflict of opinion among the Jews prevented their ideas of the D. and demons from obtaining, in spite of their broad diffusion, a dogmatic and systematic stability. The populace and the Pharisees believed fervidly in the existence of such evil spirits; but their conceptions had not only all the heat, but all the confusedness of superstition.

In this condition were the Jews when the New Testament lifts up the veil of oblivion that had partially dropped on the face of the nation more than two centuries before, and the light of history again falls brightly on its features. We now find a swarm of demons in Palestine. These unclean spirits, however, can be exorcised. When expelled from the soul of the demoniac, their proper home is 'the abyss' (*Eis ten abussou*, Luke vii. 31). According to the popular conceptions, therefore, we must suppose their dwelling to be a dark subterranean region, although, like the demons of the Old Testament, they inhabit also the earth and the air. They were not, as the Greeks and Josephus thought, the evil spirits of dead men, but had angelic natures (see Matt. xxv. 41), and formed a society governed by a chief, called Satan, Devil, Beelzebub, Belial, &c. He is now firmly seated in the popular imagination as a fallen angel; but as yet there is no hint of his having seduced his followers from their allegiance to Jehovah, or of their having fallen at the same time. This idea first appears in the book of Revelation, chap. xii., where mention is made of a great war in heaven between Michael and his angels on the one hand, and the D. and his angels on the

other. 'And the great dragon was cast out,' says the writer, 'that old serpent, called the Devil, and Satan, which deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him.' Whether or not these popular conceptions of the D. and his influence were materially or spiritually interpreted by Christ himself, it is impossible to say. He may either have accommodated his language to suit the popular mode of realising the Power of Evil (a supposition which involves nothing unworthy of his sinless character), or (for this is the only other hypothesis compatible with a belief in his divinity) he may have intended to recognise the essential truth of that doctrine of an evil personality which the Jews derived from, or, at all events, developed under the inspiration of Zoroastrian ideas.

But whether Christ meant to accommodate his language to the popular conceptions or not, the primitive church assumed the personality of the D. as an unquestionable fact. The New Testament opinions on this point were not only greatly enlarged, but in many respects entirely changed, partly through the introduction of a considerable number of heathen notions, and partly through the dogmatic tendencies of the time, in consequence of which the various statements in the Bible regarding Satan and evil were *uncritically* and *unhistorically* heaped together, and a doctrine of Satanic agency elaborated *logically* but not *theologically*. Holding firmly to the belief of a Satanic kingdom of darkness opposed to Christ's kingdom of light, the majority of the early Christians ascribed all evil, physical as well as moral, to the D. and his demons; failures of the crop, sterility, pestilence, murrain among cattle, mental maladies, persecutions of the Christians, individual vices, heresies, astrology, philosophy, and especially the whole body of heathenism, with its mythology and religious worship. The heathen gods were believed to be conquered by the work of Christ, but not to be wholly powerless; they sank down into demons, and so a part of their mythology passed into the doctrine of the Devil. It was they who, as demons, meaning to deceive, uttered oracles, were present at sacrifices, and inhaled the sacrificial incense, whereby the notion gained ground that the demon-nature was ever growing more and more sensual and materialised—a notion that reacted again on the conception of hell, which soon began to be painted in coarse earthly colours, blazing with eternal fire, through which blackened devils and scorched souls flitted in endless torment. From the gross materialism that now vitiated all conceptions of the D. and of demons, sprang the loathsome belief, common enough in the early church fathers, but during the middle ages exhibiting itself only in the superstitions of the vulgar—viz., of the carnal intercourse of devils with women. See WITCHCRAFT.

Concerning the fall of the 'devil and his angels,' opinions were long diverse. Some supposed that it occurred through envy; others, through pride; and others, again, through concupiscence and excess; some placed it before, and others after the seduction of Eve by the serpent. Several of the Fathers (for example, Augustine) believed that man was created to fill up the gap which had been caused in the kingdom of Christ through the apostasy of Satan and those whom he had led astray. Meanwhile, the idea of the importance of the death of Jesus had been dogmatically elaborated. At first, Christians saw in that death a sacrifice, and in his blood a propitiatory power; but soon after, their thoughts reverted to the other scriptural representation of an actual victory over the D., a restoration of the Divine image in man, and the source and condition

of holiness; whence was developed a very wonderful dogma concerning the devil. God having declared that whoever should transgress his law, should incur death and damnation; and man having done so, God's justice and veracity compelled him to keep his word. But inasmuch as Eve was beguiled into transgression, and fell as it were unwittingly, it did not seem for the honour or good of the Deity that rational beings, partakers also of his own spirit, should be lost through a trick of the Fiend; wherefore Jesus offered himself to the D. as a ransom for the souls of men. The D., thinking 'the man Christ Jesus' of more value than all the rest of the race put together, closed the bargain immediately. But deceived in his turn by the 'appearance of flesh,' he did not recognise the Deity concealed beneath it; and not being able to retain the latter (shrinking from it, in fact, horrified and dismayed), he lost *both*—Christ and man. The D. was, however, *actually* deprived only of Christians; in all other men he dwelt and ruled through the force of original sin. In consequence of this, he was formally 'banished' (until the 3d c.), not only from 'demoniacs,' but also from all converts from Judaism and heathenism to Christianity; and when the practice of baptism had shaped itself into the dogma, that it was 'a necessary preliminary to holiness, exorcism, or 'driving out the devil,' became a Christian 'art,' exercised on all new-born children. Those who died unbaptized, were (by that ruthless logic that frequently marks a barbarous theology) sent to hell; for although *potentially* Christ's, the church had not yet rescued them from their satanic master, by the appointed rite, and so the conditions being unfulfilled, the D. carried off his prey. Yet the heart of humanity, stronger in its simple instincts than the most iron creed ever hammered out of the human brain, shewed its holy presence even in so fearful a dogma; and although it could not deliver the lost infants from the region of eternal fire, it assigned them less painful pangs, and a less dreadful dwelling-place. But while the power of the D. over all not guarded by Christian faith and rites, was supreme; over those who were so guarded, it was utterly weak. No Christian, not even the weakest, could be *forced* by him to do evil. Thus far had the 'doctrine of the devil' been developed at the 5th c., and at this point it has essentially remained in the Eastern or Greek Church; but in the Western, it took yet another development. This was mainly occasioned by the writings of Pope Gregory the Great, who partly took up the popular notions himself, infused into them other then prevalent theological opinions, and elevated the result of the incongruous mixture to the dignity of church doctrine. He calls the D. 'a stupid beast,' because he hopes for heaven, without being able to reach it, and entangles himself in his own net; but on the other hand, he admits him to have a *potentia sublimitatis*, and utters the profound idea that he cannot comprehend our thoughts. In these three notions lie the essential germs of the Germanic Faust-devil. The old German and Norse mythologies poured a flood of heathen fancies into the 'doctrine of the Devil.' Even Ulfilas, at a much earlier period, had translated the New Testament word *daemon* or *daimonion*, by *unhalthó*, i. e., she-devil, or sorceress, because the old Germans believed in *female* demons, while the Christian *usus loquenti* contains no trace of such. The peculiarly German conception of a now malignant, now gentle *female* devil, lives to this day in the German phrase, 'The devil is beating his mother' (when rain and sunshine quickly alternate). In England and Scotland, too, the phrase is, or recently was current,

'The devil and his dam.' The Germans have also the proverb, 'Where the devil cannot come, there he sends his grandmother.' Soon, however, the word *diabolus*, in violation of the New Testament distinction between it and *daimon*, came to signify devils of every or any sort. The Gothic form of the word was *diabulus*, *diabāulus*; old Saxon, *diubhul*, *diubhal*, *diobol*; old High German, *diufal*, *tierval*, *tiubil*, &c. The dwelling of the D. was, of course, hell, which, however, according to old Germanic and Scandinavian notions, was placed in the dreary regions of the north. Although his mischievous powers are to be pretty well controlled till the coming of Antichrist, when he expects to hold carnival, yet, like the ancient gods and demons, he occasionally appears on the earth. He then assumes at times a purely human form, but, like Vulcan, who was thrown down from heaven like himself, and the smith Wieland, of German mythology, he is somewhat lame. He is covered with a gray, green, or red cloak, like the Kobolds (q. v.) and Dwarfs (q. v.), (the earth and house spirits of the suppressed heathenism): sometimes, also, he appears black and sooty, as befits his dwelling-place, and his opposition to a pure God. But as the old deities, both classical and German, possessed the power of transformation to a most remarkable degree, the D., through his relationship with these, inherited this power when they vanished from the scene. The form he most frequently assumed was that of an animal, approximating, in this respect, to the German forest-spirits and the Greek satyrs and fauns. At one time, he shews the foot of a horse or goat, with horns and tail; at another, he appears as a black horse, a he-goat, a hog, a wolf, a hell-hound, a raven, a serpent, a worm, a dragon, or a fly. The conception of the power of the D. was vastly enlarged by the influx of these new fancies. In fact, it rose almost to a new dualism; but, on the other hand, also, many mild and friendly traits of the heathen gods passed over into the popular conception of the D., and gave to his nature a quite new, humorous, and even merry side. As, after the introduction of Christianity, offerings were still occasionally made to the old gods, the D. shared in these honours. A horse, a he-goat, or a hound was at times sacrificed to him; and to the present day the expression has survived, 'To kindle a fire for the devil'—obviously an allusion to altar-flames. Various features of the old Norse gods, especially of Loki and Donar (Thor), the gods of fire and thunder, were also transferred to him. Hence the still current phrases in Germany, when thunder is heard: 'The devil must be striking,' and 'The runaway goose is gone to the devil.' (Donner, 'thunder,' is the word used for devil in this case.) Every power, too, which, according to the older heathen belief, was lodged in the lesser demons, giants, &c., had now its proper centre in the great Fiend himself, who could perform all the pranks attributed to the more grotesque creations of the Norse mythology, and work all the evil of the more malignant spirits; but, in general, these beings were rather pressed into his service than absorbed by him, or incarnated in his person.

So did this great, originally Persico-Judaic belief spread itself through all Christian lands, incorporating with itself, first, the kindred conceptions of the ancient classical world, and, ultimately, the rich and varied superstitions of our Teutonic and Scandinavian forefathers. Thus decked out in the costume of many different climes and ages, the Image of Evil passed into the light of the modern world. Every step forward that it now took robbed it of some potent spell that used to chill the blood and strike the heart with awful horror. Men first lost

faith in the D.'s occasional incarnation; then medical science destroyed his claims to the origination of mental phenomena, which he was once supposed to have directly caused; natural science deprived him of his control over the elements; historical criticism plucked from him his borrowed feathers; while metaphysics and a deeper religious exegesis have combined, not, perhaps, to annihilate his personality or deny his influence, but certainly to realise the former under a more spiritual form, and to limit the latter by a reverential belief in the wisdom and goodness of God. See Mayer's *Historia Diaboli* (2 vols. Tüb. 1780), Horst's *Demonomachie* (2 vols. Frankf. 1817) and *Zauberbibliothek* (6 vols. Mainz. 1821—1826), and Grimm's *Deutsche Mythologie* (Gött. 1835, 2d edit. 1844).

At the outset of this article, it was stated that the 'doctrine of the devil' had received no critical treatment from English scholars. The following appears to be the prevalent mode of regarding the subject in this country. The doctrine of the existence of a personal D., the chief of evil spirits, and directly or indirectly the author of at least all moral evil, is maintained by reference to the Bible, regarded as containing one revelation of truth harmonious in all its parts, and gradually developed. The Scriptures of the Old and New Testaments being thus regarded, and the supposition of conflict between the doctrines of their different books, or of error in any of them being rejected as inconsistent with a full recognition of their inspiration and divine authority, the doctrine in question is unavoidably deduced from them. It is assumed to appear in the narrative of the Fall in Genesis, and the name *serpent* is again applied to the D. in the book of Revelation, where he is described as 'that old serpent . . . which deceiveth the whole world' (Rev. xii. 9); he is believed to be repeatedly mentioned in the Old Testament. The hypothesis of an extra-national origination and development of the idea of the D. would, of course, be repudiated, and orthodox divines would consider it more probable that the Persians borrowed from the Jews than that the Jews borrowed from the Persians. The mention of the D. in the New Testament is held to be conclusive, not only of his existence, but of the belief in that existence (even when not expressed or hinted at) among the older Jews. The warnings and exhortations addressed to Christians are, it is also said, framed on the supposition of dangers arising from his violence, power, and subtlety. It is further argued, that the principal objections urged against the doctrine of the existence of a D. are substantially the same which present themselves to the mind as difficulties when we speculate on that which, however, is so undeniable—the existence of moral evil.

DEVIL'S DUST, the name sarcastically given to old woollen materials manufactured into some variety of cloth. See SHODDY.

DEVISE, in English Law, the conveyance of land by will. As personal property or chattels is said to be bequeathed, so lands are said to be devised. It is said, *Co. Litt.* 111 b. n. 1, that, under the Saxon and Danish rule in England, the owners of land were entitled to convey their lands by will. It is certain that so soon as feudal customs were established in this country, the testamentary power over land ceased; and from the Conquest to the reign of Edward IV., this species of property could be transferred by conveyance *inter vivos* only; but during the reign of the latter monarch, a new mode of transfer began to be adopted, called a Conveyance to Uses (q. v.). By means of this species of conveyance, a party wishing to convey land otherwise than

the common law allowed, actually conveyed the land to another person to such uses as he should appoint. The equity courts then regarded the party in whose favour the conveyance had been made as a mere trustee, and obliged him to relinquish the land in favour of any one whom the original owner might appoint. The power of appointment thus remaining in the owner might be exercised by will. By a statute of 27 Henry VIII., this mode of passing land by will was abolished; but, five years after, by 32 Henry VIII. c. 1, followed by 35 Henry VIII. c. 5, it was enacted, that all persons having estates in fee-simple should have power to devise the whole of their *Socage* (q. v.) lands, and two-thirds of their land holden by *Knights' Service* (q. v.). Finally, by 12 Charles II. c. 24, tenure by knight's service was abolished, and converted into socage; so that the power of devising land was extended to all lands except Copyholds (q. v.). But to the general rule that land could not pass by will, there had always existed an exception in favour of lands which, by the custom of the manor, had always been so conveyed; and this mode of devise by custom continued to exist even after the statute of wills of Henry VIII. For this practice there were two grounds: 1. That the power of devising lands was limited by statute to two-thirds of the land held by *knight's service*, whereas devise by custom might carry the whole land. 2. In order to an effectual devise of land under the statutes of Henry VIII., it was necessary that there should be a will in writing, while a verbal or nuncupative will would carry land by custom. By 29 Charles II. c. 3, the statute of Frauds (q. v.), this distinction was removed, and it was enacted that a will in writing, attested by three or four witnesses, should be necessary for conveyance of all lands. It must be observed that this power of devising lands was confined to lands belonging to the testator at the time of making his will, so that after-acquired lands would not pass by it; and also, that religious bodies and other corporations were, by the law of Mortmain (q. v.), restrained from being devisees of land. Thus stood the law at the period of the recent Wills Act, 7 Will. IV., and 1 Vict. c. 26. By this statute, devisees of land are placed on the same footing as to execution as other wills, and will carry all landed estates belonging to the devisor at the time of his death. See WILLS, and generally on this subject, see Jarman on Wills.

In Scotland, where the rules of the fental system in regard to the transference of land are still in great measure observed, it is incompetent to convey land by will. See DISPOSITION *mortis causa*; and in foreign countries the power is subject to various rules differing from those in force in England. Hence, where a person resides in one country, and is possessed of landed property in another, questions of jurisdiction frequently arise as to the law which shall govern the power of disposal. In these cases, it is now a recognised principle that the *lex rei sitæ* is that which must prevail. See Story's *Conflict of Laws*, p. 719, *et seq.*

DEVIZES (anciently, Divise, Divisis, De Vies), a parliamentary and municipal borough, in the middle of Wiltshire, near the Avon and Kennet Canal, 22 miles north-west of Salisbury. It lies high at the mouth of Pewsey Vale, between the thinly peopled tracts of Salisbury Plain and the Marlborough Downs. Pop. (1861) 6639. D. returns two members to parliament. It has silk-throwing mills, and manufactures of snuff and malt, and is the seat of one of the most important corn-markets of the west of England. The Corn Exchange has standing-room for nearly 3000 persons. The chancel

of St Mary's Church in D. is believed to be nearly as old as the Conquest. Roman household gods and coins have been found here. D. arose in a castle built by Roger, Bishop of Salisbury, in the time of Henry I. This castle, of which only the walls of one of the dungeons remain, was besieged and taken by Cromwell in 1645. From the time of Henry VIII. till about 1820, D. was the seat of extensive cloth manufactures. (1871—pop. 6840.)

DEVOIRS OF CALAIS were the customs due to the king for merchandise brought to, or carried out of, Calais while our staple (q. v.) was there.—*Cowell's Interpreter*. 'Merchants of the west may buy merchandises, so that they find sureties to carry them to the west or to Calais.'—2 Rich. II. st. 1. c. 3.

DEVONIAN SYSTEM. The name proposed by Murchison and Sedgwick to replace the more characteristic and older term Old Red Sandstone, because the slaty and calciferous strata in Devonshire contain a much more copious and rich fossil fauna than the red arenaceous rocks of Scotland, Wales, and Herefordshire, with which they were shown to be contemporaneous. The older descriptive name, Old Red Sandstone, is still generally retained, and to it we refer for a description of the rocks of the system.

DEVONPORT (before 1824, called PLYMOUTH Dock), a parliamentary and municipal borough, maritime and fortified town, and naval arsenal, in the south-west of Devonshire, situated on Stonehouse Creek, on the east shore of the estuary of the Tamar (which is four miles long by half a mile broad, and called the Hamoaze), two miles west-north-west of Plymouth. It stands on high ground, with ramparts defended by batteries. The south-east and south walls are 12 feet high, with three gates, and externally a fosse cut 12 to 20 feet deep in the solid rock. The streets are regular, and the footpaths of marble. D. is supplied with water from Dartmoor by a circuitous route of 30 miles. It owes its importance to the dock-yard established here by William III., and still one of the chief naval arsenals in Britain. Locally, the yard is in Devonport, although official documents and popular phraseology frequently refer it to Plymouth. The yard comprises six building-slips, for various rates of vessels. There are also five docks—three for first-rates, and two for second. The number of hands employed is generally about 2500. Rope-making, sail-making, and anchor-forging are also carried on. D. has residences for the port-admiral and governor, barracks for 2000 men, a military hospital, telegraph establishment, victualling-office, and grand parade. D. has breweries, soap-works, and an extensive trade in refitting and victualling ships. Pop. (1861) 64,798, much connected with the dock-yard. D. returns two members to parl. (1871—pop. 64,684.)

DEVONSHIRE, a maritime county, in the south-west peninsula of England, between the Bristol and English Channels. Greatest length, 71 miles; greatest breadth, 68; average, 46; area, 2590 square miles,  $\frac{2}{3}$ ths being in pasture or arable. The north coast, 60 miles long, is mostly steep and rocky; the chief indentation being Bideford Bay. 18 miles broad and 8 deep. The south coast, 100 miles long, is also lined with cliffs, and has Tor Bay, 3 by  $3\frac{1}{2}$  miles, and Plymouth Sound, 3 by 3 miles. The general surface is hilly, and the tablelands of Dartmoor in the south of D., Exmoor in the north-east of Devon and north-west of Somerset, and Blackdown in the east of D. are high, heathy, and rocky. The lower hills are grassy. The loftiest eminence is Yes Tor, in Dartmoor Forest, 2050 feet. The chief rocks are granite in Dartmoor, and

Devonian, Carboniferous, and Permian strata, with some Silurian strata, magnesian limestone, green-sand, chalk, and trap. Copper, tin, iron, and other metals occur, with potters' and pipe clays, Bovey coal, marble, gypsum, fluor-spar, and loadstone. The rivers are very numerous, the chief being the Exe, 54 miles long; Dart, 36; Tamar, 59; Torridge, 53; and Taw. These rivers have tidal estuaries, 5 to 11 miles long. There is an intermitting spring at Brixham. The climate is humid and equable—cool in summer, and mild in winter. The great mildness of the south coast in winter has made it much resorted to by invalids, especially those in consumption. Here myrtles flourish in the open air, and, with a little care, the orange and lemon. From its humidity, D. is more grassy than Cornwall, and there are fine meadows along the rivers. In the south, especially in Exeter Vale, the soil is very productive. The chief crops are grass and clovers, alternating with corn and potatoes. The fertile red loam of Exeter Vale produces wheat, barley, beans, pease, and flax. D. has much oak-wood and extensive orchards. It is famed for clotted cream and cider. The apple-trees grow on the hill-slopes and in the hedges. The chief manufactures are serges, linen, gloves, and lace; the chief exports are butter, cheese, cattle, and sheep. The red Devon breed of cattle is highly valued. Many ponies are fed on Dartmoor. D. has important pilehard, mackerel, dory, and salmon fisheries. The electric torpedo occurs in the estuaries. D. is divided into 33 hundreds, 470 parishes, and 17 poor-law unions. The chief towns are Exeter, the county town, Plymouth, Devonport, Tavistock, Tiverton, Barnstaple, Honiton, Totness, Ashburton, and Dartmouth. D. sends 22 members to parliament—4 for the county, and 18 for the above towns. In 1851, pop. 567,098 (in 1861, 584,531); 1614 schools, with 64,266 scholars; 1297 churches (549 Church of England, and 379 Methodist). D. has many British and Roman remains, as stone circles, cromlechs, barrows, and camps. The Saxons failed to conquer D. till the 9th century. It was ravaged by the Danes in the 9th and 10th centuries, and by the Irish in the 11th century. At the Reformation, 1549, there were great disturbances in D. In 1688, the Prince of Orange landed at Tor Bay, in this county. (1871—pop. 600,814.)

**DEW.** For any assigned temperature of the atmosphere, there is a certain quantity of aqueous vapour which it is capable of holding in suspension at a given pressure. Conversely, for any assigned quantity of aqueous vapour held in suspension in the atmosphere, there is a minimum temperature at which it can remain so suspended. This minimum temperature is called the dew-point. During the daytime, especially if there has been sunshine, a good deal of aqueous vapour is taken into suspension in the atmosphere. If the temperature in the evening now falls below the dew-point, which after a hot and calm day generally takes place about sunset, the vapour which can be no longer held in suspension is deposited on the surface of the earth, sometimes to be seen visibly falling in a fine mist. This is one form of the phenomenon of dew, but there is another. The surface of the earth, and all things on it, and especially the smooth surfaces of vegetable productions, are constantly parting with their heat by radiation. If the sky is covered with clouds, the radiation sent back from the clouds nearly supplies an equivalent for the heat thus parted with; but if the sky be clear, no equivalent is supplied, and the surface of the earth and things growing on it become colder than the atmosphere. If the night also be calm, the small portion of air contiguous to any of these surfaces will become cooled below the dew-point, and its moisture

deposited on the surface in the form of dew. If this chilled temperature be below 32° F., the dew becomes frozen, and is called *hoar-frost*. The above two phenomena, though both expressed in our language by the word dew, which perhaps helps to give rise to a confusion of ideas on the subject, are not necessarily expressed by the same word. For instance, in French, the first phenomenon—the falling evening-dew—is expressed by the word *sercin*; while the latter—the dew seen in the morning gathered in drops by the leaves of plants, or other cool surfaces—is expressed by the word *rosée*.

The merit of the discovery of the 'Theory of Dew' has been commonly ascribed to Dr Wm. Charles Wells, who published in 1814 his *Essay on Dew*, which obtained great popularity. The merit should, however, be divided between him and several others. M. Le Roi of Montpellier, M. Pictet of Geneva, and especially Professor Alex. Wilson of Glasgow, largely contributed by experiment and induction to its formation. Its history is very interesting, and the curious reader will be well repaid by a perusal of an article on the subject by Mr Tomlinson of King's College School, London, in the *Edinburgh New Philosophical Journal* (New Series), vol. xiii. No. 1. January 1861.

**DEWBERRY** (*Rubus ccesius*), a plant of the same genus with the Bramble (q. v.), and very nearly allied to it, but having weaker and more prostrate roundish stems, which take root at the end, their prickles unequal and passing insensibly into hairs, the fruit consisting only of a few (1—5) grains, which, however, are much larger than those of the brambleberry. The name is derived from the dew-like, bluish bloom which covers the fruit. The D. is common in some parts of Britain, and in many parts of Europe and of Asia. The fruit is very sweet and agreeable, and makes an excellent wine. The D. of North America

Dewberry.

(*R. procumbens*), abundant in the forests of Canada, is a delicious fruit, much superior to the British fruit of the same name, and more tart. The plant is of very humble growth, scarcely rising above the ground.

**DE WETTE, WILHELM MARTIN LEBERECHE**, one of the ablest theologians of modern Germany, was born 14th January 1780, at Ulla, near Weimar, and studied at the university of Jena. In 1807, he was appointed extraordinary professor of philosophy at Heidelberg; in 1809, professor of theology; and in 1810, was called to Berlin. By his popularity as a teacher, as also by his writings, De W. soon acquired a great reputation. In 1819, on account of a letter which he wrote addressed to the mother of the assassin of Kotzebue, he was deprived of his chair. Not long after, however, he was appointed professor of theology in the university of Basel, where his lectures and sermons in a short time secured him universal esteem and applause. In 1829, the grand council of Basel made him a member of the Council of Education, and granted him the freedom of the city.

In 1849, he was elected rector of the university, but died the same year, on the 16th of June.

De W. was a man of comprehensive learning, and acute philosophic discernment. His antipathy to the shackles of dogmatic theology gave keenness and vigour to his criticism. Yet he formed no school, and followed no master, so that it is difficult to describe his position. He cannot be classed either with Paulus, Strauss, or Baur. A temperate but very decided historical rationalism, on a broad basis of moral reverence, would perhaps best express his biblical stand-point. His principal works are: *Beiträge zur Einleitung in das Alte Testament* (Contributions to an Introduction to the Old Testament), 2 vols. (Halle, 1806—1807); *Commentar über die Psalmen* (Commentary on the Psalms), Heidelberg, 1811; *Lehrbuch der historisch-kritischen Einleitung in die Bibel Alten und Neuen Testaments* (Historico-Critical Introduction to the Books of the Old and New Testament), 2 vols. (Berlin, 1817—1826); *Lehrbuch der Christlichen Dogmatic* (Compendium of Christian Dogmatics), 2 vols. (Berlin, 1813—1816); *Christlichen Sittenlehre* (Christian Ethics); *Vorlesungen über die Religion, ihr Wesen, und ihre Erscheinungsformen* (Lectures on Religion, its Essence, and Formal Manifestations), Berlin, 1827; *Das Wesen des Christlichen Glaubens* (The Essence of Christian Faith), Basel, 1846; and *Exegetisches Handbuch zum Neuen Testament* (Exegetical Handbook of the New Testament). Besides these, De W. published a critical edition of the entire works of Luther.

DE WITT, JAN, a celebrated statesman of Holland, born at Dort in 1625, was the son of Jacob de Witt, a vehement opponent of William II., Prince of Orange. Jan inherited his father's hatred of the office of stadtholder, and the family that filled it. His education was carefully attended to, and he soon exhibited remarkable ability. He was one of the deputies sent by the States of Holland in 1652 to Zealand, for the purpose of dissuading that province from adopting an Orange policy. There his eloquence secured him universal confidence, which, however, in such troublous times could not long be retained. In the same year he was made grand pensionary. The Orange party (supported by the populace and the clergy), during the war carried on between England and Holland, was ever striving to increase the power of the young prince (afterwards William III.), who was then a mere infant; the republican, or oligarchic party, composed of the nobles and the wealthier burgesses, at the head of which was De W., sought, on the other hand, to strip the House of Orange of all power, and to abolish entirely the office of stadtholder. During William's minority, the advantage was, of course, with De W. and the republicans. In 1654, on the conclusion of the war with England, a secret article was inserted in the treaty drawn up between De W. and Cromwell, in virtue of which the House of Orange was to be deprived of all state-offices. After the restoration of Charles II., De W. leaned more to the side of France. This tendency necessarily received an impetus from the renewal of hostilities between England and Holland in 1665. These lasted for two years; and although De W. acted with great vigour, his influence was diminished, and his party was compelled to concede a larger measure of power to the House of Orange. De W.'s prospects became still more clouded when the designs of Louis XIV. upon the Spanish Netherlands became manifest. The Orange party carried their point in the elevation of William to the family dignity of stadtholder. On the invasion of the Netherlands by Louis XIV. in 1672, the Prince of Orange was appointed commander of the Dutch

forces; and the first campaign proving unfortunate, the popular clamour against De W. greatly increased, who had previously resigned his office of grand pensionary. His brother, Cornelius, accused of conspiring against the life of the stadtholder, was imprisoned, and tortured. De W. went to see him on his release. When they were coming out of prison, they were attacked by an infuriated crowd, and were both murdered, August 20, 1672. The states-general demanded an investigation, and the punishment of the murderers, but the stadtholder did not take the necessary steps. De W. was personally a man of upright character. His *Memoirs* (which were published during his lifetime) contain much important information regarding the politics of the time.

DEWSBURY, a manufacturing town in the West Riding of Yorkshire, situated at the base of a hill, on the left bank of the Calder, is 32 miles south-west of York, and 8 miles south-south-west of Leeds. It is governed by a local board of health, possesses a chamber of commerce, and is the centre of the Dewsbury union. Pop. (1861) 18,148. D. is noted for its manufactures of low woollen goods—as pilots, sealskins, unions, &c.; and carpets and blankets. There are collieries and ironworks in the immediate neighbourhood. Railways—London and North Western, and Lancashire and Yorkshire. Calder navigation connects the town with Hull and Liverpool. Here Paulinus, first Archbishop of York, lived in 627. Saxon and Roman relics have been found here.

One mile north of D. is situated BATLEY, the principal manufacturing town in the kingdom for low woollen and army cloths. It is governed by a local board of health, and possesses a chamber of commerce. It is on the Manchester and Leeds line of the London and North-Western Railway. Pop. (1861) 14,173.

DE'XTRINE (syn. British gum, torrefied starch). When starch is carefully heated to 400° F., or until vapours arise from it, it becomes soluble in cold and hot water, and loses its gelatinous character; it also has the property, when viewed by polarised light, of turning the plane of polarisation to the right; hence its name. It is often used as a substitute for gum-arabic in the processes of calico-printing, and for stiffening different goods; it is also applied to the back of postage-stamps. Its value as a substitute for gum consists in its being more flexible and less brittle when dry than that substance. Starch may be converted into dextrine by the long continued action of dilute acids at a high temperature; also by the action of Diastase (q. v.). Dextrine and starch are isomerie, both being composed of  $C_{24}H_{40}O_{20}$ ; but dextrine may be distinguished from the latter body by its pale buff colour, its insolubility in alcohol, and its not being rendered blue by iodine, which gives with it a dingy purple tint.

DEY, a word of doubtful origin, but appropriated by the ruler of Tripoli, and also of Algiers until its conquest by the French. At one period, Tunis likewise was governed by a Dey, but this title has long been supplanted by that of Bey. See BEG.

DHALAC, an island in the Red Sea, off the coast of Abyssinia, in lat. 15° 46' N., long. 40° 6' E. It is 30 miles long, 15 miles in average breadth, and 120 miles in circumference. It is composed of coral rock, and its surface in general is flat and sandy. Doobelloo, a village on the east side, trades with Lohia and Ghizan, ports on the Arabian coast, exchanging fish, sharks' fins, turtle, and pearls, for millet and dates. The groups of islands in the vicinity of D. are called the Dhalac

Archipelago. The inhabitants are good sailors and skilful fishermen.

**DHAMEE**, a hill-state of India, of about 25 square miles, on the left bank of the Sutlej, in about lat.  $31^{\circ} 12' N.$ , and long.  $77^{\circ} 8' E.$  It is merely a collection of mountains and valleys. The general elevation probably exceeds 4000 feet, and even the margin of the river is 2283 feet above the level of the sea. D. contains 3000 inhabitants, and yields a revenue of £350 a year, of which about a fifth is paid as tribute to the British government.

**DHAR**, a town situated on the table-land of Malwa, in Central India, stands in lat.  $22^{\circ} 35' N.$ , and long.  $75^{\circ} 20' E.$ , at an elevation of 1908 feet above the sea. It is said to have at one time consisted of 20,000 houses, implying a population of about 100,000, and though very greatly decayed, it yet retains many traces of bygone magnificence—two large mosques of red stone, ten water-tanks of various sizes, and a fort defended by many considerable towers. It is the capital of a protected state of the same name, having an area of 1070 square miles, with 104,860 inhabitants.

**DHA'RWAR**, a town in the presidency of Bombay, close to the frontier of the presidency of Madras, stands in lat.  $15^{\circ} 28' N.$ , and long.  $75^{\circ} 4' E.$  It has an English school, with about forty pupils, and two vernacular schools. The population has not been ascertained.

**DHARWAR**, the district of which the town above mentioned is the capital, extends in N. lat. from  $14^{\circ} 16'$  to  $15^{\circ} 50'$ , and in E. long. from  $74^{\circ} 50'$  to  $76^{\circ}$ , containing 3837 square miles, and 754,385 inhabitants. Its drainage is divided between the Arabian Sea and the Bay of Bengal, passing to the latter by the Tumbudra, a feeder of the Kistnah or Krishna, and to the former by the Kali Nadi, through a deep valley of the Western Ghauts. The most interesting feature of the country is its suitability for the growth of American cotton. In 1842, after several previous failures, the New Orleans staple was cultivated with success to the extent of 25 acres; and within five years, the breadth of land thus sown had increased a thousandfold. In connection with this enterprise, a good road has been constructed to Coompta, on the Arabian Sea, where the cotton is shipped for Bombay. The prevalent language is Canarese, and there are fourteen vernacular schools, with about 1000 pupils.

**DHOB.** See **CYNODON.**

**DHOLE** (*Canis scylax*), an Indian species of dog, existing in a wild state in the Western Ghauts and

The True Dhole (*Chryseus scylax*).

some other mountainous districts. It is in size between a wolf and a jackal, with rather long legs,

sharp muzzle, wide and pointed ears, straight and not bushy tail, light-bay colour, fierce keen eyes, and great courage. The name D. is extended to some other very similar species or varieties, natives of Ceylon, Nepal, and other parts of the East, to which the common name *Red Dogs* has been sometimes applied, and for which Colonel Hamilton Smith has proposed the sub-generic name *Chryseus*. They seem not incapable of domestication, but whether any of the domesticated dogs are derived from them is wholly uncertain. There is no reason to think that any of them are the wild offspring of once domestic races. They all want the second tubercular tooth in the lower jaw, have oblique eyes, and the soles of the feet hairy. They hunt in packs. They are all inhabitants of the deepest recesses of wild mountain-forests. A remarkable characteristic of the dholes is their hostility to the feline races, the weaker and the young of which they attack and destroy. To this is ascribed the alarm which the tiger exhibits at the sight even of a domestic dog; and 'we may surmise,' says Colonel H. Smith, 'that the species of *Chryseus* are the instruments nature has appointed to keep down the superabundant increase of the great *felina* of the wilderness.'

**DHOLPO'RE**, a town of Hindustan, on the left or north-west bank of the Chumbul, is in lat.  $26^{\circ} 41' N.$ , and long.  $77^{\circ} 58' E.$ , being 34 miles to the south of Agra, and 37 to the north of Gwalior. Here are some elaborately wrought mosques and mausoleums of freestone. Of the former, one is said to have been built by Shah Jehan, the founder of the modern Delhi, in 1634; and of the other edifices, some are of still earlier date. D. is the capital of a protected state stretching along the left bank of the Chumbul, containing 1626 square miles, and about 550,000 inhabitants.

**DHOORCATEE**, a protected state in Hindustan, of not more than five square miles, is in lat.  $31^{\circ} 8' N.$ , and long.  $77^{\circ} 40' E.$ , lying in the basin of the Jumna towards that of the Sutlej. Small as it is, it is worthy of notice as containing the peak of Toongroo, which, at an elevation of 10,102 feet above the sea, forms one of the stations of the large series of triangles in the trigonometrical survey of the Himalaya.

**DHUBBOOEE**, a decayed town in Guzerat, belonging to the Guicowar, in lat.  $22^{\circ} 8' N.$ , and long.  $73^{\circ} 23' E.$ , lies 78 miles to the north-east of Surat, and 225 to the north of Bombay. It presents many memorials of ancient grandeur—such as a rampart of two miles in circuit, backed inwardly by a handsome colonnade; a magnificent tank, bordered by a grand flight of stairs and numerous Brahmanical temples—the whole richly adorned with curious sculptures. But a still more remarkable circumstance is, that, in a purely alluvial neighbourhood, where even a pebble is unknown, all these structures are of hewn stone. The population, which is inconsiderable in number, shares the place with swarms of monkeys.

**DHUMTOUR**, or **DUMTAUR**, a valley of the Punjab, stretches in N. lat. from  $31^{\circ}$  to  $34^{\circ} 10'$ , and in E. long. from  $72^{\circ} 53'$  to  $73^{\circ} 15'$ . Here a traveller from the north first finds the peculiar vegetation of Hindustan. While behind him are luxuriant forests of oak, plane, walnut, and pine, the sugar-cane grows before him in such abundance as to form a principal article of fodder for cattle. The population is distributed into villages, each defended by a small fort against neighbouring marauders. The chief town, of the same name, is 16 miles to the east of the Indus, on the route between Attock and Cashmere.

**DHUNCHEE**, or **DHANCHI** (*Sesbania aculeata*), a plant of the natural order *Leguminosae*, sub-order *Papilionaceae*, of a genus having an elongated many-seeded pod, alternately swollen and contracted, as if it contained a string of beads. The D. is an annual herbaceous plant, much cultivated in Bengal upon account of its fibre; it has an erect, sparingly branched stem, 6—10 feet high. It is a plant of rapid growth, and succeeds best in low and wet soils. Its fibre is coarser than hemp, unless when it is cut at a very early period of its growth, is durable in water, but contracts considerably when wetted. It is steeped and prepared very much like Sunn (q. v.).

**DHWALAGTRI**, once supposed to be the highest peak of the Himalaya, but now ascertained to be at most only the third in point of altitude, is stated at 23,826 feet above the sea. Its lat. and long. are 28° 42' N., and 82° 32' E. The mountain is within the limits of Nepal.

**DIABETES** (Gr. literally a syphon, from *diabainō*, I go or flow through), a disorder of the general system, of which the principal symptom is a very much increased flow of urine. Diabetes is of two distinct kinds: the one, *diabetes insipidus*, is a mere exaggeration of the water-excreting function of the kidneys, accompanied by extreme thirst, and hence called *polydipsia* (Gr. excess of thirst) by some authorities; the other is a more complex disorder of the assimilation, consequent on the formation first, and the excretion by the kidneys afterwards, of an enormous excess of animal sugar (see GRAPE-SUGAR), the sugar being found in excess, not only in the renal excretion, but in the blood, and in nearly all the secretions which have been examined. The pathology of this disease, called *diabetes mellitus* (Lat. *mell*, honey), is very obscure, notwithstanding the numerous recent physiological researches which tend to throw light on the development of sugar in the animal organism, and which must undoubtedly be regarded as bearing on the solution of the problems connected with this disease. Unhappily, the cure of it is still entirely unknown, except in so far as it may be controlled or retarded by good management of the diet, drink, and clothing. All diabetics are subject to progressive emaciation, and they often become subject to true tubercular consumption (q. v.), or other chronic disease of the lungs; it is chiefly in warding off this termination that the medical art can be of service, as well as in relieving the symptoms as they occur. The first fact observed in cases of diabetes is usually the increased flow of urine, when it becomes so great as to amount to a practical inconvenience; and also a considerable increase of the appetite, and an unquenchable thirst, which rarely fail to accompany the disease from the beginning, but often do not attract attention, or at least suggest the idea of anything wrong, till an advanced stage of the disorder. When the patient demands medical assistance, he is usually somewhat thin; the pulse is quiet, the skin cool, the heat of the surface, indeed, habitually rather low and easily depressed. There is often a complete absence of perspiration, which gives a peculiar feeling of harshness to the surface, especially of the palms of the hands. With these symptoms, the first approaches of pulmonary disease may concur. In the very last stages, there is sometimes dropsy of the feet; and the urine may be natural in quantity, or even diminished. For the other characters of diabetic urine, see URINE. The cure consists in removing from the diet, as far as possible, consistently with comfort and due nourishment, everything which easily turns to the formation of animal sugar in the system, especially all

excess of farinaceous food. The complete suppression of sugar-forming food, however, as recommended long ago by Rollo, has not been found possible in practice in the majority of cases. Bread composed of gluten of wheat without starch, or bran-cakes baked with eggs, have been strongly recommended; and in most of the great capitals, as London and Paris, bakers may be found who regularly furnish bread suitable for this unfortunate class of sufferers; indeed, any intelligent baker who will take the trouble, may, under medical direction, be got to manufacture such bread when required; or it may be ordered in the form of cakes and biscuits, in quantities at a time, from London houses. Dr Camplin, himself a diabetic patient, has minutely studied the diet and regimen required, and published a little book, which we have no hesitation in recommending to all concerned, *On Diabetes, and its Successful Treatment*, in which full directions will be found for the manufacture of palatable and useful diabetic bread. The 'success' alluded to, however, is simply keeping the disease at bay by constant watchfulness. Medicines proper should be used only under the advice of the physician. There is no specific, and the unguarded use of strong remedies is to be condemned. Flannel should be worn next the skin, and the languid function of the cutaneous perspiration aided by the warm bath. The Turkish bath might possibly prove useful in this disorder, and could hardly do harm if carefully employed; but we have not heard, as yet, of any actual experiments in this direction for the cure of diabetes.

**DIABETIC SUGAR** is a variety of sugar found in the blood and secretions of the higher animals, especially when afflicted with the disease called diabetes. It is a variety of grape-sugar or glucose. See GRAPE-SUGAR.

**DIABLERETS**, a remarkable mountain of the Bernese Alps, Switzerland, situated between the cantons of Bern and Valais, in lat. about 46° 18' N., and long. 7° 15' E., with an elevation of 10,670 feet above the sea. The D. is composed of limestone strata, the lower beds of which are so soft and shaly, that they are easily disintegrated by the infiltration of water given off from the glaciers on the north-east. The consequence is that, the foundation being worn away, the peaks tumble over into the valley, occasioning the most terrible catastrophes. Three peaks have already fallen in this way, and the two that yet remain threaten to follow sooner or later. In the fall in 1714, 15 people, 100 head of cattle, and 53 chalets were destroyed; and the result would have been much more appalling, had not premonitory noises given the inhabitants timely warning to escape. In 1749, the fall of another peak arrested the course of the Liserne, which thereafter formed two small lakes known as Derborenze.

**DIACAUSTIC**. See CAUSTIC.

**DIACHYLON** (Gr. literally, from juices—i. e., vegetable juices, a deceptive etymology, as the plaster has really no such composition), the common healing or adhesive plaster, made by combining litharge, or the red oxide of lead, with olive-oil, so as to form a kind of soap. The preparation of this plaster is now entirely taken out of the hands of druggists, it being prepared on the great scale by machinery.

**DIADEM** was the name given to the fillet of silk, woollen, or linen which served as the distinguishing ornament of kings. It was generally narrow, being only a little broader on the forehead. The diadem of the Egyptian goddesses and kings bore the symbol of the sacred serpent. The diadem of Bacchus, as it appears in antique sculptures, was

a plaited band going round the forehead and temples, and tied behind, with the ends hanging down. Among the Persians, the diadem was bound round the tiara or turban, and was of a blue colour worked with white. The early Roman emperors refrained from using this ornament, in order not to call up recollections of the hated kingly office. Diocletian was the first to introduce it again, and Constantine the Great added new ornaments to it. After his time, it was adorned with a single or double row of pearls and precious stones. Queens are also seen on coins ornamented with the diadem, with the addition of a veil. It was finally superseded by the Crown (q. v.).

**DIÆRESIS** (Gr. *diairo*, I divide), a term used in Grammar to signify the resolution of a diphthong, or of a contracted syllable, into two syllables; as Lat. *auræ* into *aurai*. The name is also given to the mark placed above a vowel letter, to indicate that it is to be independently pronounced, and not in conjunction with a preceding vowel; as in the above example, or in the word *ærial*.

**DIAGNOSIS** (Gr. *dia*, through, and *gnosis*, knowledge), the thorough-knowledge or thorough knowledge of a disease, embracing its points of distinction from other diseases, its symptoms, their relation to one another, and to the state of the different organs and functions of the body, in so far as this can be appreciated during life. Diagnosis is usually spoken of in contrast with Prognosis, which implies the judgment framed by the physician as to the issues of disease; and also with Prophylaxis (*pro*, from, and *phylaxis*, protection), which refers to the warding off disease, when supposed to be impending. Diagnosis includes the study of all the vital phenomena of diseases, and also of their appearances after death, in so far as this can aid their discovery during the life of the patient. It is usual to speak of rational or physiological diagnosis, or diagnosis by symptoms—i. e., functional changes; and of physical diagnosis, or diagnosis by signs—i. e., objective phenomena appreciable by the senses of the observer. The latter method of diagnosis has been much enlarged in scope, and increased in importance of late years by the modern discoveries in Auscultation (q. v.) and Percussion (q. v.), and also by the great advances made in physiological chemistry, and by the use of the microscope.

**DIA'GONAL**, in Plane Geometry, is a straight line joining any two angles, not adjacent, of a rectilinear figure. A line drawn between two adjacent angles would coincide with the boundary-line. A triangle has no diagonal, because any two of its angles are adjacent; a four-sided figure has two diagonals; a five-sided, five; a six-sided, nine; &c. The number of possible diagonals in any figure is found by taking three from the number of sides, multiplying the remainder by the number of sides, and taking half the product. Thus, in the six-sided

figure, the process is  $\frac{3 \times 6}{2} = 9$ . If the diagonals must be so drawn as not to intersect, their number is always three less than the number of sides. It makes no difference whether they all proceed from one angle or not. A diagonal in a solid bounded by planes, is a line joining any two solid angles so situated that the line does not coincide with any line on the surface. To find the number of such diagonals in a given solid: Multiply the number of solid angles by the same number diminished by one, and from half this product subtract the number of edges on the figure, and also the sum

of the number of diagonals in all the faces. Thus, the cube gives  $\frac{8 \times 7}{2} - 12 - 6 \times 2 = 4$  diagonals.

**DIAGONAL SCALE**, a system of lines by means of which hundredths of units may be laid down or measured with compasses. It is thus constructed: Lay off, on a straight line, any equal parts EA, AB, BC, CD, &c. Draw ten lines parallel to DE, and equidistant; and draw EP, AQ, BI, C2,... &c., perpendicular to DE. Divide QP, AE, into 10 equal parts. Join the 1st, 2d, 3d,... divisions on QP with the 2d, 3d, 4th,... divisions on AE respectively. If the divisions on AD each represent 100, each of those on QP will represent 10. Thus, from 3 on AD to 8 on QP is 380; but by moving the points of the compasses down to the fourth line, and extending

Diagonal Scale.

them from *n* to *o*, the number will be 384. For the distance of 8 on QP from Q is 80, and of *r* from A is 90; and hence that of *o* from the line AQ is 84. When the divisions on AD denote tens, those on QP denote units, and from *n* to *o* would then represent  $38 \frac{4}{10}$  or 38.4. When the numbers representing

the lengths of the sides of any figure would give lines of an inconvenient size taken from the scale, the numbers may be all multiplied or all divided by such a number as will adapt the lengths of the lines to the required dimensions of the figure.

**DIA'GORAS**, a Greek poet and philosopher, was born in Melos, an island of the Cyclades. He flourished in the 5th c. B.C., but beyond his reputation for atheism, nothing very positive is known regarding his career. He is said to have been a disciple of Democritus of Abdera, and to have resided during the more important part of his life in Athens. He is alluded to by Aristophanes in the *Clouds* (424 B.C.); and from an epithet applied there to Socrates, it is highly probable that that great philosopher had been a pupil of D., or at least held similar opinions. This will perhaps explain to us the accusation brought against him of atheism. In all likelihood, D. was no atheist, but simply a *disbeliever in polytheism*; and the anecdotes related of him, such as his once throwing, when ill-off for fuel, a wooden image of Hercules into the fire, to cook his dinner, serve to confirm such a supposition. He seems to have been witty and fearless, and probably treated the rude superstitions of the common-place Athenians with dashing contempt. In this way he may have become specially notorious, and so fixed himself in the Greek mind as the *representative atheist*. D. was banished from Athens professedly on account of his impiety, but really on account of his politics. He went first to Pallene, and afterwards to Corinth, where he died. He wrote lyrics of various kinds, and a philosophical work entitled *Phrygiōi Logoi*. Personally, he was a man of untainted character, and discharged his duties as a citizen in an earnest and exemplary manner.

**DIAL AND DIALLING**. A *sun-dial* is an instrument for measuring time by means of the motion of the sun's shadow cast by a stile erected on its surface. It is an instrument of very great antiquity, the earliest mention of it being in Isaiah xxxviii. 8;

## DIAL AND DIALLING.

and before clocks and watches became common, it was in general use as a time-keeper. The art of constructing dials to suit any place and situation, was then an important branch of mathematical study; now the subject is more an object of curiosity than utility.

A dial consists of two parts—the *stile* or gnomon, usually the edge of a plate of metal, always made parallel to the earth's axis, and pointing towards the north pole; and the *dial-plane*, which may be of any hard substance, and on which are marked the directions of the shadow for the several hours of the day, their halves, quarters, &c. Dials receive various names, according, mostly, to the positions which they are constructed to occupy.

Old Sun-dial :  
In the Zoological Gardens, Edinburgh.

When the dial-plane is on the plane of the horizon, the dial is called a horizontal dial; when perpendicular to that plane, a vertical dial. An equinoctial dial is one whose plane is parallel to the equinoctial plane. Besides these names, there are others, such as the south dial, north dial, east dial, west dial, polar dial, declining dial, of which it is useless to write at length. These names all depend on the position of the dial-plane. The cylindrical dial is a dial drawn on the curved surface of a cylinder. The ring dial is an ingenious small portable dial, but rather a curious toy than a philosophical instrument.

A *night* or *nocturnal dial* is an instrument for shewing the hour of the night by the shadow of the moon or stars. Moon-dials may be constructed relative to the moon's motion; or the hour may be found by the moon's shadow on a sun-dial by the following rule: Observe the hour pointed out by the moon's shadow; find the days of the moon's age in the calendar, and take three-fourths of that number for the hours to be added to the time shewn by the shadow to give the hour of the night.

*Dialling*.—The *stile* of a dial being parallel to the earth's axis, those familiar with spherical trigonometry will readily see that the problem of constructing a dial resolves itself into that of ascertaining where the hour-lines cut a given circle, with a view to the graduation of the dial-plane. We do not here presume the reader to be acquainted with spherical trigonometry, and accordingly proceed to illustrate the principles of dialling in a popular manner, taking our illustrations from Ferguson's *Lectures* (4th ed., 1772, Lecture 10), which should be referred to for fuller information. Suppose *Pep*

(fig. 1), a hollow and transparent sphere, as of glass, to represent the earth; and suppose its equator divided into 24 equal parts by the meridians *a, b, c, d, &c.*, one of them passing through a given place, say London (see *HORIZON*), at the point *a*. If the hour of twelve be marked at the equator, both on the latter meridian and that opposite it, and

Fig. 1.

all the rest of the hours in order on the other meridians, those meridians will be the hour-circles of London, because, as the sun appears to move round the earth in 24 hours, he will pass from one meridian to another in one hour. Then, if the sphere has an opaque axis, as *Pep*, terminating in the poles *P* and *p*, the shadow of this axis would fall, in the course of the day, on every particular meridian and hour, as the sun came to the plane of the opposite meridian, and would thus shew the time at London, and at all other places on the same meridian as London. If the sphere were cut through the middle by a plane *ABCD*, in the rational horizon of London, and if straight lines were drawn from the centre, *e*, of the plane to the points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London; for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere. Similarly, if we suppose the sphere cut by *any* other plane facing the meridian, the hour-circles of the sphere will cut the edge of the plane in those points to which the hour-lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will hold of any plane, whether it face the meridian or not, provided it do not coincide with it, or do not coincide with a plane through the poles, and perpendicular to the plane of the equator. In the latter case, the axis would have no elevation above the plane of the dial; in the former, the shadow would not move circularly.

The *universal dialling cylinder*, an invention of Ferguson's, is represented in fig. 2. *ABCD* is a glass cylindrical tube, closed at both ends with brass plates, on the centres of which a wire or axis, *EFG*, is fixed. The tube is either fixed to a horizontal board, *H*, at an angle equal to the latitude of the place, or moves on a joint, so that it may be elevated till its axis is parallel to the earth's at any latitude. The 24 hour-lines are drawn on the outside of the glass, equidistant from one another, and parallel to the axis. The XII next *B* stands for midnight;

the XII next the board, for noon. When the axis is adjusted for the latitude, and the board levelled, with the line HN on the meridian, and the end towards the north, the axis EFG, when the sun shines, will serve as stile, and cast a shadow on the hour of the day among the parallel hour-lines. As the plate AD is parallel to the equator, and EFG

Fig. 2.

perpendicular to it, right lines drawn from the centre to the extremities of the parallels will be the hour-lines of an equinoctial dial, and the axis will be the stile. A horizontal plate, *gc*, if put into the tube, with lines drawn from the centre to the several parallels cutting its edge, will be a horizontal dial for the given latitude; and similarly a vertical plate fronting the meridian, and touching the tube with its edge, with lines drawn from its centre to the parallels, will be a vertical south dial, the axis of the instrument in both cases serving for the stile; and similarly for any other plate placed in the cylinder. If, instead of being of glass, the cylinder were of wood, any of these dials might be obtained from it by simply cutting it in the planes of the plates, and drawing the lines on the surface of the section.

**DIALECT.** In speaking of a people having essentially all one language, but living extended over an extensive territory, the name of Dialects is given to those varieties or peculiar forms which that language assumes among the various tribes or other local divisions of the people. It is clear that the wider the separation comes to be between the several tribes, and the more they differ in mode of life and other circumstances, the more marked will the differences of dialect become. Also when a particular tribe of this people increases in numbers, and also extends its territory, the same process is repeated, and its dialect becomes broken into a number of sub-dialects. The principal check to this tendency to seemingly endless subdivision of language, is furnished by an increasing degree of common culture and civilisation. Where this is wanting, as in Africa and among the native populations of America, the subdivision is practically endless.

Another element is introduced into the problem by the fact, that the civilisation of some tribes develops itself more richly and ripens earlier than that of others, while some even undergo decline;

this must occasion corresponding differences of dialect. Further, one dialect may become dominant over one or more of the others, through various influences, the chief of which is the power of poetry, especially if favoured by external relations. Finally, if to superior manifestations of oratory and poetry in any dialect, the conservative aid of writing be added, there is created a written language, which passes current among other tribes to the same extent that the literature of which it is the vehicle finds favour. It is not always the dialect most perfect in itself, nor yet that of the most powerful tribe or division of a people, that comes to be the written language. Accidental circumstances have, in many cases, decided the rivalry. The Bible happened to be translated by a High German, Luther, into his native dialect; other works on the then all-engrossing subject of religion followed in the same dialect; happily, too, the art of printing had just attained the perfection necessary to give these productions general circulation. It was this concurrence of circumstances that decided that High German should in future be the spiritual bond among the wide-spread German people. For there were other dialects whose claims to the distinction were at that time equal, if not higher. See also ENGLISH LANGUAGE.

When a dialect has thus become the vehicle of written communication, and of the higher kinds of oral address, its character and position become changed; and it stands henceforth in a sort of antagonism to the other dialects, and even to that out of which itself sprung. For written language is chiefly employed in the higher departments of human thought and activity. The intellectual and moral elements, therefore, predominate in it over the sensible; and what it gains in dignity, precision, and pliancy, it loses in richness of inflection, in friendly familiarity and naturalness. In conflict with this standard speech, the dialects must go to the wall. They live for a considerable time, it is true, even in the mouth of the educated classes, becoming, however, gradually more and more confined to the most necessary and familiar forms of intercourse, and losing their characteristics in the stream of the written language. They thus become, after a time, the exclusive possession of the lower orders, in which position they preserve many relics of old grammatical forms long after these have disappeared in the language of literature, but without the power of advancing or of being enriched by the products of deep thinking; and though they may abound in single expressions of great beauty and delicacy, the general character comes to be low and coarse. But so long as a language lives, the literary standard and the dialects never cease to act and react on one another.

The chief points of difference between the dialects of a language and the standard fall under four heads. The first consists of differences in the elementary sounds or letters, each dialect having a tendency to substitute some one or more vowels or consonants for others. Thus, the standard English *bold*, is in Ireland *bould*; in Scotland, *bauld*; *what*, where the *h* is nearly evanescent, becomes, in a Scotsman's mouth, or rather throat, *chwat*, and in Aberdeenshire Scotch, *fat*—*f* in this sub-dialect being regularly substituted for *wh*, or rather *hw*. 2. Each dialect has peculiarities of grammar: In many parts of England and in Scotland, the plural of *eye* is not *eyes*, but *eyen*, or *een*, like *oxen*. The habitual use of *be* where the standard grammar prescribes *am*, *is*, *are*, &c., is prevalent in large districts of England. Of this kind is the use of the strong conjugation for the weak, or vice versa; as *loap*, *lap*, *luppen*, for *leap*,

*leaped, leaped.* 3. Peculiarities of vocabulary: These individual words current in one or more districts, but unknown to the standard vocabulary, are properly *provincialisms*. They are generally genuine words of an older stage of the language, that have survived longer in some localities than in others. Some provincialisms, as *bearn* or *batrn*, for child, *marrow* for fellow or match, to *greet* for to weep, are common to Scotland and the north of England. Others are more local, as to *clean*, for to fasten or cement; *heppen*, a Yorkshire term for pretty near; *thrippa*, in Cheshire, to cudgel. The exclusion of such words from the standard language is often accidental, and many of them might be and are with advantage resumed; ex., *marrow, gloaming, &c.*

4. Peculiarities of intonation: This is sometimes, though with little propriety, called accent, which means strictly the stress laid upon a particular syllable of a word. There are no doubt local peculiarities of this kind too. The tendency of standard English, especially the more recent, is to throw the accent toward the beginning of the word; in Scotland, the tendency lingers to say *cuyl* for *cuyl*. But peculiarities of intonation lie in the different ways in which the *pitch* of the voice is managed—in the musical accompaniment of articulation. Differences in this respect give rise to the monotonous drawl of one district, the angry querulous tone of another, the sing-song of a third, &c.

So long as dialectic varieties of language were looked upon indiscriminately as corruptions and barbarities, they were only noticed by scholars that they might be avoided. A more rational philology, without trenching upon the rules of good writing, considers them as essential parts of the speech of a people, and a knowledge of them as necessary to any thorough investigation of the genius of that speech.

It is obvious that *Dialect* is entirely a *relative* term, and that what we call by that name in one connection, we may call a language in another connection. Thus Greek and Latin may be called sister-dialects of that primitive language from which it is held that they, as well as the other members of the Indo-European family, branched off. See ARYAN LANGUAGES. Speaking of Greek by itself, however, it is a language, and Ionic, Doric, Attic, &c., are dialects of it. The same holds good with the others. In practice, however nearly related the speech of two peoples may be, we do not apply the term dialects, unless the peoples are mutually intelligible and have a common literary standard. Intelligibility does not go for much, but political relations enter more or less into the notion. Thus, Scotch is sometimes spoken of as a distinct language from English; and yet in no part of Scotland is the common speech so unintelligible to an Englishman as is that of Somerset, which is always a 'dialect.' This arises from Scotland being thought of as a separate country, which it once was; and its speech as the vehicle of a peculiar literature. See AMERICANISMS.—Dialect is not to be confounded with artificialities, such as the jargon of thieves.

DIALECTIC is a Greek word which signified originally 'the art of conversation,' but came to have a technical signification in the language of philosophy. At first, it implied a regular and scientific method of treating general conceptions or general terms—a sort of anatomy of names, and through them of the things denoted. In the Socratic philosophy, and more especially in that of Plato, dialectic was thus the method of the highest and deepest kind of speculation. Aristotle gave another signification to the word. According to him, a scientific proof or deduction is different from a dialectic proof, which is only a probable deduction. After this,

dialectic came round to imply a sort of word-fence, the art of so using the forms of reasoning as to confound your opponent, and make fallacies pass for truth. Dialectic is sometimes used as synonymous with logic. Logic, however, which originated with Aristotle, is properly the science of the forms of thinking; it is less directly concerned with words than dialectic, which in this view becomes a subordinate province of logic—the art of disputation. Dialectic, in fact, is little heard of where philosophy is positive and experimental; it is chiefly used with regard to the more ideal and *à priori* speculations of such philosophers as Kant, Hegel, Schelling, &c.

DYALLAGE, or SCHILLER-SPAR, a mineral nearly allied to Augite (q. v.), and by some regarded as a variety of it. Its chemical composition is essentially the same. It is seldom found very perfectly crystallised, but usually massive, granular, or disseminated. It has generally a metallic and pearly or silky lustre. A very beautiful bright green D. (smaragdite), found in Switzerland, Italy, Corsica, India, Labrador, &c., is prized for ornamental purposes; in Corsica, it occurs disseminated in a felspar (*Labradorite* or *Saussurite*), which when cut and polished, appears spotted with it, and is of great beauty, is made into boxes, vases, &c., is much valued, and is known by the names *Gabbro* and *l'erde di Corsica duro*. A variety of D., usually of a yellowish or brownish colour, is sometimes called *Bronzite*.

DIALOGUE, a conversation between two or more persons, implying, however, greater unity of subject and formality than an ordinary conversation. The ancient Greek philosophers were fond of this way of conducting their investigations and conveying their instructions. The Socratic dialogue is a conversation in the form of question and answer, so contrived that the person questioned is led himself to originate those ideas that the questioner wishes to bring before him. The dialogues of Plato are, as it were, philosophical dramas, in which the Socratic method of investigation is brought to bear upon speculative subjects. The form of the dialogue is but ill adapted to the modern state of science. Of the more eminent modern writers in this form, we may mention Erasmus in Latin; Lessing, Herder, and Wieland among the Germans; Petrarch and Machiavelli in Italy; Fénelon and Fontenelle in France; and Berkeley, Hurd, and Harris in England. Landor's *Imaginary Conversations* are a happy effort of this kind. When dialogue is combined with action, we have the drama.

DIAMAGNETISM. The fact that iron is attracted by the magnet, has been known from very remote times; that bismuth exhibits a repulsive action towards the magnetic needle, has been now known for nearly 100 years. Dr Faraday was the first (1845) to shew that all bodies are more or less affected by magnetic influence, and his beautiful researches on the subject have opened up a new field in the domain of science. He found that the magnetism of bodies was manifested in two ways—either in being attracted by the magnet, as iron; or in being repelled, like bismuth. When a needle or slender rod of iron is suspended between the poles of a magnet, as in fig. I, being attracted by them, it takes up a position of rest on the line *ab*, joining the two poles. When a substance behaves itself in this manner, it is said by Faraday to be *paramagnetic*, and to place itself *axially*, *ab* being the axis. A rod of bismuth, on the other hand, being repelled by the poles of the magnet, comes to rest in the line *cd*, at right angles to *ab*. Bismuth, and the like substances, he calls

diamagnetic, and they are said to place themselves equatorially, *cd* being the equator. These terms, being both definite and graphic, have been universally adopted. Magnetic is the term used by

Fig. 1.

Faraday to indicate magnetism of either sort, although in general language it is understood to refer to paramagnetic bodies, such as iron, &c. Paramagnetic bodies, then, are those which manifest the same properties with regard to the magnet that iron does; and diamagnetic bodies are those which, like bismuth, shew opposite but corresponding properties; so that in circumstances where paramagnetic bodies place themselves axially, diamagnetic bodies place themselves equatorially; and where the former are attracted, the latter are repelled, and *vice versa*. A paramagnetic, therefore, not in the elongated form, but in a compact shape, such as a ball or cube, is attracted by either pole of the magnet, when suspended near it; a ball or cube of a diamagnetic, on the other hand, experiences, when so placed, repulsion. The paramagnetism of iron, nickel, and cobalt, becomes manifest in the presence of magnets of ordinary power; but the magnetism of most other substances is so feeble as to be developed only under the influence of the strongest magnets. As electromagnets far exceed permanent steel magnets in strength, they are selected for investigations on the magnetism of bodies. Fig. 2 represents an electromagnet which may be employed for this purpose.

Fig. 2.

The soft iron horseshoe PPP, enveloped towards its extremities in the coils of insulated copper-wire *cc*, which communicate with a galvanic battery by the wires *ve*, is fixed in an upright wooden frame. The ends or poles of the magnet rise slightly above the table or board which forms the upper part of the frame. In order conveniently to suspend substances between the poles, and to protect them while under observation from currents of air, a glass frame of simple construction, fig. 3, is made to fit the table. The upper plate of the frame admits a wooden ring, into which an upright glass tube is

fitted. The thread by which the needle is suspended is wound round a slender movable bobbin at the top, so that it can be elevated or lowered to the proper position. To modify and direct the action of the magnet, two pieces of soft iron (fig. 1) are made to rest on the end faces; these are pointed at one extremity, and flat at the other, so that the force of the magnet may be concentrated in the points, when they are turned towards each other; or diffused over the opposite flat surface, when their position is reversed.

To observe the effect of the magnet on liquids, Faraday placed them in long tubes of very thin glass, and suspended them as in the case of solid needles. It was found that some arranged themselves axially, and others equatorially. The attraction and repulsion that liquids experience in the presence of the magnet has been prettily shewn by Plucker. A large drop of liquid is placed in a watch-glass, figs. 4, 5, and laid upon two poles of the

Fig. 3.

Fig. 4.

Fig. 5.

shape shewn in the figures. If the liquid be paramagnetic, the surface becomes depressed at the interval between the poles, and heaped up over the extreme edges of them, fig. 4. A diamagnetic liquid, on the other hand, shews a depression at each edge of the poles, and a heaping up at the centre, fig. 5.

The magnetic nature of flames and gases has been also studied. When the flame of a candle is brought between the poles of a magnet, it is repelled by them, and thrown out horizontally into an equatorial position. To ascertain the magnetism of gases, Faraday inflated soap-bubbles with them, and their para- or dia- magnetism was exhibited by their being attracted or repelled by the poles. He ascertained the same by causing the gases to flow out from glass tubes in the presence of the poles, when the peculiar magnetism of the gas was shewn by its choosing an axial or equatorial means of egress.

The following list gives the kind of magnetism displayed by the more common substances:

*Paramagnetic*.—Iron, nickel, cobalt, manganese, chromium, titanium, palladium, paper, sealing-wax, peroxide of lead, plumbago, red-lead, sulphate of zinc, shell-lac, vermilion, charcoal, proto and per salts of iron, salts of manganese, oxygen, air.

*Diamagnetic*.—Bismuth, antimony, zinc, tin, cadmium, sodium, mercury, lead, silver, copper, gold, arsenic, uranium, tungsten, rock-crystal, mineral acids, alum, glass, litharge, nitre, phosphorus, sulphur, resin, water, alcohol, ether, sugar, starch, wool, bread, leather, caoutchouc, hydrogen, carbonic acid, coal-gas, nitrogen.

The nature of the medium in which the body under examination moves, exerts a powerful influence on the nature and amount of the magnetism it exhibits; thus, if a glass tube be filled with a solution of the proto-sulphate of iron, and suspended between the

poles, it will place itself axially. It will do the same if made to move in water, or a solution more dilute of the proto-sulphate of iron. It will be indifferent in a solution of the same strength; but it will place itself equatorially in a stronger solution. Thus, the same substance may appear paramagnetic, indifferent, or diamagnetic, according to the nature of the medium in which it moves. As a general rule, a body shews itself paramagnetic towards one less paramagnetic than itself, indifferent towards one equally magnetic, and diamagnetic towards one more paramagnetic than itself. The same takes place, *mutatis mutandis*, with diamagnetic substances. This has given rise to the theory, that there is no such thing as diamagnetism *per se*, and that bodies are diamagnetic only in media of greater paramagnetic power than their own. This view of the case is, however, rendered highly improbable from the fact, that diamagnetism is exhibited as decidedly in a vacuum as in any medium, and a vacuum cannot be supposed to possess magnetic properties of any kind.

**DIAMANTINO**, a significant name in the diamond districts of Brazil, indicates a river and two towns.—1. The river, apparently an affluent of the Paraguay, and, through it, of the Plate, rises in the province of Matto Grosso, being joined by the Ouro 70 miles to the north-north-west of Cuyaba.—2. Of the two towns, the more westerly stands at the confluence above mentioned, having a population of 4500.—3. The more easterly town, again, is in the province of Minas Geraes, and stands amid the head-waters of the St Francisco at an elevation of 5700 feet above the sea. It has about 14,000 inhabitants.

**DIAMETER**, in Geometry, is generally used in speaking of curves, and its most general definition is, a straight line bisecting all parallel chords in a curve. In the circle, ellipse, and hyperbola, all diameters pass through the centre, and are there bisected. Only the circle has all diameters equal; and each bisects the chords at right angles to it. In the ellipse, this last is only the case with the two diameters called the major and minor axes. In the parabola, all diameters are parallel to the axis. Many curves of the higher orders have no diameter at all.

We speak also of the diameters of solid bodies of a round shape. In the sphere, lines passing through the centre are diameters, and so in the ellipsoid; they are all bisected in the centre.

**DIAMOND** (corrupted from Gr. *adamant*, *nutamable*, refractory), the most highly valued of precious stones, and the hardest of all known substances. It consists of Carbon (q. v.), a simple or elementary substance, crystallised, and in its greatest purity. Diamonds are commonly colourless and clear like water; although sometimes, from some slight foreign intermixture, they are white, gray, yellow, green, brown, and more rarely orange, red, blue, or black. The lustre is adamantine and very high; the transparency perfect in specimens perfectly free from foreign substances, the presence of which, however, even in very small quantity, mars it, and sometimes almost produces opacity. The D. becomes positively electric by friction, but is not electrified by heat, a test which sometimes serves to distinguish it from the topaz. Its specific gravity is about 3.6. Its primary form is a regular octahedron, but it appears also in rhombic dodecahedrons; and its crystals often have curvilinear faces and edges. Its structure is distinctly lamellar. It burns before the blow-pipe in air or in oxygen gas, combining with oxygen to form carbonic acid. Its hardness renders it incapable of being scratched by

any other substance, and in cutting and polishing diamonds, diamond-dust is employed. The estimation in which it is held as a precious stone is due to its remarkable hardness, rarity, and brilliancy. The art of cutting diamonds, although long practised in India and China, was not known in Europe till after the middle of the 15th c., when it was discovered by Louis van Berguen of Bruges. Previous to that time, diamonds were set without being cut, and in that state they have often a rough, dull, and uneven surface. Diamonds are indeed found not only in the form of perfect crystals, but also in rolled grains; and they are obtained partly from alluvial soils and the sands of rivers, and partly from rocks, chiefly a quartz sandstone or conglomerate, in which they are often associated with gold. A number of localities in India have long been celebrated as productive of diamonds, particularly Golconda (q. v.); they are found also in Malacca, Borneo, and other parts of the East; nor were any diamonds procured in any other part of the world till the beginning of the 18th c., when they were discovered in remarkable abundance in the district of Serra do Frio, in the province of Minas Geraes in Brazil. Previous to that time, diamonds found in Brazilian gold mines had been disregarded as mere pebbles; their nature became known in consequence of some of them accidentally finding their way to Europe. In 1829, they were discovered in the Ural Mountains. They have also been found in Rutherford county, North Carolina; in Hale county, Georgia; in the province of Constantine, Algeria; and in Australia. Diamond mines consist in general of mere diggings and washings of alluvial deposits. In Brazil, the method pursued is to rake the alluvial matter backwards and forwards on inclined planes, over which a stream of water is made to run, till the lighter particles are carried away, when large stones are picked out by the hand, and what remains is carefully examined for diamonds. The work is carried on by slaves, and when a diamond of seventeen carats is found, the slave who finds it is entitled to his liberty. Large diamonds are comparatively rare among those of Brazil, all the notable diamonds in the world being Indian. Brazil produces yearly from 25,000 to 30,000 carats of diamonds, of which, however, not more than 9000 carats are capable of being cut, the rest being either very small or of inferior quality. The small and inferior diamonds are called *Boer*, and command a ready sale for their use in the arts, being pounded in a steel mortar, and much employed in the form of diamond-dust by lapidaries for cutting and polishing diamonds and all kinds of gems, and even for polishing rock-crystals for spectacles. Minute fragments or splinters of bort are also used for making fine drills, which are used for drilling small holes in rubies and other hard stones to be employed in watch-making, gold and silver wire-drawing, &c., and for piercing holes for rivets in china, in artificial enamel teeth, &c. The use of small diamonds by glaziers for cutting glass is well known. The diamonds so used are uncut, and they are so mounted as to act upon the glass not by an angle, but by a curvilinear edge of the crystal. The cut is only to the depth of about one two-hundredth part of an inch, but is sufficient to make the glass readily break in accordance with it.

Diamonds are cut into various forms, but principally into *brilliant*s and *rose diamonds*. The *brilliant* cut is the most expensive and difficult, but is also that which best brings out the beauty of the stone: it has an upper or principal octagonal face, surrounded with many facets, and other things being equal, the greater the number of facets the more valuable is the diamond. The lapidaries of the East,

## DIAMOND—DIAMOND BEETLE.

however, sometimes multiply facets to hide imperfections of the stone. *Rose diamonds* have a flat base, above which are two rows of triangular facets, the six uppermost uniting in a point. Rose diamonds are made of those stones which are too broad in proportion to their depth to be cut as brilliants. Stones still thinner are cut as *table diamonds*. The art of sawing diamonds, when too thick in proportion to their surface, was invented by a Dutchman named Dalbeck in the beginning of the 19th century.

The value of diamonds is variously estimated. The rule generally given is to square the number

Diamonds:

1, the Koh-i-noor; 2, Regent or Pitt Diamond; 3, Grand Duke; 4, 5, vertical and lateral appearance of the brilliant diamond; 6, 7, vertical and lateral appearance of the brilliant diamond before being recut; 8, 9, vertical and lateral appearance of rose-cut diamond; 10, 11, the table cut diamond.

of carats the diamond weighs, and then to multiply by the price of a single carat. Thus, a rough diamond of 12 carats weight, one carat being estimated at £2, would cost  $12 \times 12 \times 2 = \text{£}288$ . The value of a diamond is much increased by its being cut, although the actual weight is diminished. Beyond a certain weight, no rule of calculation can be applied, owing to the limited number of purchasers, and the most fabulous values have been assigned to famous diamonds. The price of diamonds is now less than it once was.

There is a way of falsifying diamonds by joining an under part of some other stone to an upper part of genuine diamond. Some varieties of Sapphire, Hyacinth, and Topaz, are often passed off for diamonds. The first two may be distinguished by their greater specific gravity, the latter by its becoming electric when heated. Rock-crystal, and glass or 'paste' imitations, are lighter than true diamonds, and less hard and brilliant. The best test of a genuine diamond is hardness. Care must be taken, however, to avoid breaking off its angles, in attempting to test it by scratching other substances with it, as, notwithstanding its hardness, it is somewhat brittle.

Some particular diamonds, from their unusual magnitude, or from circumstances of their history, are of such interest as to entitle them to notice. The collection of the emperor of Brazil is said to contain an uncut diamond—the Braganza diamond—of the enormous weight of 1680 carats, or about 12 ounces; but it is suspected to be only a fine colourless topaz.—The largest diamond certainly

known is that belonging to the rajah of Mattan, weighing 367 carats. It is egg-shaped, with an indented hollow near the smaller end. Many years ago, the governor of Borneo offered for it 500,000 dollars, two war-brigs fully equipped, a number of cannon, and a quantity of powder and shot. But the rajah refused to part with it, the fortunes of his family being supposed to be connected with it, and the Malays ascribing to water in which it has been dipped the power of healing all diseases.—Next to this diamond in size, ranks the celebrated Koh-i-noor (q. v.), once a boasted possession of the Great Mogul, and now belonging to the Queen of Great Britain. It weighs 279 carats; but is said to have weighed in the rough state 900 carats.—The Orlov diamond, belonging to the Russian emperor, and which was once the eye of an Indian idol, is said to have weighed, when rough, 779 carats, but is now cut, egg-shaped, and weighs 195 carats.—The Regent diamond, or Pitt diamond, which weighs in its cut state  $136\frac{1}{2}$  carats, is unrivalled in its limpidness and its form, its diameter and depth being nearly equal. It was found in Golconda, was brought from India by an English gentleman named Pitt, the grandfather of the first Earl of Chatham, and by him sold to the Duke of Orleans for £130,000. It decorated the hilt of the sword of state of the first Napoleon, was taken by the Prussians at Waterloo, and now belongs to the king of Prussia.—The Sanci diamond, weighing 106 carats, has a still more interesting history. It belonged to Charles the Bold, Duke of Burgundy, who wore it in his hat at the Battle of Nancy, where he fell. A Swiss soldier found it, and sold it to a clergyman for a guilder. It passed into the possession of Anton, king of Portugal, who was obliged to sell it, the price being 100,000 francs; and it shortly afterwards became the property of a French gentleman named Sanci, whose descendant being sent as ambassador to Soleure, King Henry III. required the diamond as a pledge; but the servant who was carrying it to the king was attacked by robbers on the way and murdered, not, however, till he had swallowed the diamond. His master, fully confident of his faithfulness, caused his body to be opened, and found it in his stomach. This diamond came into the possession of the crown of England, and James II. carried it with him to France in 1688. Louis XV. wore it at his coronation. In 1835, it was purchased by a Russian nobleman for half a million of rubles (£80,000). The Sanci diamond is said to have been the first diamond which was cut in Europe.

DIAMOND BEETLE (*Curculio imperialis*), a

Diamond Beetle (*Curculio splendens*).

beetle or coleopterous insect of the tribe to which the name WEEVIL is generally appropriated, but

remarkable for the splendour and exquisite beauty of its colours, in which it is thought to be unrivalled even among coleopterous insects. It is of a golden-green colour, with two black longitudinal bands on the thorax, and several rows of depressed spots on the elytra (wing-covers), which exhibit a beautiful and sparkling green with intervals of black. It is a native of warm parts of South America.

**DIAMOND HARBOUR**, the port of Calcutta for large ships, is situated on the left side of the Hoogly, about 30 miles below the capital, with which it is connected by an excellent road and by electric wires. As the adjacent country is swampy and unhealthy, the spot is marked only by a few native huts. The commercial value of the locality, however, is likely to increase, in proportion as the silting up of the river above impedes the upward navigation.

**DIAMOND NECKLACE, THE**, a wonderful piece of jewellery, made in Paris about the year 1775, and intended for Madame Du Barry, the favourite of Louis XV. She, however, was excluded from court on the death of Louis (1774), and before the necklace was finished. After being made, this beautiful ornament, adorned with 500 diamonds, was discovered to be so costly that no one could purchase it. It was valued at 1,800,000 livres, which in present sterling money is equal to about £80,000.

The Prince Cardinal de Rohan, a wealthy, vain, and profligate man, persuaded by a woman named De Lamotte, who waited about court, that the queen (Maria Antoinette) regarded him with an eye of favour, became so infatuated with the idea, that he was ready to do anything, however extravagant, in order to preserve this feeling in the queen. De Lamotte had stated to the cardinal that the queen was desirous of obtaining this glorious necklace, and that not having sufficient money just then, she would sign an agreement to purchase it if the cardinal would become security. The cardinal consented. The agreement was approved of and signed with the royal signature, as also with that of the cardinal, who, on the 1st February 1786, carried off the treasure to Versailles, where it had been agreed the queen should send for it. On the following day, a person, dressed in the uniform of one of the court valets, entered the apartments of the cardinal, and repeating as he entered the words, *de par la reine*, 'in the name of the queen,' he advanced to the table whereon the casket containing the treasure lay, and bore it away. In a few days De Lamotte, her husband, and the *soi-disant* valet, having all disappeared from Paris, were busily engaged separating the diamond necklace into portions, and selling them. The whole transaction had been a trick; the messages from the queen, verbal and written, were without foundation, the latter, indeed, being forged by the 'valet,' who was skilled in imitating handwriting. The plot was discovered by means of the maker of the diamond necklace, who, not receiving any money when the period of the first instalment had arrived, went to court, demanding to know if the necklace had been delivered to the queen. In a few months the cardinal found himself in the Bastille, where those by whom he had been duped were already sent. In May 1786, the trial of the prisoners was brought to a close. De Lamotte was branded on each shoulder with the letter V (for *voleuse*, thief), and was sentenced to be imprisoned for life. All the others were acquitted. The queen was falsely supposed by the populace of Paris to have been implicated in the plot, and the odium resulting from it was cast upon her, even at the last,

when she sat on the cart that bore her through a raging and cursing mob to the guillotine.

**DIANA**, a Roman goddess, corresponding in most of her attributes to the Grecian Artemis. According to the myths, she was the daughter of Jupiter and Latona, and the twin-sister of Apollo. She was born, along with her brother, on Mount Cynthus, in the isle of Delos, which till then had been a floating island, but was fixed by Neptune in its present place, that Latona might there give birth to her children in peace and safety from the persecutions of the jealous Juno. D. was worshipped by Greeks and Romans alike, as both a destroying and a preserving goddess. In the former capacity, she was represented as a full-grown virgin, armed with bow and arrows, with which she avenged herself on her enemies; as a preserving deity, she

Diana.

watched over the sick, and helped the unfortunate. Young girls, and women in childbirth, were the objects of her special care. She was herself beyond the allurements of love; and the ministers of her worship were vowed to lives of the strictest chastity. As sister of the sun-god Apollo, D. was regarded as the goddess of the moon; hence her Greek name *Selene*, and her Latin names *Lucina* and *Phoebe*. Her worship was conducted with splendid rites in different cities. Her temple at Ephesus was one of the seven wonders of the world. In Tauris (the Crimea), she was propitiated with sacrifices of human victims; and before her statue at Sparta, the public scourging of the Lacedaemonian youth used to take place. In Arcadia, she was looked upon as the special patron of hunting and all sylvan sports, and as such was represented in Greek works of art as a tall and handsome maiden, with long hair floating down her neck, drawing an arrow from her quiver with one hand, and with the other holding in a struggling deer. As goddess of the moon, she wears a long robe reaching to her feet, and bears on her brow a crescent moon.

**DIANO**, a town of Naples, in the province of Principato Citra, 45 miles south-east of Salerno. It occupies a beautiful situation on an isolated hill overlooking the river Calore, and in the fertile vale of Diano, which takes its name from the town. It has a castle of some strength, several churches, and a population of 7000.

**DIANTHUS**. See **PINK**.

**DIAPASON**, a term in music by which the ancient Greeks designated the octave. In modern music, diapason is used to denote the range, or compass of the voice, or of an instrument. The French use the term as equivalent to *pitch*. Diapason is

also the name given by English organ-builders to certain stops of pipes in the organ, of eight feet pitch, which are considered the fundamental stops, of which there are generally two—a stopped diapason and an open diapason on each manual. See ORGAN-BUILDING.

**DIAPER** (Ital. *diapro*), a term derived from *jasper* or *diasper* (see letter D), which stone being much used in ornamenting jewellery, originated the Mid. Lat. name *diaprus*, for a texture ornamented or variegated in an analogous way. In textile manufactures, the term is applied to fabrics with patterns of geometrical regularity, such as are produced by the kaleidoscope, woven in their texture, and produced with shafts and heddles, without the Jacquard machine. In Architecture, **DIAPER-WORK**, or **DIAPERING**, is a kind of decoration applied to plane surfaces, and consists of a small pattern either of flowers, leaves, or arabesques, carved or painted. The flower, or other object, is generally

Diaper.

enclosed in a small frame; and these frames, which touch each other at the edges, constitute in themselves a sort of mathematical diapering. When the pattern is carved, it is generally sunk; and when painted, it consists of a darker shade of the same colour as the plane surface, by which the effect of shadow is communicated to it. The accompanying illustration, from Bloxam's *Gothic Architecture*, exhibits a very beautiful example of decorated English diapering. It is taken from Canterbury Cathedral.

**DIAPRE** is applied in Heraldry to fields and charges, relieved by arabesque and geometrical patterns. These patterns were generally of a darker shade of the same tincture. This being merely an ornamental device, not affecting the heraldic value of the objects to which it was applied, was generally left to the fancy of the painter.

**DIAPHANOSCOPE** (Gr. *diaphanos*, transparent; *skopeo*, I see), a dark box, suitably constructed for exhibiting transparent photographs or other pictures. It may or may not be furnished with a lens.

**DIAPHORE'SIS** (Gr.), the cutaneous perspiration, whence

**DIAPHORETICS**, remedies to excite the secretions of the skin. The simplest of all diaphoretics are baths, which may be either warm baths of water, or of vapour, either simple or medicated. See BATHS. The most powerful of all, however, as regards educing perspiration, is probably the so-called Turkish bath, which consists essentially in the use of a sweating process, by means of air heated to a temperature of 140°, or even more. The following remedies, used internally, are powerful diaphoretics: antimony, ipecacuanha, opium (these three either singly or in combination); ammonia, and the carbonate or acetate of ammonia (spirit of mildererus), sarza, guaiacum, dulcamara, and saffras. On most of these substances, special articles will be found. A favourite formula is Dover's powder, consisting of a grain of opium, and a grain of ipecacuanha in each ten grains of the powder. This in doses of from five to eight grains, followed by warm drinks and plenty of blankets in bed, usually produces copious perspiration, and is very soothing and useful in many commencing inflammatory and febrile

complaints. James's powder, in doses of from three to eight grains, is often added to the above in domestic prescriptions; but neither of these medicines should be used rashly, as in certain states of the system they may prove dangerous; and they should never be given to very young children.

**DIAPHRAGM** (Gr. *diaphragma*, a partition). This is the name applied in anatomy to designate the transverse muscle which, in man and the mammalia generally, separates the cavity of the thorax or chest from that of the abdomen or belly. It is not easily described, but will be best understood by a reference to the accompanying figure (fig. 1). In form, it is nearly circular; it is fleshy at its

Fig. 1.—The Diaphragm in a state of repose. Anterior view.

edges, tendinous in its centre, and ending in a point below. In front, it is attached to the ensiform cartilage of the sternum, or breastbone; laterally, to the inner surfaces of the six lower ribs; and posteriorly, to two tendinous arches on either side, termed the *ligamenta arcuata*, and to the anterior surface of the bodies of the second, third, and fourth lumbar vertebrae on the right, and only the second and third on the left side; these origins from the vertebrae forming two large fleshy bellies (termed the *crura*), which ascend to join the central tendinous portion. The diaphragm presents three principal openings: one quadrilateral, in the tendinous centre, for the upward passage of the inferior vena cava; one of an elliptical shape, formed by the two *crura* for the oesophagus and pneumogastric nerves; and a third for the aorta, the azygos vein, and the thoracic duct.

The diaphragm is in relation superiorly with the pleuræ and pericardium, enclosing the lungs and heart; inferiorly, on the left side with the stomach and spleen, on the right with the convex upper surface of the liver; posteriorly, with the kidneys and supra-renal capsules and the duodenum; and by its circumference with the ribs and intercostal muscles, with the sternum, and with the vertebral column.

We see from figure 1 that it is convex superiorly, and concave inferiorly. When it contracts, its upward convexity approximates to a plane surface, and the cavity of the chest being thus enlarged, air rushes in to fill the partial vacuum, and expands the lungs during the act of inspiration (fig. 2). It is thus an inspiratory muscle, and is the sole agent in tranquil inspiration. The enlargement of the thoracic cavity caused by the contraction of the diaphragm, must obviously be associated with a corresponding diminution of the abdominal space. Hence this muscle, by its action

on the abdominal viscera, aids in the expulsion of the feces and urine.

Spasmodic action of the diaphragm produces hiccough and sobbing; and in laughing, the alternate

Fig. 2.—The Diaphragm in a state of contraction.  
View of lateral section.

contractions and relaxations of this muscle occur with increased rapidity. Stoppage of the action of the diaphragm, whether from great external pressure or from paralysis, is very speedily fatal.

**DIAPHRAGM**, a partition with a hole in it, employed, not only in landscape and portrait lenses for photography, but also in telescopes, microscopes, and other optical instruments, for the purpose of cutting off the superfluous rays of light, and producing greater intensity or sharpness of the image, as well as to correct aberration.

**DIAPHRAGM SHELL.** See SHELL.

**DIA'RBEKIR**, a town of Asiatic Turkey, capital of a pashalik of the same name, is situated on the right bank of the Tigris, at a short distance from the river, the intervening space being occupied by rich gardens; lat. 37° 55' N., long. 39° 52' E. The town, which is circular in shape, covers a considerable area, and is surrounded by high strong walls, flanked with towers, and pierced by four gates. The streets are dirty, and the houses for the most part are built of rough stone, plastered with a composition of mud and straw, but some of the better class are of black basalt. It has numerous handsome mosques, khans, and bazaars, and five Christian churches. Extensive manufactures of silk, cotton, and other goods, affording, with an active commerce between Aleppo and Bagdad, employment to about 40,000 families, were at one time carried on here; but the manufactures and trade have now greatly declined, and the population of D. does not amount to more than 8000 families, 6300 of whom are Turkish, the rest being Greek, Armenian, Catholic, and Jewish. The silk manufacture, which is now the staple, is said to be improving. D. occupies the site of the ancient *Amida*, which was a place of importance in the reign of Constantius, by whom it was strengthened and enlarged. In this reign it was taken by the Persians, from whom it was again captured by the Romans; but in 502 the Persians once more became masters, and put 80,000 of the inhabitants to the sword. After many vicissitudes, it passed into the hands of Sultan Selim in 1515. Many Roman and Saracenic remains still exist here.

**DIARRHŒA** (Gr. *dia*, through, and *rheō*, I flow), a disease, or rather a tribe of diseases, characterised by an increase in the discharges from the bowels, which are usually unduly liquid, sometimes

overcharged with bile, and sometimes the contrary. Diarrhœa has many varieties and many causes; but the whole tribe of diarrhœal diseases present certain relations in common, which have been studied of late years to a considerable extent from the preventive or sanitary point of view. Thus it is observed of all of these diseases, without exception, that they are more apt to prevail during summer and autumn than during the earlier seasons of the year; and it is also well established that their prevalence is to a great extent dependent on the intensity of the solar heat, so that a temperature above 60° F. seems to be almost essential, under ordinary circumstances, to their epidemic diffusion. Moreover, it has been shewn that the decomposition of organic matters in the neighbourhood of human dwellings, and the introduction of the products of decomposition into the food, drink, or air used by the healthy, has been a direct exciting cause of diarrhœa in a great number of instances where the disease has been locally epidemic; from which it is inferred that the real source of diarrhœal diseases is usually to be found in a morbid poison closely associated with the process of putrefaction, although not, perhaps, necessarily generated during that process. It has been noticed that cold and wet seasons are the least favourable to the production of diarrhœa, which is explained on the theory above alluded to by the rapid removal in such seasons of all organic debris; and there is little doubt that this explanation is correct, as the converse is equally true, the combination of heat with long-continued drought being almost sure to waken into life the epidemic seeds of diarrhœa. Again it is noticed that where drainage is imperfect, and drinking water impure, diarrhœal diseases are specially apt to occur (see CHOLERA); the class of the population most apt to be affected being those who occupy low levels, or who are otherwise exposed to the influence of this aqueous or gaseous poison. Infants are especially apt to suffer from diarrhœa, and a large number of the infantile deaths in many English towns are caused either directly by this disease, or by the abuse of stimulants and narcotics for its cure.

Diarrhœa is either simple, bilious, or choleraic; the last form has already been discussed. See CHOLERA. The ancients applied the name *lienteria* to a diarrhœa in which the dejections consisted of matters not digested, or very partially so; this form is, however, very unusual, at all events in this country. Dysentery (q. v.) is also a form of diarrhœal disease; as is the form of fever (q. v.) called gastric, typhoid, or enteric fever. Simple and bilious diarrhœa probably often differ only in degree; they are both distinguished from the advanced stages of cholera and dysentery by the presence of abundance of biliary colouring matter in the stools, and by the absence of the distinctive features of the other two diseases as described elsewhere. Diarrhœa frequently depends on organic disease, either of the intestines themselves, or of the liver, kidney, or spleen. It is also one of the most common symptoms of the advanced stage of consumption (q. v.).

When diarrhœa is plainly the consequence of improper food or drink, when it is very recent, when the strength of the patient is not much impaired, when there is much griping pain or distension of the belly, when the evacuations are very unnatural in character, and especially when they are dark coloured and very fetid; when the disease has been preceded by habitual constipation (q. v.), and when there is no organic disease to be discovered, it is well to let diarrhœa run its course, at all events for a time, and either to aid it by small doses of very simple laxatives, or, at all

events, to abstain from hastily checking the discharge, which in these cases is to be regarded as a truly curative and beneficent process, calculated to disburden the system of some poisonous or deleterious substance, and only requiring time for the restoration of the patient to health. In other cases, especially of febrile diarrhœa, an emetic of ipecacuanha at the very beginning will sometimes remove the disease with remarkable rapidity; and in most forms of diarrhœa it may be alleged that this medicine (in doses of from one to five or even ten grains) is well borne. Sometimes it is combined with opium in the form of Dover's powder. Vegetable astringents, as catechu, kino, tannin, matico, logwood, are also much employed both in acute and chronic cases; some prefer the acetate of lead, with opium (which, however, is perhaps more suitable to dysentery). It should be observed that in some forms of diarrhœa the use of opium, though a most powerful remedy, is contraindicated by the state of the constitution; it should in no case be largely given without medical advice. In many chronic cases the metallic tonics and astringents are of service—e.g., iron, sulphate of copper, zinc, and bismuth. In a very large class of cases, especially of infantile diarrhœa, depending upon a too acid state of the secretions, the leading remedy is chalk, either in powder or in the very serviceable form of the *mistura cretæ* (mixture of chalk) of the pharmacopœias, from one to three dessert spoonfuls of which may be given after every disturbance of the bowels. Lime-water, mixed with milk in the proportion of one to four or five, is easily given to very young children, and serves nearly the same purpose.

DIARY (Lat. *diarium*, from *dies*, a day), means simply a daily record. It does not, however, comprehend every sort of daily record, but only such as have reference to the writer personally. In it the *littérateur* inscribes the daily results of observation, reading, or thought; to the mercantile man, it serves the purpose of an order or day book; while the physician finds it indispensable as a register of engagements. The use of diaries has become so general, especially in England, that the making of them now forms an important branch of the book-manufacture. Letts and Co., of London, issue annually upwards of a hundred varieties of diary, from the large folio to the smallest pocket volume. The usual diary may be described as a book with a separate blank space for every day in the year, these spaces varying in size and form, as the particular bent or profession of the diarist may render necessary. Bound up with these diaries is a summary of the important events of the past year, a list of the acts of parliament passed during the previous session, an enumeration of public holidays, terms, &c., a great amount of valuable information regarding banking and insurance businesses, with a vast quantity of miscellaneous memoranda, so that the proprietor possesses in one book a diary and an almanac.

Diaries have often furnished the historian with invaluable material, supplying the absence of public records, and furnishing minute and graphic details of the social condition and of the secret springs of public events that are not to be looked for in more formal records. Perhaps the most notable in this respect are the diaries of Evelyn and Pepys.

DIASCHISMA, the Greek name of a small musical interval which only appears in the mathematical calculation of greater intervals. The diaschisma is, (1) the difference between the great half tone and the small *limma*, or the remainder when the latter is subtracted from the former, 2048 : 2025; (2) the difference between the *diesis*

and the *syntonic comma*, also 2048 : 2025. The diaschisma and the small *limma* added together always make the greater half tone, or 16 : 15; and the *syntonic comma* added to the diaschisma always make the *diesis*, 128 : 125.

DI'ASTASE is a peculiar ferment developed during the germination of all seeds. An impure solution of diastase may be procured by adding one part of hot water to two parts of ground malt (see BEER), or freshly germinated barley, and, after standing for a short time, straining through a cloth. The proportion of diastase in malt is not more than 1 part in 500 parts, and yet it performs important functions. Thus diastase has a powerful action upon starch, and at a temperature of 150° Fahr. one part is considered powerful enough to change 2000 parts of starch into dextrine, and then into grape sugar. When obtained separately, diastase is a white tasteless substance. See GERMINATION.

DIATHE'RMANOUS. See HEAT.

DIATHESIS (Gr. *dia*, through, and *titheimi*, I place or arrange), a Greek word signifying a disposition or arrangement, and applied by the old medical authors to the predisposition or constitution of the body which renders it prone to certain diseased states. Thus the tubercular, scrofulous, gouty, rheumatic, cancerous, or calculous diatheses, are described as something different from the corresponding diseases, but leading to these as natural or probable consequences, under certain conditions or exciting causes. The study of diathesis apart from existing disease, however, is almost always unsatisfactory, and leads to over-refinement and the pursuit of intangible abstractions, without due regard to evidence; inasmuch as the existence of a state which *is not* disease, but *leads to* disease, can rarely be established upon an unassailable basis.

DIATOMACEÆ, or DIATOMS, a group of organised beings, now generally regarded as belonging to the vegetable kingdom, and ranked as a sub-order of *Algae*; but formerly reckoned among animalcules, a view of their nature still entertained by some naturalists. Lindley makes D. an order of his *Algal Alliance* of thallogenous plants, including *Desmidiæ* (q. v.) as a sub-order, and distinguishing the true D. as another sub-order, under the name *Cymbellæ*. The D. are generally of a brown colour, although they not unfrequently become greenish when dry. They are remarkable for their silicious covering, composed of two pieces or valves, and their angular shape, and are among the most beautiful and interesting of microscopic objects, exhibiting great variety of markings—striae, dots, &c.—regularly and symmetrically arranged. The valves, or pieces of the silicious covering, are always equal in length, but their sides often differ much in breadth. All within appears to be only a single cell; but many of these cells are often united or in contact, according to some mode of arrangement characteristic of the particular species. D. are found both in salt and fresh water, also on the surface of damp rocks and walls, garden-paths, flower-pots, the glass of hothouses, &c. They may generally be obtained in great numbers by allowing water in which they exist to stand for a few hours, and then pouring off all except the more muddy or slimy part at the bottom. They may often be seen to move a little in the water or slime in which they exist, particularly those of most elongated form; and this was once regarded as a very conclusive evidence of their animal nature, but is now believed to be no more so than the movements of vegetable zoospores, and to be owing to their imbibing and emitting fluids in the processes of their vegetable life. They increase by division (whence the name diatomaceæ,

Gr. through-cutting), which takes place not transversely but longitudinally; and the lines which mark its progress are almost always visible in them. In this process, new silicious valves are formed along the line of division, the old valves remaining on the outer sides, and each new diatom cell having an old valve and a new one. True reproduction takes place by conjugation (q. v.), and by the formation of *Sporangia* (q. v.). *D.* very rapidly putrefy, but their silicious shields resist decomposition more perfectly than almost any product of organic nature, and are found in immense numbers in many marls, clays, and rocks. They are capable of resisting even the action of fire, and of the gastric-juice of the stomachs of animals, and are found in pumice and volcanic ashes, and in guano. The abundance of the *D.* as existing organisms, corresponds with what we infer from their remains in the oolite, chalk, &c., as to former geological periods. Britain is known to possess hundreds of existing species. Dr Hooker found them in such numbers in the Antarctic Ocean as to give an ochreous brown colour to its surface as far as the eye could reach, and to the icebergs floating in it; whilst a submarine deposit is in process of formation, composed of their silicious shields. Thus these minute organisms, unimportant as they may be deemed individually, fill no insignificant place, collectively, in the general scheme of creation.

*Fossil D.* have been observed in strata of every age. Though so minute in the individual, they form, in the aggregate, considerable thicknesses of rock—they have, in fact, in common with the associated and nearly as minute and simple organisms of the animal kingdom, the Foraminifera, produced greater changes, and left more lasting records than any effected by higher members of either kingdom. In the older rocks, *D.* have not been noticed in any quantity, their existence, however, in the clay-slates of the Lower Silurians was discovered by Mr A. Bryson, and has been subsequently noticed by other observers. In Tertiary strata they occur in abundance. There is good reason for believing that the silicious substance of flint was obtained, to a large extent, from these organisms; many of their frustules may yet be discerned in it. Tripoli-stone consists entirely of their silicious plates, hence its value as a polishing agent. Several extensive deposits of tripoli are found in Bohemia—one at Egau is two miles in length, and averages 28 feet in thickness; another at Bilin, forming the upper layer of a hill, is 14 feet thick; it is composed chiefly of a species of *Gallionella*, with specimens of *Navicula*, &c., as many as forty-one thousand millions exist in every cubic inch of the stone! The city of Richmond, in Virginia, is built on a stratum of diatomaceous earth, 18 feet thick. Similar deposits are found in different localities in Britain, as at Premnay, Dolgelly, Lough Mourne, Ransay, and Mull. From the last locality, Gregory has given a catalogue of 150 species. The whitish powder of which the deposit consists is called in Sweden Bergmehl (q. v.), and is, in seasons of scarcity, mixed by the poor with their food, though probably without any advantage, save increasing its bulk. *D.* occur in more or less abundance in marl, peat, guano, estuary mud, and other recent deposits.

DIATONIC, a term used in the science of music, originally from the Greek, meaning 'by tones,' or 'from tone to tone.' The diatonic species of the ancient Greeks—apart from their chromatic and enharmonic species—formed the foundation of their whole system of music, and was arranged in tetrachords composed of one semitone and two whole tones. The diatonic scale of modern music

is a combination of the Greek tetrachord, forming a succession of sounds progressing from degree to degree, by tones and semitones in a certain fixed order, neither omitting nor repeating; the position of the semitones varying, as the scale is major or minor.

DIATRIBE (Gr. *diatribē*, a disputation, or critical exercise) was a name originally given to a critical examination of a literary work, and at a later period to a bitter and violent criticism, either written or spoken, on any subject, in any department of literature.

DIÁZ, BARTOLOMEO, a Portuguese navigator of noble birth, who flourished during the latter half of the 15th century. His residence at the court of King John II. brought him into contact with many scientific men, among others the German cosmographer Behaim (q. v.). *D.* took a great interest in geographical discovery, and his knowledge and abilities were so highly estimated, that the king gave him the command of two vessels with a view to following up the discoveries already made by Portuguese adventurers on the west coast of Africa. *D.* soon reached the limit which had been attained in South Atlantic navigation, and first approached land in 26° south lat. After disembarking at various places, and taking possession of the shores in the name of the Portuguese king, he sailed round the southern extremity of Africa without suspecting it, and cast anchor at the mouth of the Great Fish River, a little to the east of Algoa Bay. A storm now rose, and drove him into Algoa Bay. He there found, near Port Elizabeth, his companion-vessel, from which he had been separated before rounding the Cape; but unfortunately the greater part of its crew had been murdered by the blacks. He now, for the first time, noticed his discovery, and called the cape, in remembrance of his danger, *Cabo de todos los tormentos* (Cape of all the Storms)—a name which the king of Portugal afterwards changed into its present, *Cabo de Buena Esperanza* (Cape of Good Hope). *D.* arrived in Lisbon December 1487, and was at first greeted with enthusiasm, but soon saw Vasco de Gama preferred before him, and was compelled to act under the latter in the grand expedition of 1497. Vasco de Gama even sent him back to Portugal after they had reached the Cape Verd Isles, so that he had no share in the honour of discovering a maritime route to the Indies. Three years after, he joined the expedition of Cabral, the discoverer of Brazil, but was lost in a storm, 29th May 1500.

DIBBLE AND DIBBLING. The common garden dibble is an implement too well known to require any lengthened description. A round piece of wood, about an inch and a half in diameter, sharpened at the point, is the most simple and common form. To allow it to be more easily pressed into the ground, a handle is usually added. This is all that is needed for a garden dibble. In some parts of England, where labour is plentiful, large breadths of wheat are put in with the dibble. Several dibles are usually joined together, and made of sufficient length to enable a man to perform the operation, as he walks backwards, without much stooping. Children follow with the seed, and drop two or three grains of wheat in every hole. The dibbler is often used to put in beans. By dibbling, a considerable saving of seed is effected. From one bushel to six pecks of wheat is the usual quantity required to sow an acre. Dibbling is thought to be advantageous for light lands which are in good condition. More recently, several ingenious machines for dibbling have been constructed. The one most worthy of notice is Newberry's Horse-dibble, which

sows from one to seven rows, and accomplishes the operation with great nicety and accuracy. Being an expensive machine, however, it has not come into general use. Dr Newington has invented a hand-dibble, a very perfect implement of its kind; the same machine makes the holes and deposits the seed at once. This has been a useful article on small holdings, and it is the greatest favourite at the present moment.

Dibbles of every kind are unsuitable for stiff or clayey soils; the soil, compressed and hardened around the hole which they make, not readily admitting the young fibres of the root, and retaining water to the injury of the young plant.

DIBBS, the English name of a game of great antiquity, played by boys and girls; and in Russia, as is described by Dr Clarke, it is played sometimes even by old men. It consists in throwing up the small joint-bones of the legs of sheep, and catching them first on the palm and then on the back of the hand. The antiquity of this simple kind of play is proved by figures on Grecian vases, on which females are seen kneeling and engaged in the sport. In Scotland, where the game is more usually played with small pebbles or shells, it is called 'the chucks.'

DIBDIN, CHARLES, musician and poet, was born at Southampton in 1745, educated at Winchester, and at the early age of sixteen made his literary debut in London, by writing an opera called *The Shepherd's Artifice*, which was produced at Covent Garden Theatre, of which he afterwards became musical manager. In 1789, he commenced giving a series of musical entertainments in the city, entitled *The Whim of the Moment*, which acquired a great celebrity. After several vicissitudes, he withdrew, in straitened circumstances, from public life in 1805, when government granted him, in consideration of his literary merits, a pension of £200. He died in 1814. D. is an admirable writer of sea-songs, of which he composed about 1200. Neptune, and not Apollo, seems to have inspired him. In fact, he is the only song-writer who has reached the heart of 'the mariners of England.' His verses smack of the briny deep, and reflect with astonishing felicity the easy, childlike virtues and the fearless courage of the English tar. It is known that they had a great effect during the war between France and England in supplying the navy with volunteers, and they have even been quoted in mutinies to the restoration of order and discipline. Among D.'s happiest pieces are *Poor Jack* and *Poor Tom Bowling*. The last edition of D.'s songs, with a memoir by T. Dibdin, illustrated by G. Cruikshank, appeared in 1850. D. also wrote a great number of dramatic pieces, &c.—He left two sons, CHARLES DIBDIN (died 1833), and THOMAS DIBDIN (died 1841), both of whom composed songs and dramas.

DIBDIN, REV. THOMAS FROGNALL, nephew of Charles Dibdin, the famous writer of sea-songs, was born at Calcutta in 1776. He lost both his parents when hardly four years of age, and was brought up by his mother's brother, a Mr Crompton. He studied at St John's College, Oxford, but left the university without taking a degree. After a short and unsuccessful career as a lawyer, he entered the church in 1804, and from that period until his death, 18th November 1847, continued to labour as a bibliographer with a diligence that would have been more commendable if it had been accompanied with a stronger judgment and a greater accuracy. D.'s principal works are an *Introduction to the Greek and Roman Classics* (1802), *Typographical Antiquities*, 4 vols. (1810–1819), *Bibliomania* (1811), *The Bibliographical Decameron* (1817), *Bibliotheca*

*Spenceriana* (1814), *Bibliographical, Antiquarian, and Picturesque Tour in France and Germany* (1821), *The Library Companion* (1824), and *Reminiscences of a Literary Life* (1836). All D.'s books contain valuable and rare information, but are far from trustworthy in matters of detail. Many of them are exquisite in typography and artistic decoration.

DICE (plural of die), small cubes of bone or ivory, marked on their six sides with black dots, from one up to six in number. Two dice are employed in certain games of chance, such as backgammon; also in throwing for high stakes, or settling some dispute in which the decision is referred to the highest number thrown. In this latter point, the throwing of dice is equivalent to what is usually spoken of as 'casting lots.' The throwing of dice is in all cases effected by means of a small tubular box, which, held in the hand, is shaken at will by the player. When the dice are true cubes, there is no plan by which any kind of shaking can bring out a desired number. In order to repress gambling, and secure players against deception, the state, by the Act 9 Geo. IV. c. 18, imposes a duty of 20s. on each pair of properly made dice, which are accordingly stamped, and inflicts a penalty on the sale of those issued without this mark of authority. Nevertheless, we believe there is a pretty free sale of unstamped dice, under the cant name of 'bones,' at an insignificant price. Unscrupulous gamblers, as is well known, resort to the odious practice of loading dice, by plugging them with lead on a particular side, that the higher numbers are almost certain to be turned up. Where there is any suspicion of this trick, the thrower should be requested to turn down the mouth of the box abruptly, to prevent the dice from rolling, and improperly adjusting themselves. See GAMBLING.

DICHLAMYDEOUS (Gr. *dis*, twice, and *chlamys*, a covering), a term in botany, applied to those flowers which have both a calyx and a corolla. Flowers in which the calyx and corolla are very similar, and unite to form a *perianth*, are dichlamydeous, as well as those in which they are very different.—In the system of Decandolle, dicotyledonous or exogenous plants are divided into *Dichlamydeous* and *Monochlamydeous*, the former including the three sub-classes of *Thalamifloræ*, *Calycifloræ*, and *Corollifloræ*, whilst the latter form a single sub-class.

DICHOTOMOUS (Gr. divided into two equal parts), a term often used in botanical description to designate branching by repeated forkings. The veins of the fronds of ferns and of the leaves of some coniferous-trees, the stems of some ferns, the fronds of some algae, and the stems of a few phanerogamous plants, are dichotomously branched. The stem of the mistletoe is generally divided in this manner, and it is a remarkable characteristic of that of the doom palm.

DICK, THOMAS, LL.D., a well-known religious philosopher, was born in 1774, near Dundee, Scotland, educated at the university of Edinburgh, and intended for the ministry in connection with the Secession Church. After a brief pastoral charge, however, he devoted himself to teaching, lecturing, occasional preaching, and authorship. D. proved himself to be a truly useful writer; but although his productions obtained a great popularity both in England and America, they brought him very little pecuniary return. Towards the close of his life, a small pension was granted him in consideration of his literary services. He died at Broughty Ferry, near Dundee, 29th July 1857, in the 83d year of his age. D.'s principal works are

—*The Christian Philosopher* (1823), *The Philosophy of Religion* (1825), *The Philosophy of a Future State* (1828), *Celestial Scenery* (1838), *The Sidereal Heavens* (1840), and *The Practical Astronomer* (1845). Several of D.'s writings have been translated into other languages; one, even into Chinese.

DICK BEQUEST, the name given to a fund bequeathed by James Dick of Finsbury Square, London, for the benefit of the parochial schoolmasters of Moray, Banff, and Aberdeen. Mr Dick was born at Forres, Morayshire, in November 1743. Having entered mercantile life in the West Indies at the age of 19, he amassed a considerable fortune, which he subsequently increased in London. He died on the 24th May 1828, leaving the chief part of his fortune for the purpose above mentioned. The sum bequeathed amounted in 1833 to £113,147, 4s. 7d., since increased to £122,000. These funds, being invested in heritable securities, yield (after deducting all expenses) for annual distribution a sum which amounts, on an average, to £4000. Mr Dick's object was 'to encourage active schoolmasters, and gradually to elevate the literary character of the parochial schoolmasters and schools.' Acting on this declaration of the testator's wish, the trustees in whom the administration became vested\* ordained first, that with a view to raise the literary character of the schoolmasters, none should, after a certain date, participate in the bequest who had not passed, to the satisfaction of examiners appointed by them, an examination in the English language and literature, geography, arithmetic, geometry and trigonometry, algebra to quadratic equations inclusive, Latin, Greek, history, and chronology. To these branches have lately been added an examination in the art of teaching and in physics. To those who highly distinguish themselves in these examinations, a sum of money is awarded by the trustees, and they are entitled to a small allowance during their term of office. Further, with a view to raise the literary character of the schools, and to encourage active schoolmasters, the trustees appointed a Visitor, who should report annually to them on the condition of the schools, making a round of all those schools, whose teachers claim participation, once in three years—now, once in two years.

In allocating the fund at their disposal, the trustees take into consideration the number of scholars attending each school, the branches taught, the fees paid, and the salary fixed by the heritors. Each of these elements has attached to it a certain value, the object of this being to make it the interest of teachers, heritors, and ministers to promote the education of the parish. The sum to which a teacher may be entitled in consequence of the position he holds on the books of the trustees in the above respects, is allowed, increased, restricted, or refused, according to the report of the visitor on the condition of the school. The highest sum paid to any teacher in 1860 was £44, 16s.; the smallest, £20, 14s. 10d.; the average, £30, 2s. A considerable number of teachers do not participate in consequence of their having failed to comply with the conditions of the trustees.

There can be no doubt that the operation of this bequest has been most advantageous. There is no district in Scotland in which the parochial schools are so uniformly taught by highly qualified men—all being graduates, and very many licentiates of

the church. The results of the teaching, taking into consideration both the number of subjects taught and the actual acquirements of the pupils, it would not be easy to equal anywhere.

DICKENS, CHARLES, novelist and humorist, was born at Landport, in Hampshire, in February 1812. His father, Mr John Dickens, was employed for some years in the Navy Pay Department, but at the conclusion of the war with France was pensioned, and became a parliamentary reporter. In this pursuit his son was seen distinguished for uncommon ability; and after a literary engagement—at a very early age—upon *The True Sun*, he attached himself to the staff of the *Morning Chronicle*. In this newspaper he gave the first evidence of his talents in the lively essays, entitled *Sketches by Boz*, published in 1836. Encouraged by their success, he undertook to write the letterpress of the *Adventures of Mr Pickwick*, the illustrations of which were to be executed by the then more famous Mr Seymour, a comic draughtsman. The result was as though Shakspeare had been engaged to write the libretto for an opera of Mr Balfe's. The *Pickwick Papers*, which had an enormous commercial success, commenced also an era in English literature. It was the first of a series of fictitious works exhibiting the life and manners of the middle and lower classes, which up to that time had had scarcely any exponent. In one respect, however, this book had neither predecessor nor progeny. Neither before nor since has there ever been such a literary embodiment of healthy animal spirits. There is none like it for unflagging but never unwise merriment—for humour that is very much the reverse of dry. That Mr D. has given us no more *Pickwick Papers* is to be lamented, but may be easily explained by the fact, that he never had the advantage of being five-and-twenty again. Since then, however, he has given us many works more admirable in other respects. *Nicholas Nickleby*, his next effort, was, as a story, greatly in advance of it. It was also the first of those social novels which form so marked a feature in modern literature. It was aimed at the wrongs and cruelties inflicted upon their wretched pupils by the cheap schoolmasters of Yorkshire—and it hit its mark. Since then our author has set lance in rest against many a social monster. He may be sometimes wrong, but he can scarcely be accused of want of honesty of purpose; while quite as little can partisanship (except that he is always for the poor) be laid to his charge, since at the very time that the country gentlemen were shaking their heads at him for his want of reverence for 'land,' he incensed the manufacturing interest by the publication of *Hard Times*. His sarcasm is of a rather peculiar character; too good-natured to sneer, and with eyes, notwithstanding their indignant fire, that never lose sight of the ludicrous side of things, his style is mocking argument. After *Nicholas Nickleby* came *Master Humphrey's Clock*, containing the *Old Curiosity Shop* and *Barnaby Rudge*. In the former of these, and in the character of Little Nelly, he first exhibited that power of setting forth child-life and child-thought which may have been said perhaps, before the publication of George Eliot's works, to be peculiarly his own. *Barnaby Rudge* was his first, and, with the exception of his subsequent *Tale of Two Cities*, his only attempt to describe the past; and it was a successful one. It is probably, with reference to plot and circumstance, his best novel, harring *David Copperfield*. The *Old Curiosity Shop* began in a curious dreamy manner, which, although obviously a favourite one with our author, he soon perceived was unappreciated, and had the prudence to discontinue. This disposition

\* The Keeper and Deputy-keeper of the Signet (Edinburgh), the Treasurer of the Society of Writers to the Signet, and eight Commissioners chosen by and from among the Commissioners of the Signet.

of his mind towards the weird and the grotesque he subsequently developed with greater success in his *Christmas Stories*. After a voyage across the Atlantic, Mr D. published in 1842 his *American Notes for General Circulation*; but a much more admirable result of that expedition appeared in his *Martin Chuzzlewit*. This was certainly the greatest of his humorous works since the *Pickwick Papers*, and it may almost be said to have been his last. From this period, his animal spirits—a rare gift among even comic authors, and rarely lasting so long as in his own case—appear to have deserted him. His humour, except in some rich creations, such as Mr Micawber, is no longer so apparent, while, on the other hand, his wit and pathos have increased. *Dombey and Son* was considered a falling off in one who stood so high; but his death of little Dombey brought tears to the eyes of lawyers. When men were expecting that he should wane and weaken like other prolific writers before him, he produced a novel as fresh as the dawn. In this, he, for the first time, adopted the autobiographical form, and that perhaps offered him some advantages; but at all events, the result was admirable. *David Copperfield* is, in our judgment, by far his greatest work, and will endure—though for very different reasons—as long as the *Pickwick Papers*. Its Agnes is perhaps the most charming female character in the whole range of fiction. *Bleak House*, *Hard Times*, *Little Dorrit*, the *Tale of Two Cities*, *Great Expectations*, and *Our Mutual Friend*, afterwards succeeded one another with almost periodical punctuality, and an audience larger than any English author ever had awaited each. No prose-writer was ever more quotable or more quoted than he. Sam Weller's metaphors, Mr Squeers's educational methods, Mrs Gamp's assertions, corroborated by her unreal friend Mrs Harris, and Mr Micawber's moral and commercial reflections, are in the mouths of all men; while he supplies the newspapers with their best epithets for social and political abuses. In 1845, the *Daily News* was started under Mr D.'s editorial auspices, but the task appears to have been ungenial, for he soon withdrew from it. In 1850, he commenced a weekly periodical, entitled *Household Words*, which was afterwards merged into *All the Year Round*. His last work, *The Mystery of Edwin Drood*, was left unfinished at his death, 9th June 1870.

**DICLINOUS** (Gr. *dis*, twice, and *klinē*, a bed), a term in botany, signifying that flowers are unisexual, having stamens only, or pistils only, and opposed to *monoclinous* or *hermaphrodite*. It is much used by some botanical authors.

**DICOTYLEDONOUS PLANTS** are those of which the embryo is ordinarily furnished with two seed-lobes or cotyledons (q. v.) opposite to one another, or with more than two, which in that case are verticillate. In general there are only two cotyledons; a greater number being of rare occurrence, but being found in some of the *Comiferae*, as Spruce Fir, Larch, &c., in *Ceratophyllum*, &c. It is not, however, always quite easy to determine whether a plant belongs to the class of Dicotyledonous Plants or to that of Monocotyledonous Plants (q. v.), as sometimes, in the former, only a single cotyledon presents itself, which is the case with a number of species of the sub-genus *Bulbocephalus* in the genus *Corydalis*; or the cotyledons are altogether wanting, as in Dodder (*Cuscuta*), or the embryo is in so rudimentary a state in the seed, that it at first consists only of a pair of cells as in *Monotropa*. The habit of the plants is therefore also to be taken into account, and particularly the structure of the stem and its mode of increase. The *radicle* of the embryo in

dicotyledonous plants generally elongates itself by degrees until it forms the root of the plant itself; wherefore Richard designated these plants *Exorhize* (Gr. *exo*, outward, and *rhiza*, a root). The stem is exogenous (q. v.), and usually branched. The leaves have branching veins, and exhibit great variety of form. They are articulated to the stem. The calyx and corolla, when both present, are usually more distinct and dissimilar than in monocotyledonous plants.

**DICOTYLES.** See PECCARY.

**DICRANUM**, a genus of mosses, having a single *peristome* of sixteen equidistant bifid teeth and the *calyptra* splitting up on one side (*dimidiate*). See MOSSSES. The species are numerous, and some of them are among the most common British mosses, growing on the ground and on moist rocks. Many of them have elongated branching stems.

**DICTATOR**, in the earliest times, was the name of the highest magistrate of the Latin Confederation, and in some of the Latin towns the title was continued long after these towns were subjected to the dominion of Rome. In the Roman Republic the dictator was an extraordinary magistrate, irresponsible and endowed with absolute authority, whose original name was *magister populi*.

The frequency of *crises*, or critical periods, in the quick, aggressive growth of the Roman state, necessitated such an office. The first dictator (T. Larcius or M. Valerius) was appointed 501 B.C., nine years after the expulsion of the Tarquins. According to Livy, the immediate cause of this dictatorship was a formidable war with the Latins. In general no one could be appointed dictator who had not been previously consul, and this condition was very rarely dispensed with. Niebuhr is of opinion that the dictator was originally created or elected by the curie, like the kings, but it is more probable that the senate passed a decree ordering one of the consuls to name or proclaim (*dicere*) a dictator. Originally, of course, the dictator was a patrician; the first plebeian who filled the office being C. Marcius Rutilus, 356 B.C., who was nominated by the plebeian consul M. Popillius Lanas. The dictatorship could not lawfully be held longer than six months, nor was it ever so, except in the cases of Sulla and Caesar, which were altogether peculiar. It must not be supposed that during a dictatorship the functions of the other magistrates were positively suspended. The consuls and other regular authorities continued to discharge their proper duties, but in subordination to the direction and command of the dictator; being for the time simply his officers. The superiority of his power, when compared with that of the consuls, appears chiefly in these three points: he was far more independent of the senate; he had a more extensive power of punishment, without any appeal; and he could not be called to account after his abdication of the dictatorship for anything he had done during the period of his office. The

*Dicranum (Polysctum)*: a, capsule, magnified, and with the calyptra removed, shewing the peristome.

limits of his power were as follows: he could not touch the treasury; he could not leave Italy; and he could not ride through Rome on horseback without previously obtaining the permission of the people. While the consuls had only 12 lictors, the dictator was preceded by 24, bearing the *secures* and *fascæ*. To him also belonged the *villæ curulis* and the  *toga prætexta*. The last legally elected dictator was M. Junius Pera, who entered on his office 216 B. C. From this time nominal dictators were frequently appointed for the purpose of holding the elections, but even these finally disappeared, 202 B. C. Henceforth, in critical times, a sort of dictatorial power was conferred on the consuls by the senate by the well-known formula: 'That the consuls should see to it, that the state should receive no damage.' This practice rendered the appointment of dictators no longer necessary.

DICTIONARY, is merely the English form of *dicionarium*, a word not to be found in classical Latin, though of frequent use in that called monkish or mediæval. A dictionary is, as every one knows, a book, but, in the widest sense of the word, its contents admit of no more strict definition than that they are arranged according to the order of the alphabet, and that every word within the scope professed to be embraced by the dictionary must have its proper place accordingly. It may be further said that the dictionary, in order to distinguish it from a mere list or index, must contain explanations or information about each word thus included within its scope, except in cases, of which many examples may be found in the present work, where it is sufficient to refer for a part or the whole of the account of one word to what is said under some other word. There are several other terms that are used synonymously, or nearly so, with Dictionary. The Greek word *Lexicon* is in common use for a dictionary of languages. It is not entirely so limited, however, in practice, as may be seen in such works as the *Lexicon Juridicum* of Calvinus or Kahl, which is just a dictionary of Roman and feudal law, of the same kind as Sir Edward Tomlin's *Law Dictionary* is of English law. The word *Encyclopædia* has generally a wider meaning; but there are often several books exactly of the same kind, of which some are called dictionaries, and others encyclopædias. Glossary and Vocabulary are nearly synonymous with a dictionary of a language; and the words *Thesaurus*, *Catalogue*, *Directory*, *Gazetteer*, and *Index*, are sometimes used as a title when Dictionary might be not inapplicable.

Dictionaries may be divided into two classes—(1) dictionaries whose object is to explain words and phrases; and (2) those that aim at giving information about things.

1. Dictionaries of language are, again, divided into various sub-classes or species. The most common kind—what, indeed, is understood by the term dictionary (and the equivalent Greek term *Lexicon*) when used by itself—is an alphabetical list of the words composing any language, either explained in the same language, or interpreted by the corresponding words of one or more other languages. To indicate that all, or nearly all, the words of the language are embraced, the name *Thesaurus* (*Treasury*) is sometimes used. *Special Dictionaries* contain only the words used by single authors, or classes of authors. A *Glossary* is a dictionary of unusual terms. An *Etymological Dictionary* is one in which the derivation of words is the sole or a prominent object.

2. Dictionaries of things (Ger. *Realwörterbücher*), or of information, are also of various kinds. When the whole field of human knowledge is embraced, we have an *Alphabetical Encyclopædia*. The name

*Encyclopædia* or *Cyclopædia* is sometimes given to dictionaries of special departments of knowledge, as the *Cyclopædia of Anatomy and Physiology*; but in all such cases, dictionary seems the correct term. See ENCYCLOPÆDIA.

There is no kind of information, within wide or narrow bounds, that may not be thrown into the dictionary form. Dictionaries of apt quotations from the classics, the Scriptures, or the fathers, were much in vogue in the 17th century. There are dictionaries of biography, of geography, of dates, of architecture, of cookery, of political economy, of fortification—in fact, of every object of human knowledge and practice. As dictionaries of this class are of the same nature, except as to the restriction of their field, as *Encyclopædias* properly so called, we reserve some notice of the more important of them for that head.

Dictionaries of language, in our sense of the word, are of modern origin. The Greeks and Romans had no idea of a book embracing all the words of their own or any foreign tongue. Glossaries, however, of unusual words and phrases were early current. The earliest work of the kind extant (though much interpolated) is the *Homeric Lexicon* (Gr. *Lexcis Homericis*, 'Homeric words') of Apollonius, an Alexandrine grammarian of the time of Augustus. More extensive compilations, such as the *Lexicon* of Suidas (q. v.), and the *Etymologicum Magnum* (q. v.), were made in the middle ages. A real dictionary became first possible after the invention of printing. A broad and sure basis for Greek lexicography was laid by Henry Stephens (q. v.) in his *Thesaurus* (1572); the Latin *Thesaurus* of Robert Stephens, which did the same for Latin, had appeared in 1531. Previously to the discovery of printing, and for some time after, the explanations of Latin words were given in Latin. 'The earliest printed vocabulary with which we are acquainted in which the words of any modern language answering to the Latin are inserted, is the *Promptorius Puerorum*, published by Pynson in 1499, in which English words are followed by their supposed Latin equivalents' (*Quarterly Review*, September 1855). Some of the more important dictionaries will be noticed under the heads of the several languages.

DICTION DE KENILWORTH was an edict or award between King Henry III. and all those barons and others who had been in arms against him, and so called because it was made at Kenilworth Castle, An. 5 Henry III., containing a composition of five years' rent for the lands and estates of those who had forfeited them in the rebellion.—*Cowell's Interpreter*.

DICTYOGENS, in Botany, a class established by Lindley for the reception of a comparatively small number of natural orders, genera, and species, usually included by other botanists among *Endogens* or ENDOGENOUS PLANTS (q. v.), but which, whilst they agree with endogens in the structure of the embryo, differ from them in the stem and leaves. The annual branches or aerial stems have indeed the endogenous structure, but the rhizomes or subterranean stems more resemble the structure of exogenous plants (q. v.), with pith, medullary rays, and wedge-like vascular bundles. The leaves are broad and net-veined, usually disarticulating with the stem. The most important natural orders referred by Lindley to this class are *Dioscoreaceæ* and *Smilacææ*, and the most important plants belonging to it are the different species of Yam and Sarsaparilla.

DICYNODON, the name given by Owen to a genus of fossil reptiles, whose remains have been

found in South Africa. The true age of the rock in which they occur has not been ascertained; the accompanying organisms seem to indicate that it is Triassic. Few bones of these animals, save those of the skull, have been sent to this country. A complete restoration of one would be a most valuable addition, not only to paleontology, but to systematic zoology as well; for the numerous skulls that have been examined, have been sufficient to shew that this is one of those anomalous forms which unite in their structure the characteristics of widely different animals. It has affinities with the crocodile, the lizard, and the tortoise, though perhaps the completely closed orbits and the sharp compressed jaws ally it more closely to the last-named animal. Its lower jaw also is covered with a horny plate, as in the tortoise. The most remarkable peculiarity is the existence of a pair of large sharp-pointed tusks, one from each side of the upper jaw, growing downwards as in the mammalian morse or walrus. The generic name, meaning 'two canine teeth,' has been given to them from these singular tusks, which are peculiar to this genus. The articulating surfaces of the vertebræ are both hollow—a fish-like peculiarity, from which it might be argued that these reptiles were good swimmers; probably they lived constantly in the water, but the construction of the bony passages of the nostrils proves that they must have come to the surface to breathe air. Four species have been discovered.

**DIDACTIC POETRY**, that kind of poetry which aims, or seems to aim, at instruction as its object, making pleasure entirely subservient to this. It has been disputed whether or not the existence of a kind of poetry especially entitled to the name didactic, consists with the very nature and object of the poetic art. For it is held that, to point out instruction as the peculiar object of one kind of poetry, is to overlook the high aim of all poetry; and that a poem may be in the highest sense didactic, which yet is epic, dramatic, or lyric in its form; and the Book of Job, the Psalms, and other poems contained in the Sacred Scriptures, are quoted as examples. In the poems generally called didactic, the information or instruction given in verse is accompanied with poetic reflections, illustrations, episodes, &c. The *Georgics* of Virgil have been the model according to which didactic poems have very generally been composed; and the literature of all European nations contains many productions of this kind; whilst no subject is so unpromising that it has not found some one to select it as a poetic theme.

**DIDELPHYS.** See **OPOSSUM**.

**DIDEROT, DENIS**, a celebrated French encyclopedist and philosophical writer, was born at Langres, in Champagne, 5th October 1713. He was educated for the church at the college of his native town, and subsequently at that of D'Harcourt, Paris; but disliking the clerical office, and after having made a trial of law, a profession which he also found uncongenial, he finally resolved, after various vicissitudes, upon becoming a *littérateur*. For some years, however, his mode of life was very precarious. On one occasion, being reduced to the greatest extremities, he seriously resolved that if the world should ever prosper with him, he, not ignorant of misfortune, would never disregard the applications of the indigent. This resolution was religiously kept; for after having attained a position of comparative affluence, he was continually surrounded by applicants desirous of obtaining assistance, which, whether in the shape of money or instruction, D. was always willing to afford them. Although very poor, D. married

in 1743. Necessity now drove him to increased exertions. He translated the *History of Greece* from the English of Stanyan, receiving for this work the sum of 100 crowns. Soon afterwards followed the *Essai sur le Merite et la Vertu*; the *Pensées Philosophiques*, written, it is said, in the space of four days; and the *Interprétation de la Nature*. Shortly after appeared his *Lettre sur les Aveugles*, for the writing of which he was confined three months in the prison of Vincennes. Believing that it was, among other things, his vocation to regenerate the theatre, he produced a melodrama (1758), entitled *Le Père de Famille*. It was unsuccessful, and was followed by others equally so, so that it was said, 'Le Père de Famille a été le père d'une famille déplorable.'

But D.'s great work was the *Encyclopédie*, of which he and D'Alembert were the joint-editors. It was commenced in 1749. D., besides revising all the articles, wrote the departments of history, of ancient philosophy, and of the mechanical arts. He also wrote art criticisms from 1765 to 1767, shewing a readiness in interpreting the meaning of a picture, and a power in reproducing it vividly in words, unequalled by any writer of his time. Towards the latter portion of his life, D., who had never been able to save any money, determined to sell his library, to provide for his only daughter. The Empress Catherine of Russia, having been informed by her French ambassador of his intention, bought the library, on condition that D. himself should be librarian, and undertake the care of it at a salary of 1000 francs yearly. In 1773, he set out for St Petersburg to thank his imperial benefactress, returning in the following year. But his health, which was impaired by this journey, soon after gave way, and he died on the 30th July 1784.

D. had worked at the *Encyclopædia* for the space of about 30 years. His fitness, natural and acquired, for this species of literary labour was complete. With the advantage of an excellent education, he had a great love of truth, and a curiosity to ascertain the real relations of any subject upon which he was engaged. He was distinguished by a swiftness and dexterity of intellect, that enabled him to catch the salient points of his topic, and to present them in the best light. As regards religion, D. was an atheist, sincere even to fanaticism in his opinions, and anxious to indoctrinate his countrymen with his own scepticism. The *Encyclopédie* became a vehicle for the indirect propagation of his views. One of the last recorded sayings of D. is very characteristic: 'The first step towards philosophy is incredulity;' but unfortunately D. thought it was also the last. His two most powerful tales are *Jacques le Fataliste* and *Le Neveu de Rameau*—both published after his death. The second was translated into German by Goethe.

**DIDO**, or **ELISSA**, according to the legend, the foundress of Carthage, was the daughter of a king of Tyre, called by some Agenor or Belus, by others Muto or Matgenus. His successor, Pygmalion, the brother of D., murdered her husband and uncle, a priest of Hercules named Acerbas; by Virgil, Sichaenus. With the treasures of Sichaenus, which Pygmalion had sought for in vain, and accompanied by many Tyrians, D. escaped to sea. She landed in Africa, not far from the Phœnician colony of Utica, and built a citadel called Byrsa (from Gr. *Bursa*, the hide of a bull), on a piece of ground which she had bought from the Numidian king Iarbas. The meaning of the word Byrsa, gave rise to the legend that D. purchased as much land as could be encompassed with a bullock's hide. After the agreement she cut the hide into small

thongs, and thus enclosed a large piece of territory. Here she built the city of Carthage. To avoid being compelled to marry Hiarbas, she stabbed herself on a funeral pile, which she had caused to be erected, and after her death was honoured as a deity by her subjects. Virgil ascribes the death of D. to her unrequited passion for Aeneas; but many of the ancient writers conceived that the poet had committed an anachronism in making her contemporary with the Trojan prince. The more general opinion was, that D. had built Carthage somewhere between 50 and 100 years before the foundation of Rome.

DIDOT, the name of a celebrated family of French printers and publishers.

D., FRANÇOIS, the first of the family that attained eminence, was born in 1689, and died in 1757. His principal professional achievement was the publication of the *Voyages* of his friend the Abbé Prévost, a work in 20 volumes, perfect as regards the text, and enriched with a great number of engravings and geographical maps. D. had eleven children, of whom two—FRANÇOIS AMBROISE D. (born 1730, died 1804) and PIERRE FRANÇOIS D. (born 1732, died 1795)—acquired considerable distinction as printers. HENRI D. (born 1765, died 1852), eldest son of Pierre François, made himself famous as an engraver, letter-founder, and mechanic. He was 66 years old when he engraved, for his well-known 'microscopic' editions of eminent authors, those characters which are the *ne plus ultra* of typographical art. A daughter of the third son of Pierre François married Bernardin de Saint-Pierre, who was for some time associated with the Didots in their paper manufactory of Essonne; and in his country-house near this place wrote his *Paul et Virginie*. PIERRE D., eldest son of François Ambroise (born 1760, died 1853), still further increased the fame of the family. His Louvre editions of *Virgile*, *Horace*, *Racine*, and *La Fontaine* are magnificent. At the Exhibition of the Products of Industry in 1801, a jury declared his *Racine* to be 'la plus parfaite production typographique de tous les âges.' Besides a great number of works, not less remarkable for their typographical perfection than for their literary value, such as the *Voyages de Denon*, D. published a collection of the French *chefs-d'œuvre*, dedicated *Aux amis de l'Art Typographique*. D. was also an able *littérateur*.

D., FIRMIN, brother of the preceding, and son of François Ambroise D., was born at Paris in 1764. As a printer, and especially as an engraver and founder, he raised the family name to the pinnacle of professional eminence. The absolutely perfect Roman characters, used in the Louvre editions printed by his elder brother, were engraved and cast by him. Firmin D. applied the stereotyping process to the Logarithmic Tables of Callet, a work that required to be executed with the most rigorous accuracy, and which, through this means, is perfectly free from error or blemish. The whole of the French, as well as most of the Italian and English classics, were published by him according to the same process. These stereotypic editions (the word *stereotypic* was invented by Firmin D.) were wonderfully correct and cheap; *Virgile* is without a blemish, is ornamented with vignettes, and was sold for 15 sous (7½d.); it was a kind of revolution in the book-trade of France. The most distinguished foreigners were accustomed to visit D.'s establishment as one of the great sights of Paris. The Emperor Alexander, when in Paris in 1814, minutely examined every department of it; and placed under D. two young Russians, to be instructed in all the branches of typography. Some of the most celebrated continental printers served their apprenticeship with

him. In 1827, Firmin D. retired from business, to devote himself wholly to his duties as *député*. A sage friend of freedom, he attached himself to the moderate and constitutional opposition, headed by Royer Collard. D. also obtained considerable reputation as an author by his tragedies, *La Reine de Portugal* and *La Mort d'Annibal*, and several volumes of metrical translations from the classics. He died 24th April 1836.

D., AMBROISE FIRMIN, and HYACINTHE, sons of the preceding, the first, born 20th December 1790, the second, 11th March 1794, now carry on the family business (aided by their sons, PAUL and ALFRED D.), under the firm of Firmin Didot, Frères. In their hands it still retains its magnitude and importance.

DIDYMIUM is a very rare metal found in the minerals CERITE, ALLANITE, &c.

DIÉ, St, a town of France, in the department of Vosges, is situated on the Meurthe, 25 miles north-east of Epinal. It is handsomely built; its streets clean and regular. D. is also the seat of a bishop, has an old cathedral church, and various important educational institutions. It has manufactures of cotton goods, with some trade in corn, cattle, flax, hemp, paper, ironmongery, &c. There are copper and iron mines, ironworks, and marble quarries in the neighbourhood. Pop. 6730.

DIEFFENBACH, JOH. FRIED., a celebrated surgeon of recent times, was born in Königsberg, in Prussia, in 1792. He had begun the study of theology when the war of liberation broke out, in which he took part as a volunteer. In 1816, he exchanged the study of theology for that of medicine, and especially surgery. After studying at Bonn and elsewhere, and travelling in France, he took his degree in 1822, and commenced practice in Berlin, where he soon attained distinction as an operator, and in 1840 was promoted to be professor and director of clinical surgery. He died in 1847. Besides eminent skill in all the usual operations with the knife, D. introduced many improvements, particularly in the art of forming new noses, lips, eyelids, and the like, as well as in cutting the muscles for squinting and stammering. Of his writings, we may mention *Die Transfusion des Bluts und der Einspritzung der Arzeneien in die Adern* (Berl. 1828); *Über die Durchschneidung der Sehnen und Muskeln* (Berl. 1841); *Die Heilung des Stotterns* (Berl. 1841); *Die Operative Chirurgie* (12 vols., Leip. 1844—1848), his chief work, which has been translated into several languages.

DIÉGO, SAN, the best harbour in Upper or American California, next to that of San Francisco, is in lat. 32° 45' N., and long. 117° 8' W. It is 6 miles long, and varies in breadth from 1 to 2; and it is 6 or 7 fathoms deep, even to the shore. There are two towns on the bay, distinguished as *Old* and *New*, of the same name—the former being Spanish and the other Anglo-Saxon. The trade of the place is considerable, the foreign arrivals in 1851—1852 having been 29 vessels, of 19,016 tons. The soil around is fertile, and the staple productions are barley, maize, wheat, sheep, cattle, and horses.

DIÉLYTRA, a genus of plants of the natural order *Fumariaceæ*, in appearance and habit much resembling fumitories of extraordinary size. *D. spectabilis*, a native of Siberia and the northern provinces of China, was introduced into Britain from the island of Chusan in 1846, and rapidly became a general favourite, on account of its long racemes of drooping, delicate, rosy-pink flowers. It is now to be seen not only in green-houses, but, as commonly

as almost any flower, in cottage-windows, and even in cottage-gardens, although in the northern parts of

*Delytra Spectabilis.*

Britain it seldom attains its full luxuriance in the open air. It is one of the favourite plants of the Chinese.

**DIEPENBECK**, ABRAHAM VAN, a distinguished Flemish painter, was born probably in 1607, at Herzogenbusch (Bois-le-Duc), and at first confined himself to painting on glass, in which he acquired the reputation of being the first of his time; but having conceived a disgust for this kind of painting, on account of the cracking of the glass, which he could in no way prevent, he abandoned it, and became a pupil of Rubens. He then went to Rome, and on his return to Belgium became a sort of assistant to his master. In 1641, he was elected President of the Antwerp Academy, an honour which he retained till his death, in 1675. D. painted much, and with wonderful facility, on tapestry and wainscoting. He certainly imitated Rubens, but with great freedom and force of colouring. His works consist, for the most part, of designs for title-pages, theses, devotional subjects, and the decoration of books. They exhibit great fertility and liveliness of genius, but are in general hurriedly and imperfectly finished. His master-piece in this way is the *Tableaux du Temple des Muses* (Paris, 1655), a series of designs, 59 in number, engraved by the best artists of the time—Bloemart, Maltram, &c. Those of Bellerophon, Orpheus, the Dioscuri, Leander, &c., have been pronounced unsurpassed. His oil-paintings on canvas are few, but the churches of Antwerp have many windows painted by him. D. resided in England for some time during the reign of Charles I., and painted several landscapes and animals for William Cavendish, Duke of Newcastle.

**DIEPPE**, a seaport town of France, in the department of Seine-Inférieure, at the mouth of the river Arques, on the English Channel, lat. 49° 55', long. 1° 5' E. D. is situated between two high ranges of chalk cliffs, is regularly built, with tolerably wide clean streets running parallel to the sea; and the houses—built for the most part of stone and brick, with high slanting roofs—have a picturesque appearance. It is walled, has a castle occupying a high cliff at the west end of the town, which it commands, as well as the harbour, which is situated to the north-east, and admits vessels of 500 tons burden. West of the old castle lies the little fishing suburb of Pollet, far from beautiful in appearance,

but exceedingly interesting from the fact that the inhabitants differ in language, manners, and costume from the rest of Upper Normandy, and are supposed to be descendants of those Saxons who settled on the French coast during the period of the Merovingian kings. Some interesting historical associations attach to the castle of Dieppe. Here Henry IV.—the people of D. having been the first to acknowledge his right to the throne of France—retired before the forces of the League, previous to the decisive battle of Arques, fought within four miles of D.; and here the Duchess of Longueville, so noted as a leader of the party of the Fronde, sought refuge for a time from the royal power she had defied. The castle is now occupied as a barrack. The other principal buildings are the churches of St Jacques and St Remi, the theatre, and a bathing establishment. The town has several squares, and is adorned by nearly 70 fountains, which derive their supply of water from an aqueduct about three miles long. D., being one of the principal watering-places of France, has a great accession of visitors during the summer months; and a large number of huts for the accommodation of bathers, bathing-machines being dispensed with, line the shores. The manufactures are lace, fine linen, and paper; and the carved articles of horn, bone, and ivory have long been famous. There are also ship-building yards, sugar-refineries, rope-walks, and distilleries; and the fisheries—both coast and Newfoundland—are important, almost the whole of the population of the suburb of Pollet being engaged in them. D. is a favourite landing-place of English tourists visiting France. Pop. 17,806. The rise of Havre has greatly injured the trade of Dieppe.

**DIE-SINKING**, the art of engraving the die or stamp used for striking the impression on coins, &c., and for stamping thin plates of metal into various devices.

The importance of die-sinking has much increased of late on account of the great extension of the process of stamping thin metal. Many kinds of work formerly bent into shape by the hammer and punch, are now struck by a few blows between suitable dies. As examples of these, we may mention the ornamental work of gas-fittings, window-curtain cornices, common jewellery, ornamental trays, dishes, boxes, &c. For such purposes, a pair of dies is required, one in relief, the other in intaglio, and the metal is pressed between them. Not only are ornamental articles stamped in this manner, but useful articles, composed of many parts, are made entirely by cutters and dies, each part being cut and stamped by a pair of dies, and then the parts united by another pair, the junction being effected by overlaps, which the uniting dies press into their places. See **BUTTONS**. The astonishing cheapness of many of the Birmingham products is mainly due to the use of dies for doing by a single blow the work that formerly required long and tedious manipulation. For further information on this, see **STAMPING**.

The most ancient and familiar application of dies, is in the striking of coins and medals; the method of sinking the dies used for this purpose will serve to illustrate the general method of die-sinking. Suppose the coin to be of the size of a shilling; a cylindrical piece of steel, about three or four inches in length, and two in diameter, is prepared by slightly rounding one end of the cylinder, then turning and smoothing upon the middle of this a flat face equal to the size of the coin. This blank die, which is carefully softened, is then engraved with the device of the coin in intaglio. This is a very delicate and artistic process, and is effected by a great number of careful touches with small and very hard steel

tools. The face of the die is now hardened by placing it face downwards in a crucible upon a layer of bone-dust, or a mixture of charcoal and oil. In this position it is raised to a cherry-red heat, then taken out, and plunged in water. When properly tempered, it is in a state to be used for stamping the coin; but dies of superior workmanship, from which many impressions are required, are not thus directly used, as the expense of engraving is very great, and the risk of breakage considerable. This first engraved die, called the matrix, is therefore reserved only for making other dies. An impression in relief is made from this matrix on a small block of soft steel, which is called the puncheon; this is retouched and hardened, and from it the dies directly used for striking the coins or medals are impressed.

When the engraving is not very costly, a small number of impressions required, or a soft metal is to be stamped, as in livery buttons, for example, the work is stamped directly from the engraved die or matrix. When the device is in high relief, and the metal is hard, many heavy blows are required. Some of the finest large bronze medals require two or three hundred blows for each impression, and the medal has to be annealed by heating between every two or three blows. It is on this account that the difference between the price of pewter and bronze medals of the same subject is so great, the pewter being so much softer. Copper, though harder than pewter, is much softer than bronze, and hence the reader will easily understand why the device on the new bronze coinage, now in course of manufacture at the new mint of Birmingham, is in much lower relief than the old copper coinage, as it would not pay to use repeated blows and annealing in striking common coins. An impression in high relief or deep intaglio may be obtained by a single blow by the *cliché* method. For this, a fusible alloy is used, such as type-metal, or still better, an alloy of 2 parts bismuth, 1 lead, and 1 tin, which fuses at about 212°, and becomes pasty before solidifying. The metal is poured into a box or tray a little larger than the die, and when in a pasty condition, the die is placed over it, and struck smartly with a heavy mallet or a coining-press. A steel die is by no means necessary for this; sharp impressions may be obtained from bronze medals themselves, or even from wood and plaster casts. A *cliché* mould may be made in the first instance from the medal, and then a *cliché* relief from this mould, if the process is skilfully conducted. The skill required consists mainly in striking the blow with a force proportionate to the depth of the impression and the softness of the metal, and in selecting the right moment for doing so, just as the fused metal is on the point of solidifying; for, if too fluid, it will merely be driven aside; and if at all set, an imperfect impression results. The metal should be of about the consistence of melted sealing-wax, and then the surface is set by contact with the cool die or medal, while the body of the metal still yields to the pressure. *Cliché* moulds are admirably adapted for electro-depositing.

**DIES IRÆ**, the name generally given (from the opening words) to the famous medieval hymn on the Last Judgment. On account of the solemn grandeur of the ideas which it brings before the mind, as well as the deep and trembling emotions it is fitted to excite, it soon found its way into the liturgy of the church. The authorship of the hymn has been ascribed to Gregory the Great, St Bernard of Clairvaux, Umberto, and Frangipani, the last two of whom were noted as church-hymnists; but in all probability it proceeded from the pen of the Franciscan, Thomas of Celano, a native of the Abruzzi, in the kingdom of Naples, who died about the year

1255. When the church adopted it, and made it a portion of the service of the mass, cannot be ascertained with any exactness, but it must have been in any case before 1385. Several alterations were then made in the text; that, however, is believed to be the original which is engraved on a marble tablet in the church of St Francis at Mantua. Germany has produced many translations of the hymn, such as those of Schlegel, Fichte, and Bunsen. It was translated into English by Richard Crashaw in the 17th c., and by Lord Macaulay, Lord Lindsay, the Rev. Isaac Williams of Oxford, and others in our own day. Sir Walter Scott has introduced two or three of the opening verses into his *Lay of the Last Minstrel*. The following are the most effective stanzas of the original Latin:

Dies iræ, dies illa  
Solvat seclum in favilla,  
Teste David cum Sibylla.

Tuba mirum spargens sonum  
Per sepulcra regionum  
Coget omnes ante thronum.

Mors stupebit et natura,  
Quam resurget creatura  
Judicanti responsura.

Liber scriptus proferetur,  
In quo totum continetur  
Unde mundus judicetur.

Judex ergo cum sedebit,  
Quidquid latet apparebit,  
Nil inultum remanebit.

Quid sum miser tunc dicturus,  
Quem patronum rogaturus,  
Quam vix justus sit securus?

Rex tremende majestatis,  
Qui salvandos salvas gratis,  
Salva me, fons pietatis.

Recordare, Jesu pie,  
Quod sum causa tuæ viæ:  
Ne me perdas illa die.

Quærens me sedisti lassus,  
Redemisti cruce passus,  
Tantus labor non sit cassus.

Qui Mariam absolvisti  
Et latronem exaudisti,  
Mihî quoque spem dedisti.

Inter oves locum præsta,  
Et ab hoedis me sequestra,  
Statuens in parte dextra.  
Amen.

**DÍESIS**, a term used by the ancient Greeks, in the division of musical intervals, of which they had three varieties. In modern music, the diesis is understood to be the difference between the small and the great semitone, as from C to C sharp, and from C to D flat.

**DIEST**, a town of Belgium, in the province of South Brabant, on the river Demer, 17 miles north-east of Louvain. It is a walled town, and its fortifications have recently been so improved as to render it a place of great strength. D. has considerable manufactures of hosiery and woollen goods, but its chief products are beer—which is of excellent quality, and largely exported—and gin. Here a great horse-fair is held annually. D., which was once a feudal barony, under the dominion of the Princes of Orange, was taken by Marlborough in 1705. Pop. 7720.

**DIET**. Man and animals generally require that their food should be of such a nature as to compensate

for the wear and tear of the tissues which is perpetually going on, and as at the same time to keep up the animal heat at its proper standard. Various classifications of the food of man have been at different times proposed, but those which have been most generally accepted are that of Dr Prout—in which the different kinds of food are grouped in definite chemical classes—and that of Liebig, which has reference solely to the ultimate destination of the food in the animal economy.

Dr Prout classifies all kinds of food under these heads: 1. The *aqueous*; 2. The *saccharine*; 3. The *oily or oleaginous*; and 4. The *albuminous*; to complete which, we ought to add 5. The *gelatinous*, and 6. The *saline*—whilst Liebig makes only two classes: 1. Those consisting of nitrogenised matters, which are adapted for the formation of blood, and which he terms the *plastic elements of nutrition*; and 2. The non-nitrogenised substances, which from their large amount of carbon, serve (as fuel) to keep up the animal heat, and which he names the *elements of respiration*. In place of the terms employed by Liebig, Dr R. D. Thomson has suggested *nutritive* and *calorific*, which are on the whole preferable. Although Liebig's view embraces a great general truth, there are numerous obvious exceptions to it; thus, for example, whole races of men preserve their health who live on animal food alone, containing no non-nitrogenous compound except a little fat; and when the flesh is dried in the sun, as is often the case, even the fat must melt away. We shall therefore adopt Prout's classification as the more practical of the two. It was based on the consideration, that the milk (the only *single* article of natural food that serves to support the animal body) is made up of substances which may be taken as representatives of his groups; for this, our earliest natural diet, contains water, sugar (representing his saccharine group), butter (representing his oleaginous group), caseine (a nitrogenous matter very similar to albumen, and representing his albuminous group), and salts; and recent researches have shewn that the yolk of the egg, which serves for the nourishment of the chick or other young animal before birth, similarly contains one or more representatives of the aqueous, saccharine, oleaginous, albuminous, and saline groups.

We shall now briefly consider these individual groups, and the uses to which the substances included in them are applied in the animal economy.

1. The *aqueous* group includes water and all the fluids which we use as drinks; and we must additionally bear in mind that all the varieties of animal and vegetable food which we term solids, in reality contain it, generally in great abundance; thus, for example, uncooked beef contains from 70 to 80 per cent., and some vegetables even a larger proportion of water. The uses of water are sufficiently obvious from the abundance in which it occurs in all the most important fluids of the body, as the blood, and the various digestive fluids. See DIGESTION, ORGANS AND PROCESS OF.

2. The *saccharine* group includes the different varieties of sugar, starch, gum, and cellulose, together with vinegar. This group is chemically characterised by all its members being included in the formula  $C_nH_{2n}O_n$ ; that is to say, they consist of carbon, together with hydrogen and oxygen in the proportions in which these elements form water. Hence (excepting vinegar) these substances have received the name of Carbo-hydrates.

Of the sugars, grape-sugar or glyucose is the most important, partly from its frequent occurrence in ordinary articles of food, such as fruits of most kinds, honey, &c., and partly because it is the form of sugar into which starch (a most abundant ingredient

in most kinds of vegetable food) is converted by the saliva, and pancreatic and intestinal juices, before it is fitted for absorption or any further changes. Since the sugars (which may thus be regarded as including starch) do not, in the normal condition, pass into the excretions, but are oxidised in the blood into carbonic acid and water, as ultimate products, they must contribute materially to the support of the animal heat. But they have other uses which we shall endeavour to explain, and which will, we trust, be intelligible if this article is read in conjunction with that on DIGESTION, to which we have already referred. Before becoming oxidised into their final products, they undergo various phases of less perfect oxidation, in which lactic, acetic, butyric, and other acids are evolved, of which the most important and abundant is lactic acid, which is found in considerable quantity in the small intestine, where it is doubtless of service in contributing to dissolve any nitrogenous matters which have escaped the action of the gastric-juice. Another use of these acids which are developed from the sugars is, that by acidifying the albuminous intestinal contents, they greatly increase their diffusibility through the intestinal membranes into the lacteals, and probably the capillaries. Here we probably have the clue to the therapeutic use of acids in various disorders of the chylopoietic viscera. Under certain conditions, the sugars are also converted into fat in the body.\*

The remaining carbo-hydrates are of little or no value as food. There has been much difference of opinion as to whether gum can be taken up and applied to any definite uses in the organism; but the great mass of the most trustworthy observations seem to shew that it passes through the system unchanged. Independently of experiments on animals by Boussingault, Lehmann, and others, Dr Hammond (an American chemist and physician) found from experiments upon himself (1) that gum is altogether incapable of assimilation, and therefore possesses no calorific or nutritive power whatever, but is, on the contrary, a source of irritation to the digestive organs; and (2) that in consequence of the above fact, the solids of the urine during a purely gum-and-water diet are entirely derived from the waste of the tissues of the body, while the carbon exhaled (as carbonic acid) from the lungs is derived from the consumption of the fat.

Cellulose, or the substance of the vegetable cell, resists the action of the digestive fluids, and reappears unchanged in the feces.

Vinegar is probably only of use indirectly in softening animal textures which are taken as food.

3. The *oleaginous* group includes all the fats and oils, whether derived from the animal or the vegetable kingdom. The members of this extensive group are composed of carbon (ranging from 60 to 80 per cent.) and hydrogen, with a little oxygen. Fat which has been taken with the food is mainly absorbed by the lacteals, although a portion of it passes directly into the capillaries of the villi, as has been shewn by microscopic examination, which has revealed the presence of fat-granules amongst the blood corpuscles. The modifications which are impressed upon the fats, in order to prepare them for absorption, are explained in the article DIGESTION. Their uses in the system are various. In their oxidation in the organism, whether the process be gradual or rapid, a large amount of heat is liberated;

\* The researches of Boussingault on milk-cows, of Milne Edwards and others on bees, and of Lacaze-Duthiers on the insects inhabiting galls, distinctly shew that starch and sugar are capable of being converted into fat in the animal organism.

and that they are oxidised, and for the most part ultimately resolved into carbonic acid and water, is evident, because they neither appear in any quantity in the excretions nor accumulate beyond a certain point in the organism. Moreover, in artificial, and doubtless in natural digestion, the presence of a little fat accelerates the solution of nitrogenous matters taken as food. Lastly, the occurrence of fat in milk, in the egg, in all plastic exudations, and in all highly cellular organs, is a clear indication that this substance plays an important part in the process of cell-formation; hence we may probably explain the therapeutic use of such medicines as cod-liver oil.

4. The *albuminous* group contains all those substances which are chemically known as the proteine-bodies (see PROTEINE), viz., albumen, fibrine, caseine, and the allied vegetable compounds, all of which are composed of very nearly the same proportions of carbon, hydrogen, nitrogen, and oxygen; while additionally they contain a little sulphur or phosphorus, or both: they all contain on an average about 15 per cent. of nitrogen, a substance which has not occurred in the preceding groups. All these proteine-bodies, such as occur in the fluids of the egg, in animal flesh, in the curdy matter of milk, &c., are dissolved by the gastric-juice and intestinal fluid, and converted into matters termed *peptones*, which although similar in their ultimate composition to the substances from which they are derived, differ from them in their greater solubility and their more ready diffusibility through animal membranes. Like the fats, they are chiefly absorbed by the lacteals, but to some extent by the capillaries. A reference to the chemical composition of the milk and of the fluids of the egg, shews that all the nitrogenous tissues in the body of the young animal must have been primarily derived from albumen or caseine; and it is established beyond all doubt, that these substances are throughout life the essential producers of blood, and consequently of the various nitrogenous structures which are built up from that fluid.

5. The *gelatinous* group (which formed a part of Prout's albuminous group) includes the different varieties of gluten, obtained by boiling, from many animal tissues; as, for example, bone-cartilage, tendons, skin, hoofs, &c. All soups and jellies which stiffen on cooling contain it, and such substances are popularly, but erroneously, regarded as highly nourishing. Unlike the preceding group, from which they only slightly differ in ultimate composition, they do not appear to form new blood, and their uses are still so questionable, that we will merely notice one function of them, which has been suggested by Liebig—viz., that these substances may go directly to the formation of such tissues as yield gluten on boiling, and which, if this food were not taken, would have to derive their nourishment from the members of the preceding group.

6. The *saline* group. With the exception of common salt (chloride of sodium), which we take instinctively in additional quantity with most kinds of food, the members of this group are unconsciously taken in the different articles of solid and fluid food on which we live. Want of space prevents us from noticing the different foods which yield the individual salts; but when we invariably find phosphate and carbonate of lime in the bones, in fixed and definite proportions; when we invariably find a nearly fixed proportion of chloride of sodium, alkaline phosphates, and other soluble salts, in the blood, flesh, milk, &c.; and when, further, we find that these substances are being constantly eliminated by the urine, it is obvious that they must be replaced by the food, if we would keep the organism in its normal state. The evil consequences of a deficiency

of any of these ingredients of food are well known; thus, when too little phosphate of lime (to which bone owes its firmness and hardness) is taken into the system, or when too much is again taken out (as occasionally, during pregnancy, when the fetal bones require it for their ossification), fractures do not readily unite.

It is only comparatively recently—during the last quarter of a century—that physiologists have satisfied themselves, that in order to supply the wants of the system, food must consist of a combination of these groups; and that animals which are fed exclusively on food belonging to one of the groups—as, for example, albumen or fibrin—perish under symptoms of inanition, as certainly as if they had been deprived of all nourishment. As in the infant's milk we find the albuminous, oleaginous, saccharine, and saline groups represented by the caseine, butter, sugar, and salts, so, for other periods of life, the food, whether derived from the animal or vegetable kingdom, must contain a due (although not necessarily the same) proportion of the different types. Again, in judging of the nutritive value of any kind of food, we must take into consideration its digestibility. Thus, the experiments made by Dr Beaumont on Alexis St Martin, a Canadian, in whom there was, in consequence of a gun-shot wound, a fistulous opening leading from the exterior to the interior of the stomach, and recent experiments made by Busch on a woman with a fistulous opening into the jejunum (see ELEMENTARY CANAL), shew, for example, that hard-boiled eggs, meat that has been boiled for a long time, and hard cheese, which is poor in fat, are less easily and rapidly digested than soft-boiled or fresh eggs, meat steeped in vinegar, or moist, fat cheese, and that starch is much more readily converted into sugar when boiled than in the raw form.

As the nitrogenous constituents of the food (articles containing albumen, fibrin, &c.) are chiefly employed in the formation of the blood and the reproduction of the tissues, it was at one time thought that the quantity of nitrogen which any kind of food contained might be taken as a measure of its nutritive value; but this test is not altogether to be relied on, since the nitrogen in part depends upon the gluten-yielding matters, which probably contribute little or nothing to the formation of textures.

Both daily experience and chemico-physiological observations shew us, that the best kinds of food contain both fat and carbo-hydrates, in addition to albuminous matters. Instinct teaches us to combine highly amylaceous foods with fats; as, for example, bread and butter, beans and fat bacon; and the increased digestibility of such mixtures proves, no less than the simultaneous occurrence of fat and sugar in the milk and in the egg-fluids, that both substances are necessary, as independent ingredients of food, although, perhaps, one may temporarily serve as a substitute for the other. Unfortunately, we have no trustworthy data for enabling us to determine the proportion in which the different nutrient groups should be combined, so as to form the food best suited to the general wants of the organism. The proportions occurring in human milk are the following: 10 parts of plastic or blood-forming matter (caseine), 10 parts of fat (butter), 20 parts of a carbo-hydrate (sugar), and 0.6 of a part of salts. For the wants of adult life, a lesser ratio of plastic matter (albumen, &c.) would probably suffice.

The absolute quantity of food required for the maintenance of the human body in health varies so much with the age, sex, and habits of the individual, and with the circumstances in which he may be placed, that it is impossible to fix a standard

applicable to every case; but from the consumption of food by large bodies of healthy men, such as our soldiers and sailors, we can determine with tolerable accuracy the *average* daily quantity. We extract the following remarks from Todd and Bowman's *Physiological Anatomy and Physiology of Man*. 'Each seaman in the British naval service is allowed from 31 to 35½ ounces of dry nutritious food daily, of which 26 ounces are vegetable, and the rest animal; the latter consisting of 9 ounces of salt meat, or 4½ of fresh. Sugar and cocoa are also given. The soldier is allowed a pound of bread, and three-quarters of a pound of meat. In most of the London hospitals, full diet, which is given to convalescent patients who need a liberal diet, consists generally of half a pound of meat, with from 12 to 14 ounces of bread, half a pound of potatoes, a pint of milk, and sometimes beer or porter—a pint of the former, or half a pint of the latter. The former dietary is destined for men who must be in readiness for the most active athletic exercises, requiring not only great muscular strength, but also considerable power of enduring fatigue. The latter is intended to recruit the powers of those who have been suffering from disease. If, now, we compare with these a dietary which has been found sufficient for the support of health in a state of more or less confinement, with a moderate amount of daily labour, we may fairly infer that the proper allowance for persons not engaged in actual manual labour lies between these extremes. In the union workhouses of England, able-bodied men obtain about 25 ounces of solid food daily, of which the quantity of meat does not exceed 5 or 6 ounces. In prisons, it has been found necessary to give a certain amount of animal food to prisoners who are subject to hard labour. Each of such prisoners, if confined for a term exceeding three months, and kept at hard labour, has a daily allowance of about 36 ounces of food, of which meat constitutes only a very small portion—namely, about 16 ounces in the week. The prisoner has obviously the advantage of the poor man, whose only crime is poverty; but there is doubtless sufficient justification for this in the fact, that the labour of the prisoner, and the mental depression which long-continued restraint and confinement induce, render a greater amount of nutriment necessary than the indigent would require, who seek in the workhouse a shelter from absolute want.' For further details on this subject, which is one of great practical importance, we may refer to a paper by Dr Lyon Playfair, 'On the Food of Man under Different Conditions of Age and Employment,' published in 1854, in the 50th volume of the *Edinburgh New Philosophical Journal*, and to a memoir by Dr E. Smith upon 'Prison and other Dietaries,' in the *Transactions of the Society for the Promotion of Social Science*, 1858.

It appears, then, that a daily amount of food, varying from 35 to 25 ounces, is sufficient to maintain health; and of this a fourth or fifth part ought to be animal food; but in special cases, much more or much less may be taken without apparent injury. The smallest quantity of food upon which life is known to have been supported with health and strength, is that on which Cornaro—whose history is recorded in most books on Diet and Dietetics—states that he subsisted, in order to reduce extreme corpulence, for a period of fifty-eight years—viz., 12 ounces of food, chiefly vegetable, with 4 ounces of light wine. In contrast with Cornaro's case, we may refer to instances recorded by Parry and other arctic voyagers of the voracity of the natives of those cold regions. A young Esquimaux, who was allowed 'unlimited diet,' availed himself of the privilege to the extent of devouring, in 24

hours, 35 lbs. of various kinds of food, including tallow-candles; and the Cossacks of Siberia are reported to consume daily from 12 to 20 lbs. of animal food.

An article upon diet would be imperfect without a reference to the best mode of dressing meat, for cookery and digestibility are closely allied. Most persons find meat that has been broiled most easily digested. The fire should be brisk, so that the albumen on the surface of the meat may be coagulated rapidly, and thus retain the internal juices. A similar rule applies, for the same reason, to boiling and roasting. When meat is to be boiled, it should be plunged into water already boiling; while, if soup is to be made, the meat should be put into cold water, and the temperature slowly and gradually raised—the object, in the former case, being to retain, in the latter, to extract, the nutritious fluids. (See *BOILING and BROILING*.) Fried meat and rich stews are usually very indigestible. Salted meat is not only harder and more indigestible than fresh meat, but the process of salting extracts important salts, and much of the nutrient juice from the meat; the only exception being fat pork, which is rendered more digestible by salting. On this subject, see Liebig's *Researches on Food*, 1847.

We shall conclude with a notice of certain substances which, although they are hardly entitled to be termed foods, may fairly be considered, from the universality of their use, to exert a definite influence on the organism, and to supply certain existing, although, perhaps, undefined wants. We refer to alcohol, tobacco, tea, and coffee.

From three series of observations made upon himself, Dr Hammond arrives at the conclusion, that 'alcohol increases the weight of the body, by retarding the metamorphosis of the old, and promoting the formation of new tissues, and limiting the consumption of fat.' The respiratory and urinary excretions, and the feces, were invariably diminished. These effects occurring when the amount of food was below the quantity required to maintain the weight of the body, were productive of no deleterious result to the system; but when the food was sufficient to balance the waste from the excretions, and still more, when an excess of aliment over the demands of the system was ingested, the health was disturbed, and disease almost induced. Hence the labouring-man, who can hardly find bread and meat enough to preserve the balance between the formation and decay of his tissues, finds in alcohol an agent which, if taken in moderation, enables him, without disturbing his health, to dispense with a certain quantity of food, and yet keeps up the weight and strength of his body. On the other hand, he who uses alcohol when his food is more than sufficient to supply the waste of tissue, and, at the same time, does not increase the amount of his physical exercise, or drink an additional quantity of water (by which the decay of tissue would be accelerated), retards the metamorphosis, while an increased amount of nutriment is being assimilated, and thus adds to the plethoric condition of the system which excessive food has a tendency to produce.

Tobacco, according to the experiments of the same excellent observer, resembles alcohol in these respects, that when the food is sufficient to preserve the weight of the body, it increases that weight; and when the food is not sufficient, and the body, in consequence, loses weight, it restrains that loss; but it differs from alcohol in being unattended with any unpleasant effects upon the circulation, though its action on the brain is apparent in increased nervous excitement, followed by a pleasant feeling of ease and contentment. In these experiments,

Dr Hammond, who was not in the habit of using tobacco in any form, smoked 450 grains daily.\*

Tea and coffee are usually believed to have a somewhat similar effect to that which, as we have shewn, is produced by alcohol and tobacco. The power of tea in arresting the waste of tissues has, however, recently been called in question by Dr Edward Smith in a memoir 'On the Chemical and other Phenomena of Respiration,' published in the *Philosophical Transactions* for 1859.

**DIET, DESERTION OF.** The proceedings under a criminal libel are in Scotland spoken of technically as a diet, and when the libel is abandoned by the public prosecutor, or where he fails to appear, he is said to desert the diet. The effect of a judgment of the court declaring that the diet has been deserted, is to free the accused from prosecution under the particular libel or writ, but not to prevent a new process being raised on the same grounds. Where a defect or informality has been discovered in the libel, the prosecutor may apply to the court to desert the diet *pro loco et tempore*, by which means he reserves his right to insist of new, which would be lost were he to allow the trial to proceed to an acquittal. If the prosecutor's motion be, that the court shall desert the diet *simpliciter*, the accused will be thereby finally discharged; and this motion it is in his power to make, even after a verdict of guilty has been returned by a jury. In point of law, the Lord Advocate, or his depute who is prosecuting in his name, has it in his power at the very last to save the life of a prisoner, either by moving the court to desert the diet, or by declining to move for sentence. The power, however, is one which public opinion in the present day effectually restrains him from exercising, and which, if once exercised, would certainly be abolished.

**DIETARY, MILITARY.** The chief matters concerning the dietary or sustenance of the troops in the British army, and, indirectly, in those of other countries, will be found noticed under **BAKERIES, ARMY; COMMISSARIAT; COOKERY, ARMY; and RATION.**

**DIETARY, NAVAL.** In fitting out ships for the royal navy, the quantity of victuals is calculated on two data—the established allowance or ration of certain articles, and the average experience of past years in regard to certain others. Under the first category, the ration is everywhere equal, from the admiral down to the humblest sailor; under the second, the differences are very wide. Certain articles are regarded as 'non-guaranteed' to the ordinary crew, to be given or withheld according to circumstances: such as fresh meat, preserved meat, lemon-juice, and wine.

The dietary in relation to kind and quantity of food has been changed from time to time. In 1844, the daily ration was set down thus: 1 lb. biscuit,  $\frac{3}{4}$  lb. salt meat,  $\frac{1}{2}$  lb. vegetables,  $1\frac{1}{2}$  oz. sugar, 1 oz. chocolate,  $\frac{1}{2}$  oz. tea, and  $\frac{1}{4}$  pint rum. When the meat was beef,  $\frac{3}{4}$  lb. flour was added; when pork,  $\frac{1}{2}$  pint of pease in lieu of the flour. Besides these daily allowances,  $\frac{1}{2}$  pint oatmeal was given weekly,

\* Dr Brinton, in his excellent article on 'The Stomach and Intestine,' in the *Cyclopaedia of Anatomy and Physiology*, refers to an instance of the partial starvation of a large ship's crew on a long voyage, in which the *chewers* of tobacco were alleged to have endured hunger far better than the other sufferers, while the *smokers* did not enjoy the same advantage. This fact, however, does not invalidate our statement, and only shews, as we might *à priori* have expected, that the effects of chewing are more powerful than those of smoking. When the system receives its due supply of food, we do not advise the use of tobacco in any form.

and vinegar when wanted, usually also half a pint per week. Fresh vegetables being not at times obtainable, preserved vegetables may not be in store, and circumstances may render it easy to obtain supplies of fresh meat, suet, raisins, currants, loaf-bread, rice, sago, coffee, cocoa, barley-meal, butter, cheese, onions, leeks, wine, beer, &c. At such times the dietary undergoes a temporary change, very acceptable to the crew. If the sailors draw less than their rations, they receive a money equivalent at stated intervals. The cost of the dietary to the state, on the basis of 1844, was about £18 per man per annum.

The British government have never attempted the temperance system in the navy, but they offer facilities to such seamen as choose to adopt it. In 1847, a plan was introduced for giving tea and sugar in lieu of rum. Many of the seamen have in this way abandoned spirituous liquors, but not to so great an extent as the seamen of the United States navy.

In 1859, when the Admiralty desired to increase the attractiveness of the royal navy, the dietary was made more liberal in certain particulars. The allowance of biscuit was increased to  $1\frac{1}{2}$  lb., and of sugar to 2 oz.; together with an addition of chocolate and sugar during a cold night-watch, or when exposed to severe weather. In foreign countries, with a few exceptions, the naval dietary, whether in war or trading ships, is less liberal than that of England.

The dietary for emigrants is regulated by law. Every emigrant ship is bound to be provided with certain kinds and quantities of provisions, according to the number of emigrants and the length of the voyage. The chief owners of passenger-ships engaged in the Australian and other distant trades, now pay great attention to this subject, as one which affects the good name of the several firms.

**DIETS OF COMPEARANCE**, in the law of Scotland, are the days on which a party to a civil or criminal process is cited to appear in court. Formerly, there were two diets, because there were two summonses; but by the judicature act, in 1825, it was enacted that all summonses should henceforth proceed on one diet. By 13 and 14 Vict. c. 36, s. 21, the period allowed to the defender (see **INDUCLE**) was shortened from 20 to 14 days for persons within Scotland; and for persons in Orkney, or in Shetland, or furth of Scotland, from 40 and 60 days respectively, to 21 days in both cases. In the sheriff-courts, the period is six days (16 and 17 Vict. c. 80). See **SUMMONS, INDICTMENT, INDUCLE**.

**DIEZ, FRIEDRICH CHRISTIAN**, the founder of the philology of the Romanic languages, was born at Giessen, 15th March 1794, and educated at Giessen and Göttingen. During the greater part of the years 1819 and 1820, he lived at Utrecht as a domestic tutor. In 1822, he went to Bonn as a *privat-docent*, and in 1830 was there appointed Professor of Modern Literature. His first work, *Altspan. Romanzen*, was issued in 1821. Since then, he has published a great number of valuable works on the Romanic languages, two of which are worthy of special mention—the *Grammatik der Romanischen Sprachen* (Grammar of the Romanic Languages, 3 vols., Bonn, 1836—1842), and the *Etymologisches Wörterbuch der Romanischen Sprachen* (Etymological Dictionary of the Romanic Languages, Bonn, 1853). The last of these works, in particular, is recognised not only by Germans, but by the scholars of all the Romanic nations, to be the basis for the scientific study of all the modern languages derived from the Latin.

**DIFFERENCE; DIFFERENCES; CALCULUS OF FINITE DIFFERENCES.** The word difference means usually the excess of one quantity over another of the same kind, and this is its meaning in arithmetic. In the higher branches of mathematics, however, it has a peculiar meaning, which we shall briefly explain. When we have a series of numbers connected by a regular, though not obvious law, the character of that law may be detected by forming a new series of the *differences* between each term of the original series and the next, and then treating the new series (which we may call the series of 'first differences') in the same way; and so on, till we reach a series of differences the law of which is manifest. Thus,

Given series,	. 4,	7,	11,	18,	31,	54,	92,	151
First differences,	3,	4,	7,	13,	23,	33,	59	
Second differences,	1,	3,	6,	10,	15,	21		
Third differences,	2,	3,	4,	5,	6			

The law of the series of third differences is manifest; we see that its next term must be 7, which gives 28 as the next term of the series of second differences, 87 as the next of the first differences, and so 238 for that of the original series, which we can thus continue to any number of terms. To take a simpler case. Let the series be

		43,	47,	53,	61,	71
First differences,		4,	6,	8,	10	
Second differences,		2,	2,	2		

Here the law is manifest in the first differences, and we should be able to calculate the series if we knew the first terms of the three series; viz., 43, 4, 2. It is on this principle that calculating machines (q. v.) can be constructed to compute tables of logarithms, &c. Out of the method of Differences sprung the Calculus of Finite Differences, first treated by Dr Brook Taylor, under the name of the Method of Increments. This calculus has nothing to do with the Transcendental Analysis. See CALCULUS DIFFERENTIAL, &c. It deals with the changes of functions when *definite* increments are made to the variables; while the Transcendental Analysis considers only their changes when indefinitely small or infinitesimal additions are made to the variables. It would be out of place here to attempt an account of the Calculus of Finite Differences. See FUNCTIONS.

**DIFFERENCES**, in Heraldry, though often, or indeed generally, confounded with marks of Cadency (q. v.), have, in strict usage, a totally different function—the former being employed to distinguish brothers and their descendants after the death of the father, the latter whilst he is still alive. Differences in this limited sense may consist either of a chief added to or a bordure placed round the plain shield borne by the head of the house; or should the shield exhibit any of the Ordinaries (q. v.), as the bend, fess, pale, &c., the difference may be indicated by an alteration on the lines. The proximity of the bearer to the head of the house is indicated by the character of the line by which the differing chief, or bordure, or ordinary is marked off from the field, the following being the order usually observed; the first or eldest brother, on the death of his father, inherits the pure arms of the house; the second brother, if the difference is to consist of a bordure, carries it plain; the third, ingrailed; the fourth, invected; the fifth, embattled; &c. Other modes of differencing have been invented by heralds, and are not unknown to practice; such, for example, as changing the tinctures either of the field or of the principal figures, of which Nisbet gives many famous examples—altering the position or number of the figures on the shield, adding different figures from the mother's coat or from lands, and the like. Where the cadet is far removed from the principal

family, if the field be of one tincture, it is sometimes divided into two, the charge or charges being counter-charged, so that metal may not lie on metal, or colour on colour. The confusion between differences and marks of cadency, above referred to, is by no means peculiar to the heraldic usage of England, though there it is more prevalent than in Scotland. In France, the cadets of the House of Bourbon have been in the habit of continuing these marks, and at the present day, as in Mackenzie's time, the label or lambel is to be seen on the arms of all the members of the Orleans family. That no distinction between what we call marks of cadency and differences was there observed, is further apparent from the fact that, whilst such was the practice of the House of Orleans, the House of Anjou carried a bordure gules, and that of Alençon a bordure gules charged with eight bezants. In Germany, Sir George Mackenzie says that the several branches of great families distinguish themselves only by different crests (*Precedency*—Works, ii. 616); and he gives as the reason, that all the sons succeed equally to the honours of the family. In Britain, and in France, some change is always made on the shield as carried by the head of the house; but the practice even of good heralds has been so irregular, as to bring the rule very nearly to what Mackenzie holds to be the correct one—viz., that every private person should be allowed, with the sanction of the proper authorities, 'to make what marks of distinction can suit best with the coat which his chief bears.'

**DIFFERENCES, CALCULUS OF.** See DIFFERENCE.

**DIFFERENTIAL CALCULUS.** See CALCULUS.

**DIFFERENTIAL THERMOMETER.** See THERMOMETER.

**DIFFRACTION, or INFLECTION**, of the rays of light. It was observed by Grimaldi, that if a beam of the sun's light be let into a dark room through a very small hole, the shadows of things in this light will be larger than they ought to be if the rays passed by the bodies in straight lines, and that these shadows have three parallel fringes, bands, or ranks of coloured light adjacent to them.

This phenomenon was originally known under the name of diffraction, and was supposed to arise from the refraction of the atmosphere. This explanation was disproved by the observations of Newton, who, from the conception which he was led to form of it, called the phenomenon the 'inflection of the rays of light.' It is now identified with a larger class of phenomena, which have been much more completely explained in the later development of the theory of light, and are assigned, on the hypotheses of Fresnel, to the interference of undulations. See INTERFERENCE. The observations and experiments of Newton on the subject, as detailed in the third book of his work on Optics, are, however, extremely interesting and instructive, and with regard to accurate observation and description, apart from the imperfect state of the theory, leave nothing to be desired.

Having made in a piece of lead a small hole with a pin, whose breadth was the 42d part of an inch, Newton let into the darkened chamber a beam of the sun's light. In this light, the shadows of all bodies were bordered with three parallel fringes or bands of coloured light. The shadow of a hair, too, was found to be much broader than the hair itself, and fringes of light were observed within it.

Again admitting light into the darkened apartment by a hole a quarter of an inch wide, he allowed it to pass between two knife-edges parallel

## DIFFRACTION.

to one another. In this case, owing to the breadth of the hole by which the light was admitted, the fringes did not appear within the shadows of the knives until the knife-edges were brought to approach one another, when they appeared. By making the hole smaller through which the light was admitted, they became more distinct. 'As the knife-edges continually approached one another, the fringes grew distincter and larger, until they vanished. The outmost fringe vanished first, and the middlemost next, and the innermost last; and after they were all vanished, and the line of light which was in the middle between them was grown very broad, a shadow began to appear in the middle of this line, and divide it along the middle into two lines of light, and increased until the whole light vanished. This enlargement of the fringes was so great, that the rays which go to the innermost fringe seemed to be bent above twenty times more when this fringe was ready to vanish, than when one of the knives was taken away.'

The order of these phenomena is then made clear by the following experiment: 'I caused the edges of two knives to be ground truly straight, and pricking their points into a board, so that their edges might look towards one another, and meeting near their points, contain a rectilineal angle, I fastened their handles together with pitch, to make this angle invariable. The distance of the edges of the knives from one another at the distance of four inches from the angular point, where the edges of the knives met, was the eighth of an inch; and therefore the angle contained by the edges was about  $1^{\circ} 54'$ . The knives thus fixed together I placed in a beam of the sun's light, let into my darkened chamber through a hole the 42d part of an inch wide, at the distance of 10 or 15 feet from the hole.' When the fringes of the shadows of the knives fell perpendicularly upon a paper at a great distance from the knives, they were in the form of hyperbolas, and are represented in the following figure.

In the diagram, CA, CB, are lines drawn upon the paper parallel to the edges of the knives, and between which all the light would fall, if it passed between the edges of the knives without inflection. The lines *eis*, *fti*, and *glv*, represent the terminus of the shadow of one of the knives, the dark line between the first and second fringes of that shadow, and the dark line between the second and third fringes of the same shadow. The lines *xip*, *ykq*, and *zlr*, represent the same lines corresponding to the other knife-edge. These lines are hyperbolas, having for asymptotes the line DE, and lines parallel to CA, CB, respectively.

It will be seen that in this experiment the fringes

Fig. 1.

become wider towards the narrow end of the opening, just as in the former case they became wider as the knife-edges approached one another.

The best mode for exhibiting the phenomena of diffraction, and that now generally adopted for that

purpose, is as follows: The rays of sunlight being reflected horizontally through an aperture into a darkened apartment, are concentrated by a combination of lenses to a very small focus. By this means the light is made to diverge from a very small circle, with the advantage of a greater concentration of light than is obtained by simply admitting the sunlight through a small aperture. The edges of the shadows of every object placed within the cone of light diverging from this focus, will exhibit the fringes above described.

By means of metal-leaf arranged upon a plate of glass, as in the accompanying diagram (fig. 2),

Fig. 2.

shadows can now be thrown upon a screen, so as to exhibit at once all the most peculiar phenomena of this class.

The figures *b*, *c*, in the accompanying diagram (figs. 3 and 4), represent the appearance presented

Fig. 3.

Fig. 4.

by the shadow of a wire and of a small circular disc.

The following is a popular explanation of the phenomenon above described as now understood.

Supposing light to be propagated by undulations proceeding from a single small source or focus at A (fig. 5): let Bb be a section of the front of a wave of this light, that is, a section of a surface passing through all the particles which are at the same instant in the same phase of vibration. Let Cc represent the front of the same wave, when it has passed through the additional space BC. The vibrations of the particles in Cc are the consequence of the vibrations previously existing along the space Bb. But then, the motion of the particle at C is determined not alone

by the previous motion of the point B, immediately opposite to it, but is affected more or less by the motions of every point in the surface Bb. If, therefore, the vibrations over a portion of the space Bb, be intercepted by a dark object *de*, placed there,

the circumstances which determine the motion of the point C, may be totally changed; and taking into account the united effect of these vibrations, it

Fig. 5.

which would otherwise affect it, are stopped, it may still be affected by the vibrations in the remainder of the surface Bb; and if the combined effects of these be such as to cause in it a sufficient vibration, there will be light at the point f, though it is properly within the shadow of ed. It is impossible here to go further into detail, and it can only be said that, on the assumption of Fresnel, the explanation of the whole phenomena above described is most complete and satisfactory, the fringes and dark lines being produced by the undulations alternately strengthening or destroying each other. A very beautiful experiment, devised by Fresnel for the purpose, is found to furnish a complete verification of the theory. See INTERFERENCE.

**DIFFUSION**, the gradual dispersion of particles of one liquid or gas among those of another—or of the particles of a solid in a liquid holding it in solution. It is of the greatest importance in terrestrial physics, being the cause of the uniform composition of the atmosphere at all elevations, and one of the causes of the speedy dissipation of noxious gases and vapours in the open air, and of the nearly uniform saltiness of the sea, &c., so necessary to animal and vegetable life.

We shall consider the above cases in detail, and in addition the transfusion, as it has been called, which occurs when different gases or liquids are separated from each other by a porous plate or membrane. The principal experiments on this subject are those of Graham and Bunsen—to be found in the *Philosophical Transactions* or *Graham's Chemistry*, and in Bunsen's *Gasometry*.

1. *Diffusion of Gases*.—If two flasks be filled, one with hydrogen, the other with chlorine, and connected by a long tube fitted into their necks by corks—in whatever position the compound apparatus be placed it will be found that the gases mutually interpenetrate—in this particular case the colour of the chlorine enables us to follow by the eye the course of the diffusion. When the mixture has attained its permanent state, each of the gases is found to be uniformly diffused through the whole containing space, precisely as it would have been had the other not been present. In fact, the presence of a second gas seems merely to affect the time which the first takes to distribute itself equally throughout the vessel, and in no other way to influence the final result. (Dalton, long ago, suggested the analogy of the passage of water among stones in the bed of a river.) The pressure of the mixture is the sum of the pressures corresponding to each of the gases, if separately occupying the space which they jointly fill; and the same is true of a mixture in any proportions of any number of gases, so long, at all events, as they do not act chemically upon each other.

Precisely the same is true of vapours. If, for instance, a few drops of ether be injected into an exhausted receiver, there will be an almost instantaneous conversion of a definite quantity into vapour,

so that its tension shall have a certain value depending on the temperature alone. If air be present in any quantity whatever, the vaporisation will proceed more slowly, but the final amount converted into vapour will be the same as in the former case. A familiar illustration of this is afforded by the dew-point, which is a temperature merely, having no connection with the height of the barometer.

Next let us take the case of a gas forced by difference of pressures from one vessel to another through a very small hole in a thin metallic plate—one of the vessels, for instance, being full of the gas, and the other connected with an air-pump kept continually in action. Experiment, and theory such as it is, agree in giving in this case, for the velocity with which the different gases pass through the orifice, under similar circumstances as to pressure, a result inversely proportional to the square root of the density of each gas. Now, if, instead of the plate with the small hole, we substitute a thin layer of bladder or other membrane, or a thin disc of plaster of Paris, it appears from experiment that the results are sensibly the same. Thus, if we have the same gas at different pressures on opposite sides of such a layer or disc, the rate of passage of the gas through it, from greater to less pressure, will, for the same pressures, but different gases, vary according to the above law; and, moreover, the presence of a second gas will in no degree modify the rate of transfusion of the first. If, therefore, a glass tube, say an inch in diameter, and two or three feet long, have a diaphragm of plaster of Paris formed near one end, and that end ground flat, so as to be perfectly closed by a glass plate, it may be filled with hydrogen by displacement, its other and lower extremity being plunged into water, and care being taken not to wet the diaphragm. If the glass plate be now removed, transfusion will take place—hydrogen passing out as if into a vacuum, and the constituent gases of air entering also as if into a vacuum. On account of the comparative lightness of hydrogen, the velocity with which it escapes will be considerably greater than that with which the others enter; so that the immediate effect will be a rise of the water in the tube. After a short time, the whole of the hydrogen escapes, and the tube will contain only air. The proportion of the volume of the latter to that of the hydrogen may be calculated from the above law—remembering that the hydrogen is practically diffusing into a vacuum all along, and the air entering by the pressure of the atmosphere in excess over that of the air in the tube. Allowing for the unavoidable errors of experiment, the verifications of these results are very satisfactory. It has been attempted to deduce these laws as consequences of the dynamical theory of gases. See a remarkable paper by Maxwell in the *Philosophical Magazine* for 1860.

Bunsen has suggested the application of the method of diffusion to the very important question in gas analysis—whether the constituents of a gas, as determined by the usual methods, are merely mixed, or are chemically united. It is evident that, in general, the diffusion rate of a mixture of two gases will differ from that of a compound of the same.

2. *Diffusion of Saline Matters in Solution*.—If a strong brine be placed in the bottom of a tall glass jar, pure water may be carefully introduced above it, so that no immediate mixture takes place. If the whole be allowed to stand, the salt is gradually diffused through the vessel, which, after a sufficient time, will be found to contain a brine of uniform strength. Experiments have been carefully made to determine, in such a case as the above, the distribution of the salt through the vessel at various

periods before the permanent state has been arrived at. They have been compared with the results of the theory now to be explained, and the coincidence has been found very satisfactory. The theory assumes that the rate of diffusion between contiguous layers of the water in the cylinder is proportional to the excess of salt in one layer above that in the next—the co-efficient of proportionality involving a special constant of diffusion for the particular salt experimented upon. This is precisely the assumption that is made about the linear conduction of heat in a homogeneous solid, or the propagation of electricity in a wire. The partial differential equation to which all of these cases are reducible,  $\left(C \frac{du}{dt} = \frac{d^2u}{dx^2}\right)$ , was obtained,

and its complete solution exhibited in various forms long ago by Fourier, in his *Théorie de la Chaleur*, one of the most remarkable mathematical investigations of last generation. See HEAT, CONDUCTION OF, and ELECTRICITY, THEORY OF. It is curious to consider the heating of a metallic rod, or the solution of a few crystals of salt in a tall glass jar full of water, as problems thus directly allied to the signaling through the Atlantic cable.

Graham's method of determining the diffusion co-efficient of a salt in water was simple, and yet admitted of great precision in the determinations. A number of glass bottles, cast in the same mould, had their mouths ground flat, so as to be accurately closed by a plate of glass, which—when the bottle, filled with a solution of known strength, had been carefully placed in one of a series of equal glass jars, and covered with a constant amount of water—could be slipped off without producing any considerable disturbance in the fluid. After a measured time, the glass plate was replaced, and the amount of salt which had left the bottle accurately determined.

The following are the most important of the laws thus obtained; they are quite consistent with the theory above mentioned. For solutions of the same substance, of different degrees of strength, the rate of diffusion is proportional to the strength of the solution. Different salts seem to arrange themselves in groups as regards their diffusion coefficients, the latter having simple numerical relations to each other. Analogy of chemical composition and of crystalline form appear to be the principal elements in the arrangement of the groups. The quantity diffused increases with the temperature, and at the same rate for all salts. The presence of a second salt in the solution, or in the water into which the diffusion takes place, if not in large quantity, appears not to affect the result, supposing, of course, that no chemical action takes place. It is evident that by this process a partial separation may be effected of salts which have different rates of diffusion, and do not act chemically on each other; and it is found that in certain cases even chemical compounds, such as alum, may be partially decomposed by the same means.

3. *Diffusion of Liquids. Osmose.*—If sulphuric acid be carefully poured through a tube into the bottom of a vessel filled with water, coloured by an infusion of litmus, or red cabbage, the change of colour of the vegetable dye will enable us to trace the gradual diffusion of the acid in the water. Here, the process, though probably on the whole quite analogous to the case of gases, occupies more time; but the final result is, as in the former case, an almost uniform mixture of the two fluids. There is no necessity for any special remark on this part of the subject, particularly as we have already adverted to the theory of this process. But if different fluids be separated by a membrane or diaphragm, some

extremely remarkable results are obtained, which were first carefully examined by Dutrochet. These have been attributed to the action of osmotic force, something of the same kind as capillary force, and probably a closely connected, if not identical form of molecular action. The theory of these actions is not yet well understood, but we shall endeavour to give from analogy a few attempts at explanation.

If an inverted funnel, with a very long stem, have a bladder tied over its mouth, and, being filled to the neck with syrup of sugar, be suspended so that the bladder is entirely under the surface of water in a dish, the syrup will pass through the bladder into the water, and the water will pass through in the opposite direction, but in far greater quantity—producing the extraordinary effect of a rise in the level of the fluid in the tube, which can with precaution be made to amount to a yard or two in the course of a few days. The points of the attempted explanation of this phenomenon are somewhat as follows: The bladder has more capacity for, or will absorb more of, water than of syrup. The first effect, then, is to saturate the bladder with water, very slightly mixed with syrup. On the lower side of the bladder, water, with a small quantity of sugar in solution, is diffusing into pure, or nearly pure water, this process will be a slow one; at the upper side, water (nearly pure) is diffusing into a strong syrup. Here, then, the effect is much greater, and thus a greater quantity of water passes upwards than of syrup downwards. Similar effects may be produced with a vast number of other liquids. Combined with capillarity, it is believed that these experiments explain the motion of the sap in vegetables, and various other phenomena in the vegetable and animal kingdoms.

**DIGAMMA**, an obsolete letter of the Greek alphabet, equivalent in sound to the English *v*. In some of the earlier Greek dialects the old  $\gamma$  was a kind of aspirate, which, from its form, like one capital  $\Gamma$  over another, was called digamma, and written  $\Phi$ . The Pelasgians carried this aspirate into Italy, where it remained in Latin as a real consonant, in such words as *vinum, orum*, from the Greek  $\Phi\alpha\iota\upsilon\sigma, \Phi\alpha\iota\upsilon\upsilon$ . The digamma had disappeared as a character from the Greek language before the days of Homer.

**DIGBY**, a small seaport of Nova Scotia on the Bay of Fundy, reputed for its curing of a variety of small herrings or pilchards, which are smoked and dried for export; they have a high flavour, and are known in trade as Digbics.

**DIGBY, SIR KENELME**, the son of Sir Everard Digby, noted as one of the Gunpowder Plot conspirators, was born in 1603, three years before the execution of his father. He was brought up in the Protestant faith, and at the age of 15 was entered at Gloucester Hall, Oxford. After leaving the university, where he had acquired the reputation of great ability, he spent two years in continental travel. He returned to England in 1623, and was knighted in Lord Montague's House. Under Charles I., he was a gentleman of the bedchamber, and held several public offices. In 1628, he equipped a squadron at his own expense, and sailed first against the Algerines, and subsequently against the Venetians. In 1632, on the death of Dr Allen, of Gloucester Hall, D. inherited his collection of books and manuscripts. In 1636, when in France, he was converted to the Roman Catholic faith. He returned to England in 1638, and on the breaking out of the Civil War, he was imprisoned as a royalist in Winchester House, but in 1643 he was allowed to retire to France. At Paris, he was received with favour by the court, and made the acquaintance of

Descartes. After Charles I. had fallen, D. returned to England, but the parliament forbade him the kingdom, under penalty of death. Retiring to the continent, he travelled in France and Italy; but in 1655, he was again in England, and was in frequent attendance at the court of the Protector. He went again to France, and busied himself with the preparation of philosophical papers. He returned to England in 1661, and died there in 1665. D. married a daughter of Sir Edward Stanley of Tongue Castle, in Shropshire, by whom he had one son.

His works are numerous, and on a great variety of subjects, comprising *A Conference with a Lady about the Choice of a Religion* (Par. 1638), *Observations on Spenser's Fairy Queen* (Lond. 1644), *A Treatise on the Soul, proving its Immortality* (Par. 1644), *Of the Cure of Wounds by the Powder of Sympathy* (Lond. 1658), and *Discourse on Vegetation* (Lond. 1661, &c.). *The Private Memoirs of Sir K. Digby, &c., written by Himself*, were published in London in 1827. D.'s library, which was removed to France when the Civil War broke out in England, became, on his death, the property of the French king.

DIGEST, a name often given to the Pandects (q. v.) of the civil or Roman law, because they contained 'Legalia præcepta excellenter digesta.'

DIGESTER, PAPIX'S, is a strong boiler with a closely fitting cover, in which articles of food may be boiled at a higher temperature than 212° F. As its name implies, it was invented by Papin, and a common form is the *Autoclave*, fig. 1, where the lid can be turned round under clamps or ears, and thus be rendered steam-tight. Another form is given in fig. 2, where a portion of the side is removed, to

Papin's Digester.

exhibit the interior. The lid A is fastened down by a screw B, and the steam generated in the boiler is allowed to escape at a stop-cock C, or by raising the weighted valve D. The increased pressure to which the contents of the boiler are exposed, causes the boiling-point of the water to rise to 400° F., and occasionally higher. The digester is of great value as a means of preparing soups of various kinds, and especially in the extraction of gelatine from bones.

DIGESTION, ORGANS AND PROCESS OF. The function or process of digestion is one of the chief of those organic functions which are directly concerned in maintaining the life of the individual, inasmuch as it is that through which the animal is enabled to receive aliment, and to prepare or modify it for being assimilated to, and appropriated by, the various organs of the body, or, in other words, for being converted into blood.

The general expression, 'function of digestion,' includes several minor or subordinate processes.

According to Milne Edwards, the acts of the digestive function may be classed as follows: 1. There is the Prehension of the Food; 2. Its Mastication; 3. Its Insalivation; 4. Its Deglutition; 5. Its Chymification or Stomachal Digestion; 6. Its Chylification or Intestinal Digestion; 7. Defecation; and 8. The Absorption of the Chyle.

Before examining these acts in succession, and the mechanism by which each is effected, we must have clear conceptions regarding the classification of food, the quantity of food, and other allied subjects, which are discussed in the article DIET; and we should likewise have some knowledge of the causes of those sensations which we call *hunger* and *thirst*, which are, or ought to be, our natural guides regarding the periods for taking food, and the quantity to be taken. The immediate cause of ordinary hunger cannot be explained; but that it is due to some peculiar condition of the gastric mucous membrane, seems probable from the fact, that the sensation continues after division of the pneumogastric nerves, from which the stomach mainly derives its nervous fibres, if we correctly interpret the feelings of the animals on which the experiments were made. In extreme hunger, the sufferer complains of a sense of sinking, which is referred to the region of the stomach, while general faintness and sometimes considerable pain are present. Hunger, or the want of food which occasions it, may be diminished by rest, sleep, or any cause that retards the general change which is perpetually going on in all the tissues of the body. We have shewn in the article DIET, that tobacco and alcohol have a power of limiting the disintegration of the tissues, and thus of keeping off or diminishing hunger. When the sensations of extreme hunger are not relieved by food, the body begins to feed upon its own tissues, and the symptoms of Starvation (q. v.) begin to manifest themselves. The period at which death occurs from abstinence, varies greatly in different animals—young animals always dying sooner than older ones. In man, total privation of food usually causes death in about a week; but if a little drink be allowed, life is considerably prolonged.

Thirst is dependent upon a peculiar condition (probably undue dryness) of the mucous membrane of the upper part of the digestive tube. The thirst in febrile affections is, however, probably due to the morbid state of the blood.

We now proceed to the consideration of the different acts of which the digestive function is made up.

1. In the act of prehension, man and many of the lower animals (monkeys, squirrels, &c.) employ the hands or anterior extremities and mouth; the lips and anterior teeth, and, to a certain extent, the tongue, being also employed in this function. In the lower animals, however, the modes of prehension are various. Some (like the giraffe) twist the tongue around the leaves and young branches of trees; others (the ant-eaters) have a remarkably long tongue, covered with a viscid secretion, and by thrusting this organ into ant-hills, &c., secure their prey; and in the chameleon among reptiles, and the woodpecker among birds, the tongue seems specially developed for prehensile purposes. In the elephant, this act is accomplished by the prolongation of the nostrils into the organ popularly known as the trunk. In other mammals (the Ruminants and Solipeds), the large pendulous lips are the organs employed. In birds, the bill (which is a modification of the lips) is always the prehensile organ of that class.

The prehension of fluids is effected in two ways: sometimes the liquid is poured into the mouth, and

## DIGESTION.

is allowed to fall into it by its own weight; in other cases, the tongue is used after the fashion of a piston, being drawn within the mouth so as to exhaust the anterior part of that cavity, and fluids are thus forced to enter by atmospheric pressure.

2. Mastication is effected in the cavity of the mouth by means of the teeth. This cavity is bounded superiorly by the palate or roof of the mouth, and in other directions by the cheeks, lips, and tongue. Projecting into its interior, above and below, is an arched series of teeth, which are firmly fixed by roots into corresponding sockets in the upper and lower jawbones. The upper jaw (and consequently the dental arch imbedded in it) is immovable, or only movable with the entire head; but the lower jaw, with its teeth, is capable of moving upwards, downwards, backwards, forwards, and laterally, by means of the powerful muscles of mastication. It is by the varied movements of the lower teeth against the upper, through the action of these muscles, that the food is broken down or masticated. For information regarding the structure, &c., of the teeth, see **TEETH**; see also **DEFINITION**.

The operation of mastication is very important, since the more the food is broken down the more easily will it mix with the saliva and other fluids which participate in the digestive process.

3. Insalivation is effected by the admixture of the secretions of the three pairs of salivary glands (the parotids, the submaxillaries, and the sublinguals) and of the buccal mucus with the triturated food. A brief description of these structures is given in the article **GLAND**. The common saliva, formed by the combined secretion of these various secreting organs, is a colourless, turbid, viscid, inodorous, and tasteless fluid, which, after standing for some time, deposits a layer of pavement epithelium (see **EPITHELIUM**) and mucus corpuscles. In the normal state, its reaction is alkaline, but the degree of alkalinity varies, and is greatest during and after meals. Saliva does not contain more than five or six parts of solid constituents to 995 or 994 parts of water, the most important ingredients being an organic matter termed *ptyaline*, and sulphocyanide of potassium, neither of which substances occurs in any other solid or fluid of the body. The daily quantity of saliva secreted by an adult man is estimated at about 48 ounces, but determinations of this kind must be regarded only as approximations to the truth, since the activity of the salivary glands is dependent upon various influences and conditions. Thus movement of the lower jaw, as in masticating, speaking, or singing, increases the secretion; as also do acrid and aromatic substances, and dry hard food; while the use of moist and soft food is accompanied by a scanty secretion.

The uses of the saliva in reference to digestion are partly mechanical and partly chemical. The mechanical uses are almost too apparent to require notice. The moistening of the dry food by the saliva serves the double purpose of adapting it for deglutition and of separating the particles, and thus allowing them to be more freely acted on by the other digestive fluids; moreover, from its viscosity, it lubricates the bolus of food, and thus facilitates deglutition; and it is probably also subservient to the sense of taste. The great chemical use of the saliva is to convert the amylaceous (or starchy) portion of the food into glycose or grape sugar, and thus to promote its absorption.

4. Deglutition is the act by which the food is transferred from the mouth to the stomach. The pharynx, or cavity into which the mouth leads, takes so slight a part in the digestive process, that we need scarcely allude to any anatomical details connected with it.

It is sufficient to observe that between it and the mouth is the pendulous or soft palate, which is a movable muscular partition that separates the two cavities during mastication. As soon, however, as the latter act is accomplished, and the bolus is pressed backwards by the tongue, the soft palate is drawn upwards and backwards, so as to permit the passage of the food into the pharynx. The bolus or pellet of food having arrived near the œsophagus or gullet (which is continuous inferiorly and posteriorly with the pharynx), is driven into it by the action of certain muscles, which almost surround the pharynx, and are termed its *constrictor* muscles. All voluntary action ceases as soon as the food is pressed backwards by the tongue into the pharynx. It is impossible to recall the pellet, and it is necessarily carried on (without even our cognizance) into the stomach. On receiving the food forced into its upper extremity by the action of the constrictor muscles of the pharynx, the œsophagus is dilated (for it usually lies in a collapsed state, with its walls in contact, or nearly so); this contact of the pellet with its mucous membrane causes its muscular walls to contract, and the food is thus driven, by a series of these contractions, into the stomach. The act of deglutition is now completed.

5. Stomachal digestion or chymification is the next process to be considered. The whole of the Alimentary Canal (q. v.), (fig. 1) below the Diaphragm (q. v.),

or great muscular partition which separates the cavity of the chest from that of the abdomen or belly, possesses the following points in common, in relation to structure: The stomach, the small intestine, and the large intestine, are all lined by mucous membrane, have a muscular coat, consisting of two sets of distinct fibres—namely, circular fibres which surround the tube or viscus after the manner of a series of rings, and longitudinal fibres running in the same direction as the intestine itself—and are invested with a serous membrane, the peritoneum (see **SEROUS MEMBRANES**), which at the same time retains the viscera in their proper position, and permits their necessary movements.

The human stomach is an elongated curved pouch, lying almost immediately below the diaphragm, and having the form of a bagpipe. It is very dilatible and contractile, and its function is to retain the food until it is duly acted upon and dissolved by the gastric juice, which is secreted by glands lying in its inner or mucous coat, and then to transmit it, in a semi-fluid or pulpy state, into the duodenum. Its average capacity is about five

Fig. 1.

Human Alimentary Canal.

a, œsophagus; b, stomach; c, cardiac orifice; d, pylorus; e, small intestine; f, biliary duct; g, pancreatic duct; h, ascending colon; i, transverse colon; j, descending colon; k, rectum.

joints. The parts of it which have received special names are the greater curvature (fig. 1) *b*, the lesser curvature, upon its upper border, and the cardiac, *c*, and pyloric, *d*, extremities.

The mucous membrane, or lining coat of the stomach, is thick and soft, and lies in irregular folds, in consequence of the contraction of the muscular coat, unless when the organ is distended with food. On opening the stomach, and stretching it so as to remove the appearance of folds, we perceive even with the naked eye, but better with a lens, numerous irregular pits or depressions, irregular in shape, and averaging about  $\frac{1}{20}$ th of an inch in diameter. To see them properly, the mucus with which they are filled must be washed out (fig. 2, A). These pits are so shallow as not to dip into the mucous membrane to a greater extent than  $\frac{1}{4}$ th or  $\frac{1}{3}$ th of the thickness. The rest of the thickness is chiefly

Fig. 2.

A, inner surface of the stomach, showing the cells after the mucus has been washed out, magnified 25 diameters. B, stomach-tube from the middle of the human stomach, magnified about 150 diameters: *a*, wall of the tube, lined with large oval nucleated cells; *b*, the same cells isolated; *c*, nucleated cells of columnar epithelium, occupying the upper parts of the tubes; *d*, blind extremity of the tube.

made up of minute tubes, running parallel to one another, and vertically to the surface of the stomach (fig. 2, B). These are the gastric tubes or glands which secrete the gastric juice from the blood in the capillaries which abound in the mucous membrane. They pass in twos, threes, or fours from the bottom of each pit, and usually subdivide into several tubes, which, after running a more or less tortuous course, terminate in blind or closed extremities. These tubes are filled with epithelial cells, whose contents are composed of granules, with which oil-globules are often mixed, and each tube is invested with capillaries, which usually run in the direction of its long axis. In the pyloric or duodenal end of the stomach, these tubes (at least in the dog and several other animals whose stomachs have been carefully examined in a perfectly fresh state) are considerably wider than those which we have described, and differ from them also in other respects; and hence some physiologists believe that while they collectively secrete the gastric juice, one set may secrete the free acid, and the other the organic matter termed pepsine; this free acid and the pepsine being, as we shall shortly see, the two essential constituents of the gastric juice.

When food is introduced into the stomach, three special phenomena are induced in that viscus: 1. There are certain movements induced which are

dependent on its muscular coat; 2. The mucous membrane is altered in appearance; and 3. There is the secretion of the gastric juice. Each of these phenomena requires a brief notice.

On killing an animal while the act of digestion is going on, and at once laying open its abdomen, we find that the stomach is in a contracted state, firmly embracing its contents, and with both its orifices so closed as to prevent the escape of the food, this contraction being due to the stimulation of the muscular coat by the food. If we examine the movements of the stomach during digestion, which we can do either by exposing the stomach of a living animal, or by sending a magneto-electric current through this organ in an animal just killed, we perceive that, in the cardiac half or two-thirds, the movements are extremely slow, the muscular coat apparently contracting on the food, and progressively sending it towards the pylorus; whilst in the pyloric end of the stomach the movements are more energetic and rapid, resembling the peristaltic or vermicular movement, which we shall presently describe as occurring in the intestinal canal. When the transverse constriction has reached the firmly shut pylorus, a relaxation lasting about a minute ensues, followed by a repetition of the circular contractions. The movements which these contractions impress upon the food are described by Dr Beaumont in the following terms: 'The food entering the cardiac end of the stomach, *c*, turns to the left, descends into the splenic extremity, *s*, and follows the great curvature towards the pyloric end, *d*. It then returns in the course of the smaller curvature, and makes its appearance again at the cardiac aperture in its descent into the great curvature to perform similar revolutions. These revolutions are effected in from one to three minutes.' This account, given by Dr Beaumont, is based on the observations which he made in the stomach of Alexis St Martin, a Canadian, with a fistulous opening into the stomach, whose case is referred to in the article DIER. Dr Brinton, however, adopts a modified view, which is probably the correct one. He supposes that the semi-fluid food entering at *c* (fig. 3), the cardiac

Fig. 3.

Diagram to shew the general direction of movement impressed on the semi-fluid food in the stomach.

*aa*, the hemispherical or surface current, carrying the semi-fluid food towards the closed pylorus, where it is reflected into *b*, the central current, which unites the cardiac (*c*) and pyloric (*d*) openings.

orifice, goes in the directions marked *a*, partly along the greater, and partly along the lesser curvature; and that these two currents of food meet at the closed pylorus, when they are both reflected into the direction *b*, forming a central or axial current, occupying the real axis of the stomach which unites the two apertures. The mutual interference of these currents at their borders causes a uniform admixture of the various substances composing them, while the reflection of the upper and lower currents into one another insures an equal contact of all the mass with the secreting surface of the mucous membrane.

The changes in the mucous membrane are mainly the following: The inner surface of the healthy fasting stomach is of a paler pink tint than after the introduction of food, and while in the latter case the reaction of the moisture on the surface is very acid, in the former it is neutral, or even alkaline. Dr Beaumont found (in the case of Alexis St Martin) that, on the introduction of food into the stomach, the vessels of the mucous membrane became more injected, and that its colour became changed from a pale pink to a deep red. A pure colourless and slightly viscid fluid, with a well-marked acid reaction, was then observed to distil from the surface of the membrane, and to collect in drops, which trickled down the walls, and mixed with the food.

That the *gastric juice*, which is the term applied to the acid fluid which Dr Beaumont saw exuding from the mucous membrane, and which is secreted or formed in the gastric tubes which we have already described, is capable of exerting a solvent action on food, is proved by numerous experiments. It was first ascertained by Reaumur (1752), who obtained some of this fluid by making animals swallow sponges with a string attached, by which he could withdraw them. He thus shewed that alimentary substances out of the body were altered by this fluid in the same manner as they are changed in the stomach, and disproved the favourite theory of that period, which ascribed all the changes which the food underwent in the stomach to a species of trituration. The subject of *artificial digestion*, or digestion out of the body, has, since that period, been carefully investigated by many observers, and there is now no doubt that the changes which the food undergoes in the stomach are essentially chemical, and not mechanical.

Two years before Beaumont's experiments, Dr Prout had ascertained not only that an acid fluid is secreted by the gastric mucous membrane of rabbits, hares, horses, dogs, &c., during digestion, but that the acid is the muriatic or hydrochloric acid, and it was supposed that the solvent action of the gastric juice was due to this source. But experiments shewed that the solvent action is not due simply to the acid of the gastric juice, and that the latter must contain some other ingredient which, either alone or in combination with the acid, can exercise this power. It was then discovered that the addition of a portion of the gastric mucous membrane to water acidified with hydrochloric acid produced a perfect digestive fluid, due attention being paid to the temperature, which should be kept at about 100°, or about the normal temperature of the interior of the animal body. Later observations shewed that we can obtain from the gastric mucous membrane the special organic matter on which its digestive power depends, and to this substance the name of *pepsine* has been given. The two essential elements of the gastric juice are then: 1. A free acid, which in some cases seems to be hydrochloric alone, and in others a mixture of hydrochloric and lactic acids; and 2. An organic matter, which is found on analysis to be highly nitrogenous, and to be allied to the albuminates, and which we term pepsine. The best analysis of human gastric juice is that made by Schmidt of Dorpat, who, in 1853, had an excellent and rare opportunity of examining it in the case of an Esthonian peasant, Catharine Kütt, aged 35 years, and weighing about 118 lbs., in whom there had existed for three years a gastric fistula or opening, three or four lines in diameter, under the left breast, between the cartilages of the ninth and tenth ribs. The introduction of dry pease and a little water into the stomach, through the opening, occasioned (even in the morning, on an empty stomach) the secretion

of from five to seven ounces of a clear limpid fluid with an acid reaction, which, however, was much less strong than Schmidt had observed in previous experiments on the gastric juice of dogs and sheep, in which he had artificially established similar fistulous openings. The following table gives the mean of two analyses of the gastric juice of Catharine Kütt, with corresponding mean results of the same fluid in the sheep, a purely herbivorous animal, and in the dog, a purely carnivorous animal.

	Human Gastric Juice.	Sheep's Gastric Juice.	Dogs' Gastric Juice.
Water,	994.40	986.15	971.17
Solid constituents,	5.60	13.85	28.83
Pepsine,	3.20	4.20	17.51
Hydrochloric acid,	0.20	1.56	2.70
Chlorides of sodium, &c.,	2.08	6.00	5.81
Phosphates,	0.12	2.09	2.71

The only impurity that could affect these analyses, is the saliva that possibly might have been swallowed.

The quantity of the gastric juice secreted in 24 hours was determined by Bidder and Schmidt (*Die Verdauungs-säfte*, &c.) in the sheep to be  $\frac{1}{4}$ th, and in the dog  $\frac{1}{10}$ th of the weight of the body. If the latter ratio were true for men, a man of ten stone weight would secrete about 14 lbs. of this fluid daily. In the case of Catharine Kütt, the mean daily quantity amounted to no less than 31 lbs., or to more than a fourth part of the weight of her body. On this calculation, a man of ten stone would daily secrete 37 lbs. of gastric juice.

The uses of this fluid in reference to digestion are clear. It serves not only to dissolve, but also to modify the nitrogenous elements of the food (such as albumen, fibrin, casein, and, in short, all animal food except fat, and the blood-forming portion of vegetable food), converting them into new substances, termed *peptones*, which, although they coincide in their chemical composition, and in many of their physical properties, with the substances from which they are derived, differ essentially from them in their more ready solubility in water, and in various chemical relations. Thus, albumen is converted by the gastric juice into albumen-peptone, fibrin into fibrin-peptone, &c. According to the recent investigations (1859) of Meissner, the albuminates are simultaneously decomposed or broken up into peptones and substances which he terms *parapeptones*, which latter are not further changed by the action of the gastric juice, but are converted into peptones by the action of the pancreatic juice, with which they come in contact in the duodenum.

All the best observers agree that the gastric juice exerts no apparent action on the non-nitrogenous articles of food—namely, the fats and the carbohydrates (sugar, starch, &c.); as, however, the fats exert a favourable influence on the digestion of nitrogenous matters, it is probable that they undergo some slight, although not appreciable, modification. Gelatine and the gelatinous tissues are, as far as is known, the only nitrogenous articles of food which are not converted into peptones and parapeptones by the action of the gastric juice.

Although the main object of the gastric juice is to dissolve the albuminates, &c. (e. g., the contents of the egg, flesh, cheese, &c.), it appears from the experiments of Lehmann, Schmidt, and others, that it cannot dissolve the quantity necessary for the due nutrition of the organism. According to Lehmann, gastric juice can only dissolve  $\frac{1}{37}$ th of its weight of coagulated albumen, while Schmidt makes the quantity as low as  $\frac{1}{35}$ th. Now, since a dog secretes about  $\frac{1}{10}$ th of its weight of gastric juice daily, it would only be able—even taking Lehmann's estimate, which is more than twice as high as Schmidt's—to digest 5 parts of dry or coagulated albumen

for every 1000 parts of its weight; but a dog, in order to keep in condition on an exclusive flesh diet—and this is its natural food—should take 50 parts of flesh, containing 10 parts of dry albuminates, for every 1000 parts of its weight. Hence its gastric juice only suffices for the digestion of half the albuminates necessary for nutrition—a result which is in accordance with the observed fact, that a considerable portion of the albuminates enters the duodenum in an undissolved state, and which will be explained when we consider the part which the intestinal juice—the fluid secreted by the various glands lying in the mucous membrane of the small intestine—takes in the digestive process. On comparing the experiments made on dogs with those made on Catharine Kütt, it appears that in the human subject the gastric digestion of the albuminates is much more imperfect than even in the dog.

The process of gastric digestion is slow. According to Beaumont's researches on Alexis St Martin, the mean time required for the digestion of ordinary animal food, such as butcher's meat, fowl, and game, was from two hours and three-quarters to four hours.

The next point to be considered is: What becomes of the matters that are thoroughly dissolved in the stomach? Are they absorbed, without passing further down the canal? or do they pass through the pyloric valve into the duodenum, and are they finally taken up by the lacteals? Two of our highest authorities in physiological chemistry, Frerichs and Donders, maintain that the absorption of the peptones commences in the stomach; but the view generally adopted is, that the albuminates, &c., which are converted into peptones, are for the most part taken up by the lacteals. The rapidity with which aqueous solutions of iodide of potassium, the alkaline carbonates, lactates, citrates, &c., pass into the blood, and thence into the urine, saliva, &c., shews that the absorption of fluids must take place very shortly after they are swallowed, and there is little doubt that the blood-vessels (capillaries) of the stomach constitute the principal channel through which they pass out of the intestinal tract into the blood. As the veins of the stomach, which are formed by the union of these capillaries, contribute

Fig. 4.

The under surface of the stomach and liver, which are raised to shew the duodenum and pancreas.

*st*, stomach; *p*, its pyloric end; *l*, liver; *g*, gall-bladder; *d*, duodenum, extending from the pyloric end of the stomach to the front, where the superior mesenteric artery (*sm*) crosses the intestines; *pa*, pancreas; *sp*, spleen; *a*, abdominal aorta.

to form the portal vein (see CIRCULATION, ORGANS OF), the absorbed matters pass directly to the liver, and probably stimulate it to increased secretion (fig. 4).

6. We must now follow the progress of the semi-fluid mass known as the *chyme*, from the stomach into the small intestine, and notice the changes

which are collectively impressed upon it, and are known as *chylification* or intestinal digestion. But before we can satisfactorily do this, we must say a few words regarding the intestinal mucous membrane, with its various glands, &c., and on the changes which take place in it during digestion.

The mucous membrane of the small intestine resembles that of the stomach in so far as it is of considerable thickness, and consists in a great measure of laterally grouped tubes. The reader is referred to fig. 5, which exhibits a section of the mucous membrane of the small intestine in the dog. These tubes, which form the great mass of the middle portion of the section marked *b*, are commonly called the *follicles of Lieberkuhn*, although they were first described by Brunner. They are straight, nearly uniform in diameter throughout their entire length, and are parallel to one another, and perpendicular to the inner surface of the small intestine on which they open. Nothing is known of the exact nature of their secretion; but in association with the secretions of other glands, they combine to yield the intestinal juice whose characters and uses will shortly come under our notice.

The projecting bodies marked *a* in the figure are termed the *villi*; they are minute processes of the mucous membrane of the small intestine, and obviously serve to increase to a great extent the amount of absorbing mucous membrane. They first appear in the duodenum, where they seem to develop themselves as elongations of the partitions between the cells or pits into which the tubes open. Comparatively scanty in number at first, they become very numerous (covering the whole surface) in the further part of the duodenum and the rest of the small intestines, giving to the mucous membrane a velvet-like or pilous appearance; they finally cease at the ileo-cæcal valve, which forms the boundary between the small and large intestine. In man, they are conical in shape, and measure from  $\frac{1}{16}$ th to  $\frac{1}{8}$ th of an inch in length. They vary much in shape and size in the lower mammals and in birds. (In carnivorous animals, as the dog, they are longer and more filiform than in man.)

The structure of a villus (fig. 6) is somewhat

Fig. 5.

complicated, but we must endeavour to explain it, because, without tolerably accurate knowledge on this point, no one can understand how most of the essential elements of food (the albuminates and fatty matters) make their way from the intestine to the blood. Each villus is provided with an abundant set of capillaries, which doubtless absorb fluid matters, which thus find their way directly from the bowels into the blood (fig. 7). A single artery enters its base,

Fig. 7.

Vertical section of the coats of the small intestine, shewing the capillaries and the beginnings of the portal vein. The arteries are not seen, not having been penetrated by the injection which has been thrown into the portal vein.

a, vessels of the villi; b, those of the tubes or follicles of Lieberkuhn; c, those of the muscular coat.

and passing up its centre, divides into a capillary plexus, which almost surrounds the villus immediately beneath the mucous membrane. From these arise small veins, which usually pass out of the villus in two, three, or more trunks, and contribute to form the portal vein. See CIRCULATION.

The villus also contains in its interior one or more *lacteals*, which are vessels with club-shaped closed extremities, which absorb the chyle from the intestine. Their milk-white appearance, when they are filled with chyle, suggests the origin of their name. The tissue which occupies the cavity of the villus, in which the lacteals are imbedded, and which supports the capillary plexus, is in a great measure made up of nuclei and granules, except at the free extremity, where a vesicular structure, resembling very minute fat globules, is apparent.

There is abundant evidence that the function of the villi is connected with absorption, and mainly with the absorption of chyle. 1. The villi exist only in the small intestine, where the absorption of food goes chiefly on. 2. They are most developed in that part of the intestine where chyle is first formed. 3. They are turgid, enlarged, and opaque during the process of chylification, and small and shrunken in animals that have been kept fasting for some time before death.

In addition to the villi, the mucous membrane of the small intestine presents numerous transverse folds, which are termed the *valvulae conniventes*, from their valvular form and from their movements under water resembling the winking motion of the eyelids (fig. 8). Each fold passes round three-fourths or more of the gut; and in the lower part of the duodenum, and in the jejunum (the parts in which they are most fully developed), they are often more than half an inch in depth;

further on, they diminish in depth, length, and number, and in the lowest part of the ileum they can scarcely be traced. Their object clearly is to increase the extent of the absorbent mucous membrane.

In addition to Lieberkuhn's follicles or tubes, which exist in the whole of the small intestine, there are other glandular or secreting structures, imbedded in the submucous tissue of certain portions of the intestinal tract, which require consideration. These are: 1. Brunner's glands, which occur only in the duodenum; 2. Solitary glands, which seem to occur in all parts of the intestine, both small and large; and 3. Peyer's glands, which are usually confined to the ileum.

*Brunner's glands* are most abundant at the pyloric end of the duodenum. In structure, they resemble the pancreas, their ultimate elements being bunches of vesicles, from which minute ducts arise, which coalesce and form larger ducts, through which the secretion is poured into the duodenum. It is believed that they secrete a fluid similar to the pancreatic juice. The *solitary glands* occur in all parts of the intestine, but are perhaps more numerous in the jejunum than elsewhere. Each gland is a simple membranous flask-shaped vesicle, the neck corresponding to the surface of the intestine, while the rounded base lies in the submucous tissue. The neck presents no opening, and how the contents, which consist of nuclei and granular particles, are discharged into the intestine, is not clearly known. As we never see them larger than a mustard-seed, we may presume that, on attaining that size, they burst. *Peyer's glands* (fig. 9) are apparently mere

Fig. 8.

Vertical section through a patch of Peyer's glands in the dog. a, villi; b, tubes of Lieberkuhn; c, submucous tissue, with the glands of Peyer imbedded in it; d, muscular and peritoneal coats; e, apex of one of the glands projecting among the tubes.

aggregations of solitary glands, forming oval patches in the ileum. These patches vary in size and number, being largest towards the caecum, where their long diameter sometimes measures three or four inches, and smallest towards the jejunum; while their number varies from fifteen to twenty, or even more. Nothing certain is known regarding the uses of these solitary or aggregated glands; but as they

are largest during the digestive process, we must infer that they are in some way connected with that function. Possibly, the peculiar odour of the feces may be due to their secretion. In typhoid or enteric fever, and in phthisis, these glands become ulcerated, which probably occasions the diarrhoea so common in these diseases.

Brunner's glands are much more developed in the herbivora than in the carnivora; Peyer's, on the other hand, are most developed in the latter.

We have endeavoured, in the preceding sentences, to give the reader some idea of the complicated structure of the mucous and submucous coat of the small intestines; we now proceed to notice the chief uses of the muscular coat of the intestine. This coat, as has been already mentioned, consists of two layers of muscular fibres—namely, circular and longitudinal fibres, of which the former lie next to the submucous coat. The peristaltic or vermicular action by which the substances which enter the duodenum from the stomach are moved onwards, is due to this muscular coat. A person who has once seen the abdomen of an animal laid open immediately after death, will have a better idea of the nature of this movement than can be afforded by any description. It commences about the pyloric third of the stomach, from whence successive wave-like movements are propagated through the entire length of the intestinal canal. It is the rapid succession of these alternate contractions and relaxations that impels the intestinal contents onwards, and occasion those movements which, from their resemblance to the writhings of a worm, have been termed *vermicular*. It is very probable that the rapidity of this movement varies in different individuals—those persons, for example, whose bowels act twice daily having a more rapid vermicular motion than those in whom the act of defecation occurs only once in the twenty-four hours.

We have now to consider the effects produced on the chyme by the different fluids with which it becomes mixed in the small intestine. These fluids are: 1. The bile; 2. The pancreatic juice; and, 3. The intestinal juice.

The bile (see BILE) is a faintly alkaline or neutral fluid, containing two essential constituents, one of which is of a resinous nature, while the other is a pigment. The resinous constituent is not precisely identical in all kinds of bile, but it generally consists of a soda-salt whose acid is either glyco-cholic or tauro-cholic acid (q. v.), or of a mixture of these salts. Strecker, to whom we are mainly indebted for our knowledge of the chemistry of the bile, states that in most mammals the resinous constituent merely differs in the varying proportions in which the taurocholates and glycocholates are intermixed, the former usually preponderating. According to Lehmann, the resinous constituent amounts to at least 75 per cent. of the solid residue. The bile-pigment occurs in the bile of different animals under two forms—namely, as a brown and as a green pigment, the latter probably only differing from the former in being more highly oxidised. There has never been a case in which physiologists have had an opportunity of directly observing the quantity of bile that is secreted by the human subject, and all our information on this subject is derived from observations on animals, in which the *ductus choledochus communis* (see LIVER) has been tied, and a fistulous opening established into the gall-bladder. If the same proportion of bile to bodily weight holds good in man as in the dog, a man weighing ten stone would secrete daily about five pounds of bile. All observers agree, that the amount of the biliary secretion varies directly with the quantity of food; and as animals with biliary fistula (in whom all the

bile escapes externally, instead of making its way into the duodenum) usually have voracious appetites, experiments on this point are easily made. There is great discrepancy of opinion as to how soon after a meal the bile flows most abundantly into the intestine. According to Kölliker and Müller, whose experiments were made on dogs fed only once a day, very little bile is secreted in the first and second hour after a meal; more in the third, fourth, and fifth; the maximum being sometimes attained in the fifth, sometimes not till the eighth hour.

Numerous and somewhat discrepant views have at different times been advanced regarding the functions of this fluid; we shall here only notice those functions which are connected with digestion. One use that has been ascribed to it, is to neutralise in the small intestine the acid chyme which emerges from the stomach. But the bile can contribute little or nothing to the neutralisation of the free acid, because, in the first place, the bile is very slightly alkaline, and often perfectly neutral; and secondly, because the chyme in the intestine is still acid after the admixture of the bile. Again, the bile has been asserted to possess a special solvent action on the chyme; but none of the ordinary constituents of the latter seem to be essentially changed, even when digested for a long time with fresh bile. Again, much importance has been attached to the antiseptic action of the bile on the contents of the intestinal canal, in favour of which view it is alleged that when no bile is poured into the intestine, the feces have a putrid odour, as is sometimes observed in patients with jaundice, and as was noticed by Frerichs in animals in which the *ductus choledochus* had been tied. Another use that has been assigned to the bile is, that it exerts a stimulating action on the intestinal walls, and thus acts as a natural purgative; and in support of this view, it may be mentioned that jaundice (in which the bile does not flow into the intestine) is often accompanied by extreme constipation, and that purified ox-gall, taken either in the form of pill or enema, produces an undoubted purgative action. But the main use of the bile seems to be to promote the digestion of fatty matters, and it accomplishes this end not so much by any solvent chemical action on the fats (which at most is extremely slight), as by a peculiar physical action both on the fats and on the intestinal walls, disintegrating the former, and impressing on the latter (by moistening the villi) a peculiar condition which singularly facilitates the absorption of fatty matters. This view is fully confirmed both by direct experiments out of the body, and by comparing the relative qualities of fat that are retained in the body and applied to the purposes of life by animals with biliary fistulous openings, and by healthy animals.

The pancreatic fluid which is poured into the duodenum at the same spot with the bile (see fig. 1), is a colourless, clear, somewhat viscid and ropy fluid, devoid of any special odour, and exhibiting a strong alkaline reaction. This fluid, as yielded by different dogs with permanent fistulous openings, varies considerably in chemical composition; the collective solid constituents ranging from 1.5 to 2.3 per cent., the organic matters from 0.9 to 1.6, and the mineral matters from 0.62 to 0.75.

The most abundant and important of the solid constituents is a peculiar substance termed *pancreatine*, or pancreatic diastase or ferment, in combination with soda, to which this fluid owes its principal chemical and physiological properties. Calculating from the quantity of pancreatic juice secreted by dogs of known weight, we may infer that a man weighing ten stone secretes daily about ten pounds of this fluid.

One of the chief uses of the pancreatic juice in relation to digestion, is to convert into sugar the amylaceous or starchy matters which have escaped the action of the saliva, and have passed unchanged into the duodenum. It possesses this property in a far higher degree than the saliva; and, as might be expected in reference to this use, the pancreas is found to be much more developed in herbivorous than in carnivorous animals. Bernard, the representative of the modern school of physiology in France, claims for this fluid another important function; he believes that he has proved that it is solely by the action of this secretion that the fat is reduced to a condition in which it can be absorbed and digested; that is to say, that it is decomposed into glycerine and a fatty acid. See FATS. This view has, however, not been generally accepted, and it seems probable that although the change described by Bernard takes place when fat and pancreatic juice are simply mixed together in a test-tube, it does not actually take place in the intestine, the acid gastric juice probably acting as an interfering agent. An attempt has lately been made by Corvisart and Meissner to prove that, like the gastric juice, this fluid can dissolve albuminous matters; but this view cannot be substantiated. Considering the large quantity of pancreatic fluid which is yielded in 24 hours, Schmidt, who has made the digestive juices the subject of his special study, is of opinion that the function of this fluid is not so much to promote the conversion of starch into sugar, as for the purpose of diluting the chyme, and for reconvertng the soda (which in the pancreas has been separated from the chlorine of the chloride of sodium, and has combined with the pancreatic) into chloride of sodium. He shews, from numerical calculations, that more than half of the chloride of sodium existing in the blood which circulates through the pancreas, is broken up into hydrochloric acid and soda, of which the former is separated by the gastric glands, while the latter unites with the pancreatins. Meeting again in the duodenum, the hydrochloric acid and the soda reunite, and re-form chloride of sodium, which is again absorbed, and re-enters the circulation. This is perhaps one of the most singular decompositions and reunions occurring in the animal body.

Of the last of the fluids poured into the intestine, and co-operating in the digestive process, the *intestinal juice*, we know comparatively little. It is the aggregate secretion of the various glands which we have described as occurring in the walls of the small intestine. It is a colourless, or sometimes yellowish, ropy, viscid fluid, which is invariably alkaline. We are not aware of any special or characteristic constituent in it, such as occurs in the other chyliferous fluids. Its daily quantity is probably nine or ten ounces. It seems to unite in itself the leading properties of the pancreatic and gastric juices; that is to say, it resembles the former in converting starch into sugar, and the latter in dissolving flesh and other albuminous bodies.

We shall conclude this part of the subject with a few remarks on the chemical composition of the contents of the small intestine. On laying open the gut, we usually find a semi-solid admixture of imperfectly digested and indigestible substances and of the constituents of the digestive fluids in a more or less changed condition. The reaction of this mass varies in different parts of the canal, and in some measure with the nature of the food. Thus, the contents of the stomach always reddens litmus paper, whatever kind of food has been taken; the duodenal contents are also always acid, but in a far less intense degree; in the jejunum we meet with only a faint acid reaction, which altogether

disappears in the ileum; while in the cæcum, and sometimes in the lower part of the ileum, an alkaline reaction occurs. After a purely flesh diet the acid reaction disappears shortly below the duodenum, while after the sole use of vegetable food, it may sometimes be traced even to the cæcum. As a general rule, the contents of the large intestine are alkaline.

In consequence of the rapid absorption that goes on along the intestinal surface, we meet with a comparatively small amount of soluble matters in these contents. Among these soluble matters we often find glycose (or grape-sugar), which seems to owe its origin to the metamorphosis of starch, and not to sugar having been present in the food; for after saccharine food has been taken, we rarely meet with it in any quantity in the small intestine, its absorption taking place with great rapidity. In the alcoholic extract of these contents we can almost always find evidence of the presence of biliary constituents. In the duodenum, and for a little way beyond it, we find glyco-cholic and taurocholic acid; descending a little further, they rapidly diminish, till we find the products of their disintegration; while in the large intestine, little more than a trace of these products can be detected. These chemical observations confirm the experiments of Schmidt, which shew that nearly half the bile which is poured into the duodenum is decomposed before it reaches the middle of the small intestine.

7. We have now arrived at the seventh stage of the digestive process, that of *defæcation*. The line of demarcation between the small and large intestine is very obvious, and by the peculiar arrangement of the ileo-cæcal valve (see fig. 10), matters are allowed to pass forward with facility, while regurgitation is impossible. For anatomical details regarding the large intestine, we may refer to the articles ALIMENTARY CANAL, CÆCUM, and COLON. The contents of the large intestine differ very materially from those which we have been considering in the last paragraph, and constitute the feces. They are more solid and homogeneous, and are often moulded into a definite shape by the cells of the colon. The only essential change which the contents undergo in this part of their course is, that they increase as they pass onward in solidity, in consequence of the absorption of fluid from them by the mucous membrane. They are propelled forward into the rectum by the vermicular action which has been already described. Here they accumulate, being prevented from escaping by the contraction of the sphincter muscle—a band of strong muscular fibres surrounding and closing the gut at its lower extremity. The act of defæcation, or of expulsion of the feces from the rectum, is effected partly by the muscular fibres of that part of the intestine which are stimulated to

Fig. 10.

Cæcum inflated, dried, and opened to shew the arrangement of the valve.

increase as they pass onward in solidity, in consequence of the absorption of fluid from them by the mucous membrane. They are propelled forward into the rectum by the vermicular action which has been already described. Here they accumulate, being prevented from escaping by the contraction of the sphincter muscle—a band of strong muscular fibres surrounding and closing the gut at its lower extremity. The act of defæcation, or of expulsion of the feces from the rectum, is effected partly by the muscular fibres of that part of the intestine which are stimulated to

## DIGESTION.

contraction by a certain degree of distension, and which are to a certain extent under the influence of the will, and partly by the simultaneous contractions of the abdominal muscles and of the diaphragm, which, by reducing the antero-posterior and transverse diameters of the abdominal cavity, compress the intestinal canal in such a manner as greatly to assist the expulsive action of the rectum. These forces, or some of them (for usually the detrusive action of the muscular fibres of the rectum is sufficient), overcome the passive contraction of the sphincter, and the act of defecation is the result.

The feces consist of a mixture composed of undigested particles of food (such as vegetable cellular tissue, fragments of tendon, skin, and half-digested muscular fibre), of epithelium and mucus (derived from the intestinal walls), and of traces of decomposed biliary matters. Their peculiar odour is ascribed by some to the secretion of Peyer's glands, and by others to decomposed bile; while Liebig refers it to a decomposition of albuminous matters, founding his view upon the fact, that by burning albumen with potash, he could manufacture in the laboratory odours of a fecal character. The last is the least probable view. Their colour varies with the food. On a mixed diet, they are of a yellowish-brown tint; on a flesh diet, much darker; and on a milk diet, quite yellow—and they become darker on exposure to the air. Their reaction is most commonly but not invariably alkaline. Their daily quantity is very variable; the mean of 17 observations made by a German physiologist, Wehsarg, was about 4.6 ounces, of which very nearly one ounce was solid matter, the rest being water; the largest and the smallest quantities being ten, and rather more than two ounces. Liebig, many years ago, made the observation that the insoluble salts of the food are mainly carried off by the feces, while the soluble salts are for the most part eliminated by the urine. For further details on the chemistry of this subject, we must refer to the elaborate Memoirs of Dr Marcet, published in the *Philosophical Transactions*.

8. The absorption of the chyle forms the completion of the digestive act. The coats of the intestines contain two perfectly distinct sets of vessels—one through which blood circulates, and the other containing a milky or transparent fluid, chyle or lymph, which, after a somewhat circuitous route, is poured into the blood. We have already referred to the fact, that fluids are absorbed from the stomach and intestine by the veins and capillaries of the mucous membrane; we now proceed to notice the mode in which the vessels of the second kind, the lacteals, act as absorbing agents. The lacteals are merely a portion of the great lymphatic system of the body, which will be described in a future article. See LYMPHATICS. They commence, as has been previously mentioned, in the villi, and possibly also in the intervening mucous membrane; and when an animal is killed while the digestive process is going on, they have, in consequence of their being distended with chyle, the peculiar white or milky appearance which procured for them their name of *vasa lactea*, from their discoverer, Asellius, in 1622. They pass in great numbers, and in a reticulated arrangement, between the layers of the mesentery, the portion of Peritoneum (q. v.) which surrounds the gut, and retains it in its proper position. After passing through the mesenteric glands, where their contents seem to become more highly organised, they make their way to the right side of the aorta in the lumbar region, where they finally discharge themselves into an elongated pouch, termed the *receptaculum chyli*. From this pouch, the thoracic duct, containing the chyle, passes upward along the vertebral column till it reaches the level of the arch

of the aorta, behind which it runs to the left side, and discharges its contents into the subclavian vein, close to its origin with the internal jugular, its orifice being protected by two valves. The nature of these contents has been already described in the article CHYLE. This chyle is, in reality, incipient blood, which has been formed, as we have already seen, from the food, and has been absorbed from the intestine by the lacteals. We have now traced it to its entrance into the general circulation, and it only remains for it to pass, in conjunction with the venous blood with which it is mixed, through the lungs, in order to be converted into new and perfect arterial blood, fit for the highest processes of organisation.

We shall conclude this article with a notice of some of the most striking peculiarities presented by the digestive organs in the lower animals.

In the mammalia, we have three different forms of stomach—the *simple*, the *complex*, and the *compound*. In the *simple* form, the organ consists of a single cavity, as in man, but the form may vary to a great extent. It is most simple and relatively smallest in carnivorous animals. This is the most common form of mammalian stomach. In the *complex* stomach, that viscus is made up of two or more compartments communicating with one another, but often without presenting any marked difference of structure. The kangaroo, the porcupine, and the squirrel, afford good examples of this form of stomach. In the cetacea, the stomach consists of from five to seven cavities, that communicate with each other; but whether their functions are similar or different is not known. The *compound* stomach occurs in the ruminants (the cow, sheep, camel, &c.); it consists of four distinct cavities, differing very materially in their size, and in the arrangement and structure of the lining mucous membrane (see fig. 11). The first, and by far the largest cavity, is

Fig. 11.

Compound stomach of ox.  
*a*, oesophagus; *b*, rumen, or paunch; *c*, reticulum; or second stomach; *d*, omasum, or third stomach; *e*, abomasum, or fourth stomach; *f*, the duodenum.

Fig. 12.

Alimentary canal of fowl.  
*a*, oesophagus; *b*, crop; *c*, proventriculus, or secreting stomach; *d*, gizzard, or triturating stomach; *e*, intestinal canal; *f*, two long cecal tubes indicating the theoretical commencement of large intestine.

the paunch or rumen, *b*; it occupies a great part of the abdominal cavity, and is the receptacle into which the food is received when first swallowed. The second cavity is termed (from the peculiar

arrangement of the lining membrane, which forms deep polygonal cells) the honey-comb or *reticulum*, *c*. The third cavity presents a foliated appearance internally, and is hence popularly known as the manyplies, *d*. In anatomical works, it is sometimes termed the *psalterium*, and sometimes the *omasum*. The fourth division, termed the reed or *abomasum*, *e*, is somewhat of a pyriform shape, and is the true digestive stomach, in which alone gastric juice is secreted, all the preceding cavities being merely for the purpose of preparing the food for the more essential changes which it is here destined to undergo. The food first passes in a crude unmaasticated state into the paunch, which, like the crop of birds which we shall presently notice, serves as a receptacle for the food until the act of feeding is concluded, and moistens it with the fluid secreted from its walls. The water, however, which the animal drinks, seems to pass directly into the second stomach. During rumination, small portions of the food pass from the paunch into this second stomach, from whence they are returned, in the form of pellets, to the mouth, where they undergo thorough mastication, and are then returned, as a pulp, by the œsophagus directly into the third stomach. The direction of the food into one or other of these cavities is altogether independent of the will, and results from a peculiar arrangement and property of the lower end of the œsophagus, which does not terminate at its opening into the paunch on one side, and the second stomach on the other, but is continued onwards as a deep groove or semi-canal, with two lips. If these lips come in contact, they form a perfect canal, leading directly to the third stomach; while if they remain open, the food passes into the first or second stomach. The dry food first swallowed opens the lips and escapes into the paunch, while the masticated food, being soft and pulpy, passes along the groove, without opening its lips, into the third stomach. Here it is diffused over a large surface of mucous membrane, and doubtless undergoes certain changes before entering the fourth or true stomach. In the camel, the dromedary, and the llama, numerous rows of large quadrangular deep water-cells are developed on the parietes of the second stomach, and on the part of the paunch next to that cavity. These cells are surrounded by muscular fibres, which, by their contraction, exclude the food from their interior, and by their gradual opening, the water is allowed to mix in successive small quantities with the food. It is by this arrangement that these animals only require to drink at comparatively long intervals. The intestinal canal of the ruminants is of great length, being sometimes, as in the sheep, more than thirty times the length of the body of the animal; and in herbivorous animals generally, as compared with carnivorous, the canal is very long.

It is in the large intestine that, next to the stomach, we find most varieties of structure. Cuvier has given the following *résumé* of the principal facts connected with this subject, to which, however, there are numerous exceptions. 1. In man, the oranges, and the wombats, there are both cœcum and vermiform appendix. 2. In the other quadrupeds, the digitate carnivora, the marsupialia, the rodentia, the pachydermata, the ruminantia, the solipeds, and the amphibious mammals, there is a cœcum (often in vegetable-feeders larger than the stomach, and probably subservient to the digestive process), but no vermiform appendix. 3. In the edentata, the plantigrade carnivora, and the cetacea, there is neither cœcum nor vermiform appendix.

In birds, as in all other classes of animals, the alimentary canal varies according to the nature of the food, being long and capacious, and in some

parts highly muscular, in the granivorous tribes, while it is much more simple in those which live on fish and other animal food. We take the common fowl as a good example of the former class (see fig. 12). The œsophagus, about the middle of its course, and a little above the union of the clavicles (the furculum), presents an enlargement termed the crop or *ingluvies*, which varies in form and structure according to the food, and is provided with numerous glandular follicles. Just before terminating in the gizzard, the œsophagus again dilates to form a second but smaller cavity, known as the glandular stomach, *proventriculus*, or *ventriculus succenturiatus*, *c*, from whence a copious secretion of gastric juice is poured out and mixed with the food, which, having previously been macerated by the secretion of the crop, now passes on to the gizzard, *d*, which is a muscular organ of immense strength, which grinds and crushes whatever is placed in its central cavity—a process that is facilitated by the presence of hard pebbles, which are instinctively swallowed by the bird, and act the part of millstones. There is no very marked division in birds between the large and small intestine, the theoretical limit being indicated by the presence of two (sometimes only one) cœcal appendages, *f*.

There are no special points that we need notice regarding the digestive organs of reptiles, except that as the ophidians (serpents) and saurians (lizards) are mostly carnivorous, and most of the chelonians (tortoises) are herbivorous, the apparatus in question is more simple in the former than in the latter.

The amphibia afford us an excellent illustration of the close connection between the nature of the food and the development of the intestinal canal. In the young tadpole of the common frog, which lives upon the soft vegetable matter of our fresh-water ponds and ditches, the stomach is narrow and elongated, and the intestine is of extraordinary length, and of nearly equal diameter throughout, being coiled up in a spiral manner, and distending the capacious abdomen. As the tadpole becomes metamorphosed into a frog, it changes its vegetable food for slugs, worms, grubs, flies, &c., and, at the same time, the alimentary canal becomes very much shortened, and its divisions into stomach, &c., more distinctly marked.

In osseous fishes, the alimentary canal is generally shorter and more simple than in the higher vertebrata, in many—as, for example, the herring—being shorter than the body, and, excepting the stomach, running in nearly a straight line through it. In the cartilaginous fishes, as the sharks, rays, &c., a spiral valve winds in close turns from the pyloric to the anal extremity, leaving merely a small central aperture, along which the contents slowly progress. By this singular arrangement, the intestine, although short in proportion to the length of the animal, presents an enormous absorbing surface.

The limits within which we must confine this article, preclude us from noticing the various modifications which the digestive organs present in the various departments of the invertebrate animals; and we shall conclude with a few remarks upon the mode in which digestion is carried on in some of the lowest and simplest animals. The *hydra* or fresh-water polype is a minute animal, consisting of nothing but a bag or stomach, with tentacles surrounding its single orifice. The animalcules, &c., which the *hydra* catches by these lasso-like tentacles (see *HYDRA*), are drawn into the interior, where they are digested, and applied to the nutrition of the organism, the insoluble portions being rejected by the aperture through which they entered. In the *actinophrys sol*, or sun-animalcule, there is no persistent aperture;

but when its radiating filaments—from which it derives its name—have secured a particle of organised matter fit for its nourishment, they twist over it, compress it against the globular body, which first yields, and becomes concave at the point, and finally closes over it, the prey being distinctly visible in the interior. This astomatous animalcule can thus form a mouth and stomach when it requires them. The indigestible remains are ejected by a corresponding reversed process. The *amaba* or *sponge-proteus* neither has a mouth and stomach, nor can it construct these organs: it simply folds itself around the solid particles from which it derives its nourishment, and imbibes their nutritious fluids through its cell-wall. We might adduce various other examples of animals devoid of a stomach, but we have brought forward sufficient evidence to shew that the old doctrine, that this organ is a necessary constituent of an animal, cannot be sustained, when we approach that debatable-land which separates the two great organised kingdoms of nature.

**DIGGING.** The operation of digging is performed with a spade or pronged fork. The spade or fork is thrust in with the foot, and the mass of earth is first loosened by the lever-power of the handle, then lifted and inverted. When this operation is performed in spring or summer, the ground should be dry, so as to obtain pulverisation as easily and to as great extent as possible. In stronger soils, which are dug in autumn, a little moisture is desirable, as the land lies fallow, and the frosts of winter afterwards pulverise and reduce it to a proper degree for receiving the crops in spring. Digging is almost entirely confined to the cultivation of gardens, for though a most efficient means of cultivating the soil, it is too expensive for field-crops. It is almost always resorted to, however, in this country for digging over or trenching land which has been in timber, or full of stones or boulders. Until recently, the spade was the only implement used for digging in gardens, but steel forks are coming rapidly into use, being lighter and more easily driven into the soil. Besides preparing the land for plants, the spade and the fork, chiefly the latter, are used for taking crops, such as potatoes and carrots, out of the ground.

**DIGIT** (Lat. *digitus*, the finger), a term applied to the ten symbols of number, 0, 1, 2, &c. to 9; thus, 305 is said to be a number of three digits. Numbers were originally indicated by the fingers, and hence the name. Astronomers use digit to signify a twelfth-part of the diameter of the sun or moon, and speak of an eclipse of seven digits, meaning that seven-twelfths of the diameter is covered.

**DIGITALINE** is an active principle present in *Digitalis purpurea*, or foxglove.

**DIGITALIS**, a genus of plants of the natural order *Scrophulariaceæ*, natives chiefly of the south of Europe and temperate parts of Asia. One only, the common FOXGLOVE (*D. purpurea*), is a native of Britain, and is very abundant in some parts of the country, its large purple flowers often giving a gay appearance to dry banks and steep hills. It is not unfrequently admitted into flower-gardens, particularly a white-flowered variety. Its English name, and the botanical name *D.* (Lat. *digitale*, the finger of a glove), both refer to the form of its flowers. The central and southern parts of Europe produce several species with yellow flowers, one of which, *D. grandiflora*, is not an uncommon ornament of gardens. *D. purpurea* is much valued in medicine. It was first brought into repute by Dr Withering. Its leaves and seeds are the parts used, generally the former. They are narcotic and poisonous. The leaves have a disagreeable smell when fresh, and a

bitter nauseous taste, and are violently emetic and cathartic; but when dried and administered in small and repeated doses, they are diuretic, and therefore sometimes useful in dropsy; and are still more valuable on account of their sedative power over the action of the heart and the circulation of the blood, and are used in diseases of the heart, aneurisms, hæmorrhages, &c. They appear also to possess some peculiar power over the brain and nervous system, and have been employed in insanity, epilepsy, and other diseases. They are administered generally in the form either of tincture or infusion. They ought to be collected before the flowers expand. They owe their active properties to a peculiar crystalline principle, called *Digitaline* (q. v.). The use of *D.* as a medicine requires great caution on account of a property which it possesses—very remarkable in a vegetable medicine—of cumulative action on the system. Many, if not all of the species of *D.* appear to possess similar properties with *D. purpurea*, and to be capable of being substituted for it.

*Digitalis Purpurea.*

**DIGITARIA.** See MILLET.

**DIGITIGRADA** (Lat. finger-walking), in the zoological system of Cuvier, one of the tribes of the *Carnivora* (q. v.), distinguished by walking on the toes alone, the heel not touching the ground. Among the digitigrade quadrupeds are included the most carnivorous of the *Carnivora*, the feline and canine families, hyænas, civets, weasels, &c. The Weasel family (*Mustelida*), however, forms a connecting link, in respect to the character derived from the mode of walking, between the tribe *D.* and the tribe *Plantigrada* (q. v.), being, in fact, semi-plantigrade, and not walking on the mere tips of the toes, like the other digitigrada.

**DIGNE** (Lat. *Dinia*), a town in the department of the Basses-Alpes, on the Bléonne, 60 miles north-east of Marseille, occupies a picturesque situation upon a mountain slope, and is encircled by walls, but its streets are narrow, crooked, and steep, and the houses mean and squalid. Its chief building is the Prefecture, once the bishop's palace, a very ordinary edifice. The principal manufactures of *D.* are articles of leather, and it has a trade in dried fruits, honey, wax, woollen and linen cloth, kid-skins, &c. In the neighbourhood of *D.* there are several hot saline springs, temperature 104° F. Pop. 3720. Of *Dinia*, which is mentioned by Pliny, nothing remains. It is known that it embraced Christianity at an early period, and has given title to a bishop since the year 340. In the year 1629, a plague reduced the population of *D.* from 10,000 to 1500.

**DIHONG**, or SANPO', the largest feeder of the Brahmaputra, rises on the north side of the Himalayas, near the sources of the Sutlej and the Indus, in lat. 30° 25' N., and long. 82° 5' E., and bursts through that great mountain-chain near lat. 28° 15' N., and long. 95° 10' E., having pursued through Tibet an easterly course of about 1000 miles. Finally, it joins the more easterly branch

of the Brahmaputra, near the north-east angle of Assam.

**DIJON**, a town of France, in the department of Côte d'Or, formerly capital of the old duchy of Burgundy, in lat. 47° 20' N., and long. 5° 2' E., and about 195 miles south-east of Paris by railway. D. occupies a most delightful situation in a fertile plain on the right bank of the Ouche, and at the base of the vine-clad hills which produce the famous Burgundy wines. The environs are exceedingly beautiful. D. is surrounded by lofty walls, pierced for five gates, and the ramparts being tastefully planted with fine trees, furnish very agreeable promenades. The town is for the most part well and regularly built, and the streets spacious and clean. Among the public buildings, which are numerous and imposing, the chief are the cathedral, a massive Gothic structure, dating from the 13th c., with a tall wooden spire, above 300 feet high; the church of Notre Dame, a noble specimen of the purest Gothic architecture; the church of St Michael, with a splendid renaissance front; the theatre, a handsome building, with a fine Corinthian portico; and the palace of the Dukes of Burgundy, now used as the town-hall, and much modernised externally, but possessing interiorly some of its earlier features, and containing a museum very rich in monuments of the middle ages, besides a library of 40,000 volumes, and several hundreds of manuscripts. D. is also the seat of a university academy with three faculties—law, science, and letters—and possesses, in addition, a royal college, a theological seminary, a botanic garden, and an academy of art. The manufactures of D. consist of woollen cloth, blankets, hosiery, leather, vinegar, chemical products, &c.; and there are also salt refineries, distilleries, and breweries; but the town is mainly dependent on its trade in the wines of Burgundy. Pop. 28,567. D. dates from Roman times, its ancient name being *Dibio*. It came into the possession of the Burgundians in the 5th c., and from them passed to the Franks. In the 9th c., it was ruled by counts of its own, under the suzerainty of the bishops of Langres. In the 11th c., it was united to the duchy of Burgundy, of which it became the capital, and the usual residence of the dukes, who rebuilt and greatly enlarged and improved it. D. has thirty establishments engaged in the manufacture of the Liqueur de Cassis, a beverage prepared from the black-currant, and of which, in 1859, it produced 220,000 gallons.

**DILAPIDATION**, in English law, is where an incumbent suffers his parsonage-house or outhouses to fall down, or be in decay, for want of necessary reparation; or pulls down or destroys any of the outhouses or buildings belonging to his living; or destroys woods, trees, &c.; for it is said to extend to committing or suffering any wilful waste on the inheritance of the church.—Stephens's *Ecl. Lav.* Dilapidation is a species of the legal injury known as Waste (q. v.). A rector or vicar is bound to keep his residence and the chancel of the church in repair, but not to supply or maintain anything in the way of ornament, as painting, white-washing, or papering. An ecclesiastical person suffering the church-property to get out of repair, is subject to an action for dilapidation at the instance of his successor (13 Eliz. c. 10, s. 2); and by 14 Eliz. c. 11, s. 18, the money so recovered must be applied to the repairs. By 5 and 6 Vict. c. 108, s. 19, being an act to empower ecclesiastical corporations to grant long leases, it is provided that the incumbent shall not be liable for dilapidation occurring during such leases.

**DILATORY PLEAS.** See PLEA.

**DILEMMA.** A true dilemma is defined by Whately as 'a conditional syllogism with two or more antecedents in the major, and a disjunctive minor.' The following dilemma, of the kind called destructive, will perhaps convey a clearer notion than any definition. 'If this man were wise, he would not speak irreverently of Scripture in jest; and if he were good, he would not do so in earnest; but he does it, either in jest or earnest; therefore, he is either not wise, or not good.' There being two conclusions, one or other of which your opponent must admit, he is in a manner caught between them; hence we speak of the *horns* of a dilemma.

**DILETTANTÉ** (pl. *dilettanti*, Ital.), in its original sense, is synonymous with an *amateur*, or lover of the fine arts. It is often used as a term of reproach, to signify an amateur whose taste lies in the direction of what is trivial and vulgar, or of a critic or connoisseur whose knowledge is mere affectation and pretence. It is sometimes assumed, in a spirit of self-depreciation, by those who are unwilling that their critical acquirements, or artistic productions, should be judged by the rules which would be applied to those of persons who had made a professional study of art. It was in this sense that it was assumed by the Dilettanti Society (q. v.).

**DILETTANTI SOCIETY**, a body of noblemen and gentlemen by whose exertions the study of antique art in England has been largely promoted. The Society was founded in 1734, and held its meetings at the Thatched House Tavern in St James's Street. It was in its beginnings simply an amateur club, its object being to combine social and friendly intercourse with the cultivation of artistic knowledge and the gratification of artistic tastes. But its funds having accumulated to a large amount, its members resolved, in 1764, to fit out an expedition for the purpose of collecting details and drawings of the most remarkable artistic monuments of antiquity. The persons selected for carrying out this important undertaking were Mr Chandler of Magdalen College, Oxford, the editor of the *Marmora Ozoniensis*; Mr Revett and Mr Stewart, the authors of the magnificent work on Athenian Antiquities; and Mr Pars, a talented young artist. Having spent two years in Greece, they returned in 1766, bringing with them the materials for the two splendid volumes on the Antiquities of Ionia, which were published at the expense of the Society. Architecture had been the first object of their inquiries, but their attention was now turned to sculpture, which was then at the lowest ebb in England. A series of the finest antique statues, bas-reliefs, and busts, were selected and engraved with the greatest care. This work appeared in 1809, with dissertations by Payne Knight. In 1811, a second architectural exploring-party was despatched by the Society to Asia Minor, consisting of Mr (afterwards Sir William) Gell, Mr Bedford, and Mr Gandy. Two volumes were issued, one in 1817, entitled *The Unedited Antiquities of Attica*, and a second on *Antique Sculpture* in 1835. For these spirited exertions in their behalf, the public have been indebted to a club of some sixty private gentlemen.

**DILIGENCE**, in the Law of Scotland, is a term used in various significations. 1. It means the care incumbent on the parties to a contract with regard to the preservation of the subject matter. 2. The warrants issued by courts for enforcing the attendance of witnesses and the production of writings. 3. The process of law by which person, lands, or effects are attached either on Execution (q. v.) or in security for debt. In the second of these senses, it corresponds to the English *subpoena*; and in the

third, generally to execution. The first can scarcely be regarded as a technical meaning.

**DILIGENCE**, the name given in France to a public conveyance of the nature of a stage-coach. It is a huge strong built vehicle, with four broad wheels, weighing about five tons, and is drawn by four stout horses, at the rate of about six miles an hour. It consists of three chief compartments: the front, called the *coupé*, for three persons; the second, called the *intérieur*, for six persons; and, lastly, the *rotonde*, entered from behind, for six persons. Aloft, in front, is the *banquette*, where the *conducteur* is seated; and behind this, underneath a thick leather covering, passengers are sometimes huddled among luggage and goods, with little regard to their comfort. All the places in the body of the vehicle are numbered, and assigned in the order of booking. Usually, an effort is made to be booked early, in order to secure corner-places. In booking, it is customary to pay only a portion of the fare, called *arrhes*; the remainder being paid at the end of the journey. For the *arrhes*, a receipt or bulletin ought to be given. Without this security, a traveller may be put down half-way and cheated out of his fare, or he may be compelled to pay over again. The driver being concerned only with the horses, the entire management of the vehicle, including the charge of the drag or break, devolves on the *conducteur*, a trustworthy but most dictatorial personage, dressed in a blue cloth jacket and cap, and having a badge on his breast indicative of his dignity. The greater number of the diligences in France belong to two companies in Paris—the *Messageries Impériales* and the *Messageries Générales*. The system of diligences, however, has been latterly much broken up by railway transit.

**DILL** (*Anethum*), a genus of plants of the natural order *Umbellifere*, having compound umbels without general or partial involucre, the border of the calyx minute but 5-toothed, yellow involute petals, and dorsally compressed lenticular fruit. The COMMON D. (*A. graveolens*) is an annual or biennial plant, which grows wild in cornfields in the East and in the countries around the Mediterranean, but is quite hardy in Britain. It has from a very early period been in general cultivation as an aromatic, stimulant, and carminative. It has a stem 1—4 feet high, bearing at top a flat umbel of 10—30 rays; the leaves much divided, and the final segments thread-like. It has a strong peculiar aromatic smell and taste; the leaves are sometimes used for flavouring pickles, sauces, &c. The fruit (*Dill seed*) is used in medicine, chiefly for relief of flatulence and griping in infants, and is administered in the form of *Dill Water*, in the preparation of which *Oil of Dill* is employed; a pale-yellow essential oil, on which the properties of the plant depend, and which is obtained by distillation.—SOWA D. (*A. Soukt*) is a native of Bengal, and is much cultivated in the East Indies for its fruit, which is variously used in medicine and flavouring. It is a common ingredient in curries. The plant much resembles Common D., but its flavour is stronger.

**DILLENIA'CEÆ**, a natural order of exogenous plants, consisting chiefly of trees, shrubs, or half-shrubby plants, natives of tropical and subtropical regions, allied to the natural order *Ranunculaceæ* (q. v.), but very different in general habit, and also to *Magnoliaceæ*, which in habit they more resemble. They have usually alternate leathery leaves, without stipules. The flowers are sometimes solitary, sometimes in racemes or panicles; the calyx of 5 persistent sepals; the corolla of 5 deciduous petals. The stamens are numerous. The fruit consists of 2—5 distinct or coherent, dry or succulent, carpels.

The seeds have an aril. Astringency is a general property of the order; and a number of species are used as vulneraries and for other medicinal purposes in their native countries. Some species of *Dillenia* are large trees, and afford excellent timber. The young calyces of *D. scabrella* and *D. speciosa* have a pleasant acid taste, and are used in curries, and the fruit of *D. speciosa*, although very acid, is eaten with sugar; the juice, mixed with water, is employed in India as a cooling beverage in fevers. The fruit of *D. elliptica* is used to make a sauce for fish in Amboyna. Many of the plants of this order are remarkable for the magnificence both of their foliage and their flowers. It contains about 200 known species.

**DILMAN**, a town of Northern Persia, in the province of Azerbaijan, 50 miles north-north-west of Urumiyah, and 10 miles west of the northern extremity of the lake of that name. It is of considerable extent, has clean streets, and is surrounded by gardens and orchards. D. is a new town, the former town of the same name, distant about 4 miles, is now in ruins. It is described by St Martin as a very ancient Armenian city, and the large plain in which it was situated is still inhabited by Armenians, Catholics, Nestorians, &c. Pop. of D. estimated at 15,000.

**DILUENTS** (Lat. *diluo*, I dilute), medicines whose purpose is to dilute the blood, and increase the quantity of the excretions generally. The simplest and best of diluents is water; but all watery fluids, such as lemonade, soda-water, beer, infusions or ptisans, tea, &c., may be regarded as coming under this designation. See DEMULCENTS.

**DILUVIUM**, a term formerly given by geologists to those strata which they believed to have been formed by the Deluge, and more particularly to the boulder clay. The altered opinions as to the origin of these beds have caused the word to fall into disuse. When the adjective—*diluvial*—is employed by modern writers, it is to characterise those accumulations of gravel or angular stones which have been produced by sudden or extraordinary currents of water.

**DIME**, the tenth part of a United States dollar (see DOLLAR), and equal to about fivepence English.

**DIMENSION**. In Geometry, a line, whether straight or curved, has only one dimension, or measurement—namely, length; a surface has two—length and breadth; and a solid has three dimensions—length, breadth, and thickness, or depth. These three measurements or dimensions determine all forms of extension.—In Algebra, the term dimension is applied in much the same sense as *degree*, to express the number of literal factors that enter into a term. Thus,  $x^2$ ,  $xy$ ,  $2ab$ , are all of two dimensions, or of the second degree;  $x^3$ ,  $x^2y$ ,  $abc$ ,  $\frac{a^2bc}{d}$ , are of three dimensions, &c.

**DIMINUENDO** (Ital. diminishing), a term in Music, having reference only to the power of the sound, and in no way affecting the *tempo*, as many think. Diminuendo can be applied to a single note, when it is a long note, as well as to a passage of many notes. Diminuendo is so nearly of the same meaning as *decrecendo*, that it is frequently marked with the same sign, thus  $\text{>}$

**DIMINUTIONS**, a word sometimes used in Heraldry for differences, marks of cadency, and brisures, indifferently.

**DIMINUTIVES** are forms of words, chiefly of substantives, in which the primitive notion has become lessened or diminished, as *hillock* = a little hill. With littleness is associated the idea of neatness, and also of needing protection; hence diminutives

are used as terms of endearment; sometimes they imply contempt. There is perhaps no language without diminutives; and the most common method of formation is by the addition of a syllable. This, however, is not the only method; *tip* from *top*, by attenuating the vowel, and *kid* from *goat*, are as genuine diminutives as *hillock*. The commonest of the English diminutive affixes are *ock*, *kin*, *el* or *le*, which are of Gothic origin, and *et* or *let*, of classical origin; as in *bullock*, *lambkin*, *kernel* (little corn), *lancet*. According to Dr Latham, the termination *ling*, or rather *ing*, was originally patronymic; 'Ida was the son of Eoppa,' was expressed in Anglo-Saxon by *Ida was Eopping*. From the notion of the filial relation, the transition is easy to that of littleness and endearment, as in *darling*, *duckling*. Contempt predominates in *shaveling* (a monk) and others.

Diminutives often occur in proper names; *Perkin* is the diminutive of *Peter*, *Jenkin* of *John*. These have settled down into permanent and distinct names; but in the language of fondness and familiarity, *Charles* becomes *Charley*, *John*, *Johny*, &c. In Lowland Scotch, this form of diminutive is not confined to proper names, but is applied to every object, animate or inanimate—*laddie*, *horsie*, *wifie*, *trie*. Sometimes one diminutive affix is joined to another, as *lassock*, *lassockie*; and in expressions like *a wee, wee bit horsie*, the diminution is carried to the fifth degree. It is principally in the mouths of the people and in friendly familiarity that these diminutive forms are most common; and some languages and dialects are rich in them beyond others. Italian is remarkable in this respect, especially the Tuscan dialect: *easa*, house, becomes *casarella*, little house, and *casarellina*, pretty little house; from *fratello*, brother, which is itself a diminutive of the Lat. *frater*, children, it is said, may be heard forming such fond names as *fratellinucciuetto*. The affectionateness and benhomie of the Germans expresses itself largely in this form; *vater*, father, becomes *viterehen*, dear father; and even the pronoun *du*, thou, is made into *ducken*, and *duli*.

Diminutives are not confined to nouns: *whitish* is the diminutive of the adjective *white*; and *tipple*, *scribble*, *dandle* are examples of diminutive verbs. Opposed to diminutives are AUGMENTATIVES, which abound in the Romanic languages, especially in Italian, and express not only largeness, but coarseness and vulgarity; *casotta* is a large house; *aval-laccio*, a worthless horse. Our word *balloon*, which is of foreign origin, is of this form, and means a large ball. Such words as *drunkard*, *braggart*, *buzzard*, seem to be genuine English augmentatives.

DIMITY, a stout figured cotton-fabric, used chiefly for bed-hangings. The figure or stripe is raised on one side, and depressed on the other, so that the two faces present reversed patterns. Dimity is commonly white, or of a single colour; but variegated dimities are now made, the pattern and the ground being of different colours.

DIMORPHOUS (Gr. *dis*, twice; *morphe*, shape or form) is the term applied to a substance when it exhibits the property of crystallising in two distinct forms or systems. See CRYSTALLOGRAPHY. Thus, sulphur, as found crystallised naturally, and as obtained by the spontaneous evaporation of its solution in bisulphuret of carbon, or in chloride of sulphur, presents itself in crystals of the form of octohedra, with a rhombic base, and thus belongs to the *prismatic system*; but when sulphur is heated to fusion, and then slowly cooled, prismatic crystals of an amber colour are obtained, which belong to the *oblique system*. The latter form of sulphur is not permanent, and the crystals gradually become

opaque, and pass into the form of numberless octohedra. In their turn, the octohedral crystals, when kept at a temperature of 230° F. for some time, pass into the prismatic form. Carbon is another illustration of *dimorphism*. Thus carbon crystallises in the diamond in the regular system as the octohedron and allied forms; while in the condition of graphite or Black Lead (q. v.), as obtained by the cooling of its solution in fused cast iron, it is in the form of hexagonal crystals belonging to the rhombohedral system. Carbonate of lime and iodide of mercury are also good examples of *dimorphism*; and some substances, such as the sulphate of nickel, sulphate of zinc, seleniate of nickel, and the seleniate of zinc, crystallise in three different systems, and are thus *trimorphous*.

DINAGEPORE, a city of the sub-presidency of Bengal, with about 30,000 inhabitants, stands 261 miles to the north of Calcutta, in lat. 25° 34' N., and long. 88° 38' E. It is watered by an offset of the Atree, called the Purnabada, which, through the Mahanunda, enters the Lower Ganges from the left. The place is devoid of architectural pretensions.

DINAGEPORE, the district of the above-mentioned city, stretches in N. lat. from 24° 53' to 26° 38', and in E. long. from 88° 2' to 89° 16', containing 3820 square miles, and 1,200,000 inhabitants. The country is flat, its only eminences being mere undulations; and, from the proximity of the Himalayas, the whole tract is little but a net-work of water-courses, many of the channels, however, becoming periodically dry. The winds are more variable than is usual elsewhere in India, and hail-stones are occasionally of such weight as to kill men and cattle. Rice is the principal crop, and fish are singularly plentiful.

DINAN, a very old town of France, in the department of Côtes-du-Nord, on the Rance, 30 miles north-west of Rennes, and 14 south of St Malo. The situation of D., on the summit of a steep hill of granite, and with the Rance flowing through a valley 250 feet below, is romantic in a high degree. It is surrounded by high walls, pierced by four gates, and was formerly defended by a strong castle, part of which has been converted into a prison. In the older district, the streets are crooked, narrow, and steep, many of the buildings being crazy constructions of wood; but in some parts, its overhanging houses, and arcades resting on carved granite pillars, present many picturesque architectural features, attractive to the antiquary and the artist. The cathedral of St Sauveur is a beautiful ornate edifice, built in the Romanesque style, containing the heart of the famous French warrior Bertrand du Guesclin. D. has manufactures of fine linen and of sail-cloth, of cotton and woollen goods, beet-root-sugar, &c. It has also some barge-building yards, and, owing to its position near the mouth of the Rance, has a considerable coasting and inland trade. Pop. 7420. A few miles off lies the village of Corscut, built on the ruins of the capital of the ancient Curiosolite. In the fields round about the village are still occasionally found ancient utensils, Roman coins, and traces of a temple dedicated to Mars.

DINANT, a town of Belgium, in the province of Namur, 14 miles south of the city of that name. It is situated on the Meuse, in the midst of extremely picturesque scenery. The most noteworthy buildings of D. are the church of Notre Dame, an ancient and richly decorated Gothic structure, and the town-house, once the palace of the princes of Liège. D. has several salt-refineries, mills for sawing marble, some quarries of which are worked in the vicinity,

paper-mills, breweries, and tanneries. It has also manufactures of woollen stuffs, paper, hats, cards, and cutlery. The gingerbread of D., composed of rye-flour and honey, is famous, and has an extensive sale. Pop. 6388. D., which dates from the 6th c., has suffered greatly from frequent sieges. In 1466, Philip Duke of Burgundy attacked it with a strong force, and, when the town was taken, in retaliation for the hanging of the messengers whom he had sent to summon the town to surrender, he ordered 800 of the inhabitants to be tied in comles, back to back, and cast into the Meuse. At this time, also, the town was burned, and the walls levelled.

DINAPO'RE, an important military station in the sub-presidency of Bengal, stands on the right bank of the Ganges, about ten miles above Patna, in lat. 25° 37' N., and long. 85° 7' E. The barracks are spacious and elegant; and the population—exclusive of the garrison, to which it is chiefly an appendage—numbers about 20,000. In the mutiny of 1857, D. acquired an unenviable notoriety. On 25th July, nearly eleven weeks after the commencement of the outbreak, the native troops, consisting of three regiments, rose against their officers, and that in the presence of a European force, which, if well handled, was as able, as it was ready, to crush them. After escaping with comparatively little loss, the insurgents clinging instinctively together, carried on a desultory warfare on their own account with various success. See ABRAH.

DINARIC ALPS, that branch of the Alpine system which connects the Julian Alps with the western ranges of the Balkan. It extends in a south-easterly direction, from Mount Klek, east of Fiume, to the mouth of the Narenta; and stretching along the borders of the Adriatic, it spreads its ramifications through the greater part of Croatia, Dalmatia, and Herzegovina. The D. A., the highest summits of which are Mount Dinara and Mount Prolok, seldom exceed 7000 feet in height. The range is principally calcareous.

DINGLE, a seaport, the most westerly town in Ireland, is situated in county Kerry, in a hollow on the north side of Dingle Bay, near the west end of a mountainous peninsula (30 miles by 7), 39 miles west-north-west of Killarney. It chiefly consists of one street, and has an antique aspect, some of the present houses having been built in the 16th c., in the Spanish style, with stone balconies, &c. Pop. about 3251. The chief exports are corn and butter to Liverpool. D. was incorporated in 1385. In the 17th c., D. had much trade with Spain, exchanging tanned hides, Irish friezes, woollen stockings, salt beef, salmon, and butter, for wines and spices. Dingle Bay is an indentation of the sea, on the west of Kerry, between Brac Head, Valentia Isle, on the south, and Dunmore Head and Blasket Isles on the north, from which points, which are 18 miles apart, it runs 24 miles east-north-east, narrowing to 7 miles. D. harbour is a landlocked creak in the bay, admitting ships of 300 tons up to the town of D., and forming a pretty safe retreat from the prevalent west winds of Dingle Bay.

DINGO (*Canis Dingo*), the native dog of Australia, regarded by some naturalists as a distinct species, by others as a mere variety of *Canis familiaris*. It exists both in a wild and in a domesticated state; but there is no good reason for thinking that the wild race has originated from dogs introduced from some other country by man. The domesticated D. is about the size of a shepherd's dog, the wild one is larger. The wild D. is found in all parts of Australia. It is of a tawny colour, has

a large head, with muzzle somewhat fuller than the shepherd's dog. The ears are short and erect, the tail bushy, but not so bushy as that of a fox. In running, the D., unlike dogs in general, carries

Dingo, or Australian Dog (*Canis familiaris*).

the head high, the ears erect, and turned forward. In a wild state, it does not bark. It is very destructive to the sheep of the colonists, and its delight is to kill as many as possible before proceeding to eat. It is very fierce and courageous, but capable of strong attachments.

DINGWALL, a royal and parliamentary burgh, the county town of the united counties of Ross and Cromarty, in the south-east of Ross-shire, at the head or south-west end of the Cromarty Firth, 11 miles north-west of Inverness. In Scandinavian, D. means Law or Court Hill; and in Gaelic, it is called Inverpheoran. It consists chiefly of a long street, and lies low, on what was formerly a swamp, amid rich, fertile, and well-wooded ground, at the entrance to the beautiful valley of Strathpeffer, the famous sulphureous springs of which are five miles to the west. A short canal brings vessels drawing nine feet of water up to the town, where there is also a station of the Inverness and Ross-shire Railway, expected to be opened in 1862. Its prosperity depends on agriculture. Pop. (1861) 2084, many speaking Gaelic, though all understand, and usually speak, English. It unites with Tain, Dornoch, Wick, Kirkwall, and Cromarty in sending one member to parliament. Near to D. is a vitrified fort, on a conical hill, and there are traces of an ancient castle, where the earls of Ross held their courts. (1871—pop. 2125.)

DINKELSBÜHL, a town of Bavaria, situated on the Wernitz, 44 miles south-west of Nuremberg. It is an ancient walled town, and was formerly a free city of the empire. It has important manufactures of hosiery, coarse linen, straw-hats, paper, &c.; and a dye-work, brewery, and several mills. D. suffered much during the Thirty Years' War. Pop. 7000.

DINNER. See MEALS.

DINORNIS (Gr. *deinos*, terrible or wonderful, and *ornis*, a bird), a genus of large birds of the tribe *Brevipennis* (q. v.), of which no species is now known to exist, but of which the bones have been found in New Zealand, in the most recent deposits, in the sand of the sea-shore, in swamps, in the soil of forests, in river-beds, and in caves; and concerning which, along with other large birds nearly allied to them (*Palaapteryx* and *Aptornis*), traditions are still current among the natives, rendering it probable that they continued to inhabit New Zealand, if not to the 18th, at least to the 17th century. The name by which these birds are known in the traditions of New Zealand is *Moa*. They are said to have been decked in gaudy plumage, for the sake of which

they were objects of pursuit, as well as for their flesh, which was much esteemed. They are also described as having been stupid, fat, and indolent birds, incapable of flying, living in forests and mountain-fastnesses, and feeding on vegetable food. With all this, the inferences deduced from their bones by comparative anatomists perfectly agree. These bones are not properly fossil or mineralised, but retain great part of their animal matter. It is even thought not impossible that some of the smaller species of *D.* may yet be found alive; of the larger ones, this can no longer be hoped. And these much exceeded in size any existing bird, some of the bones being at least twice the size of those of the ostrich; but the body seems to have

Dinornis Elephantopus.

restoration of skeleton has been effected. The first bone ever seen by a naturalist—a bone of the leg—was brought under the notice of Professor Owen in 1839; and it is worthy of being borne in mind, that from that one bone he assigned to the *D.* its true place in the system of nature, and pointed out some of the most important characters which are now most fully proved to have belonged to it.

**DINOSAURIA** (Gr. terrible or wonderful lizards), an order of extinct lizards, which are found in the lias, oolite, and wealden, and disappear in the lower cretaceous beds. They were gigantic reptiles, with a structure approaching nearer to the mammalian type than any other of their class. Their bodies were supported, at a considerable height, on four strong limbs, and the sacrum was composed of five amalgamated vertebrae. The principal genera are *Megalosaurus* (q. v.), *Iguanodon* (q. v.), and *Hylæosaurus* (q. v.).

**DINOTHERIUM** (Gr. terrible or wonderful beast), a remarkable extinct animal, the cranial bones of which are found in the Miocene formations of Germany, France, &c. The animal was provided, like the elephant and the walrus, with a pair of long tusks; but these projected from the end of the lower jaw, which is deflected downwards at a right angle to the body of the jaw. In addition to the two tusks, there were five double-ridged grinders on each side of both jaws. The nasal cavity is large, apparently supplying attachment for a trunk, as in the elephant. No body or limb bones have yet been

found so associated with those of the skull, as to shew that they belonged to the same animal. Hence the true position of the *D.* has not been satisfactorily determined. Cuvier and Kaup have referred it to

Restored Form of Dinotherium.

the neighbourhood of the tapir, supposing it to have been an inhabitant of large lakes. We give a figure of Kaup's restoration. De Blainville, on the other hand, makes it a herbivorous cetacean, like the manatee.

**DIOCESAN** is a bishop viewed in relation to his own clergy or flock.

**DIOCESAN COURTS.** See CONSISTORIAL COURTS.

**DIOCESE** (Fr., from Gr. *diokesis*, administration; and *dioko*, to govern), the territory over which a bishop exercises ecclesiastical jurisdiction. The term occurs as early as the time of Cicero, as the special designation of districts in Asia Minor. In the organisation of the Roman Empire introduced by Constantine the Great, the designation diocese was applied to the larger divisions, which were subdivided into provinces. About the middle of the 5th c., the dioceses of the empire were: the East, Egypt, Asia, Pontus, Thrace, Macedonia, Dacia, Illyria, Italy, Africa, Gaul, Spain, and Britain. The dioceses were governed some by Prefects, some by Proconsuls, and others by Vicars. The provinces were under Rectors. The government of the Christian religion, as established by Constantine, was in so far adapted to this division, and the term diocese and others passed over to ecclesiastical matters. At first, a diocese meant the collection of churches or congregations under the charge of an archbishop. The name came afterwards to be applied to the charge of a bishop, which had previously been called a parish. England and Wales are divided ecclesiastically into two provinces, viz., Canterbury and York, the former being presided over by the Primate of All England, and the latter by the Primate of England. Each of which is subdivided into dioceses, and these again into archdeaconries, rural deaneries, and parishes. A diocese is synonymous with the see of a suffragan bishop.

**DIODATI, JEAN**, a Swiss theologian, was born in Geneva in 1576. He belonged to a noble Italian family, originally of Lucca. His progress in letters was so rapid, that Beza caused him to be appointed professor of Hebrew at the age of 21. In 1608, he became a pastor of the Reformed Church, and in the following year, professor of theology. About this period, he endeavoured to spread the doctrines of the reformation in Venice and other cities of Italy, but without success. In 1614, he went to Nîmes, where he preached for three years; and in 1618, he was sent to the synod of Dort, to represent the Genevese Church. Here his talents were so highly estimated that he was one of the divines appointed to draw up the articles of the synod. He died at Geneva in 1649. *D.* was a somewhat intolerant Calvinist; but as a preacher, he was eloquent, persuasive, and conscientious. His Italian translation

of the Bible appeared in 1607; his French, in 1644. Among his other works may be mentioned his *Annotiones in Biblia* (1607), *De Fictio Pontificiorum Purgatorio* (1619), and *De Justa Seccessione Reformatorem ab Ecclesia Romana* (1628).

**DIODON** (Gr. two-toothed), a Linnæan genus of fishes, now giving its name to a family, *Diodontidæ* (*Gymnodontes* of Cuvier), of the order *Plectognathi*. The fishes of this family have no distinct teeth, but their jaws, which are shaped like the beak of a parrot, are covered with a substance like ivory, formed of the teeth consolidated together. This is reproduced as fast as it is worn away by use, and the mouth is admirably adapted for grinding down the crustaceans and sea-weeds on which these fishes feed. Their flesh is mucous, and that of some is regarded as poisonous. None of them are used for human food. Some of them, particularly of the genera *D.* and *Tetraodon*, have a remarkable power

Globe-fish (*Tetraodon lineatus*).

of inflating their bodies by filling their stomachs with air, the stomach being extremely dilatible, and assuming a globular form when distended, whence they have received the name **GLOBE-FISH**, whilst from the spines, which stand out in all directions, like those of a hedgehog when rolled up, as if for defence of the inflated body, some of them have been designated **PORCUPINE FISH**. When distended with air, they float in the water with the back downwards, but are not incapable of swimming in this position, as was formerly supposed. The *Diodontidæ* are fishes of warm seas; one or two species, occasionally wafted by the currents to more northern shores, are among the rarest of British fishes.—The **SUNFISH** belongs to this family. The name *D.* has recently—with the effect only of confusion—been given to a new genus of cetaceous animals, of which one very rare species has occurred on the British coast.

**DIODORUS, SICULUS**, a Greek historian, was born at Agyrium, in Sicily. Little is known of his life beyond what is told by himself. He lived in the times of Julius and Augustus Cæsar, travelled in Asia and Europe, and lived a long time in Rome, collecting the materials of his great work, the compilation of which occupied thirty years. This work, the *Bibliotheca* or *Library*, was a history of the world, in forty books, from the creation to the Gallie wars of Julius Cæsar. It was divided by the author into three parts—the first of which, in six books, comprises all the Greek and foreign myths down to the Trojan war; the second, in eleven books, contains the history from the year 1184 B.C. to the death of Alexander the Great; the third, in 23 books, continues the narrative of events from that date to the year 60 B.C. Of the *Bibliotheca*, the first five books are extant entire; the next five books are wholly lost; the next ten are complete; and of the remainder of the work, considerable fragments have been preserved. Had *D.* possessed any powers either of criticism or of arrangement, his work would have been of the greatest importance; but he was in both respects so deficient, that his history

has no practical value beyond what belongs to an immense mass of raw, and now scarcely available material. His narrative is colourless and monotonous, and his diction, generally clear and simple, holds a sort of middle place between the pure Attic and the colloquial Greek of his time. The best editions of *D.* are Wesseling's (Amst. 1746), the *Deux-ponts* (1793—1801), and Dindorf's (Leip. 1828—1831).

**DIŒCIOUS** (Gr. *dis*, twice; and *oikion*, a habitation), in Botany, a term applied either to plants or flowers, when not only the flowers but the individual plants are unisexual—i. e., when male and female flowers are produced upon separate plants. *D.* plants form a distinct class in the Linnæan sexual system; but in thus placing them apart, if the principle of arrangement had been strictly maintained, great violence would often have been done to natural affinities; *D.* species frequently occurring in genera and families usually *Monœcious* (q. v.) or *hermaphrodite*, and also monœcious and hermaphrodite species in those which are usually diœcious. Familiar examples of *D.* plants may be seen in most species of willow. Amongst cultivated plants, hemp, spinach, and the date-palm may be named as instances.

**DIŒGENES LÆRTIUS**, the author of a biographical history of the Greek philosophers, seems to have been born at Laerta, in Cilicia, and to have taken his surname from that town. So little is known of his personal history, that the very age in which he flourished is a matter of doubt. By some it is assigned to the end of the 2d, and by others to the middle of the 3d c. after Christ. His name has been kept alive by his *Lives of the Philosophers*, a work which contains a great mass of interesting information regarding the private lives and habits of the most eminent philosophers of antiquity. Though the work is utterly worthless in respect of plan, coherence, or criticism, it yet contains so many piquant anecdotes, and so many valuable quotations from lost works, that Montaigne's wish was perhaps a justifiable one—that instead of one Laertius, we had had a dozen. The best edition of Laertius is that of Hübner, 2 vols. 8vo (Leip. 1828—1831).

**DIŒMEDE ISLANDS**, a group about the middle of Behring's Strait, form, as it were, a number of stepping-stones between the most easterly point of Asia and the most westerly of America. Their names are Fairway, Crusenstern, and Ratamanow; and their central point is in lat. 65° 46' N., and long. 168° 55' W.

**DIOMEDEA.** See **ALBATROSS**.

**DIOMEDES**, the bravest, after Achilles, of all the Greeks who took part in the Trojan war. His exploits occupy a prominent place in the record of the heroic deeds sung by Homer in the *Iliad*. He vanquished in fight Hector and Æneas, the most valiant of the Trojans; and even Mars and Venus, when they took the field on the Trojan side, were attacked and wounded by him. In the games instituted by Achilles in honour of Patroclus, he gained the prize in the chariot-race, and worsted the mighty Ajax in single combat. Along with Ulysses, he carried off the Palladium, on which the fate of Troy depended. On returning to Argos (to the crown of which he had succeeded after the death of Adrastus), he found that his wife had proved unfaithful in his absence. Leaving home, he went, according to one tradition, to Italy, where he took part with the Trojans against Turnus. Several cities on the southern shores of that country claimed to have been founded by him.

**DION CASSIUS COCCEIANUS**, a celebrated Greek historian, was born at Nicæa, in Bithynia, 155 A. D. He held various high offices of state under the Roman emperors, was twice consul, and enjoyed the intimate friendship of Septimius Severus. He is best known by his *History of Rome*, in 80 books, of which only 18 (from the 36th to the 54th) have reached us complete. The others are only known to us from fragments and abridgments. His high position gave him free access to the national archives, and as an authority on some points, especially on the imperial epoch of Roman history, his work is not without very considerable value. He wrote on the model of Thucydides, to whom, indeed, he is far inferior, both in vigour of judgment and acuteness of criticism; yet many passages of his History might be quoted as among the best samples of the rhetoric of the age in which he lived. D. died at Nicæa, but the date of his death is not known. The best edition of his History is that of Sturz (Leip. 1824—1843).

**DION CHRYSOSTOMUS** (Golden-mouthed), an eminent Greek rhetorician, was born at Prusa, in Bithynia, towards the middle of the 1st century. His father, Pasircates, paid great attention to his education, which was also enriched by travel. D., after residing for some time in his native town, came to Rome, where, however, he had the misfortune to excite the suspicion of the Emperor Domitian, and was in consequence obliged to flee. On the accession of Nerva, 96 A. D., he returned to Rome, and was honourably received. Nerva's successor, Trajan, held D. in the highest estimation, even permitting him to ride beside himself in the imperial chariot. His excellent disposition procured him many friends, while his remarkable powers of oratory excited universal admiration. He died at Rome about 117 A. D. D. left a very great number of orations, of which 80 are still extant in whole, with fragments of 15 others. They discuss questions in politics, morals, and philosophy, and are written in pure Attic Greek. According to Niebuhr, he was 'the first writer after Tiberius that greatly contributed towards the revival of Greek literature.' A good edition of D.'s orations is that of Reiske (Leip. 1784).

**DIONÆA**, a very curious and interesting genus of plants of the natural order *Droseracea*, having a 5-partite calyx, 5 petals, 10—20 stamens, and one style, with 5 closely united stigmata. Only one

*Dionæa.*

species is known, *D. muscipula*, sometimes called **VENUS'S FLY-TRAP** and the **CAROLINA CATCHFLY PLANT**. It grows in marshy places in the warmer parts of North America, as far north as North Carolina, and is a perennial plant, with a rosette of root-leaves, from the midst of which arises a leafless

stem (scape) about 6 inches high, terminating in a corymb of white flowers. It is remarkable for the irritability of its leaves. The leaf-stalk is elongated, winged, and leaf-like, and bears at its extremity an orbicular leaf, set round at the margin with long stiff bristly hairs, and having on its upper surface many small glands, and three delicate irritable hairs on each side, so placed that an insect can hardly traverse the leaf without touching one of them, when the two sides of the leaf immediately fold together upon it, and lay hold of it, the marginal bristles crossing one another, and preventing the possibility of escape. The leaf does not open again till the insect is dead, and there is no longer any irritation caused by its motion. The juice from the glands seems to attract insects; but the use of all this to the plant is unknown, for that it sucks the juice out of its insect prey, or receives nourishment from the bodies of insects dissolved in a mucilaginous exudation from its glands, has only been conjectured, and not proved. Nor has the upper surface of the leaf any prickles which might pierce or lacerate insects. —The *Dionæa* is sometimes to be seen in hothouses.

**DIONYSIUS, THE AREOPAGITE**, is mentioned in the Acts of the Apostles (chap. xvii., verse 34) as one of the few persons in Athens converted to Christianity by Paul. A history has been invented for him by the church. It is said that he was in Egypt when the Crucifixion happened, and observing the eclipse that accompanied it, exclaimed: 'Either God himself is suffering, or he sympathises with some one who is suffering.' At the time when Paul visited the metropolis of Greece, D. was a member of the council of the Areopagus, whence his name. Tradition also declares that the apostle installed him as the first Bishop of Athens, and that he suffered the fate of a martyr. The writings which are falsely current under his name treat of such topics as the heavenly hierarchy, the names of God, the ecclesiastical hierarchy, &c. Their theology is of the mystical kind. The style, contents, and historic allusions clearly indicate that the author of these writings could not have flourished before the close of the 5th c., and, in fact, the writings first made their appearance in the 6th century. Dazzling neoplatonic phantasies concerning the divine essence, angels, and holy spirits, splendid descriptions of the ceremonies of the Catholic worship, glorifications of the priestly hierarchy, panegyrics on monastic life, and mystical interpretations of church doctrine, made the works immensely attractive, especially to the Greek monks, whose manner of life was pre-eminently contemplative. According to a recent hypothesis, the so-called writings of D. are the composition of some Christian Platonist, who, in opposition to the not yet wholly extinguished Gnosticism, sought to incorporate with Christianity the forms, ideas, and ceremonies of the Dionysian (Bacchic) mysteries. The translation of the work into Latin by Scotus Erigena, in the dawn of the middle ages, gave a new impulse to monasticism in the Western Church, and may be almost said to have created its mystic theology. The *Areopagitic Theology* was, in fact, the name given during the middle ages, and even as late as the 18th c., to that mystical method of apprehending religious truth made current by the writings ascribed to D., and afterwards formally introduced into Latin Christianity by Hugo St Victor in the 12th century. This theology proceeds upon the principle, that the Divine Spirit is indispensable even to the understanding of man.

**DIONYSIUS, THE ELDER**, tyrant of Syracuse, was born 431 or 430 B. C. He was originally a clerk

in a public office, but manifested at an early period a passion for political and military distinction. When the Agrigentines, after the conquest of their city by the Carthaginians, accused the Syracusan generals who had failed to relieve them of treachery, D. supported their accusations before the people of Syracuse, and induced the latter to appoint new commanders, of whom he himself was one. But in a very short time he supplanted his colleagues also, and, when only 25 years of age, made himself, by the help of his mercenaries, absolute ruler of the city. To strengthen his 'tyranny' (the name given by the Greeks to any *usurped* authority, however wisely and beneficently exercised), he married the daughter of Hermocrates, the late head of the aristocratic party, and thus attached the followers of that leader to himself. After he had fiercely suppressed several insurrections, and conquered some of the Greek towns of Sicily, he made preparations for a great war with the Carthaginians. It broke out 397 B.C. At first, fortune favoured D., but after a short time he suffered a series of reverses, so calamitous, that all his allies abandoned him, and he was shut up in the city of Syracuse, apparently without hope of escape. When he was about to fall a victim to despair, a pestilence broke out in the Carthaginian fleet. D. took courage, and suddenly attacking his enemies by land and sea, obtained a complete victory. In the years 393 and 392 B.C., the Carthaginians renewed hostilities, but were defeated on both occasions, and D. was enabled to conclude a most advantageous peace. He now turned his arms against Lower Italy, and in 387 B.C., after a siege of 11 months, captured Rhegium. From this time he continued to exercise the greatest influence over the Greek cities of Lower Italy, while his fleets swept the Tyrrhenian and Adriatic Seas. But D. was not contented with the reputation of being the first warrior and statesman of his age; he wished to shine as a poet also. He even ventured so far as to contend for the prize at the Olympic games, and about the end of 388 B.C., sent thither a splendid embassy, comprising the best reciters of the time, whose utmost skill, however, could not induce the judges to decide in his favour. D. was more successful at Athens, where he several times obtained the second and third prizes for tragedy, his last production even obtaining the first. He also invited many poets and philosophers to his court, his treatment of whom, however, was not always courteous. In 368 B.C., he renewed the war with the Carthaginians, whom he wished to drive out of Sicily altogether, but died in the following year, before he could accomplish his design. It was rumoured that his death was hastened by his physician, at the instigation of his son. D. was unquestionably a most vigorous ruler, but unscrupulous as to the means he employed to secure his ends, and tormented in his last years by the suspicion that he was surrounded with traitors.

DIONYSIUS, THE YOUNGER, son of the preceding, celebrated his entrance into public life, 367 B.C., by a splendid festival, which lasted ninety days. His political education had been designedly neglected by his father, and in consequence he grew up an indolent, pleasure-loving, and dissolute prince. Dion, a relative of his father, sought to improve him by the instructions of Plato, but his endeavours were frustrated by Philistus, the historian, who disgracefully encouraged the excesses of the youth. Dion was banished, but afterwards returning to Sicily, expelled D. from Syracuse. The latter fled to Locri, the birthplace of his mother, Doris, where he was hospitably received. He repaid the kindness of the Locrians by making himself master of their city, which he ruled despotically for several years. In

346 B.C., the course of events enabled him to return to Syracuse, but he could not firmly re-establish himself. His cruelties drove the citizens to ask the aid of the Corinthians against him. Timoleon was sent to their assistance, and D., shut up in the citadel of Syracuse, was compelled to surrender, 343 B.C. He was brought to Corinth, where he soon squandered the wealth which he had carried away from Sicily, sunk into obscurity, and died in extreme poverty.

DIONYSIUS, OF HALICARNASSUS, a learned critic, historian, and rhetorician, was the son of one Alexander of Halicarnassus, and was born probably about the middle of the century before Christ. He came to Rome at the termination of the civil wars, 29 B.C., and resided there for 22 years, familiarising himself with the language, literature, and antiquities of the Romans. His death occurred shortly after 7 B.C. D.'s most valuable work is unquestionably his *History of Rome*, although it does not exhibit the finest qualities of his mind. The author was an admirable rhetorician, but had very little political discrimination, and no perception of the difference between a myth and a historic fact. Yet, inasmuch as it contains a mine of information about the constitution, religion, history, laws, and private life of the Romans, it will always command the regard of scholars. Of the 20 books of which it originally consisted, we possess only the first 9 in a complete form, the 10th and 11th nearly so; and of the rest, only a few fragments. The first edition of the Greek original was that by Stephens (Paris, 1546), but a very good Latin version was published as early as 1480. Angelo Mai published (Milan, 1816) a collection of the fragments of the lost books from a MS. in the library at Milan, the genuineness of which has been doubted by Niebuhr. The rhetorical and critical works of D. are of the highest literary merit. The principal are his *Censura Veterum Scriptorum*, his *Ars Rhetorica*, and his *De Compositione Verborum*. The first complete edition of the *History* (or *Archæologia*, as D. called it) and rhetorical works was that of Fr. Sylburg (Frankfort, 1586); one of the best is that of Reiske (6 vols., Leip. 1774—1777).

DIOPHANTINE ANALYSIS is that section of the theory of unlimited or indeterminate problems which attempts to find rational and commensurable values answering to certain equations between squares and cubes. This class of problems was first and chiefly treated of by Diophantus (q.v.), who has given his name to the theory of their solution. We shall not here attempt to explain the nature of the analysis, which is very subtle, and guided by few general rules. The difficulties of the solution of diophantine problems in most cases fall to be overcome by the skill and ingenuity of the analyst. We confine ourselves to stating the following examples of the problems solved by the Diophantine analysis: 1. To find two whole numbers the sum of whose squares is a square. 2. To find three square numbers in arithmetical progression. 3. To find a number from which two given squares being severally subtracted, each of the remainders may be a square.

DIOPHANTUS, a distinguished Greek mathematician, lived at Alexandria, according to some, about the middle of the 4th c.; according to others, about the close of the 5th. His name first occurs in the life of Johannes Damascenus, written by John, patriarch of Jerusalem, in the 8th century. He is commonly represented as the inventor of algebra, but he himself speaks of that science as known before his time. It is possible he may have been acquainted with Hindu algebra; at all events, according to De Morgan, there is a very great

similarity between the Hindu algebra and that of Diophantus. He occupied himself chiefly with the class of problems characterised in the preceding article. Of his valuable work, the MS. of which was discovered in the 16th c., *Arithmetica*, consisting originally of 13 books, only six have been preserved. Besides this we possess a book on polygonal numbers. The best edition is that of Fermat (Toulouse, 1670); there is a German translation by Schulz (Berl. 1821).

**DIOPSIS**, a genus of dipterous insects of the same great family with the house-fly, remarkable for the prodigious prolongation of the sides of the head, so as to form stalks for the eyes, which are thus removed to a distance from the body of the insect, almost equalling in some species the length of its wings. All the species are found in warm parts of the Old

*Diopsis Ichneumonoma*: 1, magnified; 2, natural size. World.

**DIOPTRICS** is that branch of geometrical optics (see **OPTICS**) which treats of the transmission of rays of light from one medium into another, differing in kind. It consists of the results of the application of geometry to ascertain in particular cases the action of what are called the laws of refraction. When a ray of homogeneous light is incident upon a surface, the angle which its direction makes with the normal or perpendicular to the surface at the point of incidence is in dioptries, as in catoptries, called the angle of incidence. The angle which the refracted ray makes with the same line is called the angle of refraction. This being premised, we may state the laws of refraction. 1. The incident and refracted ray lie in the same plane with the normal, at the point of incidence, and on opposite sides of it. 2. The sine of the angle of incidence, whatever that angle may be, bears to the sine of the angle of refraction a constant ratio dependent only on the nature of the media between which the refraction takes place, and on the nature of the light. According to the second law, if we call the angle of incidence  $i$ , and that of refraction  $r$ , we shall have  $\sin i = \mu \sin r$ , where  $\mu$  is a quantity depending upon the nature of the media and of the light. It will have, for instance, a certain value for refraction from vacuum into glass, another from glass into water, and so on; also it will have one value for red light, another for green, and so on. The quantity  $\mu$  is called the refractive index, and is greater than 1 when refraction takes place from vacuum into a medium, and in general is greater than 1 when the refraction is from a rarer into a denser medium, and less than 1 when the opposite is the case. In dioptries, the laws of refraction may be considered as depending for their truth upon experiment; in physical optics, they are deductions from an hypothesis respecting the constitution of light. They are not merely approximately true; they are absolute physical laws.

Before proceeding to consider the simpler leading cases of refraction, one or two interesting propositions in dioptries require to be explained.—1. If the refractive index for a medium, when light is incident upon it from vacuum, be  $\mu$ , and the index for another medium, under the same circumstances, be  $\mu'$ , then, when light proceeds from the second medium into the first, the refrac-

tive index is  $\frac{\mu}{\mu'}$ . The proof of this proposition depends upon the two following experimental laws: (1.) If a ray of light proceed from a point P, to another Q, suffering any reflections or refractions in its course, then, if it be incident in the reverse direction from Q, it will follow the exactly reverse course to P. This is proved by experiment, but may be accepted as axiomatic. (2.) If a ray pass from vacuum through any number of media, having their faces plane and parallel, when the ray emerges into vacuum its direction will be parallel to that which it had before incidence. To deduce the proposition from these laws, let  $i$  be the angle of incidence from vacuum upon the medium B (fig. 1),  $r$  the angle of refraction, which will also be the angle of incidence upon the medium A. Also let  $r'$  be the angle of incidence upon the second bounding surface of A, which will also be the angle of incidence upon the second bounding surface of A. By the second of the preceding experimental laws, the angle of emergence into vacuum will be  $i$ . Hence we shall have by the first of these laws,  $\sin i = \mu' \sin r$  at the first surface, and  $\sin i = \mu \sin r'$  at the second.

Fig. 1.

From these equations, we have  $\sin r = \frac{\mu}{\mu'} \sin r'$ , which proves the proposition. It follows that if  $\mu$  be the refractive index from vacuum into a medium, that from the medium into vacuum will be  $\frac{1}{\mu}$ .—2. Our second proposition relates to what is called the *critical angle*. If  $i$  be the angle of incidence of a ray within a medium, the refractive index of which is  $\mu$ , and  $r$  the angle of refraction into vacuum, then we have from the former proposition  $\sin i = \frac{1}{\mu} \sin r$ . From this formula, if  $i$  be given,  $r$  may be found, and a real value will be given to  $r$  so long as  $\sin i$  is  $\leq \frac{1}{\mu}$ ; but when  $i$  has a value greater than that determined by the equation  $\sin i = \frac{1}{\mu}$ , the formula fails to give us a value of  $r$ , for the sine of an angle cannot be greater than 1. And experiment shews that, in fact, there is no refracted ray when the angle of incidence is greater than that above assigned, the ray being wholly reflected within the medium. The angle of which the sine is  $\frac{1}{\mu}$  is called the *critical angle*. For glass, it is about  $41^\circ 45'$ ; for water, about  $48^\circ 30'$ . This angle is sometimes called the angle of *total reflection*. In internal reflection at the surfaces of media, the reflected light is more nearly equal in intensity to the incident than in any other case of reflection. While it thus appears that refraction from a denser into a rarer medium is not always possible, it may be added that it is always possible from a rarer into a denser.

We shall now investigate some simple cases of refraction. 1. And first of refraction at a plane surface. Let DIMN (fig. 2) be any medium bounded by a plane DI, and let R be a radiant point, and RD and RI two incident rays of a divergent pencil proceeding from R to the surface of the medium; then RD being perpendicular to the surface, suffers no refraction, but proceeds along DM within the medium; but RI is refracted in the direction IN, which, produced outwards,

meets the normal DF in F. Therefore, a small pencil of rays proceeding from R, and having RD, perpendicular to the surface, for axis, will be refracted into another pencil diverging from the imaginary focus F; for all the rays intermediate between RD and RI will converge very near F when the pencil is small. An eye within the medium, and between N and M, would thus, the pencil being small, see the luminous point R, as if it were at F, or further off than it really is. In the opposite case,

Fig. 2.

Fig. 3.

represented in fig. 3, R being within the refracting medium, similar reasoning shews that after the rays emerge from the plane surface into the air, they will, if the pencil be small, appear to proceed from an imaginary focus F, nearer to the surface than R, the luminous point.

2. The case of refraction through a prism, which we are next to consider, is, in fact, the case of refraction through a medium bounded by plane surfaces which are not parallel. Conceive two planes at right angles to the plane of the paper, and making on that plane the figure BAC (fig. 4). The question is as to the laws of transmission of a ray, SPQR, of homogeneous light through the prism.

Fig. 4.

Draw  $mn'$  and  $n'n$  perpendicular to the sides. Then  $n'PQ$  and  $n'QP$  are respectively the angles of refraction at the first, and of incidence at the second surface. Now, as  $n'QA$  and  $n'PA$  are each of them right angles, and as all the angles in the figure  $n'QAP$  are equal to four right angles, it follows that the angles at  $n'$

and at A together are equal to two right angles. But the angle at  $n'$ , together with the angles  $n'PQ$  and  $n'QP$ , are equal to two right angles; therefore must the angles  $n'PQ$  and  $n'QP$  together be equal to the angle at A. In other words, in refraction through a prism: *The sum of the angles of refraction at the first surface, and of incidence at the second, is equal to the angle contained between the plane sides of the prism.* From this it might be shewn, that the deviation of a ray caused by passing through a prism is always towards the thicker part of the prism, if the medium be denser than the surrounding atmosphere. It is a geometrical proposition which the student may solve for himself, that if  $i$  be the angle of incidence at the first surface, and  $e$  that of emergence at the second, and if  $a$  be the angle of the prism, then  $\delta$ , or the change of direction of the ray in its passage, is obtained from the formula  $\delta = i + e - a$ .

3. We now take up the case of refraction at a single spherical surface of a medium denser than the surrounding air. And first, of parallel rays refracted at a convex spherical surface. Let ABQP (fig. 5) be the refracting medium, whose terminating

convex surface is spherical, C being the centre of the surface, and V its vertex. Let XV be the axis of a pencil of parallel rays, of which any ray, RI, is incident at I. Then, if CIN be a normal, the angle of refraction, CIF, will be less than the angle of incidence, RIN, and the refracted ray will thus turn towards the axis, and meet it at some point, F.

Fig. 5.

When the pencil is small, or the aperture, AVB, of only a few degrees, the rays will clearly nearly all converge to the same point, F. To find the position of F, we have, in the triangle ICF, the angle  $CIF = r$ , the angle of refraction, and  $ICV$ , the supplement of  $ICV$  or  $NIR$  (by parallel lines), i. e., of  $i$ , or the angle of incidence. Therefore,  $IF$  is to  $CF :: \sin i$  is to  $\sin r$ . And as for a very small pencil,  $IF$  may be taken  $\approx VF$ , we have  $EV : FC :: \sin i : \sin r$ , or  $:: \mu : 1$ . And putting  $FV = F$ , the principal focal distance, and  $VC = R$ , we have

$$F = \frac{\mu}{\mu - 1} R.$$

If the medium be crown-glass, for which the value of  $\mu$  is  $\frac{3}{2}$ , we have  $F = \frac{3}{\frac{3}{2} - 1} R$ , or

$F = 3R$ ; i. e., the principal focal distance is equal to three times the radius of the sphere. The student may, by similar reasoning, ascertain for himself the focus of parallel rays incident on a concave spherical refracting surface, as also the focus in the case of a pencil of parallel rays within the medium and emerging from it.

The case of a divergent pencil is incapable of such elementary treatment as to justify its insertion here. For branches of the subject, treated under separate heads, the reader should refer to the articles CAUSTIC, LENS, and REFRACTION. Under REFRACTION, he will find a table of the values of  $\mu$ —the refractive index for various media and kinds of light. See also the articles SPECTRUM and CHROMATICS.
